Preface

This report has been produced by a working group within the North Carolina Division of Air Quality. Stakeholders from industry, environmental and other organizations were also invited to provide their insights, comments and other input. The Division appreciates the efforts of all the stakeholders and other individuals who committed their time and effort to the development of this preliminary report. This open process will continue in the development of subsequent and final reports on this topic.

Many portions of this document were taken directly from other government (non-copyrighted) documents in the interest of time and completeness. Some of these sections may have only minor wording changes from the original documents. Quotations are not strictly used to identify these parts, but a strong effort has been made to reference these documents and acknowledge them. The purpose has not been to claim credit for original work of others, but to provide as much detail and accuracy as possible within a limited time.

This report consists of two volumes. Volume Two includes technical and scientific reports with background information. Volume One contains broader and more general information about mercury emissions and potential air pollution control devices.

The objective of this first interim report is to provide a technical background and to define the scope of efforts to address and respond to the legislative requirement. The purpose of this report is not to defend or promote particular conclusions regarding the consequences of emissions of mercury to the atmosphere, but to provide results or summaries of investigations and information as defined by the Clean Smokestacks Act. The underlying presumption is that it is prudent to undertake efforts to reduce these emissions, with the extent of reductions to be determined later based on the information to be provided.

CONTENTS OF VOLUME TWO

CHAPTER 1 - MERCURY CONCERNS SPECIFIC TO NC 1-1

HISTORY: MERCURY IN NORTH CAROLINA 1-1
Mercury in Fish Tissue 1-1
Human Mercury Burden 1-3
Monitoring For Atmospheric Mercury 1-4
MERCURY WET DEPOSITION 1-4
The Mercury Deposition Network 1-5
Mercury in Ambient Air 1-13
WACCAMAW ATMOSPHERIC MERCURY STUDY: 1-15
STUDY DESIGN AND PURPOSE 1-15
WACCAMAW STUDY RESULTS & DISCUSSION 1-19
TOTAL GASEOUS MERCURY: RESULTS 1-20

General Comments 4-3

List of Acronyms Used in This Report

BAF – Bioaccumulation factors
CAPA – Clean Air Planning Act – Carper Bill
DAQ – NC Division of Air Quality
DEHNR – Former NC Department of Environment, Health, and Natural Resources, now DENR and DHHS
DENR – NC Department of Environment and Natural Resources
DHHS – NC Department of Health and Human Services
DMF – Division of Marine Fisheries
DWQ – Division of Water Quality
EPA – US Environmental Protection Agency
Hg(0) – elemental mercury
Hg(2+) – reactive mercury
$HgCl_2$ – mercury chloride
MDN – Mercury Deposition Network
MERAU – Medical Evaluation and Risk Assessment Unit
NC – North Carolina
NHANES –National Health and Nutrition Examination Survey
NOx – Oxides of Nitrogen, including NO_2, the primary nitrogen species from combustion.
RGM – Reactive Gaseous Mercury
SO_2 – Sulfur Dioxide
TGM – Total Gaseous Mercury
TMDL – Total Maximum Daily Load

CHAPTER 1 - MERCURY CONCERNS SPECIFIC TO NC

HISTORY: MERCURY IN NORTH CAROLINA

Biologists suspected for many years that freshwater fish in the black water systems of eastern North Carolina would be prone to mercury contamination as found in other parts of the country sharing similar environmental conditions. In 1970 the Federal Water Quality Administration issued a report on mercury pollution that mentioned mercury contamination found in fish caught in the lower Cape Fear River basin. Industrial discharges of mercury to local waterways and mercurial pesticide use were scrutinized at that time, but no mention was made of atmospheric contributions. Past studies of mercury levels in eastern North Carolina peat deposits discussed the possible contribution of atmospheric deposition of mercury to local waterways. However, no information was available on atmospheric mercury trends in the areas surrounding eastern North Carolina's sensitive waterways

Mercury in Fish Tissue

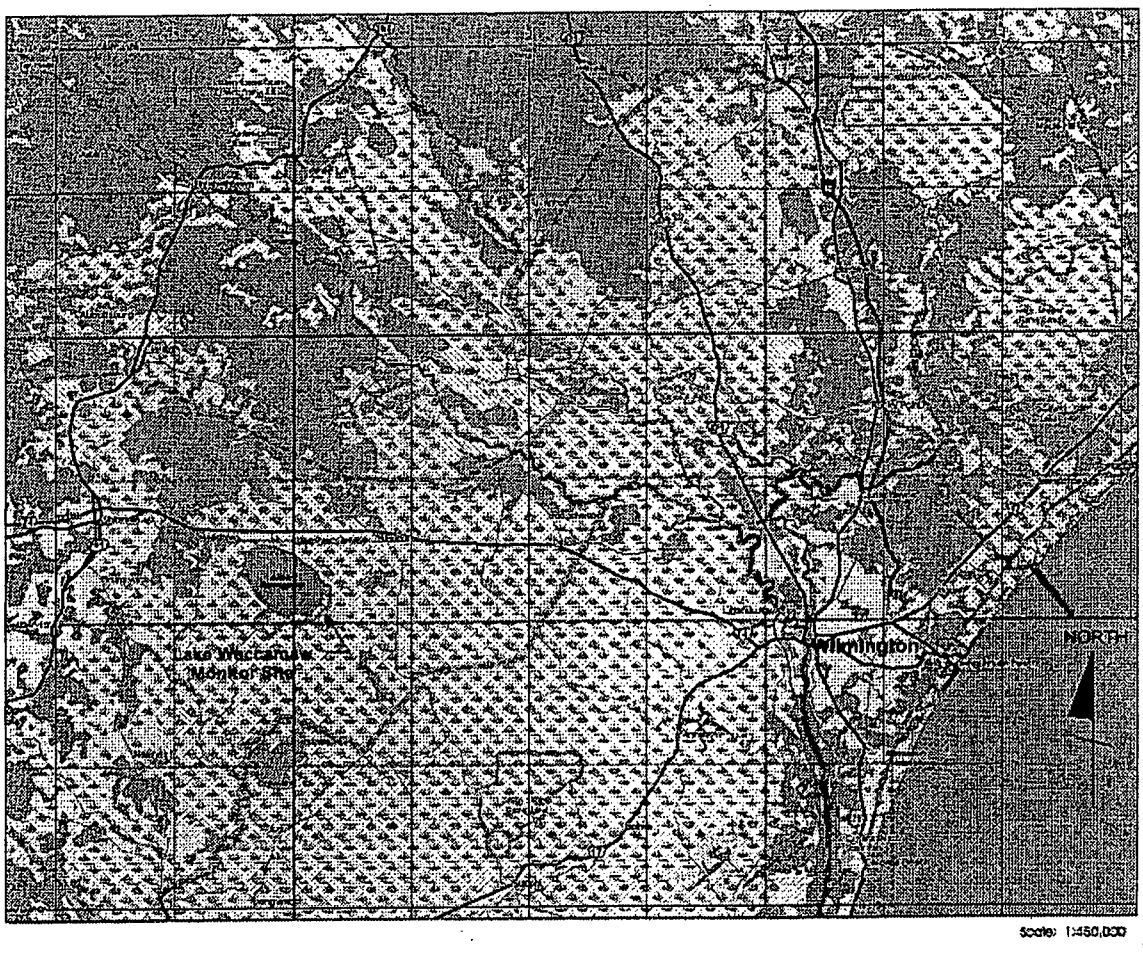
The rate and degree to which mercury bioaccumulates within a system is dependent on a number of factors. The most significant of these includes the water's pH, food chain length and composition (productivity), water temperature, water body chemistry, and the form and structure of the organisms present. Methyl mercury, the toxic and most bioaccumulative form of mercury in fish, can be concentrated in top predator species.

The Environmental Sciences Branch (fisheries programs) of the North Carolina Division of Water Quality (DWQ) conducts fish community assessments, fish tissue monitoring, fish kill data assessment, and supports special projects. In the early 1990s, DWQ division fell under the North Carolina Department of Environment, Health, and Natural Resources (NCDEHNR). In 1992, the DWQ conducted an intensive fish mercury survey in the vicinity of Lake Waccamaw, situated in the Lumber River Basin of southeastern North Carolina (Figure 1-1). In that study, 60% of largemouth bass samples from Big Creek and the Waccamaw River were found to contain mercury levels above 1 ppm, the threshold level for issuance of fish consumption advisories at that time by NCDEHNR.

Figure 1-1

Southeastern North Carolina

Including Lake Waccamaw and Surrounding Environs



The DWQ's efforts from 1995 to 1999 consisted of monitoring for mercury and other contaminants under basin-wide assessments, sampling statewide, verification of the high levels of mercury in eastern piscivores (fish-eaters), and the king mackerel mercury survey (1998-1999) with the Department of Marine Fisheries (DMF). From 1998 to 1999, DWQ assisted with the analyses of 112 king mackerel and Spanish mackerel samples that were collected by the DMF from recreational and commercial sources. The fish tissues were collected from a range of fish sizes and seasonal populations.

The Spanish mackerel samples contained low mercury levels. However, regression models using king mackerel tissue data demonstrates a strong relationship exists between king mackerel size and mercury concentration. From these regression curves, a mercury level over 1ppm is predicted for king mackerel over 13 pounds or 37 inches.

After characterizing the mercury problems in fish in North Carolina for about seven years, DWQ was forced to remove mercury assessment from routine statewide sampling due to budget limitations. Basin-wide surveys of mercury in fish tissue were discontinued in 1999 due to limited resources in "clean" watersheds. Present surveys target mercury trouble spots, such as the coastal plain, requests for surveys by regions and agencies, and sites where data are absent or suspect.

Since 1992, results of mercury concentrations in fish sampled have been shared with the Department of Health and Human Services (DHHS). In turn, DHHS posted site or basin specific advisories based on 1.0 ppm standard. They also posted the first North Carolina ocean advisory for king mackerel.

In 2001, the DHHS revaluated their methylmercury advisory protocols and decided to establish statewide fish eating guidelines based on 0.4 ppm level of concern. The new methylmercury guideline of 0.4 ppm from 1.0 ppm guideline was based on recent federal recommendations and also a need for consistency with our bordering states, which were already using the 0.4 ppm guideline.

DHHS currently recommends that women of childbearing age (15-44 years), pregnant or nursing women, and children under 15 not eat shark, swordfish, tilefish, king mackerel, blackfish (bowfin), largemouth bass, jack fish (chain pickerel) caught in North Carolina waters south and east of Interstate 85. Other women, men, and children 15 years and older are advised to eat no more than one meal per week of shark, swordfish, tilefish, or king mackerel; or blackfish (bowfin), largemouth bass, or jack fish (chain pickerel) caught in North Carolina waters south and east of Interstate 85. A meal is considered to be 6 ounces of cooked fish for adults, or 2 ounces of cooked fish for children under 15.

More information regarding fish advisories can be found on the web at this address:

http://www.schs.state.nc.us/epi/fish/

Human Mercury Burden

The 1992 fish mercury survey findings sparked interest in determining the extent of ongoing exposure to local fish consumers. In 1993, the NC DEHNR Environmental Epidemiology Section, in conjunction with Brunswick and Columbus County Health Departments, conducted a study to determine body burdens of mercury in individuals residing in Brunswick and Columbus Counties near the Waccamaw River. The data revealed a direct relationship between the extent of consumption of local fish and mercury body burdens. The more fish consumed, the greater the chance of human samples indicating a mercury burden. The average hair mercury level of 3.4 parts per million (ppm)

for consumers of freshwater fish was over ten times the average level of 0.3 ppm for those that did not eat freshwater fish. In addition, a wide distribution of hair and blood mercury concentration levels, with values as high as 33.5 ppm in hair, suggested that both elevated fish consumption rates and elevated fish tissue mercury levels were present in this study population.

Monitoring For Atmospheric Mercury

Mercury, in it's various forms, is transported into and out of the atmosphere by several different means. Mercury can be absorbed by cloud formations and deposited to the earth's surface in rainwater or as dew. This is known as "wet deposition". Mercury can also adhere to particulate matter and settle out onto vegetation and the earth's surface. This mechanism is known as "dry deposition". Levels of mercury in rainwater and adhered to particulate matter can both be measured. North Carolina has been measuring mercury in rainwater since 1996. However, the State has never had, nor does it does currently have the capability to measure particulate mercury. Mercury that is not deposited out of the atmosphere remains suspended in the ambient air and exists either in its elemental form, Hg(0), or its reactive form, Hg(2+), which is referred to as Reactive Gaseous Mercury, or RGM. Together these two forms of mercury comprise what is referred to as Total Gaseous Mercury, or TGM. North Carolina has the ability to measure these two forms of mercury while still suspended in the air and can distinguish one from the other.

Mercury Wet Deposition

Mercury wet deposition involves the transfer of mercury from the atmosphere to land or surface waters in precipitation or condensation of water vapor. Water-soluble species of gaseous or particulate mercury may be scavenged from the atmosphere by cloud water, rain, snowfall or water vapor. For many surface waters, atmospheric deposition is the most significant route of mercury loading. Dry deposition of particulate mercury or RGM also contributes to the overall rate of atmospheric deposition, although wet deposition is believed to play a larger role in the eastern United States where precipitation rates are higher than in arid western states. Together, these phenomena contribute to raise methylmercury levels in fish residing in mercury-sensitive waters.

Wet deposition is most strongly influenced by two factors: the amount of precipitation received and the concentration of mercury in the rainwater when it reaches the earth's surface. In areas impacted by high levels of atmospheric gaseous or particulate mercury, wet deposition rates would be higher than comparable areas with lower levels of atmospheric mercury. Areas that experience relatively higher rates of precipitation would also experience higher rates of mercury wet deposition than more arid environments if atmospheric mercury levels were comparable between sites. In reality, the relationship

between precipitation and wet deposition is much more complex. In arid environments, infrequent precipitation may allow gaseous mercury species to build up in the atmosphere, resulting in much higher mercury concentrations in subsequent precipitation events. Alternately, prolonged or frequent precipitation events may result in low rainwater mercury concentrations as the atmosphere is cleansed of water-soluble mercury species.

Other factors that affect rainwater mercury levels are not completely understood. They could include local source emissions, unique meteorology, terrain features or the presence of additional atmospheric pollutants. Areas influenced by local or regional emissions of particulate mercury or RGM might be expected to record higher average rainwater mercury levels. Additionally, the existence of high levels of oxidative pollutants such as ozone and reactive chlorine species in air or cloud water could contribute to the oxidation of elemental mercury into RGM, which would subsequently increase local deposition rates (Lin and Pehkonen). Monitoring sites located in heavily polluted areas might exhibit the effect of these considerations.

Meteorological phenomena, including temperature, humidity, and cloud formations, may influence wet deposition rates. Temperature could play a role in facilitating oxidation reactions that form water-soluble RGM species. Similarly, the amount and intensity of sunlight could also affect mercury deposition by facilitating photochemical reactions. Cloud formation and cloud chemistry are also recognized as important factors in mercury deposition. Many of the most plausible atmospheric reactions involving mercury are believed to take place in the aqueous phase; that is in cloud water or precipitation. Dvonch, et al. speculated that the tall, cumulonimbus clouds of south Florida would be more effective at scrubbing atmospheric mercury from a larger area, possibly explaining the relatively high wet depositions rates in these environments. The aforementioned variables all contribute to significant geographical variability in both the concentration of mercury in rainwater and cumulative wet deposition rates.

The Mercury Deposition Network

The National Atmospheric Deposition Program's Mercury Deposition Network (MDN) was designed to identify geographical and temporal trends in mercury deposition across North America. As of 2002 more than 50 sites were operating in more than 20 states and Canadian provinces (Figure 1-2). At all sites, precipitation samples are collected weekly and sent to a contract laboratory for analysis of total mercury content. Precipitation levels, total mercury concentration, and mercury wet deposition rate are reported weekly. Volume-weighted mercury concentration is calculated on a quarterly and annual basis.

Mercury Wet Deposition Sites

Shortly after the discovery of widespread mercury contamination in Lumber River basin fish, the Division of Air Quality (DAQ) stationed air monitoring instruments at Lake Waccamaw and Pettigrew State Parks to measure mercury levels in rainfall. Measurement of mercury in rainwater can provide an estimated rate of atmospheric deposition and loading to local waters. Lake Waccamaw is situated approximately 50 kilometers (31 miles) to the west of Wilmington, NC and 50 kilometers southeast of Lumberton, NC. This site was chosen to represent general atmospheric conditions in the lower Lumber River Basin. The area surrounding Lake Waccamaw is typical of the region: flat terrain with ubiquitous wetlands and waterways. Very little commercial or industrial activity takes place in the area surrounding the park. The population density is relatively low and roadways are lightly traveled. The nearest town is Whiteville, NC, located approximately 15 kilometers (9 miles) to the west-northwest of Lake Waccamaw.

Pettigrew State Park is in northeastern North Carolina, just south of the Albemarle Sound. The area immediately surrounding this site is similar to the environment around Lake Waccamaw: very lightly populated and devoid of significant industrial activities with flat terrain primarily used for agricultural purposes. On the basis of population density, commercial and industrial activity and distance to urban activities, Pettigrew qualifies as a more remote site than Lake Waccamaw.

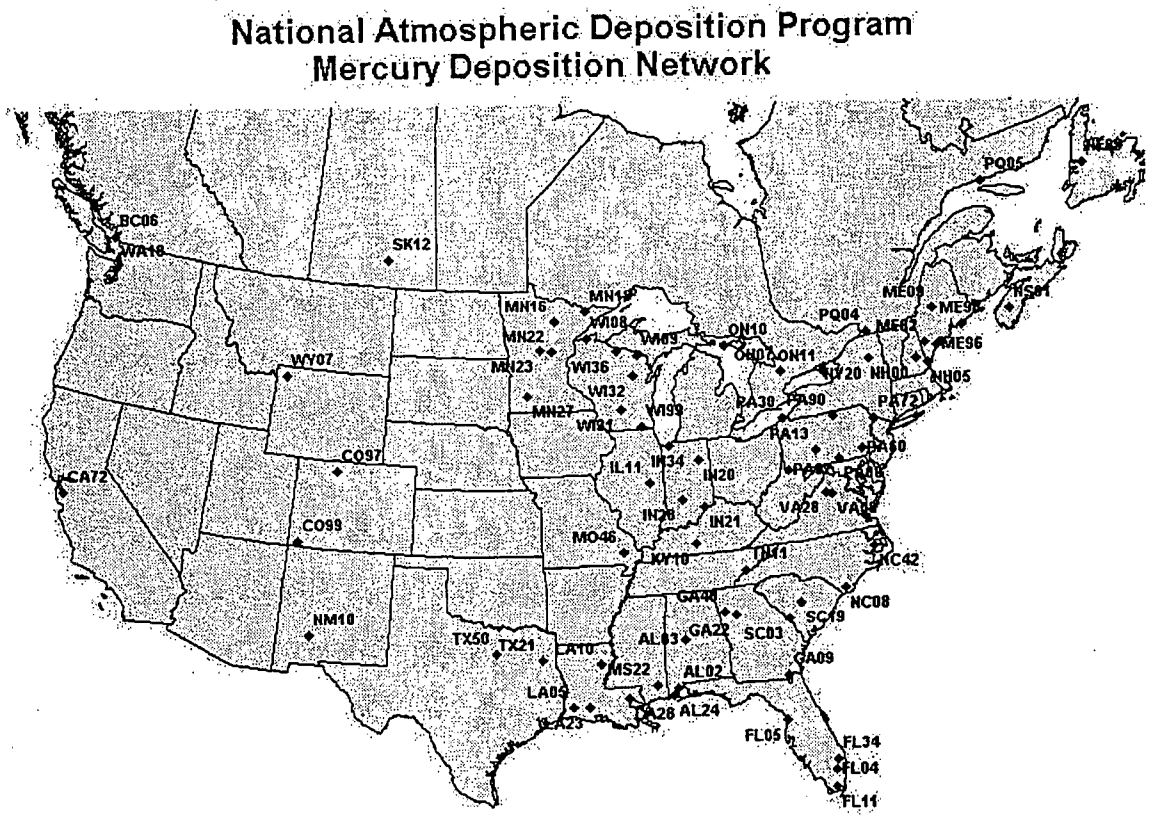
The Waccamaw and Pettigrew stations were amongst the earliest sites in the National Atmospheric Deposition Network's Mercury Deposition Network (MDN) (Figure 1-2). Composite rainwater samples were collected and analyzed weekly for total mercury content beginning in late 1995.

Mercury levels in samples of rainwater in eastern North Carolina vary greatly from week to week but are comparable to MDN data from sites across the United States. However, volume-weighted average levels of mercury in rainwater are consistently higher at Lake Waccamaw than at Pettigrew State Park, which is 150 miles north.

Figure 1-2

Map Of Current MDN Sites

(NC-08 corresponds to the Lake Waccamaw site)
(NC-42 corresponds to the Pettigrew State Park (Phelps) site)



Recent data from both sites during 1999 and 2000 suggested that mercury levels in precipitation may be declining in these areas. The most dramatic drop occurred between 1998 and 1999 at Lake Waccamaw State Park, when levels declined to values typical of the more remote location at Pettigrew State Park. Since 1998 however, the levels have crept back up. The current theory of cause and effect for mercury levels increasing may be cleanup activities at the closed chlor-alkali facility. Operations during the cleanup may have generated a considerable amount of fugitive emissions. It is possible these "cleanup" emissions are to blame for the rise in mercury levels following the drop that was observed after the plant shut down in 1999, as cleanup activities were not initiated immediately after plant closure. Continued sampling throughout the cleanup process and beyond should help to answer that question.

Results from wet deposition monitoring at the North Carolina sites are presented in Table 1-1, and Figures 1-3 and 1-4. Data recovery between 1996

and 1999 for both sites was greater than 98 percent. Sample handling problems and system blanks were the main causes of data loss, which occurred twice at Lake Waccamaw during 1996 and twice at Pettigrew State Park during 1996 and 1997. During 2000, some difficulties were encountered at both sites related to inconsistencies between the tipping rain gage and bucket precipitation samplers. A site audit performed during December of 1999 found that the tipping rain gage at the Lake Waccamaw site was prone to underreporting precipitation amount. However, subsequent estimates of rainwater mercury levels were based on the volume of rainwater collected in the volumetric flask; thus, estimated mercury levels were not consistently biased by erroneous information on rainwater amount. Improvements to the site instruments were made in June of 2000.

Table 1-1 shows a reduction in mercury deposition (a 30 percent drop compared to the previous three year average) at the Waccamaw site starting in 1999 (this reduction coincides with the closure of the HoltraChem mercury cell chlor-alkali plant). However, concentrations increase in 2000 and 2001. The weighted concentration levels in 2000 and 2001 do not reach the magnitude of pre-1999 concentrations. Data from the Pettigrew site generally follow the same curve, but with lower weighted concentrations. Figure 1-3 compares the annual amount of mercury in rainwater over a finite area (per square meter [m^2] in one millionth of a gram (microgram [µg]) increments each year). For example, in 1998, 18.7 $\mu g/m^2$ was captured. Figure 4-4 graphically compares the annual volume-weighted concentration (an average concentration) of mercury in billionth of a gram per liter (nanograms per liter = ng/L).

Discussion of NC Mercury Wet Deposition Network Data

Annual wet deposition rates in North Carolina are generally near the upper end of the range for all mercury wet deposition network (MDN) sites while annual volume-weighted mercury concentrations are close to the median value. Grasping the meaning of site-to-site variability in these parameters is difficult because the factors that influence mercury wet deposition are not completely understood. In general, the network sites that experienced the greatest rates of annual wet deposition also experienced higher annual precipitation rates. These sites are also primarily situated in the southern reaches of the network. The relatively lower rates of annual wet deposition in northern states could be due in part to the decreased scavenging efficiency of snow during winter months.

Table 1-1

Annual wet deposition of mercury at Pettigrew and Waccamaw State Parks

1996 – 2001

Year	Cumulative Wet Deposition ($ng/m^2/yr$)	Precipitation (mm/yr)	Volume-weighted concentration (mercury, ng/L)
Waccamaw			
1996	12821	1087.6	11.8
1997	10429	996.0	10.5
1998	18655	1265.7	11.7
1999	17205	1854.5	7.8
2000	12083	1337.8	9.6
2001	9197	884.2	10.4
Pettigrew			
1996	12361	1336.0	9.3
1997	9321	985.6	9.5
1998	9943	1395.5	7.1
1999	7907	1139.7	6.6
2000	10829	1302.7	8.2
2001	6114	770.8	7.9

Eastern North Carolina has moderate precipitation rates, and during winter months, precipitation is primarily in the form of rain. On the other hand, winter temperatures are significantly lower than those experienced in south Florida. If lower temperatures act to suppress atmospheric conversion of elemental mercury to water-soluble RGM, then lower rates of deposition might be expected in colder environments. This relationship is supported by seasonal trends in mercury deposition. If the North Carolina data are split into summer months (April to September) and winter months (October to March), mercury levels are clearly lower in winter versus summer months (see Fig 1-5). This phenomenon has been documented at many MDN sites, including those at lower latitudes where snow is not encountered and wintertime temperatures

Figure 1-3

Annual Cumulative Wet Deposition Of Mercury 1996 – 2001

Recorded At Lake Waccamaw And Pettigrew (Phelps) State Parks

Reported In Millionth of a Gram per Square Meter ($\mu g/M^2$)

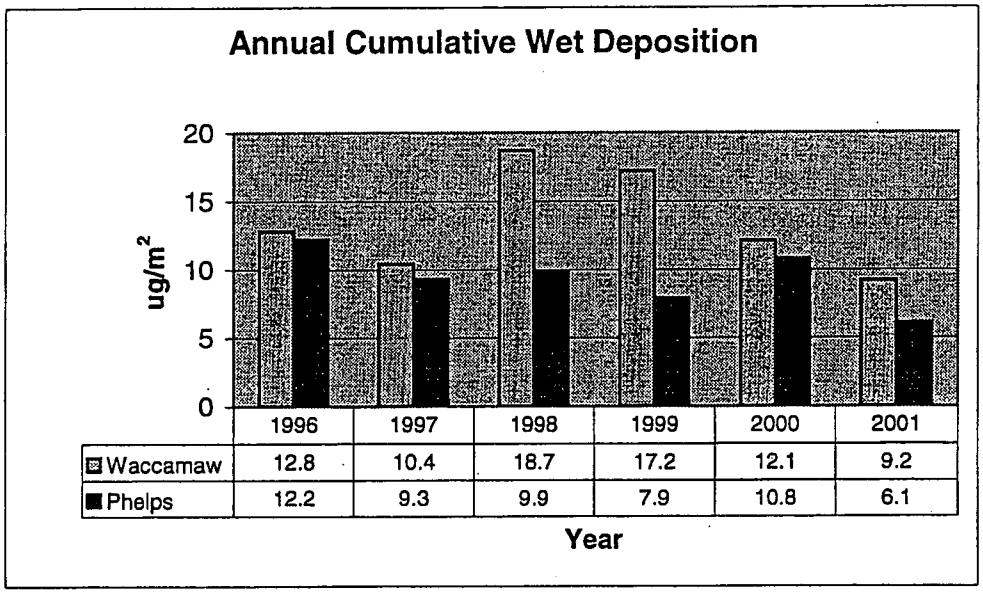


Figure 1-4

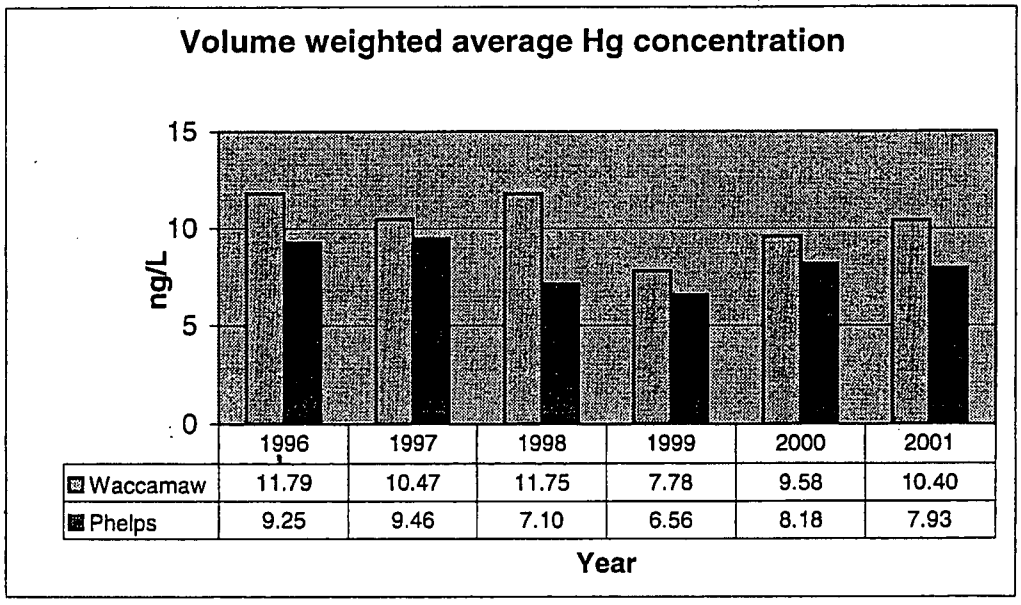
Annual Volume-Weighted Concentration Of Mercury 1996 – 2001

Recorded At Waccamaw And Pettigrew (Phelps) State Parks

Reported In Billionth of a Gram per Liter (ng/L)



are relatively warm. Other potential causes for the seasonal disparity might include air mass movement, which would tend to be northerly during the winter and southwesterly during the summer; cloud formation dynamics; and the amount and intensity of sunlight. Clearly, seasonal and regional meteorological patterns are critical factors affecting mercury wet deposition.

Additional factors affecting mercury deposition include local mercury emissions, unique terrain features, and the presence of additional atmospheric pollutants. Although MDN citing characteristics are meant to minimize the influence of emissions from local sources, invariably some network sites will be impacted. Sites influenced by local or regional emissions of RGM might be expected to record higher average levels of mercury in rainwater. Similarly, the existence of high levels of oxidative pollutants such as ozone and reactive chlorine species in air or cloud water could contribute to the oxidation of elemental mercury into RGM, which would subsequently increase local rainwater concentration and deposition rates.

While the aforementioned variables would clearly play a large role in the variability between national MDN sites located in diverse environments, they seem to serve as less plausible explanations for the differences seen between North Carolina's two MDN sites. As mentioned previously, surrounding features are very similar and the sites are only 200 kilometers apart. Annual precipitation rates between sites were similar between 1996 and 2000, with the exception of 1999 when the Waccamaw site experienced a disproportionately greater quantity of rainfall as a result of Hurricane Floyd. Other meteorological phenomena including temperature, prevailing winds and sunlight intensity should be similar.

Despite the overwhelmingly similar characteristics at the two sites, some consistent differences in mercury deposition patterns have been noted between them. Wet deposition rates have been higher at Waccamaw every year of sampling. This difference is primarily a reflection of different mercury concentration in rainwater because annual precipitation rates are comparable between sites. The magnitude of difference ranged from 10 percent during 1997 (11.5 ng/L vs. 10.5 ng/L) to over 60 percent during 1998 (11.6 ng/L vs. 7.1 ng/L). This relationship could also be observed if weekly data from each site were examined (Figure 1-6).

The consistency of this pattern suggests an additional influence on rainwater mercury levels. One important variable is regional levels of atmospheric mercury. Only limited information is available on atmospheric total gaseous mercury vapor levels in the vicinity of Pettigrew State Park, but those data indicated background conditions were present.[1] In stark contrast, total gaseous mercury levels at Lake Waccamaw were shown to fluctuate wildly

[1] Data on total gaseous mercury are from a 4-month period during the summer of 1996.

during and before 1998, which suggests that local air masses may have contained higher mercury levels (Figure 1-8). Higher atmospheric mercury levels could contribute to higher mercury levels in precipitation if significant atmospheric scavenging of water-soluble mercury species is taking place.

A substantial decrease in mercury concentration in rainwater between 1998 and 1999 at the Lake Waccamaw site occurred at the same time as a sudden decrease in atmospheric mercury levels at this site. The decrease in total gaseous mercury between 1998 and 1999 (28 percent) was somewhat less than the decrease in rainwater mercury concentration over that same time (45 percent). Additional influences, such as the unusually high precipitation rate during 1999, could also have acted to decrease average mercury levels in rainwater through dilution.

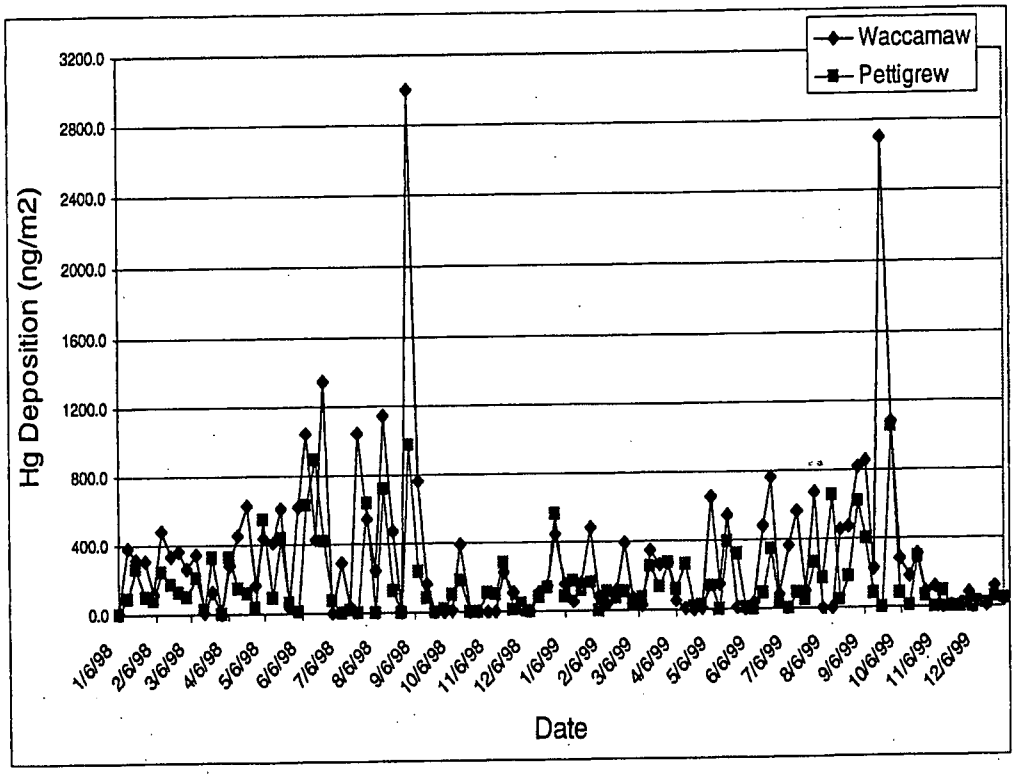
From Waccamaw And Pettigrew State Parks, 1998 - 1999



Mercury in Ambient Air

Mercury is a naturally occurring substance that is present at very low levels in ambient air as a result of both natural and anthropogenic processes. In recent years, ultra-sensitive techniques have been developed to measure and speciate mercury in ambient air and rainwater, allowing for the determination of temporal and spatial trends in atmospheric mercury. Beginning in 1997, an automated mercury vapor analyzer was added to the Lake Waccamaw monitoring site. This instrument measured and recorded TGM levels in ambient air in 15-minute increments. Mercury vapor analyzers are not dependent on precipitation events. They collect and record mercury concentrations 24-hours per day. The vast majority of these readings showed total gaseous mercury levels at or below 2 ng/m^3, which is in the range of concentrations considered "background" for this type of site. However, fluctuations of mercury vapor concentrations, up to twice background values, were periodically seen. Mercury data were matched to concurrent wind direction data to illustrate an association between elevated total gaseous mercury and winds originating from the east-northeast. This evidence

suggested a fixed upwind source might be impacting atmospheric mercury levels at Lake Waccamaw State Park.

In 1999 DAQ expanded its monitoring study to understand better the factors affecting atmospheric mercury levels and the relationship between mercury emissions and air quality in southeastern North Carolina. With assistance from the EPA, two additional sites were established in Riegelwood, NC, an industrial area located approximately 25 kilometers to the east-northeast of Lake Waccamaw and home to several mercury emission sources including a large pulp and paper operation and a mercury cell chlor-alkali plant.

The operation of a chlor-alkali plant is heavily dependent on the availability of huge quantities of direct-current electrical power, usually obtained from a high voltage source of alternating current. Chlor-alkali plants produce sodium hydroxide (caustic soda), chlorine, sodium carbonate (soda ash), potassium hydroxide (caustic potash), and hydrochloric acid. The process requires the electrolysis of sodium or potassium chloride. Mercury cells use a pool of mercury at the bottom of the cell to act as the cathode. Mercury is pumped into the cell during the process as an amalgam of sodium mercury and then is pumped out to a decomposer where the mercury is purified and recycled back to the cell. Hydrogen gas from mercury cell operation contains significant amounts of mercury, which is removed by scrubbing with sodium hypochlorite or sodium persulfate.[2]

Mercury cells were the original process equipment used throughout the country. However, two newer processes (the diaphragm cell and the membrane cell) have replaced the mercury cell process. These new process use less electrical power during the electrolysis (mercury cell requires 7 to 10 kilo-amperes per square meter (kA/m^2) while the diaphragm cell requires 1.5 to 4 kA/m^2).

By far the largest source of mercury emissions was the HoltraChem mercury cell chlor-alkali operation located in Riegelwood, NC, which was approximately 25 kilometers (16 miles) east-northeast of Lake Waccamaw. The facility reported almost 1,300 pounds of mercury emissions in 1998, over three times the amount of the second largest source, the New Hanover Waste-to-Energy municipal waste incinerator near Wilmington (1998 emissions: 362 pounds). The location and quantity of mercury released suggested that the HoltraChem plant in Riegelwood was significantly influencing regional levels of atmospheric mercury, and caused dramatic changes even at a distance of 25 kilometers from the source. However, with only the Lake Waccamaw data, other regional emission sources could not be ruled out as contributors.

---

[2] Ref. 19, pages 59-63

Atmospheric monitoring for total gaseous mercury was carried out concurrently at the Riegelwood and Lake Waccamaw locations during 1999 and 2000. The study, known as the Waccamaw Atmospheric Mercury Study, also involved chemical speciation of elemental and reactive gaseous mercury during 2000 at one of the Riegelwood sites. In addition, mercury was measured in weekly rainwater samples collected from Lake Waccamaw and a second location in northeastern North Carolina, in support of the national Mercury Deposition Network.

As previously mentioned, historical data on total gaseous mercury from Lake Waccamaw strongly suggested regional source impacts. If the relationship between regional atmospheric total gaseous mercury levels and levels of mercury in rainwater are true, then it raises the possibility that local source mercury emissions are having an identifiable impact on regional mercury wet deposition rates. To properly analyze this relationship, rain event-based sampling would have to occur concurrently with analysis of trace signature pollutants and an analysis of micrometeorological conditions. The sampling method used in the MDN network blends together multiple precipitation events into one weekly composite sample, making it impossible to distinguish single precipitation events arising from different weather systems. Precipitation occurring at the sampling site after passing over an upwind emission source cannot be distinguished from other precipitation events that contribute to that week's sample. Despite these limitations, the local and regional MDN data does provide a useful accompaniment to data on atmospheric mercury and a possible indicator of the effect of anthropogenic releases of mercury.

WACCAMAW ATMOSPHERIC MERCURY STUDY:

This study was successful in identifying long-term trends in atmospheric mercury in a rural/remote environment that is home to several mercury emission sources. All lines of evidence seem to suggest that significant improvements in regional ambient air mercury levels were most closely associated with the closing of a mercury cell chlor-alkali operation in Riegelwood, North Carolina. Conditions at Lake Waccamaw State Park appeared to represent typical mid-latitude northern hemisphere terrestrial "background" conditions for total gaseous mercury upon the conclusion of this study. Conditions in the industrial area of Riegelwood, NC, had also improved substantially but continued to show periodic elevations in both elemental and reactive gaseous mercury that suggested ongoing mercury emissions to the air, and increased atmospheric loading of mercury to local waterways.

STUDY DESIGN AND PURPOSE

To better define the cause of spikes in atmospheric mercury at the Lake Waccamaw State Park site, the DAQ proposed to expand its study to include several additional monitoring locations in the Cape Fear River Basin. The

objective was to generate data from these sites that would help to better define the role of multiple sources and determine the magnitude of effect at shorter distances from a major source of mercury emissions.

In 1998 the chlor-alkali plant reported plans to convert its mercury cell chlorine production process to a membrane process. The membrane process is preferable because it is more energy efficient and eliminates the use of mercury (USEPA, 1997b). Representatives from the DAQ and the North Carolina Department of Health and Human Services (DHHS) contacted plant representatives to request permission to situate mercury vapor monitors on facility property during the conversion process. DHHS representatives were concerned that the processing and removal of immense quantities of mercury might lead to releases of mercury vapor sufficient to cause toxic exposures for

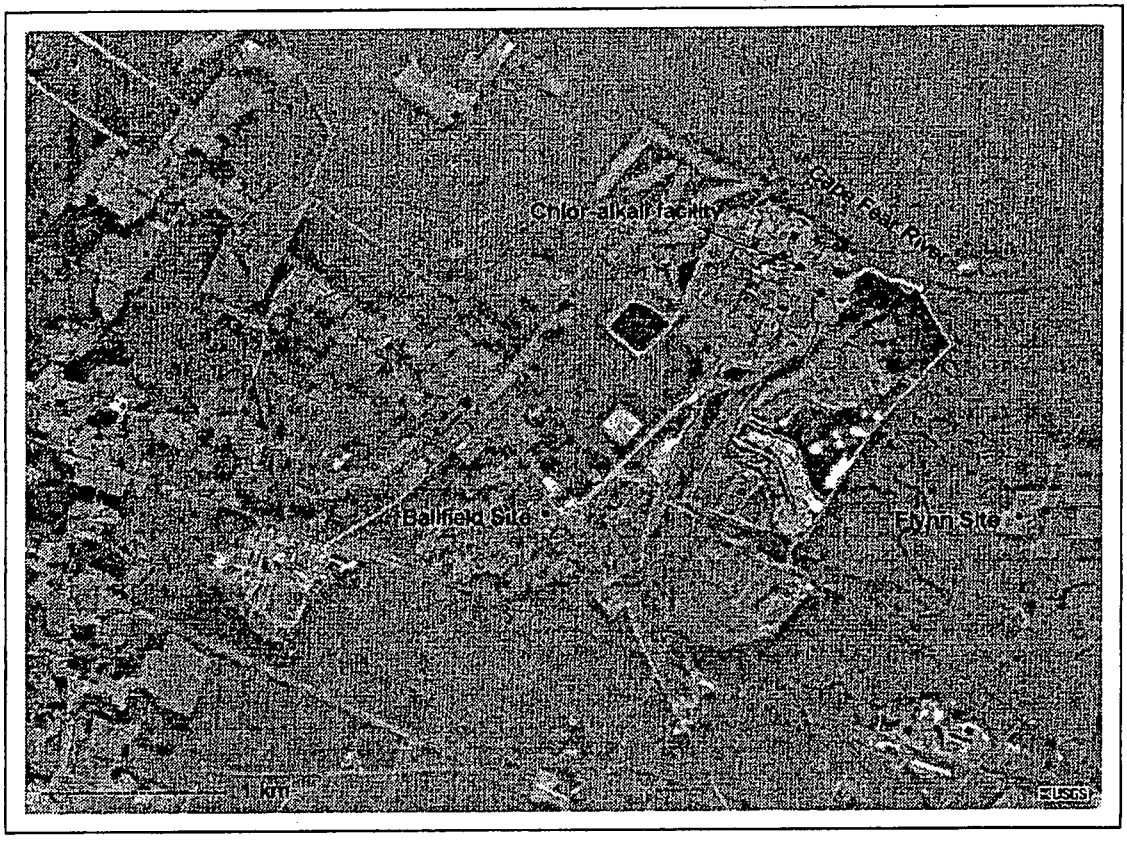


Figure 1-7: *Aerial photograph of Riegelwood, North Carolina*

workers or nearby residents. Plant officials declined to allow monitoring instruments on-site but the DAQ subsequently identified suitable monitoring locations in the immediate vicinity of the chlor-alkali and pulp and paper mill industrial complex, and in early 1999 set up two monitoring stations within one mile to the southeast and southwest of the chlor-alkali plant (Fig 1-7). Despite the close proximity, the sites differed substantially. The Riegelwood Ballpark site was located in a clearing at the edge of a county park, just beyond the right-field fence of a baseball field at the intersection of NC 87 and

Riegelwood Plant Road. The site was located directly across from the main entrance to the pulp and paper mill and provided a relatively unimpeded view to the industrial complex. To the east, west and south of this area are residential and open spaces. Some commercial structures were located near the site at the same intersection, including a gas station across NC Highway 87. Traffic near the site was moderate to heavy and continuous. The Riegelwood Flynn site was placed in a fallow plot of agricultural land, surrounded by open space and a thick stand of trees 100 meters to the north, west and south. The surrounding area is rural and very sparsely populated. Access to the site was provided by a dirt road that received little or no daily traffic. No view of the industrial complex was provided due to the trees surrounding this site.

The instruments stationed at the Riegelwood sites were identical to the instrument at Lake Waccamaw and were capable of providing continuous monitoring of TGM. Both sites were also equipped with sufficient instrumentation to provide on-site meteorological information including wind speed and direction, temperature and humidity. The original mercury vapor monitor at the Riegelwood Flynn site was provided on loan from USEPA Region 4 but had to be returned in January of 2000, leaving only one Riegelwood site operational. In late 1999 the DAQ petitioned the USEPA for funding under the Persistent Bioaccumulative and Toxic (PBT) Chemical Program to help support a long-term study of atmospheric and fish mercury trends in the Lumber River Basin. In May of 2000, the EPA committed $47,900 in PBT funds to allow for procurement of atmospheric monitoring instrumentation and supplies for air and fish monitoring. This allowed for reinstatement of total gaseous monitoring at the Riegelwood Flynn site in the third quarter of 2000 and freed up Department funds for the purchase of an annular denuder-based mercury speciation unit to be stationed at Riegelwood Ballpark. The speciation system allowed for continuous concurrent monitoring of both Hg(0) and RGM, providing important information on the speciation of mercury during both "background" and highly elevated readings. This type of information could then be used to assess the extent to which spikes in TGM could be contributing to off-site deposition of mercury into the surrounding environment.

DAQ's objectives for the expanded study included: 1) assuring that the public was not being exposed to dangerously high levels of mercury in ambient air, 2) determining the impact of the conversion process on local atmospheric conditions, and 3) determining whether the chlor-alkali operation or another source was responsible for atmospheric mercury fluctuations in the Lumber River Basin. It was envisioned that this effort would last throughout the chlor-alkali conversion process. The DAQ also committed to maintain mercury vapor monitoring at Lake Waccamaw for the duration of this study. The continued collection of data from this site was deemed critical to gain a full understanding of the "before and after" effect of the conversion process at the chlor-alkali plant. If in fact that facility was responsible for the historical peaks in TGM at

Lake Waccamaw then halting the active use of mercury might result in a return to background conditions at this site. Alternatively, if another source was primarily responsible or if documented levels represented normal variability for this region, then those conditions might be expected to persist.

Additionally, the DAQ committed to continue rainwater measurements at both North Carolina MDN sites. Data from previous years showed that rainwater mercury levels at Lake Waccamaw were consistently higher than at Pettigrew State Park. It is plausible that some of the same phenomena that had been contributing to significant fluctuations in gaseous mercury at Lake Waccamaw could also be contributing to greater concentrations of mercury in local rainwater. If so, changes that might result in decreased atmospheric levels of mercury might also contribute to decreased levels in rainfall.

This section presents information on atmospheric mercury levels collected over a three-year period between 1997 and 2000. Parameters include: 1) continuous measurement of TGM at Lake Waccamaw between 1997 and 2000, 2) measurement of TGM at both Riegelwood monitoring locations during extended periods of both 1999 and 2000, and 3) speciation of atmospheric mercury at the Ballpark site during 2000. Many of the monitoring instruments chosen for this study are cutting edge and as such a considerable amount of time and effort was spent refining methods to improve instrument performance. We will discuss these methods and their bearing on future studies. In addition, we provide observations on the behavior of atmospheric mercury, including the relationship between elemental and reactive gaseous mercury species. Finally, we present the results of an analysis of regional mercury emission patterns that explores possible relationships between industrial activities and regional atmospheric mercury levels. Meaningful findings include:

Total Gaseous Mercury:

- Data collected during 1998 at Lake Waccamaw State Park suggested that periodic spikes of total gaseous mercury exceeding 50 ng/m^3 were typical for this area during this time, but atypical for such a remote/rural location.
- On-site meteorology identified a relationship between elevations in total gaseous mercury and winds originating from the east-northeast.
- Beginning in early 1999, levels of atmospheric mercury at Lake Waccamaw State Park returned to typical "background" levels (1.5 – 2.0 ng/m^3).
- Reduced atmospheric levels of total gaseous mercury were observed simultaneous with the cessation of chlorine production at a mercury cell chlor-alkali plant located approximately 25 kilometers to the east-northeast of Lake Waccamaw State Park.

- In Riegelwood, NC, measurements of atmospheric mercury included periodic spikes in total gaseous mercury throughout 1999 and 2000.
- Quarterly average total gaseous mercury levels during 1999 and 2000 were up to 166% higher at the Riegelwood monitoring locations versus coincident readings from Lake Waccamaw State Park. However, average values appeared to decline in Riegelwood over the course of this study and at one site decreased by roughly 40% between 1999 and 2000.
- Total gaseous mercury levels did not exceed 300 ng/m^3 (NC Acceptable Ambient Level and EPA inhalation RfC) at the Riegelwood sites for an extended period of time, suggesting that health risks from non-occupational inhalation of mercury were minimal for local citizens during the study period.
- Long-term continuous measurement of atmospheric mercury can be successfully achieved, even at the exquisitely low levels found in the atmosphere. Data from these types of studies can be used in combination with on-site meteorological data to identify possible source-receptor relationships.

Reactive Gaseous Mercury:

- Levels of atmospheric reactive gaseous mercury fluctuated significantly in the Riegelwood area throughout the last half of 2000.
- Short-term increases in reactive gaseous mercury frequently occurred in tandem with increases in elemental mercury when the monitoring site was downwind of the chlor-alkali plant and pulp and paper mill, suggesting that mercury emissions included both elemental and reactive gaseous mercury.
- In addition to source-related increases in reactive gaseous mercury, smaller scale increases also frequently occurred during afternoon hours, particularly on low humidity days, suggesting a natural diel cycle for reactive gaseous mercury.
- Meteorological conditions such as wind direction, precipitation, humidity and temperature appear to affect ambient air reactive gaseous mercury levels.
- New methods to measure and distinguish reactive gaseous mercury and elemental mercury performed well over extended periods of time; however, some modifications to the instrument assembly may be needed to maintain gold trap integrity over extended sampling periods.

WACCAMAW STUDY RESULTS & DISCUSSION

In the following pages we present an enormous database of information on levels of TGM, Hg(0) and RGM along the eastern coastal plain of North Carolina. We then attempt to highlight and explain trends in the data and on occasion speculate as to causative factors behind those trends. There are several areas that deserve additional attention, including the relative influence

of meteorology and local emissions on RGM levels at Riegelwood Ballpark. Many of these questions may be answered through in-depth statistical analysis of existing data.

TOTAL GASEOUS MERCURY: RESULTS

Waccamaw State Park

Continuous monitoring for TGM was carried out at Waccamaw State Park from December 1997 through December 2000. All data from this site represent 15-minute average TGM concentration (ng/m^3) except for a brief period between July 17 and August 1, 2000 when measurements were made on a 5-minute basis. Monitoring data are summarized in Table 1-2 and presented graphically in Figure 1-8.

Table 1-2: *Quarterly statistics for ambient air TGM measured at Lake Waccamaw S.P. Values were calculated using 15-minute average TGM concentrations. All values in ng/m^3.*

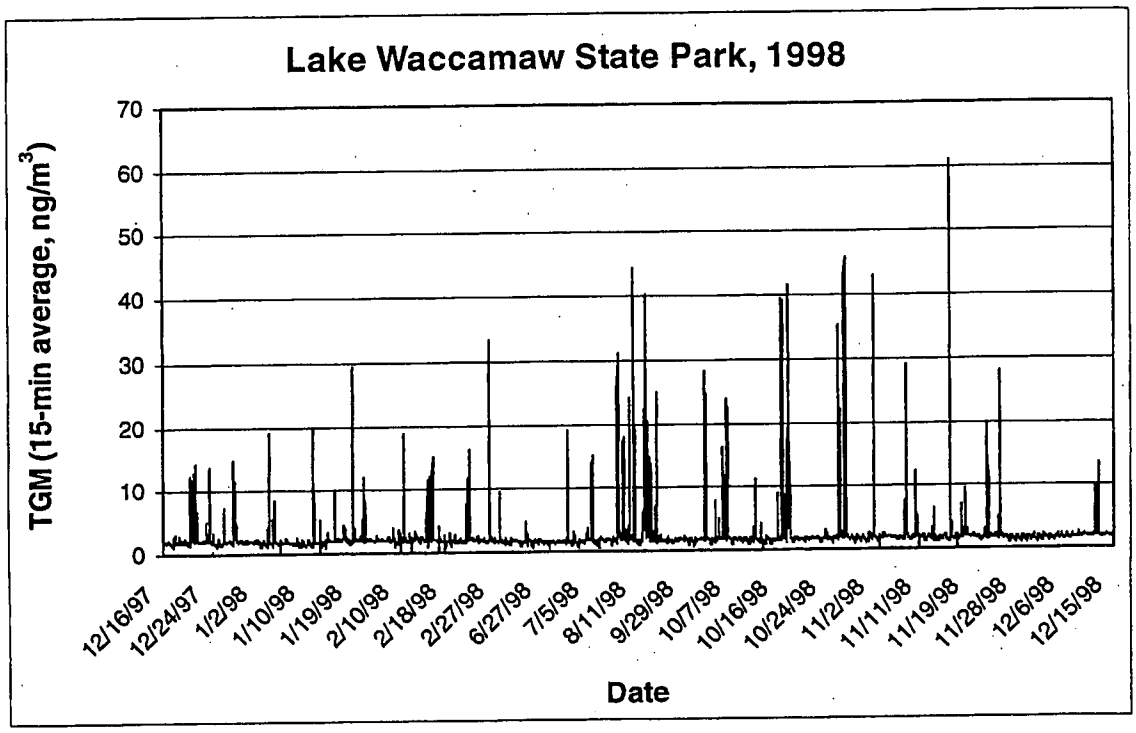
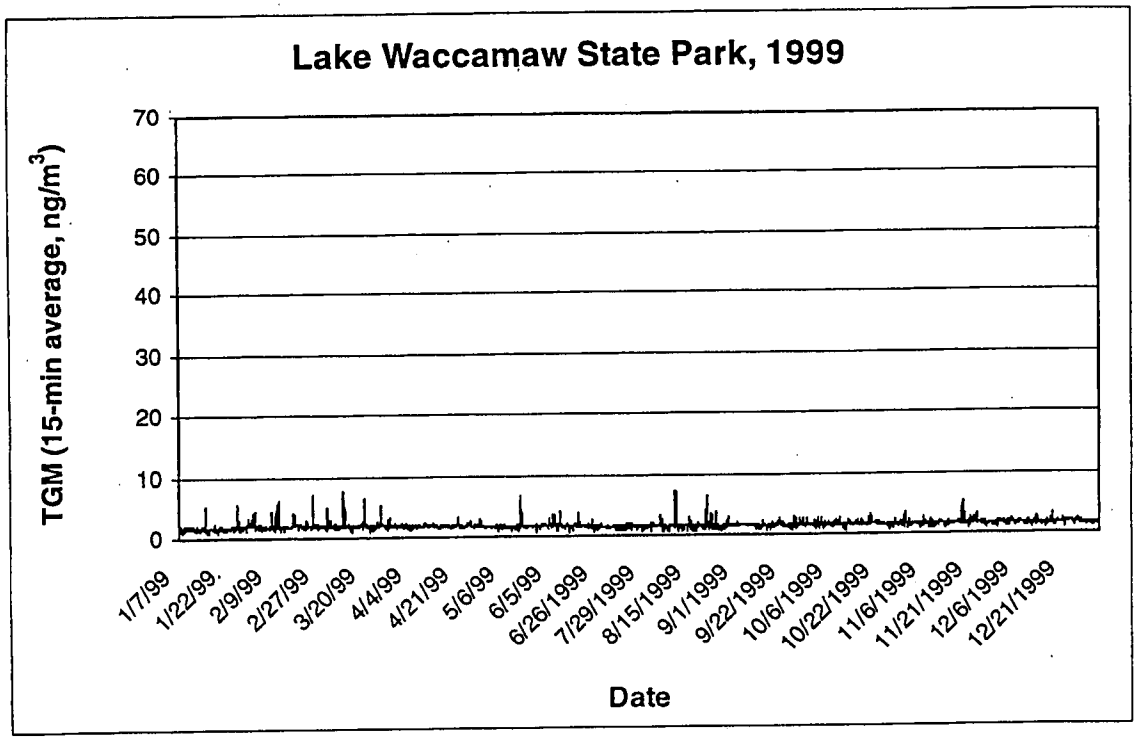
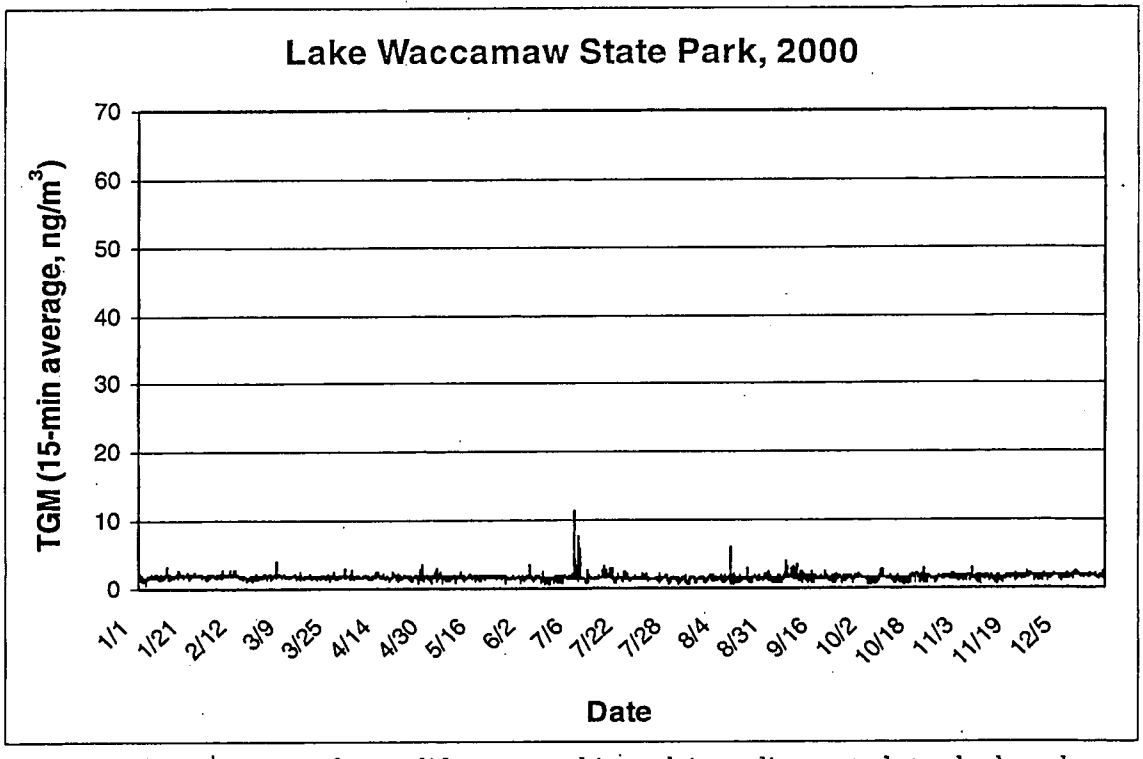
Figure 1-8: Total gaseous mercury (TGM) measured at Lake Waccamaw State Park between December 1997 and December 2000.







*Data from the 2nd quarter of 1998 did not meet this study's quality control standards and are not presented.

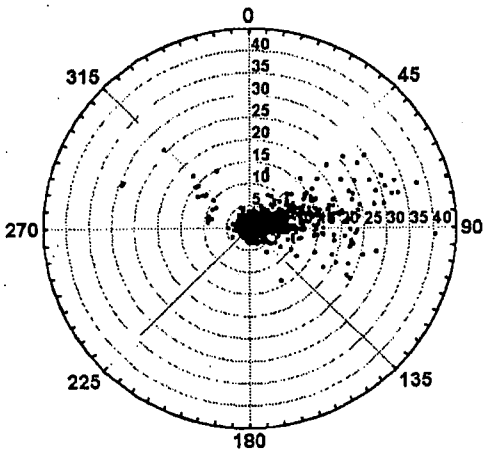
The average mercury level at Lake Waccamaw State Park during the entire study period was 1.84 ng/m^3. The annual average declined between consecutive years, from 2.34 ng/m^3 in 1998 to 1.68 ng/m^3 in 1999 and 1.61 ng/m^3 in 2000. Median mercury levels remained consistent throughout the entire length of the study, as did values in the lower percentile ranges and up through the 90th percentile. It is only in the upper end of the distribution (95th percentile and higher) that levels varied substantially between 1998 and subsequent periods. This is also reflected in quarterly standard deviations, which decreased substantially between 1998 and 1999, reflecting the absence of large deviations in mercury levels beginning in 1999. Over 133,000 individual samples passed QA tests and are presented for the 3-year period, representing over 30,000 hours of data.

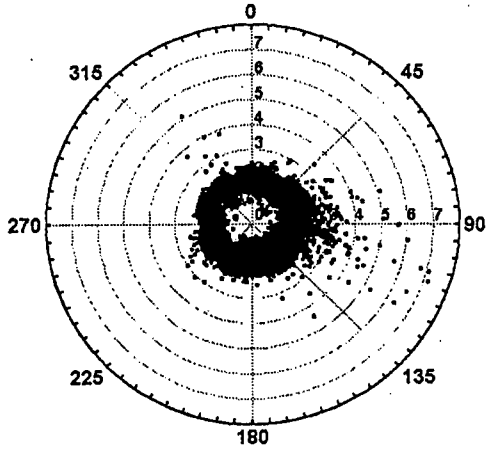
Data recovery for 1998 was approximately 45%.[3] The primary reason for the relatively greater rate of data loss during this time is failed system calibrations. These data were collected before quality assurance and quality control methods described in the Quality Assurance Project Plan were implemented, thus the data have been scrutinized closely resulting in the removal of questionable results. We believe there is no valid reason to reject 1998 data with passing calibrations and remain confident in the results

[3] Missing coverage is calculated by dividing the number of days with missing data by the total number of days during the sampling event. Instrument removal for maintenance or weather is considered lost coverage.

presented here. Data recovery is approximately 90% for calendar years 1999 and 2000. The primary reason for data loss was failed calibrations, channel disagreements and power outages related to severe weather events.

Analysis of mercury data with concurrent information on wind direction unearthed a clear association between wind conditions and elevations in TGM during 1998 (Figure 1-9). With very few exceptions, spikes in TGM were accompanied by winds arriving from the east-northeast. No clear pattern emerged during the remainder of 1999 or during 2000. The diminished events detected during this period were associated with winds arriving from various directions (Figure 1-10).[4]





Figures 1-9 (left) and 1-10 (right): *TGM vs. wind direction, measured at Lake Waccamaw State Park during 1998 (left) and 1999 (right). Radial axis represents wind direction in degrees and X and Y axes represent TGM in ng/m³. Only*

Riegelwood Flynn

The initial phase of TGM measurement began in March 1999 and continued into January 2000. A second phase of monitoring began in August of 2000 and continued through November 2000. All measurements presented in Table 1-3 and Figures 1-11 and 1-12 represent 5-minute average values in ng/m³

[4] Winds less than 3 mph were excluded to minimize the appearance of 15-minute "average" wind directions that are a misleading product of light and variable winds.

Table 1-3: *Quarterly statistics for TGM measured at Riegelwood Flynn site. Values were calculated using 5-minute average TGM concentrations. All values in ng/m³.*

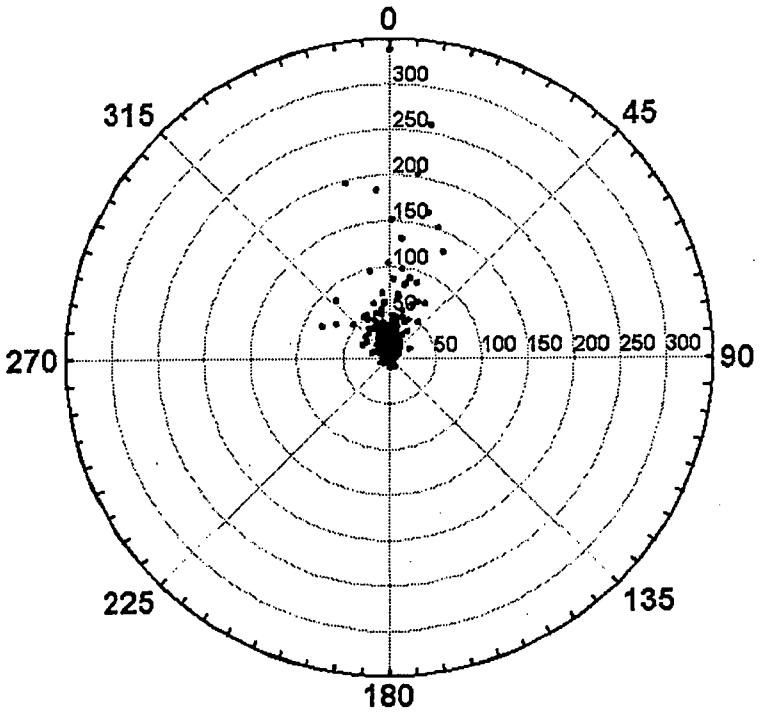

Figure 1-12a:
Riegelwood Flynn, TGM vs wind direction, May – Oct 1999. Radial axis is wind direction in degrees. X and Y axis represent TGM (ng/m³). 5-minute averages. Only includes wind speeds > 3 mph.

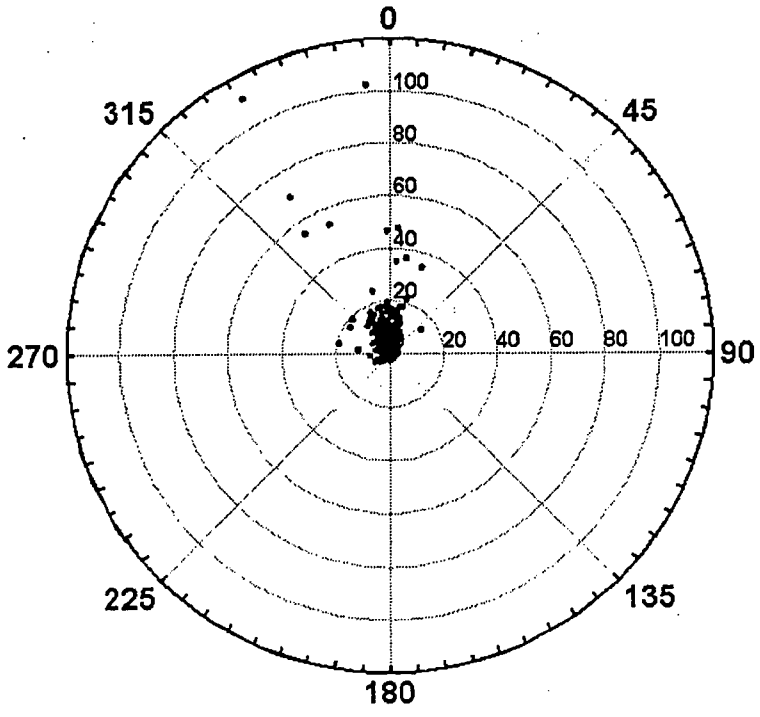

Figure 1-12b:
Riegelwood Flynn, TGM vs wind direction, Aug – Nov 2000. Radial axis is wind direction in degrees. X and Y axis represent TGM (ng/m³). 5-minute averages.

The mean mercury level at this site for the entire duration of the study was 2.29 ng/m^3. The mean levels for the first (3/99 – 1/00) and second (8/00 – 11/00) phases of sampling were 2.42 ng/m^3 and 1.95 ng/m^3, respectively. Quarterly mean values and extreme values declined throughout the first phase of monitoring, reflecting the decreasing frequency and intensity of mercury fluctuations. Similarly, quarterly standard deviations declined between each quarter during the first phase of sampling and remained low during the second phase of sampling. Despite the apparent improvement in conditions at this site, occasional excursions in atmospheric mercury were encountered during all sampling periods. Most measurement statistics including mean and standard deviation were increased slightly between the 3rd and 4th quarter of 2000. Elevated TGM was generally associated with winds arriving from the north-northwest (Figures 1-12a-b).

Approximately 60% data recovery was achieved during the first phase of monitoring at Riegelwood Flynn. Loss of coverage resulted from site start-up problems and lack of closing calibrations during site malfunctions. However, the greatest loss of data occurred during Hurricane Floyd and its aftermath. Damage to this area was catastrophic, severely hindering access to the site during September and October of 1999. Monitoring was reestablished in late November 1999 following repairs to the site. Only two disruptions were encountered during the second phase of sampling, however a 2-week period was lost due to a computer malfunction at the site. Data recovery during this period was approximately 80%. It is not believed that any event leading to loss of data at this site adversely affected those data that were successfully obtained.

Riegelwood Ballpark

Two phases of mercury measurements were carried out at Riegelwood Ballpark. Between May and October of 1999, measurements of TGM were made every 5 minutes using the Tekran 2537A mercury vapor analyzer (Figure 1-13). A second phase of monitoring carried out during 2000 involved measurement and speciation of atmospheric mercury using the Tekran 1130 mercury speciation unit. These analyses, which produced separate measurements of RGM and Hg(0), are discussed in greater detail below in the sections on mercury speciation measurements; however, for comparison purposes we present here the 5-minute data on Hg(0) collected during August through November of 2000. Hg(0) represents greater than 95% of TGM in ambient air in virtually all circumstances, which validates comparisons between TGM data from 1999 using the Tekran 2537A and Hg(0) data from 2000 generated with the Tekran 1130 speciation unit. The comparability of speciated and non-speciated data is discussed further, below.

Table 1-4: *Quarterly statistics for TGM measured at Riegelwood Ballpark site. Values represent 5-minute average concentrations (ng/m³).*

Riegelwood Ballpark (TGM)	1999			2000
	2nd Q	**3rd Q**	**4th Q**	**3rd/4th Q** [5]
10th percentile	2.18	1.86	1.78	1.28
25th percentile	2.56	2.10	1.96	1.40
50th percentile (median)	3.05	2.38	2.16	1.54
75th percentile	4.01	2.74	2.62	1.72

99th percentile	31.03	19.73	19.95	12.30
Maximum	240.94	101.35	33.83	52.46
Arithmetic mean	4.66	3.09	3.34	1.99
Standard deviation	2.13	2.18	3.50	2.10
Count (n)	9881	18200	3507	17797

The average TGM concentration throughout the first monitoring phase was 3.61 ng/m³. The most significant fluctuations were encountered during May and June of 1999, with large mercury peaks encountered during several periods lasting up to a week. During subsequent months mercury peak events were generally diminished in magnitude. Elevated mercury measurements encountered during 1999 were related to winds originating from the northeast (Figure 1-14). Data in Table 1-4 are presented as stratified by calendar quarter. However, caution must be used in interpreting these data given that 4th quarter data only represent a 2-week period in October.

[5] Data from August – November of 2000. These statistics are derived from 5-minute Hg(0) data.

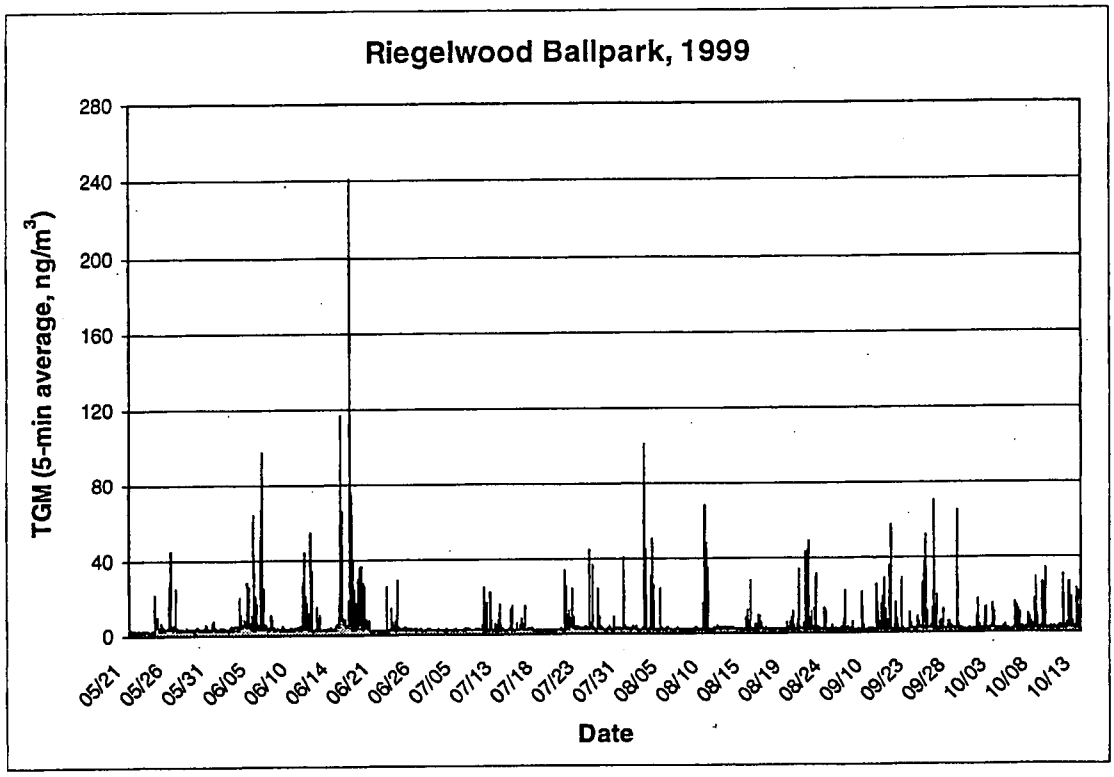

Figure 1-13: *Total gaseous mercury measured at Riegelwood Ballpark, May – October 1999. All values represent 5-minute averages in ng/m³.*

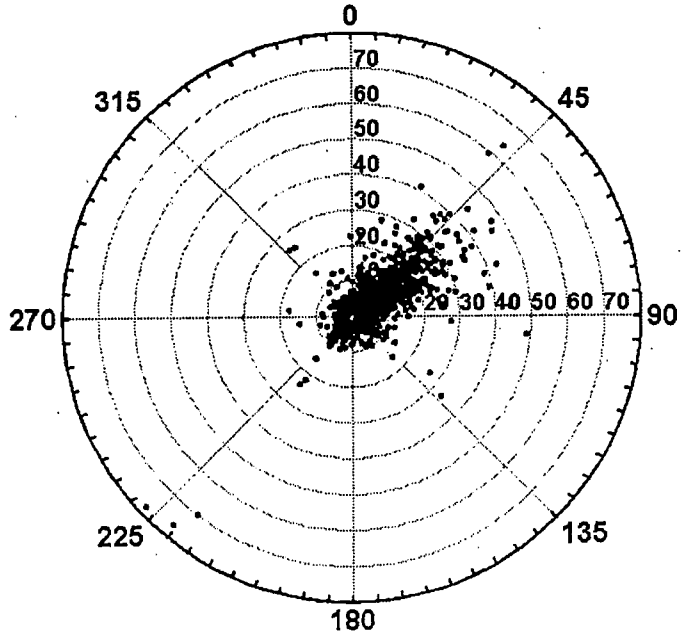

Figure 1-14: *Riegelwood Ballpark, TGM vs. wind direction, 1999. Radial axis is wind direction in degrees. X and Y axes represent TGM (ng/m³). 5-minute averages. Only includes winds > 3 mph.*

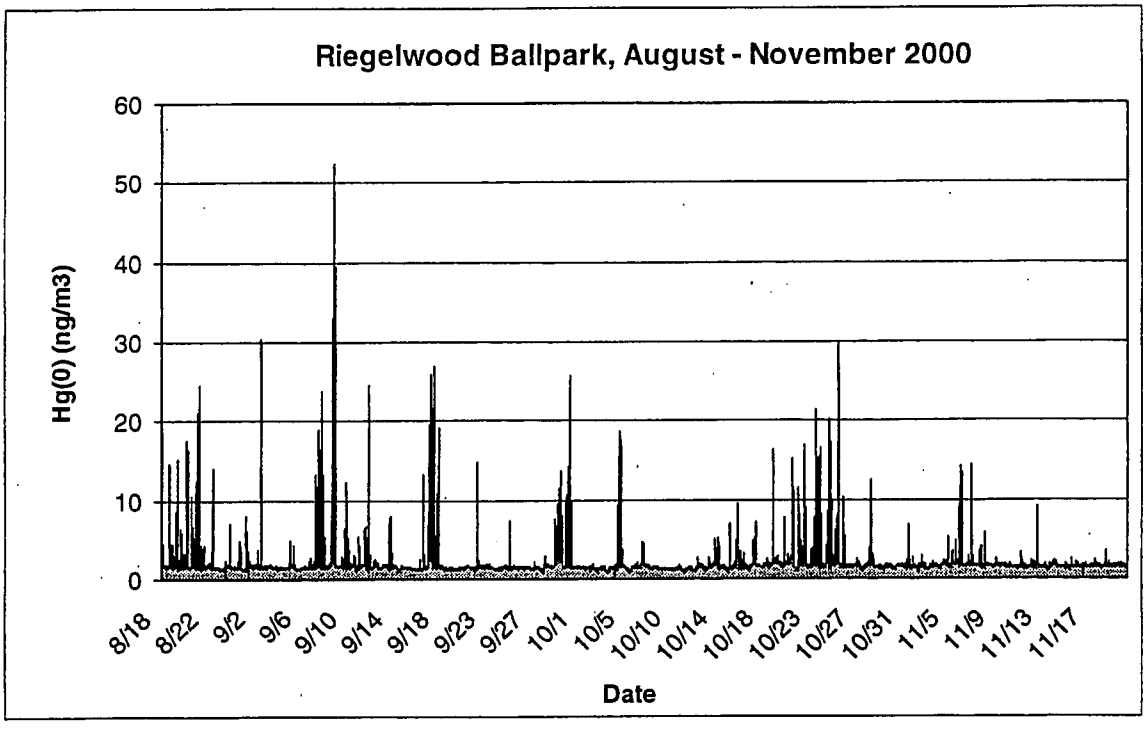

Figure 1-15: *Elemental mercury measured at Riegelwood Ballpark, August – November, 2000. All values represent 5-minute averages in ng/m³.*

showed that the direction was being misreported. The difference was +38.3 degrees at 0 degrees and +26.95 degrees at 90 degrees, indicating that values

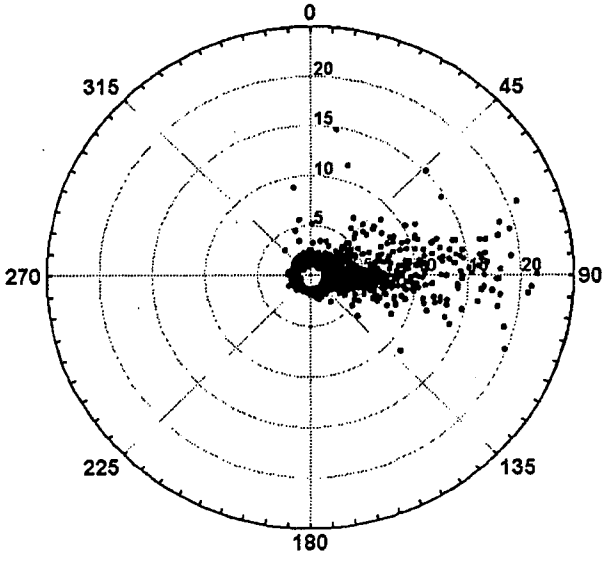

Figure 1-16: *Riegelwood Ballpark, Hg(0) vs wind direction, Aug – Nov 2000. Radial axis is wind direction in degrees. X and Y axis represent Hg(0) in ng/m³. 5-minute averages. Only includes winds > 3 mph. See text note concerning accuracy of wind direction data.*

reported as 90 degrees were in all probability over-reported by between approximately 25 to 40 degrees. Correcting for this inaccuracy would provide a range of directional data very similar to that seen for TGM in Figure 1-14, with elevated TGM primarily associated with winds arriving from the northeast.

Over 30,000 measurements of mercury were taken during 1999 at this site, representing over 2,500 hours of coverage. Gaps in coverage were primarily due to early problems with water contamination of sample lines and resulting effects on sample volumes. Substantial loss of data also occurred during the aftermath of hurricanes Dennis and Floyd during August and September of 1999. Overall, 77% coverage was achieved between May and October of 1999 at this site. Sample recovery during speciation measurements was intermittent. This subject is discussed in more detail in the RGM results and discussion section.

TOTAL GASEOUS MERCURY: DISCUSSION

General Characteristics of Atmospheric Mercury

Mercury is a naturally occurring trace contaminant of ambient air. In rural and remote areas TGM levels typically range between 1.5 and 2.0 ng/m^3 (EPA 1997a). Atmospheric levels may vary substantially depending on the proximity to local anthropogenic emission sources (Lindberg; Keeler - as summarized in EPA 1997a). The USEPA recently chose 1.6 ng/m^3 to represent modern day terrestrial "background" conditions in a multi-media fate and transport model for mercury (EPA 1997a). TGM is almost entirely comprised of vapor phase Hg(0), although much smaller quantities of particulate mercury and RGM are also present in ambient air at pg/m^3 levels. Chemical and photochemical reactions may facilitate conversion between the various forms of mercury, thus affecting atmospheric residence time. Gaseous or aqueous phase oxidation of Hg(0) could lead to production of water-soluble RGM species that may contribute to localized deposition. Alternatively, atmospheric reduction of RGM species could lead to the formation of Hg(0) vapor, and reduced regional wet and dry deposition rates.

Variability in atmospheric TGM may be related to both point source releases and natural causes. Mercury's natural geochemical cycle involves migration between earth, water and air. Mercury that settles to the earth's surface through atmospheric deposition will likely undergo re-evasion to the atmosphere. Natural processes that involve addition of mercury to the air include continuous evasion from mercury-enriched surficial soils and freshwater and marine environments (Schroeder and Munthe). Periodic events such as geothermal venting, forest fires and volcanic eruptions can also result in concerted releases of mercury to the air. In general, natural releases of mercury occur over prolonged periods of time and are comprised predominantly of Hg(0) (Gustin).

Some have also suggested that TGM may be susceptible to a natural diel cycle under certain meteorological conditions (Schroeder and Munthe). Temperature and solar radiation may enhance volatilization from snowpack, surface waters, soils and wetlands, leading to enhanced flux rates during daylight hours (LaLonde, Poissant, Lindberg and Zhang, Lindberg and Meyers). Although this may affect flux rates and measured mercury vapor concentrations at the water:air and soil:air interfaces, it is unclear whether similarly detectable deviations in atmospheric mercury would be expected at heights of a meter or greater above surface level where the air is more well-mixed. Long-term monitoring data collected to date does not support the argument that a natural diurnal pattern exists for TGM. Instead, it has been suggested that point source influences are the predominant cause of both short- and long-term measurable fluctuations in TGM at lower latitude terrestrial sites (Lindberg, Iverfeldt). Some data seem to suggest that seasonal variability in TGM levels is present, with highest levels in March and lowest levels between October and December at northern hemisphere monitoring sites (Iverfeldt). During 2000, a relatively undisturbed period at Lake Waccamaw, we observed our highest background TGM readings during the December through March timeframe and the lowest baseline readings between July and October. Whether this variability relates to natural phenomena or seasonal changes in anthropogenic emissions of mercury has not yet been determined.

Recently, dramatic changes in atmospheric mercury were noted in the Arctic region (Schroeder 1998). Atmospheric mercury was depleted from 1.5 ng/m^3 to 0.2 ng/m^3 just before the polar sunrise and during Arctic snowmelts. It was suggested that the decrease in TGM is due to chemical conversion of Hg(0) to RGM that then undergoes deposition to the earth's surface. The ready availability of reactive halide species could be contributing to this chemical reaction. To date no similar pattern has been described at lower latitudes although some have speculated that similar phenomena may occur to a lesser extent in lower latitude coastal regions (Mason, personal communication).

Historical Data on Atmospheric Mercury in North Carolina

Very few data are available describing typical atmospheric mercury levels in North Carolina. Stopford anecdotally reported levels between 1.7 and 8.9 ng/m^3 in Durham, NC in 1978, with a short-term peak of approximately 400 ng/m^3 during a plume fumigation event arising from a nearby coal-fired power plant (Stopford). Between 1998 and 2001, periodic measurements of TGM taken at a site in Research Triangle Park, NC indicated that levels rarely exceeded 2 ng/m^3, with values typically in a range between 1.4 - 1.7 ng/m^3 (Stevens). TGM was measured over a 3-month period between June and August of 1996 at Phelps Lake, a remote site in northeastern North Carolina; 15-minute readings were consistently between 1 and 2 ng/m^3 and never exceeded 6 ng/m^3.

Total Gaseous Mercury at Lake Waccamaw

At Lake Waccamaw, the vast majority of readings for TGM fell below 2 ng/m^3. Transient spikes in TGM helped raise the annual average concentration to 2.34 ng/m^3 during 1998, somewhat higher than expected for such a remote location but generally lower than levels documented in urban areas or sites immediately adjacent to point sources of mercury emissions. Spikes in TGM occurred on a regular basis and peak values frequently exceeded an order of magnitude above background. This trend remained in place throughout 1998. Beginning in spring of 1999, mercury readings stabilized below 2 ng/m^3. This pattern persisted throughout 1999 and 2000. Annual average mercury levels were approximately 28% and 31% lower than 1998 values, respectively.

Total Gaseous Mercury at Riegelwood, NC

Qualitatively, results from Riegelwood, NC appear very similar to early data from Lake Waccamaw. The majority of readings were below 2 ng/m^3 but transient spikes would occasionally reach levels exceeding 300 ng/m^3. This pattern was seen at both sites, throughout 1999 and 2000.

Long-term average TGM levels at Riegelwood Flynn declined between 1999 and 2000. The highest individual readings were encountered during the first several weeks of monitoring; however, peaks did continue to appear during subsequent months, suggesting the possibility of continued local source impacts. While mercury levels declined throughout 1999, they appeared to remain relatively stable during the latter half of 2000. A comparison between 4^{th} quarter data from 1999 and 2000 shows that mercury levels remained relatively consistent in terms of both average levels (2.23 ng/m^3 vs. 2.16 ng/m^3) and the magnitude and frequency of mercury spikes. This may suggest a "leveling-off" of atmospheric mercury levels in this area.

The profile for TGM at the Ballpark site was very similar to that encountered at Riegelwood Flynn. Baseline conditions were punctuated with periodic elevations as high as 240 ng/m^3 TGM. Monitoring was not initiated until mid-May 1999; thus measurements were not made during normal mercury cell chlor-alkali operating conditions. Although the quarterly statistics presented in Table 1-4 seem to suggest that average values declined between the 2^{nd} quarter and subsequent quarters, conditions actually appear to have remained relatively stable. Data from the entire sampling period (May - October) illustrates consistent, but highly variable, atmospheric mercury levels at this site.

It should be noted that values encountered at the lower end of the range (10^{th} - 50^{th} percentiles) were consistently higher at this site relative to similar

data from the Flynn and Waccamaw sites. This could reflect higher baseline levels of TGM due to site contamination or it could reflect an effect of instrument configuration. The Ballpark site provides a relatively unobstructed view of the nearby industrial complex and might be more susceptible to downwind migration of mercury from on-site waste ponds. However, this factor seems an unlikely explanation given the variability in wind direction. Alternatively, enhanced historical deposition of mercury to local soils could lead to greater rates of Hg(0) volatilization. If true, intraday variability might be expected with higher readings associated with elevated temperatures and solar radiation. Another possible explanation is performance of the mercury vapor monitor. Instrument configuration and operating conditions were identical to those at the other two sites, and the inlet to the sample line was positioned at a similar height. The instrument at Ballpark was housed in a mobile trailer rather than a freestanding shelter, but conditions inside the structures were similarly maintained. None of these factors is a satisfactory explanation for the higher baseline readings of TGM observed at this site. This observation could warrant further study.

During 2000, the Ballpark instrument was modified to include a denuder assembly for speciation of gaseous mercury. Estimates for TGM can be generated by combining 2-hour average values for Hg(0) and RGM or by using Hg(0) alone as a surrogate measurement. The former calculation would theoretically be a more accurate representation of atmospheric TGM but would present data on a completely different time frame than those collected during 1999 and would "smooth over" short-term elevations in atmospheric mercury. Comparing 5-minute Hg(0) measurements to historical TGM data avoids this conflict but introduces additional complicating factors. First, dedicated measurement of TGM is a nearly continuous process with a single interruption for instrument calibration only taking place over 40 minutes once every 25 hours. By contrast, measurement of Hg(0) during mercury speciation is interrupted every 2 hours for a 40-minute denuder desorption and analysis cycle. While data were closely scrutinized to assure that the desorption/analysis cycle had no effect on flanking measurements of Hg(0) it could be argued that the loss of such a substantial fraction of daily coverage might limit the effectiveness of this type of comparison by excluding such a substantial portion of the sampling time. However given the large volume of measurements and the random nature of the timing on the desorption/analysis cycles it is doubtful that these periodic interruptions would contribute to any meaningful or consistent bias in the measurement of atmospheric mercury. A more challenging question concerns the comparability of Hg(0) and TGM readings, as Hg(0) is only one component of TGM. The Tekran 2537A is described as an instrument that "performs continuous measurement of TGM in ambient air" (Tekran). However, given that the instrument configuration involves several convoluted sample lines and filter assemblies it could be argued that the RGM component is lost through adherence to the instrument parts before it can reach the gold cartridge traps. If this assumption is true then

Tekran 2537A data on "total gaseous mercury" may in fact represent only Hg(0). In fact, the point is nearly made moot by the fact that RGM appears to be a very small component of TGM in ambient air. During the course of this study RGM levels were less than 1% of TGM levels in over 90% of speciated mercury measurements and even in the most extreme situation did not exceed 7% of TGM. As evidenced in Table 1-5, a statistical comparison of Hg(0) and TGM shows that ambient levels are nearly identical. We believe that these data support the conclusion that a meaningful comparison can be made between measurements of TGM from 1999 and measurements of Hg(0) from 2000.

Using this technique, it appears that atmospheric mercury levels declined substantially between 1999 and 2000 at the Ballpark site. The average level for Hg(0) measured between August 24 and October 13 of 2000 was 1.9 ng/m^3, compared to 3.2 ng/m^3 for TGM during the period in 1999 – a 40% reduction. This reflects, in part, a reduction in the intensity of short-term elevations in atmospheric mercury, but mercury levels also appear to have fallen throughout the entire distribution of values. During 1999 even the values in the low end of the range were predominantly above 2.0 ppm while low-end readings in 2000 were generally below 1.5 ng/m^3. It is not immediately clear why baseline conditions at this site would have improved during this period.

Table 1-5: *Comparative statistics for TGM and Hg(0) at the Riegelwood Ballpark site, Aug 24 – Oct 13, 1999 vs. 2000. All values are 5-minute readings in ng/m^3.*

	1999 TGM	2000 Hg(0)
10th percentile	1.66	1.24
25th percentile	1.91	1.36
50th percentile (median)	2.14	1.48
75th percentile	2.48	1.65
90th percentile	5.46	2.15
95th percentile	9.77	4.01
99th percentile	22.58	12.93
max	70.78	52.46
mean	3.24	1.94
n	8539	9113

In general, all monitoring sites provide a similar picture for atmospheric TGM in this region of southeastern North Carolina. TGM levels appear to be declining at both Riegelwood and Lake Waccamaw. At Lake Waccamaw the dramatic improvement in atmospheric conditions beginning in early 1999 and lasting throughout the duration of this study are consistent with rural or remote readings for TGM. Improvements were also noted at both Riegelwood sites, although periodic fluctuations in TGM continue to be detected in this area, and may warrant further study.

Concurrent measurements from all three sites illustrate geographic variability in TGM. Overlapping measurements are available between May and September of 1999 and August and November of 2000 (Table 1-6). These data illustrate a reduction in long-term mercury levels at both Riegelwood sites but also illustrate that TGM levels remain higher at these sites relative to corresponding data from Lake Waccamaw.

Table 1-6: *Concurrent total gaseous mercury levels measured at all three study monitoring sites during 1999 and 2000 (mean, ng/m^3)*

Period	Lake Waccamaw	Riegelwood Flynn[6]	Riegelwood Ballpark
May 21 - Sept 14, 1999	1.52 ng/m^3	2.21 ng/m^3	3.67 ng/m^3
Aug 18 - Nov 20, 2000	1.52 ng/m^3	1.94 ng/m^3	1.99 ng/m^3

Total Gaseous Mercury and Wind Direction

Establishment of a relationship between TGM levels and wind direction may help to identify potential fixed sources of TGM emissions. This relationship was examined in the present study using data from on-site meteorological equipment. Regional wind characteristics are illustrated in Figure 1-17 using a 5-year wind rose diagram with data collected at Wilmington, NC. Winds in this area are predominantly southwesterly during the summer months and north to northeasterly during the winter months.

Data from 1998 suggested a positive relationship between elevated mercury levels at Lake Waccamaw and winds arriving from the east-northeast. During 1999, elevated mercury at Riegelwood Flynn was associated with winds arriving from the northwest while winds from the north and northeast were most strongly associated with elevated mercury at Riegelwood Ballpark.

[6] Data from 2000 only goes through November 14.

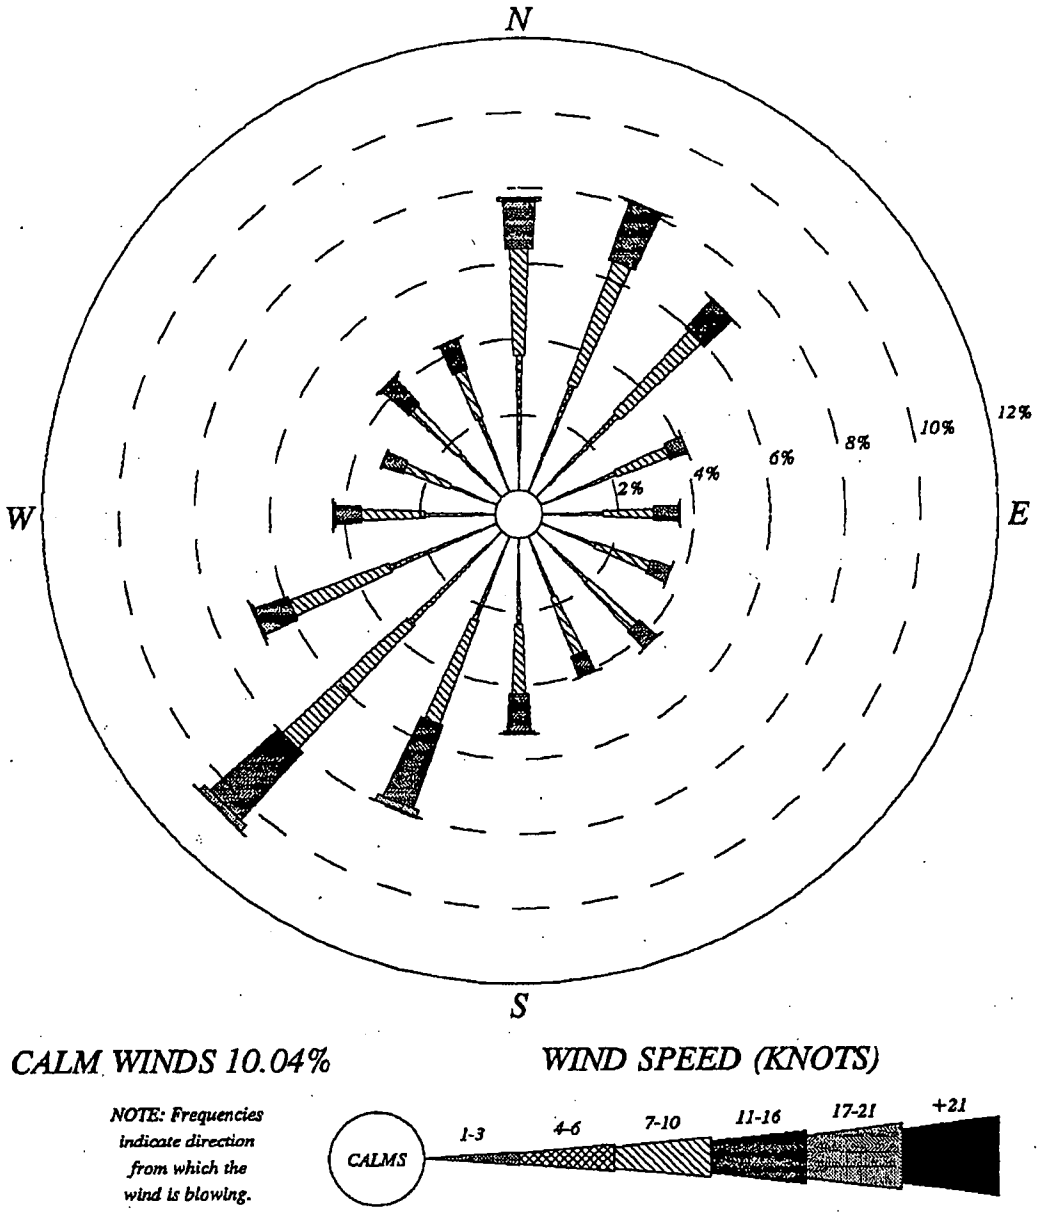

Figure 1-17: *Regional wind pattern for Wilmington, NC, 1986 – 1990.*

The combined data from all three sites provide an opportunity for "triangulation" of wind and mercury data. Early data from Lake Waccamaw was insufficient for distinguishing the most likely responsible source because several sources of mercury emissions lay to the east of this site. However, subsequent data from the Flynn site suggested that sources to the east of Riegelwood (i.e. in the vicinity of Wilmington, NC) played little role in affecting ground-level TGM in the Riegelwood area during the study period.

In our analyses, we removed data associated with wind speeds below 3 miles per hour. Wind direction data collected during periods of light and variable winds tends to be scattered and rarely provided meaningful information on relationships between mercury levels and wind direction. In addition, the calculation of an "average" 5-minute value for wind direction

under these conditions might be misleading since it would represent the product of highly variable, shifting winds. Elevated mercury readings were more frequently associated with calm winds at the Riegelwood sites as compared to Lake Waccamaw data from 1998. This phenomenon could be related to slow outward ground-level migration of a pollution plume from a nearby source as might be encountered during calm conditions. The magnitude and frequency of this type of phenomenon should be greater if ground-level monitoring stations are positioned immediately adjacent to pollution sources, thus minimizing dispersion of the pollution plume. Data from the Riegelwood sites, as such, might be suggestive of a nearby mercury emissions source.

Total Gaseous Mercury and Other Meteorological Variables

Determining a relationship between TGM levels and other meteorological parameters including temperature and humidity was complicated by the apparent influence on TGM levels by local sources; however, data from Lake Waccamaw during 2000 appear to exhibit minimal source influence and were thus analyzed closely. No clear relationship between TGM levels and temperature or humidity was identified, though possible seasonal differences were unearthed. The average TGM level during December through March was 1.8 ng/m^3, while during the warmer months levels typically averaged 1.5 ng/m^3. A diel pattern was seen during the course of the day with a bottoming out of mercury levels in pre-dawn hours followed by a rapid rise to maximal daily concentrations by late morning and a gradual descent in levels throughout the day (Fig 1-18). We are not aware of this relationship having been previously identified but believe it may warrant further examination. Possible explanations for this pattern could include photochemical reactions resulting in reduction of surficial Hg(2+) to Hg(0) and subsequent volatilization to the atmosphere. Several groups have identified enhanced flux rates from surface waters and contaminated soils following sunrise; however, the likelihood that this effect would be detectable at a 3 to 4 meter elevation seems small since atmospheric mixing is normally very efficient. Atmospheric turbulence, as represented by average wind speed, follows a similar diurnal pattern. The mid-morning rise in TGM occurs at approximately the same time of day that the wind speeds pick up and decreases to its lowest levels around nightfall. This turbulence could help to facilitate movement of deposited mercury or mixing with air masses that contain higher concentrations of gaseous mercury. It may be worth noting that virtually all mercury readings in the lowest 10th percentile of values were confined to periods when the average wind speed was less than 5 mph. Figure 14 also illustrates the apparent seasonal effect on TGM levels, as the entire spectrum of 1st quarter (Jan – Mar) readings are obviously elevated above 3rd quarter (July - September) values. It has been speculated that this pattern might be related to wintertime atmospheric phenomena such as lower mixing heights, seasonal changes in energy demand or variable rates of atmospheric oxidation of Hg(0) which might relate to ambient temperature or sunlight intensity (Sheu and Mason).

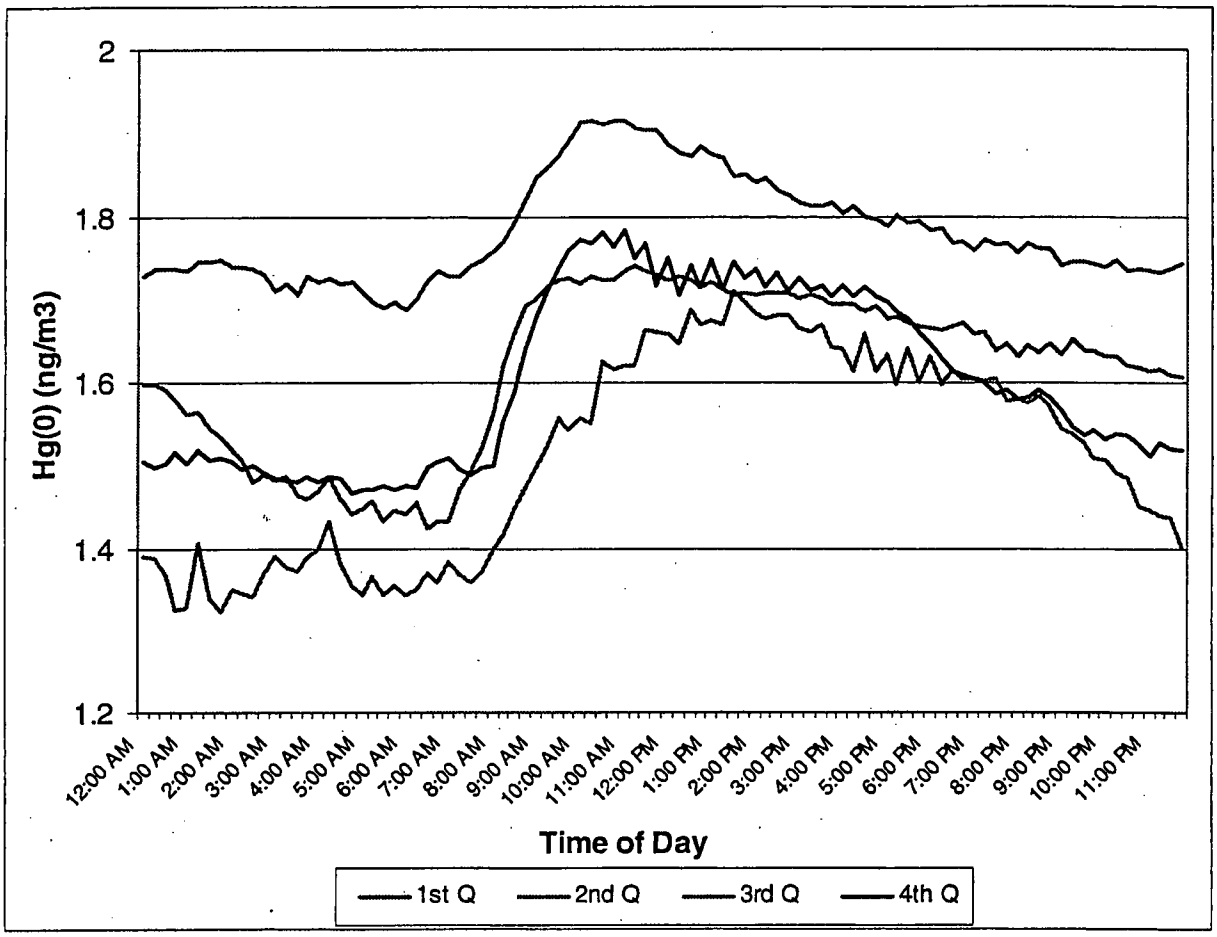

***Figure 1-18**: Stratification of TGM measurements by time of day, Lake Waccamaw State Park, 1st through 4th quarters, 2000.*

If the diel pattern for TGM at Lake Waccamaw is a true atmospheric phenomenon and not an artifact of instrument design or operator error, then an obvious question arises concerning the fate of the depleted TGM during the late evening and early morning hours. Oxidation of Hg(0) to Hg(2+) might serve to explain a daily depletion event but atmospheric mercury speciation studies conducted to date have not shown a diel pattern for Hg(2+) that is consistent with this phenomenon. Another explanation could include adsorption of Hg(0) onto particulate matter and subsequent dry deposition, with revolatilization to the lower atmosphere during the subsequent day's warming period.

Sources of Measurement Bias

Data loss was significant during several study periods but spread out randomly during 1999 and 2000. The most frequent reason for data loss, a lack or failure of instrument calibration, was randomly encountered and should not impart any consistent bias on the data. On several other occasions, data from all sites were lost due to weather phenomena such as hurricanes. These events tended to be seasonal and occurred most frequently during late summer and early fall. Data from Lake Waccamaw are missing for significant periods during 1998 including an extended period between March 4 and June 22. These patterns of missing data could bias comparisons of annualized mercury data if significant seasonal variability exists in the data; however, the data do not support the existence of this type of relationship. We noted no seasonal trends in the available data from the Riegelwood sites and visually, the fluctuations in atmospheric mercury encountered during 1998 at Lake Waccamaw appear evenly spread out across the year. Quarterly statistics are consistent between the 1st, 3rd and 4th quarters of 1998. However, because of the previously noted relationship between mercury and wind direction, bias could be introduced through the exclusion of extended periods from one portion of the year. Winds during the fall and spring tend to be variable and unpredictable, shifting between southwesterly and northerly or northwesterly (C Buckler, DAQ meteorologist, personal communication). Because of the significant variability in wind direction and the relative lack of comparable data, it is nearly impossible to assess the nature or magnitude of the bias introduced by missing data.

Another elusive potential source of bias is the relationship between catastrophic weather events and the likely disruption of industrial activities during this time. If industrial activity was interrupted during these periods, and those activities were associated with spikes in atmospheric mercury, then monitoring data from these periods may be influenced by the lack of source impacts.

SPECIATION OF ATMOSPHERIC MERCURY: RESULTS AND DISCUSSION

Our attempt at long-term speciation of atmospheric mercury was a challenging experience. At the time we initiated this study, there were no published studies documenting experiences with newly developed denuder methods for speciation of atmospheric mercury. Unexpected challenges in the field led to the loss of a large amount of data collected during the first few months of sampling. These initial failures led to the removal of the speciation instruments from the Riegelwood Ballpark site for laboratory method development. Subsequently, modifications to the analytical system were made and a successful second phase of sampling was carried out in fall of 2000.

During the second monitoring phase we were able to distinguish trends in RGM that at times mimicked changes in Hg(0) and at other times seem to behave independently. Much more data will be needed under a variety of conditions to better understand the meaning of the data we present here. It remains uncertain whether ambient fluctuations of RGM represent pollution plume impacts or normal environmental processes. However, these data do improve the understanding of the characteristics of atmospheric mercury adjacent to this contaminated industrial site and improve our understanding of the potential impacts of atmospheric mercury on regional environmental conditions.

All mercury speciation measurements were carried out at the Riegelwood Ballpark site. Two phases of monitoring took place during 2000: the first between March and June and the second beginning in mid-August and ending in mid-November. A two-month period of method development and testing was carried out between monitoring periods.

Phase 1 (March - June) Results

During the first monitoring phase, over 600 two-hour measurements of RGM and over 13,000 five-minute measurements of Hg(0) were made. Visually, the 5-minute data for Hg(0) appear very similar to the data on TGM collected during 1999, with baseline conditions punctuated by periodic spikes exceeding an order of magnitude above background. A considerable degree of variability was also seen in the RGM data. Two-hour measurements ranged from 0 to 96 pg/m^3. Concurrent two-hour measurements of Hg(0) and RGM are presented in Figure 15. Values for Hg(0) were calculated by averaging all 5-minute readings within each 2-hour sampling period.

On many occasions, 5-minute readings for Hg(0) as low as 0 ng/m^3 were seen. This type of pattern was not seen during previous measurements of TGM at any of our sites and is not considered possible given the steady-state background concentration of Hg(0) ($\sim$ 1.6 ng/m^3) that has been consistently documented at terrestrial ambient monitoring locations. It was determined that these depressed reading were most likely caused by contaminants that reduced the instruments collection efficiency. As a result, all data collected during this period have been flagged as questionable. This problem was addressed and solved during the two-month period between sampling phases, allowing for the collection of reliable data during Phase 2.

Phase 2 (Aug - Nov) Results

Between August and November of 2000, over 600 two-hour measurements of RGM and over 13,000 five-minute readings for Hg(0) were collected. Concurrent 2-hour values for Hg(0) and RGM are presented in Figure 1-19, and in Table 1-7. Short-term increases in Hg(0) were relatively common and reached levels as high as 52 ng/m^3 (refer to Table 1-4). The average value for Hg(0) over the entire sampling period was 2.0 ng/m^3. Significant variability in RGM was also seen. Levels were typically very low, with a majority of readings below 1 pg/m^3, but periodic excursions were evident. The average value[7] for RGM over the entire sampling period was 7.81 pg/m^3; the median value was 0.87 pg/m^3.

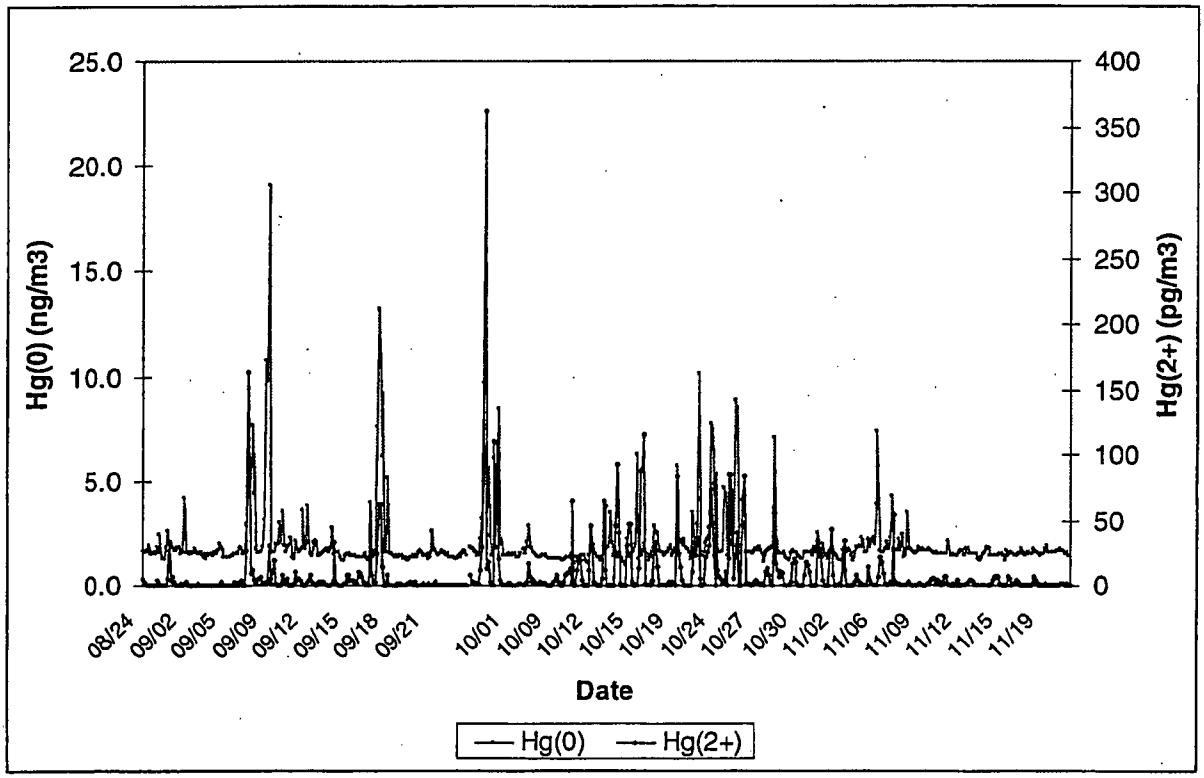

Figure 1-19: *Mercury speciation data, Riegelwood Ballpark, August 24 – November 21, 2000. All points represent 2-hour values for elemental or reactive gaseous mercury.*

Note the difference in scale between the Hg (0) and the Hg(2+).

[7] The average value for RGM during this period was calculated using actual values as reported by the instruments, except that values below 0 ng/m^3 were converted to 0 ng/m^3. An alternate mean value, substituting all values below the LQL (0.4 pg/m^3) as ½ the LQL (0.2 pg/m^3), is 7.86 pg/m^3.

Table 1-7: *Statistics for 2-hour measurements of Hg(0), RGM and TGM from the Riegelwood Ballpark site, Aug 24 – Nov 21, 2000.*

	RGM (pg/m^3)	Hg(0) (ng/m^3)	TGM (ng/m^3)	RGM/Hg(0) (%)
10th percentile	0.00	1.32	1.32	0.00
25th percentile	0.00	1.43	1.44	0.00
50th percentile (median)	0.87	1.57	1.57	0.05
75th percentile	4.20	1.76	1.78	0.23
90th percentile	20.41	2.78	2.80	0.89
95th percentile	39.30	4.90	5.02	1.51
99th percentile	91.76	9.15	9.16	3.90
max	362.40	19.10	19.13	6.70
mean	7.81	1.99	2.00	0.32
standard deviation	23.22	1.56	1.57	0.0078
n	611	611	611	611

The values in the TGM column in Table 1-7 were derived by adding concurrent two-hour readings for Hg(0) and RGM. Data on TGM exhibits a pattern similar to that seen during prior sampling events at this site; however, both average and peak values were diminished relative to earlier results. In over 90% of measurements, RGM was present at less than one-one hundredth the level of TGM, and in fact, RGM never comprised more than 7% of TGM over any 2-hour period. Thus, spikes in TGM were primarily a result of increased levels of Hg(0) rather than RGM.

The behavior of RGM could not always be predicted by changes in Hg(0). In many cases a concordance between short-term increases in Hg(0) and RGM was seen, but at other times Hg(0) and RGM behaved independently.

Several possible relationships between atmospheric mercury levels and variables such as meteorology were identified and explored in further detail:

Mercury and Time of Day

Figure 1-20 presents RGM data by time of collection. Most elevated readings for RGM arose during daylight hours, although some events were scattered throughout nighttime and early morning hours. No obvious pattern was identified for spikes of Hg(0) (Fig 1-21), but examination of 5-minute data sorted by time of day of collection revealed a diel pattern similar to that seen in Figure 14 when non-background values (>2.15 ng/m^3) were removed (data not shown).

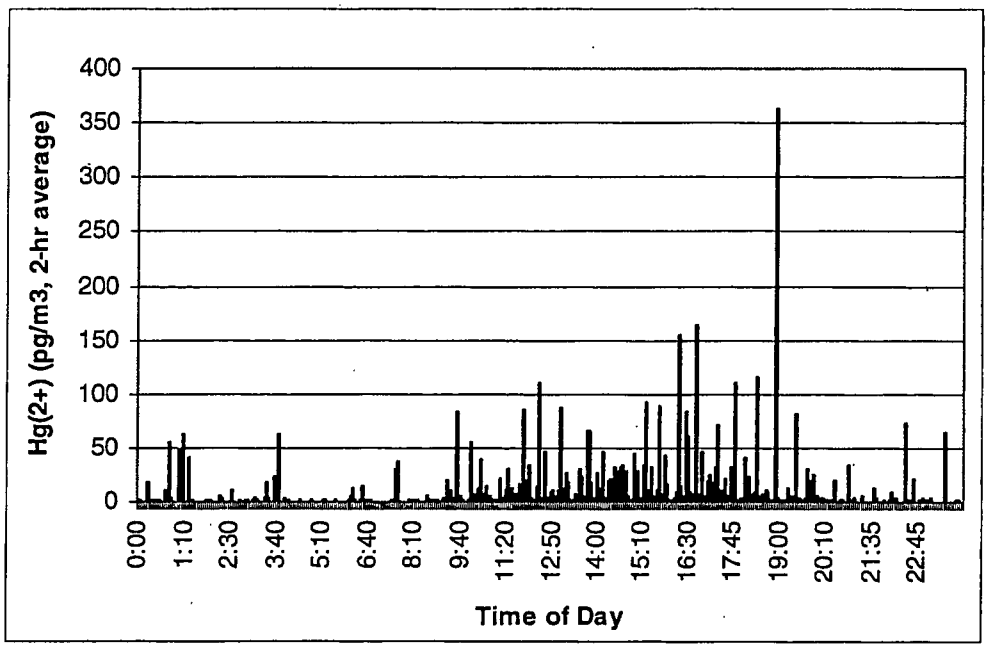

Figure 1-20: *RGM, sorted by time of sample collection. All readings represent RGM levels sampled during the preceding 2½ hours. Aug 24 – Nov 21, 2000.*

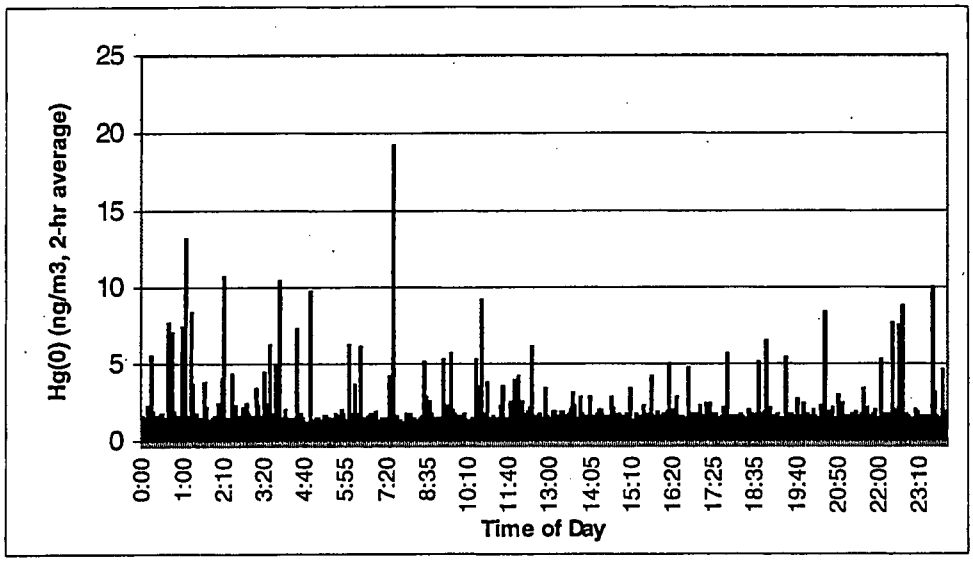

Figure 1-21: *Hg(0), sorted by time of sample collection. All readings represent an average of 24 5-minute Hg(0) measurements taken during the preceding 2 hours. Aug 24 – Nov 21, 2000.*

Mercury and Humidity

Figure 1-22 presents data on humidity levels during quantifiable measurements of RGM. Elevated RGM readings were detected under a wide range of conditions; however, the lowest readings for RGM appear to be confined to highly humid conditions. Most instrument non-detects (< 0.4 pg/m^3) were encountered under highly humid conditions. The average humidity level during instrument non-detects was 92.5% (s.d. = 6.56) vs. 64.2% (s.d. = 20.6) during quantifiable readings. The relationship between Hg(0) and relative humidity is illustrated in Figure 1-23. Most elevated Hg(0) readings occurred under moderate to high humidity conditions. Closer inspection of the data suggests that depressed readings at or below 1 ng/m^3 were almost exclusively affiliated with conditions of extreme humidity.

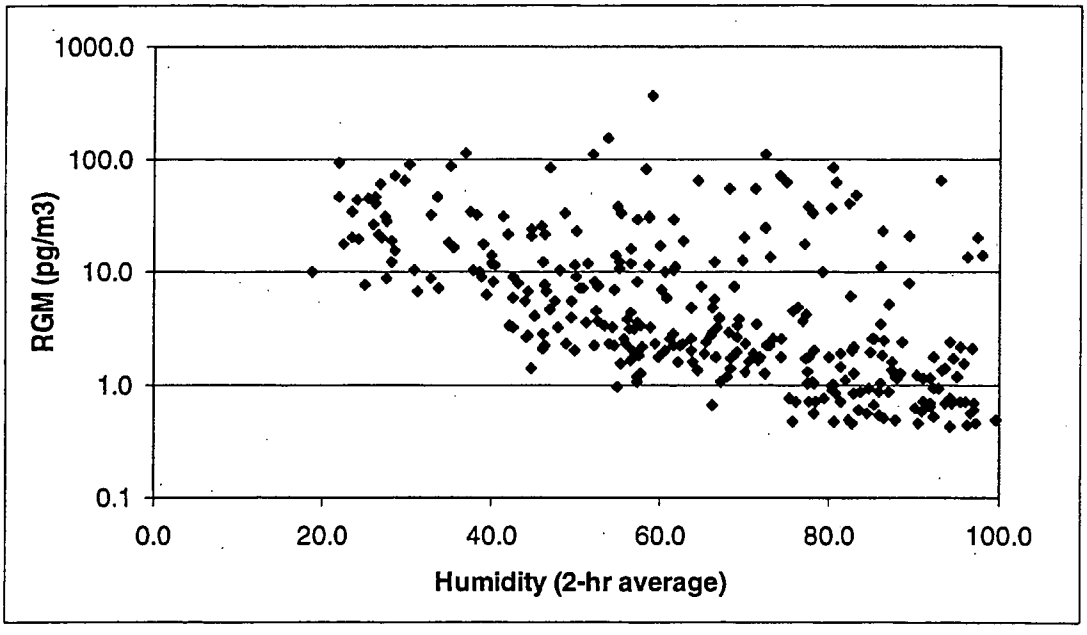

Figure 1-22: *Scatterplot of RGM vs. relative humidity, Aug 24 – Nov 21, 2000. Note semi-log scale.*

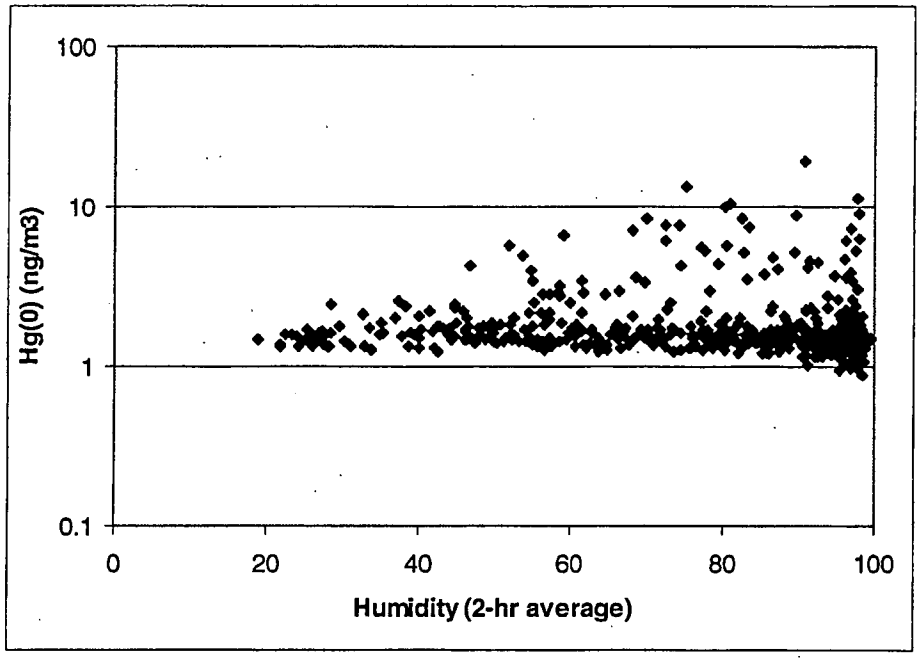

Figure 1-23: *Scatterplot of Hg(0) vs. relative humidity, Aug 24 – Nov 21, 2000. Note semi-log scale.*

Mercury and Temperature

Daily average temperature decreased during this study period with the transition from late summer to fall and early winter. No related trend in the frequency or intensity of mercury spikes was seen during this period. Neither RGM nor Hg(0) appeared to exhibit a consistent relationship with temperature (Figures 1-24 and 1-25).

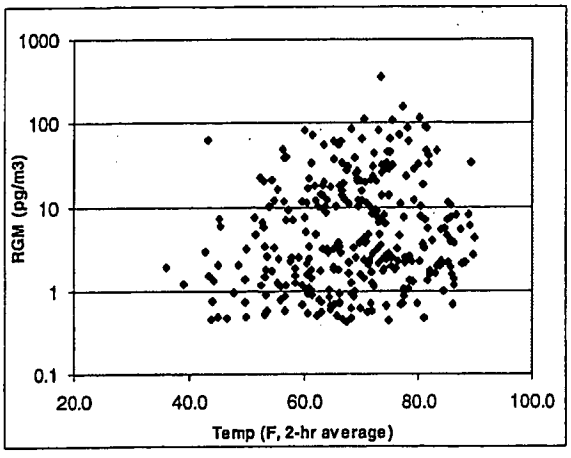

Figure 1-24: *RGM vs. temperature, Sept 1 – Nov 9,*

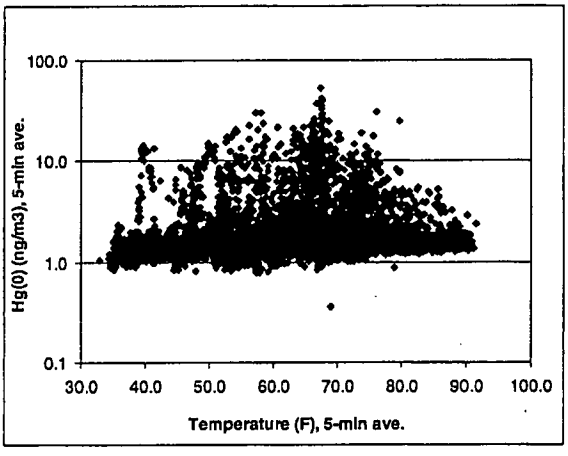

Figure 1-25: *Hg(0) vs. temperature, Sept 1 – Nov 9,*

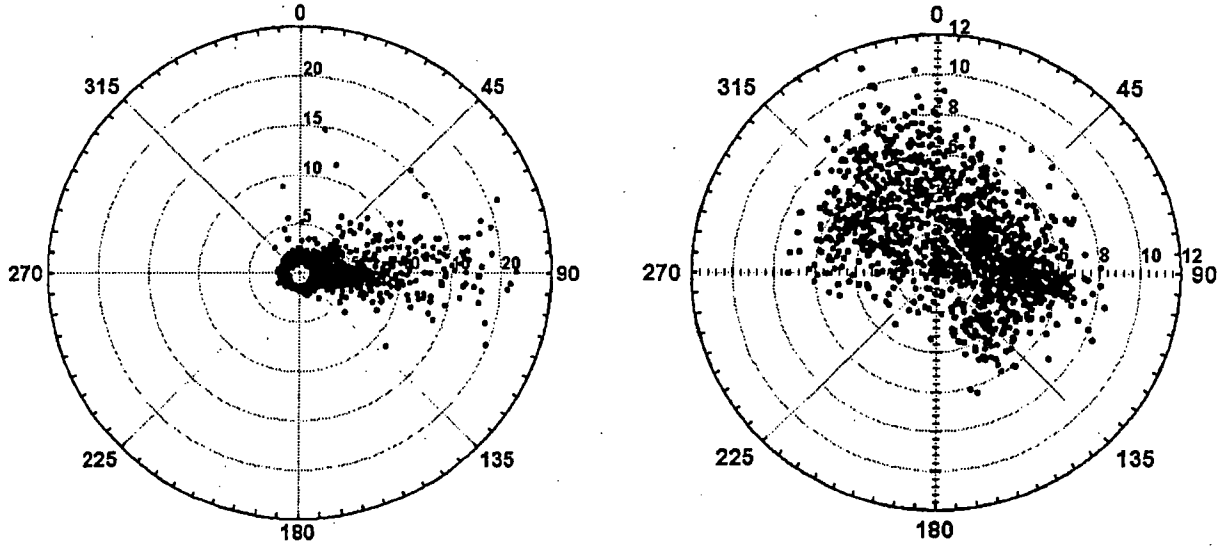
Mercury and Wind Conditions

Elevated Hg(0) was predominantly associated with winds arriving from the east-northeast. Figure 1-26 illustrates the consistent relationship between Hg(0) level and wind direction. As we noted previously, a closing site audit indicated wind direction was inaccurately measured at this site during this period. Actual wind direction was probably 25 to 40 degrees lower than the data presented in Figure 1-26, but the exact amount of offset is impossible to assess. The weather station at the Riegelwood site was not equipped to calculate average wind direction every 2 hours making it difficult to establish a clear relationship between RGM and wind direction over that time frame. Individual 5-minute data points on wind direction and wind speed correlating to 2-hour periods of elevated RGM are presented in Figure 1-27. It should be noted that variability in wind direction within each 2-hour sample collection period could confound our attempts to identify any relationship between elevated RGM and wind direction, especially if the majority of RGM was brought to the sampler during a fraction of a sampling period with highly variable winds. In the discussion section below we present wind direction data as a range based on individual 5-minute values generated within each 2-hour RGM sample collection period.

Figure 1-26: *Plot of Hg(0) vs. coincident wind direction. The radial axis represents wind direction in degrees while the X and Y axes represent Hg(0) level in ng/m³.*

Figure 1-27: *Plot of wind speed (mph, X/Y axes) and direction (radial axis) during conditions of elevated RGM. All values are 5-minute averages.*



The following table summarizes the observed relationships between Hg(0) and RGM levels and the above mentioned variables:

Table 1-7: *Summary of observed relationships between reactive gaseous mercury, elemental mercury and several measured variables, August – November, 2000.*

Variable	Reactive Gaseous Mercury	Elemental Mercury
Time of Day	Elevated readings primarily confined to daylight hours	No clear pattern, elevated readings occurred during both daylight and nighttime hours
Humidity	High readings encountered under a wide variety of humidity levels, but lowest readings confined to highly humid conditions	Highest readings under moderate to highly humid conditions, depressed readings at extreme humidity levels
Temperature	No apparent relationship	No apparent relationship
Wind Direction	No clear relationship	Highest readings with winds from N-NW to E

Phase 2 (Aug - Nov) Discussion

Instrument Performance

The soda lime system modification appeared to have been successful at reducing or eliminating artificially low readings for TGM. However, on rare occasion 5-minute Hg(0) values below 1 ng/m^3 were encountered. These values were sporadic and generally confined to a 3-week period between September 28 and October 15, 2000.

Hg(0) levels below 1 ng/m^3 were frequently associated with extremely humid conditions. This could suggest that Hg(0) levels are lower during extremely humid conditions or that instrument readings reflect some degree of impairment in the capture or measurement of Hg(0). Hg(0) is not water-soluble and not predicted to undergo significant atmospheric removal during humid conditions or precipitation events. Others have shown that TGM levels do not decrease during or following rain events (Lindberg). Another more speculative theory is that the presence of atmospheric water vapor could enhance the rate or extent of mercury oxidation, resulting in a depletion of Hg(0). Several atmospheric oxidation reactions involving mercury occur most rapidly in the aqueous phase (Lin and Pehkonen). Many of these oxidizing agents are likely to exist at elevated levels in regional ambient air due to nearby industrial emissions. However, the likelihood that this phenomenon would give rise to a measurable change in TGM levels is very small given that only a minute fraction of Hg(0) in the air would be predicted to enter into the aqueous phase where oxidation reactions would take place. The most likely scenario involves interference with instrument performance by water vapor. Water vapor could condense on sample lines or saturate particulate filters, inhibiting the passage of Hg(0). It could also overwhelm the soda lime traps, allowing moisture to reach the gold traps which might affect mercury capture efficiency. Finally, it is also conceivable that other meteorological conditions associated with high humidity (e.g. precipitation, wind or temperature) could be impacting atmospheric mercury levels or instrument performance.

TGM measurements below 1.0 ng/m^3 were not confined to this site during the study. Interestingly, these values appeared periodically during the July through September timeframe at other sites. For example, the lowest 10% of readings for TGM taken at Lake Waccamaw from the third quarter of 1998, 1999 and 2000 were consistently lower than similar values from other periods during the year (Table 1-1). During these periods warm humid air masses arrive from the Gulf of Mexico; unfortunately, concurrent information on humidity and Hg(0) are not available from these sites, preventing the establishment of a similar relationship between humidity and TGM at this site.

Despite the periodic appearance of low values for Hg(0) it does appear that system modifications improved the detection of Hg(0). It remains possible that some recorded values are lower than actual atmospheric levels, especially

during periods of extreme humidity. However, because there were no clear indications of compromised instrument performance during these periods, data on Hg(0) and RGM are included in summary statistics and figures for this sampling period.

Total Gaseous Mercury, RGM and Elemental Mercury

TGM levels fluctuated significantly between August and November of 2000 in a pattern similar to that seen during the previous year. Average levels declined significantly relative to the same time period during 1999, reflecting the decreased frequency and diminished magnitude of spikes in TGM.

Our study confirmed that TGM is comprised overwhelmingly of Hg(0). Although increases in both Hg(0) and RGM were seen on a frequent basis during this study, it was Hg(0) fluctuations that were primarily responsible for changes in TGM. RGM levels were typically two to three orders of magnitude lower than Hg(0). Even in those cases where RGM increased without concurrent changes in Hg(0), levels never exceeded one-tenth those of Hg(0). These data are consistent with findings reported in previous studies (Lindberg, Sheu and Mason).

Our data suggest that RGM and Hg(0) levels may be differentially susceptible to various outside influences. As illustrated in Figure 1-28, changes in one form of gaseous mercury would often, but not always, occur independent of changes in the other mercury species. RGM is comprised of water-soluble species such as mercuric chloride ($HgCl_2$). It is believed that these species undergo atmospheric removal mechanisms involving both wet and dry deposition. It has been shown using continuous monitoring techniques that RGM levels in ambient air fall dramatically following a rain event (Lindberg). Theoretically, these same wet deposition removal mechanisms would be enhanced by the presence of high levels of water vapor in the air, such as might exist during the extremely humid conditions periodically documented during our study. This phenomenon is a likely explanation for the pattern of RGM non-detects during periods of high humidity. During dry periods (humidity < 50%) all readings for RGM were above the instrument limit of detection. However, elevated RGM was detected under conditions of low and high humidity, suggesting that while water vapor might be an effective tool for removing low levels of RGM, its removal efficiency is less than 100% at higher atmospheric concentrations.

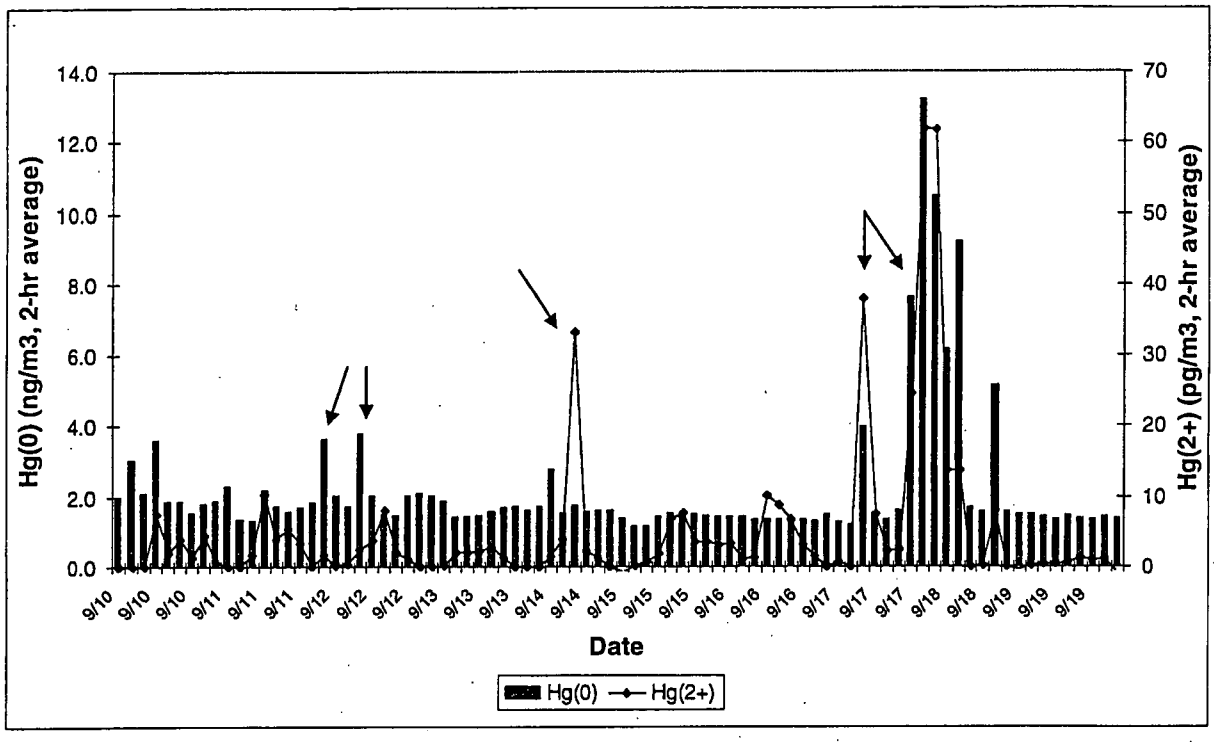


Figure 1-28: *Representative sample of mercury speciation data, September 10 – 19, 2000, illustrating the behavior of elemental and reactive gaseous mercury. Data represent 2-hr coincident readings for each mercury species.*

Except for the lower baseline readings encountered under highly humid conditions, Hg(0) readings did not appear to be dramatically affected by humidity levels. Hg(0) is not water-soluble and thus not predicted to undergo significant atmospheric removal by wet deposition. Measurable changes in Hg(0) concentrations in temperate climates are more likely to be affiliated with impacts from nearby emission sources.

Elevated readings for RGM appeared most frequently during daylight hours.[8] Sunrise and sunset ranged from 5:40 a.m. to 6:48 p.m. EST on August 24 to 6:51 a.m. to 5:04 p.m. EST on November 21. Lindberg and Stratton also reported daytime increases in RGM and speculated that photochemical production might enhance RGM levels during the day while nighttime deposition acts as a removal mechanism, depleting atmospheric RGM trapped below the stable boundary layer (Lindberg). Sheu and Mason reported varying diurnal trends for RGM at a site near the Chesapeake Bay (Sheu and Mason). While nighttime depletion and daytime increases were noted on at least one occasion during a weeklong sampling period, other patterns were also noted. The authors speculated that these increases could be related to source impacts

[8] Time of collection corresponds to sampling conducted over the preceding two hours.

or variability in RGM levels between different air masses moving across their sampling site. During our study some isolated RGM peaks were noted during nighttime and early morning hours, suggesting additional factors may have been impacting RGM levels during these periods (Fig 21). RGM levels were more highly correlated with Hg(0) levels during nighttime rather than daytime hours ($r^2 = 0.63$ vs. $r^2 = 0.54$). Peaks in Hg(0) were seen at all times of day, while background Hg(0) values appeared to conform to a diel pattern similar to that seen in Figure 29, with lowest values in the pre-dawn hours and the highest background values occurring during the middle of the day.

No correlation was identified between Hg(0) or RGM levels and temperature during this study period. Higher ambient temperatures could, in theory, facilitate several of the atmospheric reactions that could affect RGM levels; however, any association may be confounded by several simultaneous variables. During the summer months, warmer air arriving from the Gulf of Mexico is typically very humid, and the negative relationship between humidity and RGM levels may overwhelm any positive association involving temperature. Associations between wind direction and temperature could also hamper the identification of a relationship between temperature and atmospheric mercury levels, especially if mercury emission sources that are upwind during a significant portion of the year become downwind with seasonal shifts in wind direction. A more thorough statistical analysis involving analysis of variance might unearth a relationship between temperature and RGM or Hg(0) levels but is beyond the scope of this report.

The strongest historical indicator of emission source impacts on regional atmospheric mercury levels was illustrated through the consistent relationship between wind direction and elevated TGM readings at the Lake Waccamaw and Riegelwood monitoring sites. During speciation measurements, elevated RGM was most commonly associated with winds arriving from various directions, including the northwest, north and east. A wind rose plot summarizing 5-minute wind data collected in conjunction with elevated RGM shows a significant degree of variability but a notable absence of data points in the third quadrant (i.e. between south and west). Predominating winds during this period would be expected to range between southwesterly during August and September to northerly and northeasterly during October and November. In contrast, elevated readings for Hg(0) were bound to a fairly tight distribution between east-northeast and east-southeast. This suggests that increases in Hg(0) at this site may be related to a fixed upwind mercury emissions source.

Identifying Relationships between RGM and Elemental Mercury

Our data indicate that a variety of factors influenced atmospheric mercury levels at the Riegelwood Ballpark site. The single strongest line of evidence implicating point source effects is the correlation between wind direction and increases in Hg(0). Natural variability is most clearly illustrated

through the relationships between RGM, and humidity and time of day. Although data for Hg(0) and RGM appear very similar - exhibiting a predominance of background or baseline readings punctuated by periodic spikes in concentration for both species – short-term changes were periodically isolated to one species of mercury. To better understand the distinct behaviors of Hg(0) and RGM and the influence of natural variability versus anthropogenic impacts we defined three types of scenarios for further study:

- Scenario A: RGM and Hg(0) increase concurrently.
- Scenario B: RGM increases without simultaneous increase in Hg(0).
- Scenario C: Hg(0) increases without simultaneous increase in RGM.

Figure 1-28 illustrates a brief period during which several of these events appeared.[9] Once these events had been categorized, coincident data on mercury concentration, time period sampled, temperature, humidity, and wind speed and direction were compiled. Wind speed, temperature, humidity and Hg(0) concentrations were calculated by taking the arithmetic average of 24 separate five-minute readings within each 2-hour sampling period. Wind direction data were compiled from 5-minute readings. Summary statistics for temperature, humidity and wind speed are presented in the following table.

Table 1-8: *Observed meteorological conditions during periods of elevated gaseous mercury and during the complete study period, September – November, 2000.*

Scenario	Temperature mean (sd)	Relative Humidity mean (sd)	Wind Speed mean (sd)	# Events
A: Both RGM and Hg(0) increase simultaneously	64.6 (7.6)	74.0 (16.3)	3.44 (1.87)	24
B: RGM increases while Hg(0) remains at baseline	71.3 (9.5)	34.9 (15.1)	4.12 (2.02)	43
C: Hg(0) increases while RGM remains depressed	55.9 (13.6)	92.2 (7.6)	1.33 (1.70)	10
Complete Study Period[10]	*65.7 (12.4)*	*75.7 (21.5)*	*2.80 (2.60)*	

[9] For the purpose of this report, we chose events by visual inspection. In future studies we may attempt to define peaks by statistical parameters.

[10] statistics based on 2-hour average measurements except wind speed which is based on all 5-minute readings obtained between 9/1/00 and 11/9/00. See Appendix 5 for a more complete description of meteorological conditions during Scenarios A, B and C.

Scenarios A and C include elevated readings for Hg(0). We initially suspected that short-term increases in Hg(0) would primarily be due to local or regional industrial emissions. Natural causes of short-term peaks in Hg(0) such as forest fires, volcanic activity or nearby geological deposits of mercury were absent and would not be expected to contribute substantially. Variability in RGM is possibly related to natural phenomena but may also reflect transport of local or regional emissions of RGM. Elevated readings for RGM were encountered under scenarios A and B.

An obvious difference between scenarios A and C is the accompanying humidity level. While atmospheric conditions in the former case very closely mimicked conditions encountered throughout the duration of the study, humidity levels were substantially higher in the latter scenario. High humidity may contribute to the removal of RGM from the air. It is conceivable that the monitoring instrument was measuring the impact of pollution plumes containing mercury during these periods but any RGM that may have been present was scavenged through wet deposition mechanisms as the plume moved away from the source. It is notable that wind speed was also substantially lower in the latter case. Slow winds might further inhibit the lateral movement of RGM and enhance the likelihood of atmospheric removal on short distance scales. If these atmospheric removal mechanisms are in place and are affecting measured RGM levels while leaving Hg(0) levels unchanged, then it is entirely plausible that scenarios A and C represent pollution plume impacts under differing meteorological conditions.[11]

Under scenario B, increases in RGM were unaccompanied by changes in Hg(0). This could arise from several situations including plume impacts from point source releases of RGM, local formation of RGM through oxidation of available Hg(0), RGM releases from natural sources, or variable levels of RGM in different air masses. Wind direction associated with these events was highly variable, decreasing the likelihood of plume impacts from a single point source. Humidity levels were frequently very low, reflecting favorable conditions for the existence of RGM in ambient air. Although we cannot rule out the possibility that increases in RGM without concurrent increases in Hg(0) were caused by point source releases of mercury, there also remains a strong possibility that these peaks in RGM levels reflect a natural diel cycle.

If elevated readings for Hg(0) are used to identify plume fumigation events, then the concurrent presence or absence of RGM appears to be most significantly tied to local atmospheric conditions. Closer examination of the data shows that a negative correlation exists between humidity levels and the ratio of RGM to TGM during plume fumigation events (Table 1-9). During the most highly humid conditions (> 90%) no RGM was measured, despite

[11] We initially suspected that periods of increased Hg(0) and baseline RGM might be indicative of plume fumigation during rain events. However, rainfall data from nearby Lake Waccamaw suggested that nearly all these events occurred in the absence of rainfall.

markedly elevated levels of TGM. This suggests that extremely humid conditions were able to influence the chemical speciation of mercury reaching the monitoring station during plume fumigation events by removing RGM on a very short (< 1 mile) distance scale. The resulting increase in mercury wet deposition over a relatively small area might significantly impact runoff to surrounding surface waters. It is worth noting that on occasion, increases in RGM were seen even under conditions of greater than 90% humidity. However, the ratio of RGM to TGM was low, suggesting some degree of removal may have been taking place.

Table 1-9: *Description of meteorological conditions during suspected plume fumigation events (scenarios A & C), September – November, 2000.* [12,13]

# Events	Rel. Humidity	RGM/TGM	Correlation (RGM/RH)
34	Mean: 79.4% Range: 38% – 98%	Mean: 0.46% Range: 0.00% - 1.45%	-0.812

Although we have used the combined effect of increased Hg(0) and wind direction to highlight suspected local plume fumigation events it also remains possible that pollution impacts are responsible for some of the increases in RGM alone. Lindberg, et al reported several events during which RGM levels increased without concomitant increases in Hg(0) (Lindberg). They were able to present coincident data on SO_2, NO_x and ozone to strengthen their argument that these changes were caused by a plume fumigation event resulting from coal-fired utility boiler emissions. They also presented data suggesting that RGM levels conform to a diel cycle, with highest readings during late morning and afternoon hours. The absence of data on additional pollutants limits our ability to distinguish between natural variability and source influences on RGM levels, however several lines of evidence support the argument for natural variability. Most importantly, these events were almost completely confined to daytime hours - consistent with the diel cycle described above and contrasted with the continuous operating schedules of local mercury emission sources. Secondly, winds during these events were primarily northerly and westerly and likely comprised of cool, dry air - favorable conditions for the existence of RGM. Finally, Hg(0) levels remained at baseline suggesting the absence of plume impacts from ground-level sources in the immediate vicinity of Riegelwood. At present there is no known diel pattern for Hg(0), although some have speculated that such a pattern might exist (Schroeder 1999).

[12] "events" defined as scenarios A and C.

[13] These data were generated using actual instrument readings, including those below 0.4 pg/m^3, the limit of detection for reactive gaseous mercury.

The possible association with northerly winds could provide an argument for long-range regional transport of RGM from emission sources to the north and west of Riegelwood. Major emission sources exist in this direction including coal-fired utility boilers that serve the Charlotte, Fayetteville, Winston-Salem and Raleigh-Durham areas. The closest unit is positioned 95 km to the west-northwest near Lumberton, NC (1998 reported mercury emissions: 90 lbs.). Given these distances and the necessary convergence of emissions and meteorological conditions favoring downward mixing of the plume aloft, it seems improbable that upwind sources are the cause of all short-term fluctuations in RGM. Further study, including co-monitoring of additional pollutants such as SO_2 or trace metals would be needed to determine the extent of source impacts.

The relative impact of natural vs. man-made effects on atmospheric RGM deserves further attention. Many of our highest readings for RGM were obtained under conditions that are most likely to reflect natural variation. These increases were also far more common than events suspected to be due to local source impacts and exhibited considerable variability in magnitude and duration. Measurements at ground-level only tell a small part of the picture since sources with tall stacks are also likely to affect atmospheric mercury levels at much higher elevations. Additional critical measurements would include short-term wet deposition samples or cloud water analysis. We believe our study provides very strong evidence for point source contributions of RGM. However, at this point it would be premature to attempt to use the data from this study to quantitatively define natural vs. man-made impacts. Both are clearly important phenomena and should be factored into the design of future studies.

Regional Anthropogenic Emissions

The preceding data support a possible relationship between man-made mercury emissions and regional levels of mercury in ambient air and precipitation. To further investigate this possibility, we collected information on emission sources proximal to Lake Waccamaw and Pettigrew State Park. We utilized all available information on reported emissions and the most recent estimates on the physicochemical speciation of mercury pollution. In addition, we explored several major changes in regional industrial activities that may have had a significant impact on mercury emissions. The improvements made at several of these sources ultimately may result in reduced quantities of atmospheric mercury reaching the sensitive waterways of eastern North Carolina.

Table 1-10 includes summary information on the most significant sources of anthropogenic mercury emissions surrounding Lake Waccamaw and Pettigrew State Park (Figure 1-3). The data shows that several significant changes occurred between 1998 and 1999. The reported 1999 process

emissions from the chlor-alkali facility are provided. The facility experienced frequent power disruptions during the first few months of 1999 then ceased mercury-cell operations in favor of an alternate non-mercury chlorine production process in April. Reported emissions are most likely related to normal mercury cell chlor-alkali production activity occurring during early 1999. A reduction in mercury emissions between 1998 and 1999 at the adjacent pulp and paper mill may be due in part to the discontinued use of mercury-contaminated products from the adjacent mercury cell chlor-alkali plant. Apparent reductions from the coal-fired electric utility boilers likely resulted from improved emission estimates[14]. Additional reductions in regional mercury emissions are also likely. For example, a carbon injection system was added to the largest stack at the municipal waste incinerator in New Hanover County during late 2000. This modification could reduce mercury emissions from that stack by as much as 90% and facility-wide mercury emissions by 40% (40 CFR Part 60). Mercury emissions from other large sources have remained relatively stable. These emissions generally arise from the combustion of coal in large industrial boilers and may fluctuate depending on facility energy consumption.

All sources reported emissions prior to 1999 as "mercury vapor" or "mercury and compounds," consistent with guidance for applicable emissions inventories. Mercury emissions were not distinguished by chemical or physical characteristics largely because information on these parameters was lacking. However, this information is critical in determining the atmospheric fate of mercury emissions. Emissions of Hg(0) vapor would be prone to long-range transport and could be carried hundreds or even thousands of miles before undergoing processes that would lead to removal from the atmosphere. RGM and particulate mercury could undergo rapid removal from the atmosphere and could thus contribute to local or regional deposition patterns following release to the air.

[14] Data from 1999 was obtained from the USEPA's Information Collection Request (ICR) and is based on actual measurements in coal and stack gas.

Table 1-10: *Mercury emissions near Waccamaw and Pettigrew S.P. Includes estimates of mercury speciation based on 1999 emissions. Refer also to Figure 2.*

	Reported Hg emissions (lbs)[1]		1999 Speciated emissions (est.) [2]

[1]Reported emissions from state air quality permit database, self-reported values or TRI.
[2]Estimates of speciation from EPA Mercury Study Report to Congress.
[3]Reported emissions from 1996 state air quality permit database.

In its 1997 Mercury Study Report to Congress, the USEPA provided estimates of physicochemical speciation of mercury emissions from a variety of anthropogenic sources including industrial boilers, waste incineration units and coal-fired electric utility boilers. The authors based these estimates on limited stack tests and conceded "considerable uncertainty as to the actual speciation." Improved information was collected by the USEPA and major coal-fired electric utility boilers throughout 1999 as part of the ICR program. Advanced methods were used to speciate mercury in exiting stack gases from a handful of large (>25 MW) coal-fired electric utility boilers. Facilities were categorized based on plant configuration and emission control devices. Data from representative utilities were then used to estimate speciated mercury emissions from other similarly configured plants. For this report we utilized ICR data to estimate 1999 speciated mercury emissions from the coal-fired electric utility boilers. For all other sources we relied on the EPA's 1997 report. Our estimates of speciated mercury emissions are provided in Table 1-10, based on 1999 reported emissions.

Plume dispersion factors also play a large role in affecting the environmental fate of mercury emissions. Ground-level releases would be more likely to result in measurable changes at nearby monitoring sites. Pollution

released from an elevated source is more likely to undergo significant dispersion before impacting ambient air at ground level. This effect would broaden the area of impact but would also result in more modest increases in ground level air pollution. Plume rise and dispersion are also enhanced by higher stack gas exit velocities and temperatures, such as those encountered in many high-temperature combustion processes. Meteorological conditions including wind turbulence, temperature, boundary layer mixing and humidity can dramatically enhance or impede plume dispersion. Calm conditions will often result in the formation of an atmospheric inversion, thus trapping mercury emissions near ground level. Finally, surface features such as elevation changes, vegetation, buildings, traffic patterns and waterways will all affect plume dispersion to varying extents.

The variables above will all affect regional fate and transport of atmospheric mercury emissions and influence the likelihood that emissions will lead to measurable changes in ground-level atmospheric mercury. Local ground level emission sources releasing large quantities of Hg(0) at ambient temperatures would be most likely to impact nearby surface measurements of atmospheric TGM. In contrast, distant releases of predominantly particulate mercury or RGM under conditions favorable for plume dispersion would be less likely to result in measurable increases in ground-level TGM. Instead, these emissions would contribute more substantially to regional wet and dry deposition patterns.

The point sources described above possess a wide array of emissions characteristics. The coal-fired electric utility boilers have tall stacks and release Hg(0) and RGM at high temperatures and velocities. These factors would enhance dispersion and possibly give rise to a modest increase in mercury deposition rates over a relatively wide area. The same considerations might affect gaseous mercury released by large coal-fired industrial boilers, such as those found at many of the local chemical manufacturing facilities and pulp and paper mills. Mercury emitted by the New Hanover County municipal waste incinerator is primarily in the form of RGM or particulate mercury. This factor would contribute more directly to localized deposition rather than medium or long-range changes in atmospheric TGM.

The most significant regional source of mercury emissions is the mercury cell chlor-alkali operation in Riegelwood, NC. Mercury cell chlorine production facilities use thousands of pounds of mercury, housed in electrochemical cells. These cells act to provide an electrical charge that forms the products chlorine gas, sodium hydroxide and hydrogen gas from brine. Mercury may be released in the hydrogen gas stream, in cell end box ventilation air or in cell room ventilation air. Spills and maintenance activities involving the opening of cells may add large amounts of mercury vapor to cell room air. Generally, cell rooms are vented directly to the outside air. It is believed that the predominant form of mercury emitted from chlor-alkali

facilities is Hg(0) vapor, however the presence of large quantities of chlorine could act to produce smaller quantities of RGM species such as $HgCl_2$ (USEPA, 1997a). Recent ambient monitoring studies conducted in the vicinity of active mercury cell chlor-alkali plants have shown fluctuations in RGM and Hg(0), both independently and in tandem (Stevens, personal communication).

Chlor-alkali mercury emissions fit many of those characteristics that would increase ground level TGM. Releases of Hg(0) would likely disperse outward from the source, carried by prevailing winds over long distances. The areas surrounding Riegelwood and Lake Waccamaw contain very few terrain features that would significantly disrupt ground-level plume dispersion. Outward migration of RGM might be hindered by adherence to vegetation or ground surfaces or atmospheric scrubbing during precipitation or high humidity events. These factors would decrease atmospheric levels but add to the depositional load in the immediate vicinity of the source.

Ambient monitoring data from Lake Waccamaw seems to bolster the link between chlor-alkali plant activities and regional atmospheric mercury levels. Elevated TGM readings were frequently encountered during 1998, when the facility was in normal operating mode. However, in 1999, when the plant began experiencing manufacturing interruptions and then ceased using the mercury-cell process, measured levels of TGM in ambient air at Lake Waccamaw dropped off and the peaks that were associated with easterly winds disappeared. No other regional emission sources to the east of Lake Waccamaw underwent such dramatic changes in their mercury emissions during this same time frame.

Although several of the mercury emission sources in the vicinity of Wilmington, NC, contribute significant quantities of mercury to the air, they are less likely to contribute to detectable changes in ground-level TGM because they 1) do not release substantially large amounts of mercury, 2) release predominantly RGM, or 3) release their emissions from tall stacks at high temperatures, thereby diluting local ground-level plume impacts. However, the Lake Waccamaw data cannot be used to rule those sources out as potential contributing factors. Fortunately, the positioning of the Riegelwood Flynn site to the east of the chlor-alkali industrial complex allowed us to determine that a continued influence from the east was not present. As evidenced in Figure 8, elevated mercury values were not affiliated with easterly winds. Instead, events were linked to winds arriving from the N and NW, in the direction of the chlor-alkali/pulp and paper mill industrial complex. At the Riegelwood Ballpark site, events were correlated to northeasterly winds – again, consistent with an impact from the nearby industrial complex.

The most obvious remaining question concerns the cause of ongoing fluctuations of TGM in Riegelwood. The patterns observed at these sites were reminiscent of earlier results from Lake Waccamaw and strongly suggestive of

nearby emissions of both Hg(0) and RGM. Although mercury cell chlor-alkali production was terminated in April 1999, several potential sources of mercury emissions remain on site including chlor-alkali plant deconstruction, site cleanup activities, gross site contamination and mercury-laden waste ponds. In addition, combustion of coal and other organic materials at the pulp and paper mill will give rise to mercury emissions that could lead to detectable changes in nearby ground-level atmospheric mercury.

Dismantling of the cell rooms commenced almost immediately following the termination of mercury cell operations in April of 1999. Many of the associated activities could result in significant releases of mercury to the air. For example, the opening of covered mercury cells for product removal exposes a large quantity of mercury to the atmosphere that could lead to significant loss by volatilization. Subsequent transfer of mercury to large shipping containers could lead to spillage and further loss through volatilization. Building washing and other decontamination activities could involve the exposure of mercury contaminated surfaces, further facilitating loss of mercury to the atmosphere.

Between May 26 and June 8, 1999 over 57 tons of mercury was removed from covered cells and shipped offsite. By July 12 another 38 tons of mercury was recovered during continued cell draining and washing activities. Subsequent activities focused on cleaning work areas and removing process components such as scrap aluminum and copper. Disassembly of cell covers began in November 1999 and continued into the first half of 2000. It was reported that residual mercury was contained within the cells. Thus the opening of these cells may have facilitated mercury volatilization. Several interruptions of normal deconstruction activities were documented including a prolonged period during August and September of 1999 when Hurricanes Dennis and Floyd made landfall. Only limited reports are available after August 2000 but it is likely that cleanup efforts continued during the remainder of 2000.

It is difficult to ascertain whether specific mercury removal activities were directly related to increases in atmospheric mercury at either Riegelwood monitoring site. For example, during the May 26 - June 8, 1999 timeframe when over 57 tons of mercury was drained and recovered, several large peaks for TGM were detected at the Flynn site; however, the majority of these were associated with light and variable winds, making a source-receptor relationship difficult to pinpoint. At the Ballpark site the few events that occurred were both associated with winds arriving from the plant as well as winds arriving from other directions. During subsequent weeks, when additional mercury cells were drained and another 27 tons of mercury was recovered, very few large peaks of TGM were seen at the Flynn site. At Ballpark a series of peaks between June 4 and 6 appeared to arrive from the chlor-alkali plant but another series between June 15 and 20 showed only a weak relationship to wind direction. It is also worth noting that inconsistent monitoring results were obtained during

"down times" when little or no mercury cell room activity was taking place. For example, between July 3 and 8, 1999 no cell room activities were reported and no peaks of atmospheric mercury were observed at either Riegelwood site. In contrast, a similar downtime between July 17 and 22, 1999 saw several short-term peaks in atmospheric mercury appear at both sites on July 21 and 22. Further in-depth analysis of ambient monitoring data, à more detailed accounting of decommissioning events and on-site monitoring data would be necessary to fully explore the relationship between specific site activities and off-site mercury measurements.

The chlor-alkali operation also maintained mercury-contaminated waste ponds that could act as a source of mercury emissions. Lindberg and Turner identified residual waste deposits at former mercury cell chlor-alkali facilities as important atmospheric mercury emission sources (Lindberg and Turner). In their study they estimated that approximately 160 pounds of mercury per year (predominantly Hg(0)) would be released to the air from the mercury-containing waste ponds they studied. Although they point out that a well-mixed atmosphere would substantially dilute mercury levels at distances outside of 1.5 kilometers from the source, they were able to measure an increase in mercury levels at distances exceeding 1 kilometer from the source. The authors highlighted a positive relationship between waste pond surface temperature and mercury emission rate with dramatically increased emissions above 20°C. A similar relationship was seen for air temperature.

The mercury contaminated soils and waste ponds at this facility undoubtedly act as a source of mercury emissions. Tremendous variability in emissions would be expected due to water temperature, air temperature, pH or the chemical composition of the pond water and ongoing addition of wastes. As with surface waters, photochemical reactions might enhance volatilization of mercury thus sunlight could also impact emissions from the waste ponds. Our data do not exhibit a relationship between air temperature and mercury levels. However, other site deconstruction activities most likely would confound this relationship.

Although total emissions are relatively insignificant compared to many of the sources discussed above, the pulp and paper mill is less than a mile from monitoring stations in Riegelwood and thus cannot be ruled out as a potential local influence on atmospheric mercury levels. In addition to the pulp and paper mill and chlor-alkali plant, Wright Chemical Corporation, a chemical manufacturer was also active in the Riegelwood area. This facility is located approximately 1 kilometer to the south of Riegelwood Flynn and 2 kilometers to the east-southeast of Riegelwood Ballpark. The primary emissions from this facility include ammonia, formaldehyde and hydrogen chloride resulting from the synthesis of organic chemicals. In 1999, 1.13 pounds of mercury emissions were reported, primarily a result of industrial boiler activity. This represents

less than 0.1% of the level of reported annual emissions from the chlor-alkali facility.

Note: Recently (February, 2002), a site investigation performed by the USEPA and the DENR Division of Waste Management turned up abnormally high readings for atmospheric mercury on Holtrachem plant property. Measurable readings taken with a Jerome mercury vapor analyzer recorded levels in the air between 0.03 and 0.077 mg/m^3 near the mercury cell building and retort pad. Visible contamination of plant structures with liquid mercury was reported during the visit. If this level of site contamination can be confirmed, then it may explain in large part the fluctuations in atmospheric mercury observed at our Riegelwood monitoring sites.

THE CHARLOTTE MERCURY STUDY

Background

Charlotte is the largest urban city in North Carolina. It is surrounded by several significant point sources of mercury emissions including coal-fired electric utility boilers, medical and municipal waste incinerators, and large industrial boilers. Since mercury emitted to the atmosphere is capable of undergoing both short and long-range transport it is probable that emissions from the Charlotte area affect downwind locations, including local aquatic systems and sensitive waterways of eastern North Carolina. Continuous atmospheric monitoring for mercury will help to identify the magnitude and nature of these influences.

Sufficient information is not currently available to determine long-term trends for atmospheric mercury in the Charlotte area. This information is required to better understand relevant trends for atmospheric pollutants in the urban areas, especially in rapidly growing population centers. Monitoring data during this study will help provide a picture of atmospheric mercury trends in and around the Charlotte area. A mobile monitoring unit is providing DAQ information to assess geographical variability in the atmospheric levels.

Project Description

This study proposed to define temporal and geographic trends in atmospheric mercury in the vicinity of Charlotte, North Carolina. To achieve this, two sampling sites are being operated continuously for length of the study, beginning March 2002. The fixed location site is near the center of downtown Charlotte. Continuous data on total gaseous mercury (TGM) and meteorological conditions is generated at this site. This site also houses a variety of other instruments providing data for other DAQ atmospheric monitoring initiatives.

It is anticipated that this data will create a snapshot of "urban" air quality conditions for this area. A mobile monitoring trailer will also be positioned at three other locations on the perimeter of Charlotte over the course of the study. This station will be equipped to monitor for TGM/RGM/Hg(0) with the capability to also monitor for VOCs and carbonyls. This site is designed to capture air quality conditions on the rapidly changing periphery of Charlotte. Sites will be chosen to capture a variety of influences including seasonal upwind/downwind patterns, local major point sources and/or heavy traffic areas.

Meteorological data will be collected at each sampling site. Parameters to be measured include temperature, relative humidity and wind speed and direction.

Sampling Sites

Three mobile sites located around the periphery of Charlotte have been selected. These sites are located to the N, SW and SE of the city center. The first site is located at Smithville Park; approximately 30.5 kilometers north of Charlotte and 0.5 kilometers east of Interstate 77 at the corner of Catawba Avenue and South Ferry St in Cornelius, NC. The park includes a picnic shelter, playground, large soccer field, lighted ball field and another unlighted ball field. The park is surrounded by residential neighborhoods and some small businesses to the northeast.

The second site, referred to as the Matthews site, is located approximately 1 kilometer to the northwest of the Mecklenburg County line and 3 kilometers southeast of Matthews, NC. The closest major thoroughfares are NC Highway 74, 2 kilometers to the east, and I-485, two kilometers to the north and west of the site. The area around the site is hilly, rural and sparsely populated. The site itself is located on a slightly elevated area in the middle of an open field with waist-high natural vegetation. The clearing extends for at least 300 feet in all directions. A small portion of the clearing is maintained for power lines, which traverse the middle of the site. A satellite campus of the Central Piedmont Community College is located approximately ½ mile to the north of the site, across a two lane local road that is 200 feet from the site. A medical waste incinerator is present, approximately 2 kilometers to the west of the site. Although the incinerator operation is not visible from the monitoring site due to a buffer of trees, a steam plume can be seen when the incinerator is operational.

The third site is located at Kennedy Middle School (KMS) in rural southwest Mecklenburg County, near the intersection of Sandy Porter Road and Brown Grier Road. The site is approximately 12 kilometers to the southwest of downtown Charlotte. The nearest significant source of mercury emissions is the Duke Power Allen Steam Plant, located approximately 6 kilometers to the

northwest of KMS. Other significant local features include Charlotte-Douglas International Airport (6 kilometers N) and I-485 (1 kilometer E). Areas to the immediate north, west and south are predominantly rural or sparsely populated. To the east, considerable residential and commercial development exists along the I-485/I-77 corridor.

By providing continuous, multi-site monitoring coverage, we hope to be able to characterize differences between urban and "suburban" Charlotte air and determine the relative influence of major point sources versus mobile or area sources clustered around Charlotte. It is assumed that our chosen monitoring sites will be representative of air typical of this environment. If highly unusual data are retrieved or local point sources completely swamp out other potentially relevant influences on local air quality, repositioning of the mobile sampling site may be considered.

Fluctuations in total gaseous mercury can be indicative of point source influences but lack the specific information to determine the potential for transfer between the air and the earth's surface. By characterizing multiple species of atmospheric mercury, e.g. elemental and RGM, we hope to gain an understanding of the potential for regional movement of those species predisposed to atmospheric deposition and the relationship between fluctuations in TGM and RGM in this urban/suburban environment.

MERCURY IN WATER

Waters affected by fish advisories by the Department of Health and Human Services (DHHS) are considered to be impaired by the DWQ. Therefore, DWQ is required to perform Total Maximum Daily Load (TMDL) studies. The TMDL is the amount of a given pollutant that a waterbody can assimilate while maintaining its designated uses. This allowable pollutant load must be allocated to the various point and area sources within the watershed. To establish a TMDL, the current level of contamination must be determined.

In the past, water samples collected by the DWQ were analyzed according to EPA Method 245.1, which has a method detection limit of 0.2 ug/L. All sample results were reported as being below the method detection limit. The most recent sampling effort by the DWQ, known as the *NC Eastern Regional Mercury Study*, utilizes EPA Method 1631. This method has a detection limit three orders of magnitude lower than EPA Method 245.1 and is also below the current water quality standard for mercury of 0.12 ug/L.

The DWQ has identified 4 major goals for this study. They are:

1. To determine levels of ambient mercury in the surface water system.

2. To estimate site-specific total mercury methylmercury translators to evaluate water quality criteria.

3. To develop site-specific water to fish bioaccumulation factors (BAFs).

4. To determine levels of mercury in treatment plant effluent.

Study plans call for quarterly sampling from twelve sites in selected waterbody systems in the eastern portion of the state where the majority of fish advisories have been issued or are anticipated (Table 1-11).

Table 1-11
Water Study For Mercury Contamination

Mercury study sites

River basin	Waterbody	Area
Cape Fear	Black River	Southern Coastal Plain
	South River	Southern Coastal Plain
Lumber	Lumber River	Southern Coastal Plain
	Lake Waccamaw	Southern Coastal Plain
	Waccamaw River	Southern Coastal Plain
Neuse	Eno River	Piedmont
	Contentnea Creek	Northern Coastal Plain
Pasquotank	Kentricks Creek	Northern Coastal Plain
	Phelps Lake	Northern Coastal Plain
Roanoke	Cashie River	Northern Coastal Plain
Yadkin	Abbotts Creek	Piedmont
	Ledbetter Lake	Southern Coastal Plain

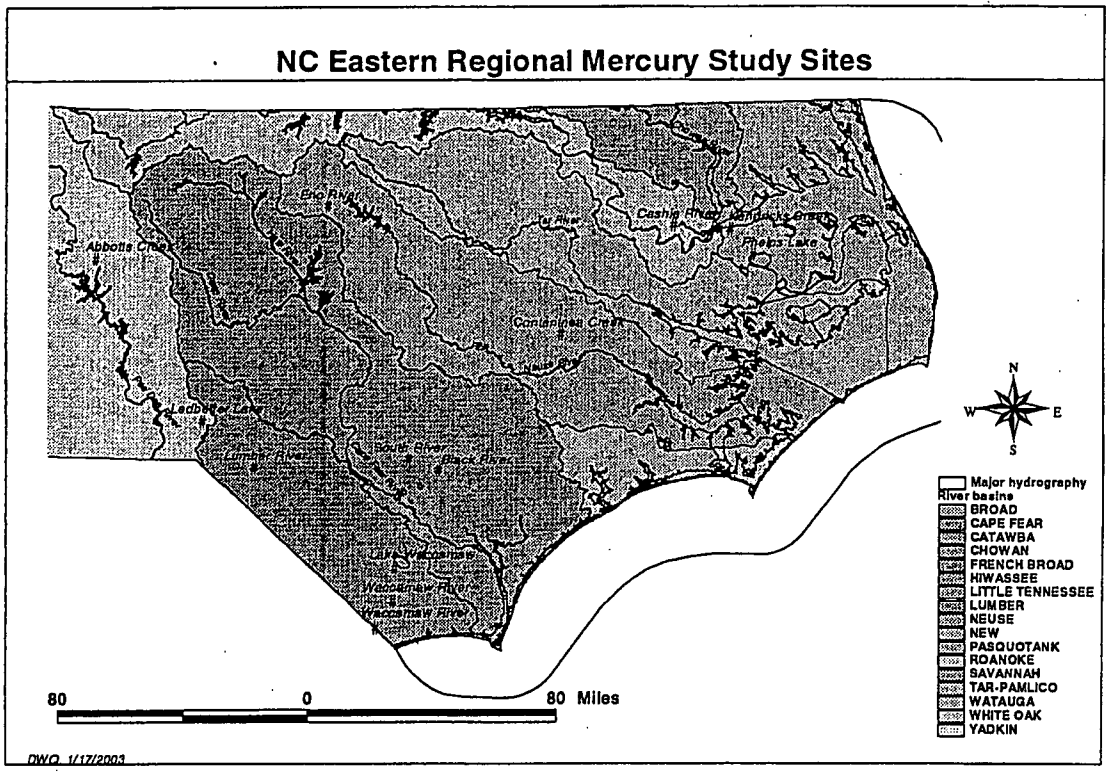
Intensive monitoring at each system on a quarterly basis should reveal seasonal variations in mercury levels and methylmercury percentages, as well as time-variable data for potential model construction.

Surface water will be collected each quarter and analyzed for total mercury (THg), total methylmercury (MeHg), dissolved organic carbon (DOC), and acid volatile sulfides (AVS). Sediment will be collected during the summer and winter quarters and analyzed for THg and MeHg. A comprehensive synoptic look at levels in wastewater treatment plant (WWTP) effluent is also being conducted as part of this project. Effluent from approximately 40 facilities in eastern North Carolina will be sampled and analyzed for total mercury using EPA Method 1631. Figure 1-29 shows the water study area.

Interim Results

The first two quarters of ambient monitoring are complete. This includes two quarters of data for surface water, and winter data for sediment. The monitoring of WWTP effluent is underway. Ambient monitoring results are plotted against United State Geological Survey (USGS) 2000 data collected in *National Ambient Water Quality Assessment* river basins. The Santee River Basin includes the Catawba and Broad River Basins in North and South Carolina.

Figure 1-29
Location of Water Study Areas



It is difficult to compare actual results with the USGS data with only two quarters of non-summer data collected. However, using the USGS data as a base, total mercury and methylmercury concentrations in North Carolina waters do not appear to be significantly different than those observed in other areas of EPA Region IV. The total mercury chart includes data the Middle Cape Fear River Basin Association collected in 1999 and 2000.

CURRENT AND FUTURE MERCURY MONITORING EFFORTS

The MDN sites at Lake Waccamaw and Pettigrew State Park continue to collect data. If improvements in source emissions and total gaseous mercury at Lake Waccamaw in fact are related to declining mercury levels in regional precipitation, then rainwater data from this site should be comparable to results from Pettigrew State Park in future years. Atmospheric total gaseous mercury remained stable at baseline conditions during 2000 at Lake Waccamaw. Mercury levels in rainwater during this period rose slightly relative to the previous year but remained lower than results from 1996 to 1998. This could be partly a reflection of lower precipitation rates, which declined by approximately 40 percent between 1999 and 2000. Mercury levels in rainwater at Lake Waccamaw were slightly higher than levels at Pettigrew State Park during the same period, but they were comparable to historical data from that site. Mercury levels in rainwater levels rose again at Lake Waccamaw between 2000 and 2001. Again this rise could reflect lower precipitation rates, which fell an additional 30 percent between 2000 and 2001. Or the increase could be due to cleanup efforts at the defunct chlor-alkali facility. More data, collected over several years is needed to determine whether trends seen over the past two to three years support evidence for a relationship between regional anthropogenic activities and total gaseous mercury levels, or instead represent normal year-to-year variability in mercury wet deposition.

The DWQ will continue to monitor mercury in fish across North Carolina and has several studies in the works:

- Continue low-level waterborne mercury study in eastern NC.
- Monitor tissue analysis in marine species after removal of known atmospheric source.
- Operate six stations around the defunct Riegelwood chlor-alkali plant (begun in 2001 and will continue as resources allow for the foreseeable future).
- Monitor 12 sites for low-level ambient mercury.
- Determine ambient levels of mercury in surface water.
- Develop site specific BAF's with fish.
- Continue methylmercury analysis of marine species (Spot, Croaker, Speckled Trout, and Bluefish, with more species as resources allow) jointly with the DWQ, DHHS, and DMF.

CHAPTER 2 - DATA MANAGEMENT

Mercury Vapor Analyzers

Analytical data from the Tekran 2537A unit was stored in ASCII text files and saved on a computer hard drive located at the sampling sites. Information stored included identification of sampling date and time, sample type, channel, peak status, units factor, adsorption time, sample volume, baseline voltage, baseline deviation voltage, maximum voltage, peak area, and average mercury vapor concentration. TGM concentration was calculated and presented based on area values and total sample volume. Periodic calibration outputs (conducted every 25 hours) performed on zero air and permeation source air also appeared on data outputs (Fig 2-1).

Data files were copied onto floppy diskette and labeled with time, date and sampling site by the field operator and returned to the laboratory. Here, the weekly data were converted to worksheet form using Microsoft Excel and transferred to a master file containing data from previous weeks' sampling during that quarter. Data were color-coded to delineate calibration data from actual sampling data. Data preceding or following an unsuccessful calibration exercise were coded as rejected data and were not considered valid.

Validated, quality-coded meteorological and analytical data were posted by the Data Manager on the DAQ network drive weekly. The original data files were not manipulated by anyone other than the Data Manager. A second study participant reviewed the converted data to assure proper data handling. Weekly analytical data was kept in its raw unconverted form, in addition to the final color-coded form. This allowed the data manager to back-check data to confirm integrity through the conversion process.

Data in this report are presented using outputs from Microsoft Excel and Harvard Graphics. All statistical evaluations were carried out using Microsoft Excel.

Mercury Speciation Unit

Data are stored at the site on a computer hard drive and handled as described above for the mercury vapor analyzers. The same data evaluation procedures were used to verify or reject data based on QA/QC parameters. However, in addition to 5-minute continuous data on Hg(0) levels the instrument outputs data on clean and analysis cycles for RGM. Data on the zero air (flush) runs were inspected closely to assure that sufficient cleaning of the sample lines was taking place prior to the

desorption and analysis cycle for RGM. Ideally the final zero air run should read 0.000 ng/m^3. In addition, readings for RGM were scrutinized to assure that sequential values declined over each of the three readings. This ensures that proper displacement of RGM from the denuder surface is taking place during the desorption and analysis cycle. In theory, almost all captured RGM should arrive at the gold traps within the first 5-minute sampling period. Suspect samples were flagged and removed from all subsequent analyses of the RGM data.

Generally data for both reactive gaseous and Hg(0) are presented as simultaneous 2-hour averages. RGM values are calculated by summing the first two analysis values and subtracting two times the final system flush reading.[15] A limit of detection of 0.4 pg/m^3 was calculated for RGM based on the reported 0.1 ng/m^3 limit of detection for TGM (see calculation, below). All RGM readings less than 0.4 pg/m^3 have been reported as non-detect.

Average[16] Span value (AUC) per ng/m^3 Hg(0) = 44268.4

Area at 0.1 ng/m^3 Hg(0), reported minimum level of detection = 4426.8

Average AUC value per pg/m^3 Hg(2+) = 10494.9

Level of Hg(2+) at 4426.8 AUC minimum level of detection = **0.4 pg/m^3**

Meteorology

All data from meteorological stations were stored electronically and downloaded weekly from Climatronics CR-10 and CR-10x data loggers onto laptop computer hard drives. At the laboratory, data was converted from its raw text form to tabular form in Microsoft Excel and was reviewed closely by the data manager to ensure reasonable values had been recorded. Meteorological data included sampling interval, average wind speed, average and standard deviation of wind direction, and temperature. Additionally, information on

[15] For example, the reading for RGM taken from the example in Figure 4-25 would be calculated as (7.640 + 0.000) – 2*(0.397) = 7.243 ng/m^3.

[16] Average was calculated using SPAN data from 12 separate calibration events occurring at 2-week intervals between September and November, 2000.

relative humidity was available from the Riegelwood Ballpark site during mercury speciation studies. A copy of the raw meteorological data was kept on floppy diskette to allow the data manager to confirm the integrity of the data.

CHAPTER 3 - HEALTH EFFECTS

Consumption of fish can be beneficial for both pregnant and breastfeeding women, and their developing children. The developing retina and nervous system of an unborn child may benefit from maternal consumption of fish during pregnancy. Additionally, fish consumption has been associated with a decreased risk of heart attack and coronary artery disease in adults (Neuringer, M., S. Reisbick, and J. Janowsky, 1994. The role of n-3 fatty acids in visual and cognitive development: current evidence and methods of assessment. J. Pediatr. 125:S39-47. Toxicology Excellence for Risk Assessment TERA, 1999. Comparative Dietary Risks: Balancing the Risks and Benefits of Fish Consumption. Results of a Cooperative Agreement between US. Environmental Protection Agency and Toxicology Excellence for Risk Assessment Final). However, a form of methylmercury known as methylmercury can accumulate to harmful concentrations in predatory fish (Environmental Protection Agency EPA, 1997. Summary. Vol. 1. In: Environmental Protection Agency (US). Methylmercury Study Report to Congress. Washington: EPA. Pub. No.EPA-452/R-97-001). Consumption of these fish by pregnant and/or nursing women and by children poses a health risk to children and fetuses.

The developing human nervous system is particularly sensitive to methylmercury. Several studies have reported increasing effects on the developing nervous system of an unborn child with increasing maternal methylmercury exposure from routine fish and whale consumption. Neurological processes in the areas of language, attention, and memory were most affected. According to the National Academy of Sciences, studies conducted in the New Zealand and Faroe Islands show that the deficits observed can be considered predictive of problems in cognitive and academic performance associated with methylmercury exposure, or can affect the way the children may think, learn, and problem solve. These studies have shown the developing fetus to be at least three times more sensitive than adults (NRC National Research Council 2000. Toxicological Effects of Methylmercury. Committee on the Toxicological Effects of Methylmercury, Board on environmental Studies and Toxicology, Commission on Life Sciences, National Research Council. Washington, DC: National Academy Press).

Routine consumption of fish containing concentrations of 0.4 mg/kg or greater of methylmercury poses an increased risk of neurodevelopmental effects for the developing fetus and children under 15 years of age (US EPA Water Quality Criterion for the Protection of Human Health: Methylmercury, Final. Office of Science and Technology, Office of Water, Washington, DC. EPA-823-R-01-001. January 2001). The US EPA reference dose for methylmercury is 0.1 ug/kg-day (corresponds to maternal hair level of 1 mg/kg and blood level of 5.8 ug/L). This is the dose that is not likely to be associated

with health effects for the developing fetus and child. Routine consumption of fish containing 0.4 mg/kg of methylmercury can result in exceedance of the US EPA reference dose for methylmercury. To derive the reference dose of 0.1 ug/kg-day, EPA calculated benchmark doses (BMD) or doses associated with a 5% incremental risk above background (background associated with 5% risk) of having abnormal neuropsychological test scores for children from the Faroe Islands located in the North Sea between Scotland and Iceland. These test scores provide a measure of the way children learn, think, and problem solve. The mothers of these children consumed three fish meals per week and less than one pilot whale meal per month. The benchmark dose chosen based on EPA and National Academy of Science review was 85 ppb in cord blood which corresponds to 15 mg/kg in hair. At these blood and hair levels, there is an estimated 5% incremental risk above background of having abnormal neuropsychological test scores. EPA determined the 95% confidence interval or the range of doses that would be expected to be associated with a total 10% risk of having abnormal scores or 5% incremental risk above background. The lowest dose of this interval was 58 ppb in cord blood or 10 mg/kg in maternal hair and is designated as the Benchmark Dose Limit (BMDL). This corresponds to an intake of 1.081 ug/kg-day. An uncertainty factor of 10 was applied to the 1.081 ug/kg-day to account for variability in susceptibility within the study cohort, variability in pharmacokinetic parameters for methylmercury, and lack of data on long term sequelae of in utero exposure. The resulting reference dose is 0.1 ug/kg-day or 0.0001 mg/kg-day corresponding to hair level of 1.0 mg/kg. (Reference dose of 0.0001 mg/kg-day supported by the National Academy of Sciences as referenced in the Toxicological Effects of Methylmercury, National Research Council, National Academy Press, Washington, DC 2000.)

The Centers for Disease Control and Prevention's 1999 National Health and Nutrition Examination Survey (NHANES) reported blood and hair methylmercury sample results for women ages 16 to 49. Approximately 10 percent of the women surveyed had hair methylmercury levels above the EPA-recommended hair level of 1 mg/kg to protect developing fetuses (corresponds to reference dose of 0.1 ug/kg-day). According to the Centers for Disease Control and Prevention, this indicates a narrow margin of safety for some fetuses (Blood and Hair Methylmercury Levels in Young Children and Women of Childbearing Age–United States, 1999. 1999 National Health and Nutrition Examination Survey, *MMWR* March 02, 2001 /50 (08);140-3). EPA estimates that at or below the reference dose of 0.1 ug/kg-day or maternal hair level of 1 mg/kg, chronic noncancer health effects are not likely to occur. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

FISH TISSUE SAMPLING LED TO STATE ADVICE

In January 2001, the United States Environmental Protection Agency (EPA) and the Food and Drug Administration (FDA) issued national advisories for fish due to the presence of methylmercury in fish. Some fish like shark, swordfish, king mackerel, and tilefish contain high levels of methylmercury. EPA and FDA are concerned that maternal or child consumption of these fish could cause harm, particularly to the developing brain of the fetus and child. The federal advisories recommend that women of childbearing age and children not eat shark, swordfish, king mackerel, and tilefish. However, federal officials recognize the health benefits of eating fish and are recommending that women of childbearing age and children eat up to two meals a week of other fish including fish sold in stores and restaurants as well as those caught in freshwater and the ocean. The NC Department of Health and Human Services has developed fish consumption advice that supplements the EPA and FDA advisories for sensitive populations which can be found at http://www.epi.state.nc.us/epi/fish/.

This new advice was based on the toxicological review completed by the National Academy of Sciences and the 1990-1999 methylmercury freshwater fish tissue data collected across the state (Toxicological Effects of Methylmercury, National Research Council, National Academy Press, Washington, DC 2000; Booker, J. memo to Williams, L. 2001. Center for Health Informatics and Statistics statistical analyses of North Carolina methylmercury fish tissue data).

The mean and/or median levels for all the basins sampled are compared to the level of concern of 0.4 mg/kg. Based on the statewide basin-by-basin review, the median methylmercury levels for largemouth bass, bowfin, and chain pickerel are equal to or greater than the 0.4 mg/kg in a majority of the basins located south and east of Interstate 85. For largemouth bass, the median methylmercury levels for 10 out of 16 basins sampled were equal to or greater than 0.4 mg/kg. For bowfin, the median methylmercury levels for 11 out of 12 basins sampled were equal to or greater than 0.4 mg/kg. For chain pickerel, the median methylmercury levels for 9 out of 10 basins sampled were equal to or greater than 0.4 mg/kg. In addition, the statewide mean and median methylmercury levels for largemouth bass, bowfin, and chain pickerel are all greater than 0.4 mg/kg. The number of largemouth bass, bowfin, and chain pickerel sampled across the state was 820, 475, and 103, respectively.

Approximately 26 states have issued methylmercury fish consumption advisories for largemouth bass, bowfin, and chain pickerel (http://www.epa.gov/ost/fish).

Based on NC DHHS review of the fish tissue data and risk assessment, three freshwater species have been added to the federal list of fish

recommended for no consumption for sensitive populations. NC DHHS is advising that women of childbearing age – including women who are likely to get pregnant, nursing women, and pregnant women – and children under 15 years of age follow FDA advice and not eat shark, swordfish, king mackerel, and tilefish. According to FDA, the average methylmercury levels for tilefish, swordfish, shark, and king mackerel are 1.45 mg/kg, 1.00 mg/kg, 0.96 mg/kg, and 0.73 mg/kg, respectively. Also, these individuals should not eat bowfin (blackfish), chain pickerel (jack fish) or largemouth bass collected from North Carolina waters south and east of Interstate 85 (areas of concern for these species).

NC DHHS is advising that women of childbearing age and children eat two meals per week of fish low in methylmercury like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.

HUMAN METHYLMERCURY BURDEN

Methylmercury is a metal and never degrades or breaks down in the environment to a less toxic form. In fact, methylmercury is often converted in the aquatic environment to a much more toxic form, methylmercury. This is the form of methylmercury that is incorporated into the food chain so efficiently that fish at the top of the aquatic food chain can have concentrations of methylmercury in their muscle tissue that can be one million times higher than the methylmercury concentration in the water. Fish consumption is the primary way that both humans and wildlife are exposed to methylmercury. Methylmercury can accumulate to harmful concentrations in predatory fish. In North Carolina, high levels of methylmercury (levels at 0.4 mg/kg or greater) have been found in ocean fish like shark, swordfish, king mackerel, and tilefish, and in freshwater fish like largemouth bass, bowfin, and chain pickerel south and east of Interstate 85. Women of childbearing age and children have been notified through advisories to not eat the four ocean fish and the three freshwater fish south and east of Interstate 85 (primarily located in the south eastern portion of the state) but have been given recommendations to eat other low methylmercury fish. See attached maps. These advisories have been issued to protect the most sensitive population, the developing child. The developing human nervous system is particularly sensitive to methylmercury. Several studies have reported increasing effects on the developing nervous system of an unborn child with increasing maternal methylmercury exposure from routine fish and whale consumption. Neurological processes in the areas of language, attention, and memory have been most affected.

The NC DHHS is seeking funding from the Centers for Disease Control and Prevention to conduct biomonitoring in seven counties including

Columbus (Co), Brunswick (Br), Bladen (Bl), Moore (Mo), Scotland (Sc), Duplin (Du), and Martin (Ma) Counties. The largemouth bass and bowfin in these counties have some of the highest methylmercury fish tissue concentrations in the state. Based on consultation with local residents from these counties and with the North Carolina Fish and Wildlife, there are recreational and subsistence fishermen in these counties. The potential for exposure to high levels of methylmercury exists for individuals living in these counties. Even though there are advisories in these areas, the people may not be aware of the advisories or may choose to ignore them. An epidemiological study consisting of blood and hair methylmercury analysis was completed in 1990 after discovering elevated fish tissue levels in largemouth bass and bowfin for Columbus and Brunswick Counties. Some of the highest levels of methylmercury in human hair and blood ever recorded in the United States have been identified among residents living in Columbus and Brunswick Counties. The purpose of this study was to determine if the subsistence fishermen in these counties had elevated methylmercury blood or hair levels. A total of 64 blood samples and 77 hair samples were collected for 81 residents living in these two counties. There was a positive correlation between residents with high rates of fish consumption from the waters under advisory and elevated methylmercury hair and blood levels. The blood levels ranged from non detect to 141 ug/L (well above 5 % effect level of 58 ug/L associated with abnormal neurodevelopmental scores above background). The hair levels ranged from non detect to 33.5 mg/kg (well above 5% effect level of 10 mg/kg associated with abnormal neurodevelopmental scores above background).

Additional biomonitoring is needed to prevent illness and improve public health through the following:

- To determine awareness of the fish advisories pertaining to methylmercury and to also communicate the fish advisories.
- To modify and/or expand approach for communicating fish advisories if decreased awareness or individuals are not following advice.
- To determine methylmercury body burden levels among women of childbearing age and children within the counties that have some of the highest methylmercury fish tissue levels in the state and to recommend low methylmercury fish choices.

The results of the study will benefit women of childbearing age and their offspring. The program will obtain information about the proportion of women who are aware of the advisory and how to successfully distribute advisory information to women who are not getting the message. By increasing the proportion of women who are aware of the advisory, the program will decrease methylmercury exposure to the women and their offspring. In addition, the intervention design will be shared with other states so that their advisory information will be distributed successfully to this subpopulation. The end result is to ensure that women of childbearing age are getting the advisory

information so that they will limit their exposure to methylmercury and other contaminants through consumption of fish.

Estimated Risk to Newborns in North Carolina

The potential number of newborns in North Carolina at risk from maternal exposure to methylmercury is calculated using data from the 1999 National Health and Nutrition Examination Survey (NHANES). This survey reported blood and hair methylmercury sample results for women ages 16 to 49. Approximately 10 percent of the women surveyed had hair methylmercury levels above the EPA-recommended hair level of 1 mg/kg to protect developing fetuses (corresponds to reference dose of 0.1 ug/kg-day). According to the Centers for Disease Control and Prevention, this indicates a narrow margin of safety for some fetuses (Blood and Hair Methylmercury Levels in Young Children and Women of Childbearing Age–United States, 1999. 1999 National Health and Nutrition Examination Survey, *MMWR* March 02, 2001 /50 (08);140-3). EPA estimates that at or below the reference dose of 0.1 ug/kg-day or maternal hair level of 1 mg/kg, chronic noncancer health effects are not likely to occur. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

Using this information, one may extrapolate to find the number of newborn infants in North Carolina that may potentially be at risk. This extrapolation assumes that the NHANES population surveyed is representative of a cross section of North Carolina and that women in North Carolina have methylmercury levels similar to levels found in the NHANES survey.

Based on the 1995 national fecundity rates for women ages 15 to 44 and the population data for North Carolina, it is estimated that there are 1,105,045 fertile women in North Carolina (National Center for Health Statistics, http://www.cdc.gov/nchs/data/series/sr_23/sr23_19.pdf). Using the North Carolina fertility rate of live births of 67.5 per 1,000 fertile women for 1999, one can expect 74,590 live births (Center for Health Informatics and Statistics, http://sdc.state.nc.us). If one assumes that 10 percent of the maternal hair levels for the 74,590 births are greater than 1 mg/kg as reported in the national survey, then 7,459 North Carolina fetuses may be at a dose higher than that recommended by EPA. EPA estimates that chronic noncancer health effects are not likely to occur at or below the reference dose. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

Need for Mercury Biomonitoring in North Carolina

Mercury is a metal and never degrades or breaks down in the environment to a less toxic form. In fact, mercury is often converted in the aquatic environment to a much more toxic form, methylmercury. This is the

form of mercury that is incorporated into the food chain so efficiently that fish at the top of the aquatic food chain can have concentrations of methylmercury in their muscle tissue that can be one million times higher than the mercury concentration in the water. Fish consumption is the primary way that both humans and wildlife are exposed to mercury. Methylmercury can accumulate to harmful concentrations in predatory fish. In North Carolina, high levels of methylmercury (levels at 0.4 mg/kg or greater) have been found in ocean fish like shark, swordfish, king mackerel, and tilefish, and in freshwater fish in the south eastern portion of North Carolina like largemouth bass, bowfin, and chain pickerel. Women of childbearing age and children have been advised through advisories to not eat the four ocean fish and the three freshwater fish south and east of Interstate 85 (primarily located in the south eastern portion of the state) but have been given recommendations to eat other low mercury fish. These advisories have been issued to protect the most sensitive population, the developing child. The developing human nervous system is particularly sensitive to mercury. Several studies have reported increasing effects on the developing nervous system of an unborn child with increasing maternal mercury exposure from routine fish and whale consumption. Neurological processes in the areas of language, attention, and memory have been most affected.

As shown in the attached maps, the seven counties considered in the mercury biomonitoring study include Columbus (Co), Brunswick (Br), Bladen (Bl), Moore (Mo), Scotland (Sc), Duplin (Du), and Martin (Ma) Counties which have some of the highest mean methylmercury concentrations reported in the state for largemouth bass and bowfin. Based on consultation with local residents from these counties and with the North Carolina Fish and Wildlife, there are recreational and subsistence fishermen in these counties. The potential for exposure to high levels of methylmercury exists for individuals living these counties. Even though there are advisories in these areas, the people may not be aware of the advisories or may choose to ignore them. Some of the highest levels of mercury in human hair and blood ever recorded in the United States have been identified among residents living Columbus and Brunswick Counties (two counties being considered in the study and have some of the highest methylmercury levels in largemouth bass and bowfin in the state). After finding elevated methylmercury levels in largemouth bass and bowfin, an epidemiological study in 1990 was conducted where 64 blood samples and 77 hair samples were collected for 81 residents living in these two counties. There was a positive correlation between residents with high rates of fish consumption from the waters under advisory and elevated mercury hair and blood levels. The blood levels ranged from non detect to 141 ug/L (well above 5 % effect level of 58 ug/L associated with abnormal neurodevelopmental scores above background). The hair levels ranged from non detect to 33.5 mg/kg (well above 5% effect level of 10 mg/kg associated with abnormal neurodevelopmental scores above background).

Additional biomonitoring is needed to prevent illness and improve public health through the following:

- To determine awareness of the fish advisories pertaining to mercury and to also communicate the fish advisories.
- To modify and/or expand approach for communicating fish advisories if decreased awareness or individuals are not following advice.
- To determine mercury body burden level among women of childbearing age and children within the counties that have some of the highest methylmercury fish tissue levels in the state and to recommend low mercury fish choices.

The results of the study will benefit women of childbearing age and their offspring. The program will obtain information about the proportion of women who are aware of the advisory and how to successfully distribute advisory information to women who are not getting the message. By increasing the proportion of women who are aware of the advisory, the program will decrease mercury exposure to the women and their offspring. In addition, the intervention design will be shared with other states so that their advisory information will be distributed successfully to this subpopulation. The end result is to ensure that women of childbearing age are getting the advisory information so that they will limit their exposure to mercury and other contaminants through consumption of sport fish.

CHAPTER 4 - NC SAFE FISH EATING GUIDELINES

Prepared by the
Medical Evaluation and Risk Assessment Unit (MERAU)

August 29, 2001

Women of Childbearing Age (15-44 years), Pregnant Women, Nursing Women, and Children Under 15 Years

- **Eat two meals per week of fish low in methylmercury** like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.*

- **Do not eat** shark, swordfish, tilefish, or king mackerel.** Also, **do not eat** bowfin (blackfish), chain pickerel (jack fish) or largemouth bass caught in North Carolina waters south and east of Interstate 85.

Other Women, Men, and Children over 15 Years

- **Eat four meals per week of fish low in methylmercury** like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.*

- **Eat no more than one meal per week** of shark, swordfish, tilefish, or king mackerel. Also, **eat no more than one meal per week** of bowfin (blackfish), chain pickerel (jack fish), or largemouth bass caught in North Carolina waters south and east of Interstate 85.

*All fish and shellfish should be properly prepared and cooked.

**On January 12, 2001 EPA and FDA issued national fish consumption advisories due to high levels of mercury in some marine fish. These advisories recommend that women of childbearing age and children should not eat shark, swordfish, king mackerel or tilefish. The advisories also recommend that these individuals eat one to two meals a week of other (low-mercury) fish.

DISCUSSION OF NORTH CAROLINA SAFE FISH EATING GUIDELINES
DUE TO METHYLMERCURY IN FISH

August 29, 2001

Medical Evaluation and Risk Assessment Unit (MERAU)

Risk Assessment

Maternal consumption of fish containing methylmercury is associated with adverse fetal neurodevelopmental effects. Fetal exposure to methylmercury may affect the way a child thinks, learns, and problem solves later in life. Children under age 15 are considered to be potentially at risk from consumption of methylmercury in fish, since the neurological systems of children are more likely to be affected by methylmercury exposure than the neurological systems of adults. The risk assessment for methylmercury in fish is in Attachment A. Fish meals per month and week are calculated for women of childbearing age (15 to 44 years), children (under 15 years), and general public (males 15 years and older and women older than 44 years). The reference dose for methylmercury used for women of childbearing age and children is 0.1 ug/kg-day (corresponds to maternal hair level of 1 ppm and cord blood level of 5.8 ppb). The reference dose for methylmercury used for the general public is 0.3 ug/kg-day. Based on the risk assessment and EPA guidance, fish tissue concentrations of 0.4 ppm or greater pose an increased risk of neurodevelopmental effects for the developing fetus and children under 15 years of age (US EPA Water Quality Criterion for the Protection of Human Health: Methylmercury, Final. Office of Science and Technology, Office of Water, Washington, DC. EPA-823-R-01-001. January 2001).

Estimated Risk

The potential number of newborns in North Carolina at risk from maternal exposure to methylmercury is calculated using data from the 1999 National Health and Nutrition Examination Survey (NHANES). This survey reported blood and hair methylmercury sample results for women ages 16 to 49. Approximately 10 percent of the women surveyed had hair methylmercury levels above the EPA-recommended hair level of 1 ppm to protect developing fetuses (corresponds to reference dose of 0.1 ug/kg-day). According to the Centers for Disease Control and Prevention, this indicates a narrow margin of safety for some fetuses (Blood and Hair Methylmercury Levels in Young Children and Women of Childbearing Age–United States, 1999. 1999 National Health and Nutrition Examination Survey, *MMWR* March 02, 2001 /50 (08);140-3). EPA estimates that at or below the reference dose of 0.1 ug/kg-day or maternal hair level of 1 ppm, chronic noncancer health effects are not likely to occur. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

There were no mercury levels greater than the 5 percent effect level of 10 ppm hair and 58 ppb blood, both of which are associated with a 5 percent risk of abnormal neurodevelopmental scores above background. Therefore, the potential risk to the developing fetuses of the women surveyed was reported to be less than 5 percent.

Using this information, one may extrapolate to find the number of newborn infants in North Carolina that may potentially be at risk. This extrapolation assumes that the NHANES population surveyed is representative of a cross section of North Carolina and that women in North Carolina have methylmercury levels similar to levels found in the NHANES survey.

Based on the 1995 national fecundity rates for women ages 15 to 44 and the population data for North Carolina, it is estimated that there are 1,105,045 fertile women in North Carolina (National Center for Health Statistics, http://www.cdc.gov/nchs/data/series/sr_23/sr23_19.pdf). Using the North Carolina fertility rate of live births of 67.5 per 1,000 fertile women for 1999, one can expect 74,590 live births (Center for Health Informatics and Statistics, http://sdc.state.nc.us). If one assumes that 10 percent of the maternal hair levels for the 74,590 births are greater than 1 ppm as reported in the national survey, then 7,459 North Carolina fetuses may be at a dose higher than that recommended by EPA but still be at less than a 5 percent risk of developing abnormal neuropyschological test scores. EPA estimates that chronic noncancer health effects are not likely to occur at or below the reference dose. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

General Comments

MERAU requested that the North Carolina Department of Health and Human Services Center for Health Informatics and Statistics do a statistical analysis of the 1990 to 1999 total mercury fish tissue data collected by the North Carolina Department of Environment and Natural Resources Water Quality Section (see Attachments B and C). The mean and/or median levels for all the basins sampled are compared to the level of concern of 0.4 ppm. Based on the statewide basin-by-basin review, the median methylmercury levels for largemouth bass, bowfin, and chain pickerel are equal to or greater than the 0.4 ppm level of concern south and east of Interstate 85. For largemouth bass, the median methylmercury levels for 10 out of 16 basins sampled were equal to or greater than 0.4 ppm. For bowfin, the median methylmercury levels for 11 out of 12 basins sampled were equal to or greater than 0.4 ppm. For chain pickerel, the median methylmercury levels for 9 out of 10 basins sampled were equal to or greater than 0.4 ppm. In addition, the statewide mean and median mercury levels for largemouth bass, bowfin, and chain pickerel are all greater than 0.4 ppm. The number of largemouth bass, bowfin, and chain pickerel sampled across the state was 820, 475, and 103, respectively.

Fish tissue data are not available for some basins and counties as identified in Attachments B and C. In addition, the sample size per county is small. Because of the limited sample size per county, the mean and/or median for each basin is compared to the action level of 0.4 ppm. Recommendations will be made to the Water Quality Section to continue fish tissue sampling and total mercury fish tissue analysis, particularly in areas not previously sampled.

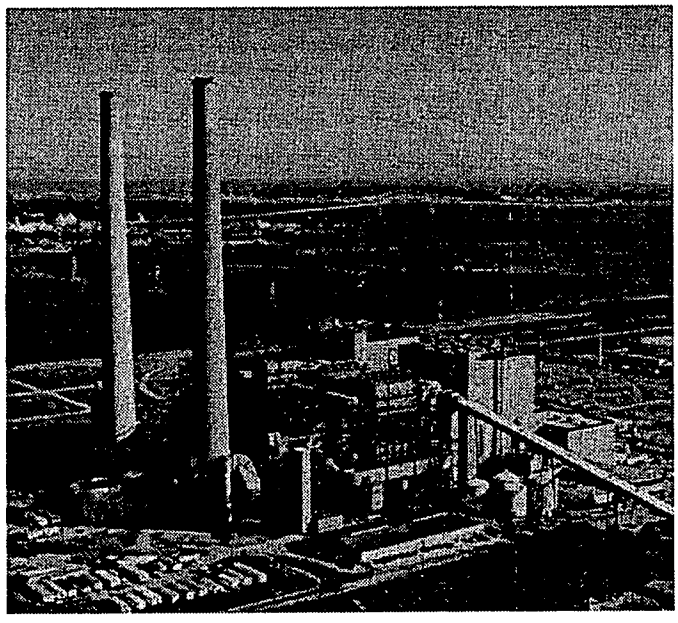
The majority of the basins sampled across the state had median (50th percentile) methylmercury levels of 0.4 ppm or greater for largemouth bass, bowfin, and chain pickerel (63%, 92%, and 90%) as identified in Attachment C. In other words, 50 percent of the largemouth bass, bowfin, and chain pickerel within the majority of basins sampled are at levels of concern. Approximately 26 states have issued mercury fish consumption advisories for largemouth bass, bowfin, and chain pickerel (http://www.epa.gov/ost/fish).

Based on MERAU review of the fish tissue data and risk assessment, MERAU is advising that women of childbearing age – including women who are likely to get pregnant, nursing women, and pregnant women – and children under 15 years of age follow FDA advice and not eat shark, swordfish, king mackerel, and tilefish. According to FDA, the average methylmercury levels for tilefish, swordfish, shark, and king mackerel are 1.45 pm, 1.00 ppm, 0.96 ppm, and 0.73 ppm, respectively. Also, these individuals should not eat bowfin (blackfish), chain pickerel (jack fish) or largemouth bass collected from North Carolina waters south and east of Interstate 85 (areas of most concern for these species).

MERAU is advising that women of childbearing age and children eat two meals per week of fish low in methylmercury like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.

MERAU is advising that the general public – all other women, men, and children over 15 years – eat no more than one meal per week of fish that may be high in methylmercury such as shark, swordfish, tilefish, and king mackerel. These individuals should eat only one meal per week of bowfin, chain pickerel, or largemouth bass collected in North Carolina waters south and east of Interstate 85. In addition, the general public should eat 4 meals per week of fish low in methylmercury, like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.

MERAU further recommends that all fish and shellfish be properly prepared and cooked.



CO_2 Emission Reduction Options For Coal-fired Electrical Utility Boilers and Other Stationary Sources

First Interim Report

September 1, 2003

NCDENR

North Carolina
Department of Environment and Natural Resources

Division of Air Quality
1641 Mail Service Center
Raleigh, North Carolina 27699-1641

The Requirement: Excerpted from the Clean Smokestacks Act

[**Title**: An Act to Improve Air Quality in the State by Imposing Limits on the Emission of Certain Pollutants from Certain Facilities that Burn Coal to Generate Electricity and to Provide for Recovery by Electric Utilities of the Costs of Achieving Compliance with Those Limits]

SECTION 13. The Division of Air Quality of the Department of Environment and Natural Resources shall study issues related to the development and implementation of standards and plans to implement programs to control emissions of carbon dioxide (CO_2) from coal-fired generating units and other stationary sources of air pollution. The Division shall evaluate available control technologies and shall estimate the benefits and costs of alternative strategies to reduce emissions of carbon dioxide (CO_2). The Division shall annually report its interim findings and recommendations to the Environmental Management Commission and the Environmental Review Commission beginning 1 September 2003. The Division shall report its final findings and recommendations to the Environmental Management Commission and the Environmental Review Commission no later than 1 September 2005. The costs of implementing any air quality standards and plans to reduce the emission of carbon dioxide (CO_2) from coal-fired generating units below the standards in effect on the date this act becomes effective, except to the extent that the emission of carbon dioxide (CO_2) is reduced as a result of the reductions in the emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO_2) required to achieve the emissions limitations set out in G.S. 143-215.107D, as enacted by Section 1 of this act, shall not be recoverable pursuant to G.S. 62-133.6, as enacted by Section 9 of this act.

GENERAL ASSEMBLY OF NORTH CAROLINA - SESSION 2001 – (SENATE BILL 1078)
Ratified the 19th day of June 2002. (Ch. SL 2002-4 S.13)

September 1, 2003

TO: Environmental Review Commission
Environmental Management Commission

FROM: William G. Ross, Jr. WGR/

SUBJECT: Mercury and CO_2 Reports Required by Clean Smokestacks Act

When the North Carolina General Assembly passed, and Governor Easley signed the Clean Smokestacks Act in June of 2002, our State took two crucial steps toward addressing several of the most pressing environmental and public health issues of our time. One step was highly visible, the other less so.

The visible step was to attack the problems of ozone, smog and pollution from fine particles by requiring North Carolina's fourteen coal-fired power plants to make deep cuts in sulfur dioxide and nitrogen oxides, and to do so quickly. The utility companies swung into action and are on schedule to achieve the required reductions.

The less visible, but nonetheless crucial, steps that North Carolina took under the leadership of the General Assembly and Governor Easley was to call for our state to address the issues related to the emissions of carbon dioxide from coal-fired power plants and other stationary sources also related to the emissions of mercury from power plants. Under the new law, our department, through our Division of Air Quality, will study and make findings and recommendations on both subjects in reports due in September 2003, 2004 and 2005. We are this week issuing the 2003 reports on CO_2 and mercury.

Why is it crucial that North Carolina address emissions of CO_2 and mercury? In my view it is crucial that we focus on the biggest problems facing us, and mercury and carbon dioxide emissions seem clearly to be among our biggest problems. With mercury, there is a growing concern about its impacts on public health. With carbon dioxide, there is the concern that we are changing the climate in a manner and pace that are unprecedented.

In his 2002 book, The Earth Remains Forever, Professor Rob Jackson of Duke University frames the question this way:

> "Based on current scientific evidence, I believe that by the end of the twenty-first century:
>
> I. There will be at least nine billion people on earth.
> II. Annual global energy use will be at least fifty percent higher per capita than at the end of the twentieth century, and total energy consumption will triple.

1601 Mail Service Center, Raleigh, North Carolina 27699-1601
Phone: 919-733-4984 / FAX: 919-715-3060 /Internet: www.enr.state.nc.us/ENR
An Equal Opportunity \ Affirmative Action Employer – 50% Recycled \ 10% Post Consumer Paper

III. Atmospheric carbon dioxide concentrations will be more than five hundred parts per million, double the pre-industrial levels and higher than at any time in the past forty million years. In consequence, the average temperature of the earth will be at least 5° F warmer.
IV. Thousands, perhaps millions, of species will be extinct.
V. The demographic and economic momentum behind these changes is immense." (p 129)

"Most of all, I want to know that we did our best, that we tried everything we could to preserve the quality of life for people today and tomorrow and saved as much room as possible for the rest of life on earth. Who doesn't want this? The moral, the practical, the ultimate question is what we do about it, what we will give up today so that we and our descendants and the rest of life on earth may have their tomorrow." (p.132)

Thanks to the leadership of the General Assembly and Governor Easley, our state is a national leader in reducing emissions of SO_2 and NOx from coal-fired power plants. To answer Professor Jackson's question, we are doing our best as a state on these two issues.

What will we do about mercury and carbon dioxide? Thanks again to our legislators and the Governor, we also have a chance to answer Professor Jackson's question, this time for mercury and carbon dioxide in a similar, positive way.

We appreciate your attention to these two reports. We look forward to your comments and questions about them.

Thank you.

Preface

This 2003 report has been produced by a working group within the North Carolina Division of Air Quality (DAQ). Stakeholders from both Duke Energy and Progress Energy, environmental interests (e.g. Environmental Defense Fund, Sierra Club etc.) and other organizations (e.g. NC Utilities Commission, State Energy Office, Global Warming Initiatives, Advanced Energy, Inc., etc.), through an open call, were invited to provide their insights, comments and input. The Division appreciates the efforts of all the stakeholders and other individuals who committed their time and effort to the development of this preliminary report. This open process will continue in the development of subsequent and final reports on this topic.

Many portions of this document were taken directly from other government (non-copyrighted) documents in the interest of time and completeness. Some of these sections may have only minor wording changes from the original documents. Quotations are not strictly used to identify these parts, but a strong effort was made to reference these documents and acknowledge them. The purpose has not been to claim credit for original work of others, but to provide as much detail and accuracy as possible within a limited time.

The objective of the 2003 report is to provide a general background ("state of knowledge") and to define the scope of efforts needed to address and respond to the legislative requirements. This 2003 report is a first step and will be followed with reports in 2004 and 2005 that build on the background contained in this report, on the increasing state of knowledge, on developments in the federal sector and on any courses of action that may follow. The 2003 report is the first step in a three-step process to study issues and make findings and recommendations related to the development and implementation of standards and plans to implement programs to reduce emissions of carbon dioxide from coal-fired power plants and other stationary sources of air pollution.

The 2004 report is due to the Environmental Management Commission and the Environmental Review Commission (of the Legislature) in September 2004. We expect to base that report on input from a proposed workshop (with presentations by DAQ, stakeholders and other state and outside experts) hosted by DAQ, in the spring of 2004, with supplemental information and summaries provided by DAQ staff. A third and final report, the 2005 report, will then be prepared by September 2005 and include findings and recommendations that build upon the 2003 and 2004 reports.

Acronyms Used in This Report

AEFL - Amine-Enhanced Flue Lean Gas Reburn
CAA – Clean Air Act – Primary federal statute governing clean air requirements
CAPA – Clean Air Planning Act – Carper Bill
CCAR – California Climate Action Registry
CEM – Continuous Emission Measurement
CO_2 – Carbon Dioxide – the major global warming gas
CPA – Clean Power Act p Jeffords-Waxman Bill
CSA – NC Clean Smokestacks Act (Also see CSI, below)
CSI – Clear Skies Initiative – Proposal for revised CAA legislation by the Bush Administration (also recently referred to as Clean Skies Act, though not yet an actual Act)
DAQ – NC Division of Air Quality
DENR – NC Department of Environment and Natural Resources
DOA – Department of Agriculture (US and NC)
DOE – The US Department of Energy
EPA – US Environmental Protection Agency
GHG – Global Warming Gas(s)
GWP – Global Warming Potential
HFC's - Hydroflurocarbons
HVAC – High Volume Air Conditioning
IPCC - Intergovernmental Panel on Climate Change, international authority on climate change
LNB – Low NOx Burner
NAAQS – National Ambient Air Quality Standards
NAS - National Academy of Science
NC – North Carolina
NCSU – North Carolina State University
NESCAUM - Northeast States for Coordinated Air Use Management
NHCPS – New Hampshire Clean Power Strategy
NOx – Oxides of Nitrogen, including NO_2, the primary nitrogen species from combustion
OFA – Overfire Air
PFC's - Perfluorocarbons
ROFA – Rotating Opposed-Fired Air
ROTAMIX – Injection of Ammonia to further reduce NOx (Used in combination with ROFA)
RPS – Renewable Portfolio Standard
SCR – Selective Catalytic Reduction
SCRUB – Wet scrubber for SOx
SEO – State Energy Office of NC
SNCR – Selective Non-Catalytic Reduction
SOx – Oxides of Sulfur, including SO_2, the primary combustion product of sulfur
SUV – Sport Utility Vehicle
TFS2000 – Combination Low-NOx Burner/Overfire Air
UNFCCC - United Nations Framework Convention on Climate Change
WIR - Underfire Air

Super Summary

The NC DENR Division of Air Quality (DAQ) is required to provide three reports to the Environmental Management Commission and the Environmental Review Commission, by September 1, 2003, 2004 and 2005, addressing issues related to the development and implementation of standards and plans to control CO_2 emissions from coal fired utility boilers and other stationary sources of air pollution. This is the first of those three reports.

- The Executive Summary of this report provides a list of the major points determined to date:
  - Global warming/climate change is a real concern. (See background in Appendix)
    - Continually increasing man-made greenhouse gas emissions are an important causal factor in this phenomenon.
    - These conclusions are supported by a broad, but not unanimous, scientific consensus.
    - It is prudent that steps be taken to mitigate these changes.
    - The NC Legislature has recognized the seriousness of the problem and initiated these efforts to help determine ways to mitigate the problem.
    - Other sources of CO_2 and other global warming gases will need to be addressed in the overall solution.
  - CO_2 emissions occur when any carbon-based fuel is burned.
    - Coal fired power plants account for a major portion of the CO_2 emissions in the state.
    - Mobile sources, residential, industrial and commercial buildings and related facilities, agricultural burning and forest fires are also important direct CO_2 sources.
    - Buildings and facilities are also major consumers of electricity and, thus are indirect sources of CO_2.
  - Conventional "end of stack" emission controls applicable to reduction of CO_2 are not currently available, but research continues.
  - Reduction in energy consumption is a prime means for reduction in CO_2 emissions from coal fired power plants and other fossil fuel burners; whether by conservation, efficiency technologies or other means.
  - It is important that any solutions offered for use in NC be such that they can be integrated and synchronized with national/federal (and even international) efforts, particularly as they may apply to companies and other entities that have locations in multiple areas.
  - A number of other states are undertaking CO_2 reduction efforts. These efforts take a variety of forms and are described in Chapter 3.

- Further studies by the DAQ, stakeholders, universities and other interested parties over the next two years should provide valuable insights and recommendations into what is feasible, cost-effective and appropriate for North Carolina utilities and other stationary sources, relative to the best means to control and mitigate CO_2 emissions.

Chapter 1 Executive Summary

Summary of Statute

Chapter 2 The North Carolina (NC) Clean Smokestacks Act (CSA)[1] requires the NC Division of Air Quality (DAQ) of the Department of Environment and Natural Resources (DENR), to study issues related to the development and implementation of standards to control emissions of carbon dioxide (CO_2) from coal-fired generating units and other stationary sources of air pollution. (See the inside front cover for the actual language for the applicable section of the Act.) The NC DAQ is required to evaluate available control technologies and estimate the benefits and costs of alternative strategies to reduce emissions of carbon dioxide (CO_2). The findings of these studies and related recommendations are to be included in three reports to the Environmental Management Commission (EMC) and the Environmental Review Commission (ERC), annually, starting September 1, 2003 and continuing through September 1, 2005.

Emissions of global warming gases (GWG), especially CO_2, have been increasing proportional to man's population and sophistication. Many of these changes have happened almost without notice, just as the frog in the pot of water is not aware of the changes that take place gradually as it is heated to boiling. Though there are ways that CO_2 may be removed from the air ("sinks"), the emission side of the equation has been gaining rapidly in the last several decades, as is reflected in measurements in the ambient air. Forensic air quality scientists, who look at temperature measurements, concentrations in glacial air bubbles, and other means, tell us that atmospheric concentrations have risen almost by a factor of two in just the last century or so.[2] There are many off-setting causes of changes in CO_2 and the average global atmospheric temperature of the Earth, but many of the world's most recognized and respected scientists have declared that global warming/climate change is a real and growing problem that must be addressed soon. Otherwise, we will be like the frog and eventually face a less than desirable result. The challenge is difficult. However, the NC General Assembly has given us the charge to try to find ways to reverse this trend. At the end of the three years, the DAQ hopes to be able to make solid recommendations to assist in achieving this end.

Scope & Objectives of This and Future Reports

This report is intended to provide the background and 'state of the science' information on CO_2 emissions. The purpose is not to establish new scientific findings, but instead to identify and summarize work already accomplished by others and apply it to North Carolina. We hope to present objective analyses and conclusions to help the EMC, the ERC, the General Assembly and our state sort through the facts and issues in order to arrive at reasonable and prudent actions and recommendations for action. The intent is that these recommendations and actions precipitate actions that will conserve and protect our natural resources and maintain a high quality environment for the health and well-being of all North Carolinians.

---

[2] Rob Jackson, The Earth Remains Forever, University of Texas Press, 2002.

The phenomenon of global warming ("**Climate change**") has been widely accepted by the scientific community worldwide. However, technical issues related to the severity of the impacts associated with global warming or climate change can generate extended discussion. The topic of this report is not one to study in isolation. Climate change in North Carolina is not affected by science and conditions that pertain just to this state or just within the state's boundaries. Actions in other states and regions, and on the national and international level, will be required for changes made in North Carolina to realize their full potential to protect the health of our citizens and our environment. However, studies and NC's experiences with other air pollutants have shown that cleaning up at home first provides the most benefits to a state and can lead the way to action on a much broader scale. Eileen Claussen of the Pew Center on Global Climate Change recently summarized the issues current status of climate change understanding and emphasized that the debate has shifted from "whether to do something" to "what to do and when to do it."[1] A background discussion summarizing more of the scientific background and consensus is contained in the Appendix to this report.

Federal Actions and Requirements

There are currently no federal standards for the control of carbon dioxide emissions or for the broader group of Greenhouse Gases (GHG). However, much effort has been expended on this topic within the national and international arenas in the past 25-30 years. During these times various reduction strategies have been developed and promoted, registries have been implemented, and research continues, but no significant and specific federal mandates currently exist to control them in the United States. Efforts to formalize and finalize subscription to international treaties related to international registries and to tracking and reducing GHG have not been (and may not be) completed by the US. However, significant research continues and efforts to refine existing federal registries to allow for reductions in GHG by cap and trade programs appear to be gaining momentum. Significant announcements of efforts to expand the program and provide more uniform and universally interchangeable quantification and certification of such emissions are expected from the US Department of Energy (DOE) soon.

The Kyoto protocol is frequently mentioned in regard to climate change and to track and mitigate emissions. The US has participated in several world conferences dealing with global climate change.[2] In Kyoto, Japan, in 1997, most industrial countries of the world tentatively agreed to undertake efforts to lower their GHG productions to, or below, 1990 levels. Negotiators for the US tentatively proposed to reduce emissions by 7% below 1990 emissions level, and to achieve this target between 2008 and 2012. However, the treaty has not been ratified by the United States. The Bush Administration made significant changes in the U.S. position. These changes would delay or preclude the treaty from being ratified by the U.S. at all.

[2] North Carolina's $ensible Greenhouse Gas Reduction $trategies Executive Summary, Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

Additionally, in late July 2003, the Administration released a new plan. This plan focuses on additional research in several areas. However, some critics view it as a delay tactic.[1] Thus, the current position does not provide for U.S. support of the Kyoto accord. More on this topic is discussed later in this report.

Provisions of the Clear Skies Initiative (**CSI** - proposed by President George W. Bush - now also known as Clean Skies Act) and several bills that have been introduced into the U.S. Congress contain proposals for mitigation of CO_2. These are also referred to as the "multi-pollutant" bills or other variations of this term. The four pollutants involved are NOx, SOx, mercury and CO_2. Whether federal legislation will be enacted, and if so, whether it will address CO_2 and other GHG is unknown at this time.

Efforts by Other States

Several states have developed their own legislation and regulations, in spite of potential incongruence with proposed efforts at the federal level. Some observers have described the current level of state activity as "striking,"[2] in contrast to the lack of decisive federal actions. The cited Pew Center report discusses nine states with state-level initiatives, including NC. The NC reference is specifically for methane considerations from animal waste operations being researched at NCSU under the Smithfield Agreement. Efforts in these and other states (21 states are discussed individually later in this report) have covered a wide range, but typically, include development of registries, implementation of programs with specific targets, and promotion of the steps necessary for reduction of CO_2 and other GHG.

States often appear to be motivated not only by a sense of urgency to do something about the climate change, but also by the economic, social and environmental benefits that accompany reductions in GHG. These include cleaner air, cost savings from energy efficiency, marketing opportunities for renewable energy and other reasons that may sometimes seem unrelated to climate change. Many of the state programs to address climate change that exist today are part of an economic development strategy designed for the longer term. Renewed efforts toward a unified national and internationally acceptable registry with defensible reduction and tracking programs for these gases could result in less confusion and increased efforts to revamp existing programs. Resulting estimates could then be more universally compatible and be able to be banked and traded in a formal and certified manner. This topic is also discussed later in this report with state-by-state notes summarizing the major activities underway.

In an interesting, and possibly important recent development, attorneys general from the states of Connecticut, Maine and Massachusetts filed suit in federal district court in Connecticut (June 4, 2003) against EPA for its "failure to regulate carbon dioxide (CO_2) under the Clean Air Act." According to the lawsuit[3], EPA has acknowledged both that CO_2 emissions pose a serious

risk to human health and that it has authority to regulate CO_2 emissions under the Clean Air Act (CAA). Accordingly, the suit claims that EPA has a mandatory duty to regulate CO_2 emissions under the CAA. If the lawsuit succeeded, EPA would have to list CO_2 as a criteria pollutant and develop a national ambient air quality standard for it. Since all health related impacts of the GHG appear to be "indirect," an entire new process would need to be developed to set such standards. Historically, this process has taken 10-15, or more, years to reach implementation.

Since the suit mentioned above and in a separate action, EPA has issued a ruling that CO2 is not an air pollutant subject to listing and regulation as a criteria pollutant under the Clean Air Act. Though the intent or effect may tend to be preemptive, this ruling was not as a result of the separate action still being (to be) considered in the court.

North Carolina Actions to Date

Little has been done from a programmatic or regulatory standpoint to mandate reduction of CO_2 emissions from coal-fired power plants or other sources. An effort by North Carolina to pursue participation in a climate change registry was initiated in 1994-1995 with a program called ***Climate-Wise***, a means to enter emissions into the US DOE registry and bring mitigation options to the attention of the participants, but this program has not included utility units. A number (39) of companies agreed to (and continue to) participate in this effort. However, the formal (financial) state support of this program has been cut. A private non-profit corporation was recently formed to continue the participation of these companies in this effort, on a voluntary basis. Since many of the results of this type of program tend to pay for themselves in cost savings, the state may need to look for ways to resume funding of this program. Other related energy (CO_2 generation) use reduction programs in place in the state are described in more detail later in this report.

In the 2003 North Carolina General Assembly, legislation was introduced, but never acted upon, to rekindle a "voluntary" state registry program for GHG. The bill recognized the possibility that GHG registration might become mandatory later. Coal fired utility boilers are a large contributor to this emission pool. However, these plants are already required to report their CO_2 emissions annually (the only GHG reported) to the EPA Acid Rain Program (Title IV of the Clean Air Act), which then reports these emissions. Other related efforts are underway and proposed regarding energy conservation and a state energy policy/plan. Such efforts are closely correlated to potential reductions of CO_2 in the state. More details are provided in later chapters.

Summary of Preliminary Findings and Plans

In this first report, no new and original scientific or technical findings are presented. (A background summary of what we perceive to be the underlying scientific consensus concerning climate change is included as an Appendix.) Judgments in this report are made using existing information and are based primarily on the work of others. Such judgments and findings will be refined and applied to North Carolina during the preparation of the 2004 and 2005 reports. This document has undergone a brief stakeholder participation process, but it was not subject to public hearings or other such reviews and participation. Future reports will be prepared with participation and input from stakeholders, members of the public, universities and other interested parties.

To date, we have concluded that the following are reliable statements on the issues:

- Leading national and international science authorities have concluded that man-made emissions contribute to climate change and that it is prudent to take steps to reduce those emissions. The accepted science and background information are discussed in more detail in the Appendix.
    - The Intergovernmental Panel on Climate Change's (IPCC) Working Group I has provided several conclusions related to the evidence of climate change phenomena and encourages mitigation actions. The panel concluded "An increasing body of observations gives a collective picture of a warming world and other (man-made) changes in the climate system." [1]
    - The Bush Administration commissioned and supports the conclusions of the National Academy of Science's (NAS) report entitled "Climate Change Science," which restated the IPCC conclusions and encourages reductions of GHG.
    - The Bush Administration's "US Climate Action Report 2002"[2] accepts and supports the conclusions of the above NAS report ("Greenhouse gases are accumulating in Earth's atmosphere as a result of human activities, causing global mean surface air temperature and subsurface ocean temperature to rise.")
    - CO_2 in the atmosphere (as well as other GHG) has continued to increase significantly over the last 100 years, especially in the latter half of the century (1950-2000). [3]
    - Despite the strong and growing scientific consensus, many still debate the severity of impacts from increased GHG, including CO_2[4], and what should be done in response to rising GHG levels.

- The NC General Assembly has directed DENR/DAQ to study issues related to the development and implementation of standards and plans to implement programs to control emissions of carbon dioxide from coal-fired generating units and other stationary sources. Here are some preliminary observations concerning the issue:
    - Climate change is a concern at all levels, from local to global, and must be addressed at local, state, national and international levels, with coordinated leadership contributing to efficient reductions.
    - Though a substantial effect from human activities is accepted, it is also necessary to recognize the Earth's underlying natural cycles of warming and cooling, but not to use this as an excuse for inaction.
    - The Kyoto Protocol has been signed by a majority of producers of GHG but not the United States.

[3] Climate Change: State of Knowledge; Office of Science and Technology Policy; Office of the President, Washington, D.C., October 1997.

[4] Status of the Kyoto Protocol; The United Nations Framework Convention on Climate Change, July 2003.

- Options for reducing GHG emissions include conservation, process changes, development and adoption of new technologies and other approaches at all levels of society.
- CO_2 is only one of several (usually identified as 5 major[1]) greenhouse gases that affect the climate, but the CSA only addresses CO_2.
- The observed rise in CO_2 in the atmosphere is largely attributable to human activity, mainly the burning of fossil and other carbon fuels that release CO_2, though natural sources exist as well. Major anthropogenic sources include:
  - Fossil-fueled (and other carbon-based fuels) utility and other boilers,
  - Carbon-based-fueled internal combustion engines (automobiles, trucks, construction equipment, boats, lawnmowers, etc);
  - Incineration of refuse, prescribed burning, agricultural burning and other forms of combustion; and
  - Many industrial processes, especially those such as the petroleum refining and the petrochemical industry, where large quantities of carbon fuels are used.
- A distinction is normally made between fossil fuel combustion and "renewable" fuels, although combustion of one atom of carbon from any fuel (e.g. wood or alcohol) produces one molecule of carbon dioxide.

- Emission estimates are crucial for the analysis and management of CO_2.
  - CO_2 emissions are relatively easy to quantify (within a reasonable margin of error) by estimation and calculations;
    - However, few facilities are monitored by continuous emission measurement (CEM) instrumentation.
    - Protocols for estimation are not universally adopted which contributes to some imprecision, but the disagreements are generally minor.
  - Title IV of the Clean Air Act (1990 Amendments) requires coal-fired electric utilities to report CO_2 estimates to the US Environmental Protection Agency (EPA) annually;
    - A database of this information is publicly available from the EPA.
  - The emissions of CO_2 in North Carolina from known sources have been quantified by multiple studies.
    - These studies provide data that are acceptable for purposes of problem assessment,
    - However, for emission trading purposes, the protocols and documentation standards required may be inadequate.
  - EPA has compiled emission estimates of GHG for NC as part of a national effort.
    - EPA updates these estimates annually.
    - The initial effort used contract assistance from Appalachian State University.
      - That effort reflected review comments from the DAQ.
  - The US DOE and EPA promote, encourage and maintain registries of CO_2 and other emissions of GHG.
    - These registries are now separate and not identical in participation requirements and calculation standards or protocols.

---

[1] Emissions of Greenhouse Gases in the United States 2001, DOE/EIA-0573, US DOE, Energy Information Administration, Washington, DC, December 2002.

        - They have a low probability to be merged into a combined national registry sometime in the future as would be desirable.
    - Several states have established their own registries (and mitigation activities) to address these gases, with 1990 (the baseline date in the Kyoto Protocol) being a common reference year.
    - A program called "***Climate Wise***" was developed by NC's Energy Office to provide a climate change gases registry program in 1994,
        - It was later discontinued due to budget cuts.
        - A "re-born" program is continuing via the private sector with a non-profit organization (Global Warming Initiatives, Inc.).
    - Other energy savings programs exist (and have been proposed) in NC that contribute, or have the potential to contribute, to the reduction of GHG emissions. For example, the proposed **NC Energy Plan** is closely aligned with these and based on similar principles. This report provides more detail in later discussions.

- Currently, reductions in emissions of CO2 are expected to most likely come from energy efficiency improvements and other measures to reduce fuel consumption.
    - When combustion occurs, carbon chemically bonds with oxygen to form CO_2 and releasing useful heat. CO_2 cannot be converted to a more desirable form (i.e. "unburned") without using up energy. Complete removal would require an equal or greater consumption of energy than was generated to burn it in the first place.
    - The recognized most effective way to "control" CO_2 is to refrain from or reduce burning of carbon-based fuels.
    - Many programs have successfully demonstrated the feasibility of increasing energy efficiency and reducing waste in order to burn less with the same product output.
    - Research studies of ways to collect and dispose of CO_2 in an acceptable manner are promising, but such processes would likely be very costly.
    - Scrubbers that control or reduce NOx or SO_2 emissions are not effective in significantly reducing CO_2.
        - Such scrubbers actually add a CO_2 penalty in that the increased power requirements for pumps, blowers, etc., affiliated with these controls reduce the net output of the facility by about 1%.
    - Several DOE (and other) research projects aim to
        - Increase efficiency of utility boilers and,
        - Control the gases by new and innovative methods (such as injection of the stack effluent into deep underground coal seams or brine pools).
        - However, these have not yet been proven successful or economically practical.
    - Policy changes that are under consideration for legislative actions nationally will likely have important impacts on NC efforts.

Therefore, DENR/DAQ expects to pursue the general course below following this initial report. This plan is a combination of several immediate actions and tracking of various efforts by others, in NC and elsewhere. We will build upon this report in the 2004 and 2005 reports. These actions include:

- To continue to recognize CO_2 as the most predominant climate change gas, especially for coal fired utility boilers addressed by the CSA,
- To acknowledge the importance of other climate change gases, such as methane.
- To continue to follow, evaluate and provide updated information regarding any breakthroughs in legislation or control technology research by federal and international organizations, especially those that might be promising for CO_2 reductions from NC sources.
- To continue to evaluate methods and programs (new and existing, such as ***Energy Star Partners***, ***Climate Challenge***, ***Green Power Program***, ***Climate Leaders***, and ***Climate-Wise, as related to the NC Energy Plan)*** - that can lead to reduction of CO_2 by energy efficiency increases, waste reductions, changes in processes (or product characteristics), etc. We expect that DAQ will be able to develop a basis to make other recommendations on ways to adopt and promote such methods and programs in NC, considering the environment and economy.
- To explore further concepts and actions to sequester carbon within the state, including but not limited to planting policies, species selection and other actions as have been initiated by NC State University (NCSU), the NC Department of Agriculture (DOA), DENR/Division of Forest Resources, etc., and make further recommendations as warranted.
- To continue to investigate alternative approaches and make recommendations for NC to take to establish/expand and otherwise participate in a registry of greenhouse gases.
- To explore the feasibility and effectiveness of statewide goals for reduction of GHG.
- To hold a broadly based (NC DAQ, stakeholders, other NC and outside experts) conference on CO_2 and Mercury in the spring of 2004 and use the results of this workshop in preparing the 2004 report.

Chapter 2 North Carolina Emission Sources and Characteristics

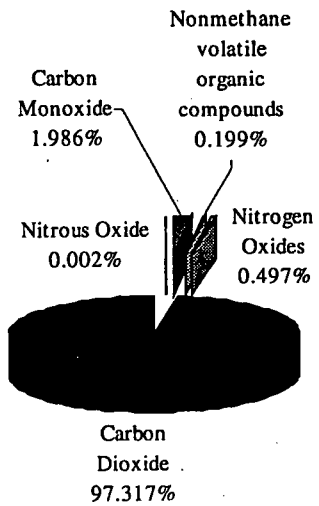
Databases Available and Used

Emissions of CO_2 are generally estimated, not measured. Consequently, there is always some level of uncertainty. However, because fuel use, and thus carbon, relate to operating costs, usage is generally tracked carefully, making estimation a relatively accurate way to determine CO_2 emissions. Several sources of information and data are available for coal fired utilities. The first is the Acid Rain data required by Title IV of the Clean Air Act.[1] These data are reported annually by each coal-fired power plant for each boiler. This information is available from EPA on the Internet. The second source is a series of reports annually published by EPA that use these data and other data to produce state-by-state and national emission estimates for GHG. The first such compilation for North Carolina was compiled for EPA by Appalachian State University[2, 3] in 1996 (for Calendar Year 1990). DAQ provided limited review of these data and we used them in this report.

Fuel Consumption in North Carolina

In NC, emissions from fossil-fuel combustion comprise the majority of GHG emissions. CO_2, resulting from the oxidation of the carbon in the fuel, is the predominant emission, in terms of mass or volume, from combustion processes (See Figure 2.1). Over 97% of the mass of GHG emissions attributable to combustion of fossil fuels is carbon dioxide.

Figure 2.1: Proportion of Greenhouse Gases from Combustion of Fossil Fuel in NC



[1] Clean Air Act; PL 101-549, 101st Congress, Washington, DC, November 15, 1990

[2] Climate Change and North Carolina; US EPA, Climate and Policy Assessment Division, , EP 236-F-98-007q, September 1998.

[3] North Carolina's $ensible Greenhouse Gas Reduction $trategies Executive Summary; Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

Emissions from fossil fuel combustion are related directly to the type and amount of fuel consumed, the efficiency with which the fuel is oxidized and the carbon content of the fuel. These relationships depend upon the amount of carbon contained in the fuel per unit of useful energy produced, which varies among different fuel types. For example, coal contains the highest amount of carbon per useful unit of energy, while petroleum and natural gas have about 80% and 55%, respectively, that of coal. In addition, due to inefficiencies in the combustion process, not all carbon in fuel products is oxidized to CO_2. Relatively minor amounts of carbon are incompletely oxidized to CO (carbon monoxide) which eventually is oxidized to CO_2 in the atmosphere or is removed by other sinks.

The Department of Geography and Planning at Appalachian State University generated a 1990 NC GHG emissions inventory.[1,2] Generating the GHG emissions inventory for 1990 was important because it established a baseline (consistent with the Kyoto Protocol) for strategic planning and it also identified areas where emission reductions can be targeted. Furthermore, the base year emissions inventory is integral in projecting future emissions because it serves as a baseline to compare the effectiveness of reduction strategies on future emissions inventories, and provides a sense of what sector of the economy is responsible for the use/emissions. Figure 2.2[3] provides a summary of the 1990 GHG emissions, by use sector, in North Carolina.

Figure 2.2 – North Carolina Greenhouse Gas Emissions in 1990 (with fossil-fueled utility electric generation allocated to sectors of the economy that used the electricity)

Commercial/Institutional Sector

The commercial/institutional sector includes a variety of buildings used by businesses, organizations, and government agencies, such as office buildings, hotels, multi-story apartments, beauty salons, bookstores, shopping malls, dry cleaners, lumber stores and school buildings. GHG emissions from the commercial/institutional sector come from energy for heating, cooling, lighting, domestic hot water, refrigeration, cooking, electronic equipment, and other similar operations. CO_2 emissions directly produced from combustion in this sector are approximately 49.4 % from natural gas; 42.2% from oil, 7% from coal and 1.5% from biomass.

CO_2 emissions from this sector totaled 3.7 million tons in 1990, only about 3% of the 120.9 million tons of CO_2 emissions that originated from fossil-fuel consumption in the state. Therefore, this sector is not the major (direct) generator of the carbon load being added to the atmosphere in NC, though they are a user of electric power and thus an indirect contributor.

Industrial/Manufacturing Sector

Direct emissions of CO_2 by the industrial/manufacturing sector in 1990 totaled 38.9 million tons from all carbon fuels, some 28.3% of the 137.4 million tons of CO_2 emitted due to combustion of all fuels in North Carolina. On a percentage basis, fuels utilized in the industrial/manufacturing sector are distributed among oil at 27.3%, coal at 19.4% and gas at 13.2%. Other fuels, primarily biomass (wood is commonly used as a fuel for many furniture and wood/paper product facilities), account for over 15 million tons of CO_2; or approximately 40% of the total.

NC Electric Production and Use

In North Carolina, coal, natural gas, light fuel oil, motor gas, diesel fuel, and propane account for nearly all of the CO_2 emissions. In 1990, electricity accounted for 59 million tons of CO_2 emissions. At 0.188 tons of CO_2 per million Btu, electric generation is the most GHG-intensive form of energy used in the state. Generation of electricity emits over twice as much CO_2 per unit of end use energy as gasoline and other petroleum products, and three times as much as the direct use of natural gas. Therefore, the utility sector is a key in any GHG reduction strategy.

The utilities sector produces electricity utilized by other sectors of the economy. As cited in *North Carolina's $ensible Greenhouse Gas Reduction $trategies*[1], the data used for 1990 allocated utility emissions to the end use sectors, specifically, industrial, commercial, residential, and agriculture. To prevent double counting of emissions attributable to the utilities sector, the report totaled the supply-side utilities emissions from the projected 2010 emissions totals, and subtracted the impact of all the electricity demand measures implemented in the end use sectors. Thus, it allows analysis of the impacts of strategies specific to the utilities sector.

North Carolina's energy demand is driven by the rapid growth in all sectors of the economy. The Virginia and Carolina Region of the Southern Electric Reliability Council

[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies Executive Summary Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

projected[1] peak load growths of 2.3% for both summer and winter peaks for 1995-2004. Furthermore, North Carolina's final electricity consumption in terms of kilowatt-hour (kWh) sales is evenly distributed between the residential (38.5%), commercial (28.3%), and industrial (32%) sectors. The state's electric demand growth is occurring in all three sectors.

In a "business-as-usual" forecast, these studies projected that electricity demand will likely grow to 512 trillion Btu by 2010, 31% higher than its 1990 level. The use of natural gas for power production was just beginning in 1990, but by 2010, it may grow to supply over 10% of the State's power. By 2010, the studies projected petroleum fueled power plants to grow to produce about 5% of the State's power.[2] Thus, electricity has experienced exponential growth.[3]

Figure 2.3:
Energy Use in Utility Sector

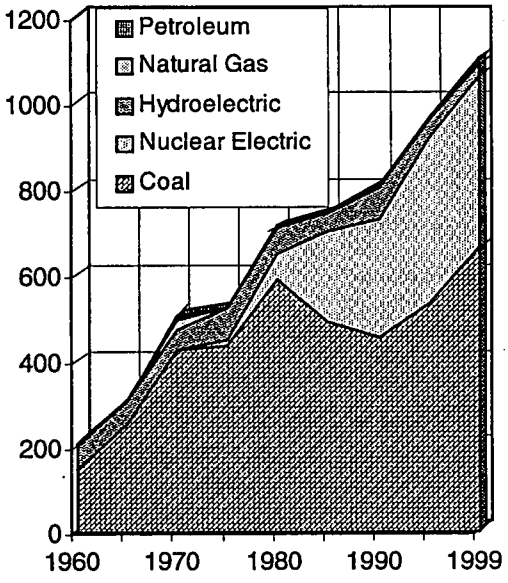

Figure 2.3 shows the trend for energy use in the electric utility sector. Coal has maintained and extended its historical dominance.

As shown in Table 2.1, coal-generated electricity currently provides about 60% of total electricity needs for North Carolina, nuclear power provides about 36%, hydroelectric plants supply 2.5%, and natural gas and petroleum supply 1% or less.

EXISTING COAL FIRED UTILITY CO_2 EMISSIONS

Coal combustion from the utility sector accounted for 45.9 million tons of CO_2 in 1990.[1] The quantities of other GHG emissions by utilities are relatively small. Emissions of carbon dioxide by specific fossil-fired power plants are shown in Table 2.2.

Table 2.2: CO_2 Emissions by Specific (CSA) Coal Fired Unit in North Carolina (tons)

A measure of relative CO_2 emission rate efficiency among power plants is the **CO_2 Emissions Rate** in pounds per Megawatt hour (lbs/MWh). This value for CSA-affected units is shown in Table 2.3, also adapted from the ASU reports previously cited.

PROPOSED CLEAN SMOKESTACKS CONTROLS BY PLANT

The CSA requires a level of system-wide controls for NOx and SOx, but does not specify any limits or specific control devices on specific plants. The management of that process is left to the utility to propose, based on technologies available, physical layout, costs and other plant-specific factors. The plants are required to keep DENR informed and will have to apply for specific permit changes in each instance. To date, both companies in NC that are effected by the requirements have provided lists of general types of devices that they are considering that will provide the reductions required (or better). These are still subject to some revisions as design, cost and other factors become more clearly defined and final decisions are made. Table 2.4 lists the proposed controls as of this writing[1], [2] and no major changes are expected. The addition of these controls will not have any significant effect on the collection and removal of CO_2 from the stacks of these units. Other options being researched to provide such controls and sequestration are discussed elsewhere in this report.

One point that should be noted is that the installations of the controls required by the CSA are not without a penalty as far as CO_2 is concerned. The added air moving and liquid

moving equipment (fans and pumps) that are inherent in the controls to be installed, require energy, which must come from a reduction of the electric output of the unit (generally maximum fuel use and gross output are fixed and can not be increased). The unit cannot overcome these losses without basic process changes that may be discouraged under other current laws and regulations which will reduce the net electrical output of these units by about one percent.[1]

Terms used in this table are defined below:

AEFL- Amine-Enhanced Flue Lean Gas Reburn
LNB – Low NOx Burner
OFA – Overfire Air
ROFA – Rotating Opposed-Fired Air
ROTAMIX – Injection of Ammonia to further reduce NOx (Used in combination with ROFA)
SCR – Selective Catalytic Reduction
SCRUB – Wet scrubber for SOx
SNCR – Selective Non-Catalytic Reduction
TFS2000 – Combination Low-NOx Burner/Overfire Air
WIR- Underfire Air

Chapter 3 The Regulatory "Climate" Outside North Carolina

The discussions in this chapter are intended to put the North Carolina actions and planning regarding CO_2 emissions and reduction expectations in perspective with international and national actions, plans and uncertainties at the time of the writing of this document, especially with regard to other requirements that may be imposed externally.

Kyoto Treaty and its Predecessors

In an effort to reduce GHG (including CO_2) and mitigate their effects, the US has participated in several world conferences dealing with global climate change.[1] The most noteworthy of these conferences was probably the one held in Kyoto, Japan in 1997. At this meeting, most industrial countries of the world, including the US, agreed to lower their GHG production. Negotiators for the US agreed to reduce emissions by 7% below its 1990 emissions level between 2008 and 2012. However, this treaty was subject to Senate approval. The US Senate has yet to formally ratify or further validate the treaty and the Bush Administration has not been in support of the protocol. Instead, an alternate proposal has been made that provides for the U.S. to commit to a reduction in the rate at which the release of these gases is increasing. This proposal falls far short of the original target. Bush's Clear Skies Initiative (CSI-February 2002, aka Clear Skies Act): proposed to reduce GHG "intensity" by 18% by 2012, where "GHG intensity" is a measure of the ratio of GHG emissions to economic output. This proposal allows total emissions to rise with increasing economic activity, rather than through a cap on emissions as specified in Kyoto.

The text of the protocol to the United Nations Framework Convention on Climate Change (UNFCCC) was adopted at the third session of the Conference of the Parties to the UNFCCC in Kyoto, Japan, on December 11, 1997. The protocol is subject to ratification, acceptance, approval or accession by Parties to the Convention. It was open for signature from March 16, 1998 to March 15, 1999 at United Nations Headquarters in New York. By that date, the protocol had received 84 signatures. Those parties that have not yet signed the Kyoto Protocol may access it at any time at the UN Headquarters in New York. It was determined to enter into force on the ninetieth day after the date on which not less than 55 parties to the Convention signed Annex I. Parties that accounted in total for at least 55% of the total carbon dioxide emissions for 1990 from that group have deposited their instruments of ratification, acceptance, approval or accession. As of July 10, 2003, 84 Parties had signed and 111 Parties had ratified or acceded to the Kyoto Protocol[2], accounting for about 44.2% of the global GHG.

In March 2001, President Bush formally announced opposition to the Kyoto Protocol, and Congress reacted by proposing legislation supporting further positive action in the international negotiations on climate change. A budget resolution for fiscal year 2002 passed, including funds for US participation in further international climate change negotiations.

---

[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies; Appalachian State University, Department of Geography and Planning, , Boone, NC, January 2000.

[2] Status of the Kyoto Protocol; The United Nations Framework Convention on Climate Change, http://unfccc.int/resource/convkp.html#kp, New York, NY, July 18, 2003.

Senator John F. Kerry authored and proposed a non-binding resolution urging the US to put forth a proposal to secure US participation in a revised Kyoto Protocol or other future binding climate change agreements. An amended version of the Kerry resolution was included in the energy policy bill passed by the Senate, but have not yet received full Congressional approval.[1]

The President's fiscal year 2003 budget includes $555 million in clean energy tax incentives, as the first part of a $4.5 billion commitment over the next five years ($7.1 billion over the next 10 years) to address climate change. The budget also requests over $3 billion (a $1 billion increase above the baseline) as the first part of a ten-year (2002-2011) commitment to implement and improve the conservation title of the Farm Bill, which will significantly enhance the natural storage of carbon.

In a new policy announcement on July 24, 2003 the President unveiled a new five point plan for increased research.[2] This Climate Change Science Program Strategic Plan's stated primary goal is to identify "natural variability" in climate change. The second is to find better ways of measuring climate effects from burning fossil fuels, industrial production of warming gases and changes in land use. The other goals of this ten year program are to reduce uncertainty in climate forecasting; to better understand how changes in climate affect human, wildlife and plant communities; and to find more exact ways of calculating the risks of global warming. The administration also will ask Congress for a new $103 million, two-year initiative to speed up "high priority" research on carbon pollution, aerosols and oceans and determine the best ways to compile and disseminate information about them.

Current EPA and DOE Approaches & Registries

Since there are currently no federal legislation or standards requiring control of CO_2 emissions or the broader group of GHG, the reduction activities undertaken to date have been somewhat meandering and splintered. EPA has continued to focus on its traditional pollutant-by-pollutant rulemaking scheme, as required under the Clean Air Act (CAA) for other pollutants. The National Ambient Air Quality Standards (NAAQS) required in the CAA are implemented through a health or welfare effects "criteria" determination, with subsequent ambient standards specified. These are then normally implemented by delegation to state programs. There are also parts of the CAA that apply to hazardous air pollutants, which include mercury, but not CO_2. Efforts to implement this part of the CAA have produced drafts and plans on mercury, but no indication that any efforts are likely to require or develop mandatory controls on CO_2/GHG's. The efforts, however, to build the case for reductions have continued; and tools, registries, promotion programs and other similar efforts have generated a large amount of activity and concerns.

Debate over potential limits on emissions has demonstrated conflicting, or at least not fully harmonious, views from the EPA and the DOE.[3] In July 2002, the EPA signaled that it

---

[1] Summary of National Climate Change Programs; California Energy Commission; http://www.energy.ca.gov/global_climate_change/summary.html, July 2003.

[2] John Marburger, Climate Change Science Program Strategic Plan Announcement; Office of Science and Technology Policy, Executive Office of the President, Washington, DC, July 24, 2003.

[3] *"US gov't reports set stage for multi-pollutant debate"*; Reuters, http://www.planetark.org/ dailynewsstory.cfm/newsid/12637/story.htm, June 6, 2003.

might replace current regulations with a new cap-and-trade system for NOx, sulfur dioxide and mercury, but this move did not include CO_2. That approach would allow power plants to buy emission rights from cleaner plants. DOE has opposed EPA's actions, presumably because they feel this might hamper US utilities from boosting electricity output.

Section 1605(b) of the Energy Policy Act of 1992 [42 U.S.C. ¤13385] established the **Voluntary Reporting of Greenhouse Gases Program**, which allows and encourages sources to report GHG reductions. Currently, both DOE and EPA have GHG registries. Registries are a first step in reduction strategies and mandatory for banking-and-trading scenarios. The DOE 1605(b) registry is the closest to a US-wide registry. North Carolina has been a leader in the efforts to register (39) industries within the state in that registry. However, EPA also has a registry that promotes the reporting of emissions and the adoption of agreements to reduce emissions. On the other hand, EPA's registry is primarily viewed as a means of tracking its own success in encouraging reductions of emissions only. Currently there is no mechanism, nor does there appear to be significant serious movement, to join or "seamlessly" relate one of these registries to the other. Major announcements from DOE regarding their registry and reporting mechanisms are overdue and expected "any day."

Under the US Senate-passed (only) Energy Policy Act in April of 2002, reporting of GHG emissions would be voluntary, at first. After five years, however, if fewer than 60 percent of the US GHG emissions were not reported under the program, it would become mandatory for the largest emitters. This bill has not become law. Steps to refine existing federal registries to make them more transparent and uniform will be necessary to facilitate reductions in GHG by cap-and-trade programs that appear to be gaining momentum. Ideally, standardized reporting should consolidate these tools and make them more useful for all purposes, including any cap-and-trade programs.

Activity in many of these continues, but remain uncertain. It would appear appropriate for NC to support and encourage, along with other states, a single and clearly defined registry. This would be supported by most other states, emission trading organizations, industry and the international community.

Federal Multi Pollutant Bills

In the past 25-30 years, various reduction strategies have been developed and promoted, registries implemented, and research carried out, but no significant and specific federal mandates currently exist to control CO_2 or other GHG in the United States. Efforts to formalize and finalize subscription to international treaties and agreements related to international registries and tracking of GHG are incomplete. Rumors and speculated intentions continue to appear, but decisive action is slow in coming.

CLEAR SKIES INITIATIVE

The Bush Administration has proposed a CSI,[1] as previously mentioned, that is awaiting Congressional action. In the meanwhile, other bills are active to some degree in both the US

[1] Clear Skies Act of 2003 Fact Sheet: *Cleaner Air, Better Health, Brighter Future;* EPA, Following President George W. Bush, State of the Union, Washington, DC, January 28, 2003.

House and Senate. There has been considerable debate whether any legislation would be three-pollutant (SOx, NOx and Mercury) or four-pollutant (add CO_2). The main legislative initiatives to date, in addition to the CSI, are the Jeffords-Waxman Bills and the Carper Clean Air Planning Act (CAPA - S3135). None of the bills introduced to date have made significant progress toward full consideration by the Senate and House, though committee testimony, debate and behind-the-scene efforts remain quite active. It is reasonable to speculate that actual legislation will not be voted upon until after the next Presidential election. The discussion below does not encompass all actions and discussions underway, but to provide some major points.

JEFFORDS-WAXMAN BILLS

The Senate Environment and Public Works Committee has held several hearings to date, and in June of 2002, narrowly passed the "Clean Power Act"[1] (S.556 or "CPA") proposed by Sen. James Jeffords. The House companion bill, Henry Waxman's "Clean Smokestacks Act" (H.R. 1256), has not passed in committee or on the House floor. As a matter of measure, the Senate rejected the climate change provisions of the 2002 Senate Energy Bill by a margin of 15 to 1. The final CPA, if passed as generally proposed, would establish new controls on power plant emissions of sulfur dioxide (SO_2), nitrogen oxides (NOx), mercury and carbon dioxide (CO_2). The bill would make the Kyoto agenda a central focus of U.S. energy policy. Opponents say that these bills would "abandon that common-sense approach and attempt to reduce pollution indirectly," by suppressing energy use.

CARPER BILL

The Carper Bill, also known as the Clean Air Planning Act [2] (CAPA S.3135) was introduced by Sen. Thomas Carper during the last days of the 107th Congress. Primarily, it was authored because the CSI and CPA were so far apart. Although, the proposal was a bipartisan effort, it has not yet received full consideration in either Committee, much less the full Senate.

Probably these bills will become the subject of debate during upcoming elections and perhaps will wither for the time being and reintroduced after the elections are completed.

Activities in Various States

A majority of the states has initiated some kind of efforts independent of, or in conjunction with, the federal efforts. North Carolina has been primarily involved through the DOE registry and related "**Climate Wise**" program and somewhat indirectly through its actions on the research of ways to convert animal waste into a viable energy source. The summary below was compiled from several state and national web sites and other information sources and may not be complete or entirely up to date. The list of activities covers a wide variety of activities ranging from direct climate change strategies/actions to others that could be better characterized as only indirectly oriented toward climate change.

---

[2] Introduction, Clean Air Planning Act; **Congressional Record**, U.S. Senate, http://carper.senate.gov/acrobat%20files/FS101702.pdf ; October 17, 2002.

According to a California DOE summary[1], GHG inventories have been completed in thirty-seven states, with four more in progress. Nineteen states have completed action plans to reduce GHG emissions, with eight more in progress. Twelve states have established renewable portfolio standards. Several states are developing voluntary registries for GHG emissions and the picture is changing rapidly so it is hard to keep exactly up to date.

CALIFORNIA

On July 10, 2002, California passed a bill[2] that requires reductions in automobile tailpipe emissions of carbon dioxide and other greenhouse gases. What this means simply is that they must burn less fuel. The initial California tailpipe emissions proposal was heavily opposed by a coalition led by automakers and their unions that had previously killed higher fuel efficiency standards in the US Congress. This coalition claimed that the bill's purpose was to run SUVs off the roads. The bill's primary sponsor modified the legislation to deal with these arguments, and required that California air regulators balance the benefits of emission reductions with the costs of building more fuel-efficient cars. It prohibits bans on the use of SUVs or any other specific vehicles. More than 80 percent of California residents support global warming pollution cuts, according to a poll by the non-partisan Public Policy Institute of California[3]. This new law (AB 1493) requires the California Air Resources Board to design policies to "achieve the maximum feasible reduction of greenhouse gases" from cars and trucks by 2005. New regulations would first apply to the 2009 vehicle model year. This law prohibits new taxes and provides for legislative review before new regulations go into effect.

California has also been a leader in GHG registries. The **California Climate Action Registry** (the Registry) was established by California statute as a non-profit voluntary registry for GHG emissions. The purpose of the Registry is to help companies and organizations with operations in the state to establish GHG emissions baselines against which any future GHG emission reduction requirements may be applied. The Registry[4] encourages voluntary actions to increase energy efficiency and decrease GHG emissions. Using any year from 1990 forward as a base year, participants can record their GHG emissions inventory. The State of California, in turn, will offer its best efforts to ensure that participants receive appropriate consideration for early actions in the event of any future state, federal or international GHG regulatory scheme. Registry participants include businesses, non-profit organizations, municipalities, state agencies, and other entities. California remains a leader in GHG actions, especially for motor vehicles and GHG registry development.

CONNECTICUT

Connecticut is a participant in the July 2003 coalition of Northeastern states. For more details, see discussion on New York below.

DELAWARE

Delaware is a participant in the July 2003 coalition of Northeastern states. For more details, see discussion on New York below.

GEORGIA

Georgia has a **No-Tillage Assistance Program**. This program leases "no-till" equipment to farmers, thereby reducing fuel use compared to conventional tilling techniques. Since 1987, the program is credited with saving over 2.7 million gallons of fuel to avoid an estimated 25,000 tons of CO_2.[1]

ILLINOIS

The Illinois' **Clean Energy Community Trust** provides grants, loans, and other financial incentives to develop, improve, and implement energy efficiency and renewable energy projects and programs.[2]

INDIANA

The state's **Public Facility Energy Efficiency Program** provides loans from the Indiana Efficiency Loan Fund to help schools, political subdivisions and public libraries identify and/or implement energy projects. The state also provides grants to businesses, non-profits, and local governments to cover the incremental cost of renewable energy projects. The **Alternative Fuel Vehicle Infrastructure Grant Program** provides grants on a competitive basis to encourage the building of alternative fueling sites.[3]

IOWA

This state's **Building Energy Management Program** (1989) enables Iowa schools, local governments, and hospitals to implement cost-effective energy management programs without incurring up-front costs. In 2001, over 500,000 tons of CO_2 emissions were avoided through the program. Iowa recently developed 2 major wind farms, which together will avoid more than 700,000 tons of CO2 emissions annually. The state's Department of Natural Resources provides support, funding, and information to promote switch grass as a biomass energy crop. Iowa plans to get 10% of its energy from renewable sources by 2015.[4]

KANSAS

Kansas provides income tax credits for the purchase of alternative-fuel vehicles.[5]

MAINE

Maine has adopted renewable portfolio standards (RPS) that set a target for renewable energy as a proportion of the overall electricity fuel mix. They are developing a voluntary

[4] Ibid Reference 1

[5] Ibid Reference 1

registry for GHG emissions. The state is also a participant in the July 2003 coalition of Northeastern states formed for addressing the climate issues. For more details, see discussion on New York below.

MARYLAND

Maryland provides income tax credits for the production and sale of electric power from biomass combustion. They also provide tax incentives for purchases and investments in clean energy technologies and consumer products. The governor has released an **Executive Order** requiring state facilities to purchase a percentage of energy from "green" sources, evaluate energy efficiency in state building design and maintenance, and purchase **Energy Star**-labeled products when available.

MASSACHUSETTS

In April 2001, Massachusetts capped CO_2 emissions from its 6 highest-emitting power plants and created an emission standard that will require CO_2 reductions of about 10% below the current average emission rate. This regulation allows companies to buy carbon credits to meet the reduction requirements[1]. The state is also a participant in the July 2003 coalition of Northeastern states formed for addressing the climate issues. For more details, see discussion on New York below.

MISSOURI

Missouri provides schools and local governments with technology and financial assistance to implement energy-efficient upgrades. In 2000, the program claimed to have reduced CO_2 emissions by about 10,000 tons.

MONTANA

Their **Universal Systems Benefit Program** requires all electric and natural gas utilities within the state to collect funds from their customers, to be redistributed to offer individuals, organizations, and business support for energy efficiency improvements.[2]

NEW HAMPSHIRE

The **New Hampshire Clean Power Strategy (NHCPS)**[3] was developed to address

- Risks to NH's environment and public health associated with power plant emissions
- Opportunities for taking advantage of an integrated approach for control of multiple pollutants SO_2, NOx, mercury, and CO_2 , and
- NH Legislature's expectations for environmental improvement under electric deregulation.

---

[1] Ibid Reference 1

[2] Summary of National Climate Change Programs; California Energy Commission; http://www.energy.ca.gov/global_climate_change/summary.html; July 2003.

[3] Danuta Andzelm, The New Hampshire Clean Power Strategy: A Review; http://www3.gov.ab.ca/env/air/emissions_trading/pdf/newhampshire.pdf, Alberta Environment, June 2002.

The **NHCPS** applies to all existing fossil fuel-burning power plants with a capacity of 25 MW or greater, the same applicability threshold used by EPA's NOx SIP Call. The CO_2 emission limit originally included a 7% reduction below 1990 levels. This was modified by the Legislature to equal the 1990 levels due to economic considerations.

The state has also indicated its intention to be a participant in the July 2003 coalition of Northeastern states formed for addressing the climate issues. For more details, see discussion on New York below.

NEW JERSEY

A Governor's **Executive Order** to reduce the state's annual GHG emissions to 3.5% below 1990 levels by 2005 is in place. The state's emissions reduction plan includes a combination of voluntary actions and state initiatives. Their **Sustainability Greenhouse Gas Action Plan (2000)** includes policies and technologies on which the potential emission reductions are based. In addition, a mandatory statewide recycling program is in place, through which the state avoided 8.7 million tons of GHG emissions from 1990 through 1995. The state is also developing a voluntary registry for GHG emissions[1, 2]

The state is also a participant in the July 2003 coalition of Northeastern states formed for addressing the climate issues. For more details, see discussion on New York below.

NEW YORK

New York has developed a **New York GHG Task Force**. This group has studied the means for the state to make reductions and recently made recommendations to reduce GHG in the state. On May 8, 2003, they submitted a report to Governor Pataki with 27 recommendations for reducing GHG emissions. Their recommendations include:

- Establishing a state GHG emission reduction target of 5% below 1990 levels by 2010 and 10% below 1990 levels by 2020;
- Creating a program to limit emissions from electricity generation to levels 25% below 1990 levels by 2010, and making this cap part of a regionally coordinated policy with each state adopting its own cap;
- Redirecting state transportation funds to transit, walking and bicycling;
- Adopting California's GHG motor vehicle emission standards for model year 2009;
- Establishing a comprehensive GHG inventory, with mandatory reporting by major industries and sectors and a voluntary emission reductions registry; and
- Negotiating voluntary reduction agreements with industry.

New York has begun to implement some of the Task Force recommendations[3]. Governor Pataki announced in January 2003 that New York would adopt California's GHG motor vehicle emission standard and a "Renewable Portfolio Standard" so that 25% of electricity purchased in

[1] NESCAUM State Comparison Matrix; http://www.nescaum.org/Greenhouse/Registry/state_matrix.html, July 2003.

[2] Summary of National Climate Change Programs; California Energy Commission, http://www.energy.ca.gov/global_climate_change/summary.html; July 2003.

[3] Greenhouse Gas State Registry Collaborative; NESCAUM, http://www.nescaum.org/Greenhouse/Registry/state_matrix.html ,July 2003.

the state would come from renewable sources. In June 2003, the New York State Energy Planning Board adopted the Task Force's recommendations for a GHG emission reduction target and to redirect transportation funding.

In **Phase II**, participants will tackle a number of projects aimed at advancing two primary project objectives: (1) public education and outreach and (2) building consensus on broader policy issues. These projects include,

- Expand the case studies to other entities (e.g., state and municipal authorities; hospitals, universities, etc.) and types of sources (e.g. manufacturing, pharmaceuticals, etc.),
- Develop a small-business outreach component that links large private-sector participants with their upstream and downstream business partners to explore untapped emission reduction opportunities and build political support for action within a crucial new stakeholder constituency,
- Examine baseline scenarios for pre-2000 reduction activities, with the aim of developing proposals to ensure baseline protection for entities that act early to reduce GHG emissions,
- Develop a model, regional GHG emission reduction registry that can provide guidance on methodological issues in documenting reductions and bring consistency to individual states' efforts to create early action registries, and
- Review the DOE Energy Information Agency's 1605(b) voluntary registry submissions, assess the "real" reductions represented by these actions taking into account entity-wide emissions, and develop criteria for recognizing early actions in the context of a future regulatory program.

On July 27, 2003, New York announced an additional agreement[1] that brings nine northeast states together to develop a regional strategy of actions on climate change. This coalition of states will work together to develop a market-based emissions trading system to reduce emissions from power plants. The states that have agreed to take part in this initiative include New York, Connecticut, Vermont, New Hampshire, Delaware, Maine, New Jersey, Pennsylvania, Massachusetts, and Rhode Island.

OREGON

Oregon bills its **CO_2 Policy and Legislation** as the first CO_2 regulatory standard in the US.[2] It regulates CO_2 by

- Requiring new power plants and other large energy facilities to avoid or offset a significant portion of their CO_2 emissions
- Encourages the developers to build the most efficient power plant possible,
- Provides Developer Options,
- Creates several methods for meeting the CO_2 standard, including providing funds to an independent trust to implement CO_2 offsets, and

[1] "Environmental Defense Applauds Pataki Multi-State Climate Effort" (News Release) http://www.environmentaldefense.org/pressrelease.cfm?ContentID=2910 Environmental Defense Fund, Washington, D.C., July 24, 2003.

[2] Mike Burnett, Innovative Policy for Greenfield Greenhouse Gas Emissions; Oregon Climate Trust, http://www.cultural.org/ace/pt/pres/burnett/tsld002.htm, November 1999

- Provides for an Evolving Standard: The Energy Facility Siting Council can reset and tighten the allowable limits over time.

The Legislation Provides that:

- New gas-fired power plant CO_2 emissions rate limits for gas fired plants
- Includes a mechanism for EFSC to tighten the CO_2 standard as power plant efficiency improves
- Standard is tied to a rate of 17% less CO_2 emissions than the most efficient power plant nationwide.

PENNSYLVANIA

Pennsylvania is a participant in the coalition of Northeastern states formed in July 2003 for addressing the climate issues in the northeastern states For more details, see discussion on New York above.

RHODE ISLAND

Rhode Island is a participant in the coalition of Northeastern states formed in July 2003 for addressing the climate issues in the northeastern states For more details, see discussion on New York above.

TEXAS

The **Texas Loan STAR Program** provides energy efficiency project financing for state agencies, institutions of higher education, school districts, and local governments. A new **Renewable Portfolio Standard** requires that all electricity providers obtain renewable energy capacity, finance construction of renewable energy facilities, and develop new renewable energy resources by 2009. Energy producers can meet the standard by developing renewable energy capacity or by purchasing renewable energy credits.[1]

UTAH

Utah actions have resulted in the financing and installation of solar energy and energy efficient technologies in many of its state and national parks and monuments to reduce pollution in pristine areas and educate visitors about clean energy.

VERMONT

Vermont's stated goal is to reduce region wide greenhouse gas emissions, by state government, from the 1990 baseline by: 25% by 2012; 50;% by 2028; and, if practicable using reasonable efforts, 75% percent by 2050. An **Executive Order** signed in August 2002 by Governor Harold Dean MD[2] requires:

- A working group tasked with coordinating, documenting, and encouraging efforts to meet Vermont's greenhouse gas emission reduction goals. It prepares a biennial report

---

[1] Summary of National Climate Change Programs; California Energy Commission, http://www.energy.ca.gov/global_climate_change/summary.html; July 2003

[2] Harold Dean MD; Executive Order 11-02; State of Vermont Executive Department; http://www.anr.state.vt.us/dec/wastediv/csc/execorder.pdf; August 2002.

documenting these efforts, identifies future steps, their anticipated impacts, challenges for meeting the goals, and opportunities for expediting greenhouse gas emission reductions.

- Directs all state government agencies, offices, and departments to:
  - Purchase only energy-consuming devices that meet or exceed the **Energy Star®** or comparable standards established by the U.S. federal government;
  - Purchase vehicles that have the highest available fuel efficiency in each respective vehicle class;
  - Develop programs to encourage state employees, through the use of incentives, to use transportation alternatives to a single person in a single motor vehicle for travel;
  - Ensure that every state building reduces its energy consumption to meet the outlined greenhouse gas reductions;
  - The Department of Buildings and General Services must investigate cost-effective opportunities to purchase renewable energy to reduce the state's reliance on fossil fuels; including electricity derived from solar, wind, geothermal, landfill methane gas, or small scale (less than 30 megawatts) hydroelectric projects.
  - The Working Group must prepare a report to the Governor and the General Assembly describing opportunities to initiate a statewide voluntary greenhouse gas emissions registry, and investigate the feasibility of a carbon emissions cap and trading program for the state as a strategy for further reducing region-wide greenhouse gas emissions.
  - The order also requires the establishment of sector-specific baselines, development of an emission tracking protocol, and institution of an emissions trading mechanism.
  - The Group must also recommend further greenhouse gas reduction targets and identify activities to help meet those targets.

The state is also a participant in the July 2003 coalition of Northeastern states formed for addressing the climate issues. For more details, see discussion on New York above.

WASHINGTON

Washington has achieved reductions in electricity use through "demand site management," requiring electric utilities to control electricity demand. In addition, electric generating facilities powered by renewable resources are eligible for certain tax exemptions. Their **Commute Trip Reduction Program** (1991) includes state assistance and requires employers with over 100 employees (in 9 counties) to develop programs to encourage use of mass transit, carpooling, etc.[1]

WISCONSIN

Wisconsin assists one of its largest dairy farms with manure-to-energy technology. The state has developed a voluntary registry for GHG emissions.

---

[1] Summary of National Climate Change Programs; California Energy Commission, http://www.energy.ca.gov/global_climate_change/summary.html; July 2003.

WYOMING

Wyoming recently established an advisory committee to implement a carbon sequestration and carbon credit-marketing program[1].

Groups of States and Other Jurisdictions

NESCAUM

The Northeast States for Coordinated Air Use Management (NESCAUM), a planning organization with membership from six New England States plus New York and New Jersey, has been active in the analysis and promotion of many issues related to GHG's. It has initiated a GHG demonstration project, which is now into Phase II. During the first phase of the project, participants quantified the effect of companies' specific GHG-reducing activities and began to explore broader issues related to the eventual treatment of these voluntary actions in the context of a future regulatory regime. Through this process, it demonstrated the availability of cost-effective and quantifiable GHG reduction opportunities in a host of industrial, residential, and transportation applications.

Nine GHG reduction projects were submitted to the **NESCAUM GHG Trading Demonstration Project** during **Phase I**:

- Tumbler front load clothes washers, an energy efficiency project submitted by the Northeast Energy Efficiency Partnership, Inc,
- A power plant fuel switch to natural gas submitted by PG&E Generation,
- Hydroelectric electricity production submitted by Ontario Hydro Generation (CHI Energy, Inc./North American Carbon Inc.),
- Landfill gas energy project submitted by PG&E Generation,
- Residential boiler conversions to natural gas submitted by KeySpan Energy,
- Battery operated shuttle buses submitted by the Northeast Alternative Vehicle Consortium,
    - Fuel cell energy production submitted by KeySpan Energy,
    - A waste heat project submitted by Sunoco, and
    - Biomass fueled electricity production project submitted by PSEG Global.

The NESCAUM web site has more details.[2]

NESCAUM has also begun utilizing new funding for developing a registry. Their stated aim is to "develop a voluntary registry with rigorous reporting and certification standards that could underwrite an emissions crediting and trading system(s) in the future, focusing initially on the power sector, and to have it enter operation within 18 to 24 months of the project's start." They plan to partner with the California Climate Action Registry and with the World Resources Institute, both of which have significant experience and expertise on GHG measurement and reporting. They also plan to make the NE registry compatible with the California registry so that companies can report to both using the same guidelines for quantifying emissions and certifying their reports. They have designed the project to fulfill the directive for a regional registry in the NEG/ECP action plan and to meet the parallel interests of New York and New Jersey under their

---

[1] Ibid Reference 1

[2] Overview of the NESCAUM Greenhouse Gas Early Action Demonstration Project: Phase II, http://www.nescaum.org/Greenhouse/index.html, NESCAUM, July 2003.

respective climate change agendas. However, they have also are invited other interested states to participate.[1]

NEW ENGLAND STATES AND EASTERN CANADIAN PROVINCES

In August of 2001, the New England Governors and the Eastern Canadian Premiers (NEG-ECP) signed an agreement for a comprehensive regional **Climate Change Action Plan** to jointly reduce regional GHG emissions. The Plan seeks to reduce regional GHG emissions to 1990 levels by 2010, reduce emissions by 10% below 1990 levels by 2020, and eventually reduce emissions sufficiently to eliminate any dangerous threat to the climate (75-85% below current levels). It also calls for a regional standardized GHG emissions inventory and registry. The plan includes measures to adapt regional economies and infrastructure to the negative impacts predicted to result from climate change[2].

NEW YORK COALITION OF NINE STATES

As indicated in discussions above, on July 27, 2003 New York's Governor announced[3] an agreement that brings nine northeast states together to develop a regional strategy of actions on climate change. This coalition of states will work together to develop a market-based emissions trading system to reduce emissions from power plants. The states that have agreed to take part in this initiative include; New York, Connecticut, Vermont, New Hampshire, Delaware, Maine, New Jersey, Pennsylvania, Massachusetts, and Rhode Island. Together with full implementation of the earlier commitment in New York for mobile sources, a regional cap on power plant emissions is expected to achieve a goal of showing how practical, market-based tools can create a multi-sector solution to climate change.

Northeastern States Suit to List CO_2 as a Criteria Pollutant

Attorneys General from the states of Connecticut, Maine and Massachusetts recently filed suit June 4, 2003 in federal district court in Connecticut against EPA for its "failure to regulate carbon dioxide (CO_2) under the Clean Air Act." According to the lawsuit[4], EPA has acknowledged both that CO_2 emissions pose a serious risk to human health and that it has authority to regulate CO_2 emissions under the Clean Air Act. Accordingly, the suit contends that EPA has a mandatory duty to regulate CO_2 emissions under the Clean Air Act. If the lawsuit is successful, EPA will likely have to list CO_2 as a criteria pollutant and develop a national ambient air quality standard for it. Such a process would no doubt be lengthy (10-20 years before implementation) and would require development of a new process for "indirect" health effects.

Perhaps as a preemptive action, directly as a response to a petition and because of other internal decisions related to 5-year reviews required for criteria pollutants, EPA on August 27,

---

[1] Jennifer Weeks, Senior Policy Analyst, NESCAUM, email dated July 21, 2003.

[3] "Environmental Defense Applauds Pataki Multi-State Climate Effort" (News Release) http://www.environmentaldefense.org/pressrelease.cfm?ContentID=2910 Environmental Defense Fund, Washington, D.C., July 24, 2003.

[4] Commonwealth of Massachusetts, State of Connecticut, and State of Maine, Civil Action v. Christine Todd Whitman; Defendant, in her capacity as Administrator of the United States Environmental Protection Agency, United States District Court, District of Connecticut, June 4, 2003.

2003 announced a ruling[1] in the Federal Register on the status of CO_2 as an air pollutant for purposes of regulating motor vehicles and declared that it was not a criteria air pollutant. The announcement did however, reinforce other continuing climate change programs such as **Climate Leaders, Energy Star, Green Power, Smart Way** and **Best Workplaces for Commuters**. This action is independent of the court actions mentioned above, though there may be a bearing one on the other. It is likely to be a few months before the court rules on this suit.

[1] "EPA Denies Petition to Regulate Greenhouse Gas Emissions from Motor Vehicles," http://www.epa.gov/newsroom/headline_082803.htm; US EPA, Washington, D.C., August 28, 2003.

Chapter 4 Technical and Policy Options for Further Study

Various technical and policy options have been proposed in various studies and reports to provide answers to CO_2 emissions from the utility sector. Some such proposals may turn out to be practical and worthy of implementation and some proposals are continuing to be under development and research or have serious economic downsides that preclude their implementation in the near future. Some such options may have the appearance of providing a cure for the "problem" but with more in depth consideration, may be impractical or impossible.

The purpose of this chapter of the report is to identify some of these candidates for further study and to provide some insights into how future reports and considerations in NC may lead to rejection or eventual adoption of those that are advantageous for the state. Generally, these policies and technologies fall into:

1) Direct utility sector improvements in efficiency or methods of operation that result in more electricity for equal or less fuel,
2) Development and/or implementation of means to remove and directly sequester GHG before they enter the atmosphere,
3) New customer improvements in efficiency and the like to reduce power requirements and subsequently the GHG emissions at the utility plants,
4) New replacement energy generation technologies that generate less (or no) GHG and
5) Means to improve the sequestration and removal of emissions that have already entered the atmosphere.

Direct Utility Sector Improvement Opportunities

In this category, one must consider how to reduce emissions prior to their generation or to collect them after generation. As is often the case, efficiency and economics are key factors. The seriousness of the requirements, the practicality and viability of the solutions and the economic plausibility must be evaluated and traded off with regard to other impacts.

Direct Power Plant Efficiency Improvements

Since the majority of CO_2 emissions from the electric industry (especially in NC) are from coal-fired power plants, attention must be given to evaluating possible methods for reducing emissions directly from these facilities. These options might include:

- Fuel Switching[1]
- Gasified Coal
- Increased Use of Oil and Gas Turbines[2]
- Combustion Modification
- Distributed Generation
- Others

[1] *Reducing Greenhouse Gases & Air Pollution: A Menu of Harmonized Options;* State and Territorial Air Pollution Program Administrators/Association of Local Air Pollution Control Officials (STAPPA/ ALAPCO), Washington, DC, October 1999.

[2] R.W. Smith, et. al.; Advanced Technology Combined Cycles, GER-3936A, GE Power Systems; May 2001.

Potential Options from STAPPA/ALAPCO Study and Caveats

Table 4.1 is adapted from the cited STAPPA/ALAPCO study.[1] It summarizes technology-based options that may be worthy of further analysis during this study. Theoretical merits of these options may be evaluated for application to the NC plant "fleet." However, DAQ recognizes that such analyses must be undertaken in the context of economics and physical practicality and the current complex regulatory scheme. Fluidized-bed combustion, for example is probably an excellent high-efficiency means to improve the overall plant fleet. However, application of this technology would involve a substantially new plant and complication of the regulatory situation that now exists. One must assume that while the utilities in the business to generate electricity, they also need to make a profit and likely have already considered many options to increase efficiency and thus profitability. Evaluation of such barriers encountered in modifications may be worthy of further analysis.

Table 4.1: Summary of Potential Technology-Based Utility Emission Reduction Strategies

Technology-Based Strategy	Description
Combined Heat and Power	The combined heat and power process generates electricity and useful heat or steam in the same process. Cogeneration begins with either electricity or steam production. Excess energy from the first process is the input to the second.
Gas-Fired Combined Cycle	Combined cycle technology uses fossil fuel combustion to drive a combustion turbine. The waste hear from this process is then captured to drive a conventional steam generator with thermal efficiencies to 60% versus "the 30's" for conventional units.
Co-Firing with Biomass and Gas	Co-firing is the simultaneous combustion of coal and biomass or coal and natural gas in a previously coal-fired boiler. The process reduces both SO_2 and CO_2 emissions.
Integrated Gasification Combined Cycle	This process is the combustion of gasified coal in a combined-cycle system. A major benefit of coal gasification is that is allows many of the impurities in coal to be removed, providing considerable reductions in criteria pollutant emissions in relation to conventional coal combustion.
Fluidized-Bed Combustion	Combustion of crushed coal in a suspended mass within the boiler results in increased combustion efficiency and lower combustion temperatures relative to conventional coal boilers.
Fuel Cells	Fuel cells generate electricity and heat in an electrochemical reaction, as opposed to combustion.
Carbon-Sensitive Plant Dispatch	This plan promotes the operation of more low-emitting plants less high-emitting plants.

[1] Reducing Greenhouse Gases & Air Pollution: A Menu of Harmonized Options; State and Territorial Air Pollution Program Administrators/Association of Local Air Pollution Control Officials (STAPPA/ALAPCO), Washington, DC, October 1999.

POLICY-BASED OPTIONS TARGETED AT DIRECT REDUCTIONS

In addition to the aforementioned technology-based strategies to apply directly to coal fired power systems, there are policy-based strategies that should be evaluated and further considered. Such changes would be targeted at direct reductions before the emissions are produced, such as regulation of carbon emissions (carbon tax). Table 4.2 summarizes some policy-based strategies that were suggested in the study and report cited earlier.[1]

Table 4.2: Potential Policy-Based Utility Emission Reduction Strategies

Policy-Based Strategies	Description
Comparable Emission Standards	These standards would require old plants, formerly "grand fathered," to comply with tighter regulatory policies.
Output-Based Emission Standards	This system would establish emission standards in terms of mass per unit of electrical output, rather than per unit of heat output.
Tax Credits	Shift state and federal fiscal policy toward the support of lower-carbon generating technologies (similar to "Green Power Program.")
Environmental Disclosure	Disclosure laws would require all electricity suppliers to identify the environmental impacts of the electricity they are selling.
State-Level Emission Portfolio Standards	This program would require all retail electricity suppliers in a state to acquire power from sources that were at or below designated emission rates.
Anticipating Nuclear Retirements	This plan involves assessing the viability of existing nuclear plants and planning for their retirement or refurbishment.
Interconnection Policy	This policy would improve rules for interconnecting small generators with electricity distribution systems to facilitate interconnection and maintain the safety and reliability of the system.
Carbon Requirements in the Plant Siting Process	This plan would require developers of new power plants to offset future carbon emissions with investments in sequestration projects or the purchase of GHG credits when available.
Emission Trading	Emission trading would allow emission allowances or credits for emission reductions to be traded among market participants.
Carbon Taxes	A tax would be levied on carbon emissions.
Renewable Portfolio Standard [RPS(s)]	All energy suppliers licensed in a state being required to sell energy from renewable sources as a percentage of their total energy sales, with provisions for periodic review to evaluate effectiveness.

Direct Removal and Sequestration of CO_2 Emissions from Utility Boilers

As a basic concept, the removal of CO_2 from a voluminous gas stream is monumental and an unlikely technological accomplishment within low costs. On the principle that "one atom of carbon burned equals one atom of CO_2," the most efficient means to reduce CO_2 emissions may be to reduce combustion through increased energy conversion efficiency and/or conservation practices. Many have targeted reducing CO2 from large stationary combustion systems as a

[1] *Reducing Greenhouse Gases & Air Pollution: A Menu of Harmonized Options,* State and Territorial Air Pollution Program Administrators/Association of Local Air Pollution Control Officials (STAPPA/ ALAPCO), Washington, DC, October 1999.

means to reduce greenhouse emissions from fossil fuel combustion systems. Proposals developed for reducing emissions, include fuel switching, efficiency improvements, CO_2 capture from conventional flue gas streams and oxy-fuel[1] fired systems with CO_2 capture.

Research continues at the US DOE and other organizations to further examine the potential for various add-on technologies as well as means to sequester CO_2 emissions in other forms. No conventional methods are yet available to efficiently and economically remove (wash out) significant percentages of CO_2 from the exhaust stream of a coal fired utility boiler. However, methods have been proposed, and are being tested, to accomplish this. Projected cost/power "penalties" for such advanced technologies are expected (by DOE) to range from 9% to 15% of plant generating capacity. Capital costs can also be significant for such reaction and recovery trains to remove the low concentrations of CO_2 in the flue gas.[2]

OXY-FUEL

One proposed way to help overcome some of the problems of collection, according to DOE, is to switch to oxy-fuel combustion. Use of oxygen in place of air creates a much lower volume of flue gas, which enhances thermal efficiency, thereby lowering CO_2 emissions, and resulting in lower quantities to treat. Since much of the flue gas consists of CO_2 and water, separation and purification are thus greatly simplified. These advantages have led several groups to explore oxy-fuel based boilers to enhance the boiler efficiencies and CO_2 recovery. A unit at Progress Energy has shown efficiency improvements from such a process (without recovery).

MOLECULAR SIEVE AND OTHER NOVEL COLLECTION & SEPARATION IDEAS

Another DOE research project is investigating a carbon fiber composite molecular sieve to remove CO_2. Other such projects sponsored by DOE include investigation of methods by which fly ash can be stabilized into conglomerates to be used as road construction or fill material and by which microbial processes could be applied to produce various carbonates by iron-reducing bacteria. Carbonates are produced *in situ* at the surface by photosynthetic algae and at depth by anaerobic carbonate producing bacteria. Microbial activities would convert CO_2 into a stable mineral; waste ash would be converted to a useful product. Leaching of heavy metals from fly ash ponds would be reduced/avoided, and other applications of this technology in agriculture or food processing are possible[3] as well as other novel ideas that are being pursued.

SEPARATION AND DUCTING TO DEEP UNDERGROUND COAL SEAMS

A major research area at DOE involves the collection, separation and "ducting" of CO_2 from the utility exhaust into deep unmineable coal seams to scavenge and/or "generate" methane, which is then forced to the surface for useful consumption. The objective of this project is to

---

White, et. al., Separation and Capture of CO2 from Large Stationary Sources and Sequestration in Geological Formations – Coalbeds and Deep Saline Aquifers, National Energy Technology Laboratory, Pittsburgh, Pennsylvania; **Journal of the Air & Waste Management Association; Volume 53**, June 2003 (Critical Review Presented at the A&WMA Annual Conference, San Diego, Ca, June 2003.

[3] Biomineralization for Carbon Sequestration, U.S. Department of Energy, http://dominoweb2.fossil.energy.gov/domino/apps/fred/fred.nsf/ , July 2003.

provide a wide range of benefits to the industry. The tasks include providing two significant field-demonstration sites that involve collecting or sequestering N_2/CO_2 mixtures, which is similar to power-plant flue gas. This project would also examine the feasibility of CO_2 sequestration in the broad set of conditions (coal types and emission compositions) that are likely to be encountered in the U.S. It would develop screening models to enable industry to quickly evaluate the technical and economic feasibility of CO_2 sequestration in coal beds for project specific conditions.[1]

As one may surmise, these and several other research areas are continuing to show progress. The difficulties of CO_2 removal are high, as will be the likely costs for accomplishing reductions. This is not to say that it is not worthy and necessary to research and develop, if possible, but the results will not likely be accessible for actual practical and economically feasible application within the time span of this effort. These areas must be followed closely and continually assessed.

Customer-Side Emission Reduction Options

The various use sectors (demand side) of electrical output use large quantities of electricity. Thus, many places have been identified for potential efficiency improvements. Much waste can be eliminated and consequently emissions from utility plants reduced, accordingly. A reduction at the customer sector will also translate to approximately 10% recovery of efficiency due to line loses that are not experienced from delivering that quantity of electricity.

Residential And Commercial Buildings Energy Consumption

Residential and commercial buildings consume, both directly and indirectly, over one-third of the fossil-fuel based energy in the US. Combined, these sectors represent the second largest source of GHG emissions in the US. Approximately two-thirds of the emissions from these sectors cause emissions at the electric generating facility. Electricity consumption is a result of lighting, heating, cooling and operating appliances. The remaining emissions occur on-site and result from direct consumption of natural gas and petroleum products used for space heating, water heating, and cooling needs etc.

Residential Energy Use

The residential sector is also a large consumer of fuels on-site and from electric energy generated elsewhere. Direct air emissions come from consumption of natural gas and other petroleum products utilized for space heating, water heating and cooking. In 1997, the residential sector directly consumed approximately 7.21 quadrillion British thermal units (quads) of fuel on-site.[2] See Figure 4.1 and 4.2.

[2] Biomineralization for Carbon Sequestration, U.S. Department of Energy, http://dominoweb2.fossil.energy.gov/domino/apps/fred/fred.nsf/, July 2003.

Commercial Buildings Energy Use

The commercial sector accounts for 5% of the buildings in the US, but uses 40% of the building energy. In commercial buildings, the five largest end-uses are (1) miscellaneous equipment, (2) space heating, (3) lighting, (4) water heating, and (5) space cooling. In 1996, the commercial sector consumed 3.33 quads of electricity.

Figure 4.1: 1997 US Residential Electricity End Uses

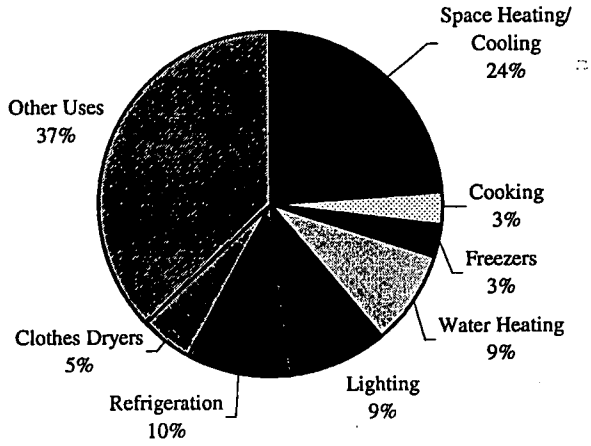

Figure 4.2: 1997 US Residential On-Site Energy Use by Fuel Type

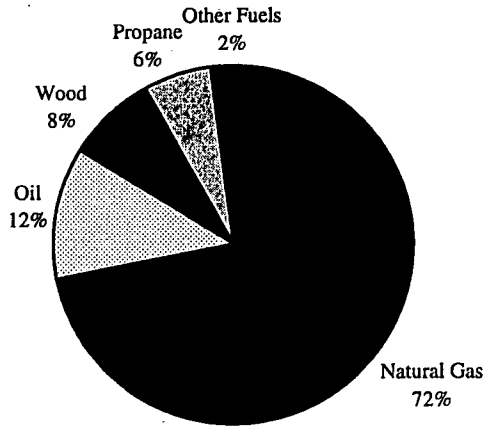

Figure 4.3: 1997 U.S. Commercial Electricity Use

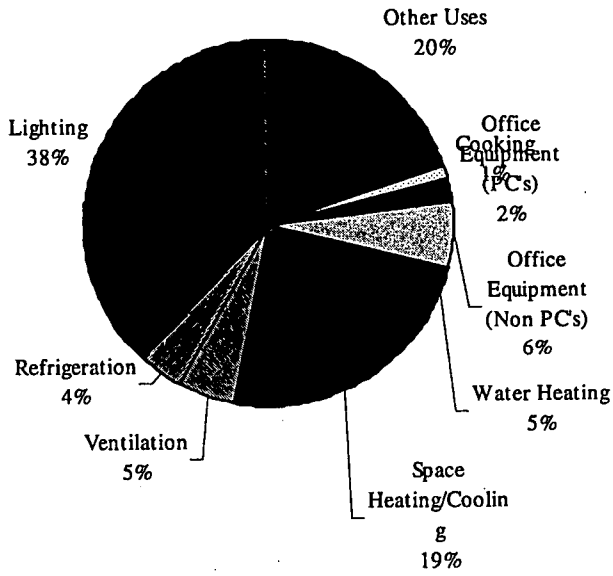


Substantial quantities of emissions come from residential and commercial consumption of natural gas and other petroleum products utilized primarily for space and water heating and to power motors. In 1997, the commercial sector consumed approximately 3.7 quads of fuel on-site, with natural gas representing 91% of the fuel consumed, oil 1% and other fuels 8%. Table 4.3 below illustrates the CO_2 emissions per fuel type for both of the residential and commercial buildings sector.

Table 4.3: 1996 CO_2 Emissions (MMCTE) from On-Site Fossil Fuel Combustion

End-Use Sector	Coal	Natural Gas	Petroleum	Totals
Residential	1.4	77.4	27.2	106.0
Commercial	2.1	47.4	15.3	64.8
Total	**3.5**	**124.8**	**42.5**	**170.8**

POTENTIAL RESIDENTIAL/COMMERCIAL REDUCTION STRATEGIES

Several methods such as efficiency measures, equipment upgrades, and policy options that can be used to improve energy consumption in buildings.

- Thermal Efficiency Increases from Insulation
  - Thicker wall/ceiling
  - Retrofits with foam
- Air Sealing Measures[1]

[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies, Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

- Light Efficiency Measures
  - More efficient bulbs
  - Better controls to minimize time on
- HVAC Efficiency Measures
  - More efficient heat exchange
  - Better controls to maximize comfort with less energy use
- Hot Water Efficiency Measures
  - More efficient heat recovery
  - Less heat loss to air
- Energy Audits
- Building Code Improvements
  - Increased wall and roof insulation requirements,
  - Increased window insulating values and require shading devices,
  - More stringent requirements for efficient heating and cooling systems,
  - Increased efficiency requirements for lighting systems, and
  - Requirements for better control over all energy-using devices that reduce consumption when the building is not occupied

Summary

The series of tables that follow summarize some of the technology-based and policy-based strategies that can be applied to the residential and commercial buildings sectors to achieve emissions reductions.

Table 4.3: Reduction Opportunities for Residential Emission Sector

Technology-Based Strategy	Description
Residential Sector	
Space Heating	High efficiency furnaces, high efficiency heat pumps and water- and ground-source heat pumps.
Small Appliances	Using energy-efficient designed products such as Energy Star
Water Heating	Use less, set thermostat lower, insulate the heater, and use a more efficient water heater – consider point of use heaters if possible
Lighting	Use compact high-efficiency and fluorescent lamps.

Table 4.4: Reduction Opportunities for Commercial Emission Sector

Commercial Sector	Description
Space Heating	Replace old heating systems with systems that include energy-efficient furnaces, boilers and geothermal heat pumps. Common retrofits are controls, improved chillers and maintenance.
Lighting	Use high intensity/low energy lights and improved controls.
Other Miscellaneous Equipment	Technologies that have significant potential to reduce energy use and emissions are motor drive systems commonly used in systems and processes such as conveyors, fans and pumping systems.

Table 4.5: Policy and Market Based Opportunities for Use/Emission Reductions

Policy-Based Strategy	Description
Voluntary Programs	1) Identify and promote profitable energy-efficient technologies, 2) Assist industry participants in marketing energy-efficiency products and services and 3) Educate the public about the benefits of products and services to stimulate consumer demand.
Building Energy Codes and Standards	More stringent energy requirements in building codes.
Utility Rebates/Incentives	Demand-side management programs to save energy Change building practices to include energy-saving design features through rebates and financial incentives.
Collaborative Efforts of Stakeholders and Consumers	Participate in ENERGY STAR Homes for residents and ENERGY STAR Buildings for commercial and industrial buildings & others.
Tax Credits	Tax policies that favor energy efficiency.
Emission Trading	Emission trading programs allow private entities, under certain circumstances, to buy and sell excess pollution reductions that they achieve.
Public Awareness and Education	Information programs that include advertising, educational campaigns, informational reports, voluntary actions, support for R&D, demonstration projects and technical assistance.

The *North Carolina's $ensible Greenhouse Gas Reduction $trategies*,[1] made several recommendations to achieve reductions and improve energy efficiency of existing and new commercial buildings and improve equipment and lighting. The measures defined would provide significant energy and cost savings. Table 4.6 summarizes these savings.

Table 4.6: Emission Reductions from Mitigation Strategies for the Commercial Sector

Strategy	CO_2 (million tons)	Percent of Total
Existing Buildings: Thermal Efficiency Improvements	1.38	1.3
Existing Buildings: Lighting Efficiency Measures	0.40	0.4
Existing Buildings: HVAC Efficiency Measures	0.23	0.2
Existing Buildings: Domestic Hot Water Efficiency Measures	0.07	0.1
Existing Buildings: Appliance and Office Equipment Measures	0.05	0
Fuel Switching: Solar Water and Space Heating	0.05	0
Fuel Switching: Electric to Natural Gas for Space Heating	0.33	0.3
Fuel Switching: Electric to Natural Gas for Water Heating	0.08	0.1
New Buildings: Improvements in Thermal, Hot Water and HVAC Efficiencies, Alternative Energy Options	2.82	2.7
Sector Total	**5.40**	**5.1**

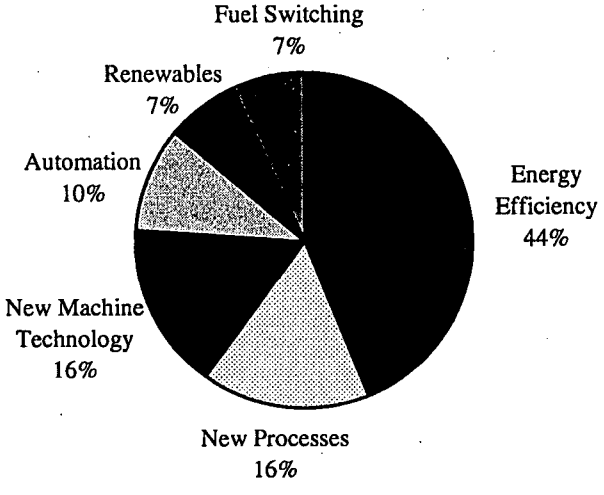
[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies, Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

INDUSTRIAL SECTOR

The industrial sector in North Carolina ranks first in terms of end use consumption of energy. Estimated final energy demand in the State's industrial sector was 447.3 trillion Btu or almost a third of all energy use in NC in 1997. Strategies to reduce GHG for energy intensive industries must focus more heavily on boilers and direct processes uses such as motors, compressors, and steam systems. Figure 4.4 displays the relative emissions saving from instituting the strategies outlined below.

North Carolina is known for its biotechnology industry, textiles, furniture, tobacco and paper products. This is only a small sample of the overall industrial sector in the state. Figure 4.5 lists the 20 primary Standard Industrial Codes and the number of employing businesses for each respective code type in North Carolina.

Figure 4.4 – Relative Emissions Reduction Contributions from Industrial Strategies



Energy Efficiency Measures

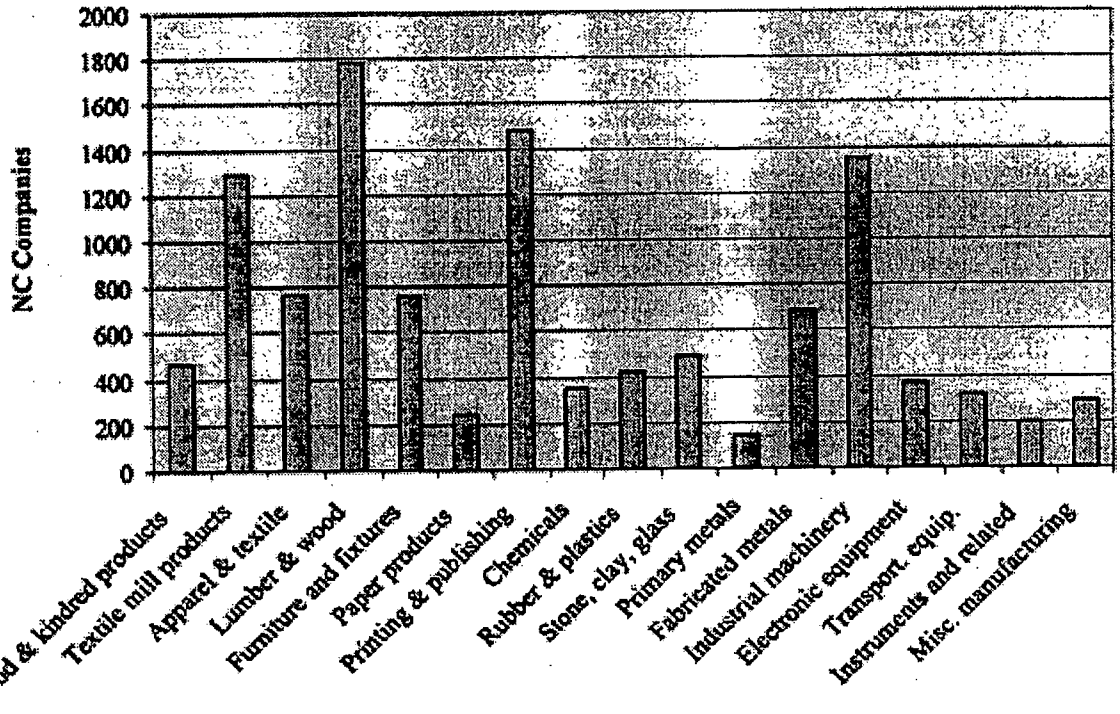
Several common measures were recommended from the ASU study [1] which is referenced herein as a major source document. These include:

- Boilers efficiency improvements evaluated included
  - Fuels used; including coal, wood, natural gas, fuel oil, and other petroleum products
  - Industries using most boilers are furniture, paper products, and chemicals
  - Average savings from efficient boiler measures can 3% of the total facility energy use.
  - Boiler load management

[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies, Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

        - Size for load
        - Tune-ups, maintenance and adjustment of air/fuel ratios
        - Waste heat recovery
    - Insulation and heat containment
    - Process waste heat recovery
    - Etc.
- Use of Compressed Air Systems
- Cogeneration
- Use of Energy Efficient Motors
- Heating and Air Conditioning Improvements
- Lighting Efficiency and Control Improvements
- Use of New Machine Technologies (more efficient)
- Automation

Figure 4.5 – Number of Companies in North Carolina by Industry Type



Policy Options

Four categories are available for CO_2 reductions in the industrial sector.[1] Table 4.7 highlights the programs under their respective category.

[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies, Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

Table 4.7– Summary of Policy Options Available for the Industrial Sector

Measure	Program Name
Direct Financial Incentives	Tax incentives for efficiency investments Subsidized loans for efficiency investments Carbon trading allowances
Regulatory Action	Mandated emissions limits Emissions portfolio standards
Recognition Programs	EPA **Energy Star** **Governor's Award** for Industrial Energy Innovation
Technical Assistance and Education	**Climate Wise** for Industry Industrial Assessment Center

Industrial Summary Remarks

The State's dominant industries, tobacco, woodworking, and textiles, are not energy-intensive. These industries generally require more precisely applied quantities of heat and do not produce large quantities of heat. However, a few high-energy intensive industries may provide an earlier pay back. Because of environmental concerns, natural gas and electricity usage will likely increase in this sector while the use of coal will diminish. Table 4.8[1] summarizes the relative emissions savings from instituting the above strategies.

Table 4.8 – Potential CO_2 Industrial Sector Emission Reductions Strategies

Strategy	CO_2 (million tons)	Percent of Total
Energy Efficiency Improvements	7.44	7.1
New Processes (Modernized Manufacturing Processes)	2.57	2.5
New Machine Technology	3.18	3.0
Automation	1.72	1.7
Fuel Switching: Coal to Natural Gas	0.64	0.6
Renewable	1.14	1.1
Total	**16.70**	**15.7**

North Carolina is projected to become more of a commercial and financial center and less of an industrial one. As a result, manufacturing employment is expected to decrease by 0.5% per year. Therefore, the future demand for energy in the industrial sector is predicted to be less than the demand in residential and commercial sectors.

Use of Energy Generation Options That Do Not Produce CO_2

Non-GHG producing energy is being used on site for direct thermal energy and electricity. Numerous promising options and programs exist and are under development to generate electricity or provide energy in a form for direct use. Every watt of such energy generated

[1] North Carolina's $ensible Greenhouse Gas Reduction $trategies, Appalachian State University, Department of Geography and Planning, Boone, NC, January 2000.

replaces a watt of energy that would have been otherwise generated by burning carbon fuels. However, this section only identifies some of the potential options. These will require further study, research, evaluation and discussion before any meaningful and useful recommendations can be made toward the objectives of the needs.

Technologies already identified and available for evaluation include:

- Solar walls - thermal collectors vertically oriented on a south-facing wall to provide space and process air heating
  - Power roofs – concentrating trough thermal systems for commercial roofs
  - Standard flat plate solar hot water collectors - used to produce high temperature water for preheating and processes
- Biomass combustion instead of coal- for example, co-fire wood residues with coal for heat production.
- Energy conservation measures already discussed and such factors as "white" reflective roofs to cut cooling loads (**Cool City Program**),
- Alternate electrical generation systems,
  - Wind turbines
  - Photovoltaic cells and systems
  - Fuel cells
  - Thermal Electric Systems
  - Hydro-power construction or renovation
  - Nuclear

Future versions of this report will address these further as far as they may relate to the scope and objectives of this effort.

Sequestration of CO_2 from the Atmosphere

Forests and other vegetation remove CO_2 from the atmosphere through their regular living and growing processes. Removal of wood and processing into houses and other structures tend to sequester the carbon from the air and make permanent or semi-permanent forms of carbon containing materials that will hold on to the carbon for long periods of time (e.g. until building demolition, burning, etc.). Maintenance of standing timber/forests also retains carbon in a solid form not released into the atmosphere. However, removal and burning of vast forests, such as in the South American rain forests releases large quantities of CO_2. Wild fires and controlled burning for forest management also release considerable CO_2. Burning also removes these sequestering organisms from the sequestering side of the equation and has a detrimental effect on the Earth's capacity to remove CO_2 from the atmosphere. Although research[1] has shown a natural ability of existing vegetation to adapt and take on more CO_2 at a higher rate in higher concentrations, but this is not adequate to make up for the extra carbon burned.

Many potential policies and projects have been initiated and proposed that would result in the planting large quantities of vegetation to take further advantage of the natural sequestration

[1] The Duke Forest FACE facility; FACE Project, Duke University, http://c-h2oecology.env.duke.edu/Duke-FACE/description.cfm, July, 2003.

capabilities of vegetation. Research has also shown that biological modifications may be possible to generate more "CO_2-hungry" forms of vegetation. However, since vast quantities of forest have been cut and large emissions of CO_2 have been emitted from these and fossil fuels, huge quantities of vegetation would need to be grown to capture all the "extra" carbon. This vegetation then will need to remain unburned, to make significant differences in the levels of CO_2 in the atmosphere.

Biotechnology may hold some promise for moderating global warming caused by the greenhouse effect. The type of genetic enhancement possible through biotechnology is not going to change dramatically rates of terrestrial carbon sequestration or bypass the laws of thermodynamics, however. Researchers are focusing on several possible ways biotechnology might help on both fronts. Some crops already being designed to withstand wind could help sequester more carbon into soils, says agronomy professor Charles Rice of Kansas State University[1]. For example, corn that is engineered to grow thicker, woodier stalks uses more carbon. The carbon is needed to make all the woody lignin and cellulose that makes them thicker and stiffer. Lignin and cellulose are slow to decompose in the soil, says Rice, "The more biomass you produce, the more carbon that's put into the soil." The DOE's **Center for Research on Enhancing Carbon Sequestration in Terrestrial Ecosystems (CSiTE)** is studying many grasses, trees and all manner organic and inorganic ways to sequester carbon and enhance carbon capture and long-term sequestration.

Biomass-derived ethanol has been touted as a potential liquid fuel replacement for gasoline. However, finding a substitute for oil, a high-energy-density liquid fuel that has powered the U.S. economy for more than a century, will not be quick or easy. Indeed, it's likely that nothing will replace the convenience and versatility of petroleum until it is forced by unavailability. Ethanol production from corn produces a net energy loss, so research scientists are studying the feasibility of using cellulose feedstock (agricultural and forestry wastes, grasses and certain components of municipal waste) to produce biofuel more efficiently. Producing cellulosic ethanol from trees and grass may be more efficient than using corn, but ultimately, the energy required to mine ore, produce steel, and manufacture tractors and farming equipment; and the amount of fuel, whether ethanol or biodiesel, needed to harvest, transport, and process the biomass is often greater than that contained in the ethanol produced. This has not deterred the push for increasing the production of ethanol.

Chapter 5 Existing NC Programs Pertinent to CO_2 Reductions

Several programs in North Carolina already exist that follow the principles required for reduction of carbon energy use and thus the production of CO_2. The list below is only a sampling of them.

NC Climate Wise

Climate Wise[1] is a government-industry partnership designed to help businesses turn energy efficiency and environmental performance into a corporate asset. It is based on a concept that what is good for business is good for the environment. According to Climate Wise Partners and officials, actions to improve energy efficiency and reduce greenhouse gas emissions save money and boost productivity. The base program is jointly sponsored by the US DOE and the EPA. The program is designed to help business and other organizations to be innovative and provides access to technical and financial assistance. The program in North Carolina was funded by the state until the budget problems forced its discontinuation. It has now been "privatized" in the form of a non-profit company called **Global Warming Initiatives** that is run from the NC State Centennial Campus. Thirty-nine companies have participated in the program in previous years and high interest continues.

Climate Leaders

Climate Leaders[2] is an EPA originated voluntary industry- government partnership that encourages companies to develop long-term comprehensive climate change strategies and set GHG emissions reduction goals. The program has just recently been initiated and no statistics have been seen on its success.

The **Climate Leaders** agreement spells out that the company will:

- Develop a company-wide inventory of GHG emissions annually as outlined by **Climate Leaders'** emission protocol's Core Module (direct emissions and emissions from electricity use).
- Report its GHG inventory data annually.
- Enter into discussions with EPA to develop an aggressive corporate-wide GHG reduction goal to be achieved over 5 to 10 years.

Climate Challenge

Climate Challenge began in 1994 as a DOE program. Through a mechanism of **Participation Accords**, Duke Power Company (Duke Power) and DOE agreed to participate in the **Climate Challenge Program** in pursuit of the President's goals for reducing greenhouse gas emissions. The **Climate Challenge** program is a joint, voluntary effort of DOE and the electric utility industry to reduce, avoid or sequester greenhouse gas emissions. The framework of

---

[1] GWI Services; http://24.172.16.181/docs/gwi%20services.pdf July 2003.

[2] Climate Leaders Partnership Agreement, http://www.epa.gov/climateleaders/pdf/agreement.pdf, EPA, Washington, DC, July 31, 2003.

Climate Challenge was established in the project's Memorandum of Understanding.[1] The program was developed with the intent of running through 2000. It was to accomplish the following elements under the agreement.

- Financial contributions to assist in promotion and support of the program
- Improve the capacity factor for their nuclear generation
- Realize improvements in hydro capacity, thereby displacing fossil generation
- Increase the utilization of combustion ash
- Reduce system losses on transmission and distribution system
- Conduct a program to increase the efficiency of fossil stations
- Purchase electric vehicles (EVs) and evaluate them
- Maintain efforts to be first in the nation in coal-fired heat rate
- Implement special rates for recharging EVs as an incentive for others to purchase
- Set and meet challenging goals for the corporate recycling of paper, cardboard, aluminum, glass, and other products, and
- Perform energy efficiency audits to implement measures that make economic sense.

Energy Star Partners

Energy efficient homes can be certified to meet the standards of the EPA's **Energy Star®** program[2,3]. The homes meeting these standards help reduce annual energy costs by up to 30 percent; thanks to their high-efficiency heating and cooling equipment and high-quality materials and construction. These standards also result in greater comfort year-round. In some cases, the power supplier provides incentives such as Progress Energy, which takes 5 percent off the customer's total monthly electric bill. The savings over the life of the home are substantial and the benefits include the potential for higher resale value and significant savings on financing. The **Energy Star** standards are assured by a third-party verification process to assures customers and the public that the homes meets these standards and, thus, qualifies it for a discount and other advantages.

The program also extends beyond the residential setting into commercial and other areas. As an example, Food Lion[4] as well as others have been recognized as Energy Star Partners

GreenPower

Green Power is synonymous with renewable energy resources. It denotes that the electricity is "greener" than electricity generated from traditional sources. Such sources can include nuclear, large scale-hydro, photoelectric and others, and results in lower or no air pollution emissions.

[4] Food Lion earns award for exemplary energy efficiency efforts, http://www.foodlion.com/cor_news.asp?parm=216, Salisbury, NC, March 2003.

NC's New GreenPower Program

NC GreenPower is a new program designed to improve the environment by encouraging the development of renewable resources in North Carolina. **NC GreenPower**[1] will provide electric consumers with an opportunity to voluntarily purchase green power at a small premium. The program is a cooperative effort between renewable energy generators, electric utilities, and electric consumers to implement and support green power generation in North Carolina. Under this voluntary program (announced July 28, 2003, but starting full operation in October), customers are provided the option to pay an additional $4 on their electric bills for each block (100 kilowatt-hours) of energy produced from wind, solar or methane sources. Utilities then must get that block of energy from a "green" energy generator. The concept is that for every block of clean energy purchased, one fewer block of power will be produced by fossil fuels.

The program offers two basic options to electric customers: a mass-market product available to everyone and a large volume product available to customers who purchase a minimum of 10,000 kWh or more from the program per month. All qualifying **NC GreenPower** resources will be used to supply the demand for the large volume product.

This program will enable the development of multiple types of renewable energy in NC. Initially, the mix of renewable resources used is expected to emphasize biomass (agricultural and wood waste, energy crops), landfill gas (methane), and small hydro. These sources are available, plentiful and facilities to utilize them can be constructed quickly. Solar and wind are a bit more expensive and will be developed later along with photovoltaic and wind generation sources. The program would benefit from state income tax credits for renewable energy technology deployment and Federal tax incentives.

Renewable Portfolio Standard

Renewable portfolio standards (**RPS**) are required programs somewhat similar to the voluntary **Green Power** programs. They require each utility selling power in an area to use renewable energy generation to generate a certain percent of its electricity. The **RPS** are billed as a flexible and easily verified means to guarantee that renewables grow in the market. The **RPS** are expected to help lower cost and increase the competitiveness of renewable technologies by increasing sales, commercialization, and use of available technologies. Shortcomings of the **RPS** include that it will probably not promote new and emerging technologies, not readily expand beyond existing renewable installations, likely not foster research and development needs or protect low-income consumers.

Public Benefits Fund

A converse option to the RPS employed in some areas, is a **Public Benefits Fund**. This is a charge applied to the sale of non-renewable generated electricity and is similar to the system benefit charge used in some states. The purpose of the fund is to collect and distribute money for investment in actions that are in the public interest, but which would not happen in a regulated or unregulated market. The fund is collected from each ratepayer as a small fraction for each kWh sold. It can support smaller scale renewable energy projects, energy efficiency projects not done by the market place, training, consumer education, low interest loans, and other refinancing

[1] NC GreenPower Is Here; http://www.ncgreenpower.org/ , July 2003.

mechanisms as well as funds for low-income assistance. As a policy tool, the public benefits fund is applicable with or without the restructuring of the utility industry.

In the absence of restructuring legislation, the NC Utilities Commission can establish such a fund. A public benefits fund is also necessary when an **RPS** program is implemented because the **RPS** typically favors economical and established renewable technologies. While supporting the goal of the **RPS**, the public benefits fund will also commercialize newer technologies, provide affordable loans for in-state, smaller scale, renewable and efficiency projects, and create new local jobs and businesses. See the discussions of the proposed **State Energy Plan** that appears below.

Advanced Energy Corporation

Advanced Energy Corporation was previously known as Alternative Energy Corporation, or AEC. They were founded by the NC Utilities Commission in 1980 to explore alternative ways of producing electricity and get more work out of the electricity (especially motors) already available.

Located in Raleigh, North Carolina, **Advanced Energy** is a national resource that focuses on industrial process technologies, motors and drives testing, and applied building science, with state-of-the-art laboratories in which to do testing and applied research. They are a non-profit corporation that creates economic and environmental benefits through innovative approaches to energy. They offer consulting, testing, and training, and strive to develop innovative solutions to energy problems. Their primary mission is to increase efficiency and productivity in industries, businesses, and homes (especially through use of improved efficiency motors) as they transform energy into goods, services, and environmental conditioning. They work with utilities to develop programs and services to benefit their customers. They work with industry to test new equipment, help develop new products, and improve manufacturing processes. For the building industry, they help builders, developers, and mechanical contractors improve homes and small commercial buildings.

Over the last few years as competition has entered the industry, many utilities have cut or eliminated research and development, renewable energy and Demand Side Management programs and funding. This applies to NC investor-owned utilities' where demand side management, and research and development programs have been reduced in recent years from 1993 levels when these funds amounted over $125 million. In NC, a per kWh charge is now used to fund (by legislative statute) the NC Utilities Commission and the Public Staff, and to fund **Advanced Energy Corporation** by voluntary participation of the investor-owned utilities and rural electric cooperatives. For example, **Advanced Energy Corp.**[1] currently collects $0.00003567/kWh (approximately $3.5 million annually).

Waste Reduction Partners

Waste Reduction Partners[2], previously known as the **Waste Reduction and Technology Transfer (WRATT)** program, was established in 1992, through the collaborative

[1] About Advanced Energy; http://www.advancedenergy.org/general/about_us/index.html, July 2003.
[2] Waste Reduction Partners; http://landofsky.fp.skyrunner.net/wrp/About_WRP.htm, July 2003.

efforts of the Tennessee Valley Authority, Land-of-Sky Regional Council, and the North Carolina Division of Pollution Prevention and Environmental Assistance. The program, headquartered in the Asheville area, was formed to assist WNC businesses, industries, institutions, and governmental entities reduce waste and utilize natural resources more efficiently free of charge.

The **Waste Reduction Partners** team conducts on-site assessments and provides technical assistance to businesses and public facilities throughout Western North Carolina. WRP helps organizations improve environmental and energy management through efficiency techniques that save money. The team emphasizes innovative cost-saving strategies and resources that promote environmental excellence and pollution prevention. All work performed is confidential and provided at no cost to the recipient.

High Performance Building Guidelines

DOE has initiated a number of programs[1], which have been picked up by various organizations across the country, that encourage higher efficiency in buildings through improved standards. A high performance commercial building design strategy requires a clear definition of goals and performance benchmarks from the owner and an inter-disciplinary design and construction approach. Design criteria should be based on environmental and energy cost/benefit analyses and attention to "whole-building" and system performance. North Carolina has adopted a set of such standards.

North Carolina's High Performance Guidelines [2]provide a model for the design and construction of energy efficient, cost-effective, durable, and environmentally sound buildings. These programs are supplemented by:

- Energy code assessment and training,
- Energy improvement loan programs,
- And energy efficiency in state construction,
- Center for Energy Research and Technology (CERT), an energy education institute at North Carolina A&T State University,
- University Research focused on energy use and energy efficiency in manufactured housing, solar electricity in public housing, and the development of fuel cells,
- Clean Technology Demonstrations that develop partnerships with North Carolina colleges and universities to demonstrate clean energy technologies, such as fuel cells, biomass, wind, solar, and geothermal,
- Energy Efficiency in State Construction, with projects to demonstrate energy improvements in lighting, boiler controls, HVAC controls, chilled water systems,
- And other energy efficiency measures in state and university buildings,
- Energy for Buildings provides industrial companies with assistance in their efforts to reduce emissions of carbon dioxide and other greenhouse gases that contribute to both global warming and air pollution,
- Provide training and presentations about the High Performance Guidelines that have recently been developed by Triangle J Council of Governments,

---

[1] High Performance Buildings; http://landofsky.fp.skyrunner.net/wrp/default.htm. July 2003.
[2] High Performance Guidelines; http://www.doa.state.nc.us/energy/Energy2/build.htm, July 2003.

- Targets policy makers, designers and other professionals who design, build and manage public schools, state and local government buildings, and facilities at universities and community colleges,
- Housing Energy Efficiency program to create a market demand for homes that exceed the North Carolina Energy Code,
- Home energy rating & documentation for a program recognized by the national mortgage industry,
- Provides matching funds for costs associated with increasing the energy efficiency of local government buildings,
- North Carolina Energy Code Assessment and Training to evaluates the effectiveness of residential and commercial building energy codes and enforcement in the state,
- Public School Energy Improvement that provides matching funds for costs associated with increasing the energy efficiency of K-12 public schools (now in Lee County only), and
- Steam Trap Surveys that assist businesses by identifying and reporting the condition of steam traps, specifying those needing repair or replacement.

Overall, this appears to be an extensive and very helpful program contributing to reduced electric requirements, which in turn reduces emissions of CO_2 to the atmosphere.

Leadership in Energy and Environmental Design (LEED)

The **U. S. Green Building Council** (USGBC) is a coalition of members from the building industry who are promoting buildings that are environmentally responsible, profitable and healthy places to live and work. The **LEED** Green Building Rating System is a national consensus-based rating system designed to result in green building practices. It entails the design, construction and certification of these buildings. They provide workshops, accreditation, resources and third-party certification. They also hold a **Greenbuild** conference annually to exchange information within the industry and a Federal Summit to interact with the regulators within the federal arena. They have several committees and sub committees which work on the various aspects of their aims. The efforts of this organization are recognized as being influential toward reduction of GHG's directly and through increased energy efficiencies and subsequent fuel and emission reductions.

NC Energy Plan

NC's General Assembly established the **Energy Policy Council** (EPC) in 1975 to address energy issues and concerns in North Carolina. The **1992 NC Energy Plan** provided the Council's last examination of energy use, energy production, and environmental concerns in the state. Since state and national energy issues have changed during that time, an updated plan was developed. Through development of a proposed new **State Energy Plan,**[1] NC has taken positive action toward reduction of energy waste, which translates directly into reductions in CO_2 emissions. The plan is based on a premise that the state's energy industries continue to provide high quality, reliable electricity and fuels to buildings and industry.

---

[1] The (Proposed) North Carolina Energy Plan, Chapter 1; http://www.ncenergy.appstate.edu/index.php, June, 2003

The **Energy Policy Working Group** recorded and organized the input received and, after months of extensive deliberation, provided a draft set of recommended policies and programs to the **Energy Policy Council** in January, 2003. The Council discussed the recommended policies and programs and approved 93 measures, as set forth herein, that meet the plan's objectives. The policies and programs approved by the **Energy Policy Council** primarily addressed the following sectors and issues in the state:

1. Energy, Economics, and the Environment, Fossil and Nuclear Fuels,
2. Electric Utilities and Energy Use,
3. Alternative Fuels from Biomass,
4. Alternative Energy Sources and
   - Energy Use in
     - the Public Sector
     - the Residential Sector
     - the Commercial Sector
     - the Industrial Sector
     - the Transportation Sector,
5. Energy Education and Research and
6. Funding for Energy Policies and Programs

IMMEDIATE ACTION ITEMS

The EPC reviewed the entire list of 93 policies and programs to determine which measures would require action by the Governor, NC General Assembly, NC Utilities Commission, or other regulating or administrative agency. From the entire list, the EPC recommended 15 key legislative, regulatory, and administrative policies for action in 2003 and 2004[1] (these are slightly edited and shortened below from the original text):

Energy, Economic, and Environmental Issues

Exec-1 The NC Department of Commerce (DOC) and the SEO should encourage and support economic development of energy-related enterprises whose products are intended to increase energy efficiency or use renewable resources, such as providers of specialized insulation and window products, heating and air conditioning equipment and controls, distributed generation equipment, solar and wind energy equipment, and fuel cells.

Exec-2 The SEO should communicate the energy research being performed in the state to the NC DOC for its development strategy.

Exec-3 The NC DENR should create a greenhouse gas registry to track emissions of carbon dioxide and other greenhouse gases,

Alternative Fuels from Biomass

Exec-4 NC should support the development of an alternative fuel industry through dedicated funding and grant matching of promising alternative fuel projects (including agricultural waste processing facilities, biodiesel and ethanol). NC should support the development of an alternative fuel industry through dedicated funding and grant. These efforts should include agricultural waste processing facilities, biodiesel and ethanol refineries, fueling stations for alternative-fueled vehicles, production incentives for farmers and refiners, incentives

[1] North Carolina Energy Plan, Executive Summary, http://www.ncenergy.appstate.edu/plan/ , July 2003.

for highly efficient or alternative-fueled vehicles, and education and awareness programs. Insure that all 100 counties in the state have alternative fueling infrastructure by 2007. The EPC supports a program to pay for alternative fuels development via a $1 to $2 fee applied to annual vehicle registration fees.

Exec-5 The NC General Assembly should pursue strategies that convert animal waste into environmentally sound energy sources.

Alternative Energy Sources

Exec-6 The General Assembly should consider adopting net metering for application to all electric utilities in the state.

Exec-7 The General Assembly should evaluate a renewable portfolio standard (**RPS**) that complements the NC **GreenPower** program and fosters the development of a renewable electricity market. This should require that all electric utilities increase the percentage electricity that comes from renewable sources.

Exec-8 The General Assembly should reexamine the Mountain Ridge Protection Act as it pertains to wind energy while still protecting NC's natural beauty.

Exec-9 The SEO should assess and propose incentives and regulatory or administrative measures for development of renewable electricity generation facilities, solar water heating, passive and active solar space heating, and lighting.

Exec-10 The General Assembly should require that all electric utilities in NC provide generation disclosure of fuel mix percentages and emissions statistics on sulfur dioxide, nitrogen oxides, carbon dioxide, and mercury annually by bill insert and via website.

Energy Use in the Public Sector

Exec-11 State agencies and universities, with coordination by the NC Department of Administration, should reduce energy consumption in state buildings by 20% by 2008, 4% per year or more for the next 5 years. The SEO should submit an annual report to the Energy Policy Council, the Governor's Office, the State University System and other major energy users in NC to summarize the source, cost and energy efficiency activities undertaken, the approximate investment in energy efficiency measures, and their overall economic costs and benefits.

Exec-12 Working in conjunction with the State Construction Office, the SEO should monitor, analyze, and report on the energy savings attributed to the new requirements on life-cycle cost analyses of the $3.1 billion higher education building program currently underway. The SEO should maintain records of the consequences of effects of life-cycle cost procedures.

Exec-13 NC should facilitate efforts of local governments to finance energy efficiency and renewable energy projects to achieve economies of scale and improve opportunities for financing, restructure the underwriting provisions of the SEO's low-interest energy loan program, and provide training in energy efficiency.

Energy Use in the Residential Sector

Exec-14 NC State Government should continue to support a strong low-income weatherization program to include review of the effectiveness of energy conservation programs conducted through the program and opportunities for improvements. The SEO should develop additional programs to address energy-efficient housing in the low-income sector.

Funding for Energy Programs

Exec-15 The General Assembly should review options, such as a Public Benefits Fund or other means, to enable funding of the basic services provided by the State Energy Office and the recommendations in the State Energy Plan.

Generalizations

In addition to the above, the proposed **NC Energy Plan** includes many other detailed recommendations and observations, many of which have been referenced previously in this document. Many other programs and resources exist that may likely have merit for discussion but are omitted here.[1] The CSA appears to be in consonance with these (proposed) policies. In addition, other new state and federal regulations on vehicle emissions will ultimately reduce emissions from cars and trucks and be in harmony with the stated purposes of the plan. Other new and ongoing programs will continue to promote energy efficiency and renewable resources that will reduce required uses of fuels. Though the charge of DAQ under the Section 13 of the CSA does not include the review, endorsement or otherwise mention the NC Energy Plan, they appear to be quite complimentary and headed toward similar and compatible objectives. The melding or alignment of these efforts will no doubt further evolve as these efforts march forward in the next few months and years.

Chapter 6 Interim Conclusions and Expectations

This report has been generated with the intent of providing background and state of knowledge as relates to emissions of CO_2 in North Carolina and elsewhere, the options for reduction and/or removal of these emissions from the atmosphere and a summary of state, national and international processes that relate to the actions or proposed actions in NC. The 2004 and 2005 reports will provide more information and eventually NC-specific recommendations on what should be done to reduce emissions of CO_2 from NC coal-fired power plants and other stationary sources.

Proposed Stakeholder and Public Workshop

In connection with our preparation of the 2004 Report, the Division of Air Quality is planning to hold a workshop to provide information and to solicit discussion of issues, viewpoints and other information needed to make the final decisions required by this Section of the CSA. We expect to discuss a list of issues and topics for which there are currently gaps of information and understanding, or for which there is a benefit of stakeholder feedback. These issues will be targeted at specific persons or organizations who will agree to prepare written papers on the topic(s) outlined, with as much supporting information and reference material as possible. At the conclusion of the workshop, these papers will be used to prepare a proceedings report for the meeting. An introduction, with an overview and the summation of the DAQ's view on the material and positions presented will be prepared and included as a part of these proceedings. Our intent is to provide this information and summary to the EMC and ERC as the 2004 report. This process will provide a means of identifying further issues and gaps that must be filled prior to the final 2005 report.

Economic Costs and Benefits

Currently, the costs of various options for reducing emissions of CO_2 are essentially in a state of flux that likely will not begin to stabilize until significant decisions are made and issues resolved at the national and international level. The fluctuating prices of natural gas, aggravated by increased demands upon a supply that is claimed adequate for needs on one day but pointed out to be unavailable because of transport and location factors the next, further complicate the uncertainty and method of dealing with optimum planning for the future. In addition, the research level of most of the sequestration and removal activities for collection and safe, stable, long-term disposal exacerbates the problems to make defensible statements on the economics. As this effort progresses over the next two years, many of these decisions will likely be made and it will be possible to collect more meaningful data and provide them in a manner that will be of benefit to these studies for the CSA. The DAQ will undertake what it is able, but most of these types of efforts will be subject to national forces.

Appendix A - General Background for CO_2 and Other GHG

DAQ staff feels it is important to the task of understanding the associated phenomena and regulatory options or requirements that a basic set of information be provided as background. This is the context and purpose of this appendix.

CHEMICAL/PHYSICAL ATTRIBUTES OF CO_2

CO_2 is a colorless, odorless gas that exists normally in the atmosphere in concentrations currently in the range of 370 parts per million by volume. Since it occurs naturally in ambient air and does not directly impair human health at ambient levels, it is not considered an "air pollutant" under the current interpretations of the Clean Air Act. This interpretation is currently being challenged in the courts by a collection of northeastern states.[1] Although at high concentrations CO_2 will displace the body's ability to take in oxygen and cause suffocation, it is not normally considered a toxic gas at normal ambient concentrations. In fact, the human body generates and exudes low concentrations of CO_2 as a product of the normal oxidation process of the body to generate energy from food. Thus, the body takes in oxygen, combines it with the carbon in the food, and releases the CO_2 as a by-product, which in turn is taken up by plants to use to generate oxygen and maintain the cycle.

SOURCES OF CO_2

CO_2 results when any carbon-containing material (fuel) burns. CO_2 is the GHG emitted by human activities in the largest quantities because it is a primary product of fossil-fuel combustion, as in coal-fired utility boilers and automobiles, vegetation burning, normal vegetative decomposition, and other such activities. Whether fossil or renewable, most fuels are carbon. Fossil fuels include coal, oil, natural and gas, which be believed were formed from prehistoric plant and animal matter that has been exposed to great pressures under the Earth over billions of years. Renewable fuels such as grain (ethyl) and wood (methyl) alcohols, which result from carbon compounds being formed within historic times and are available in the form in which they "grew" or derived from there, such that they result from sequestering carbon atoms from the "recent" atmosphere. These fuels are considered renewable because they can be produced or harvested by human activities and can be replaced within a few years or lifetimes as opposed to processes beyond the consideration of man that take millions or billions of years to achieve. Although there are reasons to promote the combustion of renewable fuels over fossil fuels, the burning of one atom of carbon will generate one molecule of CO_2 no matter the source of that carbon atom. In reality, natural decomposition is a form of "slow combustion" and contributes to the emission load. More details on the sources in general, and particularly in North Carolina, are presented later in this report.

In 2000, total estimated U.S. GHG emissions rose to 7,011 teragrams of carbon dioxide equivalent (Tg CO_2 Eq).[2] The increase from 1999 to 2000 was 2.5%, which was greater than the

---

[2] Inventory of US GHG Emissions and Sinks 1990-2000,US EPA, Washington, DC, April 2002.

average annual rate of increase between 1990 and 2000 that was 1.3%. The higher than average increase in emissions in 2000 was, in part, attributable to robust economic growth in 2000, which led to increased demand for electricity and transportation fuels, cooler winter conditions compared to the previous two years, and decreased output from hydroelectric dams. The largest source of CO_2 and the overall GHG emissions continues to be fossil-fuel combustion.

UNDERSTANDING THE GREENHOUSE PHENOMENON

For many years, there have been speculations and suppositions regarding the warming or cooling of Earth due to various physical forces and phenomenon. However, in the early 1960s, more and more scientists started to more seriously investigate and take actual measurements in a consistent manner so that they began to clearly recognize that concentrations of carbon dioxide in Earth's atmosphere were increasing every year. Because current concentrations of GHG keep Earth at its present temperature, scientists postulated that increasing concentrations of GHG would make the Earth warmer.[1] In computer-based simulation models, rising concentration of GHG nearly always result in an expected increase in the atmospheric temperature of Earth. (Note: Although this report is oriented toward CO_2 from coal-fired utility boilers, other GHG are discussed for completeness and context).

Average Earth Temperature

GHG, especially CO_2, result from burning coal, oil, and natural gas as well as wood and other organic matter from activities such as deforestation, burning of waste, prescribed burning, forest fires and land clearing. Natural decay of organic matter also results in such emissions. Over the last century, GHG have been emitted faster than natural processes, such as plant growth-carbon sequestration, can remove them. In a natural state, GHG would keep the Earth's surface about 60° F warmer than it would be without them. These GHG's trap outgoing energy and retain heat in similar manner to glass panels in a greenhouse and slow heat loss by re-radiation back to space.

Figure A.1: Illustration of the Greenhouse Effect

[2] Climate Change: State of Knowledge, Office of Science and Technology Policy, Office of the President, Washington, DC, October 1997.

Contributors to Greenhouse Gases

Since the beginning of the industrial revolution, scientists have reconstructed information showing that atmospheric concentrations of CO_2 have increased nearly 30%, while methane concentrations have more than doubled and nitrous oxide concentrations have risen by 15%.[1, 2] Fossil-fuels burned to operate cars and trucks, heat homes and businesses, generate electricity and power factories are responsible for about 98% of US carbon dioxide emissions, 24% of methane emissions, and 18% of nitrous oxide emissions. In addition to fossil fuel combustion, increased agriculture, deforestation, landfills, industrial production and mining, all are significant tributors to GHG emissions. In 1994, the U.S., with about 5% of the globe's population, emitted about 20% of the Earth's total GHG.

Changes in CO_2 emissions from fossil fuel combustion are influenced by long-term and short-term factors, such as population and economic growth, energy price fluctuations, technological changes, and seasonal temperatures. Consumption of fossil fuels fluctuates in response to changes in economic conditions, energy prices, weather, and availability of non-fossil alternatives. Long-term changes in energy use patterns are largely a function of changes that affect the scale of consumption (e.g., population, number of cars and size of houses), the efficiency with which energy is used in equipment (e.g., cars, power plants, steel mills and light bulbs) and consumer behavior (e.g., walking, bicycling, or telecommuting to work instead of driving). Energy related CO_2 emissions are also a function of the type of fuel or energy consumed and its carbon intensity. Producing heat or electricity using natural gas instead of coal, for example, can reduce the CO_2 emissions associated with a specific quantity of energy consumption because of the lower carbon content of natural gas per unit of useful energy produced. This is not to say that there are not other trade offs and considerations, such as the increased use of natural gas, which inevitably causes increases in its price, and it may not be adequately available.

Energy-related activities accounted for the majority of US CO_2 emissions between 1990 and 2000. CO_2 from fossil-fuel combustion was the dominant contributor. In 2000, approximately 85% of the energy consumed was produced through fossil fuel combustion. The remaining 15% came from other energy sources such as hydropower, biomass, nuclear, wind and solar energy. From 1990 to 2000, petroleum supplied the largest share of US energy demands, accounting for an average of 39% of total energy consumption. Natural gas and coal accounted for an average of 24% and 23% of the total energy consumed, respectively. Most of the petroleum was consumed in the transportation end-use sector, the electricity power generators utilized the majority of coal and natural gas was largely consumed by the industrial and residential end-users.

Emissions of CO_2 from fossil-fuel combustion increased at an average annual rate of 1.6% from 1990 to 2000. The fundamental factors causing this trend were (1) a robust domestic economy, (2) relatively low energy prices as compared to 1990, (3) significant growth in

---

[1] Global Warming – Climate, (http://yosemite.epa.gov/oar/globalwarming.nsf/content/climate.html), US EPA, Washington, DC, July 2003.

[2] Climate Change: State of Knowledge, Office of Science and Technology Policy, Office of the President, October 1997.

emissions from transportation activities and electricity generation, and (4) heavier reliance on nuclear energy (leading to a lower rate of increase).

Relation of CO_2 to other global warming gases

CO_2 is the largest global warming gas in terms of relative tonnage emitted. However, quantity is not the only climate change factor. Each GHG has two additional factors that make them different. These factors are the **relative global warming potential** and the **atmospheric lifetime**. The global warming potential relates to the physical aspect of the gas, which determines its ability to reflect the proper wavelengths of light or heat energy to result in the allowance or disallowance of this energy to escape from Earth's atmosphere. In order to compare the relativity of each GHG to trap heat in the atmosphere, the IPCC commissioned by the United Nations to assess the scientific, technical, and socioeconomic information relevant for the understanding of the risk of human-induced climate change, developed a system referred to as the global warming potential (GWP). GWP's are defined using the warming effects relative to CO_2 as the baseline. For example, methane has a GWP of 21, which indicates it has a global warming potential of 21 times that of CO_2. This comparison is valid for only GHG with long atmospheric lifetimes, making them more likely to be evenly distributed throughout the atmosphere. Also, the GWP's are used to convert GHG emissions to units of million metric tons of carbon equivalent (MMTCE).[1]

Greenhouse gases of most concern are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). The first three are the most prominent and important in most analyses. Table A-1 contains relevant information on the three primary GHG.

Table A.1: Global atmospheric concentration (ppm), Atmospheric Lifetime (years) and Global Warming Potential of Selected Greenhouse Gases

Atmospheric Variable	CO_2	CH_4	N_2O
Pre-Industrial (1790) Concentration	278	0.700	0.270
1998 Atmospheric Concentration	365	1.745	0.314
Atmospheric Lifetime-years	50-200[a]	12[b]	114[b]
Global Warming Potential	1[c]	21[c]	310[c]

[a] No single lifetime can be defined for CO_2 because of the different rates of uptake by different removal processes.
[b] This lifetime has been defined as an "adjustment time" that takes into account the indirect effect of the gas on its own residence time.
[c] GWP's are calculated over a 100 year time horizon.

- **Methane** (CH_4) is a colorless and odorless hydrocarbon produced through anaerobic (without oxygen) decomposition of waste landfills, animal digestion, decomposition of animal wastes, production and distribution of natural gas, coal and oil production and

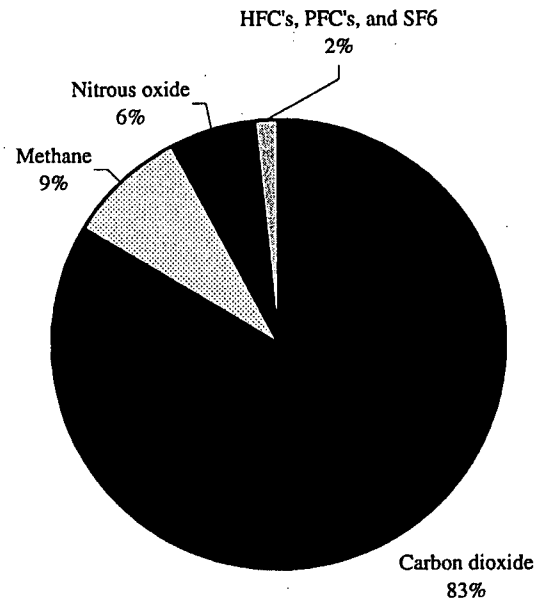
[1] Greenhouse Gases and Global Warming Potential Values,US EPA, Office of Atmospheric Programs, Washington, DC, April 2002.

incomplete fossil fuel combustion. As may be imagined, these sources proliferate in both the manmade and the natural environment.

- **Sulfur Hexafluoride** (SF_6) is a colorless gas utilized (in relatively small quantities) primarily in electrical transmission and distribution systems and in electronics. Often this gas is released in small quantities as a tracer in scientific atmospheric studies as it can be detected at very low levels and natural sources do not exist.
- **Perfluorocarbons** (PFCs) and **Hydroflurocarbons** (HFC's) are a group of man made chemicals composed only of carbon and fluorine. These chemicals were introduced as alternatives to certain ozone depleting substances. Additionally, perfluorocarbons and hydrofluorocarbons are emitted as by-products of industrial processes and used in manufacturing.
- **Nitrous Oxide** (N_2O) is emitted from farm soil (especially where commercial and organic fertilizers are used), fossil fuel combustion, nitric acid production and biomass combustion. Since N_2O is quickly oxidized to Nitrogen Dioxide (NO_2) in the atmosphere, it is normally estimated and presented as NOx. This pollutant (as emitted from coal fired utility boilers) is addressed by the controls imposed by the CSA.

The figure below illustrates the distribution of GHG by gas for 2000.[1]

Figure A.2: 2000 Greenhouse Gas Emissions by Gas



Review of these relative comparisons show that no simple relationship between the largest quantities of gas emitted in any given year and the predominant affecter of the resulting climate change phenomenon exist. Of course, one must not lose sight of the uncertainties

[1] Inventory of US GHG Emissions and Sinks 1990-2000,US EPA, Washington, DC, April 2002.

involved in all of these estimates. Though scientifically derived, the uncertainties are high, and it is difficult to make absolute and certain statements that can be defended without caveats and reservations.

Global Climatic Effects of Greenhouse Gases

Climate change refers to long-term fluctuations in temperature, precipitation, wind, and other elements of the Earth's climate system. The climate system can also be influenced by changes in the concentration of various gases in the atmosphere, which affect the Earth's absorption of radiation.[1] Under the United Nations Framework Convention on Climate Change (UNFCCC), the definition of climate change is " a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods." Given the following definition, IPCC concluded in its Second Assessment Report that:

> *Human activities are changing the atmospheric concentrations and distributions of greenhouse gases and aerosols. These changes can produce a radiative forcing by changing either the reflection or absorption of solar radiation, or the emission and absorption of terrestrial radiation.*

IPCC further concluded, "Concentrations of atmospheric greenhouse gases and their radiative forcing have continued to increase as a result of human activities." In the aftermath of the IPCC report, the National Academy of Sciences commissioned the National Research Council to review the IPCC report and identify areas of uncertainty in the science of climate change. Among the National Research Council findings were:

- Greenhouse gases are accumulating in the earth's atmosphere because of human activities, causing surface air temperatures and subsurface ocean temperatures to rise.
- Human induced warming and associated sea-level rises are expected to continue through the 21st century. Secondary effects are suggested by computer model simulations and basic physical reasoning. These include increases in rainfall rates and increased susceptibility of semi-arid regions to drought.
- The greater our emissions of greenhouse gases and the associated changes in climate, the more severe the adverse impacts of climate change will be.
- Because there is considerable uncertainty in current understanding of how the climate system varies naturally and reacts to emissions of greenhouse gases and aerosols, current estimates of the magnitude of future warming should be regarded as tentative and subject to future adjustments.

The Earth's surface temperature has risen by approximately 1 degree Fahrenheit over the past century with accelerated warming over the past two decades, according to the National Academy of Sciences. Global mean surface temperatures have increased 0.5 to 1.0° F since the late 19th century. The 20th century's ten warmest years all occurred in the last fifteen years of this century.[2] Warming of this magnitude can cause changes in temperature and precipitation patterns, induces sea level rise, and alters the distribution of fresh water supplies. Globally, sea

---

[1] Climate Change: State of Knowledge, Office of Science and Technology Policy, Office of the President, October 1997.

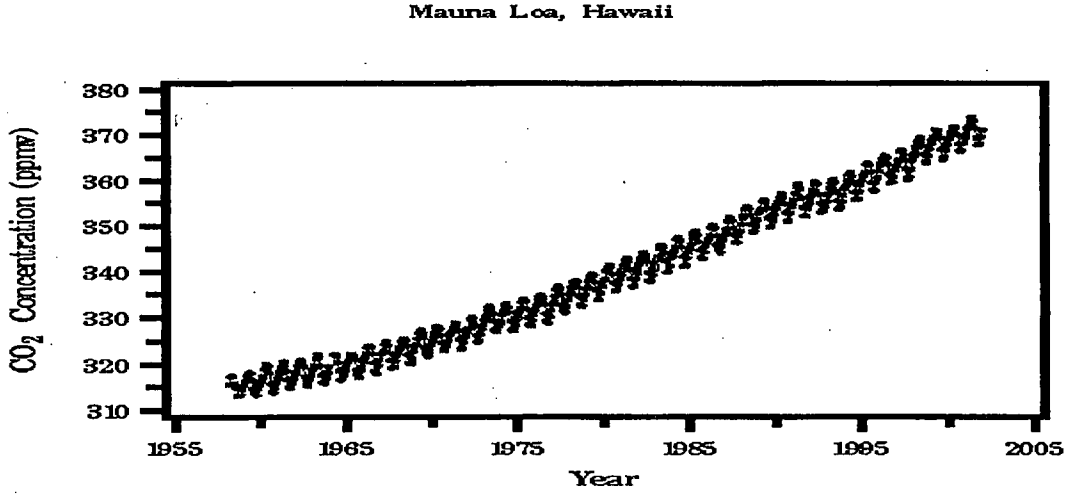
[2] Global Warming – Climate, US EPA, (http://yosemite.epa.gov/oar/globalwarming.nsf/content/index.html), July 2003

level has risen 4 to 10 inches over the past century and precipitation over land has increased by approximately 1%. Scientists expect that the average global surface temperature could rise 1 to 4.5° F in the next fifty years and 2.2 to 10° F in the next century. GHG have an atmospheric lifetime ranging from decades to centuries. The GHG currently being emitted will affect the climate well into the 21st century.

At Mauna Loa, Hawaii, atmospheric CO_2 measurements shown in Figure.A.3 constitute the longest continuous record of atmospheric CO_2 concentrations available in the world. The Mauna Loa site is considered one of the most favorable locations for measuring undisturbed air because possible local influences of vegetation or human activities on atmospheric CO_2 concentrations are minimal and any influences from volcanic vents may be excluded from the records. The methods and equipment used to obtain these measurements have remained essentially unchanged during the 44+-year monitoring program.

As Earth becomes warmer, the global water cycle speeds up. This is the exchange of water among the oceans, atmosphere, and land. Higher temperatures cause more evaporation, and soils dry out faster. Increased amounts of water in the atmosphere causes more rain or snow overall. Cold spells would still occur in the winter, but heat waves ill likely be more common. Some places will be drier and others wetter. Since the beginning of the century, precipitation in the U.S. has increased by about 6% and the frequency of intense precipitation (heavy downpours of more than two inches per day) has increased by 20%.[1] Such events can cause severe flooding. Between 1981 and 1991, the length of the growing season in the northern latitudes has been estimated to have increased by up to twelve days. "Greening" in spring and summer also have been estimated to occur up to eight days earlier than normal, and vegetation continued to photosynthesize about four days longer than "historically."

Figure A.2: Example of Ambient CO2 Concentration Trend[2]



Source: Dave Keeling and Tim Whorf (Scripps Institution of Oceanography)

[1] Climate Change: State of Knowledge, Office of Science and Technology Policy, Office of the President, October 1997.

[2] Carbon Dioxide Research Group, Scripps Institution of Oceanography, University of California, La Jolla, California, http://cdiac.esd.ornl.gov/trends/co2/sio-mlo.htm, 2003

A decrease in Northern Hemisphere snow cover, a decrease in Artic Sea ice, and continued melting of alpine glaciers, have also been corroborated. The global mean sea level has risen 4 to 10 inches over the last century, mainly because water expands when heated. Melting of glaciers, which has been measured worldwide over the last century, is believed to be a contributing factor to the rise in the sea level. Formerly frozen soils in the Alaskan and Siberian artic have begun the melt, damaging both the ecosystems and infrastructure. Melting and tundra warming will also lead to decay of organic matter and the release of trapped carbon and methane, thereby creating an additional source of GHG. Whether these are directly caused by man's activity is somewhat speculative, but they are certainly well correlated with the increases in GHG.

PREDICTIONS OF FUTURE CLIMATIC CHANGES

General circulation models are complex computer simulations that describe the circulation of air and ocean currents and how energy is transported with the climate system. Though still somewhat uncertain, these models provide powerful tools for studying climate. With such models, the developers and other scientists believe that a projected increase in the atmosphere's heat trapping ability for a given concentration of GHG has reasonable precision. However, the resulting impact on climate is more uncertain. This is primarily because the climate system is very complex and dynamic, with constant interaction between the atmosphere, land, ice, and oceans.

Such model calculations suggest that the global surface temperature could increase an average of 1.6 to 6.3° F by 2100, with considerable regional variation. These temperature changes would be far greater than recent natural fluctuations, and they would occur faster than any known changes in the last 10,000 years with the US is expected to warm faster than the global average.

The models suggest that the rate of evaporation will increase as the climate warms, increasing average global precipitation. They also suggest increased frequency of intense rainfall as well as a marked decrease in soil moisture over some mid-continental regions during the summer. Using these model results, sea level is projected to increase between 6 and 38 inches by 2100. The frequency and intensity of some extreme weather of critical importance to ecological systems (droughts, floods, frosts, cloudiness, the frequency of hot or cold spells, and the intensity of associated fire and pest outbreaks) could increase.

Projections for North Carolina

Calculations and estimates of climate change are much less reliable at regional scales than globally. It remains unclear whether the regional climate will become more variable. In reports authored by EPA and researchers at Appalachian State University, a series of projections were compiled from various sources.[1] These projections are very uncertain, and in many cases are internally inconsistent and contradictory. Separating the "sky is falling" scenarios from those that are realistic in a shorter term (100 years) or those that will likely or plausibly happen over centuries is difficult to impossible. This does not mean that we should not take prudent actions

[1] Climate Change and North Carolina, EP 236-F-98-007q, US EPA, Climate and Policy Assessment Division, September 1998.

to mitigate the effects. Some of these projections are summarized below for purposes of completeness and reference.

Climatic Effects

Based on projections made by the IPCC and results from the United Kingdom Hadley Centre climate model (HadCM2), temperatures in North Carolina could increase by 3° F (with a range of 1 to 5° F) in all seasons. By the same measures, precipitation could increase by about 15% (with a range of 5 to 30%) in winter and spring and slightly more in fall and summer. Variations (swings) in wet and dry extremes are also predicted to increase. Recent reports with updates and testing of this model have been reported to indicate that revisions to model cause it to provide substantially different results. This information will be reviewed and updated in a future report.

Health Effects

Direct effects of ambient CO_2 in the atmosphere on the human body have not been shown and are not believed to be problematic. Of course, extremely high levels of CO_2 levels in breathing air could cause suffocation. However, the concerns for health as projected from high ambient levels and climate changes are more subtle and indirect. Levels found in smokestacks from coal-fired power plants do not approach the levels to make this a problem in ambient air.

Possible or likely indirect health effects from elevated GHG have been identified that are not related to direct mechanisms. With variable degrees of plausibility some of these speculations are outlined below:

- Some increases in heat related deaths and illnesses.
- Mosquito populations could possibly increase, thus increasing the potential for transmission of diseases.
- Increased duration, intensity, and extent of harmful algal blooms (red tides) and related bacterial growth.
- Possible (over time) decline (and/or migration) of various forest and vegetative species northward.[1]

Water Resources

Increased precipitation could help alleviate water supply problems and provide more water for dilution of pollutants. However, projections[2] indicate there could also be increased flooding. Other projections made in these reports include:

- Higher rainfall could increase erosion and exacerbate levels of pesticides and fertilizers in runoff from agricultural mining and urban areas.
- Higher stream flows could intensify problems in low-lying coastal areas and recent developments in floodplains.
- Lower flows and higher water temperatures (from the increased irregularity of "dry" times) also could degrade water quality by concentrating pollutant levels and reducing the assimilation of wastes.

[1] Climate Change: State of Knowledge, Office of Science and Technology Policy, Office of the President, Washington, DC, October 1997.

[2] Ibid Reference 1.

- Aquifers in the Coastal Plains could be diminished further under the drought scenario predictions that occur because of the variable conditions predicted in the model.

Agriculture

Climatic conditions and water availability influence the mix of crop and livestock production. The list of speculations below is typical:

- As climate warms, production patterns could shift northward.
- Increases in climate variability could make adaptation by farmers more difficult.
- Increases in heavy rainfall episodes could increase erosion.
- Warmer climates and less soil moisture (Note uncertainty and apparent conflict with previous projection of higher rainfall) because of increased evaporation may increase the need for irrigation. The updated model may provide improved information.
- Decreased water supplies, again from the variability predicted by the models.

Coastal Areas

Sea level rise could lead to flooding of low-lying property, loss of coastal wetlands, erosion of beaches, saltwater contamination of drinking water, and decreased longevity of low-lying roads, causeways, and bridges. In addition, sea level rise could increase vulnerability of coastal areas to storms and associated flooding.

Forests

Trees and forests are adapted to specific climate conditions. As climate becomes warmer and drier (or wetter), forests change. Such changes may include:

- Species composition
- Geographic range
- Health and productivity
- Types of trees dominating those forests.[1]

Ecosystems

Valuable ecosystems in North Carolina, include spruce-fir forests, bogs, and un-vegetated hilltops in the mountainous regions; bottomland hardwood forests and fire-maintained prairies in the piedmont; and longleaf pine forests, provide critical habitat for numerous native plants and animals. The Great Smoky Mountains are recognized as a center for biodiversity. The southern Appalachians also contain a diverse array of salamanders, which are very sensitive to climatic changes. In addition to climatic changes, air pollution (acid rain and ground-level ozone) and exotic pests (hemlock wooly adelgid) already threaten the Appalachian spruce-fir forests.[2] Climatic changes could result in significant changes in these ecosystems.

- Warmer temperatures could lead to reduced stream flow and warmer water temperatures, which could impair fish reproduction.
- Increases in average temperatures could also reduce the distribution and limit the range of some fish species.

[2] Ibid Reference 1

- In coastal habitats, rising sea levels could inundate,
- Salinization may increase, and
- Sedimentation of vital wildlife habitats may occur.
- These effects will likely include further inland penetration of saltwater with many streams and rivers affected.

UNCERTAINTY

No estimate or projection is certain. This is especially true with projected consequences of global warming and climate change. Science can be certain that something is happening and may be able to measure some of its attributes. Due to randomness, known and unknown variables, and the immensity of the volume of global gases and landmass, no one can say that they know all the answers with an unquestionable degree of certainty. Debate continues on climate change and global warming, by scientists on each side of the issue that appear to have appropriate credentials. Nevertheless, the National Academy of Sciences, and the IPCC, internationally are the recognized bodies of leading scientists on the topic, and they have declared that global warming is already happening and that it is caused by human activities, mainly the burning of fossil fuels, which produces CO_2 and other GHG pollution. Thus, this is generally the conclusion that the DAQ recognizes as having the most credibility, and the one that prudent decisions should be based upon, at least until proven to be faulty. The approaches of these studies will be focused on when and how to achieve these goals, rather than if they should be goals.

MEMORANDUM

To: Members of the Environmental Review Commission
From: Tim Dodge, Research Assistant for Environmental Issues
Re: Environmental Management Commission Reports

Attached to this memorandum are copies of the 2003 quarterly reports of the operation, activities, programs, and progress of the Environmental Management Commission (EMC) that were submitted to the Environmental Review Commission pursuant to G.S. 143B-282(b). Dr. David Moreau, chair of the EMC, will give an oral presentation summarizing these activities at today's Environmental Review Commission meeting.

Please contact George Givens, Jeff Hudson, Jennifer McGinnis, Susan Iddings, or Tim Dodge at (919) 733-2578 if you have any questions or comments.

QUARTERLY REPORT

TO THE

ENVIRONMENTAL REVIEW COMMISSION

ON

ENVIRONMENTAL MANAGEMENT COMMISSION ACTIVITIES

April 2003

YEAR 2002 – 2003 THIRD QUARTER REPORT TO ERC

I. Quarterly Report On **Air Quality** Activities

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

II. Quarterly Report On **Ground Water Quality** Activities

A. Future EMC And Committee Agenda Items

III. Quarterly Report On **Surface Water Quality** Activities

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

I. AIR QUALITY ACTIVITIES

Agenda Item _____: Consideration of a Temporary Amendment to the Municipal Waste Combustor Rule

Explanation:

The Environmental Management Commission is requested to adopt a temporary amendment to 15A NCAC 2D .1205, Municipal Waste Combustors, to change the final compliance date for small municipal waste combustors from March 1, 2003 to December 1, 2004. This change is being made as a result of Session Law 2002-24, Section 2.

The municipal waste combustor (MWC) rule currently requires small MWC to be in compliance by March 1, 2003. This date was set in response to a law enacted by the General Assembly in 2001 requiring the Environmental Management Commission to require small MWC to be in compliance no later than March 1, 2003. Last year (2002) the General Assembly enacted a law directing the Environmental Management Commission to change the final compliance date to be on or after December 1, 2004.

Furthermore, the Environment Management Commission is requested to approve one or more public hearings to consider this amendment following the permanent rulemaking procedures.

Recommendation:

The Director recommends that the Commission adopt the proposed amendment and authorized the Chairman to sign the temporary rule certification on behalf of the Commission. The Director also recommends that the Commission authorize a public hearing(s) on this amendment and that the Chairman appoint a member(s) of the Commission to serve as hearing officer(s).

Temporary rule adopted by EMC
EMC approved taking permanent rule to public hearing

Agenda Item _____ : Request to Proceed to Public Hearing on Air Quality Rules for Special Orders

Explanation:

The Environmental Management Commission is requested to approve one or more public hearings to consider adoption of special order rules for air quality.

Currently, special orders are issued under the procedures in 15A NCAC 2H .1200, Special Order by Consent. This Section was written for the old Division of Environmental Management and covers both air and water quality. The proposed change creates a new section of rules that describe the procedures that the Division of Air Quality would use in issuing special orders. These procedures are similar to those in the current rules.

Recommendation:

The Director also recommends that the Commission authorize a public hearing(s) on these proposed rules and that the Chairman appoint a member(s) of the Commission to serve as hearing officer(s).

Approved by EMC

Agenda Item : Hearing Officer's Report on the Amendment to Air Permitting Rule

Explanation:

On August 20, 2002, Mr. Dan Besse held a public hearing on the adoption of and amendments to various air quality rules. At the Commission's September meeting, Mr. Besse presented his recommendations for all but one rule, 15A NCAC 2Q .0306, Permits Requiring Public Participation. He delayed making a recommendation on this rule change so that he could further consider the public comment made on it.

Six people opposed the removal of Subparagraph 15A NCAC 2Q .0306(a)(5). This Subparagraph requires that the Director provide for public notice for comments, with an opportunity to request a public hearing, on draft permits for any physical or operational limit on the capacity of a source to emit a pollutant to avoid the applicability of 15A NCAC 2Q .0500, Title V Procedures (i.e., to be designated as a "synthetic minor" source).

All original draft permits to limit operating hours or control air pollutants to avoid the applicability of Title V Procedures have been issued.

Paragraph (b) has been added to the Rule that provides for public notice on the Division's website for comments with an opportunity to request a public hearing on draft permits to incorporate conditions to avoid Title V permitting. The information contained in the public notice is specified, and it shall allow at least 30 days for public comment. This procedure expands the size of the community given notice for public comment and streamlines administrative action.

An addendum to the hearing record was sent to you earlier.

Recommendation:

The Director recommends that the Commission adopt the proposed amendment contained in the addendum to the hearing record and authorize the Chairman to sign the certifications on behalf of the Commission.

Adopted by EMC

FUTURE EMC AND AIR QUALITY COMMITTEE AGENDA ITEMS

MONTH	AQC CONCEPTS	AQC DRAFT RULES	EMC ACTION
May 03			Hearing Request -Clarify 2D .0933 Re Shoe-Mounted Secondary Seals (363) -2Q .0105 to Change Address Where Permits May Be Reviewed (384) -Local Zoning Consistency Determination (331) -Add Insignificant Activities to 2Q .0706(a)(1) (336) -General Fugitive Dust Control (276) -Revision of Standards for Air Curtain Burners; Addition of No Nuisance Requirements to Land Clearing Burning; Revise 2D .1906 to add Municipalities (254, 272, 288) -Correction of Column Titles in 2Q .0203 (372) -Exclusionary Rule for Concrete Batch Plants (380) -Option for Ethylene Oxide Sterilizes to Comply with Air Toxic Rules (381) -Concrete Batch Plants (284) -Revision of AAL for Hydrogen Sulfide and Exempting Wastewater Treatment Systems at Paper Mills (378, 400) Adoption -112(j) Revisions (377) -Lower Opacity Standard for Asphalt Plant s (308)

III. SURFACE WATER QUALITY ACTIVITIES

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request for Approval of the Final *Broad River Basinwide Water Quality Plan*

Explanation:

The *Broad River Basinwide Water Quality Plan* is sixteenth in a series of revised basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Broad River Basinwide Plan was approved by the Water Quality Committee in September 2002 to be taken to public meetings. Two public meetings were held in Lake Lure and Spindale in December 2002 with 57 people in attendance. Revisions were made and information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members.

This Basinwide Plan is a planning document that will guide the Division's actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Broad River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in the Broad River basin.

EMC ACTION:

The EMC approved the *Broad River Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request for Approval of the Final *Yadkin – Pee Dee River Basinwide Water Quality Plan*

Explanation:

The *Yadkin – Pee Dee River Basinwide Water Quality Plan* is seventeenth in a series of revised basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Yadkin – Pee Dee River Basinwide Plan was approved by the Water Quality Committee in December 2002 to be taken to public meetings. Five public meetings were held in Elkin, Winston-Salem, Albemarle, Salisbury, and Monroe in January 2003 with 161 people in attendance. Revisions were made and information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members.

This Basinwide Plan is a planning document that will guide the Division's actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Yadkin – Pee Dee River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in the Yadkin – Pee Dee River basin.

EMC ACTION:

The EMC approved the *Yadkin – Pee Dee Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request to Proceed to Public Hearing with Proposed Permanent National Pollutant Discharge Elimination System (NPDES) Phase 2 Stormwater Rules

Explanation:

In July 2002 the EMC and DWQ held five public hearings to gather public input on draft NPDES Phase 2 Stormwater Rules. These hearings were held in Asheville, Kernersville, Smithfield, Washington and Wilmington. Following these hearings, the Hearing Officers and Division Staff developed temporary rules that were approved by the EMC at its October meeting. DWQ Staff has now returned with proposed permanent NPDES Phase 2 Stormwater Rules and a request to publish the Notice of Text and proceed to public hearing with these proposed rules (mailed separately).

Recommendation:

That the EMC approve the request to proceed to public hearing with the proposed permanent NPDES Phase 2 Stormwater Rules.

EMC ACTION:

The EMC approved the request to proceed to public hearing with the proposed permanent NPDES Phase 2 Stormwater Rules as recommended.

Agenda Item:

Request to Proceed to Public Hearings with Proposed Permanent Catawba Buffer Rules

Explanation:

Temporary buffer rules were adopted by the Commission on May 10, 2001 and had an effective date of July 1, 2001. The rules imposed 50-foot wide buffers along the shorelines of the free-flowing portions of the Catawba River mainstem below Lake James and along the mainstem lake shorelines from the headwaters of Lake James to the North Carolina-South Carolina state line in Lake Wylie. The rules were set to expire within 270 days of their May 2001 adoption date unless permanent rules were adopted and submitted to the Rules Review Commission. However, the General Assembly passed legislation (HB 189) extending the effective life of the temporary rules until September 1, 2003.

The Commission has requested that staff prepare permanent buffer rules, based on the temporary rules, and present them for approval to go to public hearings. The intent is to adopt the existing temporary rules as permanent prior the September 1, 2003 expiration date. Staff's presentation will include a summary of the fiscal analysis of the rules, their benefits and limitations, staff resource needs, public sentiment, and possible tie-ins with other proposed rules.

Recommendation:

It is recommended that the Commission provide guidance to the staff on how to proceed with permanent buffer rule adoption based on the factors presented.

EMC ACTION:

The EMC directed DWQ Staff to proceed with the proposed Permanent Catawba Buffer Rules to public hearings.

Agenda Item:

Request for Approval of Tar-Pamlico Model Local Stormwater Program

Explanation:

As part of the Tar-Pamlico Nutrient Sensitive Waters strategy, the Tar-Pamlico stormwater rule requires the EMC to approve a model local stormwater program that DWQ staff has developed in cooperation with subject local governments. Following this approval, using the model as guidance, those jurisdictions are to design their programs over the ensuing year for submittal to the Commission. Since February 2002, staff has met regularly with the affected local governments and others to develop this model, which builds on a similar product created for the Neuse basin. The group, with contracted facilitation and technical support, addressed unique rule elements and improved on Neuse methods. Staff will offer the consensus recommendation of the group that the Commission approve the Tar-Pamlico model local stormwater program. Materials for this item were mailed to the members of the EMC.

Recommendation:

Staff requests that the Commission approve the Tar-Pamlico Model Local Stormwater Program to meet the requirements of the Tar-Pamlico stormwater rule, 15A NCAC 2B .0258.

EMC ACTION:

The EMC approved the Tar-Pamlico Model Local Stormwater Program as recommended.

Agenda Item:

Request for Approval of Full Tar-Pamlico Agricultural Accounting Method

Explanation:

In October 2002, as part of the Tar-Pamlico Nutrient Sensitive Waters strategy, the Commission approved a cropland nitrogen accounting method for the Tar-Pamlico agriculture rule, which was effective September 1, 2001. Session Law S.L. 2001-355, a product of legislative review of the rule, requires that the EMC approve a combined accounting method that incorporates accounting for pasture-based operations. Staff worked with the Basin Oversight Committee (BOC), experts from North Carolina State University, and pasture representatives to develop a combined accounting process, and will present the BOC's recommendation to approve this method. The method will be used by county-level Local Advisory Committees and the BOC to develop annual estimates of progress for each county and the basin as a whole toward the 30% nitrogen reduction goal of the rule. Staff will also provide an update on efforts to achieve full farmer registration under the rule. Materials for this item were mailed to the members of the EMC.

Recommendation:

Staff requests that the Commission approve the combined accounting tool to meet the full accounting requirements of session law S.L. 2001-355 and the Tar-Pamlico agriculture rule, 15A NCAC 2B .0256.

EMC ACTION:

The EMC approved the Tar-Pamlico Agricultural Accounting Method as recommended.

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

III. Quarterly Report On **Surface Water Quality** Activities

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

I. AIR QUALITY ACTIVITIES

AGENDA ITEM _____ : Request to Proceed to Public Hearing on the Adoption of Amendments to Various Air Quality Rules

The Environmental Management Commission is requested to approve one or more public hearings to consider amendments to eighteen rules and the adoption of four new rules.

The toxic air pollutant guideline (15A NCAC 2D .1104) for hydrogen sulfide is proposed to be revised. Three options are being proposed. The rule for emission rates requiring a permit (15A NCAC 2Q .0711) is also proposed to be amended to revise the rate for hydrogen sulfide to correspond to the revised guideline. The air toxic permit exemption rule (15A NCAC 2Q .0702) is proposed to be amended to exempt wastewater treatment systems at pulp and paper mills until February 1, 2007, at which time the exemption would expire. A new rule (15A NCAC 2Q .0714) is proposed to require testing of emissions from wastewater treatment systems at pulp and paper mills and evaluation of activated sludge systems for wastewater treatment.

The ethylene oxide emissions standard rule (15A NCAC 2D .0538) is proposed to be amended to provide a compliance option for the unload and backdraft valve exhaust. It is also being amended to allow facilities that are covered under this rule to comply with the air toxic rules instead of the requirements of this rule.

A new rule (15A NCAC 2D .0543) is proposed to control particulate emissions from concrete batch plants. As a result of this proposed amendment, a definition for PM2.5 is proposed to be added to the definition rule (15A NCAC 2D .0101). Also, the visible emission rule (15A NCAC 2D .0521) is proposed to be amended to exempt concrete batch plants as the new rule contains visible emission limits for them.

The rule for petroleum liquid storage in external floating roof tanks (15A NCAC 2D .0933) is proposed to be amended to clarify the treatment of

metallic-type shoe primary seals with shoe-mounted secondary seals.

Several clarifications and other changes are proposed to be made to the open burning rule (Section 15A NCAC 2D .1900). Several new definitions are proposed (15A NCAC 2D .1901). A prohibition of most types of open burning on days forecast to be code orange or above is also proposed (15A NCAC 2D .1903 and .1904). The new source performance standards for air curtain burners covered under these standards are added to the air curtain burner rule (15A NCAC 2D .1904). (These requirements have already been adopted under the new source performance standard rule. They are also being added here for clarity.) The need for temporary air curtain burners to have a certified visible emissions reader onsite is proposed to be removed.

The rule notifying the public where copies of referenced documents may be reviewed (15A NCAC 2Q .0105) is proposed to be amended to update addresses.

A new rule (15A NCAC 2Q .0113) is proposed to require permit applicants in areas without zoning to notify the public of intent to file an air quality permit application before filing such application. Notification shall be by publishing a legal notice in a local newspaper and by posting a sign on the affected property. In addition to the rule, four other permitting rules are proposed to be amended to reference the new rule.

The rule containing the fees schedule for permit fees (15A NCAC 2Q .0203) is proposed to be amended to correct column titles in the permit application fee table.

The permit exemption rule for toxic air pollutants (15A NCAC 2Q .0702) is proposed to be amended to correct a cross-reference and to simplify the exemption for perchloroethylene drycleaning processes.

The air toxic rule for modifications (15A NCAC 2Q .0706) is proposed to amended to treat insignificant activities at Title V facilities the same way exempted activities at non-Title V facilities are treated. Before insignificant activities were required to be included in the Title V permit, they were treated the same way as exempted activities at non-Title V facilities.

A new exclusionary rule (15A NCAC 2Q .0809) is proposed for concrete batch plants. This rule declares concrete batch plants that produce less than 1,210,000 cubic yards of concrete to be small for permitting purposes.

RECOMMENDATIONS: The Director recommends that the Commission authorize a public hearing(s) on these amendments and that the Chairman appoint a member(s) of the Commission to serve as hearing officer(s)

EMC approved taking the rules to public hearing.

Agenda Item : Hearing Officer's Report on the Amendment to Hot Mix Asphalt Plant Rule

Explanation:

On August 20, 2002, Mr. Dan Besse held a public hearing on the adoption of and amendments to various air quality rules. The proposed Rule 15A NCAC 2D .0506, Particulates From Hot Mix Asphalt Plants, was adopted by the Environmental Management Commission and forwarded to the Rules Review Commission. Prior to their review of 2D .0506, the Division of Air Quality received a letter from attorneys representing the Carolina Asphalt Pavement Association (CAPA). They expressed concern with Paragraph 2D .0506(e), inserted into the Rule in response to the public hearing comments received.

During the hearing, a commenter drew attention that the term "fugitive emissions" had been stricken with the addition of "scavenger" dust system in the Rule. In response to the comment, paragraph (e) was added to the Rule to cover fugitive emissions not covered elsewhere by the Rule The proposed limit for fugitive emissions was ten percent.

In response to CAPA's concerns, the Rule was withdrawn from the Rules Review Commission and the public hearing comment period extended. CAPA and the National Asphalt Pavement Association provided written comments concerning this proposed Rule. They shared concern that the opacity standard for fugitive emissions, not otherwise covered in the Rule, would be reduced from 20 percent to 10 percent. They anticipate compliance costs will be $200,000 per plant. In response to comments received during the extended comment period, the opacity requirement for fugitive emissions not elsewhere covered under this Rule is proposed to be changed to 20 percent.

Additionally, CAPA requested that the compliance date for sources, currently subject to a 40 percent stack opacity standard, to meet the 20 percent opacity standard, be revised from January 1, 2004, to January 1,2005. Due to current legislative timing,

this request is reasonable. The compliance date has been revised to January 1, 2005

An addendum to the hearing record follows.

Recommendation:

The hearing officer recommends that the Commission adopt the proposed amendments contained in the addendum to the hearing record and authorize the Chairman to sign the certifications on behalf of the Commission.

EMC adopted rule.

II. GROUNDWATER ACTIVITIES

May 2003 EMC Agenda Item 03-20:

ACTION ITEM FROM THE DIVISION OF WATER QUALITY – GROUNDWATER SECTON: Request for Approval a Variance from Groundwater Quality Standards for the Flynt-Wansona Manufacturing Corporation Facility in Wadesboro, North Carolina (Groundwater Incident Number 14009)

EXPLANATION:

A textile manufacturing facility in Wadesboro, North Carolina was built back in the 1950s and was purchased by the Flynt Wansona Manufacturing Corporation in 1995. The corporate entities that had owned this facility through the years have released liquids into two former settling ponds from a building known as the "Main Plant". These former ponds have been covered and a storage building and catwalk now exist over one of these ponds. Liquids were also released from another building known as the "Wul-Zenco Facility" into a former septic tank and drainfield system. Both of the waste disposal areas are within the area requested for variance. The two waste disposal areas no longer receive waste and have been rendered such that they cannot. All wastewater from the plant is now pretreated and processed at the City of Wadesboro Treatment Plant. Substances found at this site include metals, volatile organic chemicals (VOCs) and other organic substances in soils and groundwater near the former settling ponds and former septic tank and drainfield system. The variance is requested for an 8.4-acre area of a 50-acre property owned by the Flynt Wansona Manufacturing Corporation. The Flynt/Wansona Manufacturing Corporation is entirely responsible for cleanup of this release, which is shown in Division of Water Quality files as Groundwater Incident Number 14009.

Pursuant to requirements of title 15A NCAC 2L .0113, a public notice was issued on December 18, 2003. This notice advised interested parties that a hearing on this variance request was scheduled for January 16, 2003 Notice of this variance was sent to local government officials and to the Anson County Health Director pursuant to 15A NCAC 2L.0113 rule. Individual notices were sent per the requirements of 15A NCAC 2L.0113 to 66 adjacent property owners and area property owners identified by Flynt-Wansona Corporation in its variance request. Approximately 67 notices were sent to the public at large consisting of persons listed in the Groundwater Section's Mailing List and served by the Groundwater Section in the Fayetteville Regional Office. A copy of the hearing notice was also published in the "Anson County Record" on December 18, 2002

The public hearing was held on Thursday, January 16, 2003 at 7:00 PM in Wadesboro, North Carolina. Nine persons attended the public hearing. Five of these persons were from the Division and the rest of the attendees were members of the public. Three persons expressed comments at the hearing. The hearing record remained open for written comments until February 18, 2003 and two written comments were received before that date. One comment made at the

hearing expressed concerns about water supply wells near the area proposed for variance. The consultant for the Flynt Wansona Manufacturing Corporation also expressed comments at this hearing as well as a representative from the Town of Wadesboro Public Works Department. One written comment from Town of Wadesboro employees expressed the view that monitoring should continue at this site. Another comment from the Fruit of the Loom stated that property shown in the Groundwater Section records as being owned by this company is no longer in its possession and expressed no interest in the public hearing.

Based on the information contained in the variance request it does not appear that substances within the area requested for variance is migrating at concentrations above the Groundwater Quality Standards. As stated in the hearing officer's report groundwater contamination is confined to a perched groundwater lense, which has no hydrogeological continuity with the deeper aquifers that supply groundwater to wells in the vicinity of the Flynt-Wansona facility. Also, in support of the variance request it has been shown that the subsoils and sediments in which the contaminant plume is situated are fine silts and clays, which serve to bind the contaminants and release them only very slowly back into the groundwater system. The company has submitted information showing that the extent of contamination is limited and that contaminants will attenuate within the area of the requested variance. The Flynt Wansona Manufacturing Corporation has submitted information showing that there is an extremely low probability of any off-site impacts. They have also demonstrated that there would be an extreme financial burden on the company if pump and treat cleanup or other Best Available Technology were implemented pursuant to 15A NCAC 2L .0106. Comments on this variance have also been received from the Division of Public Health and they have concluded that groundwater monitoring of the site should continue.

EMC Action:

On May 8, 2003, the Environmental Management Commission granted the variance request for the Flynt Wansona Manufacturing Corporation at One Wansona Way in Wadesboro, North Carolina (*Groundwater Incident Number # 14009*) pursuant to the requirements of 15A NCAC 2L .0113 and North Carolina General Statute 143-215.3(e). The Commission gave approval with a condition that a program of groundwater monitoring be continued for this site, pursuant to a monitoring plan approved by the Groundwater Section. Monitoring is to be implemented and maintained at the facility for as long as groundwater contamination is in excess of state standards. The Commission also granted this variance with the stipulation that the two areas of residual soil contamination be paved with impervious surfaces as proposed in Flynt-Wansona Company's variance request.

*Dates shown are projections. Actual schedules could vary 1-3 months either direction. Text shown in ***bold and italic type*** are ACTION ITEMS. Note that other items may be added as the year progresses.

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request to Proceed to Public Hearing with the Proposed Reclassification of Two Sections of the Rocky River in Chatham County to WS-III CA

Explanation:

Dr. J.H. Carter III and Associates and the Town of Siler City submitted a request to reclassify two Rocky River segments to WS-III CA. The reason for the reclassification is to allow a new dam structure to be placed below the existing dam. The existing dam does not impound enough water to result in a true reservoir according to DWQ and DEH staff. However, the new dam will cause the nature of this water supply source to change from run-of-river to an approximately 160-acre reservoir. The new dam will raise the normal water level above the spillway of the existing dam, and as a result, approximately 140 acres of land will be impounded in the new CA. The Town wishes to have the new dam constructed and the resulting reservoir created in order to meet water demands through 2030.

The waters to be reclassified above the current CA meet water supply water standards because these waters are currently classified as WS-III. The waters to be reclassified below the current CA meet water supply water standards according to DWQ staff.

If reclassified, development and discharge restrictions will apply. However, there are no current or planned dischargers and no planned development in the entire proposed reclassification area. Chatham County and the Town of Siler City, the only local governments with jurisdiction in the reclassification area, would need to modify their water supply watershed protection ordinances within 270 days after the reclassification effective date. Chatham County has provided written support for this reclassification.

The Environmental Assessment for this proposed project was previously forwarded to the EMC Members. The proposed effective date for this reclassification is August 1, 2004.

Recommendation:

The Director and staff recommend that the EMC grant staff permission to proceed to public hearing for the above-mentioned proposed reclassification.

EMC ACTION:

The EMC approved the request to proceed to public hearing with the proposed reclassification.

SURFACE WATER QUALITY WQC/EMC FUTURE AGENDAS

	WQC Agenda	EMC Agenda
July 2003	• Request Permission to Send the Draft Lumber River Basinwide Plan to Public Meetings • Request Consideration of Major Variance to Neuse Riparian Area for Mr. Hunter/Watauga Str. • Request Approval of Greensboro's Use of a Special Studies Map for Managing Water Supply Buffers • Introduction to Developing Amendments to Rules for Waste Not Discharged to Surface Waters (15A NCAC 2H .0200) • CHPP- Request Approval of Annual Report	• Request for Adoption of NPDES Phase 2 Stormwater Permanent Rules • Request Approval of a Plan for Local Government Delegation of State Stormwater Management Program • Request for Adoption of Catawba River Buffer Permanent Rules • Request for Adoption of EMC's Declaratory Rulings Rules • Update on Changes to the Administrative Procedure Act Rulemaking Process as a Result of House Bill 1151
Aug 2003	No meeting scheduled.	No meeting scheduled.
Sept 2003	• Consideration of a Request for a Major Variance from the Tar-Pamlico River Riparian Area Protection Rule - Robert Hornung / Ocracoke • Ecosystem Enhancement Program: Program Presentation • Request for Approval of Water Supply Ordinance for Wilkes County	• Request Delegation of Metropolitan Sewerage District for Fayetteville

I. AIR QUALITY ACTIVITIES

AGENDA ITEM: Mercury Emissions and Mercury Controls for Coal-fired Electrical Utility Boilers: First Interim Report

EXPLANATION: The DAQ is required by G.S. 143-215.107D of the Clean Smokestacks Act to study issues related to emissions of mercury from coal-fired generating units and report its interim findings and recommendations annually to the Environmental Management Commission and the Environmental Review Commission beginning September 1, 2003. The objective of this first interim report is to provide a technical background on mercury and mercury emission controls.

EMC ACTION: Report presented to EMC.

AGENDA ITEM: CO2 Emission Reduction Options for Coal-fired Electrical Utility Boilers and Other Stationary Sources

EXPLANATION: The DAQ is required by G.S. 143-215.107D of the Clean Smokestacks Act to study issues related issues related to the implementation of programs to control emissions of carbon dioxide (CO2) from coal-fired generating units and other stationary sources of air pollution, and to present its first interim report to the Environmental Management Commission and the Environmental Review Commission no later than September 1, 2003. The objective of this report is to provide technical background information about CO2 and to define the anticipated scope of effort.

EMC ACTION: Report presented to EMC.

AGENDA ITEM: Hearing Officer's Report on Rules Implementing Section 112(j) of the Federal Clean Air Act

EXPLANATION:

On August 20, 2002, Mr. Dan Besse held a public hearing on amendments to rules implementing Section 112(j) of the Clean Air Act.

Section 112(j) of the Clean Air Act requires state permitting authorities to require sources in a category that EPA has identified that it intends to cover under a Maximum Achievable Control Technology (MACT) standard to comply with a MACT level emission limitation if EPA fails to promulgate that MACT standard within 18 months of the date listed in the Clean Air Act schedule. The EMC previously adopted rules to implement 112(j) requirements as part of its approved Title V permit program. On March 5, 2002, the US EPA amended those portions of 40 CFR Part 63 subpart B that implement Section 112(j). The state rules implementing those requirements were proposed to be amended to incorporate the federal changes for consistency. The March 2002 federal and corresponding state rule amendments revise, delete, and add several definitions, restructure and reword text to clarify the relationship between case-by-case MACT determinations under Section 112(g) versus Section 112 (j) and their timing. The amendments also modify the case-by-case permitting procedures by splitting the application process into two parts, thereby delaying submittal of the substantive portion of the application by 24 months.

Two persons commented at the hearing and one additional person submitted written comments. The comments focused on the changes in definitions. No changes are proposed as the result of the public comments since the definition changes are being made for consistency with the federal regulation.

On August 15, 2002 EPA signed a settlement agreement that called for amendments to the 112 (j) rule that would decrease the time to submit Part 2 application to 12 months after submittal of the Part 1 application. A revised settlement agreement signed November 26, 2002 changed the submittal

timeframe to 60 days after the scheduled promulgation date. The 60 day submittal was proposed December 9, 2002 and finalized May 30, 2003.

The hearing record was sent to you earlier.

RECOMMENDATION: The hearing officer recommends that the Commission adopt the recommendation in Chapter I of the hearing record and authorize the Chairman to sign the certification on behalf of the Commission.

EMC ACTION: Approved renoticing for additional comments on changes recommended by Hearing Officer because of recent changes in EPA rule.

III. SURFACE WATER QUALITY ACTIVITIES

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request for Approval of Proposed Permanent NPDES Phase 2 Stormwater Rules

Explanation:

In October 2002 the EMC approved temporary NPDES Phase 2 Stormwater Rules. The temporary rules became effective November 1, 2002. A permanent rulemaking process followed including five public hearings held by the EMC and DWQ across the state in April 2003 to gather public input on draft NPDES Phase 2 Stormwater Rules. These hearings were held in Asheville, Kernersville, Smithfield, Washington and Wilmington. The hearing officers reviewed comments received and worked with the Division on development of a final draft of the rules that was presented to the full EMC for review and approval.

Recommendation:

The Hearing Officers recommended that the Commission approve the proposed permanent NPDES Phase 2 Stormwater Rules.

EMC ACTION:

The EMC approved the proposed NPDES Phase 2 Stormwater Rules.

Agenda Item:

Request for Adoption of Proposed Permanent Catawba River Buffer Rules. (EMC Hearing Officers)

Explanation:

In February 2003, the EMC directed staff to develop permanent Catawba riparian buffer rules to replace temporary rules that protect existing riparian buffers along the mainstem Catawba River below Lake James and the mainstem lakes. Public comments were taken from March 2003 through May 2003. Three public hearings in April drew a total of 99 registered attendees. Written and oral comments were received from over 280 people during the comment period. In general, the vast majority of commenters supported the proposed permanent rule.

Recommendation:

The Hearing Officers recommended that the Environmental Management Commission adopt these rules addressing riparian buffer protection in the Catawba River Basin as permanent rules.

EMC ACTION:

The EMC approved the proposed permanent Catawba River Buffer Rules.

Agenda Item:

Request for Approval of Proposed Temporary Rules and Request to Proceed to Public Hearing with Proposed Permanent Rules Amending the Sandy Creek and Swift Creek ORW Reclassification as Specified in House Bill 566 (30 Day Waiver required)

Explanation:

This rulemaking was proposed as a result of House Bill 566. The proposed temporary and permanent rules will amend the North Carolina Administrative Code (NCAC) to reflect the appropriate ORW reclassification and management strategy that were approved for these waters by the North Carolina General Assembly as a result of the legislative review performed under the auspices of House Bill 566. These proposed rules will assign the ORW classification and the ORW management strategy to the 14 miles of Sandy Creek and Swift Creek that had been identified as possessing excellent water quality. Furthermore, these proposed rules will implement the ORW management strategy in the watershed of the remainder of Sandy Creek, which is upstream of this 14 mile stretch. These actions were discussed in detail at the September 2003 Water Quality Committee Meeting.

A copy of the proposed rules was included separately in the agenda item package. Per the new rulemaking procedures implemented under House Bill 1151, the estimated effective date of the proposed temporary rules is October 2, 2003, and the estimated effective date of the proposed permanent rules is May 1, 2004, assuming that the permanent rules are not subject to further legislative review.

A 30 day waiver was required for the Commission to act on this proposal.

Recommendation:

The Director and staff recommended that the Environmental Management Commission approve the 30 day waiver, approve the proposed temporary rules, and grant staff permission to proceed to public hearing with the proposed permanent rules amending the Swift Creek and Sandy Creek ORW reclassification.

EMC ACTION:

The EMC approved the proposed temporary rules and the request to proceed to public hearing with the proposed permanent rules for the Sandy and Swift Creek ORW Reclassification as specified in House Bill 566.

SURFACE WATER QUALITY WQC/EMC FUTURE AGENDAS

	WQC Agenda	EMC Agenda
Oct 2003	• WS Ordinance for Garner • Overview of the Ecosystem Enhancement Program (EEP) • Request Approval to take the Draft Tar-Pamlico Basinwide Plan to Public Meetings • Approval of Local Strategies under the Tar-Pamlico Ag Rule • Annual Progress Report on the Neuse Agricultural Rule • Distribute TMDL Development Information	• Approval of Local Strategies under the Tar-Pamlico Ag Rule • Annual Progress Report on the Neuse Agricultural Rule

I. AIR QUALITY ACTIVITIES

AGENDA ITEM:

Hearing Officer's Report on Rules Implementing Section 112(j) of the Federal Clean Air Act

EXPLANATION:

On August 20, 2002, Mr. Dan Besse held a public hearing on amendments to rules implementing Section 112(j) of the Clean Air Act.

Section 112(j) of the Clean Air Act requires state permitting authorities to require sources in a category that EPA has identified that it intends to cover under a Maximum Achievable Control Technology (MACT) standard to comply with a MACT level emission limitation if EPA fails to promulgate that MACT standard within 18 months of the date listed in the Clean Air Act schedule. The EMC previously adopted rules to implement 112(j) requirements as part of its approved Title V permit program. On March 5, 2002, the EPA amended those portions of 40 CFR Part 63 subpart B that implement Section 112(j). The state rules implementing those requirements were proposed to be amended to incorporate the federal changes for consistency. The March 2002 federal and corresponding state rule amendments revise, delete, and add several definitions, restructure and reword text to clarify the relationship between case-by-case MACT determinations under Section 112(g) versus Section 112 (j) and their timing. The amendments also modify the case-by-case permitting procedures by splitting the application process into two parts, thereby delaying submittal of the substantive portion of the application by 24 months.

Two persons commented at the hearing and one additional person submitted written comments. The comments focused on the changes in definitions. No changes are proposed as the result of the public comments since the definition changes are being made for consistency with the federal regulation.

On August 15, 2002 EPA signed a settlement agreement that called for amendments to the 112 (j) rule that would decrease the time to submit Part 2 application to 12 months after submittal of the Part 1 application. A revised settlement agreement signed November 26, 2002 changed the submittal timeframe to 60 days after the scheduled promulgation date. The 60 day submittal was proposed December 9, 2002 and finalized May 30, 2003.

Because of the change in Part 2 application submittal deadline initiated during the comment period and subsequently finalized, and in light of the July 1, 2003 changes to North Carolina's Administrative Procedures Act, the Commission voted at its July 2003 meeting to re-notice the final rules resulting from the hearing and incorporating the subsequent federal rule deadline changes. The 60-day comment period closed September 30, 2003. No one requested a public hearing and no additional comments were received.

The hearing record was sent to you earlier.

RECOMMENDATION:

The hearing officer recommends that the Commission adopt the proposed amendments in Chapter II of the hearing record and authorize the Chairman to sign the certification on behalf of the Commission.

EMC adopted amendments.

Request to APPROVE a Change to the MTBE Groundwater Quality Standard in 15A NCAC 2L .0202.** 2. **Request to APPROVE Changes to Arsenic and Chromium Groundwater Quality Standards.**

*Dates shown are projections. Actual schedules could vary 1-3 months either direction. Text shown in ***bold and italic type*** are ACTION ITEMS. Note that other items may be added as the year progresses.

III. SURFACE WATER QUALITY ACTIVITIES

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request for Approval of the Final Lumber River Basinwide Water Quality Plan

Explanation:

The *Lumber River Basinwide Water Quality Plan* is in the third cycle of basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Lumber River Basinwide Water Quality Plan was approved by the Water Quality Committee in July 2003 to be taken to public meetings. Three public meetings were held throughout the basin; Southern Pines, Lumberton and Ocean Isle Beach in September 2003 with approximately 60 people in attendance. Revisions were made and some information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members in the EMC package.

This Basinwide Water Quality Plan is a planning document that will guide the Division's management actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Lumber River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in this river basin.

EMC ACTION:

The EMC approved the *Lumber River Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request for Approval of Local Nitrogen Strategies, Tar-Pamlico Agriculture Rule

Explanation:

The Tar-Pamlico agriculture rule, part of the basin's NSW nutrient strategy, requires Local Advisory Committees (LACs) to develop county-level implementation strategies for achieving the rule's 30% nitrogen reduction goal. The Basin Oversight Committee and EMC are to approve these local strategies within two years of the rule's effective date. During Spring 2003, LACs were provided with tools and training with which to develop their strategies, which they submitted during August and September. The BOC has reviewed and approved them, and now seeks EMC approval. Counties have until September 2006 to accomplish remaining nitrogen reductions to reach local and basinwide agricultural goals. Materials have been provided in a separate mailing.

Recommendation:

Staff, reporting for the BOC, requests that the Commission approve the fourteen local strategies for achieving the Tar-Pamlico agricultural nitrogen reduction goal of 30% from 1991 loading.

EMC ACTION:

The EMC approved the fourteen local strategies for achieving the Tar-Pamlico agricultural nitrogen reduction goal as requested.

Agenda Item:

Request to Review Proposed Amendments to the Catawba Buffer Rules to Address Comments From the Staff of the Rules Review Commission

Explanation:

The revised Catawba Buffer Rules were submitted to the Rules Review Commission (RRC) in October and appeared on the RRC's October 16th agenda. The RRC staff provided comments to the Division on the rules and requested a number of technical changes. In addition, the RRC staff requested clarification concerning the measurement of the width of the riparian buffers. Another issue raised by the RRC staff was clarification regarding whether the local riparian buffer ordinance should be approved by the Division or the EMC. At their October meeting, the RRC objected to the rules based on ambiguity. The language regarding the start point of riparian buffers in the rules was modified. Now the rules clearly state that riparian buffers start at the top of the bank for the mainstem Catawba River, and riparian buffers start at the full pond elevation for the mainstem Catawba lakes. The local riparian buffer ordinance should be approved by the Division and the rules were modified accordingly.

Recommendation:

Staff recommends that the EMC act to approve the revised Catawba Buffer Rules that resulted from the objection of the RRC and technical changes recommended by the RRC.

EMC ACTION:

The EMC approved the revised Catawba Buffer Rules as proposed.

Agenda Item:

Update on NPDES Phase 2 Stormwater Rules

Explanation:

The Hearing Officers and DWQ Staff will update the Environmental Management Commission on the status and possible required changes to the proposed permanent NPDES Phase 2 Stormwater Rules as a result of the October Meeting of the Rules Review Commission and the objections of that Commission.

Recommendation:

That the Commission approve the Hearing Officers' recommended changes.

EMC ACTION:

The EMC approved the proposed changes to the Phase 2 Stormwater Rules.

Agenda Item:

Annual Progress Report of the Neuse Agricultural Rule (15A NCAC 2B .0238)

Explanation:

The Neuse Basin Oversight Committee (BOC) is required to report to the N.C. Environmental Management Commission each October on annual progress of implementation of the Neuse Agricultural Rule (15A NCAC 2B .0238). The BOC has received and approved annual reports from 17 Local Advisory Committees (LACs) in September 2003. As the result, the agricultural community for the basin as a whole has achieved a 37% Nitrogen reduction compared to the overall baseline. Nitrogen loss reduction from agricultural land was accomplished through BMP installation, fertilizer application reduction and cropland attenuation.

Recommendation:

This item was presented for information purposes. No action was recommended.

EMC ACTION:

This item was presented for information purposes only. No action was required.

SURFACE WATER QUALITY WQC/EMC FUTURE AGENDAS

	WQC Agenda	EMC Agenda
Jan 2004	• No meeting scheduled.	• No meeting scheduled.
Feb 2004	• Water Supply Ordinance Approval (Johnston Co.) • Variance Request for Project on Redfern Drive in Cary • Swamp Biological Criteria Update	• Request to Proceed to Public Hearing with Proposed Rules for Exceptions from DWQ Rules • Phase II Stormwater Rules Update
March 2004	• Request for Permission to Proceed to EMC for Final Approval of the Draft Tar-Pamlico River Basinwide Water Quality Plan	• Request for Final Approval of the Draft Tar-Pamlico River Basinwide Water Quality Plan

AIR QUALITY
April 2003

Temporary Amendment to the Municipal Waste Combustor Rule

Proceed to Public Hearing on Air Quality Rules for Special Orders

Amendment to Air Permitting Rule –technical changes

July 2003

Request to Proceed to Public Hearing on Amendments to Various Air Quality Rules

- hydrogen sulfide – revised guidelines/pulp and paper mills
- The ethylene oxide emissions
- control particulate emissions from concrete batch plants.
- petroleum liquid storage in external floating roof - seals
- require permit applicants in areas without zoning to notify the
- fees schedule for permit fees
- A new exclusionary rule for concrete batch plants.

Amendment to Hot Mix Asphalt Plant Rule – comment period extended

October 2003

Mercury Emissions and Mercury Controls for Coal-fired Electrical Utility Boilers: First Interim Report – required by Clean Smokestacks

CO2 Reduction Options for Coal-fired Electrical Utility Boilers and Other Stationary Sources - required by Clean Smokestacks

Renotice of Rules Implementing Section 112(j) of the Federal Clean Air Act – toxic air pollutant rule -changes made by EPA after rule published

January 2004

Rules Implementing Section 112(j) of the Federal Clean Air Act

SURFACE WATER QUALITY ACTIVITIES
April 2003

Approval of the Final *Broad River Basinwide Water Quality Plan*

Approval of the Final *Yadkin – Pee Dee River Basinwide Water Quality Plan*

Proceed to Public Hearing with Proposed Permanent National Pollutant Discharge Elimination System (NPDES) Phase 2 Stormwater Rules

Proceed to Public Hearings with Proposed Permanent Catawba Buffer Rules

Approval of Tar-Pamlico Model Local Stormwater Program

Approval of Full Tar-Pamlico Agricultural Accounting Method

July 2003

Proceed to Public Hearing with the Proposed Reclassification of Two Sections of the Rocky River in Chatham County to WS-III CA –Siler City water supply expansion

October 2003

Approval of Proposed Permanent NPDES Phase 2 Stormwater Rules

Adoption of Proposed Permanent Catawba River Buffer Rules.

Approval of Temporary Rules and Proceed to Public Hearing with Proposed Permanent Rules Amending the Sandy Creek and Swift Creek ORW Reclassification as Specified in House Bill 566 (30 Day Waiver required)

January 2004

Approval of the Final Lumber River Basinwide Water Quality Plan

Amendments to the Catawba Buffer Rules to Address Comments From the Staff of the Rules Review Commission

Update on NPDES Phase 2 Stormwater Rules – changes in response to RRC objections

Annual Progress Report of the Neuse Agricultural Rule (15A NCAC 2B .0238)

GROUNDWATER - July 2003

Approval a Variance from Groundwater Quality Standards for the Flynt-Wansona Manufacturing Corporation Facility in Wadesboro, North Carolina

Annual Report from the Basinwide Planning Program

For the Period of October 1, 2002 through September 30, 2003

I. Progress in Developing and Implementing Basinwide Water Quality Plans

A. Public Outreach/Involvement

The Basinwide Planning Program finalized the first cycle of basin plans in May 1998. The second cycle of plans was completed with the *Yadkin-Pee Dee Basinwide Water Quality Plan* in March 2003. The third cycle of basinwide water quality plans has begun, with the finalization and Environmental Management Commission approval of the *Neuse River Basinwide Water Quality Plan* in July 2002. Completion of the remaining third cycle plans is well underway for the Tar-Pamlico, Lumber, Catawba and French Broad River basins. Activities related to gathering public input on the basinwide plans during October 2002 through September 2003 are listed below.

River Basin	Plan Approved by Environmental Management Commission	Public Workshops	Public Meetings
Broad	February 2003		November 2002 (2)
Yadkin-Pee Dee	March 2003		January 2003 (3)
Lumber		December 2002 (3)	September 2003 (3)
Tar-Pamlico		March 2003 (4)	
Catawba		September 2003 (3)	
TOTAL	**2**	**10**	**8**

B. Coordination and Collaboration Activities Related to Basinwide Planning Implementation

Many additional activities have occurred over the past year that are not tied to a specific basin, but rather can be applied to the program as a whole. Some of the more significant activities are as follows.

- In an effort to assure Basinwide Plan implementation and to increase coordination among Division of Water Quality staff and other agencies, meetings to discuss implementation needs are held every six months for each river basin. At least one meeting has been held with each regional office staff during this reporting period to discuss the Implementation Packet for each river basin covered by the regional office. Central office staff from various units either attend these meetings with Basinwide staff, or further coordination is conducted with central office staff as follow-up to the meetings. Additional meetings are conducted with other agency personnel and local watershed organizations as needed to discuss specific management strategies and to assess progress being made to implement these strategies. These meetings are also used as an opportunity to share more information and jointly develop appropriate management strategies to address specific problems.

- Basinwide staff coordinate constantly with Wetlands Restoration Program staff on prioritization of targeted watersheds and getting input from local resource professionals.
- Staff coordinated with other state, federal and local agencies to obtain information pertinent to the basinwide plans, increasing the level of coordination and communication with these agencies and their participation in the development of basinwide plans. Discussions between the Basinwide Planning Program and the NC Divisions of Soil and Water Conservation, Environmental Health, Coastal Management, and Marine Fisheries, as well as the Wildlife Resources Commission and US Fish and Wildlife have occurred as a means of improving communication, sharing information and assuring appropriate information is presented in the basin plans.
- Basinwide information was provided to applicants for Clean Water Management Trust Fund and Section 319 grants. Basin planners also provide initial technical reviews of applications.
- Basinwide plans, basin statistics, notices of public input opportunities, a river quiz and other relevant information to the basinwide planning program are updated on the web site to provide interested parties with more access to information (see http://h2o.enr.state.nc.us/basinwide/).
- Over 1,076 copies of basin plans were printed and distributed during 2002 in response to public request for copies of the plans. Since the basin plans can be downloaded from the web page, we believe that several hundred more have been downloaded in this format.
- Over 330 people have attended the ten public workshops for the third cycle (includes the third cycle of workshops for the Neuse, Lumber and Tar-Pamlico River basins) and over 75 people attended the third cycle of public meetings (held only for the Neuse river basin to date).
- Basinwide staff continues to coordinate with the Classifications & Standards Unit and other federal and state agencies to develop management strategies for threatened and endangered species per DWQ rule.
- Basinwide staff provided presentations on use support and basinwide planning to the Coastal Resources Commision -Planning and Special Issues Committee. The Committee is especially interested in the development of improved use support methods for assessing shellfish harvesting in Class SA waters.
- Basinwide staff continues to work with US Geologic Survey, NC Department of Transportation (NCDOT) and the Center for Geographic Information and Analysis in development of 1:24,000 National Hydrography Data (NHD) for North Carolina. Methods continue to be developed and tested to incorporate water quality and NCDOT data onto the NHD. The NHD will be a necessary data layer for submittal of future 303(d) impaired waters lists to the Environmental Protection Agency.
- Basinwide staff continues to develop information and improve skills related to Geographic Information System procedures. The result of these efforts will increase proficiency in use support mapping and analysis.
- Basinwide staff continues to enhance procedures, methods and database implementation pertaining to use support decisions on water quality status (see Part II below).

C. Some Plan Development and Implementation Activities Related to Specific River Basins

The following bullets, by basin, present some of the more significant activities and accomplishments over the past year to achieve the goals of the Basinwide Planning Program. The program had two of four basin planner positions vacant for most of this reporting period due to hiring freezes and resulting inability to fill these positions.

Broad River –

- Held two public meetings in November 2002, with 57 people attending.
- Prepared a draft Broad River Basinwide Water Quality Plan, presented the plan to the Environmental Management Commission for final approval in February 2003.

Cape Fear River –

- Conducted basinwide biological sampling in addition to ambient monitoring.
- Continued to work with the Basin Coalitions in development of projects and coordination with basinwide planning efforts.
- Presented drought and water quality overview for Cape Fear River Assembly annual joint technical advisory committee.
- Participated in modeling and Total Maximum Daily Load (TMDL) meetings with stakeholders in lower Cape Fear and Durham.
- Participated in Conservation Resource Enhancement Program (CREP)) meeting to discuss nutrient impacted waters.
- Presented at basinwide meeting to coordinate efforts of Land Conservancies.

Catawba River –

- Participate in quarterly meetings of the Catawba River Bi-State Task Force, often providing a presentation on status of Catawba River Basinwide issues.
- Provide input to the Catawba River Bi-State Task Force by serving on the Executive Committee.
- Participating in monthly meetings with Department of Environment and Natural Resources agency staff and other stakeholders and Duke Power representatives to explore the potential for, and developing a process for, a Federal Energy Regulatory Commission (FERC) relicensing settlement agreement. Program supervisor, basin planner and regional office staff person each participate in a different team, the State Relicensing Team and Local Advisory Groups. Staff are working with the agencies and Duke Power to develop study plans to assess the impacts of hydropower operations on water quality, wetlands and aquatic habitat. Studies will begin in the spring and are expected to be completed in the coming year. Additional studies may be identified as needed next year. A 401 Certificate is required by DWQ and the FERC for renewing the expiring hydropower license. The new license will be a 30 or 40-year license.
- Beginning the process of updating the 1999 Basinwide Plan by developing use support ratings.
- Holding three public workshops in September to obtain input for updating the basin plan in 2004.

Chowan and Pasquotank Rivers –

- Coordinating with the Albemarle-Pamlico National Estuary Program (APNEP) and the Division of Solid Waste regarding oil recycling for the North Carolina/Virginia work group formed under the APNEP Memorandum of Agreement with Virginia.
- Participating in Submerged Aquatic Vegetation (SAV) meetings with several state and federal agencies to develop a SAV monitoring plan. Discussion is primarily focused on flight line planning for Back Bay and Currituck Sound for documentation of presence and/or absence of SAVs in these areas.

Little Tennessee River –

- Providing assistance to the Nonpoint Source Team of local, state and federal agencies and local watershed organizations to conduct education and demonstration projects in the basin.
- Worked with several professors at Western Carolina University to disseminate information and give presentations to students about water quality and state government jobs.
- Serving on the technical advisory board for the Little Tennessee Watershed Association.
- Working with the Wildlife Resources Commission and US Fish & Wildlife Service on strategies to improve and sustain water quality to protect federally-listed mussel and fish species in the basin.

Lumber River –

- Gave presentation at 2-day education workshops for the Friends of Lake Waccamaw with emphasis on Outstanding Resource Waters and how it pertains to Lake Waccamaw.
- Participated in discussions of the National Pollutant Discharge Elimination System/Pretreatment Mercury group pertaining to the new 1631 methods for mercury sampling.
- Coordinating with National Resource Conservation Service, Columbus County Soil and Water Conservation District office and the Conservation Resource Enhancement Program (CREP) coordinator regarding priority areas in the Lumber Basin.
- Coordinating with the Lumber River Council of Governments regarding a possible discharger coalition formation.

Neuse River –

- Participated in Upper Neuse River Basin Association technical advisory committee to develop recommendations on septic systems and on development of a watershed evaluation tool.
- Presented and participated in Envirothon at the Swift Creek with Soil and Water Conservation District.

New River –

- Conducted basinwide biological sampling in addition to ambient monitoring.

Roanoke River –

- Participating in Section 216 feasibility study meetings with multiple state and federal agencies. The Section 216 study regards the Army Corps of Engineers' (ACE) dam project at Kerr Reservoir. The States of NC and VA, as well as the ACE, are conducting a comprehensive study on impacts from the dam on the lower Roanoke River. Twelve technical workgroups have formed. The basin planner is serving on four workgroups and has been elected to serve as technical group leader for the 'Water Quality' workgroup. Several state and federal agencies and non-profit organizations are participants in this study. The study is composed of three phases. Phase One, the feasibility phase, is composed of several tasks such as gathering and evaluating existing relevant data, identifying gaps in the existing relevant data, and identifying and evaluating existing methods and tools for study of the subject. Phase One, scheduled for twelve months, has just begun. Phase Two, the design phase, will begin after the feasibility phase and is scheduled for 24-36 months. Phase Three, the construction phase, will begin after the design phase and is scheduled for 24 months.
- Coordinating communications between the Division of Water Quality and relevant agencies regarding flood releases/reductions from Kerr Reservior.

Tar-Pamlico River–

- Held three public workshops in March 2003, with 167 people attending.
- Participated in Upper Tar River collaboration effort with the Division of Soil and Water Conservation (DSWC), National Resources Conservation Service, Conservation REP, Division of Forest Resources (DFR), Wildlife Resources Commission (WRC) and Tar River Land Conservancy to identify, coordinate water quality target project areas and resources.
- Advised WRC, Division of Parks and Recreation National Heritage Program (DPR NHP), and US Fish and Wildlife Service (USFWS) staff in development of endangered species management plans for watersheds in the upper portion of the basin.

White Oak River –

- Presented and discussed the Division of Water Quality use support assessment methods for shellfish waters to shellfish committee of the Marine Fisheries Commission.

Yadkin-Pee Dee River –

- Held three public meetings in January 2003, with 161 people attending.
- Working with the Wildlife Resources Commission and US Fish & Wildlife Service on a strategy to improve and sustain water quality to protect federally-listed mussel species in the Goose Creek watershed.
- Prepared a draft Yadkin-Pee Dee River Basinwide Water Quality Plan; presented the plan to the Environmental Management Commission for final approval.
- Participating in monthly meetings with Department Of Environment And Natural Resources (DENR) agency staff and other stakeholders, along with Progress Energy and Yadkin, Inc. (APGI) representatives to explore the potential for, and developing a process for, Federal Energy Regulatory Commission (FERC)) relicensing settlement agreements for both hydropower facilities.

II. Activities Related to Use Support Assessments and Methods

A. Changes in Methodologies to Assess Water Quality Conditions

- Key to making determinations of the quality of the waters is a tool to assess the "use support" of a particular water body. Use support is directly related to the classification of the water body. For example, a water body may need to support a quality sufficient to enable the water to be used as a water supply. Staff continue to revise and improve both the decision-making methods as well as the database to support the decisions.
- Significant progress has made towards developing methods to better assess shellfish harvest area closures by using a frequency-based closures method to determine impairment, rather than simply using the Division of Environmental Health growing area classifications. A database and Geographic Information System related system is being developed to facilitate the use of these new methods. Presentations on these new methods have been given to the various commissions (Coastal Resources Commission and Marine Fisheries Commission) and other interested groups.

B. 305(b) Report

- Submitted electronic update of the *Water Quality Progress in North Carolina Year 2003 305(b) Update* and associated data to EPA by April 1, 2003.

- Incorporated this data into the submittal of the 305(b)/303(d) integrated report to EPA. EPA has approved the integrated report.

February 24, 2004 ERC Meeting
EXHIBIT H

Report to the Environmental Review Commission

Status of New Source Review Rulemaking Process
B. Keith Overcash, Director
Division of Air Quality
February 24, 2004

- EPA finalized changes to New Source Review on December 31, 2002.
- The rule changes became effective on March 2, 2003.
- As an approved NSR program, NC has 3 years to adopt the new rules or rules that are "at least as stringent as" the new rules (no later than March 2, 2006).
- Due to the APA process in NC, DAQ had to begin the process to adopt our rules at an early date.
- DAQ held two stakeholder public meetings in the Fall of 2003 to receive comments by interested parties.
- DAQ internal workgroup has met (January 2004) to discuss comments received and to begin a draft of rules.
- Another stakeholder meeting is planned for sometime in March 2004 to present proposed rules.
- Proposed rules to Air Quality Committee of EMC in April 2004
- Proposed rules to EMC for approval to take them to public hearing in May 2004
- Public hearing(s) in July/August 2004 time frame
- Hearing Officers' recommendations to EMC for approval of new rules in October 2004
- Rules to RRC in November 2004
- If approved by RRC and no written objections received, rules would be effective in December 2004.

This schedule is necessary because we must leave enough time for written objections to be considered during the '05 legislative session because the '06 session will not convene early enough for rules to be considered within the 3-year period which ends 3/02/06.

Background on NSR Reform

The history of reform of the New Source Review (NSR) Program began more than ten years ago with the first "NSR Simplification Workshop" held in August 1992. After countless meetings and negotiations with stakeholders of the program, the EPA published the first of a number of proposed changes in 1996. The fact sheet for this proposal noted that, "as part of the ...Administration's commitment to "reinventing" government, today's proposal [will] ...eliminate over 50 percent of the major source permitting actions [as compared with] ...the existing regulations." After more proposals and meetings, the EPA published a final rule on December 31, 2002 to *partially* amend the applicability provisions of the PSD program. On the same day, the EPA also published a new proposal for a change in the routine replacement provision of the program. The proposed routine replacement rule became final on October 27, 2003.

While many commentators have criticized the changes in the NSR rules without distinguishing between these two sets of rules, the substance of the criticisms are generally concerned with the replacement rule because it is at the heart of the EPA's on-going litigation with many electric utility companies including Duke Energy.

Attached is a brief explanation of the changes to the applicability provisions of the NSR program (the December 31, 2002 rule) as well as comments on how the changes compare with the current rules in North Carolina.

North Carolina's Approach to Implementing the Applicability Rules

As a state with an approved NSR program, North Carolina has three years to submit to the EPA approvable state rules implementing the applicability rule changes. While the state could adopt the rules by reference, the DAQ could also make changes to the rules that are at least as stringent as the EPA provisions. The national association of state and local regulators has also prepared rule language that could be used as a starting point for amendments to North Carolina's rules.

The Division has already held two public meetings (in Raleigh and in Hickory) to listen to comments by interested parties. The Division will now prepare a draft rule for consideration at an additional stakeholder meeting before proceeding to the AQC and the EMC to begin the rulemaking process.

Summary of (12/31/02) Rule Changes

(1) Baseline calculation – The new rule will use the highest utilization factor (widgets/yr) over the past ten years and the most recent (over the past 2 years) emission factor (lbs pollutant/widget) to determine baseline actual emissions.

Comment: In the past, sources were allowed to simply use the most "representative" 2-year emission rate (lbs pollutant/yr) over the past ten or more years.

(2) Plant-wide Applicability Limits (PALs) – The new rule will use the actual emissions as calculated under (1) above as the baseline for these caps. The facility will be able to make improvements, additions and modifications without triggering NSR *provided* their emissions do not exceed this cap. The facility will only be able to exceed the cap under certain approvals by the permitting authority. In addition, any other emission reduction rules (e.g., due to non-attainment designation) adjust the cap downward.

Comment: Based on six pilot studies, the EPA believes that the PAL option will result in a "net environmental benefit." Under the current rules, facilities can make multiple modifications over time with emission increases provided each is less than the significance level under NSR. This would not be allowed under the PAL. However, under the PAL, the facility may make changes without lengthy permit reviews.

(3) Clean Unit Exemption – The new rule will allow, without triggering NSR, modifications of sources that have installed BACT-level controls within the previous 10 years.

Comment: This option saves processing time and resources that, in the past, virtually never resulted in any emission reductions. In the past, additional control of already controlled sources that were modified was considered under the BACT analysis. However, since only the marginal reductions (beyond the existing control efficiency) would be compared with the considerable additional costs associated with retrofitting control devices, the cost effectiveness was always prohibitively large. Thus, additional controls were seldom required despite the considerable expenditure of resources.

(4) Pollution Control/Prevention projects – The new rule will allow non-utility facilities to put control projects into service even when a collateral increase in another pollutant may exceed the significance level for NSR.

Comment: Utilities were already given this option under the rules since 1992. The new rule effectively codifies existing guidance that allowed non-utility facilities to pursue emission control projects with greater regulatory certainty.

(5) Use of past-actual emission rates to compare with future actuals – The new rule will use these two emission rates for non-utility facilities to determine whether a proposed modification constitutes a major modification under NSR.

Comment: This is also the same approach that the EPA approved for the utility industry in 1992. The EPA stated that they believed other industries should be treated similarly to the utility industry. Under the current rules, past actuals were compared with future potential emissions. Since industrial equipment is seldom operated continuously for 365 days/year, this approach tended to overstate the increase in emissions.

February 24, 2004 ERC Meeting
EXHIBIT I

Designation of Areas as Non-Attainment for Fine Particulate Matter and Ground Level Ozone

Discussion Before Environmental Review Commission

February 24, 2004

Brock M. Nicholson, P.E.
Deputy Director
Division of Air Quality

What are designations?

- Federal rulemaking action by the Administrator of USEPA

Why is it required?

- By Federal Clean Air Act
- Upon establishment of National Ambient Air Quality Standard (NAAQS)
  - Particulate Matter, fine (PM fine)
  - Ozone (Ground level)

What is the State's role?

- Make recommendations to the US EPA

What is action status and schedule?

- **PM fine:**
- Recommendations to EPA on February 15, 2004
- EPA's intended modifications of recommendations by 120 days prior to final action -expected ~ July 2004
- Final rulemaking expected by EPA December 31, 2004
- **Ozone**
- Recommendations to EPA on July 15, 2003
- EPA sent its intended modifications of NC's recommendations by letter December 3, 2003
- State responded to EPA's comments February 6, 2004
- Final rulemaking by EPA by April 15, 2004

What are the requirement for setting boundaries?

- Area with a measured violation
- Area contributing to the violation

What is EPA's presumption?

- Metropolitan Statistical Areas (MSA)
- All counties of MSA and whole counties

Can there be areas smaller than EPA's presumption?

- Yes, based on EPA's published guidance - 9 point criteria for PM fine and 11 point for ozone

What generally was the basis for NC recommendations?

- Urban Vs rural, contributing to problem or not, existing controls and would inclusion make a difference in compliance strategy?

How does NC support areas less than EPA's presumption?

- Extensive technical analysis and documentation
  - Wind trajectories, Population, Population density, Vehicle use (VMT), Emissions, Rural, Growth potential
- Existing measures **in place; CSA, I/M**
- Air Quality forecasting
- North Carolina can control emissions **without designation** of non-attainment
- State's commitment to demonstrate maintenance (10 years), assure continual conformity with transportation plans - annual checks on growth and periodic updated demonstrations of NAAQS maintenance (every 8 years)
- No additional control strategy requirements expected - Attainment by 2007 / 2010 **without designating full EPA presumption**

What is the issue with NC's ozone (and PM fine) recommendations?

- Size of the designated area -i.e., boundaries
- NC recommended some counties be less than EPA's presumption for area

•What process did NC follow to develop the recommendations?

- Public meetings, meetings with local officials (city, county, MPO)
- Consulted / concurrence with DOT, Commerce and Agriculture

What are the consequences for areas designated as non-attainment?

- Non-attainment new source review (NSR) for major new or modified industry
    - Best control technology (LAER), Offset emissions
- Conformity analysis required; implication for Federal highway funds
    - Transportation / General
- Impact on economic development
    - "Tag" of non-attainment
    - Opportunities lost

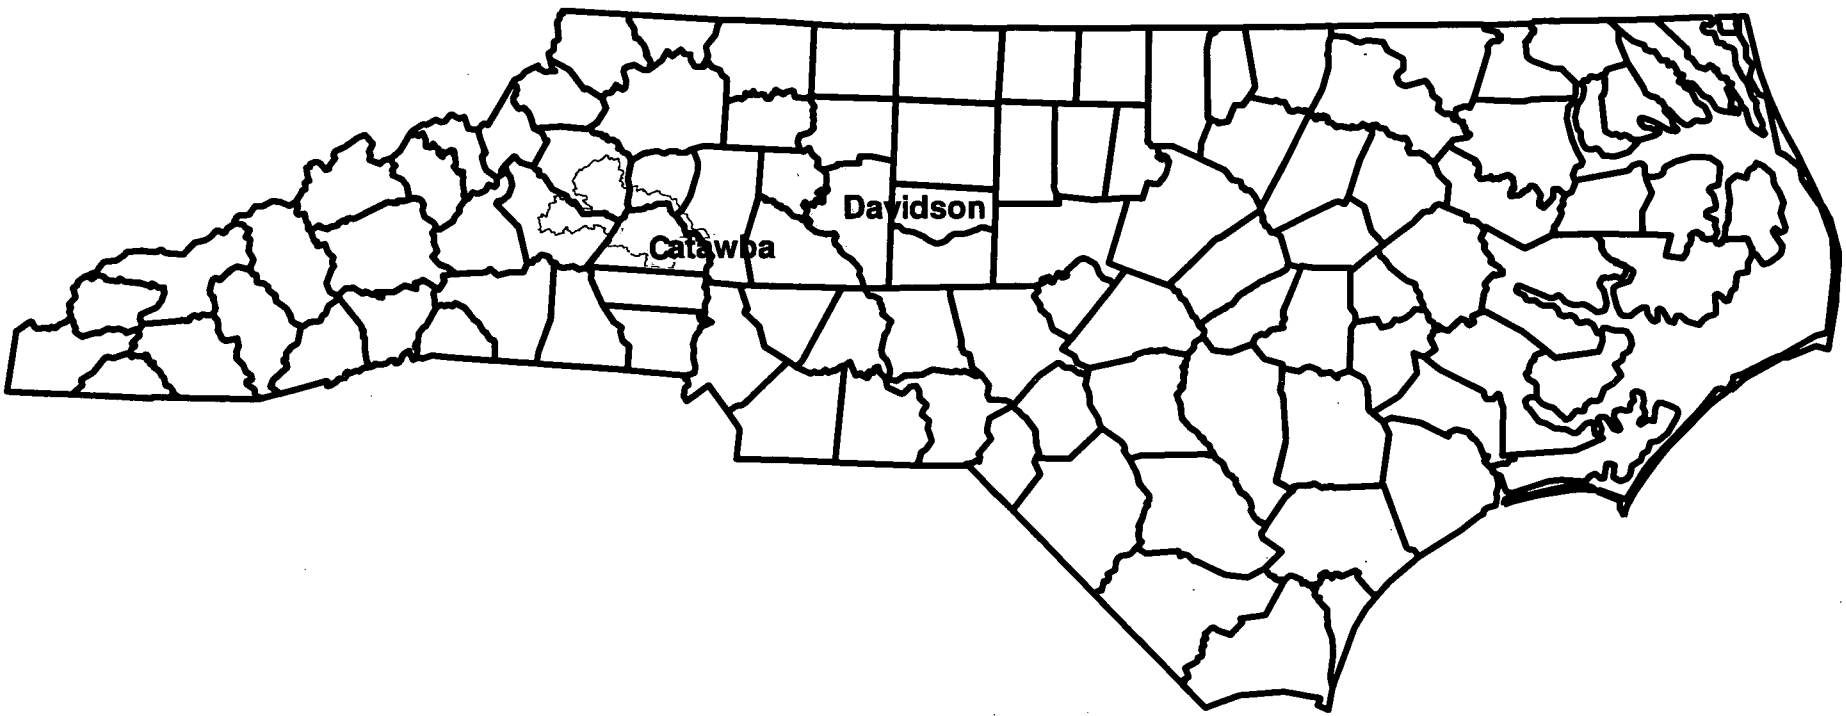
What was the basis for EPA's rejection of NC's recommendations?

- Primarily desire to be uniform across country (?)
- Secondarily growth issues

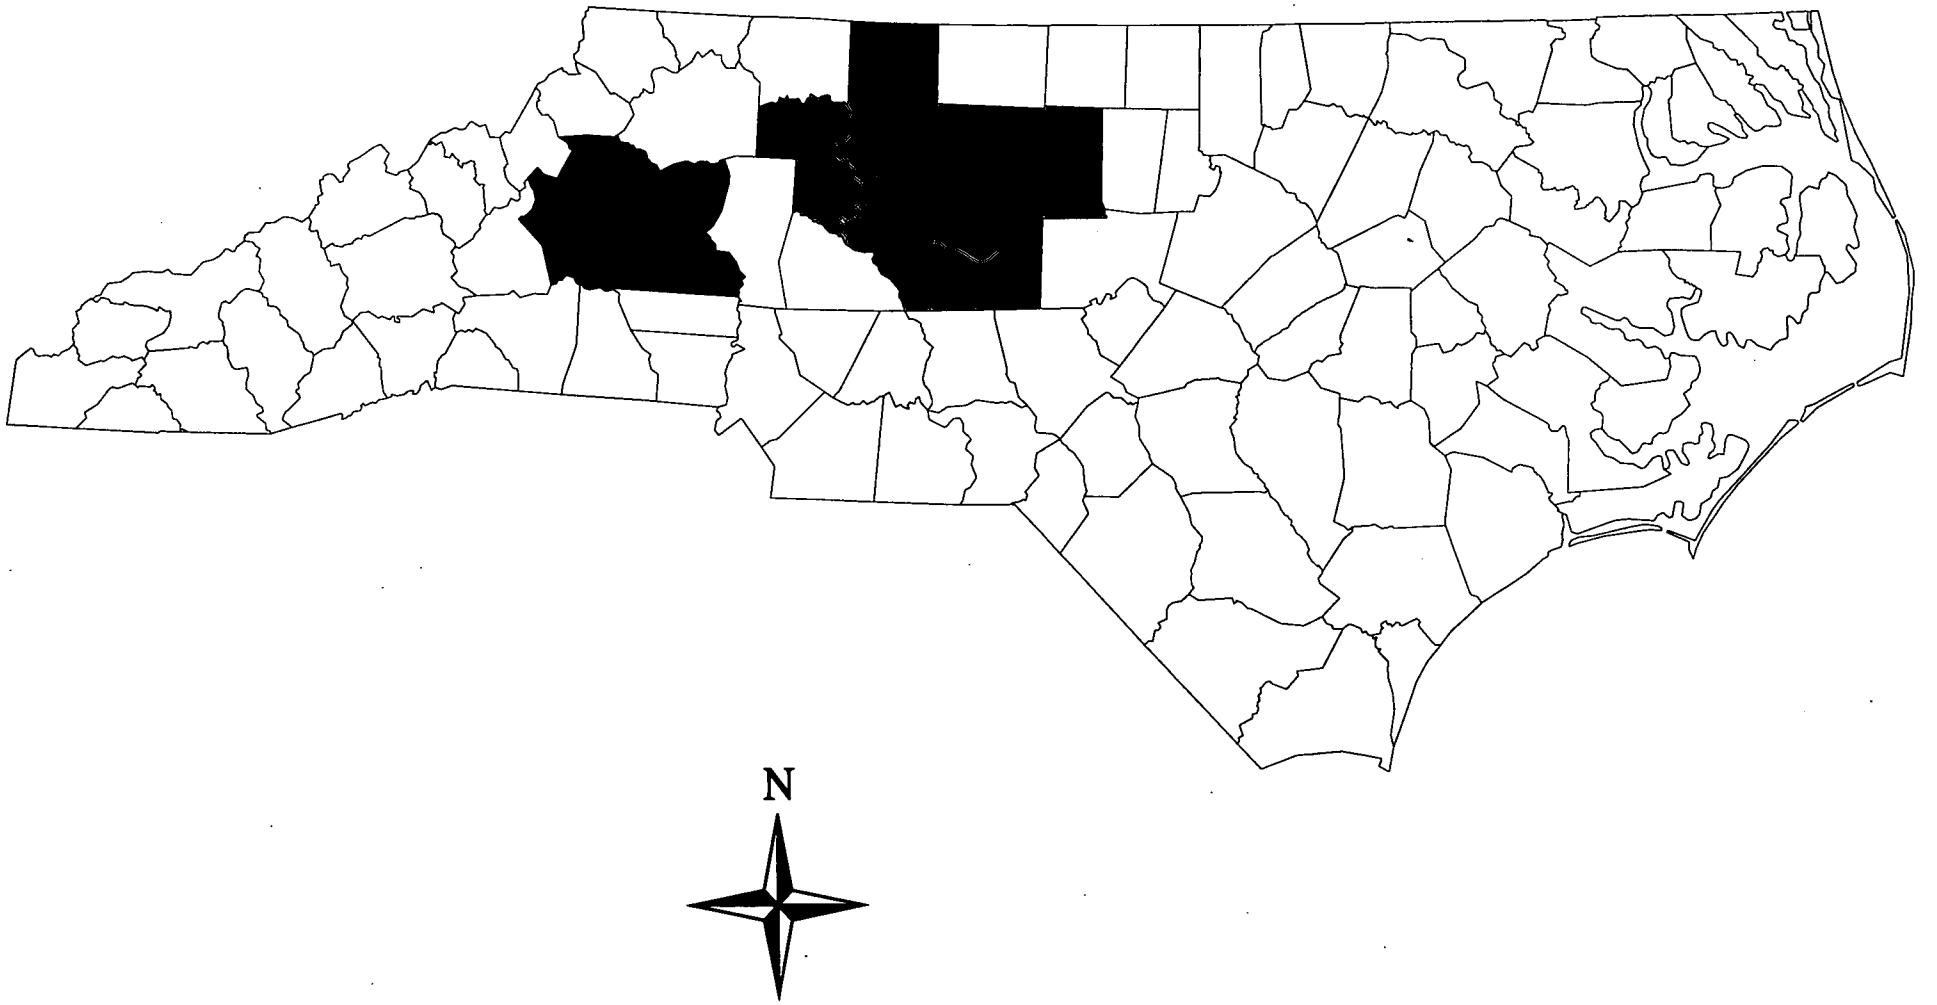
What is being done to change EPA's mind?

- Letters and meetings

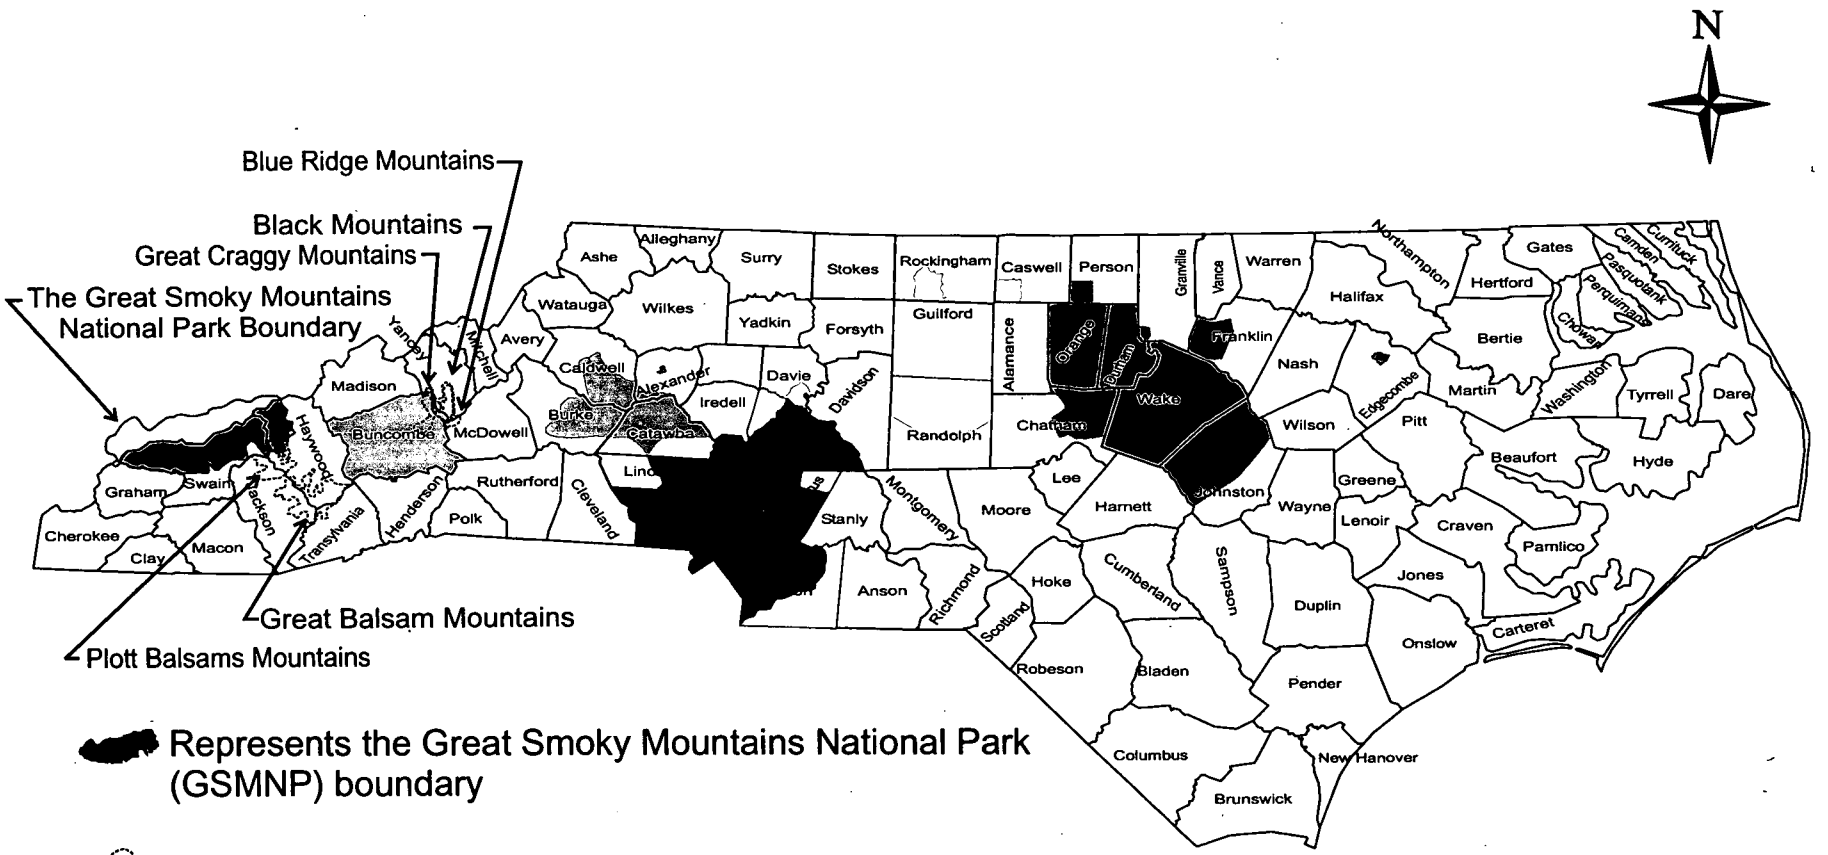
North Carolina's Recommendations on Boundaries for $PM_{2.5}$ Nonattainment Areas



Potential PM2.5 Nonattainment Areas Based on EPA's Presumptive MSA Boundary Guidence



North Carolina's Recommendation on 8-hr Ozone Nonattainment Boundaries



Reductions in emissions will be required in areas as needed, even in areas not designated nonattainment.

Not To Scale

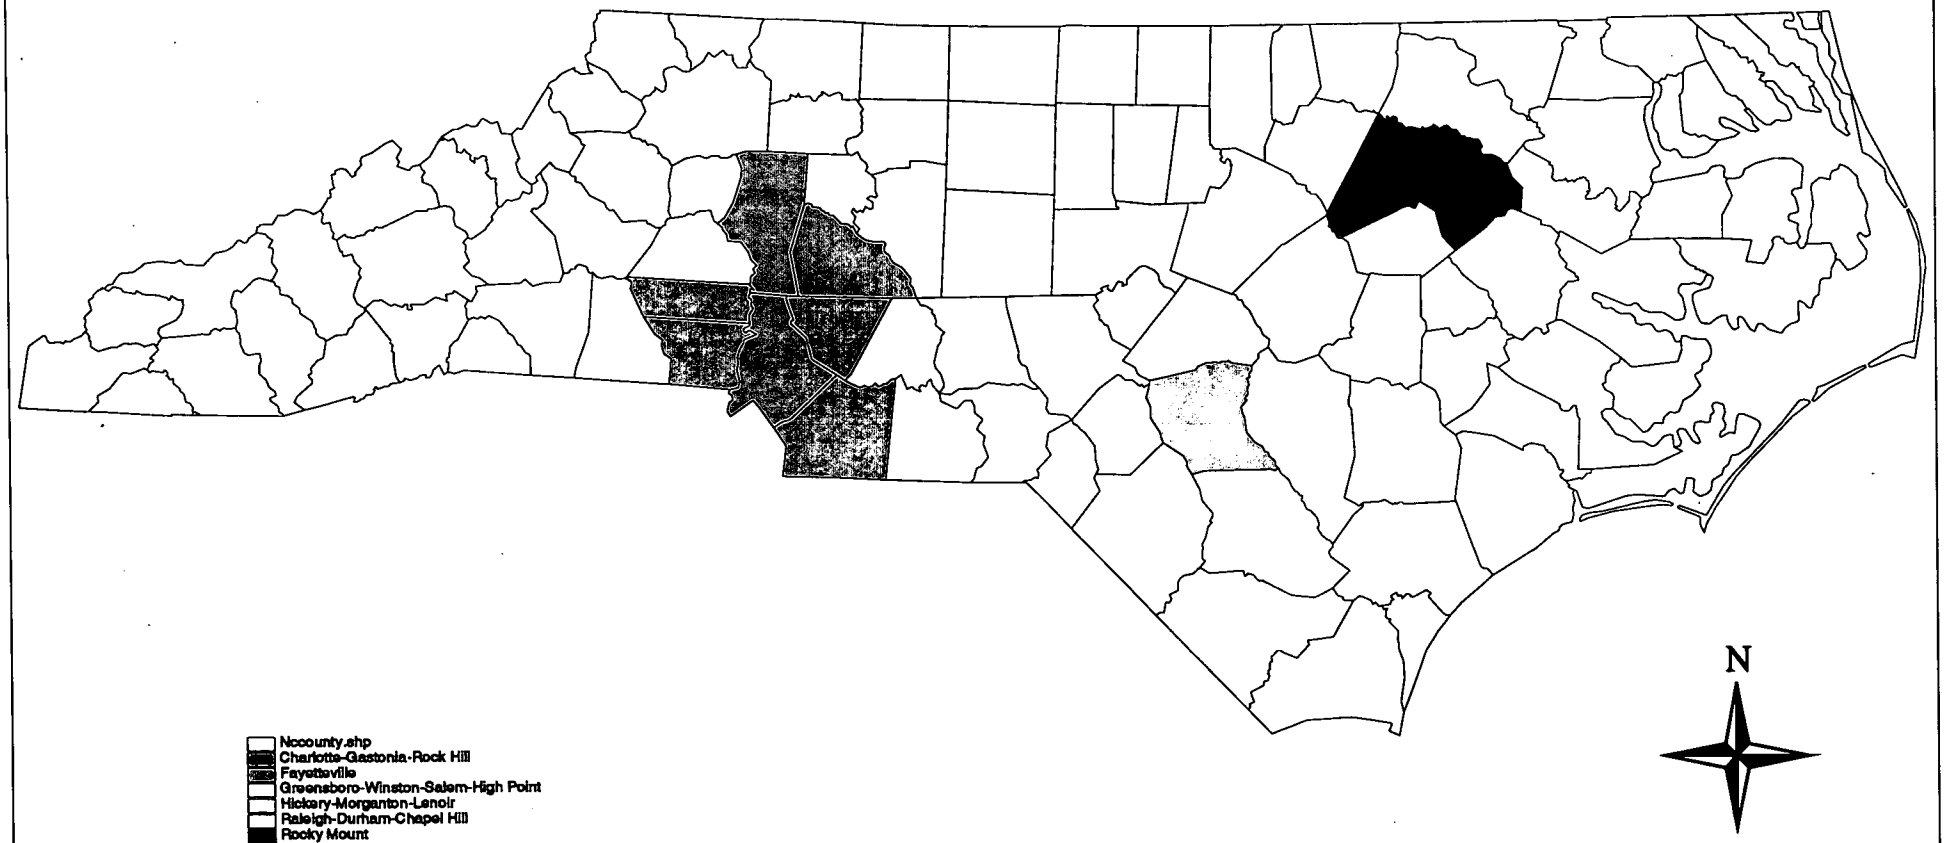
EPA Recommended 8-Hour Ozone Nonattainment Boundary for North Carolina



1/6/04

February 24, 2004 ERC Meeting
EXHIBIT J

Remarks to the Environmental Review Commission
24 February 2004

Thank you Mr. Chairman. My name is Preston Howard and I appear before you today on behalf of the Manufacturers and Chemical Industry Council of North Carolina – MCIC.

I think that Brock Nicholson did a good job of covering the technical details of the 8-hour ozone nonattainment area delineations that he and his colleagues in the Department have proposed.

I appear before you this morning in support of the approach that the Department has taken in drawing the ozone nonattainment boundaries.

Although this is a subject that we collectively could spend days debating, I want to leave you with 3 specific reasons for why you should endorse the approach that the department has taken in drawing the nonattainment area boundaries: Jobs – Actions Already Taken – Consistent Successes.

1) **Jobs**

I don't need to remind you all that our state is hemorrhaging jobs. If we concede to draw our nonattainment area boundaries the way that EPA wants us to, based on their own "guidance" – not regulation – then our prospects for replacing those tens of thousands of jobs will be significantly diminished.

You see, once a county is included in the nonattainment area boundary, a significantly more detailed and complex and timely set of permit requirements are imposed on new and expanding industries.

It is no secret that companies that are looking to expand or to build new manufacturing operations look closely at the permitting requirements for the areas under consideration.

Having a prospective site located in a "nonattainment area" means at least one thing to the company – permitting is going to

be much morecomplicated and it's going to take much, much longer. Instead of looking at a 90 day widow for permitting the company will face a permitting window of 6 – 18 months.

In addition to the increased complexity and time requirements, As Dr. Moreau pointed out earlier, the company may also have to identify "offsets" greater than 1:1 for its new emissions. In other words, for every ton of VOC NOx emissions produced by the new facility, the applicant willhave to secure more than equal that amount from another source.

The bottom line is that the company will look elsewhere!

Which would be to bad, particularly in a situation like Representative Fox's district. Granville County is one of those outlying counties where EPA wants the entire county included in the nonattainment area boundaries.

Although most of the air quality problems in Granville County are being caused by the heavy concentration of motor vehicles in the Triangle Area (Raleigh Durham RTP), and they have virtually no industry that is contributing to nonattainment in the county.

Under EPA's approach to drawing the boundaries, Granville County will lose much of its competitive edge in attracting new jobs to other areas.

Senator Swindell and his constituents in Nash County would face the same dilemma. Most of their nonattainment is due to sources in neighboring counties (principally automobiles) – not sources in Nash County.

Ane the same handicaps on recruiting new industry in Granville and Nash Counties will be played out all across the state – that is if EPA has its way!

2) **Actions Already Taken**

As a result of two major steps that the North Carolina General

Assembly has already taken, we expect to attain the standard earlier than EPA requires in all areas except Charlotte.

First – in the Clean Air Act Amendments of 1999 (which Rep. Hackney championed) you significantly expanded the motor vehicle testing requirements from 9 to 48 counties, with full implementation in all 48 counties expected by 2006.

Second – in 2002 you adopted the Clean Smokestacks Act which which will result in 189,000 tons of NOx emissions reductions – a 77% reduction in NOx from 14 coal fired power plants in North Carolina.

3) **Consistent Successes**

A few of you were in the General Assembly in the early 1990's when we were going through a similar process for drawing the nonattainment boundaries for the 1-hour ozone nonattainment areas. In that case, the state also proposed "partial county" delineations.

At that time the Department took the position that most of the nonattainment measured at monitors in those rural outlying counties was due to automobile emissions in upwind counties – not industrial sources in the rural county where the monitor was located.

In that case EPA also objected.

But Governor Martin stood firm.

He asked EPA why in the world we would impose requirements that limit growth and development in the outlying counties when we know that they are not the ones contributing to their ozone nonattainment.

That same question needs to be asked – and is being asked today.

Just as in the early 1990's, most of our ozone nonattainment is

being caused by automobile emissions – not industrial sources.

We think the Department's approach to drawing the nonattainment boundaries is the right one! It is consistent with the successful approach taken in the early 1990's, and it is also the most protective of our ability to recruit and retain jobs in our state.

Thank you Mr. Chairman. I'll be happy to answer any questions.

Report to the Environmental Review Commission

Update on Hydrogen Sulfide (H_2S) Acceptable Ambient Level (AAL) Rulemaking

B. Keith Overcash, Director
Division of Air Quality
February 24, 2004

The purpose of the rulemaking is to revise the H_2S AAL Guideline.

Current AAL

- Established in 1986 and adopted in 1990
- Only based on short-term effects of high level exposure, not long-term effects of low level exposure
- Set at 1500 ppb (2.1 mg/m^3, or 2100 ug/m^3), for 1-hour average, based on studies of acute irritancy.

In 2001 NC DENR Scientific Advisory Board reviewed studies since 1986 of long-term adverse effects of low level exposure.

SAB recommended 3 options over a range of H_2S AALs for consideration:

- 40 ppb (0.056 mg/m^3, or 56 ug/m^3), for 1-hour average, based on studies of respiratory effects in exposed asthmatics;
- 23 ppb (0.033 mg/m^3, or 33 ug/m^3) for 24-hour average, based on studies of eye irritation in exposed workers;
- 83 ppb (0.120 mg/m^3, or 120 ug/m^3) for 24-hour average, based on studies of nasal toxicity in exposed rats.

In late 2002 and early 2003 -- AQC reviewed the SAB recommended H_2S AALs economic impact of complying with the AALs, and other related issues.

DAQ received permission from EMC to take the proposed AAL change for H_2S to public hearing in May 2003.

H_2S rule proposed options approved by the EMC

Pollutant: Hydrogen sulfide	Annual (Carcinogens)	24-hour (Chronic Toxicants)	1-hour (Acute Systemic Toxicants)	1-hour (Acute Irritants)
OPTION 1		0.12		
OPTION 2			0.056	
OPTION 3 *		0.033		
OPTION 4 *		0.033	0.056	
OPTION 5 New facility Old facility (existing)		 0.033 0.12		
OPTION 6 * New facility Old facility (existing)		 0.033 0.12	0.056	

- Due to potentially high costs of new controls, the proposed rules include options exempting paper mills wastewater treatment systems

Late October / early November 2003 – Two public hearings (Winterville and Asheville) were held to receive comments on the proposed options for the revised H_2S AALs

November 2003 / February 2004 -- Public Hearing Officers' review of comments

March 2004 -- Public Hearing Officers' recommendation(s) of revised H_2S AAL to EMC for adoption consideration

If an option is approved by EMC in March, the proposed rule will go to the Rules Review Commission in April.

If approved by RRC and <10 written objections to the rule are received by the RRC, the rule change will go into effect on May 1, 2004.

Update on the Implementation of the Expanded Inspection and Maintenance Program

Brian C. Phillips
Division of Air Quality
February 23, 2004

February 24, 2004 ERC Meeting
EXHIBIT L

Inspection/Maintenance (I/M) Program Update

- I/M is the program to perform annual emissions inspections on motor vehicles
- Legislation enacted in 1999 and 2000
  - Introduce new test procedure
  - Expand from 9 to 48 counties

Introduce new test procedure

- Onboard diagnostics (OBD2)
  - 1996 and newer light duty gasoline vehicles have built-in computers and monitors
  - Continually self-monitor engine systems and emission control devices
  - Stores trouble codes and illuminates dashboard lamp
- Car constantly tests itself; inspector retrieves the results

Introduce new test procedure

- First OBD test performed in July 2002
- Widespread OBD2 testing by October 2002
- Performing over 5,000 inspections per day; about 2 million per year
  - Numbers will double when program is fully implemented in two years

Introduce new test procedure

- Overall, very positive reaction
  - Fast and easy for inspectors to perform
  - With dashboard light, motorists usually know whether they are going to pass
  - Trouble codes give technicians a head start on diagnostics
- Failure rate is 4%
  - Idle failure on same vehicles was less than 1%
  - Fail rate is consistent with other states

Expand from 9 to 48 counties

- Adding about six counties every six months
- There are currently 23 counties performing emissions inspections
- Next up (July 1): Buncombe, Cleveland, Granville, Harnett, and Rockingham
- Expansion will be complete on 1/1/06

Expand from 9 to 48 counties

- Advance preparations
  - License stations and inspectors (DMV)
  - Train inspectors and repair technicians (community colleges)
  - Buy test equipment (inspection stations)
  - Public outreach (DMV and DAQ)

Summary

- Overall, it has gone very well
  - Inspection capacity has not been a problem
  - Fail rates have been reasonable
  - Early problems affected small percentage of the fleet; were quickly addressed
  - Generally positive reaction from motorists, inspectors, and repair technicians

RE: Inactive Hazardous Sites Annual Report

In 1987 the North Carolina General Assembly enacted the Inactive Hazardous Sites Response Act (N.C.G.S. 130A-310) to address sites with non-permitted releases of hazardous substances. This legislation requires annual reporting to the Environmental Review Commission. The 2003 annual status report is enclosed.

Should you have any questions, please feel free to contact Jack Butler, Chief, Superfund Section, Division of Waste Management at 733-2801, ext. 293.

Report to the North Carolina General Assembly on the Inactive Hazardous Sites Program

October 2003

Superfund Section
Division of Waste Management
North Carolina Department of Environment and Natural Resources

http://www.wastenotnc.org

EXECUTIVE SUMMARY

The Inactive Hazardous Sites Program was created by the North Carolina General Assembly to identify, control and correct properties contaminated with hazardous substances.

To date, 1,816 chemical spill or disposal sites and old, unlined dumps or landfills have been catalogued. Of this number, 1,400 still require work to address their hazards. The old, unlined landfills make up about one half of the sites still requiring action. In most cases, the locations of the landfills are still being determined. The Inactive Hazardous Sites Branch is currently supervising a contract to locate these landfills, collect information on property use, and determine the potential for exposure. Of the 241 landfills inspected under this contract thus far, 166 (or 69 percent) have a residence, school, church, day care or drinking water source on or within 1,000 feet of the landfill. Based on observations at sites investigated by the USEPA and the North Carolina Division of Waste Management, most of North Carolina's unlined landfills can be expected to have groundwater contamination.

The branch has a six person staff. To increase efficiency without additional appropriations, the General Assembly authorized the use of branch-approved private environmental consulting firms to certify lower priority, voluntary party cleanup actions. Called Registered Environmental Consultants or RECs, these private overseers are working on 31 sites. State staff audit a portion of the REC's work activities. At present, 70 firms have received REC status. In addition, oversight of remedial actions at two sites is being provided by federally-funded staff and oversight of work at 35 former manufactured gas plant sites is being provided through an agreement with a consortium of utilities and municipalities which fund two staff members.

The following summarizes site cleanup activities over this past reporting year.

Sites Identified	
Chemical spill or disposal sites	1,086
Old unlined dumps and landfills	730
Total	**1,816**
Sites With All Work Complete	
Since last status report in 10/02	12
Previous site completions	404
Total	**416**
Ongoing Cleanup Actions	
Ongoing REC-Supervised Site Cleanup Actions	31
Ongoing Priority Cleanup Actions Supervised by State Staff	64
Total	**95**

The Inactive Hazardous Sites Response Act requires annual reporting to the General Assembly. All of the reporting requirements specified under N.C.G.S. 130A-310.10 are met in this report. The status report on the Brownfields program, as required by N.C.G.S. 130A-310.40, is provided separately.

I. THE INACTIVE HAZARDOUS WASTE SITES PRIORITY LIST

The Inactive Hazardous Sites Branch is within the North Carolina Department of Environment and Natural Resources' Division of Waste Management. It implements the Inactive Hazardous Sites Response Act of 1987. This act requires the branch to maintain a catalog of inactive hazardous substance or waste disposal sites. Table 1, on the following page, provides a list of sites added to that inventory since the last program report in October 2003. Table 2, on page 3, provides a list of sites assigned "No Further Action" status. The entire inventory can be found in Appendix II. Figure 1, on page 4, shows how the inventory is distributed by category. Appendix I provides a description of each inventory category.

N.C.G.S. 130A-310.2 requires that sites catalogued in the Inactive Hazardous Sites Inventory be prioritized based on their threat to public health and the environment. After discovery, sites are first cataloged in the "Evaluations Pending" category of the Inactive Hazardous Sites Inventory until their rank is determined. Site rankings are determined using the rules found in 15A NCAC 13C .0200. Once ranked, sites are transferred to the Inactive Hazardous Waste Sites Priority List. This list is provided in Table 3, found on page 5.

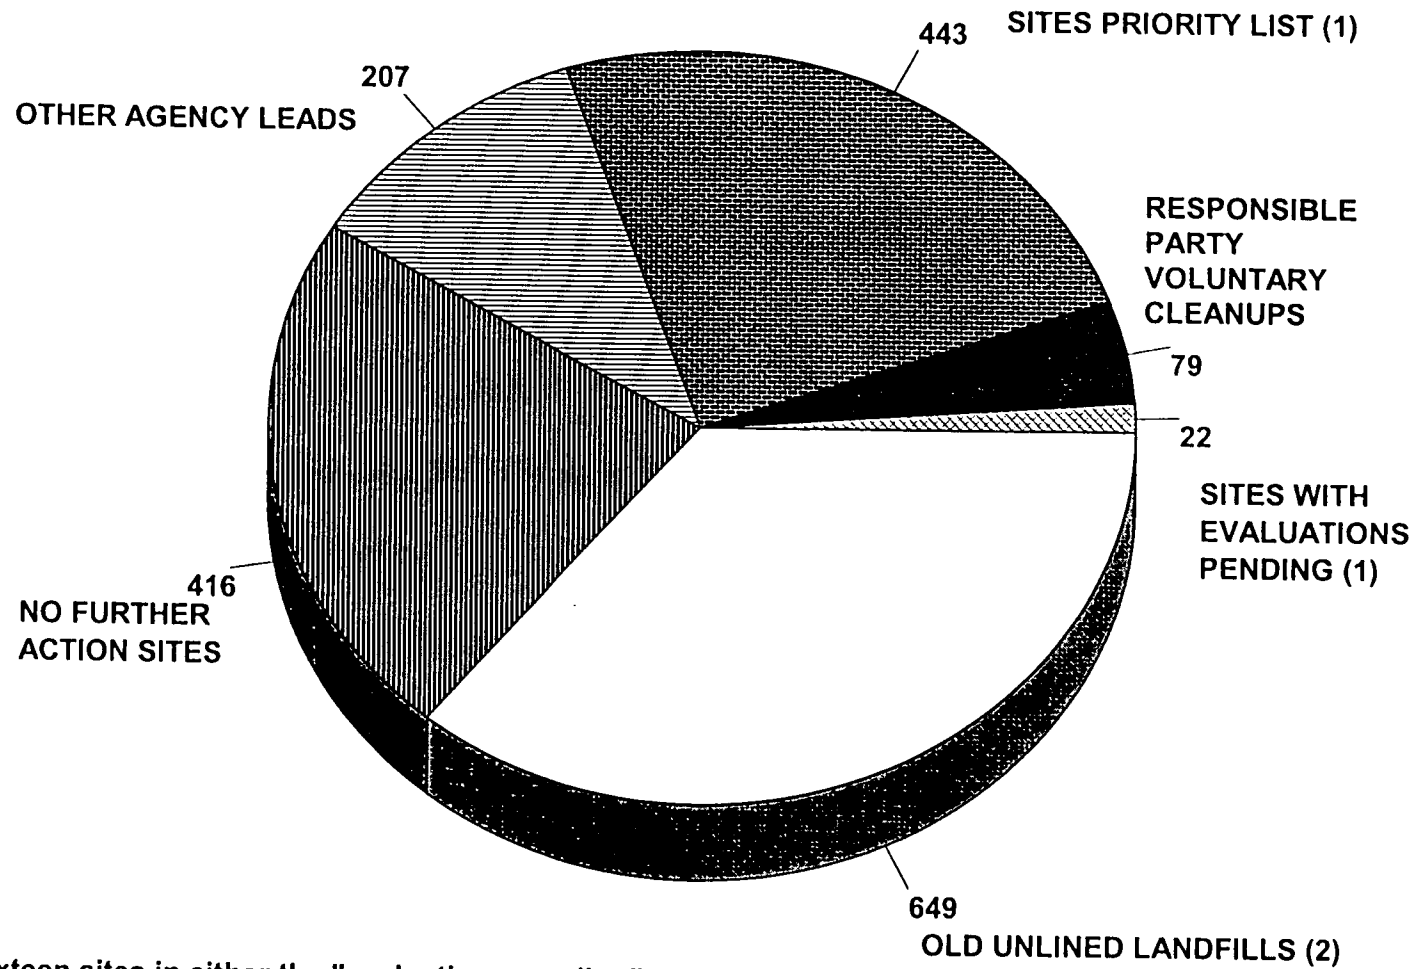
FIGURE 1. INACTIVE HAZARDOUS SITES
OCTOBER 2003 INVENTORY CATEGORICAL DISTRIBUTION
(1,816 Sites)



(1) Sixteen sites in either the "evaluations pending" or "sites priority list" categories are also undergoing assessment and/or cleanup with program supervision (but not under an agreement).
(2) Inventory has 730 landfills. Of that number, 81 were already included in the inventory before the addition of the larger catalog of old, unlined landfills. As a result, they fall into other categories.

II. SITES THAT MAY OR ARE KNOWN TO REQUIRE USE OF THE INACTIVE HAZARDOUS SITES CLEANUP FUND

Purpose of the Fund

The Inactive Hazardous Sites Cleanup Fund is used to: (1) address imminent hazard sites; (2) pay for assessment and cleanup when responsible parties do not comply with orders to clean up sites; (3) pay for assessment and cleanup of sites without financially-viable responsible parties (orphan sites); and (4) pay for state-contracted survey and legal assistance necessary to prepare notices of Inactive Hazardous Substance or Waste Disposal Sites where owners do not comply with orders to conduct such work. The state must attempt to recover its expenditures from responsible parties in the first, second and fourth cases.

The branch's Sites Priority List helps determine priorities for cleanup. Responsible parties for top priority sites are encouraged to voluntarily clean up their sites. When a responsible party does not comply with a request and subsequent order to clean up a site, the state must perform the cleanup using the Inactive Hazardous Sites Cleanup Fund. The demand for state funds to conduct site cleanups, also known as "remedial actions," depends on two factors. First, how often responsible parties refuse to comply with orders to conduct remedial action. Second, how often sites are without financially-viable responsible parties. To date, the program has been successful in encouraging voluntary actions by responsible parties. Funds are mainly needed for orphan cases.

The statute requires that the program report the list of sites known to require funds and the list of sites suspected to require funds for cleanup. Determining if responsible parties exist (and thus, if funds are needed) is often a complex and lengthy process. This information can become dated as owners and operators of the facilities change over time. Therefore, to operate as efficiently as possible with limited staff resources, responsible party research is not done until a site is next in priority for action. For this reason, the total number of orphan sites on the SPL requiring state funds is not presently known.

Orphan Chemical Sites

As of this writing, the branch has identified 39 orphaned chemical waste sites. Of these, 33 have attributes that make them a high priority. These attributes include current use as a residence or some other use with high exposure potential, such as the existence of drinking water wells on or close to the disposal site. We have let a contract to collect samples and to conduct some waste and contaminated soil removal at these sites. This contract commits the remaining funds in the Inactive Hazardous Sites Cleanup Fund toward addressing some of these sites.

In addition to these orphan sites, the branch has been expending cleanup funds to address the large threat to public health and the environment posed by the Texfi, Inc. site in Fayetteville, Cumberland County. Groundwater contaminated with hazardous substances has migrated from Texfi to the adjoining City of Fayetteville's Hoffer Water Plant property. The contaminated groundwater is in contact with the city's primary

finished drinking water holding tank. This tank sits, in part, below the groundwater table. The tank's construction and the nature of its water flow make it possible for contaminated groundwater to enter the tank. In addition, the city's drinking water intakes on the Cape Fear River, 450 feet downstream from the Texfi property, and a city park adjoining the Texfi property, are also concerns. Thus far, analysis indicates the drinking water has not been affected.

The branch used cleanup funds to construct a barrier wall to prevent additional flow of contaminated water toward the tank. Extraction wells have been installed to remove some of the contaminated water that had already passed on to the water plant property and around the tank. Groundwater contaminant concentrations in the area between the wall and the tank have declined since initiating this action. The construction of the barrier wall, the removal of contaminated groundwater from between the wall and the tank and monitoring of the city's drinking water are being conducted as immediate protective measures. These activities will not clean up the larger groundwater contaminant plume or its sources at the Texfi site. Our contract for conducting the monitoring and maintenance of the protective measure will end in March 2004 when funds will be depleted.

There is a risk the barrier wall will fail overtime. Thus it is important to remove the source of the groundwater contamination on the Texfi property. The sources are solvents in the subsurface and contaminated soils.

Settlement of North Carolina's bankruptcy claim against the Texfi estate mandated that a portion of the proceeds from the estate's law suits and property sales are to be placed in a trust fund to conduct the removal of contaminant sources. We do not know how long it may take to generate these funds or how much money will result. After removing the sources of groundwater contamination, it could take many years before significant reductions in groundwater contaminant concentrations will occur.

Unlined Landfills

Due to the frequency of old unlined landfills having hazardous substance contamination, the branch has contracted the task of determining the location and current use of these sites. This activity is being funded by special state funds and by federal funds. These funds will be depleted by the end of the 2003 calendar year. A total of 39 of the 100 counties will have had this work completed. To date, we have completed field surveys of 241 old landfills. Of the landfills inspected, 166 are considered priorities. This is due to a drinking water source, a residence, a school, a church, or a daycare on the property or within 1,000 feet of the landfill.

We can estimate the number of old, unlined landfills that pose the greatest hazard by using the following equation:

> *Number of landfills with exposure concerns (166) ÷ number of landfills surveyed thus far (241) X total number of landfills in inventory (730) = estimated 503 landfills with exposure concerns.*

Almost without exception, these landfills were operated either by private individuals with limited financial ability or by counties and municipalities that operated in the public interest and did not make a profit. Thus, these sites may be considered to have no responsible parties available to pay for any corrective measures required.

Cleanup Funds Needed

There are a total of 769 orphan chemical sites and old unlined landfills that remain to be addressed. Of these, 199 are considered high priorities due to exposure concerns. There are only sufficient funds in the Inactive Hazardous Sites Cleanup Fund to address four or five of the 33 orphan chemical sites identified as being a priority due to exposure concerns. Based on the average cost expended per site under our contract, another $3,360,000 will be needed to address the remaining 28 sites. No monies are available to address the orphan landfills and the lower priority orphan chemical sites.

The Texfi, Inc. site has no other responsible parties. The federal government has already indicated the site is not a candidate for a cleanup under Superfund. Drinking water for the entire population of the City of Fayetteville is threatened. At a minimum, additional funds are needed to continue operating and maintaining the extraction wells on the City's property, and monitoring of the City's drinking water. These funds are needed until bankruptcy funds accrue to a level which can support a source area removal and until groundwater contaminant concentrations drop as a result. This may take many years. An estimated $28,000 per year is needed to conduct this work

As of July 31, 2003, the balance of the Inactive Hazardous Sites Cleanup Fund totaled $697,860. This balance is committed toward two contracts and will be depleted by March of 2004.

III. NATIONAL PRIORITIES LIST SITES REQUIRING A STATE COST SHARE

National Priorities List sites are those hazardous substance or waste disposal sites that are priorities for cleanup under the federal Comprehensive Environmental Response, Compensation and Liability Act, more commonly known as Superfund. North Carolina has 28 NPL sites.

The NPL includes sites with and without financially-viable responsible parties. Cleanup costs are financed either by responsible parties or by a federal trust fund with a state cost share. When the federal trust fund is used, CERCLA requires North Carolina to pay 10 percent of the cleanup cost plus 100 percent of the cost to operate and maintain the remediation system.

Table 4, found on page 52, provides a list of the North Carolina NPL sites, their locations, investigation/cleanup status, estimated costs, and projected start dates for cleanup. Part I, found on page 52, includes those sites where the Federal Trust Fund/North Carolina cost share is required. A summary of North Carolina's cost share obligations is provided at the end of this part. Part II, found on page 54 includes the status of responsible party funded cleanups.

TABLE 4. NORTH CAROLINA NATIONAL PRIORITIES LIST SITES
PART I - SITES WHERE FEDERAL TRUST FUND/NORTH CAROLINA COST SHARE IS REQUIRED

SUMMARY OF NORTH CAROLINA COST SHARE REQUIREMENTS
As of 30 June 2003

Estimated total cost of pending/ongoing federal trust fund/N.C. cost share cleanups:	$89,566,598
N.C.'s 10 percent cost share for pending/ongoing cleanups:	$8,956,660*
Fund disbursements for cost share payments:	$5,266,188
Current fund balance:	$5,139,891
Encumbered amount of the fund balance for cost share payments:	$3,690,472

* This number will increase due to remedial action cost estimates not being available for all sites. Also, other sites may be added to the National Priorities List which will require a state cost share.

** Date applies to either entire site or operable unit.

IV. RESPONSIBLE PARTY VOLUNTARY SITE REMEDIAL ACTION

When the Inactive Hazardous Sites Branch solicits the cooperation of responsible parties in taking action at a priority site, most parties agree to voluntarily conduct a cleanup with branch approval. In addition to these voluntary actions, responsible parties and owners often come forward on their own to initiate an approved assessment and/or remedial action. Due to the number of volunteers and very limited staff resources, the branch was authorized by the General Assembly to privatize its oversight role at lower priority, voluntary site remedial actions. Sites with more severe public health threats or concerns are still reviewed by state staff.

The privatized portion of the voluntary cleanup program is called the Registered Environmental Consultant, or REC Program. Under this program, a responsible party hires an REC to both conduct, and to certify the regulatory compliance of, a site's assessment and clean up. In order for a firm to qualify as an REC, it must demonstrate it meets certain regulatory qualifications criteria. The REC certification replaces state oversight. The state audits a portion of the REC projects to ensure the integrity of the program. The state sanctions RECs where necessary. A state staff auditor is funded through fees collected from the voluntary participants.

A current list of sites which have parties conducting assessments and cleanups in accordance with consent agreements with the state is provided in Table 5, on the following page. Table 6, found on page 59, is a list of additional, ongoing, Branch-directed priority actions not under consent agreements.

Note: There are 24 additional sites with active ongoing bankruptcy claims, new site screenings, "no further action" reviews or monitoring of perpetual land use restrictions.

V. IMMINENT HAZARD SITES

The N.C. Department of Environment and Natural Resources and the USEPA are committed to addressing imminent hazard sites when identified. Table 7 provides a list of sites where imminent hazards have been discovered, or where abatement activities have continued, since the last legislative report in October 2002. Their location, a site description, status and funding source are also provided.

TABLE 7. SUMMARY OF IMMINENT HAZARD SITES

Site	City/ County	Site Description	Status	Funding Source
Charlotte Potassium Cyanide Site	Charlottte/ Mecklenburg	Container of potassium cyanide discovered during a USEPA terrorist investigation.	Container was removed in 2003.	USEPA
Holmes Scrap Yard	East Spencer/ Rowan	Abandoned source of radium 226 found at scrap yard.	Source removal completed in 2003.	USEPA
Holtra Chem/Honeywell	Riegelwood/ Columbus	Tanks, lagoons, ponds, soils, materials and a building contaminated with mercury.	Waste removal ongoing. USEPA negotiating cleanup work with owner.	Owner
Fowler Properties Scrapyard	Kinston/ Lenoir	Numerous abandoned small containers of various chemicals.	Containers removed in 2002.	USEPA
P & B Distribution	Williamston/ Martin	Runoff from a fire caused a fish kill in Peter Creek.	Contaminated soils removed in 2002.	USEPA
Rosso Scrapyard	Dover/Craven	Numerous small containers of various chemicals in a dilapidated school building.	Containers removed in 2003.	USEPA
Texfi Industries	Fayetteville/ Cumberland	Chlorinated solvent groundwater contaminant plume has migrated from a former textile mill to the City of Fayetteville's water plant property. The city's finished drinking water holding tank sits in contact with contaminated groundwater. The city's drinking water intakes on the Cape Fear River are 450 feet downstream from the Texfi property line.	The State constructed a barrier wall to prevent further contaminant migration to the holding tank area and installed extraction wells to remove contamination presently near the tank. The State will operate the extraction wells and monitor the groundwater until March 2004 when funds will be depleted. The State is waiting for funds through a bankruptcy settlement to conduct a source removal.	State
VC Chemical	Wadesboro/ Anson	Former fertilizer manufacturing operation. Very high levels of metals in soils. Property is near a residential area.	Soil removal completed 2003.	Responsible party
West Pharmaceutical Fire	Kinston/ Lenoir	Fire at facility. Chemicals present at facility.	Owner conducting a cleanup with USEPA supervision.	Owner

VI. SUMMARY OF THE INACTIVE HAZARDOUS SITES CLEANUP FUND AND NATIONAL PRIORITIES LIST COST SHARE FUND

Inactive Hazardous Sites Cleanup Fund
As of July 31, 2003

Deposits (9/02-7/03)	
Interest	$58,478
Cost recovery of previous expenditures	$6,000
No further action review fees	$2,034
Total Deposits	**$66,512**
Withdrawals (9/02-7/03)	
Texfi Industries-Fayetteville emergency abatement contract	$111,746
Orphan priority site sampling/removal contract	$70,330
PCB Landfill Transfer	$2,500,000
Total Withdrawals	**$2,682,076**
Current Balance	**$697,861**
Obligations	
Texfi emergency abatement contract	$132,417
Orphan priority site sampling/removal contract	$565,444
Total Current Obligations	**$697,861**
Effective Balance	**$0**
Orphan Cleanup Cost Requirements (see Chapter II for more details)	
Funds needed for 28 additional priority orphan sites	$3,360,000
Funds to continue to maintain Texfi emergency abatement measure for five years	$140,000
Priority Orphan Site Cleanup Costs	**$3,500,000***

* Note that this figure does not cover the numerous orphan unlined landfill sites with exposure concerns.

National Priorities List Cost Share Fund
As of June 30, 2003

Estimated cost of federal trust fund/N.C. cost share cleanups	$89,566,598
N.C.'s 10 percent cost share for pending/ongoing cleanups	$8,956,660*
Fund disbursements for cost share payments	$5,266,188
Current balance	$5,139,891
Encumbered amount of the fund balance for cost share payments	$3,690,472
Effective Balance	**$1,449,419***

* Cleanup cost estimates are not yet available for all sites. The cost share figure will increase as cost estimates become available. Also, other sites may be added to the National Priorities List that will require a state cost share. This account will also be required to pay for the state's operation and maintenance obligations which, will begin in the next few years at some sites. Aside from interest, the fund has no continuing source of income.

APPENDIX I

INACTIVE HAZARDOUS SITES INVENTORY
Description of Categories

The Department of Environment and Natural Resources is required by North Carolina General Statute 130A-310.1(a) to maintain an inventory of inactive hazardous substance or waste disposal sites. The Inactive Hazardous Sites Inventory accounts for all of the sites in the EPA's Comprehensive Environmental Response, Compensation and Liability Act inventory of potential contaminated sites called CERCLIS. The intent is to address those sites determined not to be federal priorities. Many sites in the CERCLIS inventory, and therefore also the Inactive Hazardous Sites Inventory, are regulated by other state and federal laws. Thus, they are not priorities for the Inactive Hazardous Sites Branch. The Inactive Hazardous Sites Inventory is organized in the categories described below. To avoid duplication of work, sites being addressed by other agencies are tracked in separate categories. Ten of the inventory sites appear in multiple other agency lead categories (4 through 10).

1. **Sites Priority List**
   The SPL includes sites with confirmed contamination or known disposal of hazardous substances that have been ranked using the Prioritization System rules (15A NCAC Subchapter 13C .0200).

2. **Responsible Party Voluntary Remedial Action Sites**
   In accordance with North Carolina General Statute 130A-310.9(b), voluntary cleanups or "remedial actions" conducted by responsible parties under agreements with the state must be listed in a separate category.

3. **Sites with Evaluations Pending**
   This category includes those sites that require evaluation before site priority can be determined. Each site with evidence of contamination will be ranked and transferred to the SPL. Those sites where no further action is required will also be transferred to that category.

4. **National Priorities List**
   The NPL consists of sites the federal government has determined to be the most serious, uncontrolled hazardous waste disposal sites in the nation. Either federal and state dollars or responsible parties will fund these cleanups. This list only includes North Carolina NPL sites.

5. **Non-NPL Federal Superfund Cleanups**
   NPL-caliber sites where the USEPA has entered into agreements with responsible parties to conduct remedial action are supervised by the USEPA. This list includes only the USEPA non-NPL remedial action sites located in North Carolina.

6. **Inventory Sites Managed as TSD Facilities by the Hazardous Waste Section***
   Facilities that have, or are in the process of applying for, a Resource Conservation and Recovery Act permit to treat, store or dispose of hazardous waste are tracked in this category. These sites are exempt pursuant to G.S. 130A-310(3).

7. **Non-TSD Inventory Sites Under the Jurisdiction of the Hazardous Waste Section***
   The inventory includes some sites that are currently undergoing Resource Conservation and Recovery Act corrective action under the direction of the North Carolina Hazardous Waste Section, but do not hold RCRA permits.

8. **Inventory Sites Under the Jurisdiction of the Solid Waste Section***
   Permitted solid waste landfills being monitored and controlled by the North Carolina Solid Waste Section are tracked in this category.

9. **Inventory Sites Under the Jurisdiction of the Division of Water Quality ***
   Sites in this category include those where the North Carolina Division of Water Quality has been specified as the lead agency to oversee assessment and/or cleanup.

10. **Inventory Sites Under the Jurisdiction of the Division of Environmental Health's Radiation Protection Section***
    Sites conducting assessment and cleanup under the direction of the North Carolina North Carolina Radiation Protection Section are tracked in this category.

11. **Old Unlined Landfills**
    This is a list of all the old unlined landfills catalogued by the branch. Seventy-seven of the 755 landfills are also listed in other categories.

* **Additional sites, not included in the Inactive Hazardous Sites Inventory, may be managed by these regulatory agencies.**

RE: Report on Superfund Cost Share Fund Expenditures for North Carolina's 10 Percent Share for Cleanup of Sites on the National Priorities List

Section 15.12 (a) of House Bill 352 (ratified August 28, 1997) authorizes the Department of Environment and Natural Resources, with the approval of the Office of State Budget and Management, to use available funds for the 10 percent cost share required for Superfund cleanups on the National Priorities List sites.

Section 15.12 (b) directs the DENR to report to the Environmental Review Commission and the Joint Legislative Commission on Governmental Operations as to "the amount and source of the funds used pursuant to subsection (a) of this section within 30 days of the expenditure of these funds." The attached report provides this information.

If you have any questions, please contact Mr. David Lown, Head, Federal Remediation Branch, Superfund Section at 733-2801 x.278.

Report to the
Environmental Review Commission

Expenditures from the
Superfund Cost Share Fund
For North Carolina's 10 Percent Share

July 2003

NORTH CAROLINA DEPARTMENT OF
ENVIRONMENT AND NATURAL RESOURCES

Superfund Section
Division of Waste Management

http://www.wastenotnc.org/

REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION ON EXPENDITURES FROM THE SUPERFUND COST SHARE FUND FOR NORTH CAROLINA'S 10 PERCENT SHARE OF CLEANUPS FOR SITES ON THE NATIONAL PRIORITIES LIST

At present, 28 hazardous waste sites in North Carolina have been included on the National Priority List (NPL) for cleanup. At twelve of the NPL sites, no viable responsible parties have been identified. These sites will be cleaned up using a combination of federal and state public funds. The federal Hazardous Response Trust Fund (the Superfund) contributes 90 percent of the money for remedial actions at these sites; the State contributes the remaining 10 percent. If the cleanup involves the ongoing use of remediation systems, the State must pay 100% of the operation and maintenance (O & M) costs for the system. One new North Carolina site has been proposed for addition to the NPL; that site will also be Fund financed.

Both the State's 10% cost share and any O & M costs are paid out of the State's Superfund Cost Share Fund (SCSF). As of July 31, 2003, the Fund had accumulated $11,914,069 in appropriations, interest and other income. Of that total, $8,756,660 has been encumbered or disbursed to pay for the State's share of clean up costs at eight NPL sites with signed Superfund State Contracts (SSCs). Other disbursements and reductions have removed $1,496,966 from the SCSF, leaving only $1,660,443 available for future cleanup actions. All remaining available SCSF funding could be obligated for cleanups in the next few months.

At the remaining four NPL sites, the State has not yet negotiated Superfund State Contracts and remedial actions have not begun. In addition to those four NPL sites, another potential Fund-financed site is proposed for the NPL. The actual amount required for State cost-share at those sites cannot be known until assessment of the sites has been completed. Additional sites likely will be added to the NPL in the future and some of those future sites will likely require a 10 percent state cost share for cleanup. Once funds in the SCSF have been exhausted, Superfund cleanups of NPL sites in North Carolina could end.

The attached table, Fund-Financed NPL Sites, lists the eight fund-financed sites for which an SSC has been signed. The table also shows all encumbrances and disbursements that have occurred due to the State's 10 percent cost share requirement. Note that some sites are divided into Operable Units (OU). This is common practice in the cleanup of NPL sites, because it makes designing and executing the cleanups more structured and easier to control.

There is one disbursement of $3,803 from the SCSF that was made in July 2003, for ABC Cleaners OU-2. This is the only disbursement since May 2003.

Report to the Environmental Review Commission

Expenditures from the Superfund Cost Share Fund For North Carolina's 10 Percent Share

January 2004

NORTH CAROLINA DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

Superfund Section
Division of Waste Management

http://www.wastenotnc.org/

REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION ON EXPENDITURES FROM THE SUPERFUND COST SHARE FUND FOR NORTH CAROLINA'S 10 PERCENT SHARE OF CLEANUPS FOR SITES ON THE NATIONAL PRIORITIES LIST

Exhaustion of North Carolina's Superfund Cost Share Fund (SCSF) threatens to end the cleanup of fund-lead National Priorities List (NPL) sites in the state. The remaining portions of the SCSF could be obligated to cleanups led by the USEPA in the next few months.

At present, 29 hazardous waste sites in North Carolina are included on the NPL. Thirteen of the NPL sites are fund-financed sites, where no viable responsible parties have been identified. These sites are being cleaned up using a combination of federal and state public funds. The Hazardous Response Trust Fund (the Superfund) contributes 90 percent of the money for remedial actions at these sites and the state contributes the remaining 10 percent.

The state's 10 percent contribution comes from the SCSF. As of 31 January 2004, the fund had accumulated $11,980,858 in appropriations, interest and other income. Of that total, $8,756,660 has been encumbered or disbursed to pay for the state's share of clean up costs at eight NPL sites with signed Superfund State Contracts (SSCs).

Other disbursements and reductions have removed $1,496,966 from the SCSF, leaving only $1,715,956 available for future cleanup actions. Available funding could be obligated for cleanups in the next few months. Remedial actions needed at five NPL sites have not begun. To date no SSCs have been negotiated for these sites. In addition to the sites discussed above, other sites will be added to the NPL. Some of these sites will require a 10 percent state cost share for cleanup. In addition to the 10 percent cost share at these fund-financed NPL sites, the state is responsible for the operation and maintenance (O&M) costs as well. The funds to perform O&M also come from the Superfund Cost Share Fund.

The attached table, Fund-Financed NPL Sites, lists the eight fund-financed sites for which an SSC has been signed. The table also shows all encumbrances and disbursements that have occurred due to the state's 10 percent cost share requirement. Note that some sites are divided into Operable Units (OU). This is common practice in the cleanup of NPL sites, because it makes designing and executing the cleanups more structured and easier to control.

Two disbursements totaling $27,092 were made the SCSF in December 2003. A payment of $5,133 was made for ABC Cleaners OU-2 and a payment of $21,958 was made for the Davis Park Road site. These are the only disbursements since July 2003.

To continue the cleanup of North Carolina's NPL sites, it is important that funding for the SCSF be reestablished.

2019	$600,000
2020	$600,000
TOTAL (Through 2020)	$9,550,000

Remarks Before the Environmental Review Commission of the NC General Assembly

NC Division of Waste Management Brownfields Program

February 24, 2004
Raleigh, NC

Mr. Chairmen and members of the environmental review Commission, my name is Bruce Nicholson. I am the Brownfields Program Manager in the Division of Waste Management. I thank you for the opportunity to once again speak to you about the Brownfields Program. And I am even more pleased to be once again giving you good news about the program's progress and effectiveness.

However, my time for this presentation is all too brief, so I will not take it up by citing all of the statistics that you may read in the annual report. Suffice to say, in 2003 the program has had a record number of applications and a record number of brownfields agreements processed. The program has now facilitated over $615 million in committed private investment in the cleanup and redevelopment of these sites, a number that is even biased low because of developers' hesitance in giving us their confidential capital investment numbers on many projects. Setting aside all the numbers for a moment, what the program is doing is recycling properties....by

providing prospective developers the option to reuse these brownfields sites rather than develop on greenspace all the time.

I show here a map of sites that are in the program [Show SLIDE of state map with sites marked]. Completed sites are in red, and sites in progress are in blue. The first thing you notice here is that there are now 98 sites in the program, and they are spread across the entire state. We know of several developers preparing letters of intent on new sites so that very soon, maybe by month's end, we will have our 100th site in the program.

Certainly the City of Charlotte has been more active than any other city in the renewal and redevelopment of sites. But their activity, fueled by the national brownfields conference being held in Charlotte last year, is certainly beginning to rub off on developers and local governments across the state, both in urban and rural areas. One statistic that may interest you is the number of abandoned textile operations that have entered the program. Of the 98 sites in the program, 26 are former textile operations. So we feel that the program is certainly serving to help redevelop the facilities of this industry as it declines. [One of these former textile facilities is a multimillion dollar redevelopment just a mile north of here that transformed an abandoned vagrant hangout into office space on the National Register of Historic Places. Office space redevelopment which has led to further investment into the neighboring parcels and has completely changed the area north of Peace College from "eyesore" into "eyepopping".

Projects like this are creating good use and good jobs out of abandoned facilities.]

Because we are spending federal dollars efficiently, facilitating actual redevelopments, rather than just assessing sites and hoping developers will come, the program's progress has made an impression on EPA Region 4. In October, we were able to obtain $1 million in federal funding for the brownfields and voluntary cleanup programs under the new federal brownfields act. This has allowed us to hire more staff for the program to handle the increasing demand. Two vacancies are posted as I speak to you. Two of these staff positions are in offices local offices remote from Raleigh. The first is in Charlotte where in 2002 the city committed its own funds to help us pay for a staffer. That funding has come to an end this year though the city continues to partner with us by providing office space for our staffer in Charlotte so that she has direct access to developers in the area. This DENR/City partnership has worked so well that we are now attempting to duplicate this arrangement through a partnership with the Land of Sky Regional Council in Asheville, where we hope to house a brand new position.

I also wanted to inform the Commission that, in addition to our Site-Specific activities, we are working on program development tasks to enhance the program. First, we are holding a Brownfields Workshop on April 1 where developers and local governments can learn about how the program can help them redevelop brownfields in their area, and also teach local government officials how to

apply U.S. EPA brownfield grants and how to use them to their best advantage. We are also planning to develop a demographic inventory of brownfield sites in order to characterize the number and nature of brownfields across the state, possibly working with the Institute of Government to do so.

The program looks forward to many more successful years ahead in safely recycling contaminated abandoned properties for the benefit of all the state's citizens.

I thank you for your attention and will answer any questions.

Brownfields Property Reuse Act
Annual Report to the General Assembly
December 2003

Executive Summary

This report to the General Assembly, required by the Brownfields Property Reuse Act (BPRA) of 1997 (G.S. 130-310.30 *et seq.*), describes the continued growth and success of the Brownfields Program in 2003. It also examines how effectively the BPRA encourages and facilitates the safe and productive reuse of abandoned, idled or underutilized properties where the threat of liability due to environmental contamination has hindered redevelopment.

During 2003, the Brownfields Program built on its success with expanded cost effectiveness and leveraging capability. By the end of 2003, the program will have completed a record 15 brownfields agreements -- a 50 percent increase over 2002 -- bringing the total of completed agreements to 39. These 39 projects represent more than $550 million in private investment committed to brownfields redevelopment. Moreover, demand for program service continues to increase. DENR projects that a record 33 applications to the program (Letters of Intent) will have been received from prospective developers during 2003, also a 50 percent increase over 2002. DENR's efforts to address the program's expanding inventory and the increasing demand are briefly described below.

- In June 2003, the U.S. EPA's Region 4 awarded DENR $1 million in Section 128(a) funding (for state response programs) under the Small Business Liability Protection and Brownfields Revitalization Act, which was enacted in December 2002. Increased federal funding enables DENR to significantly expand its ability to meet the increasing demand for Brownfields Program services. DENR recently added two project managers and plans to add one additional project manager in the first quarter of 2004. A toxicologist and a database/IT manager are also scheduled to be hired in early 2004. Grant funding will also be used to expand the state's voluntary cleanup program by adding two technical staff members to increase this program's effectiveness.

- The assistant attorney general that provided years of legal representation to brownfields and other Superfund-related programs will now work exclusively for the Brownfields Program. In addition to receiving more timely negotiation and review of brownfields agreements, the development community will benefit from additional programmatic continuity.

Background

Redeveloping brownfields properties has become increasingly popular as developers and cities realize these properties offer viable opportunities to bring economic growth, public health protection, jobs, and quality of life benefits to cities and rural areas. Brownfields are abandoned, idled or underutilized properties where environmental contamination hinders redevelopment due

to concerns about environmental liability. The BPRA gives DENR the authority to enter into brownfields agreements with prospective developers who did not cause or contribute to site contamination. The BPRA modifies the environmental liability barrier for prospective developers and motivates them to bring these properties and their hindrances to the department's attention. The department partners with the prospective developer to evaluate the possible risks associated with site contamination, and negotiates a brownfields agreement that stipulates the steps necessary to make the site safe for a specific intended reuse. The result is a redevelopment project that works economically while fully protecting public health and the environment.

Because brownfields agreements afford prospective developers liability protection for as long as they make and maintain the site safe for its intended reuse, the specter of open-ended financial uncertainty is lifted. This economic shield allows prospective developers to obtain financing hitherto unavailable for these properties.

Thus, the BPRA provides guidelines for a new public policy that allows DENR to distinguish between prospective developers of brownfields properties and the properties' polluters. Instead of mandating the site be cleaned to current standards, the BPRA requires developers to make the site safe for reuse. The program must examine the risks to public health or environment posed by the site. Then, DENR determines what the prospective developer must do to ensure safe redevelopment. These actions can range from land-use restrictions to cleanup, or a mixture of both. In addition to holding prospective developers accountable to their agreements, DENR reserves the right to enforce against those parties responsible for the original contamination. The process is summarized in Table 1 below.

Table 1. Summary of the Brownfield Process

Step 1 – A prospective developer with a brownfield site that needs liability protection submits a letter of intent with basic site facts. DENR determines if the prospective developer and the property proposed for reuse are eligible under the BPRA statute.
Step 2 - DENR reviews existing site data to determine the risk posed by contamination at the site. If the data are insufficient to evaluate such risk, DENR advises the prospective developer on further site assessment to gather the necessary data.
Step 3 - DENR determines what actions are necessary to make the site safe for reuse and includes these actions in a brownfields agreement. The prospective developer pays statutory fee.
Step 4 - The brownfields agreement is published with a 60-day public comment period.
Step 5 - The brownfields agreement is finalized after any public comments are considered and incorporated. The prospective developer uses the final brownfields agreement, which provides liability protection, to obtain financing for the project. Liability protection is contingent upon the completion of the actions required by the brownfields agreement. The brownfield agreement makes the site eligible for the brownfields property tax incentive.

The ancillary brownfields property tax incentive for prospective developers allows them to recoup funds spent on assessment and cleanup. The program motivates the market to recycle these sites back to productive reuse, while preserving or reducing the use of pristine or undeveloped "greenfield" property. While the environmental benefits are obvious, most

redevelopments also create a significant number of jobs and put properties back on the tax rolls. This double economic-environmental gain benefits the state, local government, and the brownfields developer.

As these benefits become better known, the program's popularity increases. After three years of successive record breaking growth, the program boasts 39 completed brownfields agreements and has over 50 others in the pipeline. Over $550 million private investment dollars have been used to redevelop abandoned properties that blighted urban and rural landscapes.

The overall result is a win-win scenario for both the environment and economic development. Risk reductions and cleanups are achieved at sites that could have harmed the public or the environment while prospective developers redevelop abandoned properties that once had little hope for redevelopment or productive reuse. The public benefits of job creation, improved quality of life in the surrounding neighborhoods, local tax base expansion and contribution to the general fund are other positive impacts.

The program also supports smart growth, sustainability and the One North Carolina Naturally agenda. Every project that reuses property in urban centers reduces suburban sprawl and preserves green space. Without brownfields agreements, many redevelopment dollars would have been spent on projects that increase suburban sprawl and promote commercial development in greenspace areas. In a very real sense, for each brownfield redeveloped, a greenspace is saved.

Program Status

Like past years, 2003 has seen significant program growth. The two staff members added in 2002 have gained experience and helped the program meet its increased demand for services. Their efforts made the program's success in 2003 possible.

Despite stagnant economic conditions in the development sector, a record-breaking 25 Letters of Intent were submitted to the program by the end of September 2003. We anticipate increased demand as the program's expansion serves to better educate both the public and the development community about brownfields' redevelopment benefits. The federal brownfield assessment and cleanup grants awarded by the U.S. EPA to local governments in 2003 (Greensboro, Concord, and Farmville) will further increase demand as these communities begin local brownfields redevelopment efforts.

In July 2003, the U.S. EPA's Region 4 approved DENR's application for brownfield cooperative agreement funding. It awarded DENR $1 million under Section 128 of the federal Small Business Liability Relief and Brownfields Revitalization Act. The funds are authorized for use starting October 1, 2003 through October 1, 2004.

This represents a five-fold increase in funding over the previous year. It allows DENR to expand the Brownfields Program to meet its increasing demand. DENR added its fourth project manager to the program in November 2003 and plans to hire an additional project manager, a toxicologist, and a database/IT manager in the first quarter of 2004. These hires will be made

using solely federal funds. The program also uses these funds to contract with the Department of Justice for one full time attorney position.

The City of Charlotte renewed its cooperative funding agreement with DENR on July 1, 2003. The agreement provides the program with the funds needed to locate a staff member in the City of Charlotte. In anticipation of receiving federal funds, the city's agreements allowed its salary funding commitment to drop by 50 percent. By adding federal funds in addition to those the city provides, the staff person is free to work projects outside the city as necessary. If funding allows, the City of Charlotte agreement may be reduced to zero salary dollars in the next renewal period although the city remains committed to providing office space and clerical support to support the position.

Site Summaries

For a brief description of all brownfields projects pending at the end of September 2003, please see the Appendix. The table is divided into three sections: active eligible projects, projects pending eligibility and projects with finalized brownfields agreements.

Active eligible projects have been deemed eligible by the program as they meet the statutory criteria. These developers are working with DENR in some stage of data gathering, analysis or agreement negotiation. At present, there are 44 active eligible projects. Projects at this stage receive guidance from DENR as they gather the additional data needed to ensure protection of public health and environment. Once research is complete, DENR analyzes the data, then drafts and negotiates the terms of the brownfields agreement with the prospective developer. At most of these sites, DENR is waiting for additional data requested by the program.

Projects pending eligibility are in the initial stage of consideration because the program has yet to determine if the sites are eligible by meeting statutory requirements. Here, the program has requested clarification or additional information from prospective developers regarding eligibility for nine sites. It is anticipated that most projects in this stage will be deemed eligible by year's end. Based on recent trends, the program anticipates that a total of 33 Letters of Intent will have been received by the end of 2003.

Projects with finalized brownfields agreements have completed the public notice phase of the brownfields process and either have a signed brownfields agreement or are waiting for the agreement to be executed. As of October 1, 2003, 36 projects had finalized agreements and three more agreements are anticipated by year's end. With a total of 39 completed projects in 2003, the program shows a 50 percent growth rate over 2002.

Brownfield Project Demographics

Brownfield sites in heavily industrial regions of the country tend to be weighted toward urban areas. However, North Carolina's tradition of rural manufacturing creates a significant number of rural brownfields opportunities. This fact continues to be reflected in the distribution of the program's inventory of projects. Of the 15 agreements to be completed during 2003, four are rural. Half of the program pending and eligible projects are rural, as are one-third of the program's total of 39 completed agreements.

The additional staff hired in 2002 allowed the program to conduct the outreach needed to make rural communities more aware of the state's Brownfields Program. As a result of these efforts, the public benefits enjoyed by urban areas with brownfields projects will extend to rural regions of the state as well. DENR will continue to focus on the importance of rural brownfields to their surrounding communities.

Improving Effectiveness

In its six-year existence, the Brownfields Program has provided a high "bang" for the federal and city "bucks" it uses for operation funds. The program's 39 brownfields agreements represent over $550 million in committed private redevelopment investment. To date, the program has spent approximately $405,000 in public funds ($335,000 from federal cooperative funding and $70,000 from the City of Charlotte). The extent to which these funds have been successfully leveraged has proven that the BPRA is both efficient and effective. By increasing resources, the program increases effectiveness by upping the total of projects that move through the brownfields process.

Adding program staff in 2002 significantly increased the program's volume capacity, but demand continues to increase. New internal technical protocols, more experienced project managers and an improved project tracking system reduced process time, as did streamlining and standardizing various administrative elements. The program continues to upgrade and update its Web site, which helps disseminate essential and timely information to brownfields stakeholders. These efforts have allowed staff to spend less time conveying information and more time processing applications and advancing projects through the brownfields process. This increase in effectiveness and efficiency is largely responsible for the program record of 15 agreements completed during 2003.

Placing a Brownfields Program staff person in the city of Charlotte has proven very successful. Processing time for Charlotte projects was reduced while efforts to educate and encourage developers to undertake brownfields redevelopment projects increased. In 2004, the program plans a similar arrangement in the Asheville area. A staff person will be housed in the Land-of-Sky Council of Governments (Land-of-Sky) offices. Coordination with Land-of-Sky has already yielded numerous redevelopment projects; the program hopes to duplicate the Charlotte success in Asheville. This is the program's first attempt to place a staff person outside of a large metro area, but, if the model proves successful, the program will explore placing additional staff in other cities as it grows.

The program is also increasing outreach efforts to educate property developers about BPRA. It plans to hold a state brownfields workshop for local governments and developers in 2004. The focus of the workshop will be two-fold. First, to educate developers about the program and second, to inform local governments about how to apply for and use U.S. EPA Brownfields Grants. North Carolina's program has found it more effective to use these funds to actually redevelop sites with committed prospective developers. In other states, funds are often used to assess eligible properties without regard to their future redevelopment prospects.

Fund Status

The Brownfields Property Reuse Act Implementation Account receives its income from the $2,000 fee charged to prospective developers who enter the program, and is to be used by DENR to defray the cost of the program. As of December 2003, the Brownfields Property Reuse Act Implementation Account had a balance of $75,199. The 2003 starting balance was $23,959. The total income was $51,901 in fees and interest. Expenditures from the fund totaled $661; the funds were used for supplies and software.

Further Information

For additional information on the Brownfields Program and how it works, please visit our Web site at **www.ncbrownfields.org**.

APPENDIX

Status Summary of Brownfield Projects as of September 30, 2003

Appendix

Status Summary of Brownfield Projects as of September 30, 2003

ACTIVE ELIGIBLE PROJECTS (44)

8th STREET LANDFILL West 8th Street Kannapolis, Rowan Co. PD: City of Kannapolis	Former landfill operated by Cannon Mills for the disposal of residential, commercial and industrial waste from the early 1900s through 1972. Landfill contents may include hazardous and regulated compounds. PD intends to redevelop the site for public recreational and dedicated open space uses.
ABC ENGRAVERS 724 North I-85 Charlotte, Mecklenburg Co. PD: Holden Business Park, LLC	Former engraving and plating facility with known chromium and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site as an office complex.
ALPHA MILLS 312 E. 12th St. Charlotte, Mecklenburg Co. PD: Crosland, Inc.	Approximately 5.77-acre parcel that was historically a textile mill. Most recently the site was the former Consolidated Group Incorporated engraving facility. The site has known soil, groundwater, surface water and sediment impacts from historical site operations. PD intends to redevelop the property for residential apartments with compatible commercial and retail development.
AIRPORT EXXON 3305 North Liberty St. Winston-Salem, Forsyth Co. PD: Mrs. Becky Flowers	Former automobile engine repair and maintenance facility. Known soil and likely groundwater contamination involving petroleum and degreasing solvent constituents. Intended redevelopment is a gas station/convenience store to serve Smith-Reynolds Airport customers and employees.
ALAMAC AMERICAN 1885 Alamac Road Lumberton, Robeson Co. PD: Alamac American Knits, LLC	150-acre site containing a textile manufacturing facility. Known chlorinated solvent groundwater contamination from previous operations. PD intends to take over existing water quality monitoring plan prepared under N.C. DWQ and to redevelop the property for textile manufacturing.
FORMER AMP FACILITY 1126 Church Street Greensboro, Guilford Co. PD: Church Street Medical, LLC	Approximately 10-acre site is the former location of AMP Incorporated, a metal stamping, plating and manufacturing facility. Closed since the mid-1980s, the site has known chlorinated solvent groundwater contamination, which is being cleaned up under an approved CAP within the N.C. DWQ Groundwater Section. PD intends to redevelop the site as a medical office campus.
ARCHDALE MARKETPLACE 5801-6025 South Blvd Charlotte, Mecklenburg Co. PD: Eastbourne Investments Ltd.	Approximately 13-acre parcel known as Archdale Marketplace Shopping Center. Groundwater is contaminated due to historical site operations by an A&P grocery store, Sno-White Cleaners, and K-mart auto service center. PD intends to redevelop the property for commercial and retail.
AUSTIN FOODS 315 East Chatham Street Cary, Wake Co. PD: Cary Ice Company	This six-acre site contains former food processing and warehousing facilities. Known pesticide and herbicide contamination from previous operations exists in soil and groundwater. PD intends to redevelop the property as an ice manufacturing and distribution facility.

FORMER R.H. BOULIGNY 2320 N. Davidson St. Charlotte, Mecklenburg Co. PD: NODA Properties, LLC	Approximately 3.5-acre parcel that was the former R.H Bouligny facility. The site has known groundwater impacts from chlorinated solvents. PD intends to redevelop the property for mixed-use development with commercial, retail, industrial and residential uses.
BROWN'S SOLVENT CO. 2935 Griffith Street Charlotte, Mecklenburg Co. PD: Kathryn C. Bell Estate	Former paint and solvent formulation facility with known solvent-impacted soil and groundwater. PD intends to initially renovate and reuse the existing structure for office/warehouse use. Ultimately, PD will raze the building and redevelop the site as a mixed office/retail complex in keeping with other redevelopment taking place in Charlotte's South End.
BURLINGTON – JAMESTOWN 6008 High Point Road Jamestown, Guilford Co. PD: Alberdingk Boley, Inc.	22-acre site containing a abandoned chemical formulation facility operated in support of Burlington Industries textile manufacturing operations. Known chlorinated and petroleum hydrocarbon contamination exists in site soil and groundwater and is being addressed under a consent order with DENR. PD intends to redevelop the property as polyurethane and polyacrylate emulsions manufacturing facility.
BURLINGTON MILLS 476 South Main St. Mooresville, Iredell Co. PD: Cherokee Investment Partners	Abandoned textile manufacturing facility with known petroleum hydrocarbon contamination in soil and groundwater, and chlorinated solvent contamination in groundwater. PD intends to redevelop the site as an auto racing industry complex with office, flex, shop and R&D space.
CAMDEN ROAD 1600 Camden Road Charlotte, Mecklenburg Co. PD: Harris Murr & Vermillion, LLC	Approximate .25-acre parcel in Historic South End of Charlotte. The site has known groundwater impacts from previous gas station, tire repair and plumbing repair activities amid and other uses. PD intends to redevelop the property for commercial and retail purposes.
CAMEL CITY CLEANERS 501 East Third St. Winston-Salem, Forsyth Co. PD: Brownfields Redevelopment International	Former dry cleaning facility with chlorinated solvent-impacted soil and groundwater from dry cleaning operations and semi-volatile impacted groundwater from nearby manufactured gas plant facility. Intended reuse is for commercial/light industrial flex space.
CAROLINA LOG BUILDINGS Howard Gap Rd at US Hwy. 25 Fletcher, Henderson Co. PD: Town of Fletcher	Former wood treating facility with known pentachlorophenol contamination in soil and groundwater. PD intends to redevelop the 30-acre site as the new heart of the Town of Fletcher to include various office and retail uses.
CENTRAL PARK LANDFILL Salem and South Main Street Winston-Salem, Forsyth County PD: Salem Recreational Fields LLC	Former municipal landfill for the City of Winston-Salem. Site is 7.23 acres in size and has been used as a city park since the 1950s. Low levels of chlorinated solvents, with no surficial soil contamination. PD intends to redevelop the site as a soccer and a softball field for the adjoining Salem Academy and College so their current fields can be used for additional building space. A passive methane collection system will be installed before the recreational fields are installed.

CHATHAM MANUFACTURING NC Hwy. 268 Elkin, Surry Co. PD: Town of Elkin	A 30-acre site containing solid waste disposal area used by former textile manufacturing facility. Known VOC and SVOC contamination exists in groundwater at the site. PD intends to redevelop the property for park and recreational uses in keeping with the current use of adjoining property as baseball fields.
CHEROKEE OIL 925 Summit Avenue Charlotte, Mecklenburg Co. PD: M & J Equities, LLC	Approximately 2-acre site was formerly a non-permitted hazardous waste storage facility and the site of an EPA removal action. Known arsenic, oil and grease, and solvent contamination exist in site soil and groundwater. PD intends to redevelop the property as a nightclub and parking facility.
CMI WWTP NC Hwy. 268 Elkin, Surry Co. PD: Town of Elkin	Located in the flood plain of the Yadkin River, this 11-acre site was the former of an industrial waste water treatment plant with excess permitted capacity. Known VOC and SVOC contamination in soil and groundwater. PD intends to consolidate the town's sanitary waste and the current industrial waste into this single facility, allowing for current and future waste treatment requirements.
CSX RIVERFRONT 515 Nutt Street Wilmington, New Hanover County PD: Riverfront Developers, LLC	An 8.26-acre tract on the Cape Fear River in downtown Wilmington. Former CSX railroad property last used for offloading diesel for rail distribution. Minor naphthalene contamination in the groundwater and some polynuclear aromatic hydrocarbons in soil. Intended use is multi-purpose development that could include a hotel, private residences, professional offices, retail stores, restaurants and private marina. Public waterfront amenities, with a 600' extension of Wilmington's historic riverfront.
DYNATECH INDUSTRIES 2213 Toomey Ave. Charlotte, Mecklenburg Co. PD: R. G. Automation, Inc.	Former plating facility with metals-impacted soil and groundwater. EPA conducted soil removal activities at the site and has classified it as "no further remedial action planned." PD intends to redevelop the property for use as mixed office/retail complex.
EAST GANNON PROPERTY SE corner East Gannon and Arendell Avenues Zebulon, Wake Co. PD: Berkshire-Hudson Capital XI, LLC	This property consists of four parcels of land that total 1.75 acres with four exiting structures (former restaurant, current auto sales, auto service garage and hair salon). Site planned to be redeveloped into a stand-alone Eckerd Drug Store, with other surrounding complimentary retail tenants. Soil and groundwater are contaminated with petroleum constituents from above ground storage tanks used by previous gas station.
EAST PARK – BOYER 1607 & 1611 E. Fourth St. Charlotte, Mecklenburg Co. PD: Torrence Street Partners	Approximately .39-acre parcel that is a portion of the East Park Development Project. Known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian, urban-infill multiple-use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.
EAST PARK – DOROTHY HALL 1423 & 1427 E. Fourth St Charlotte, Mecklenburg Co. PD: Torrence Street Partners	Approximately .8-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian, urban- infill multiple use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.

EAST PARK – Craver 1601,1609,1615 Elizabeth Ave Charlotte, Mecklenburg Co. PD: Torrence Street Partners	Approximately .65-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian, urban-infill multiple-use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.
ECUSTA 1 Ecusta Road Pisgah Forest, Transylvania Co. PD: Ecusta Business Development Center, LLC	In its prime, this 540-acre site was the world's largest non-wood pulp and specialty paper manufacturing facility. Closed since late 2002, the site has known metals, caustic and solvent contamination. PD intends to re-start flax pulping operations and to market the pulp to paper manufacturers. PD may also undertake other uses of site buildings and facilities, including office space and possible use of excess waste water treatment capacity by local municipalities.
ELK MOUNTAIN LANDFILL Elk Mountain Road Woodfin, Buncombe Co. PD: Town of Woodfin	Approximately 156-acre site contains a former municipal landfill which was operated under lease by the City of Asheville, and which has been closed since the late 1970s. PD has operated a 9-hole golf course on the site since 1990. PD will conduct assessment activities to determine if there is actual contamination at the site. PD intends to redevelop the site into an 18-hole golf course and approximately 250 condominiums in areas outside of the waste cells.
FISHBURNE EQUIPMENT Airport Road Arden, Buncombe Co. PD: R. & P. Van Praag	Former metal fabrication and tobacco press manufacturing facility with suspected VOC contamination in soil and groundwater (based on detection of these compounds on adjoining, downgradient property, the former Buncombe County landfill). PD intends to redevelop the site for light manufacturing/assembly, warehousing and public storage uses.
GENERAL WOOD 1901 Wood Treatment Road Leland, Brunswick County PD: Leland Land, LLC	Former 120-acre pole treatment facility [creosote, chromated copper arsenate (CCA) and pentachlorophenol (PCP)] under Chapter 11 bankruptcy, currently under RCRA jurisdiction. PD's intent is to be able to distinguish old from new contamination and then continue with pole treatment (CCA and PCP only). Groundwater contamination mainly associated with creosote and petroleum. Metal and PCP contamination in soil.
GLEN RAVEN MILLS 114 Raven Circle Kings Mountain, Cleveland Co. PD: Consortium for Progress	Former textile manufacturing facility with solvent contamination in groundwater. PD intends to redevelop the property as a residential/retirement center for senior citizens. Responsible party will continue assessment and/or cleanup activities under state Voluntary Cleanup Program.
GREY HOSIERY MILL Fourth & Laurel Streets Hendersonville, Henderson Co. PD: Old Mill Arts Committee	Former hosiery manufacturing facility located in downtown Hendersonville with low concentrations of chlorinated solvents in site groundwater. PD intends to renovate the building and redevelop the property as a performing arts center.
HOME DEPOT – South Blvd. 4750 South Boulevard Charlotte, Mecklenburg County PD: CNR Properties, RLLLP	This 12-acre site is currently occupied by a produce grocer and office rental store (1 acre), parking (7 acres), abandoned plant nursery (1acre) and the rest is undeveloped. Operations at adjacent Academy Steel Drum from 1947-69 included the disposal of wastes and sludge from drums into pits/lagoons appears to have contaminated subject property. After ASD burned in 1969, contamination was spread during re-grading of the site. Elevated concentrations of lead, chromium, and PCBs in soil along with lead, 2-chlorophenol, and trichloroethylene. PD plans to lease property to Home Depot for construction of a new Home Depot home improvement retail store.

HOME INNOVATIONS SITE Hwy 52 S & Ratliff Gin Road Morven, Anson Co. PD: Dan River Inc.	Former textile manufacturing facility with petroleum hydrocarbon and VOC contamination in soil and groundwater. PD intends to redevelop the site as a modern textile manufacturing operation where present environmental contaminant compounds are not used. Project has significant job creation potential.
KIDD LANE BATTERY DISPOSAL 3607 Kidd Lane Charlotte, Mecklenburg Co. PD: Joshua's Farm	Abandoned dairy farm with historical lead battery disposal operations. The approximately 1-acre parcel is adjacent to a 22-acre horse and animal farm area for the Joshua's Farm Operations. The site has a limited area with lead contamination in the surficial soils. PD intends to redevelop the area as a parking lot for the horse and animal farm operations.
NORTH HILLS MALL 4217 Six Forks Road Raleigh, Wake Co. PD: North Hills Mall Ownership Organization, LLC	This 31-acre site was originally developed in 1963 and later expanded into one of Raleigh's earliest enclosed malls. The site has known petroleum and chlorinated solvent contamination in soil and groundwater from auto gas and repair facilities and from an off-site drycleaner. DP intends to redevelop the site into a pedestrian friendly mixed-use retail, commercial and residential complex.
QUALITY METAL PRODUCTS 1111 Oates Road Gastonia, Gaston Co. PD: Porter's Fabrications	This 11-acre site contains an abandoned 48,000 square feet facility formerly used for metal fabrication. Parts cleaning activities resulted in solvent impacts to soil and groundwater. PD intends to refurbish the facility for metal fabrication utilizing high-tech, non-contaminating methods.
RADIATOR SPECIALTY 1900 Wilkinson Blvd. Charlotte, Mecklenburg Co. PD: Suttle Avenue, LLC	Idled automotive chemicals and hardware, and plumbing supplies manufacturing facility with volatile, semi-volatile and metals contamination in soil and groundwater. PD intends to redevelop the property into a major mixed-use office, retail, commercial and multi-family residential development.
RUSAK PROPERTY 3004 Bank Street/ 3331 Griffith Street Charlotte, Mecklenburg Co. PD: Charlotte Mecklenburg Board of Education	A 1.21-acre parcel that is adjacent to the Marie G. Davis Middle School. The site is contaminated from historical operations as a metal plating facility. The PD intends to incorporate the adjacent parcels into the new middle school construction. The brownfields parcel will be the plaza entrance.
SHELBY DYEING & FINISHING 1000 West Grover Street Shelby, Cleveland Co. PD: GMAC Commercial Credit, LLC	Former textile dyeing and finishing facility with solvent and metals contamination in soil and groundwater. Through its sale of the property to Environmental Fibers, PD intends to facilitate the redevelopment of the site as a cotton recycling facility, bringing the two site buildings back into productive use, and bringing jobs and tax base improvements to the community.
SHELBY WILLIAMS 401 Meacham Road Statesville, Iredell Co. PD: Lou Jay Associates, LLC	The 28-acre site contains an idled furniture manufacturing facility with metals contamination in soil and groundwater from former plating operations conducted at the site. Applicant-PD intends to up-fit the facility for the production of high-end cabinetry and add an estimated 650 jobs in the next three years.

SOUTH TRYON STREET 2028-2040 S. Tryon Street Charlotte, Mecklenburg Co. PD: Citiline, LLC	A 2.88-acre parcel near historic South End. PD intends to redevelop the property for commercial purposes such as office and showroom condominiums. Groundwater is contaminated due to historical site operations as industrial/warehouse storage.
SUTTON SHOPPING CENTER NW Corner of Walkup & Sutherland Ave Monroe, Union Co. PD: Whitley Commercial Properties	The site is an old run-down shopping strip center in the Monroe Area. It has known soil and groundwater contamination from chlorinated solvents and gasoline constituents. PD intends to renovated the shopping center and expand the building area.
TAR HEEL LIFT 7055 Albert Pick Road Greensboro, Guilford Co. PD: Idlewild Grading Co., LLC	This 8-acre site contains a forklift sales, maintenance and repair facility on approximately two acres. The site has known environmental contamination from historic operations of the forklift facility. The site is currently underused and PD intends to relocate and expand its grading business from Winston-Salem, NC to this brownfields property.
WELLMAN SITE 3224 Cedar Creek Road Fayetteville, Cumberland Co. PD: Technofil, Inc.	The Wellman site is approximately 18 acres and contains a filament polyester yard manufacturing facility which has been idle since January 2003. There is known PCE contamination in groundwater at the site. PD intends to refurbish and reuse a portion of the facility to manufacture polyester and bicomponent yarns utilizing a process that will allows discrimination of old contamination from new.

PROJECTS PENDING ELIGIBILITY (9)

ANDREX INDUSTRIES 220 Deaverview Road Asheville, Buncombe Co. PD: Milkco, Inc.	This nine-acre, light manufacturing site was formerly a textile facility that operated a knitting, weaving and cutting business along with dry cleaning, shrinking and packaging of fabrics. Tetrachloroethylene groundwater contamination from dry cleaning operations is being remediated by RP with pump-and-treat system. PD is adjacent property owner, a milk processing and distributing plant. Initial plan is to use part of property for truck and trailer parking. Within three years they plan to demolish Andrex buildings and expand the Milkco Plant to double capacity within eight years.
GUILFORD MILLS – W. Market Street 4925 W. Market Street Greensboro, Guilford County PD: Kim's Greensboro Real Estate, LLC	A 19.8-acre vacant textile facility with ancillary buildings. Minor groundwater contamination associated with former underground storage tanks. Other non-UST contamination has been documented but information has not yet been sent to us. PD plans to use the site for general commercial property.
HISTORIC COTTON MILL 191 Riverside Drive Asheville, Buncombe Co. PD: RiverLink, Inc.	This 2.63-acre site was formerly occupied by a cotton mill operated from the 1900s then abandoned for many years. PD will conduct environmental assessment to determine if the site has any contamination. PD intends to redevelop the site in mixed commercial/retail and residential uses. This project is part of the Asheville French Broad Riverfront Plan.
LEARY BROTHERS STORAGE Virginia & Broad Streets Edenton, Chowan Co. PD: Charles M. Reeves III	Approximate 6-acre site containing former flower distribution and pesticide storage facility. Known arsenic contamination exists in site soil and groundwater. PD intends to redevelop the property in commercial retail uses.

MOSER-HALL Indian Trail, Union Co. PD: Moser-Hall, LLC	Property with petroleum hydrocarbon contamination in groundwater which has migrated onto the property. The source of the contamination was a release from a leaking underground storage tank system located on an adjoining parcel. PD intends to redevelop the site for commercial/retail use.
NATIONAL TEXTILES Jamestown Road Morgantown, Burke Co. PD: National Textiles	Former textile manufacturing facility with chlorinated solvent contamination in soil and groundwater. The applicant PD intends to sell the site to an identified potential buyer for conversion and reuse as a furniture manufacturing facility.
SALEM UNIFORM 4015 N. Cherry Street Winston-Salem, Forsyth County PD: Winston Weaver Co. Inc.	Vacant for many years, this 2.53-acre site was leased from 1967-83 by Salem Uniform and from 1983-86 by Cintus Corp. who then purchased the Salem Uniform assets. During a Limited Site Assessment for petroleum USTs, high levels of PCE were discovered, probably from dry cleaning solvents. PD is currently leasing space, but would like to improve it for use as fertilizer storage and other commercial usage.
SPANCO Inc. 1604 Boone Trail Road Sanford, Lee Co. PD: Pier Real Estate, Ltd.	Former hosiery manufacturing facility on approximately 10 acres with chlorinated solvent contamination in soil and groundwater. Applicant-PD intends to redevelop the property for use as a fasteners manufacturing and distribution facility.
WILSON LANDFILL 6700 Ward Boulevard Wilson, Wilson Co. PD: Dillon Properties, LLC	This underused 14-acre site was formerly occupied by a waste-water treatment facility owned and operated by the City of Wilson. The site has known metals contamination in groundwater. PD intends to redevelop for mixed commercial, warehousing and residential uses

FINALIZED BROWNFIELDS AGREEMENTS (36) EITHER IN FORCE OR PENDING SIGNATURE

ALAMAC KNIT FABRIC Hamilton, Martin Co.	Former textile manufacturing facility with known soil and groundwater contamination involving chlorinated solvents. Site is undergoing active remediation under NC DWQ CAP. Intended reuse is as a non-polluting school locker manufacturing facility that will employ some 350 workers.
ANCHOR MILL Huntersville, Mecklenburg Co.	Abandoned textile manufacturing facility with known metals contamination in soil, and lead, chlorinated solvent, and petroleum hydrocarbon contamination in groundwater. PD intends to redevelop the 32-acre site as a mixed-use transit village that reuses the old mill building and adds new office, retail, and residential components.
BALDOR ELECTRIC Charlotte, Mecklenburg Co.	Former electric motor and motor component assembly and manufacturing facility with solvent impacted soil and groundwater. PD intends to redevelop the property for use as industrial condominiums.

BURKHART CAROLINA Henderson, Vance Co.	Former pickle processing and packing facility with chloride impacted soil and groundwater and minor solvent contamination in groundwater. PD intends to redevelop the property for commercial retail use. Simultaneously, the responsible party will implement groundwater remediation at the site under separate action. The PD's development will provide an impervious cap on the site, further assisting remedial efforts.
CAMDEN SQUARE Charlotte, Mecklenburg Co.	Abandoned knitting and printing operations rebuilt into the "Design Center of the Carolinas." Development supported by the Wilmore Community as a vital redevelopment in an economically depressed area. Land use restrictions for chlorinated solvents in groundwater.
CAMDEN SQUARE ADDITION Charlotte, Mecklenburg Co.	This project will add, by amendment, 4.5 acres to the first brownfields agreement completed in North Carolina, Camden Square, in Charlotte's South End redevelopment corridor. Contamination includes VOC- and SVOC-impacted soil and groundwater. Intended reuse is mixed office and retail.
CAROLINA PRODUCTION FINISHING Asheville, Buncombe Co.	Former textile finishing facility with metals contamination in both soil and groundwater. PD intends to redevelop the site for warehousing and as a sewing operation. PD is in the process of reviewing DENR's draft brownfields agreement for this site.
CITY WEST COMMONS Charlotte, Mecklenburg Co.	Dilapidated shopping center seized in a drug raid by the U.S. Dept. of Justice that has been approved for transfer to the city of Charlotte. Site had VOC and chlorinated solvent contamination in soil and groundwater. The City intends transfer the property to a not-for-profit development corporation to redevelop the site as commercial retail shopping facility.
C.K. LAND DEVELOPMENT Charlotte, Mecklenburg Co.	A large mixed use development on a former industrial services firm adjacent to a manufactured gas plant. Ground floor retail and studio with office and residential units above. Project is in vicinity of Camden Square and provides redevelopment to economically depressed area. Capping and land use restrictions regarding PAHs in soil and chlorinated solvents in soil and groundwater.
CUMBERLAND SHOPPING CENTER Greensboro, Guilford Co.	Site of former shopping center and dry cleaners with chlorinated solvent impacted soil and groundwater. PD is a not-for-profit community development corporation. The PD has performed soil cleanup activities and intends to redevelop the site with affordable residential housing.

EAST GANNON PROPERTY Zebulon, Wake Co.	This property consists of four parcels of land totaling 1.75 acres with four exiting structures (former restaurant, current auto sales, auto service garage and hair salon). Site planned to be redeveloped into a stand-alone Eckerd Drug Store, with other surrounding complimentary retail tenants. Soil and groundwater are contaminated with petroleum constituents from above ground storage tanks used by previous gas station.
EAST PARK – JOAL REALTY Charlotte, Mecklenburg Co.	Part of the 24-acre site encompasses a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the pedestrian needs an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the CBD and the historic residential neighborhoods of Elizabeth and Myers Park.
EAST PARK – KOSSOVE Charlotte, Mecklenburg Co.	Part of the 24-acre site encompasses a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the needs of pedestrians in an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the CBD and the historic residential neighborhoods of Elizabeth and Myers Park.
ERWIN SQUARE Durham, Durham Co.	This approximately six acre property is a portion of a decommissioned former Burlington Industries site; other portions have already been redeveloped. There is known chlorinated solvent contamination in groundwater, and these impacts are being addressed under an approved Division of Water Quality corrective action plan. PD intends to redevelop the site in high density residential use.
FLEMINGTON LANDFILL Wilmington, New Hanover Co.	Site of a closed (1979), privately-operated domestic and industrial solid waste landfill with VOC-impacted soil and groundwater. Intended reuse is for a soccer complex. This is the first former landfill property proposed for redevelopment under the N.C. brownfields statute. The project's feasibility and technical challenges are being carefully evaluated.
FOOD LION Winston-Salem, Forsyth Co.	A new large supermarket placed on the site of an abandoned grocery store in urban Winston-Salem. Project had strong community support as a quality of life issue as the community had no supermarket. Land use restrictions for chlorinated solvent contamination in groundwater. Brownfield assessment determined the source to be nearby drycleaner.
GUILFORD MILLS Greensboro, Guilford Co.	This 55-acre site contains a former textile manufacturing facility with known VOC contamination in soil and groundwater. PD intends to redevelop the property in mixed retail uses. Public benefits include the creation of an estimated 500 jobs and substantial tax roles increases.
HAMILTON PROPERTY Charlotte, Mecklenburg Co.	Dilapidated property bought for the expansion of Cost Effective Maintenance Inc., a small business in the South End area of Charlotte. Expansion into this property allowed CEM to stay in Charlotte instead of move to suburbs. Land use restrictions for chlorinated solvent contamination in groundwater.

HILLSBOROUGH VENTURES Raleigh, Wake Co.	Project involves redeveloping an area of parking lots and dilapidated, underused retail structures. Land use restrictions are in place for the petroleum hydrocarbon and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the property as mixed residential (private student dormitory for N.C. State University) and retail complex.
HILLSBOROUGH VENTURES ADDITION Raleigh, Wake Co.	Prospective developer added acreage to the footprint of original Hillsborough Ventures project, which involves redeveloping an area of parking lots and dilapidated, underused retail structures adjacent to N.C. State University for mixed residential (private student dormitory) and retail uses.
LEWITH TEXTILE Charlotte, Mecklenburg Co.	Project involves the redevelopment of 50+ acres of abandoned and underused commercial and industrial property, including the former Lewith Textile facility. Contaminants include petroleum hydrocarbon and chlorinated solvents in soil and groundwater. PD intends to redevelop the site as an industrial park for light manufacturing and warehousing/distribution.
LUCENT TECHNOLOGIES Greensboro, Guilford Co.	Former cotton mill and manufacturing facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site in mixed commercial retail/office and residential.
MALLARD CREEK Charlotte, Mecklenburg Co.	This 21-acre site neighbors a former auto service station and chainsaw service center operations. Petroleum hydrocarbon and chlorinated solvent contamination in groundwater, sourced from underground and aboveground storage tanks releases on the adjacent site, has migrated onto the subject property. PD intends to redevelop the property as an apartment complex.
OXFORD PRINTING Oxford, Granville Co.	Former textile printing and finishing facility with VOC contamination in groundwater. PD has conducted cleanup of floor drain contents. PD intends to redevelop the site for industrial/distribution use.
PILOT MILLS Raleigh, Wake Co.	Abandoned, condemned, turn-of-the-century textile mill in Downtown Raleigh redeveloped into office space and preserved on the National Register of Historic Places. Land use restrictions for chlorinated solvent in groundwater and capping of mercury in soils.
REDMAN HOMES Mebane, Orange Co.	Former mobile home manufacturing facility with metals and solvent contamination in soil and groundwater. PD has performed drum removal and soil remediation activities. PD intends to redevelop the site as a manufacturing facility to produce windows and doors.
SANFORD WWTP Sanford, Lee Co.	Former municipal waste water treatment plant site with petroleum impacted sewer sludge and metals impacts in site soils and low concentrations of volatile and semi-volatile compounds in groundwater. PD intends to redevelop the property in commercial use, including restaurant, retail space and a multi-screen movie theater.
SINGER COMPANY Chocowinity, Beaufort Co.	Abandoned rural manufacturing facility with lead and phthalate contamination in soil and groundwater. The brownfields agreement provides for partial site remediation. PD intends to redevelop the site with mixed retail and light industrial uses.

SMITH METAL & IRON Charlotte, Mecklenburg Co.	Former site of a scrap metal yard and of a waste cell created for the temporary disposal of impacted soil removed during the construction of the adjoining Carolina Panther's practice field. The waste in the cell has been removed, and minor chlorinated solvent impacts remain in site groundwater. PD intends to redevelop the site in high density residential with additional office, entertainment, and retail potential.
SMITH PROPERTY Shelby, Cleveland Co.	Project involves the redevelopment of an area occupied by seven underused and dilapidated residential homes with petroleum hydrocarbon and chlorinated solvent contamination in groundwater. PD has the support of local residents to reuse the site as a parking lot serving the Cleveland County Offices.
SOUTHERN MANUFACTURING Charlotte, Mecklenburg Co.	This nine-acre site located in inner Charlotte was a former asbestos tile manufacturing facility. Operations involving asbestos were discontinued in 1986 and the facility was closed in 1999. The site has known asbestos contamination in soils. Intended reuse of the site includes an outdoor amphitheater, a technical business park, or a mixed-use development with industrial, commercial and residential components.
STATE FARM ROAD Boone, Watauga Co.	Project involves the redevelopment of property occupied by a rural residence with chlorinated solvent contamination in groundwater and in a spring from an off-site source. PD intends to redevelop the site as a medical office complex.
TARTAN MARINE Hamlet, Richmond Co.	Former boat manufacturing facility with lead contamination in soil. Additional site sampling conducted by the PD has shown previous soil removal actions to have left no health-based lead problems. PD intends to redevelop the site as a chair and table base manufacturing facility.
TERRELL MACHINE Charlotte, Mecklenburg Co.	Site of former textile manufacturing and gear box machining operations, property in Charlotte's South End district is being redeveloped with ground floor retail and office/residential above. Remedial actions to eliminate hot spot contamination included soil removal and groundwater pump and treat. Land use restrictions are in place to address chlorinated solvent contamination remaining in groundwater.
VANIER GRAPHICS Eden, Rockingham Co.	Former printing facility with petroleum and chlorinated hydrocarbon contamination in the soil and solvent contamination in the groundwater. PD intends to redevelop the site as a furniture assembly and upholstering facility.
WEST MOREHEAD Charlotte, Mecklenburg Co.	Former automobile repair and maintenance facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site, to include both facility renovation and new construction for use as commercial office/retail.

Brownfields Property Reuse Act
Annual Report to the General Assembly
December 2003

Executive Summary

This report to the General Assembly, required by the Brownfields Property Reuse Act (BPRA) of 1997 (G.S. 130-310.30 *et seq.*), describes the continued growth and success of the Brownfields Program in 2003. It also examines how effectively the BPRA encourages and facilitates the safe and productive reuse of abandoned, idled or underutilized properties where the threat of liability due to environmental contamination has hindered redevelopment.

During 2003, the Brownfields Program built on its success with expanded cost effectiveness and leveraging capability. By the end of 2003, the program will have completed a record 15 brownfields agreements -- a 50 percent increase over 2002 -- bringing the total of completed agreements to 39. These 39 projects represent more than $550 million in private investment committed to brownfields redevelopment. Moreover, demand for program service continues to increase. DENR projects that a record 33 applications to the program (Letters of Intent) will have been received from prospective developers during 2003, also a 50 percent increase over 2002. DENR's efforts to address the program's expanding inventory and the increasing demand are briefly described below.

- In June 2003, the U.S. EPA's Region 4 awarded DENR $1 million in Section 128(a) funding (for state response programs) under the Small Business Liability Protection and Brownfields Revitalization Act, which was enacted in December 2002. Increased federal funding enables DENR to significantly expand its ability to meet the increasing demand for Brownfields Program services. DENR recently added two project managers and plans to add one additional project manager in the first quarter of 2004. A toxicologist and a database/IT manager are also scheduled to be hired in early 2004. Grant funding will also be used to expand the state's voluntary cleanup program by adding two technical staff members to increase this program's effectiveness.

- The assistant attorney general that provided years of legal representation to brownfields and other Superfund-related programs will now work exclusively for the Brownfields Program. In addition to receiving more timely negotiation and review of brownfields agreements, the development community will benefit from additional programmatic continuity.

Background

Redeveloping brownfields properties has become increasingly popular as developers and cities realize these properties offer viable opportunities to bring economic growth, public health protection, jobs, and quality of life benefits to cities and rural areas. Brownfields are abandoned, idled or underutilized properties where environmental contamination hinders redevelopment due

to concerns about environmental liability. The BPRA gives DENR the authority to enter into brownfields agreements with prospective developers who did not cause or contribute to site contamination. The BPRA modifies the environmental liability barrier for prospective developers and motivates them to bring these properties and their hindrances to the department's attention. The department partners with the prospective developer to evaluate the possible risks associated with site contamination, and negotiates a brownfields agreement that stipulates the steps necessary to make the site safe for a specific intended reuse. The result is a redevelopment project that works economically while fully protecting public health and the environment.

Because brownfields agreements afford prospective developers liability protection for as long as they make and maintain the site safe for its intended reuse, the specter of open-ended financial uncertainty is lifted. This economic shield allows prospective developers to obtain financing hitherto unavailable for these properties.

Thus, the BPRA provides guidelines for a new public policy that allows DENR to distinguish between prospective developers of brownfields properties and the properties' polluters. Instead of mandating the site be cleaned to current standards, the BPRA requires developers to make the site safe for reuse. The program must examine the risks to public health or environment posed by the site. Then, DENR determines what the prospective developer must do to ensure safe redevelopment. These actions can range from land-use restrictions to cleanup, or a mixture of both. In addition to holding prospective developers accountable to their agreements, DENR reserves the right to enforce against those parties responsible for the original contamination. The process is summarized in Table 1 below.

Table 1. Summary of the Brownfield Process

Step 1 – A prospective developer with a brownfield site that needs liability protection submits a letter of intent with basic site facts. DENR determines if the prospective developer and the property proposed for reuse are eligible under the BPRA statute.
Step 2 - DENR reviews existing site data to determine the risk posed by contamination at the site. If the data are insufficient to evaluate such risk, DENR advises the prospective developer on further site assessment to gather the necessary data.
Step 3 - DENR determines what actions are necessary to make the site safe for reuse and includes these actions in a brownfields agreement. The prospective developer pays statutory fee.
Step 4 - The brownfields agreement is published with a 60-day public comment period.
Step 5 - The brownfields agreement is finalized after any public comments are considered and incorporated. The prospective developer uses the final brownfields agreement, which provides liability protection, to obtain financing for the project. Liability protection is contingent upon the completion of the actions required by the brownfields agreement. The brownfield agreement makes the site eligible for the brownfields property tax incentive.

The ancillary brownfields property tax incentive for prospective developers allows them to recoup funds spent on assessment and cleanup. The program motivates the market to recycle these sites back to productive reuse, while preserving or reducing the use of pristine or undeveloped "greenfield" property. While the environmental benefits are obvious, most

redevelopments also create a significant number of jobs and put properties back on the tax rolls. This double economic-environmental gain benefits the state, local government, and the brownfields developer.

As these benefits become better known, the program's popularity increases. After three years of successive record breaking growth, the program boasts 39 completed brownfields agreements and has over 50 others in the pipeline. Over $550 million private investment dollars have been used to redevelop abandoned properties that blighted urban and rural landscapes.

The overall result is a win-win scenario for both the environment and economic development. Risk reductions and cleanups are achieved at sites that could have harmed the public or the environment while prospective developers redevelop abandoned properties that once had little hope for redevelopment or productive reuse. The public benefits of job creation, improved quality of life in the surrounding neighborhoods, local tax base expansion and contribution to the general fund are other positive impacts.

The program also supports smart growth, sustainability and the One North Carolina Naturally agenda. Every project that reuses property in urban centers reduces suburban sprawl and preserves green space. Without brownfields agreements, many redevelopment dollars would have been spent on projects that increase suburban sprawl and promote commercial development in greenspace areas. In a very real sense, for each brownfield redeveloped, a greenspace is saved.

Program Status

Like past years, 2003 has seen significant program growth. The two staff members added in 2002 have gained experience and helped the program meet its increased demand for services. Their efforts made the program's success in 2003 possible.

Despite stagnant economic conditions in the development sector, a record-breaking 25 Letters of Intent were submitted to the program by the end of September 2003. We anticipate increased demand as the program's expansion serves to better educate both the public and the development community about brownfields' redevelopment benefits. The federal brownfield assessment and cleanup grants awarded by the U.S. EPA to local governments in 2003 (Greensboro, Concord, and Farmville) will further increase demand as these communities begin local brownfields redevelopment efforts.

In July 2003, the U.S. EPA's Region 4 approved DENR's application for brownfield cooperative agreement funding. It awarded DENR $1 million under Section 128 of the federal Small Business Liability Relief and Brownfields Revitalization Act. The funds are authorized for use starting October 1, 2003 through October 1, 2004.

This represents a five-fold increase in funding over the previous year. It allows DENR to expand the Brownfields Program to meet its increasing demand. DENR added its fourth project manager to the program in November 2003 and plans to hire an additional project manager, a toxicologist, and a database/IT manager in the first quarter of 2004. These hires will be made

using solely federal funds. The program also uses these funds to contract with the Department of Justice for one full time attorney position.

The City of Charlotte renewed its cooperative funding agreement with DENR on July 1, 2003. The agreement provides the program with the funds needed to locate a staff member in the City of Charlotte. In anticipation of receiving federal funds, the city's agreements allowed its salary funding commitment to drop by 50 percent. By adding federal funds in addition to those the city provides, the staff person is free to work projects outside the city as necessary. If funding allows, the City of Charlotte agreement may be reduced to zero salary dollars in the next renewal period although the city remains committed to providing office space and clerical support to support the position.

Site Summaries

For a brief description of all brownfields projects pending at the end of September 2003, please see the Appendix. The table is divided into three sections: active eligible projects, projects pending eligibility and projects with finalized brownfields agreements.

Active eligible projects have been deemed eligible by the program as they meet the statutory criteria. These developers are working with DENR in some stage of data gathering, analysis or agreement negotiation. At present, there are 44 active eligible projects. Projects at this stage receive guidance from DENR as they gather the additional data needed to ensure protection of public health and environment. Once research is complete, DENR analyzes the data, then drafts and negotiates the terms of the brownfields agreement with the prospective developer. At most of these sites, DENR is waiting for additional data requested by the program.

Projects pending eligibility are in the initial stage of consideration because the program has yet to determine if the sites are eligible by meeting statutory requirements. Here, the program has requested clarification or additional information from prospective developers regarding eligibility for nine sites. It is anticipated that most projects in this stage will be deemed eligible by year's end. Based on recent trends, the program anticipates that a total of 33 Letters of Intent will have been received by the end of 2003.

Projects with finalized brownfields agreements have completed the public notice phase of the brownfields process and either have a signed brownfields agreement or are waiting for the agreement to be executed. As of October 1, 2003, 36 projects had finalized agreements and three more agreements are anticipated by year's end. With a total of 39 completed projects in 2003, the program shows a 50 percent growth rate over 2002.

Brownfield Project Demographics

Brownfield sites in heavily industrial regions of the country tend to be weighted toward urban areas. However, North Carolina's tradition of rural manufacturing creates a significant number of rural brownfields opportunities. This fact continues to be reflected in the distribution of the program's inventory of projects. Of the 15 agreements to be completed during 2003, four are rural. Half of the program pending and eligible projects are rural, as are one-third of the program's total of 39 completed agreements.

The additional staff hired in 2002 allowed the program to conduct the outreach needed to make rural communities more aware of the state's Brownfields Program. As a result of these efforts, the public benefits enjoyed by urban areas with brownfields projects will extend to rural regions of the state as well. DENR will continue to focus on the importance of rural brownfields to their surrounding communities.

Improving Effectiveness

In its six-year existence, the Brownfields Program has provided a high "bang" for the federal and city "bucks" it uses for operation funds. The program's 39 brownfields agreements represent over $550 million in committed private redevelopment investment. To date, the program has spent approximately $405,000 in public funds ($335,000 from federal cooperative funding and $70,000 from the City of Charlotte). The extent to which these funds have been successfully leveraged has proven that the BPRA is both efficient and effective. By increasing resources, the program increases effectiveness by upping the total of projects that move through the brownfields process.

Adding program staff in 2002 significantly increased the program's volume capacity, but demand continues to increase. New internal technical protocols, more experienced project managers and an improved project tracking system reduced process time, as did streamlining and standardizing various administrative elements. The program continues to upgrade and update its Web site, which helps disseminate essential and timely information to brownfields stakeholders. These efforts have allowed staff to spend less time conveying information and more time processing applications and advancing projects through the brownfields process. This increase in effectiveness and efficiency is largely responsible for the program record of 15 agreements completed during 2003.

Placing a Brownfields Program staff person in the city of Charlotte has proven very successful. Processing time for Charlotte projects was reduced while efforts to educate and encourage developers to undertake brownfields redevelopment projects increased. In 2004, the program plans a similar arrangement in the Asheville area. A staff person will be housed in the Land-of-Sky Council of Governments (Land-of-Sky) offices. Coordination with Land-of-Sky has already yielded numerous redevelopment projects; the program hopes to duplicate the Charlotte success in Asheville. This is the program's first attempt to place a staff person outside of a large metro area, but, if the model proves successful, the program will explore placing additional staff in other cities as it grows.

The program is also increasing outreach efforts to educate property developers about BPRA. It plans to hold a state brownfields workshop for local governments and developers in 2004. The focus of the workshop will be two-fold. First, to educate developers about the program and second, to inform local governments about how to apply for and use U.S. EPA Brownfields Grants. North Carolina's program has found it more effective to use these funds to actually redevelop sites with committed prospective developers. In other states, funds are often used to assess eligible properties without regard to their future redevelopment prospects.

Fund Status

The Brownfields Property Reuse Act Implementation Account receives its income from the $2,000 fee charged to prospective developers who enter the program, and is to be used by DENR to defray the cost of the program. As of December 2003, the Brownfields Property Reuse Act Implementation Account had a balance of $75,199. The 2003 starting balance was $23,959. The total income was $51,901 in fees and interest. Expenditures from the fund totaled $661; the funds were used for supplies and software.

Further Information

For additional information on the Brownfields Program and how it works, please visit our Web site at **www.ncbrownfields.org**.

APPENDIX

Status Summary of Brownfield Projects as of September 30, 2003

Appendix

Status Summary of Brownfield Projects as of September 30, 2003

ACTIVE ELIGIBLE PROJECTS (44)

8th STREET LANDFILL West 8th Street Kannapolis, Rowan Co. PD: City of Kannapolis	Former landfill operated by Cannon Mills for the disposal of residential, commercial and industrial waste from the early 1900s through 1972. Landfill contents may include hazardous and regulated compounds. PD intends to redevelop the site for public recreational and dedicated open space uses.
ABC ENGRAVERS 724 North I-85 Charlotte, Mecklenburg Co. PD: Holden Business Park, LLC	Former engraving and plating facility with known chromium and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site as an office complex.
ALPHA MILLS 312 E. 12th St. Charlotte, Mecklenburg Co. PD: Crosland, Inc.	Approximately 5.77-acre parcel that was historically a textile mill. Most recently the site was the former Consolidated Group Incorporated engraving facility. The site has known soil, groundwater, surface water and sediment impacts from historical site operations. PD intends to redevelop the property for residential apartments with compatible commercial and retail development.
AIRPORT EXXON 3305 North Liberty St. Winston-Salem, Forsyth Co. PD: Mrs. Becky Flowers	Former automobile engine repair and maintenance facility. Known soil and likely groundwater contamination involving petroleum and degreasing solvent constituents. Intended redevelopment is a gas station/convenience store to serve Smith-Reynolds Airport customers and employees.
ALAMAC AMERICAN 1885 Alamac Road Lumberton, Robeson Co. PD: Alamac American Knits, LLC	150-acre site containing a textile manufacturing facility. Known chlorinated solvent groundwater contamination from previous operations. PD intends to take over existing water quality monitoring plan prepared under N.C. DWQ and to redevelop the property for textile manufacturing.
FORMER AMP FACILITY 1126 Church Street Greensboro, Guilford Co. PD: Church Street Medical, LLC	Approximately 10-acre site is the former location of AMP Incorporated, a metal stamping, plating and manufacturing facility. Closed since the mid-1980s, the site has known chlorinated solvent groundwater contamination, which is being cleaned up under an approved CAP within the N.C. DWQ Groundwater Section. PD intends to redevelop the site as a medical office campus.
ARCHDALE MARKETPLACE 5801-6025 South Blvd Charlotte, Mecklenburg Co. PD: Eastbourne Investments Ltd.	Approximately 13-acre parcel known as Archdale Marketplace Shopping Center. Groundwater is contaminated due to historical site operations by an A&P grocery store, Sno-White Cleaners, and K-mart auto service center. PD intends to redevelop the property for commercial and retail.
AUSTIN FOODS 315 East Chatham Street Cary, Wake Co. PD: Cary Ice Company	This six-acre site contains former food processing and warehousing facilities. Known pesticide and herbicide contamination from previous operations exists in soil and groundwater. PD intends to redevelop the property as an ice manufacturing and distribution facility.

FORMER R.H. BOULIGNY 2320 N. Davidson St. Charlotte, Mecklenburg Co. PD: NODA Properties, LLC	Approximately 3.5-acre parcel that was the former R.H Bouligny facility. The site has known groundwater impacts from chlorinated solvents. PD intends to redevelop the property for mixed-use development with commercial, retail, industrial and residential uses.
BROWN'S SOLVENT CO. 2935 Griffith Street Charlotte, Mecklenburg Co. PD: Kathryn C. Bell Estate	Former paint and solvent formulation facility with known solvent-impacted soil and groundwater. PD intends to initially renovate and reuse the existing structure for office/warehouse use. Ultimately, PD will raze the building and redevelop the site as a mixed office/retail complex in keeping with other redevelopment taking place in Charlotte's South End.
BURLINGTON – JAMESTOWN 6008 High Point Road Jamestown, Guilford Co. PD: Alberdingk Boley, Inc.	22-acre site containing a abandoned chemical formulation facility operated in support of Burlington Industries textile manufacturing operations. Known chlorinated and petroleum hydrocarbon contamination exists in site soil and groundwater and is being addressed under a consent order with DENR. PD intends to redevelop the property as polyurethane and polyacrylate emulsions manufacturing facility.
BURLINGTON MILLS 476 South Main St. Mooresville, Iredell Co. PD: Cherokee Investment Partners	Abandoned textile manufacturing facility with known petroleum hydrocarbon contamination in soil and groundwater, and chlorinated solvent contamination in groundwater. PD intends to redevelop the site as an auto racing industry complex with office, flex, shop and R&D space.
CAMDEN ROAD 1600 Camden Road Charlotte, Mecklenburg Co. PD: Harris Murr & Vermillion, LLC	Approximate .25-acre parcel in Historic South End of Charlotte. The site has known groundwater impacts from previous gas station, tire repair and plumbing repair activities amid and other uses. PD intends to redevelop the property for commercial and retail purposes.
CAMEL CITY CLEANERS 501 East Third St. Winston-Salem, Forsyth Co. PD: Brownfields Redevelopment International	Former dry cleaning facility with chlorinated solvent-impacted soil and groundwater from dry cleaning operations and semi-volatile impacted groundwater from nearby manufactured gas plant facility. Intended reuse is for commercial/light industrial flex space.
CAROLINA LOG BUILDINGS Howard Gap Rd at US Hwy. 25 Fletcher, Henderson Co. PD: Town of Fletcher	Former wood treating facility with known pentachlorophenol contamination in soil and groundwater. PD intends to redevelop the 30-acre site as the new heart of the Town of Fletcher to include various office and retail uses.
CENTRAL PARK LANDFILL Salem and South Main Street Winston-Salem, Forsyth County PD: Salem Recreational Fields LLC	Former municipal landfill for the City of Winston-Salem. Site is 7.23 acres in size and has been used as a city park since the 1950s. Low levels of chlorinated solvents, with no surficial soil contamination. PD intends to redevelop the site as a soccer and a softball field for the adjoining Salem Academy and College so their current fields can be used for additional building space. A passive methane collection system will be installed before the recreational fields are installed.

CHATHAM MANUFACTURING NC Hwy. 268 Elkin, Surry Co. PD: Town of Elkin	A 30-acre site containing solid waste disposal area used by former textile manufacturing facility. Known VOC and SVOC contamination exists in groundwater at the site. PD intends to redevelop the property for park and recreational uses in keeping with the current use of adjoining property as baseball fields.
CHEROKEE OIL 925 Summit Avenue Charlotte, Mecklenburg Co. PD: M & J Equities, LLC	Approximately 2-acre site was formerly a non-permitted hazardous waste storage facility and the site of an EPA removal action. Known arsenic, oil and grease, and solvent contamination exist in site soil and groundwater. PD intends to redevelop the property as a nightclub and parking facility.
CMI WWTP NC Hwy. 268 Elkin, Surry Co. PD: Town of Elkin	Located in the flood plain of the Yadkin River, this 11-acre site was the former of an industrial waste water treatment plant with excess permitted capacity. Known VOC and SVOC contamination in soil and groundwater. PD intends to consolidate the town's sanitary waste and the current industrial waste into this single facility, allowing for current and future waste treatment requirements.
CSX RIVERFRONT 515 Nutt Street Wilmington, New Hanover County PD: Riverfront Developers, LLC	An 8.26-acre tract on the Cape Fear River in downtown Wilmington. Former CSX railroad property last used for offloading diesel for rail distribution. Minor naphthalene contamination in the groundwater and some polynuclear aromatic hydrocarbons in soil. Intended use is multi-purpose development that could include a hotel, private residences, professional offices, retail stores, restaurants and private marina. Public waterfront amenities, with a 600' extension of Wilmington's historic riverfront.
DYNATECH INDUSTRIES 2213 Toomey Ave. Charlotte, Mecklenburg Co. PD: R. G. Automation, Inc.	Former plating facility with metals-impacted soil and groundwater. EPA conducted soil removal activities at the site and has classified it as "no further remedial action planned." PD intends to redevelop the property for use as mixed office/retail complex.
EAST GANNON PROPERTY SE corner East Gannon and Arendell Avenues Zebulon, Wake Co. PD: Berkshire-Hudson Capital XI, LLC	This property consists of four parcels of land that total 1.75 acres with four exiting structures (former restaurant, current auto sales, auto service garage and hair salon). Site planned to be redeveloped into a stand-alone Eckerd Drug Store, with other surrounding complimentary retail tenants. Soil and groundwater are contaminated with petroleum constituents from above ground storage tanks used by previous gas station.
EAST PARK – BOYER 1607 & 1611 E. Fourth St. Charlotte, Mecklenburg Co. PD: Torrence Street Partners	Approximately .39-acre parcel that is a portion of the East Park Development Project. Known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian, urban-infill multiple-use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.
EAST PARK – DOROTHY HALL 1423 & 1427 E. Fourth St Charlotte, Mecklenburg Co. PD: Torrence Street Partners	Approximately .8-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian, urban- infill multiple use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.

EAST PARK – Craver 1601,1609,1615 Elizabeth Ave Charlotte, Mecklenburg Co. PD: Torrence Street Partners	Approximately .65-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian, urban-infill multiple-use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.
ECUSTA 1 Ecusta Road Pisgah Forest, Transylvania Co. PD: Ecusta Business Development Center, LLC	In its prime, this 540-acre site was the world's largest non-wood pulp and specialty paper manufacturing facility. Closed since late 2002, the site has known metals, caustic and solvent contamination. PD intends to re-start flax pulping operations and to market the pulp to paper manufacturers. PD may also undertake other uses of site buildings and facilities, including office space and possible use of excess waste water treatment capacity by local municipalities.
ELK MOUNTAIN LANDFILL Elk Mountain Road Woodfin, Buncombe Co. PD: Town of Woodfin	Approximately 156-acre site contains a former municipal landfill which was operated under lease by the City of Asheville, and which has been closed since the late 1970s. PD has operated a 9-hole golf course on the site since 1990. PD will conduct assessment activities to determine if there is actual contamination at the site. PD intends to redevelop the site into an 18-hole golf course and approximately 250 condominiums in areas outside of the waste cells.
FISHBURNE EQUIPMENT Airport Road Arden, Buncombe Co. PD: R. & P. Van Praag	Former metal fabrication and tobacco press manufacturing facility with suspected VOC contamination in soil and groundwater (based on detection of these compounds on adjoining, downgradient property, the former Buncombe County landfill). PD intends to redevelop the site for light manufacturing/assembly, warehousing and public storage uses.
GENERAL WOOD 1901 Wood Treatment Road Leland, Brunswick County PD: Leland Land, LLC	Former 120-acre pole treatment facility [creosote, chromated copper arsenate (CCA) and pentachlorophenol (PCP)] under Chapter 11 bankruptcy, currently under RCRA jurisdiction. PD's intent is to be able to distinguish old from new contamination and then continue with pole treatment (CCA and PCP only). Groundwater contamination mainly associated with creosote and petroleum. Metal and PCP contamination in soil.
GLEN RAVEN MILLS 114 Raven Circle Kings Mountain, Cleveland Co. PD: Consortium for Progress	Former textile manufacturing facility with solvent contamination in groundwater. PD intends to redevelop the property as a residential/retirement center for senior citizens. Responsible party will continue assessment and/or cleanup activities under state Voluntary Cleanup Program.
GREY HOSIERY MILL Fourth & Laurel Streets Hendersonville, Henderson Co. PD: Old Mill Arts Committee	Former hosiery manufacturing facility located in downtown Hendersonville with low concentrations of chlorinated solvents in site groundwater. PD intends to renovate the building and redevelop the property as a performing arts center.
HOME DEPOT – South Blvd. 4750 South Boulevard Charlotte, Mecklenburg County PD: CNR Properties, RLLLP	This 12-acre site is currently occupied by a produce grocer and office rental store (1 acre), parking (7 acres), abandoned plant nursery (1acre) and the rest is undeveloped. Operations at adjacent Academy Steel Drum from 1947-69 included the disposal of wastes and sludge from drums into pits/lagoons appears to have contaminated subject property. After ASD burned in 1969, contamination was spread during re-grading of the site. Elevated concentrations of lead, chromium, and PCBs in soil along with lead, 2-chlorophenol, and trichloroethylene. PD plans to lease property to Home Depot for construction of a new Home Depot home improvement retail store.

HOME INNOVATIONS SITE Hwy 52 S & Ratliff Gin Road Morven, Anson Co. PD: Dan River Inc.	Former textile manufacturing facility with petroleum hydrocarbon and VOC contamination in soil and groundwater. PD intends to redevelop the site as a modern textile manufacturing operation where present environmental contaminant compounds are not used. Project has significant job creation potential.
KIDD LANE BATTERY DISPOSAL 3607 Kidd Lane Charlotte, Mecklenburg Co. PD: Joshua's Farm	Abandoned dairy farm with historical lead battery disposal operations. The approximately 1-acre parcel is adjacent to a 22-acre horse and animal farm area for the Joshua's Farm Operations. The site has a limited area with lead contamination in the surficial soils. PD intends to redevelop the area as a parking lot for the horse and animal farm operations.
NORTH HILLS MALL 4217 Six Forks Road Raleigh, Wake Co. PD: North Hills Mall Ownership Organization, LLC	This 31-acre site was originally developed in 1963 and later expanded into one of Raleigh's earliest enclosed malls. The site has known petroleum and chlorinated solvent contamination in soil and groundwater from auto gas and repair facilities and from an off-site drycleaner. DP intends to redevelop the site into a pedestrian friendly mixed-use retail, commercial and residential complex.
QUALITY METAL PRODUCTS 1111 Oates Road Gastonia, Gaston Co. PD: Porter's Fabrications	This 11-acre site contains an abandoned 48,000 square feet facility formerly used for metal fabrication. Parts cleaning activities resulted in solvent impacts to soil and groundwater. PD intends to refurbish the facility for metal fabrication utilizing high-tech, non-contaminating methods.
RADIATOR SPECIALTY 1900 Wilkinson Blvd. Charlotte, Mecklenburg Co. PD: Suttle Avenue, LLC	Idled automotive chemicals and hardware, and plumbing supplies manufacturing facility with volatile, semi-volatile and metals contamination in soil and groundwater. PD intends to redevelop the property into a major mixed-use office, retail, commercial and multi-family residential development.
RUSAK PROPERTY 3004 Bank Street/ 3331 Griffith Street Charlotte, Mecklenburg Co. PD: Charlotte Mecklenburg Board of Education	A 1.21-acre parcel that is adjacent to the Marie G. Davis Middle School. The site is contaminated from historical operations as a metal plating facility. The PD intends to incorporate the adjacent parcels into the new middle school construction. The brownfields parcel will be the plaza entrance.
SHELBY DYEING & FINISHING 1000 West Grover Street Shelby, Cleveland Co. PD: GMAC Commercial Credit, LLC	Former textile dyeing and finishing facility with solvent and metals contamination in soil and groundwater. Through its sale of the property to Environmental Fibers, PD intends to facilitate the redevelopment of the site as a cotton recycling facility, bringing the two site buildings back into productive use, and bringing jobs and tax base improvements to the community.
SHELBY WILLIAMS 401 Meacham Road Statesville, Iredell Co. PD: Lou Jay Associates, LLC	The 28-acre site contains an idled furniture manufacturing facility with metals contamination in soil and groundwater from former plating operations conducted at the site. Applicant-PD intends to up-fit the facility for the production of high-end cabinetry and add an estimated 650 jobs in the next three years.

SOUTH TRYON STREET 2028-2040 S. Tryon Street Charlotte, Mecklenburg Co. PD: Citiline, LLC	A 2.88-acre parcel near historic South End. PD intends to redevelop the property for commercial purposes such as office and showroom condominiums. Groundwater is contaminated due to historical site operations as industrial/warehouse storage.
SUTTON SHOPPING CENTER NW Corner of Walkup & Sutherland Ave Monroe, Union Co. PD: Whitley Commercial Properties	The site is an old run-down shopping strip center in the Monroe Area. It has known soil and groundwater contamination from chlorinated solvents and gasoline constituents. PD intends to renovated the shopping center and expand the building area.
TAR HEEL LIFT 7055 Albert Pick Road Greensboro, Guilford Co. PD: Idlewild Grading Co., LLC	This 8-acre site contains a forklift sales, maintenance and repair facility on approximately two acres. The site has known environmental contamination from historic operations of the forklift facility. The site is currently underused and PD intends to relocate and expand its grading business from Winston-Salem, NC to this brownfields property.
WELLMAN SITE 3224 Cedar Creek Road Fayetteville, Cumberland Co. PD: Technofil, Inc.	The Wellman site is approximately 18 acres and contains a filament polyester yard manufacturing facility which has been idle since January 2003. There is known PCE contamination in groundwater at the site. PD intends to refurbish and reuse a portion of the facility to manufacture polyester and bicomponent yarns utilizing a process that will allows discrimination of old contamination from new.

PROJECTS PENDING ELIGIBILITY (9)

ANDREX INDUSTRIES 220 Deaverview Road Asheville, Buncombe Co. PD: Milkco, Inc.	This nine-acre, light manufacturing site was formerly a textile facility that operated a knitting, weaving and cutting business along with dry cleaning, shrinking and packaging of fabrics. Tetrachloroethylene groundwater contamination from dry cleaning operations is being remediated by RP with pump-and-treat system. PD is adjacent property owner, a milk processing and distributing plant. Initial plan is to use part of property for truck and trailer parking. Within three years they plan to demolish Andrex buildings and expand the Milkco Plant to double capacity within eight years.
GUILFORD MILLS – W. Market Street 4925 W. Market Street Greensboro, Guilford County PD: Kim's Greensboro Real Estate, LLC	A 19.8-acre vacant textile facility with ancillary buildings. Minor groundwater contamination associated with former underground storage tanks. Other non-UST contamination has been documented but information has not yet been sent to us. PD plans to use the site for general commercial property.
HISTORIC COTTON MILL 191 Riverside Drive Asheville, Buncombe Co. PD: RiverLink, Inc.	This 2.63-acre site was formerly occupied by a cotton mill operated from the 1900s then abandoned for many years. PD will conduct environmental assessment to determine if the site has any contamination. PD intends to redevelop the site in mixed commercial/retail and residential uses. This project is part of the Asheville French Broad Riverfront Plan.
LEARY BROTHERS STORAGE Virginia & Broad Streets Edenton, Chowan Co. PD: Charles M. Reeves III	Approximate 6-acre site containing former flower distribution and pesticide storage facility. Known arsenic contamination exists in site soil and groundwater. PD intends to redevelop the property in commercial retail uses.

MOSER-HALL Indian Trail, Union Co. PD: Moser-Hall, LLC	Property with petroleum hydrocarbon contamination in groundwater which has migrated onto the property. The source of the contamination was a release from a leaking underground storage tank system located on an adjoining parcel. PD intends to redevelop the site for commercial/retail use.
NATIONAL TEXTILES Jamestown Road Morgantown, Burke Co. PD: National Textiles	Former textile manufacturing facility with chlorinated solvent contamination in soil and groundwater. The applicant PD intends to sell the site to an identified potential buyer for conversion and reuse as a furniture manufacturing facility.
SALEM UNIFORM 4015 N. Cherry Street Winston-Salem, Forsyth County PD: Winston Weaver Co. Inc.	Vacant for many years, this 2.53-acre site was leased from 1967-83 by Salem Uniform and from 1983-86 by Cintus Corp. who then purchased the Salem Uniform assets. During a Limited Site Assessment for petroleum USTs, high levels of PCE were discovered, probably from dry cleaning solvents. PD is currently leasing space, but would like to improve it for use as fertilizer storage and other commercial usage.
SPANCO Inc. 1604 Boone Trail Road Sanford, Lee Co. PD: Pier Real Estate, Ltd.	Former hosiery manufacturing facility on approximately 10 acres with chlorinated solvent contamination in soil and groundwater. Applicant-PD intends to redevelop the property for use as a fasteners manufacturing and distribution facility.
WILSON LANDFILL 6700 Ward Boulevard Wilson, Wilson Co. PD: Dillon Properties, LLC	This underused 14-acre site was formerly occupied by a waste-water treatment facility owned and operated by the City of Wilson. The site has known metals contamination in groundwater. PD intends to redevelop for mixed commercial, warehousing and residential uses

FINALIZED BROWNFIELDS AGREEMENTS (36) EITHER IN FORCE OR PENDING SIGNATURE

ALAMAC KNIT FABRIC Hamilton, Martin Co.	Former textile manufacturing facility with known soil and groundwater contamination involving chlorinated solvents. Site is undergoing active remediation under NC DWQ CAP. Intended reuse is as a non-polluting school locker manufacturing facility that will employ some 350 workers.
ANCHOR MILL Huntersville, Mecklenburg Co.	Abandoned textile manufacturing facility with known metals contamination in soil, and lead, chlorinated solvent, and petroleum hydrocarbon contamination in groundwater. PD intends to redevelop the 32-acre site as a mixed-use transit village that reuses the old mill building and adds new office, retail, and residential components.
BALDOR ELECTRIC Charlotte, Mecklenburg Co.	Former electric motor and motor component assembly and manufacturing facility with solvent impacted soil and groundwater. PD intends to redevelop the property for use as industrial condominiums.

BURKHART CAROLINA Henderson, Vance Co.	Former pickle processing and packing facility with chloride impacted soil and groundwater and minor solvent contamination in groundwater. PD intends to redevelop the property for commercial retail use. Simultaneously, the responsible party will implement groundwater remediation at the site under separate action. The PD's development will provide an impervious cap on the site, further assisting remedial efforts.
CAMDEN SQUARE Charlotte, Mecklenburg Co.	Abandoned knitting and printing operations rebuilt into the "Design Center of the Carolinas." Development supported by the Wilmore Community as a vital redevelopment in an economically depressed area. Land use restrictions for chlorinated solvents in groundwater.
CAMDEN SQUARE ADDITION Charlotte, Mecklenburg Co.	This project will add, by amendment, 4.5 acres to the first brownfields agreement completed in North Carolina, Camden Square, in Charlotte's South End redevelopment corridor. Contamination includes VOC- and SVOC-impacted soil and groundwater. Intended reuse is mixed office and retail.
CAROLINA PRODUCTION FINISHING Asheville, Buncombe Co.	Former textile finishing facility with metals contamination in both soil and groundwater. PD intends to redevelop the site for warehousing and as a sewing operation. PD is in the process of reviewing DENR's draft brownfields agreement for this site.
CITY WEST COMMONS Charlotte, Mecklenburg Co.	Dilapidated shopping center seized in a drug raid by the U.S. Dept. of Justice that has been approved for transfer to the city of Charlotte. Site had VOC and chlorinated solvent contamination in soil and groundwater. The City intends transfer the property to a not-for-profit development corporation to redevelop the site as commercial retail shopping facility.
C.K. LAND DEVELOPMENT Charlotte, Mecklenburg Co.	A large mixed use development on a former industrial services firm adjacent to a manufactured gas plant. Ground floor retail and studio with office and residential units above. Project is in vicinity of Camden Square and provides redevelopment to economically depressed area. Capping and land use restrictions regarding PAHs in soil and chlorinated solvents in soil and groundwater.
CUMBERLAND SHOPPING CENTER Greensboro, Guilford Co.	Site of former shopping center and dry cleaners with chlorinated solvent impacted soil and groundwater. PD is a not-for-profit community development corporation. The PD has performed soil cleanup activities and intends to redevelop the site with affordable residential housing.

EAST GANNON PROPERTY Zebulon, Wake Co.	This property consists of four parcels of land totaling 1.75 acres with four exiting structures (former restaurant, current auto sales, auto service garage and hair salon). Site planned to be redeveloped into a stand-alone Eckerd Drug Store, with other surrounding complimentary retail tenants. Soil and groundwater are contaminated with petroleum constituents from above ground storage tanks used by previous gas station.
EAST PARK – JOAL REALTY Charlotte, Mecklenburg Co.	Part of the 24-acre site encompasses a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the pedestrian needs an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the CBD and the historic residential neighborhoods of Elizabeth and Myers Park.
EAST PARK – KOSSOVE Charlotte, Mecklenburg Co.	Part of the 24-acre site encompasses a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the needs of pedestrians in an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the CBD and the historic residential neighborhoods of Elizabeth and Myers Park.
ERWIN SQUARE Durham, Durham Co.	This approximately six acre property is a portion of a decommissioned former Burlington Industries site; other portions have already been redeveloped. There is known chlorinated solvent contamination in groundwater, and these impacts are being addressed under an approved Division of Water Quality corrective action plan. PD intends to redevelop the site in high density residential use.
FLEMINGTON LANDFILL Wilmington, New Hanover Co.	Site of a closed (1979), privately-operated domestic and industrial solid waste landfill with VOC-impacted soil and groundwater. Intended reuse is for a soccer complex. This is the first former landfill property proposed for redevelopment under the N.C. brownfields statute. The project's feasibility and technical challenges are being carefully evaluated.
FOOD LION Winston-Salem, Forsyth Co.	A new large supermarket placed on the site of an abandoned grocery store in urban Winston-Salem. Project had strong community support as a quality of life issue as the community had no supermarket. Land use restrictions for chlorinated solvent contamination in groundwater. Brownfield assessment determined the source to be nearby drycleaner.
GUILFORD MILLS Greensboro, Guilford Co.	This 55-acre site contains a former textile manufacturing facility with known VOC contamination in soil and groundwater. PD intends to redevelop the property in mixed retail uses. Public benefits include the creation of an estimated 500 jobs and substantial tax roles increases.
HAMILTON PROPERTY Charlotte, Mecklenburg Co.	Dilapidated property bought for the expansion of Cost Effective Maintenance Inc., a small business in the South End area of Charlotte. Expansion into this property allowed CEM to stay in Charlotte instead of move to suburbs. Land use restrictions for chlorinated solvent contamination in groundwater.

HILLSBOROUGH VENTURES Raleigh, Wake Co.	Project involves redeveloping an area of parking lots and dilapidated, underused retail structures. Land use restrictions are in place for the petroleum hydrocarbon and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the property as mixed residential (private student dormitory for N.C. State University) and retail complex.
HILLSBOROUGH VENTURES ADDITION Raleigh, Wake Co.	Prospective developer added acreage to the footprint of original Hillsborough Ventures project, which involves redeveloping an area of parking lots and dilapidated, underused retail structures adjacent to N.C. State University for mixed residential (private student dormitory) and retail uses.
LEWITH TEXTILE Charlotte, Mecklenburg Co.	Project involves the redevelopment of 50+ acres of abandoned and underused commercial and industrial property, including the former Lewith Textile facility. Contaminants include petroleum hydrocarbon and chlorinated solvents in soil and groundwater. PD intends to redevelop the site as an industrial park for light manufacturing and warehousing/distribution.
LUCENT TECHNOLOGIES Greensboro, Guilford Co.	Former cotton mill and manufacturing facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site in mixed commercial retail/office and residential.
MALLARD CREEK Charlotte, Mecklenburg Co.	This 21-acre site neighbors a former auto service station and chainsaw service center operations. Petroleum hydrocarbon and chlorinated solvent contamination in groundwater, sourced from underground and aboveground storage tanks releases on the adjacent site, has migrated onto the subject property. PD intends to redevelop the property as an apartment complex.
OXFORD PRINTING Oxford, Granville Co.	Former textile printing and finishing facility with VOC contamination in groundwater. PD has conducted cleanup of floor drain contents. PD intends to redevelop the site for industrial/distribution use.
PILOT MILLS Raleigh, Wake Co.	Abandoned, condemned, turn-of-the-century textile mill in Downtown Raleigh redeveloped into office space and preserved on the National Register of Historic Places. Land use restrictions for chlorinated solvent in groundwater and capping of mercury in soils.
REDMAN HOMES Mebane, Orange Co.	Former mobile home manufacturing facility with metals and solvent contamination in soil and groundwater. PD has performed drum removal and soil remediation activities. PD intends to redevelop the site as a manufacturing facility to produce windows and doors.
SANFORD WWTP Sanford, Lee Co.	Former municipal waste water treatment plant site with petroleum impacted sewer sludge and metals impacts in site soils and low concentrations of volatile and semi-volatile compounds in groundwater. PD intends to redevelop the property in commercial use, including restaurant, retail space and a multi-screen movie theater.
SINGER COMPANY Chocowinity, Beaufort Co.	Abandoned rural manufacturing facility with lead and phthalate contamination in soil and groundwater. The brownfields agreement provides for partial site remediation. PD intends to redevelop the site with mixed retail and light industrial uses.

SMITH METAL & IRON Charlotte, Mecklenburg Co.	Former site of a scrap metal yard and of a waste cell created for the temporary disposal of impacted soil removed during the construction of the adjoining Carolina Panther's practice field. The waste in the cell has been removed, and minor chlorinated solvent impacts remain in site groundwater. PD intends to redevelop the site in high density residential with additional office, entertainment, and retail potential.
SMITH PROPERTY Shelby, Cleveland Co.	Project involves the redevelopment of an area occupied by seven underused and dilapidated residential homes with petroleum hydrocarbon and chlorinated solvent contamination in groundwater. PD has the support of local residents to reuse the site as a parking lot serving the Cleveland County Offices.
SOUTHERN MANUFACTURING Charlotte, Mecklenburg Co.	This nine-acre site located in inner Charlotte was a former asbestos tile manufacturing facility. Operations involving asbestos were discontinued in 1986 and the facility was closed in 1999. The site has known asbestos contamination in soils. Intended reuse of the site includes an outdoor amphitheater, a technical business park, or a mixed-use development with industrial, commercial and residential components.
STATE FARM ROAD Boone, Watauga Co.	Project involves the redevelopment of property occupied by a rural residence with chlorinated solvent contamination in groundwater and in a spring from an off-site source. PD intends to redevelop the site as a medical office complex.
TARTAN MARINE Hamlet, Richmond Co.	Former boat manufacturing facility with lead contamination in soil. Additional site sampling conducted by the PD has shown previous soil removal actions to have left no health-based lead problems. PD intends to redevelop the site as a chair and table base manufacturing facility.
TERRELL MACHINE Charlotte, Mecklenburg Co.	Site of former textile manufacturing and gear box machining operations, property in Charlotte's South End district is being redeveloped with ground floor retail and office/residential above. Remedial actions to eliminate hot spot contamination included soil removal and groundwater pump and treat. Land use restrictions are in place to address chlorinated solvent contamination remaining in groundwater.
VANIER GRAPHICS Eden, Rockingham Co.	Former printing facility with petroleum and chlorinated hydrocarbon contamination in the soil and solvent contamination in the groundwater. PD intends to redevelop the site as a furniture assembly and upholstering facility.
WEST MOREHEAD Charlotte, Mecklenburg Co.	Former automobile repair and maintenance facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site, to include both facility renovation and new construction for use as commercial office/retail.

RE: Interim Report on Implementation of House Bill 1215

Dear Mr. Givens:

House Bill 1215, enacted in October 2002, requires the submission of an interim report to the Environmental Review Commission.

Attached is a copy of the Interim Report, which describes efforts made to: 1) evaluate water conservation measures being implemented in the State, and 2) identify incentive programs and other voluntary programs that can help foster water conservation and water reuse.

Sincerely,

William G. Ross Jr.

Department of Environment and Natural Resources
INTERIM REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION AND ENVIRONMENTAL MANAGEMENT COMMISSION ON IMPLEMENTATION OF HOUSE BILL 1215 (Session Law 2002-167)

House Bill 1215, enacted by the North Carolina General Assembly in October 2001, has three related components targeted at improving water management.

Section 3 requires the Environmental Management Commission to develop and implement permanent rules governing water conservation and water reuse during droughts and water emergency situations in time to allow review by the 2005 Regular Session of the General Assembly. The rules are to establish minimum standards and practices for water conservation and water reuse for the following classes of water users: publicly owned water systems, privately owned water systems, State agencies, local governments, business users, industrial users, agricultural users, and horticultural users. The Department is directed to consult with these types of water users in developing the rules.

Section 4 establishes a goal to reduce water consumption by State agencies by 10 percent.

Section 5 requires the Department of Environment and Natural Resources to evaluate water conservation measures being implemented in the State and to identify incentives and voluntary programs that can help foster water conservation and water reuse. In conducting its evaluation, the Department is to review measures being implemented or advocated by the types of water users identified in Section 3 of the bill, plus residential users, electric utilities, environmental protection advocacy groups and natural resource advocacy groups.

Some of the tasks outlined in H1215 are already underway. In particular, the goal of reducing water consumption by State agencies is currently being addressed by the Utility Savings Initiative, a recommendation of the Governor's Efficiency Study Commission, and by Governor Easley's Executive Order 26 on water conservation. However, evaluation of water conservation measures, identification of incentive programs and formation of policies governing water conservation and reuse will require significant additional effort.

Three DENR divisions are cooperating on the implementation of H1215. The Division of Water Resources is coordinating the effort and concentrating on municipal water systems. The Division of Soil and Water Conservation has the lead role on agriculture, with the Division of Pollution Prevention and Environmental Assistance leading on industrial and commercial water use.

On March 7, these three divisions sponsored a meeting, to which representatives of all the groups identified in the statute were invited, to inform water users that the Department would be conducting an evaluation of water conservation measures. Participants were

asked to provide information on water conservation measures currently in use and those that should be included in the evaluation. Participants were also asked to suggest ideas for incentives and voluntary programs that could encourage water conservation and water reuse among any or all water users in the State. Participants were provided questionnaires designed to collect information needed for the evaluation and were encouraged to send in other suggestions and information useful to the evaluation process.

This meeting also served to inform interested parties about the formation of rules governing water use and reuse during drought and water emergency situations as required by Section 3 of House Bill 1215.

More than sixty people, representing almost all groups of water users specified in the statute, attended the meeting. Representatives of several user groups offered suggestions about water conservation with at least one suggestion of a voluntary program that could be used to improve water use efficiency. Departmental staff members expect to receive additional information as participants return questionnaires. Many participants stressed the importance of developing long term water resource management plans to ensure adequate future water supplies, to integrate appropriate water conservation measures and to encourage water recycling. The Department will continue to work with interested parties to determine the best way to develop the desired long-term plans. Participants also stated a desire that efforts at improving water efficiency be given due consideration in the formation of the rules governing water use during droughts. Additional meetings will be held in the coming months after we have had the opportunity to review survey results and determine an appropriate course of action.

To gather additional relevant information, the Division of Water Resources has developed a questionnaire to collect information about water conservation measures from water systems that submit Local Water Supply Plans under General Statute 243-355(l). Water systems are being asked to include information on the effectiveness of water conservation measures they use. This information is expected to provide data on water conservation measures that affect many of the designated water user groups, since many rely on public water systems for their water. Local Water Supply Plans are expected from more than 540 water systems. Water systems are being encouraged to submit local plans by the end of July 2003. The timing of these submissions will provide valuable information for the evaluation of water conservation measures by February 2004, as required by H1215.

The responsible divisions will continue working with water users and other interested parties toward the report due to the General Assembly on February 15, 2004. The next priorities are to gather information about successful incentives and voluntary programs that have been used in other states. Obtaining assistance from the university system and from other sources is being explored.

Report on Water Conservation and Water Use Efficiency
As Required by
House Bill 1215 (Session Law 2002-167), Section 5

INTRODUCTION

House Bill 1215 was ratified by the North Carolina General Assembly on October 3, 2002. House Bill 1215, now Session Law 2002-167, contains a number of provisions related to water conservation and water supply planning, motivated by North Carolina's experience with the extreme drought of 2002 and a heightened awareness of the need to focus more attention on assuring that North Carolina has an adequate water supply for future needs.

After experiencing dryer than normal weather for four years, the drought reached a critical point in 2002. During that year, North Carolina experienced many record lows for stream flows and ground water levels. In some cases these new drought records go back 50 to 75 years. In some of North Carolina's river basins, the State faced a danger that storage capacity in major reservoirs would be exhausted, leading to a disastrous drop in water availability for critical water supply needs. Agriculture experienced such severe drought-related impacts that the U.S. Department of Agriculture issued a disaster declaration for many North Carolina counties at Governor Easley's request.

During the 2002 drought, the Department of Environment and Natural Resources and the Drought Monitoring Council developed a 3-tier classification of communities according to their drought vulnerability. Thirty communities were included in Tier 1, which included those most vulnerable to running out of water. Tier 2 contained 88 communities with a serious but somewhat lesser degree of vulnerability. Tier 3 included 152 other communities of concern. Local governments, other water users, and state agencies responded to the drought challenge by increasing their monitoring of drought conditions, intensifying communication about drought dangers, and coordinating drought response measures. Many communities took vigorous steps to assure water supply availability for essential needs during the drought and to reduce their vulnerability to future droughts.

Against this background of concern regarding drought and the adequacy of future water supplies, House Bill 1215 dealt with two types of "water conservation" that are sometimes lumped together, but are in fact quite different.

The first type of water conservation is addressed by Section 3 of House Bill 1215, which deals with water conservation efforts necessary on a short-term basis during droughts or other emergency situations when water supply suddenly becomes reduced. Section 3 calls for the Environmental Management Commission to develop an administrative rule establishing minimum standards and practices for water conservation and water reuse for the following classes of water users: publicly and privately owned water supply systems, state agencies, local governments, business and industrial users, and agricultural and horticultural users.

During the 2002 drought, there were concerns that neighboring communities adopted very different approaches to emergency water conservation and that various types of water users were treated differently from community to community. There was also a lack of understanding about how water use by one community can affect other communities downstream. The intent of Section 3 of House Bill 1215 is to establish a fair and uniform set of minimum standards for

times when emergency reductions in water use are required to keep water demand in balance with a temporarily limited supply.

Similar to floods, droughts are random and unpredictable natural events. We know that, at some time in the future, droughts of various degrees of severity will occur. It is prudent for all North Carolina water suppliers to have policies and plans in place for emergency conservation when necessary to protect their most critical water needs and to minimize economic damage.

House Bill 1215 also deals with a second type of water conservation, which might be best described as year round water use efficiency. Efficient water use means using better practices or technology to get more economic productivity per unit of water used. Section 5 of House Bill 1215 requires the Department to evaluate water conservation measures being implemented in the state and to identify incentives and voluntary programs that can help foster water conservation and water reuse. The type of water conservation dealt with in Section 5 does not focus on occasional emergencies; instead, it is the kind of water conservation that all water users should work toward on an everyday basis. For every type of water user, including municipal, residential, industrial, agricultural, and others, there are proven practices that can improve the efficiency of water use. To the extent that North Carolina water users can become more efficient, we can stretch our available natural supply of water to support new water users in a growing economy. Improved water use efficiency can also postpone the need for costly capital investments in water supply infrastructure. While the General Assembly directed the Environmental Management Commission to develop an administrative rule for emergency water conservation as included in Section 3 of the Bill, it directed DENR to pursue voluntary measures and incentives that can increase long-range water use efficiency under Section 5.

This report deals only with Section 5 of House Bill 1215, the part directed toward improving long-range water use efficiency by North Carolina water users. This report was developed by the Division of Water Resources (primary responsibility for municipal water use), the Division of Soil and Water Conservation (agricultural water use), and the Division of Pollution Prevention and Environmental Assistance (industrial and commercial facilities and state agencies). The Division of Water Quality and the Division of Environmental Health also participated. To develop this report and recommendations, the Department held a public meeting on March 7, 2003, with participation by a broad range of water users, including municipal water systems, state agencies, businesses and industries, and agricultural water users. We requested the participants at this meeting to send us their recommendations on both techniques and methods to improve water use efficiency and on incentives or other voluntary measures that would motivate water users to become more efficient. The Department also requested and received information and recommendations on water use efficiency from the over 400 local governments that prepared and submitted Local Water Supply Plans (LWSP) to the Department during 2003. We sent out a follow-up email to a very broad list of water users and other interest groups on January 15, 2004 to invite any additional recommendations for the report.

The task of adopting an administrative rule on emergency water conservation during droughts or other temporary water shortages, as required by Section 3 of House Bill 1215, requires a different approach. The Department of Environment and Natural Resources will assemble an informal advisory committee to help us in drafting a rule to set minimum standards

for emergency water conservation for all types of water users. The draft rule will then go through the normal public notice and public hearing process before being considered by the Environmental Management Commission.

Improving water use efficiency in North Carolina, the subject of Section 5 of House Bill 1215, is a long-range effort that will require sustained attention over a period of years. Success will involve public education, improved incentives, and new practices and technology.

Determining the best approach to improve water use efficiency requires participation from all types of water users, who best understand the opportunities for improvement in their own operations. Because of this need for widespread participation and commitment, the Department intends to revise this report toward the end of the year, based on comments from the public and any additional recommendations that we receive during 2004.

Water conservation is an important element in good water resources management, but must be understood in the larger context. Improving the management of North Carolina's water resources and assuring adequate water supplies for our future requires a coordinated effort on three fronts:

- Accurate **monitoring** of the natural availability of water in North Carolina and of the rate of use of our surface and ground water supplies.
- Farsighted **planning** to project future water needs and to determine the most cost effective and environmentally sound water sources to meet these needs.
- Appropriate **incentives** and **regulation** to assure that North Carolina water resources are equitably shared among those who need to use them and that our use of water avoids the depletion or damage of our water resources.

Within this larger context, standards for emergency water conservation during droughts or other occasional water shortages will prepare communities to withstand these emergencies with minimal damage to public health and the economy. Improving our long-range efficiency of water use will improve the cost effectiveness of our water supplies and make water available for future economic development. Both of these aspects of water conservation are an important part of our total strategy for good long-range management of this essential natural resource.

RESIDENTIAL WATER USE

Families use residential water conservation measures to reduce water bills for purchased water or to avoid exceeding the capacity of their private wells. Many individuals are also motivated to conserve water because it contributes to good environmental stewardship. The willingness of individuals to comply with voluntary water conservation measures has a significant effect on total water use. Voluntary water conservation alone can reduce residential water use by an estimated two percent to five percent. Voluntary residential measures include:

shorter showers, turning off faucets while brushing teeth and shaving, washing only full loads of dishes and clothing, using a basin of rinse water when washing dishes by hand, installing automatic shut-off valves on water hoses, and using water efficiently when watering lawns and gardens.

CURRENT RESIDENTIAL CONSERVATION MEASURES

Home Water Audits

Home water audits and retrofit programs offer citizens assistance in quantifying how much water is being used in their home and recommendations to reduce water waste. Utility employees can perform home audits or provide education kits that teach customers to perform self-audits. A home water audit typically entails quantifying the amount of water being used and wasted throughout a household. An audit helps in developing an action plan to reduce wasted water. The plan may require leak detection and repair and retrofitting old faucets, showerheads and toilets with appropriate low flow devices.

Retrofitting and Replacing Inefficient Fixtures

Retrofitting and replacing fixtures and appliances with more efficient models are helping households to significantly reduce water use. Replacing inefficient toilets, showerheads, washing machines, and other water-using appliances can reduce water use by these devices between 18 percent to 44 percent.

Retrofitting involves making an improvement to an existing appliance or fixture rather than replacing it all together. It is generally much less expensive and can frequently be done by the user. A basic retrofitting kit generally includes low-flow faucet aerators, low-flow showerheads, leak detection dye tablets for the toilet, and replacement flapper valves for toilets. Standard retrofit kits are estimated to save 21.1 gallons per person per day (USEPA Water Conservation Plan Guidelines 150 – 151, 163, 166).

Irrigation Efficiency

Landscaping accounts for 31 percent of all residential water use (Vickers 12). Widespread use of xeriscaping and lawn watering guidelines can result in an estimated 22.5 percent to 27.5 percent reduction in outdoor water use (USEPA Water Conservation Plan Guidelines 166). Due to the large potential water savings, many major water systems, including Charlotte, Cary, Asheville, and OWASA, place a strong emphasis on irrigation practices, xeriscaping, and soil and lawn care. Irrigation policies include limitations on time of day, day of week and amount of watering; prohibiting the watering of non-vegetated surfaces such as sidewalks and driveways; eliminating water run-off outside of property lines; and installing moisture or rain sensors on irrigation systems.

Xeriscaping

In addition to modifying traditional irrigation methods, water systems are encouraging customers to reduce the need for irrigation. Educating residents about xeriscaping (landscaping

practices that utilize drought-tolerant native plants and grasses) and aeration of lawns reduces the need for irrigation by an estimated 7.5 percent and helps residents to keep their landscape beautiful (USEPA Water Conservation Plan Guidelines 166).

Charlotte-Mecklenburg has undertaken water efficient landscape education through the Mecklenburg County Solid Waste Division's Piedmont Landscape and Naturescape Training program (PLANT). The program emphasizes planting drought-resistant native plants, mulching to retain moisture, using compost to amend and aerate soil, and efficient watering methods. PLANT reached many Mecklenburg County residents in 2003 through school and community college programs and general public education workshops (Gill).

Results of Residential Programs

Where communities have coupled public education and indoor and outdoor water conservation policies, great water savings have occurred. For example, faced with a more than doubling population over the last 10 years and high water demands during summers, Cary's water resources were seriously strained. Through public education, landscape and irrigation ordinances, toilet flapper rebates, residential audits, a conservation rate structure, a new home water efficiency rating program, landscape water budgets and a water reclamation facility, Cary has drastically cut water demands on its system. These measures are expected to reduce water supply plant production by an estimated 4.6 million gallons per day by the end of 2028. This 16 percent savings will reduce operating costs and allowed Cary to delay two water plant expansions (USEPA Cases in Water Conservation 3).

WATER SUPPLY SYSTEMS

CURRENT WATER SYSTEM CONSERVATION MEASURES

Water System Audits and Universal Metering

In order for water systems to conserve water effectively, an accurate accounting of water entering and leaving the water system is necessary. A water system audit quantifies how much water a system produces and purchases and where that water is going. The first step should include universal metering, or the metering of all water-service connections. Water supply intakes and connections with other systems should also be metered. All the water entering the system should then be tracked through monitored service-connection meters (water that is billed for) and public-use meters (water provided free of charge). An annual average of 16 percent of water systems submitting a 2002 Local Water Supply Plan (LWSP) performed a water audit within the past five years, with 95 audits in 2002. To assure accurate metering, meters must be regularly tested and replaced when necessary. Sixty-seven percent of the water systems submitting a 2002 LWSP currently have a meter replacement program (2002 LWSP data).

If the water audit shows a difference of more than 15 percent between the water withdrawn and the water that can be accounted for, a thorough inspection of the water system is needed to determine the causes for water loss. Water meters should be checked for accuracy and leak detection and repair programs should be implemented (USEPA Water Conservation Plan Guidelines 144-146).

Leak Detection and Repair

Leak detection is a process to identify and repair water system leaks that are causing water loss. Leak detection methods range from visual inspection to using specialized leak detection equipment to find hidden leaks. The use of leak detection equipment is a more accurate and thorough method for locating leaks. Leaks can be detected by listening with a special microphone on contact points such as fire hydrants, meters, and valves and by listening on the ground over water lines with a special ground microphone. While 31 percent of the water systems in the state have an established leak detection program, 26 percent of the systems are seeking help to implement one (2002 LWSP data). A water loss reduction program that includes leak detection and repair enables water systems to reduce water waste and recover more of their operational costs by being able to bill for all the water they produce.

Water Pressure Reduction

Reducing excessive pressure within a water distribution system can save between three percent and six percent of a system's total production by limiting leakage. An auxiliary benefit of reducing pressure is a reduction in stress to the water distribution infrastructure. Decreased stress on the system can increase the life of pipes and valves and reduce maintenance costs. A system-wide decrease in pressure also reduces flow through open faucets and lessens wear on fixtures and appliances.

If the pressure in residential areas is greater than 80 pounds per square inch, water systems should determine if changing the system pressure is feasible. If decreasing the pressure of the entire system is not feasible, other water pressure reductions, such as pressure-reducing valves leading into buildings and flow restrictors on service meters can be put into place for water use efficiency. Water customer savings from pressure reduction range from five percent to 30 percent (USEPA Water Conservation Plan Guidelines 151, 166).

Water Reuse

Not all water uses require top quality potable water. Highly treated wastewater can be used for many purposes, such as irrigation, dust control, and some industrial processes. Reusing treated wastewater for suitable purposes increases efficiency by using the same water twice, allowing a water system to meet potable water demand with a smaller withdrawal from its water supply source.

Over eight percent of the water systems in North Carolina sell reclaimed water (2002 LWSP data). The Town of Cary implemented a reclaimed water project in June 2001. The project provides reclaimed, non-potable water for 400 residential and commercial users through a parallel distribution system to reduce demand on the potable water supply. As an incentive for reuse, Cary's year-round outdoor watering restrictions do not apply to reclaimed water use. Bulk reclaimed water (up to 200,000 gallons per day) is made available free to be hauled in tanker trucks to work sites for use for dust control, soil compaction, or landscaping. The program is helping Cary to meet its 20 percent water use reduction goal. UNC-Chapel Hill and the Orange Water and Sewer Authority (OWASA) are currently evaluating the feasibility of using highly treated wastewater in the University's cooling and steam cogeneration facilities. The proposed

reuse system would save one million gallons per day of OWASA's potable water production (Davis).

Public Education

Public education is a major factor encouraging year-round residential water conservation. Presently, 34 percent of the water systems submitting a 2002 Local Water Supply Plan (LWSP) have a water conservation public education program. Some water systems are hiring water conservation specialists to increase public awareness of residential water conservation. Other communities are coupling water conservation education responsibilities with other duties. For example, Greensboro's Storm Water Department is also responsible for water conservation education. Education initiatives include media announcements, informative water bills with usage histories, landscaping and irrigation workshops, school programs, and home water audits.

WATER SYSTEM EFFICIENCY INCENTIVES

Retrofitting and Replacement Incentives

The two most commonly practiced replacement and retrofit incentives employed in North Carolina are rebate and give-away programs. Rebate programs require customers to provide proof of purchase and installation of low flow appliances or devices to receive a one-time rebate for each device installed. Some public utilities give away low flow devices (such as low-flow showerheads, toilet bladders, faucet aerators, etc.) free of charge to customers. Currently, 35 percent of the water systems in North Carolina encourage the retrofitting of inefficient water fixtures.

While rebate and incentive programs generate up-front costs for the water system, replacing an old toilet and showerhead will save an estimated 24.1 gallons of water per resident per day (USEPA Water Conservation Plan Guidelines 166). The City of Asheville has an effective retrofit program, which has distributed more than 34,000 kits and produced a 7 percent water savings. The Asheville Housing Authority has upgraded sinks, showers and toilets with low-flow devices for a savings of more than 20 million gallons annually.

Retrofit and replacement programs targeted to older residential areas maximize water conservation efforts. New construction codes usually incorporate the installation of water efficient fixtures, making older homes a priority. Replacing a showerhead installed before 1980 can save over 14 gallons per person per day, with a yearly savings of over 5,000 gallons for the average household (Vickers 88).

Rate Structures

The traditional decreasing-block rate structure does not encourage water conservation (McNeill and Tate). In a decreasing-block rate structure, the price per unit volume of water decreases as the total volume consumed increases. Currently, 24 percent of the water systems in North Carolina submitting a 2002 LWSP use a decreasing-block rate structure. A flat rate (also known as uniform rate) is a constant price per unit of water consumed. Almost a third (31 percent) of the water systems submitting a 2002 LWSP use a flat rate structure.

Rate structures that encourage the efficient use of water include increasing-block rates, seasonal rates, and emergency water conservation rates. The increasing-block rate is a rate structure in which the cost per unit volume increases with the amount used. The more water consumers use above a specified threshold, the greater the cost of each unit. Approximately 22 percent of the water systems submitting local plans are currently using an increasing-block rate structure. The increasing-block rate establishes a clear economic incentive for customers to reduce water use. Customers are more inclined to perform water audits, repair leaks, and make use of conservation measures to avoid paying the higher rates. Simply by applying an increasing block rate to water utility bills, the Town of Cary projects a water savings of 140,000 gallons per day by 2009 (Platt, J. and Delforge M. 78).

Water systems have to be sized to treat and distribute enough water to meet peak demands. It is the growth in peak demands that frequently drives the need to expand treatment plants and the development of additional water sources. Seasonal conservation rates are designed to promote water conservation during the season when water demands are at their peak or available supplies are low. Two different rate structures, typically one for winter and a higher one for summer, are established. By charging more for water during peak use periods, seasonal rates can help control the growth in peak demands and extend the life of existing facilities and supplies. According to the submitted 2002 LWSPs, less than two percent of the systems reporting use a seasonal water rate structure.

BUSINESS AND INDUSTRIAL WATER USE

CURRENT BUSINESS AND INDUSTRIAL CONSERVATION MEASURES

Technical Assistance

Businesses and industries are motivated to use less water to reduce operating costs by lowering water bills. Cost savings can come from reduced water purchases, pumping expenses, and wastewater treatment costs. While many conservation measures used by this group of water users are the same as residential and municipal practices, many others have to be tailored to the specific processes at each plant or facility. DENR's Division of Pollution Prevention and Environmental Assistance and the Waste Reduction Partners (WRP) program provide technical assistance to business and industry to identify potential water, solid waste, and energy efficiency options. WRP is a group of retired engineers who volunteer their services in western North Carolina. As with other water users, the first step is a water audit to measure and evaluate water needs for specific processes within a facility. Common targets for water use reductions in businesses and industries include cooling water, process water, sanitation, exterior maintenance, and domestic water uses. In fiscal year 2003, WRP conducted 17 commercial and industrial water efficiency assessments for the Regional Water Authority of Asheville, Buncombe and Henderson. WRP assessors recommended measures to reduce water consumption by 15.2 million gallons per year. These strategies represent a potential cost saving of $209,200 per year for clients.

Cooling Water

Cooling towers can consume 20 percent to 30 percent of the water used by commercial and industrial facilities, making them prime targets for water conservation efforts. Depending on the nature of the facility, various measures can be implemented to make the use of cooling water more efficient. Facilities throughout North Carolina are investigating the use of reclaimed water for cooling purposes. For instance, WRP performed a water efficiency audit for a small medical equipment manufacturer in Arden, NC. An inefficient water-cooling system was identified. WRP engineers recommended that a closed loop chiller be installed to reduce costs and save water. The company acted upon the recommendations and is now saving 6.6 million gallons of water per year with an annual cost savings of $30,500.

Fixture Replacement

Business and industrial operations include domestic water use, such as washrooms and food preparation facilities. Replacing faucets, toilets, showerheads, hose nozzles, and other water delivery devices with more efficient models is a common, low-cost method of reducing water use.

Water Use Procedures

Water is used in many ways within a production facility. Careful investigation typically reveals many possible adjustments that can be made to operations to reduce water use. Switching to dry sweeping of floors instead of hosing them down has reduced water use in many facilities. Not washing waste down floor drains has the added benefit of reducing wastewater discharges. Installing automatic shutoff nozzles on hoses reduces water waste. Restaurant and food service operations have reduced water use by modifying dishwashing procedures and automatic dishwater operations. For example, the Statesville K&W Cafeteria's water consumption was reduced by 9,000 gallons per day, a 75 percent reduction, by modifying water use practices and equipment.

Process Water

Many production facilities in a variety of industries have been able to reduce water use by making adjustments to their production processes. A common adjustment is to recycle water based on the quality of water needed by various steps in an operation. The car wash industry has made good use of water recycling to reduce the amount of water needed for their operations. The North Carolina Chapter of the Southeastern Carwash Association provided information for this report, including a proposal for an incentive program discussed in the next section.

Sara Lee Knit Products in Winston-Salem requested an audit to help improve water efficiency and reduce production costs. The high cost of production, chemicals, and wastewater treatment was reducing profits. A water use study provided the basis for installing a 240,000-gallon per day filtration system that produces reusable brine and a treatable concentrated color solution. The new system significantly reduces water use, with savings estimated at $795,000 per year.

BUSINESS AND INDUSTRIAL EFFICIENCY INCENTIVES

Water Conservation Certification Programs

The North Carolina Chapter of the Southeastern Carwash Association suggested a Car Wash Water Conservation Certification Program. This voluntary program would certify that a particular facility is in compliance with a set of best management standards for water conservation. This program could be expanded to encompass other business sectors. The proposal calls for this program to be implemented at the local level with inspection and certification handled by the local water purveyor or local government inspection officials. Improved efficiency will reduce demand for water from the local water system. As an incentive, certified facilities would be recognized as efficient water users and be given consideration in the procedures established to reduce water use in response to drought and other water shortages.

The Regional Water Authority (RWA) of Asheville, Buncombe and Henderson worked with the WRP to assist businesses with a water efficiency certification for facilities that were already practicing state-of-the-art water efficiency measures. The certifications exempted businesses from water use surcharges when water use restrictions were imposed during the 2002 drought. The certification was an excellent incentive for businesses to quickly implement water use efficiency recommendations. The WRP program estimated a water savings of more than 90 million gallons per year from certified facilities.

STATE GOVERNMENT

CURRENT STATE CONSERVATION MEASURES

Policies

In August 2002, Gov. Mike Easley issued Executive Order #26, which banned non-essential water use by state agencies. House Bill 1215 mandates that state agencies reduce water consumption by 10 percent. The Utility Saving Initiative, led by the State Energy Office, is assisting state agencies and universities to reduce all types of utility costs, including reducing water use and water bills.

Technical Assistance

N.C. Project Green began in 1998 when the governor challenged state government to set an example of environmental stewardship in the way agencies operate and conduct business. To help state agencies and universities meet the challenge, the Division of Pollution Prevention and Environmental Assistance developed a number of tools and resources that are available on the N.C. Project Green website (www.sustainablenc.org). The long-term Water Efficiency Plan Guidance provides a step-by-step process, including a template and sample plan, to assist agencies with water use efficiency. The Division of Pollution Prevention and Environmental Assistance is also part of *The Way To Go* design committee. This group of state government divisions has pledged to adopt sustainable building practices in state government capital

remodeling and new construction projects, to use energy and water efficient design in all projects, and to manage natural resources in a sustainable manner.

Facility Water Use Efficiency

Water use by governmental agencies varies from facility to facility and includes indoor and outdoor water uses similar to other residential, institutional and commercial water users. Therefore, agency water efficiency plans include some of the same measures, such as auditing water use, preventing and repairing leaks, establishing water use policies to reduce waste, improving fixture and appliance efficiency, etc. To date, agencies have adopted the following measures to use water more efficiently: better accounting for water used, repair of leaks, reducing vehicle washing, reducing irrigation, converting cooling systems to reuse water, storing rainwater to irrigate athletic fields, consolidating ice making operations, installing water-free urinals, and educating water users. DENR's Washington Regional Office has completed a Water Efficiency Plan that can serve as an example for other agencies.

STATE EFFICIENCY INCENTIVES

Loan and Grant Funding

The Clean Water and Drinking Water State Revolving Fund Programs (CWSRF and DWSRF, respectively) were established by the federal Clean Water Act (CWA) and the North Carolina Clean Water Revolving Loan and Grant Program (NCCWRL&GP) to provide low interest loans and high unit-cost grants to wastewater and water systems. Under these programs, eligible projects receive funding priority points for different rating variables. Incentives for water conservation are created by assigning additional points for demonstrating efficient water use measures such as water loss reduction programs that include water audits, universal metering, and leak detection, water conservation education, incentive rates, retrofit and replacement programs, and a water reclamation or reuse system (15A NCAC 01J, 01L, and 01N).

Water Use Permit Requirements

In an effort to preserve future ground water supplies in the Central Coastal Plain Capacity Use Area (CCPCUA), all ground water users withdrawing more than 100,000 gallons per day are required to obtain a water use withdrawal permit. One condition of the permit requires well operators to "develop and implement a feasible water conservation plan" that must include, at a minimum, a water conservation rate structure, a water loss reduction program for systems exhibiting more than 15 percent unaccounted-for-water, an irrigation ordinance, retrofit and public education programs, and a water reuse feasibility study (15A NCAC 2E .0502(d)(5)).

Interbasin Transfer Certification also includes a water conservation requirement. An applicant must demonstrate that water conservation measures will be used to assure efficient use of the water and avoidance of waste (G.S. 143-215.22I(c)(3)). Communities requesting a water supply allocation from Jordan Lake also must include in their application details on their conservation and demand-management practices (15A NCAC 02G.0503(a)(4)).

Environmental Stewardship Initiative

DENR's Environmental Stewardship Initiative is designed to promote and encourage superior environmental performance by North Carolina's regulated facilities. This voluntary program gives recognition to companies that use innovative pollution prevention methods (including water conservation) to meet and exceed regulatory requirements. The program seeks to improve environmental quality beyond what is required by current laws and permits.

The program has two levels of participation. The "Environmental Partner" level is designed for adoption by a broad range of corporations or other institutions that want to develop a systematic approach to improving their environmental performance. Partners must set environmental performance goals that include pollution prevention and that are appropriate to the nature, scale and environmental impact of the organization. The "Environmental Steward" level is for those organizations that already display a commitment to exemplary environmental performance beyond what is required by law. Stewards are required to set aggressive environmental performance goals that include pollution prevention, a commitment to exceed compliance, and annual improvements to performance.

NPDES Permit Application Review

Applicants for new NPDES permits are encouraged to investigate how implementing water conservation measures could reduce the volume of wastewater discharges. The analysis should include realistic evaluations of how discharges could be reduced or avoided by improving the efficiency with which water is used in the system or facility applying for the permit.

Metering in Multifamily Residences

EPA recently revised a policy regarding the application of the Safe Drinking Water Act (SDWA) requirements to submetered properties in an effort to avoid discouraging this water efficient measure. Under the old policy, multifamily property owners who installed submeters to track and bill water use by individual tenants were subject to SDWA's national primary drinking water regulations. The new policy revision enables multifamily property owners to install submeters without facing any additional regulatory burden (USEPA Office of Water Memorandum, Dec. 16, 3003).

Submetering fosters water efficiency by making tenants and co-op property owners responsible for paying for their water use. The new policy change is a positive step towards water use efficiency and provides an incentive for property owners to implement submetering.

AGRICULTURAL WATER USE

CURRENT AGRICULTURAL CONSERVATION MEASURES

Agricultural and Horticultural Water Audits

As with all types of water use, the first step in improving efficiency is to do a water audit and characterize current conditions. A water audit helps identify components of an operation that are using more water than needed to accomplish the desired task. A major North Carolina livestock operation has reduced water use by 38 percent by tracking water use and making adjustments to reduce wasted water.

Technical Assistance

Technical assistance provided to agriculture for improved water management has a long history in North Carolina. Many agricultural best management practices were designed to improve water quality, but also conserve water resources. The Natural Resource Conservation Service publishes a series of Conservation Practice Standards that address many components of water management and water conservation for agricultural operations. The Soil and Water Conservation Districts and the Agricultural Extension Service provide technical assistance for implementing these practices in each county. Some producers have responded to the 2002 drought by becoming more efficient in water management through the improved use of storage ponds or water control structures. These improvements to water management also result in benefits to water quality by combining improved water storage and retention with the capture and attenuation of potential pollutants.

As improved water management systems are tested and proven effective, state and federal agencies provide technical assistance and incentives to assist farmers in putting them into operation. The North Carolina Soil and Water Conservation Commission is working through its technical advisory committee to consider how these water-saving technologies can be made available to producers through the NC Agriculture Cost Share Program. The program already offers assistance with conservation practices for watering cattle that reduce the wastage associated with earlier systems.

Livestock Watering Efficiency

North Carolina State University has on-going research and outreach programs to improve water management and reduce water waste across the spectrum of agricultural water applications. NCSU research continues to improve the efficiency of watering devices for livestock, especially in the swine industry. Producers and companies have tested various watering devices for the delivery of drinking water to animals in swine houses. Several of these technologies significantly reduce water use and wastewater generation. Similar research is underway for reducing water needs in the poultry industry. Potential water efficiency practices for swine houses can achieve an estimated 10 percent to 65 percent water savings.

Irrigation Efficiency

The simplest measures for water conservation in irrigated agriculture are fine-tuning equipment to avoid leaks and waste and monitoring the amount and timing of irrigation to meet crop requirements without excess. A more costly alternative involves retrofitting irrigation systems with more efficient component parts. For example, switching to low pressure nozzles or drop nozzles will reduce water loss from evaporation and wind drift and result in more effective water placement. Soil and Water Conservation Districts and the Cooperative Extension Service provide demonstrations and information in efficient irrigation practices to help promote water conservation.

AGRICULTURAL EFFICIENCY INCENTIVES

Agriculture Cost Share Program

The NC Agriculture Cost Share Program and the federal USDA Environmental Quality Incentives Program (EQIP) offer financial assistance for water conservation and for water saving technology. These programs offer over forty approved best management practices for producers that contribute to water use reduction and efficiency. Improved water management often results in improved water quality as well as water savings. State and federal agricultural cost share and technical assistance programs recognize this connection and are giving more attention to water use efficiency and conservation.

Technical Assistance

Current agricultural cost-share and technical assistance programs can be augmented by new and innovative approaches to promote efficiency. An example of such a tool is the Agricultural Mobile Irrigation Lab (MIL). This tool was developed by the USDA Natural Resources Conservation Service to help Florida agricultural operators conserve water by learning how to improve their water management and irrigation systems. MIL technicians work with producers to improve system performance through on-site evaluations. By developing proper irrigation schedules and avoiding over-watering, producers can save both water and energy while improving the utilization of nutrients and crop yields. MILs could assist golf courses, nurseries, local governments, homeowner associations, and commercial gardens as well as farmers.

The Division of Pollution Prevention and Environmental Assistance assists pork producers to implement environmental management systems (EMS). EMSs help pork producers to assess their operation's environmental impacts (including water use efficiency) and to develop a plan to reduce these impacts. Some limited funding provides an incentive for producers to participate in the program.

Reclaimed Water

Agriculture has very good potential for the application of reclaimed water. While reclaimed water is not appropriate for direct food chain crops, it does meet water quality standards for application on foraging crops. Agriculture can be a convenient and cost-effective partner for wastewater systems when developing and implementing water reuse projects. In

Florida, agricultural water users (and other users such as golf courses) perform feasibility assessments on the use of reclaimed water for irrigation needs. Farmers enter into agreements with wastewater treatment plants to meet their irrigation needs and provide a use for reclaimed wastewater. The application of reclaimed water to agriculture provides greater assurances of water availability for producers, cost effective treatment and disposal of wastewater, and conservation of water.

CONCLUSION

Improving water use efficiency means getting more benefit from each unit of water. In other words, using water efficiently gives us all the benefits that we are seeking from using water, but without wasting this resource.

Public water supply systems can benefit from improved water use efficiency by being able to postpone costly investments in new water supply capacity and by reducing operating costs for water treatment and wastewater treatment. Improved water use efficiency by existing water system customers can extend water supply availability for new businesses and industries.

Commercial and industrial facilities can benefit from water use efficiency by reducing their water purchase or production costs. Because industrial and business facilities are so diverse in the ways they use water, the opportunities available for improved efficiency are equally diverse. Experience has shown that many businesses and industries have great opportunities to reduce their costs and become more competitive by making careful audits of their water use and developing improved procedures or technology to use water more efficiently.

Agricultural and horticultural water users can benefit from improved efficiency by reducing their costs of pumping and applying water and in some cases by reducing the need to treat wastewater. Improved efficiency can allow a farmer to use his available water supply to support expanded production.

Using water efficiently also benefits North Carolina's environment. By reducing water withdrawals, the stress on rivers, streams, and aquifers is reduced and the amount of wastewater that must be assimilated by our streams also may be reduced. Consequently, water quality and aquatic habitat are improved. In some cases, the environmental benefits of improved water use efficiency are very significant, particularly in cases where reduced withdrawals would reduce overdraft of aquifers or the undesirable dewatering of streams and rivers.

It is important to recognize that the urgency of improving water use efficiency is not the same in all parts of the state or for all water users. Some water users have a more urgent need to make their limited available water supplies go further to serve new users or to postpone having to make investments to expand their water capacity. However, some communities may face difficult financial problems if improved water use efficiency causes their water revenues to drop too sharply. Many North Carolina communities have lost industrial water customers, which have resulted in fewer water users to pay the cost of operating their water systems and paying off

loans that were used to build them. Public water systems must carefully evaluate their revenues and costs and schedule water use efficiency improvements in a way that will not damage their financial security.

RECOMMENDATIONS

House Bill 1215 is directed toward voluntary programs and incentives that will improve water use efficiency. A voluntary or incentive-based approach requires reaching a consensus on water conservation measures that will be supported and implemented by water users. Although the Department of Environment and Natural Resources has met with a broad range of water users and invited their comments and suggestions, the North Carolina community of water users has not yet fully engaged with the water use efficiency issue. Further involvement of water users is needed to work out the best program for North Carolina.

- DENR should circulate this report and recommendations widely to water users in North Carolina and invite further comments and suggestions. DENR should review and revise the report in the fall of 2004 to incorporate the comments that have been received and to make more specific recommendations.

Public water supply systems have many effective tools available to them to improve water use efficiency. Many of these approaches have been successfully pioneered by communities in North Carolina who are willing to share their knowledge and experience.

- Reducing water loss within a water system will reduce water waste without affecting water revenues. Water audits, leak detection and repair programs, and water pressure adjustments should be pursued by all local governments for both environmental and financial stewardship reasons.

- Creating incentives for residential water users to replace or retrofit inefficient water-using appliances and fixtures can save a significant amount of water. Local governments should adopt these programs to improve water use efficiency.

- The use of water for landscape beautification is increasing in North Carolina and appears to be causing an increase in per capita water use in some areas. Local governments should have reasonable policies in place to assure that water for landscaping is efficiently used and to manage the demand from landscape uses, particularly to control the increases in high peak demands that require expensive capital investments.

- Public water supply systems should investigate opportunities for reuse of treated wastewater, which uses the same water supply twice and increases efficiency. Irrigation, construction site water uses, and some cooling and industrial uses are good possibilities. Water reuse projects must be planned with careful attention to all economic and environmental costs and impacts.

- Water use rates are the most powerful incentive available to local governments to motivate efficient water use. Rate changes should be evaluated with careful attention both to potential efficiency improvements and to assure fairness to all types of water users, including low-income users.

Businesses and industry in North Carolina have many opportunities available to improve water use efficiency. In the current economic climate, reducing water costs can help companies stay more competitive in the world economy.

- Because business and industrial water use is so diverse, water audits are a necessary starting point to determine what kinds of efficiency improvements are most cost effective. All businesses that use significant amounts of water should take advantage of efficiency opportunities to improve their balance sheets.

- Water efficiency certification programs, which identify those businesses within a particular category that have met high standards of water use efficiency, encourage efficiency improvements and create more fairness when water use reductions are required by droughts. Efficient water users should be given some degree of priority when water use reductions during droughts are necessary.

North Carolina's large agricultural economy is vitally dependent on water. Efficiency improvements in water use can reduce costs of production by reducing pumping and application costs and can also stretch a farm's water sources to serve expanded production.

- The key to improving agricultural water use efficiency is stronger technical assistance from federal and state agencies, including North Carolina State University, the NC Division of Soil and Water Conservation, the NC Department of Agriculture, and the Soil and Water Conservation Districts. The strong tradition of technical assistance for agriculture is the most effective means of bringing about water use improvements. Making mobile irrigation laboratories available to farmers, nurseries, and golf courses could help these water users improve efficiency and lower their costs.

State government is a large water using institution and has many opportunities to improve water use efficiency. State government is proceeding with the Utility Savings Plan, which will reduce water use as well as other utility costs, and is also working toward a directive from House Bill 1215 to reduce water use by ten percent.

RE: Report on Water Supply Planning Program

Pursuant to General Statute 143-355 (n), I am transmitting a report on the progress of Water Supply Planning and related programs.

The report was prepared by DENR's Division of Water Resources, which oversees the Water Supply Planning program. If you have further questions or would like additional information, please contact John Morris at 715-5422.

Department of Environment and Natural Resources

Division of Water Resources

STATUS REPORT TO THE GENERAL ASSEMBLY

ON

WATER SUPPLY PLANNING

OCTOBER 1, 2002 THROUGH AUGUST 31, 2003

Drought

During the summer of 2002, many water systems in North Carolina faced serious water shortages due to an extended drought. Before relief arrived in the form of increased rainfall in September and October, 248 public water systems had instituted some degree of water use restrictions. Throughout 2002, the Department of Environment and Natural Resources and the Drought Monitoring Council closely monitored water resource conditions and provided assistance to local communities. Much staff time, especially in the Division of Water Resources and the Division of Environmental Health, was dedicated to helping local communities to assess available supplies of water, find alternative sources of water and develop water use reduction strategies. Funds made available through the Department of Commerce and the NC Rural Center were used to assist nine water systems with projects designed to help alleviate drought-related water supply shortages. Since October 2002, rainfall across the state has been above normal. In some areas precipitation has been considerably above normal. Surface waters recovered rapidly with most reservoirs approaching or above full by spring 2003. Ground waters recovered more slowly. By August 2003, wells in the monitoring network were indicating water levels at or above historical averages. Some wells had water levels above the previous maximum for the period of record. Recovery from the drought has been faster than anticipated due to the above average rainfall over the period covered in this report.

Water Supply Planning Program

Water supply planning in North Carolina is undertaken mainly at the local level. Local communities have the primary responsibility for maintaining adequate water supplies. To help assure and assess the availability of water and to protect the state's water resources, the General Assembly has established several planning and regulatory programs administered by the Division of Water Resources. The programs require a variety of activities which include: assessing the availability of water through a network of monitoring wells and stream gages, assisting with the preparation of Local Water Supply Plans by local government water systems, development of a statewide North Carolina Water Supply Plan, registration of large water withdrawals, certification of interbasin transfers of surface water, and permitting of water withdrawals in designated capacity use areas. This status report provides an update on these water supply programs, as well as on other related Division activities.

Local Water Supply Plans

The General Assembly established a water supply planning program under General Statute 143-355(l) and (m) in order to assure the availability of adequate supplies of good quality water to protect the public health and to support desirable economic

growth. The statute requires units of local government that provide or plan to provide public water service to prepare a Local Water Supply Plan (LWSP). LWSPs describe current and future water needs, as well as an assessment of the system's ability to meet those supply needs. LWSPs must be adopted by the water system's local governing board and updated at least every five years. The Division of Water Resources is responsible for reviewing the local plans for completeness and consistency with plans of other water systems in the same region. The Division uses the information from the LWSPs and other sources to develop the North Carolina Water Supply Plan (NCWSP), mandated by G.S. 143-355(m). The NCWSP presents a summary of water use statewide and identifies areas of concern where water availability or conflicts between uses may limit the ability to meet water demand.

Information from the local plans is available on the Division's web site (www.ncwater.org). The plans provide a valuable source of data for all local and regional water supply planning. Throughout 2002, water systems compiled information to update their local plans in 2003. Division staff, with the help of the North Carolina Rural Water Association, conducted eight workshops in the spring of 2003 to assist water system administrators with their local plan updates. We expect about 600 water systems to prepare 2002 local plans.

To simplify the completion of LWSPs, the Division has developed an online submission process that provides local officials with the option of completing and submitting their plans electronically. As of the end of this report period, 294 systems have submitted plans or are working on their plans online. Of that number, 248 systems are using the online system. Online submission of plans will reduce paperwork, speed the review process and reduce the staff time needed to enter and verify data.

During the 2003 legislative session, the General Assembly amended the local water supply planning statute. House Bill 1062 extended the scope of the statute to include some community water systems not operated by a unit of local government. Community water systems that regularly serve 1,000 or more service connections or 3,000 or more individuals are now required to prepare a LWSP. We estimate that this amendment will add about 30 additional water systems to the local water supply planning program. The affected systems have been notified of the changes to the statute and have been given the necessary forms for developing a LWSP.

As a result of the severe 2002 drought and the difficulties it caused for many local governments, DWR included a Water Shortage Response Plan as a necessary component of 2002 Local Water Supply Plans. In 2003, House Bill 1062 added the requirement that all systems completing a LWSP must include a description of how they will respond to future water shortage emergencies. We have updated our Water Shortage Response Plan Handbook and prepared a template to assist local officials with developing their Water Shortage Response Plan.

Legislation passed in 2002 (House Bill 1215), requires an analysis of water conservation measures and possible incentive programs that could encourage water conservation and water reuse. It also requires the development of rules establishing minimum standards and practices for water use during drought and water emergencies. We have added questions to the LWSP forms to collect data that will help identify current water conservation practices and their effectiveness as well as to receive suggestions on possible incentive programs. We are optimistic that the data from the local plans will

provide the necessary information to fulfill the requirements of the law that pertain to public water systems. We have also included a survey to identify and possibly quantify the impacts of last year's drought on public water systems. To date 57 competed surveys are in our database.

North Carolina Water Supply Plan (NCWSP)

The 2001 NCWSP is available on the Division of Water Resources web site at www.ncwater.org. It is based on information from the 1997 LWSPs and 1999 water withdrawal registrations submitted pursuant to General Statute 143-215.22H. No changes were made to this document during the period covered by this report. The NCWSP will be updated to reflect changes in conditions shown in the 2002 Local Water Supply Plans and the results of the River Basin Water Supply Plans.

River Basin Water Supply Plans

To further the legislative goal of assuring the availability of adequate supplies of water, DWR will be developing a River Basin Water Supply Plan for each of the major river basins in the state. The River Basin Water Supply Plans will provide a useful and reliable framework for local and regional water supply planning and will create the potential for increased integration of water resources management. The plans will combine projections of water supply demands and wastewater discharge needs with a hydrologic model of each basin to analyze the impacts of withdrawals and discharges on river flows.

The River Basin Water Supply Plans will analyze water demands and availability through the year 2050. Initial priority will focus on developing River Basin Water Supply Plans for the Catawba and Yadkin river basins in conjunction with the relicensing of hydropower operations in those basins.

The long-range River Basin Water Supply Plans will allow decision-makers to develop cost-effective and sustainable plans for the water supplies that are needed to support North Carolina's economy.

Bladen County Capacity Use Investigation

For some time, there has been concern that ground water withdrawals in the Bladen County area may be threatening the reliability of the underlying aquifers as long-term sources of water. In December 2002, the Environmental Management Commission (EMC) charged the Division with the task of conducting a capacity use investigation and reporting back to the EMC by June 2004. Information is being compiled and used to characterize the structure of the underlying aquifers, current regional water use rates and the impacts of withdrawals on regional aquifers. During FY 2003-2004, DWR will be adding some new multi-well monitoring stations in this area to provide additional data for analysis and monitoring.

Central Coastal Plain Capacity Use Area

For many years, communities in the Coastal Plain have depended on high quality ground water from the Black Creek and Upper Cape Fear aquifers to meet their public water supply needs. Ground water monitoring over the last decade indicated that water was being withdrawn from these aquifers faster than it could be recharged. The over-pumping

of the aquifers was leading to a failure of many water systems to be able to meet demands, which would have been an economic disaster.

In November 1998, the Division of Water Resources recommended that the EMC designate a Central Coastal Plain Capacity Use Area (CCPCUA) under authority granted to it by the Water Use Act of 1967. After several years of planning and consultation with affected water users, 15 counties in the coastal plain were so designated. Rules governing water use in the CCPCUA became effective on August 1, 2002. The rules and supporting documentation are available on the Division's web site at www.ncwater.org.

The purpose of the rules is to provide a fair and predictable schedule for reducing the unsustainable demand on the threatened aquifers and for developing new water sources to meet future needs. A variety of surface and ground water sources are available in the region.

Under the rules, anyone withdrawing more than 100,000 gallons of ground water per day in the designated counties must apply for a water use permit from the Division of Water Resources. To provide a better picture of overall water use in the region, the rules also require that anyone withdrawing more than 10,000 gallons per day of surface water or ground water must register their water use on an annual basis. Water withdrawals from the Black Creek and Upper Cape Fear aquifers within the defined management areas will be reduced in three stages over a 16-year period. In defined critical areas, reductions will be as much as 75 percent of current withdrawals. In addition, applicants for a water use permit must adopt a set of minimum water conservation measures to improve water use efficiency.

Many local governments in the 15-county region are actively planning to manage water demands and develop new, sustainable water sources to meet their future needs. As of August 25, 2003, there were 100 active water withdrawal permits and 92 applications for permits being processed.

The Division of Water Resources is partnering with the Department of Agriculture and Consumer Services (DA&CS) for registration and reporting of agricultural water use. In December 2002, the Agricultural Statistics Division of DA&CS mailed almost 6,000 surveys to agricultural operation in the fifteen counties of the CCPCUA. They collected water use data from 372 agricultural operations that used between 10,000 and 100,000 gallons on any one day. The information is being compiled and the results are expected to be released by the end of 2003.

Interbasin Transfer Certifications

General Statute 145-215.22I regulates large transfers (over 2 mgd) of surface water between designated river basins. In March 2002, the EMC approved, with conditions, an increase in the allowable interbasin transfer for Charlotte Mecklenburg Utilities from 16.1 to 33 million gallons per day. No interbasin transfer certificates were issued or applied for during the period covered by this report.

Hydropower Facility Relicensing

As noted in previous status reports, the licenses issued by the Federal Energy Regulatory Commission (FERC) for the major, non-federal hydroelectric projects in the state expire between 2001 and 2008. Nearly a dozen projects, involving over 30 impoundments along the Yadkin-PeeDee, Catawba, Roanoke, Little Tennessee, and other rivers will be relicensed. Relicensing is an intensive, multi-year process that attempts to

balance the many benefits of these projects, such as power generation, recreation, aquatic habitat, water quality, water supply, and others. The process provides a vehicle to address concerns of resource management agencies and local communities about how the lakes are managed. Licenses are typically issued for 30 to 50 years.

Relicensing is nearing completion for Dominion Energy's Lake Gaston and Roanoke Rapids projects on the Roanoke River. Relicensing begins five years before the expiration date of the current license. Holders of existing licenses are required to submit a license application to FERC two years before the current license expires. The three years prior to application submittal are used to identify, study and resolve, if possible, issues that need to be addressed in any new license. Duke Power-Nantahala Area submitted license applications for their facilities in the Nantahala, Tuckasegee, Little Tennessee, and Hiwassee river systems in July 2003. Alcoa Power Generating Inc.'s Tapoco Division's submitted a license application in February 2003 for its Tapoco project on the Little Tennessee River in western North Carolina and eastern Tennessee.

Work began this year on relicensing of Duke Power's facilities in the Catawba River Basin. Duke Power's lakes on the Catawba River are used by many water systems as sources for their public water supplies. Also, relicensing began this year for facilities operated by Alcoa Power Generating, Inc.-Yadkin Division and Progress Energy in the Yadkin-Pee Dee River Basin. Several water systems depend on these lakes for public water supplies. DWR personnel are actively involved in the relicensing process to insure that drinking water and other concerns are addressed in the licenses that will determine how these rivers and hydropower lakes are managed for the next 30-50 years.

02/24/04

What North Carolina Needs to Do to Provide Water Supplies For Future Needs

The continuing growth of North Carolina's population and economy is requiring additional water. In recent years, a number of water supply problem spots have developed, where increased need for water is threatening to exceed available supplies. The four-year drought, which intensified in 2002, stressed North Carolina's water supply system, spotlighted some weaknesses in many water systems, and pointed out actions that need to be taken to assure a water supply that can support North Carolina's current and future economy.

Meeting North Carolina's water supply needs requires a partnership between state government and local government. The State must monitor water use and water availability statewide, provide a state and regional framework for planning, administer water management laws, and establish policies that will contribute to solving water supply problems.

Local governments must plan for meeting water needs in their service areas, cooperate with neighboring water systems to achieve regional efficiency and reliability, and make timely investments in infrastructure.

Industrial, agricultural, and other water users should provide data on their water use, cooperate in regional water supply planning, and take measures to use water efficiently.

To assure that water supply shortages are not a constraint to healthy economic growth in North Carolina and that our water supplies are as economical and as environmentally sound as possible, we need a coordinated program of monitoring, planning, and regulation.

Monitoring

The foundation of good water supply management is accurate and usable information, both about the amount of water available in the environment and about the amount that we are withdrawing for our use. North Carolina has a good system of water resources and water use data, which is superior to that of our neighboring states. However, some improvements are needed.

We determine the amount of surface water that is available by a network of stream gages which measure the flow of streams and rivers. These gages are supported by a partnership between the Department of Environment and Natural Resources, water users, and the US Geological Survey. Many of these gages have records 50 to 75 years long, which allows us to have a good statistical understanding of the probability and magnitude of droughts and floods that may be expected in

the future. We determine the availability of ground water through a network of over 500 monitoring wells operated by the Division of Water Resources, plus a much smaller network operated by the US Geological Survey. These wells measure water levels in major aquifers over time and allow us to determine how the natural recharge to aquifers and our withdrawals from them is changing the amount of water available in storage. Monitoring wells in shallow aquifers are also an early warning measure of serious drought, allowing us to determine when the ground water supplies that maintain the flow in rivers and streams is becoming exhausted.

It is also necessary to have good data on our withdrawals of ground and surface water and of the effect of these withdrawals on our water resources. North Carolina has excellent information on water use by units of local government in the legislatively-mandated water supply plans, which are updated every 5 years. These plans make up an extremely valuable data source on present and projected water use by local government, which is unmatched by other states. We have data on other kinds of water users from a requirement to register water use that exceeds 100,000 gallons per day (1 million gallons per day in the case of agricultural users). Our knowledge of agricultural water use has greatly increased due to a recent survey by the North Carolina Department of Agriculture of the fifteen counties in the Central Coastal Plain Capacity Use Area. The Department of Agriculture surveyed all agricultural water use of surface water and ground water exceeding 10,000 gallons per day, giving us by far the most detailed knowledge of agricultural water use in this region ever available.

This data on water availability and water use is the foundation for planning sustainable water sources for our future water needs.

Priorities for 2004

- **Ground water monitoring**--More monitoring wells are needed in the Central Coastal Plain and the Southern Coastal Plain areas, which are subject to actual or potential ground water depletion. This data is essential to assist local governments and other water users to make the maximum sustainable use of ground water resources.

- **Climate effect monitoring wells**--During the 2002 drought, we learned that declining water levels in shallow aquifers are the best warning sign of the approach of critical drought periods. More climate effect monitoring wells are needed in the piedmont and mountain region of North Carolina to allow us to anticipate and manage droughts more successfully.

- **Stream gages**--North Carolina's network of 72 stream gages gives us a generally good basis for water management, but there are a some critical holes in the system that leave local governments and portions of river basins without good management information. About 20 to 30 more stream gages are needed to fill these gaps.

- **Agricultural water use data**--Good information on the amount of water used for agricultural purposes is needed to evaluate the total demand on water resources and to make sure that agriculture is included in regional and river basin water supply planning. The North Carolina Department of Agriculture has a good means of surveying farmers to

gather this information. As resources permit, the Department of Agriculture should extend statewide the type of survey used in the Central Coastal Plain.

Planning

In addition to having good data on water availability and water use, North Carolina communities need to project their future water needs and determine the most desirable sources for meeting these needs. Following a legislative enactment in 1989, North Carolina has followed a "bottom up" approach to water supply planning, which has been extremely successful. About 600 local governments now prepare local water supply plans, projecting their water needs and water sources 30 years into the future. These plans are updated every 5 years. The latest update is now underway, based on water use data from 2002. These plans were submitted to the Division of Water Resources in 2003 and the technical review and adoption of the plans is underway. The completed plans are placed on the Division's website, where they are an essential source of information for any kind of local or regional water supply planning.

Responding to the same 1989 legislative act, the Division of Water Resources has developed a North Carolina Water Supply Plan, using the local water supply plans and other information as building blocks. The North Carolina plan summarizes the current water supply situation and projections of future needs in each river basin and identifies problems or issues that need attention. The latest version of the state plan was produced in 2001 and is available on our website at www.ncwater.org .

Priorities for 2004

- **River basin water supply plans**--Local water supply plans are essential and useful, but they cannot evaluate the long term, cumulative demand on an entire river basin. To make sure that we have reliable water sources for North Carolina's future, we must plan for water supply at the river basin level, to assure that our projected demands on the basin are sustainable and that we are choosing the most economically and environmentally sound water sources. The Division of Water Resources has developed a pilot river basin water supply plan for the Cape Fear River Basin. This plan, done in partnership with local governments and other water users, projects water needs for fifty years into the future and then uses a hydrologic model to analyze the interactions among upstream and downstream users over time to assess the cumulative impact on the basin. This same approach is being extended to all major river basins in North Carolina, with first priority on the Catawba and Yadkin basins, where this long-range water supply information is needed to meet the schedule for the relicensing of hydroelectric projects. In these two basins, North Carolina needs to develop the data and analytical tools to assure that our interests are protected and that adequate provisions are made for future water supply sources.

- **Local Water Supply Plans**--DWR will assist about 600 local governments with the completion of technically sound and feasible water supply plans. This third generation of LWSP's is emphasizing drought preparedness, accurate estimates of the safe yield of

water sources, and consideration of regional cooperation to secure reliable and cost effective water sources.

- **Ground water management**--In North Carolina's coastal plain, regional aquifers cover thousands of square miles and provide water to most of the cities, towns, industry, and agriculture in that part of the state. Our major aquifers do not coincide with river basin boundaries. We must develop management plans in partnership with water users for these major regional aquifers, just as we do for surface water from our river basins. In the Central Coastal Plain, local governments are evaluating their options for new water sources to provide for a planned transition from over-pumped aquifers to sustainable water supplies. The Southern Coastal Plain faces similar issues, but less advanced and confined to a smaller area. The Division of Water Resources is working with local governments and water users in the Southern Coastal Plain to develop a water management plan that will avoid aquifer damage and the economic risk of relying on unsustainable rates of ground water use.

- **Water Use Efficiency**--There are proven techniques that allow municipal, industrial, commercial, and agricultural water users to avoid wasting water and to get more productivity from each unit of water used. Adopting these techniques can reduce business costs and increase competitiveness, make water available for economic growth, and improve environmental quality. The General Assembly gave support to improved water use efficiency in House Bill 1215, enacted in 2002. The Department of Environment and Natural Resources has prepared a report and recommendations on water use efficiency as required by this act.

- **Drought Preparedness**--The 2002 drought stressed water systems statewide. Many new records were set for low river flows and ground water levels. The drought identified those communities most vulnerable to running out of water and motivated action to reduce this vulnerability. Governor Easley made special financial assistance available to communities to improve the security of their supplies. Sixteen communities received a total of $7 million in grants and $20.5 million in loans. At present, five projects are completed and eleven are underway. The Division of Water Resources is emphasizing drought preparedness in the current updates of Local Water Supply Plans. The North Carolina General Assembly enacted H1062 in 2003 to establish a technically sound drought warning system to allow water users to take steps to mitigate drought damage.

Regulation

Regulation of water use is sometimes needed to assure that water users have equitable access to water and to avoid depletion of water resources. North Carolina's primary laws for water use regulation are:

- **Water Use Act**--Regulates water use by permit in declared capacity use areas where there is a danger of depleting water resources.

- **Surface Water Transfers Act**--Regulates transfers of water from one river basin to another.

- **Dam Safety Act**--Provides for minimum releases of water from dams to protect downstream water users and aquatic habitat.

- **North Carolina Environmental Policy Act, US Environmental Policy Act, US Clean Water Act 404 Permits and 401 Certifications**--Statutes not specifically targeted at water use, but which can achieve review, coordination, and regulation of proposed water withdrawals.

Priorities for 2004

- **Hydropower relicensing**-- Federal law provides for the licensing of privately owned hydroelectric projects. These licenses, issued for periods of 30 to 50 years by the Federal Energy Regulatory Commission, determine the uses of these water sources for water supply, public recreation, and fish and wildlife habitat. North Carolina agencies and interested parties have a role in determining license provisions. Relicensing is underway in the Yadkin and Catawba basins, involving many water supply users and interstate issues with South Carolina. The State of North Carolina needs to develop the data and analytical tools to assure that state interests are protected and that adequate provisions are made for future water supply sources.

- **Central Coastal Capacity Use Area Permits**--The CCPCUA program will issue about 190 water use permits in the 15-county area. About 120 have been issued and the remaining 70 are projected to be completed by about October 2004. The permits are designed to allow water users to make the maximum use of ground water at rates that are sustainable and which will avoid aquifer damage.

- **Interbasin Transfer**--The Surface Water Transfers Act defines 38 river basins for the purpose of regulating interbasin transfers. Most other water management programs are based on the 17 major basins. Water managers and the General Assembly should consider whether making the interbasin transfer law consistent with other programs would be desirable.

- **Southern Coastal Plain**--DWR is working with local governments, water users, and the Lumber River Council of Governments to make recommendations to the Environmental Management Commission that will avoid damage to aquifers and assure sound long range management of ground water resources.

DRAFT

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
March 25, 2004

The Environmental Review Commission (ERC) met on Thursday 25 March 2004 at 9:30 a.m. in Room 643 of the Legislative Office Building.

Senator Daniel Clodfelter and Representative Daniel McComas presided over the 25 March 2004 meeting. The following members were present: Senators Clodfelter, Dorsett, Forrester, Horton, Kinnaird, Swindell and Weinstein, and Representatives Fox, Hackney, Justice, LaRoque, McComas, Weiss and Williams. Mr. George Givens, Commission Counsel, Jeffrey Hudson, Assistant Commission Counsel, Assistant Commission Counsel, Jennifer McGinnis, Assistant Commission Counsel, Tim Dodge, Research Assistant, and Mary Watson, Commission Clerk were also present.

On 8 March 2004, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. A copy of the visitor registration and the agenda for the meeting are included in the attachments as **Exhibits B and C**.

Senator Clodfelter called the meeting to order and welcomed members and visitors attending the meeting.

George Givens, Commission Counsel, was asked to explain the agenda.

Mr. Givens announced that Senator Albertson and Representative Gibson sent their regrets at not being able to attend today's meeting.

Mr. Givens said that he had distributed to each member, copies of read only reports that are required by law to be made to the Commission. These reports are listed as **Exhibit D**.

Mr. Givens called attention to the Quarterly Report on the Cape Fear River Assembly. This report relates to an appropriation that was originally made in 1997 for $1.5 million to the Cape Fear River Assembly. Attached to that appropriation was a reporting requirement to the Environmental Commission which was repealed three years ago because the money had been allocated; however, representatives from the Cape Fear River Assembly advised him that $91,247 of money which was obligated was not used by the grantee in a timely fashion and is being pulled back for reallocation for the original purpose of working the Cape Fear River area and it was felt that a report to the ERC was necessary.

Mr. Don Freeman, grantee of the Cape Fear River Assembly was present and available for questions.

Mr. Givens noted that the staff-planning meeting was held on Friday 12 March 2004. Mr. Givens said the next business meeting is scheduled for Tuesday 20 April 2004 from 9 a.m. until 12:00 Noon in Room 1228 of the Legislative Building.

Mr. Givens said that the final planning meeting before the Short Session will be held on 13 April 2004 in Room 605 of the LOB.

Mr. Givens said that the tentative agenda for 20 April 2004 will cover underground storage tanks, express review pallet program, one-stop permit assistance, littering, transportation management, Swift Creek and some discussion of the hydrogen sulfide rule. This rule is very controversial and will probably be ready for review by the General Assembly during the Short Session.

Mr. Givens said that there will be a tour of the Belews Creek Steam facility tomorrow, Friday 26 March 2004, for those members who are able to attend. The tour will begin with lunch at 11:30 a.m.

Mr. Givens reviewed the schedule for April. He noted that in addition to the 20 April 2004 meeting, there will be a special meeting on Thursday and Friday, 22 and 23 April 2004 in Brevard. The business portion of the meeting will be held on the afternoon of the 22 April with the focus on land conservation and preservation of open space. There will be a tour on Thursday morning of Gorges State Park and a tour on Friday morning of Dupont Forest. A poll will be taken of the membership as to room reservation needs for this trip. He encouraged members to attend if at all possible.

Mr. Givens reminded members to sign their reimbursement forms and send them forward and asked visitors to sign the registration pad.

Mr. Givens called to members' attention the issue of the organization of the environmental and public health programs and the administrative placement of those programs. The Public Health Task Force has submitted preliminary recommendations, which are attached to these minutes as Exhibit **E**.

Senator Kinnaird said that she had many inquiries into this issue.

Mr. Givens said that one of the programs that is at issue is the septic tanks issue.

Senator Forrester said that when environmental health was pulled out of the Department of Health it was thought that they would be able to receive more funding through new department if it was moved. It was found out that this was not the case and is now trying to get back into DHHS.

Mr. Givens said that it was some truth to that and the drinking water program is a source of federal funds that makes it appealing to whoever gets it.

Senator Clodfelter asked Mr. Givens if it was likely that the task force would make a final recommendation to ERC before the Short Session.

Mr. Givens said it was not clear to him and was one of the matters he is looking into.

Mr. James C. Gulick, Senior Deputy Attorney General, Environmental Division, North Carolina Department of Justice gave a report on the status of petitions to the Administrator of the United State Environmental Protection Agency (EPA) filed by North Carolina under Section 126 of the federal Clean Air Act for purposes of reducing interstate transport of ozone and its precursors.

Mr. Gulick said he was asked to give a status report with regard to the petition filed by the Attorney General's office on behalf of the State of North Carolina on March 18, 2004 with the EPA under Section 126 of the Clean Air Act. Under that section, the State is asking the EPA to make a finding that electric generating units in thirteen other states are significantly contributing to air quality problems in North Carolina, specifically to non-attainment or interference with maintenance of two national air quality standards: one dealing with ground level ozone and the second dealing with fine particulate matter (PM2.5).

Mr. Gulick said that the petition was filed on March 18, 2004 and alleges, and seeks to show in detail, that 12 of the 13 states significantly contribute to North Carolina's fine particulate issues and that four of those states and the State of Maryland contribute to North Carolina's difficulties in non attainment of ozone standards.

Mr. Gulick added that under the law, the EPA has 60 days from the receipt of the petition to make a finding as to the merits of this petition. This action was taken by the AG's office, in consultation with DENR and the Governor's office after numerous efforts were made to seek to engage with other states to negotiate similar reductions in their states to those taken in North Carolina under the Clean Smokestacks Act.

Mr. Gulick said that this step was taken in accordance with a directive in Section 10 of the Clean Smokestacks Act (CSA) that all available means, not limited to petitions under Section 126, to achieve that result. The ultimate goal was to achieve results as directed by the General Assembly in the CSA to achieve similar reductions in emissions.

Senator Clodfelter asked Mr. Gulick was are some of the things that could happen in response to the 126 petitions.

Mr. Gulick said that what 126 says is that EPA must make a finding either of merit to find that there is significant contribution or deny the petition. The result that flows from this, under the Act, is that the sources that are found to significantly contribute must cease operations within three months or the EPA could enter into a binding arrangement for changes in their operations that eliminate the significant contribution.

Mr. Gulick said that the schedule mandated by the Act was that the corrections must be made on a schedule of three years from the date the finding is made.

Senator Clodfelter asked Mr. Gulick if this had been done before.

Mr. Gulick said that what happened in the NOx SIP call is that the findings were made, the EPA did issue a rule that mandated the changes in accordance with that schedule; however, at the same time it had adopted a rule that called for the states directly to regulate the same facilities for the same pollutants and it eventually harmonized the two results with an order that provided that if a state adopted a SIP that implemented the NOx SIP call, that remedy would leave the facilities of the direct obligation under the 126 remedy.

Senator Clodfelter asked Mr. Gulick if EPA agrees, makes a finding and issues a mandated agreement, is there a three-year compliance deadline.

Mr. Gulick said this was correct.

Senator Clodfelter asked Mr. Gulick how that compares to the deadlines set out in the Clean Smokestacks Act.

Mr. Gulick said it would be a faster timeframe than the one set in the CSA.

Senator Clodfelter asked if EPA has the flexibility to match their schedule to ours.

Mr. Gulick said it was fair to say that in the proposed rule adopted, EPA believes it does have that flexibility although there is a legal debate on the subject.

Senator Kinnaird asked Mr. Gulick if the acknowledgement that TVA was contributing to our air pollution would help North Carolina.

Mr. Gulick said that the filing of this petition would have a salutary effect with respect to the whole process.

Senator Kinnaird asked Mr. Gulick if the mercury issue would be affected positively by the actions taken to clean up the air.

Mr. Gulick said that is believed that the controls that are going to be required to be put on to control SO2 and noxide emissions do have the collateral benefit of removing some of the mercury that is in the emissions.

Senator Clodfelter asked Mr. Gulick if North Carolina had individual negotiations with each of the 13 states with the conclusion that we were not going to get anywhere with this issue.

Mr. Gulick said that all of the states were invited to directly contribute to the negotiations but the response, while polite, was generally not indicative of a desire to negotiate.

Senator Clodfelter commented that we needed to be careful with our dialogue with our neighboring states to the south because they have a lot to say about the water that comes from our state. He hoped that our initiating legal proceedings against South Carolina would not diminish their enthusiasm for cooperating with us on water pollution issues.

Mr. Gulick said that the 126 petitions actually ask EPA to regulate sources within those states.

Senator Clodfelter asked Mr. Gulick when we are likely to hear some development on this issue.

Mr. Gulick said that it is highly likely that there will be some contact and discussions prior to the 60-day period under which the statute says that EPA is supposed to make a finding. The Clean Air Act does provide that EPA is to have a public hearing prior to making its determination under Section 126.

Mr. Givens said that with regard to the next item on the agenda which is stormwater, the ERC would be asked in April or May to look at a bill to address the stormwater matter or a bill would be introduced or a committee substitute would be offered for an existing bill would be offered that would address the stormwater matter.

Mr. Givens added that there was some discussion as to whether or not there should be a stakeholder working group formed to handle this issue. He said that the time does not seem right at this time. In the meantime, we have litigation. The Administrative Procedures Oversight Committee (APO), which focuses on procedural matters, has been assigned this issue.

Mr. Givens said that the Rules Review Commission (RRC) had been invited to speak at today's meeting concerning the status of litigation against the Rules Review Commission over its decision and the Phase II stormwater runoff rules. However, they did not feel it appropriate to discuss the lawsuits at this time. A letter declining the invitation to speak is listed as **Exhibit F**.

Mr. Gulick gave an update on issues related to the Phase II stormwater rules as legal counsel for the Environmental Management Commission (EMC).

Mr. Gulick said that the RRC returned the stormwater rules and made additional objections. The EMC met shortly thereafter and voted to ask counsel to seek appropriate judicial relief from this action by the RRC and also requested directly that in a letter to the RRC the rule stay the effect of its action until there had been an opportunity for a court to review the propriety of their return of the rules. The RRC met and put on the record the request from the EMC but took no action on.

Mr. Gulick said that on March 8, 2004, the AG's office, on behalf of the EMC, filed a complaint in Wake County Superior Court challenging the action of the RRC, which is the sole defendant in the EMC's action.

Mr. Gulick said that the complaint by the EMC is that the RRC exceeded its authority in returning the rule without a request from the EMC that it do so. And, further a ruling that the EMC had properly responded to the earlier objections of the RRC with respect to ambiguity and to the issue it had raised with regard to statutory authority and also that it had statutory authority that if the EMC had statutory authority for the revised rules that it had been tendered to the RRC and seeks relief accordingly from the Superior Court.

Mr. Gulick said that the fundamental issue is that the EMC believed it was following the process that had been established in the statute and that the RRC had without authority abruptly terminated that process with respect to these rules.

Senator Kinnaird asked Mr. Gulick if only this individual action is being challenged or if the constitutional entity of the RRC itself.

Mr. Gulick said that the EMC's complaint does not raise constitutional claims. It is alleging actions in excess of statutory authority are arbitrary and capricious.

Senator Kinnaird asked Mr. Gulick what effect this is going to have on our requirement from the federal government on the timelines for stormwater.

Mr. Gulick said that they, at the direction of the EMC, will be seeking a stay of the effectiveness of this rule while the court has this matter under consideration. The EMC alleges the action of the RRC, in terminating this rulemaking process, terminated the temporary rule, which had the effect of regularizing the process and setting out deadlines that municipalities and the state could meet to comply with federal rule that requires the state to address these stormwater issues.

Senator Clodfelter asked how it is decided whom the Attorney General represents when one state agency sues another state agency.

Mr. Gulick said that he is unable to respond to that question at this time.

Senator Clodfelter asked Mr. Gulick if the RRC is entitled to legal representation at the State level.

Mr. Gulick said he was not at liberty to answer the question.

Senator Kinnaird asked if the stay that the state court gives likely to convince the federal government that we don't need to meet the timeline.

Mr. Gulick said the state had authority under the federal rules to adjust timelines appropriately and it did, in fact, adjust the timelines using the

temporary rule as the mechanism to establish a process for applications for permits. If the temporary rule does not exist, the concern is that we are back on the original federal timeline, which has already passed for the application of permits.

Mr. Donnell "Trip" Van Noppen, III, Carolinas Office Director, Southern Environmental Law Center, gave his comments on the RRC's veto of the EMC's Phase II stormwater rules. A handout of his summary is listed as **Exhibit G**.

Mr. Van Noppen said that the stormwater rules, which have been vetoed, are essential to protecting the quality of our rivers and streams in coastal waters. The rules had specific protection for shell fishing and trout waters.

Mr. Van Noppen said that the Southern Environmental Law Center (SELC) also alleges that the RRC has improperly vetoed these rules, that EMC did follow the appropriate procedure and that the RRC was wrong in determining that the stormwater rules were without statutory authority and were wrong in determining that the stormwater rules were ambiguous.

Mr. Van Noppen said that the SELC had asked the court to validate these rules and over rule the RRC. In addition, a separate category of claims says that the RRC, as it is currently empowered by the general statutes, is unconstitutional.

Mr. Van Noppen said that there is a need for the RRC to make sure the rules are drafted clearly, the rulemaking procedure is followed; however, the law gives the RRC veto power over the actions of the executive branch, acting as a legislature but without having bills passed by both houses. They also intrude upon the role of the executive branch in carrying out the programs that are delegated by the General Assembly and they intrude upon the role of the courts in making binding determinations of statutory authority.

Representative Williams asked Mr. Van Noppen how long the RRC has had this authority.

Mr. Van Noppen said that the RRC had been given these additional authorities in the mid 1990s. They used to have a role of expressing objections to rules with the veto power. The veto power is what gives rise to the issues at hand.

Representative Williams asked if this veto power had ever been challenged.

Mr. Van Noppen said that it had been challenged but never ruled on. In three previous cases, there have been lawsuits filed to challenge actions of the RRC, the first two resolved without judicial ruling and a case pending which involves the Pharmacy Board and the RRC but have not been ruled on by the courts.

Senator Clodfelter asked if a judge had been assigned to the cases.

Mr. Van Noppen said that the two cases had not been assigned to a judge or consolidated but that SELC is requesting consolidation.

Senator Horton said that the reason the RRC was changed in the 1990s is because the bureaucracy was spewing out a volume of administrative rules, which had the effect of law on our citizens, and the General Assembly said they are responsible for passing the laws.

Mr. Van Noppen said that one thing that would have to be decided by the court is how far can the legislature go in delegating that authority to a non-legislative body.

Senator Clodfelter said that he believes the main message that we take away from it is the lawsuits make it probable that we may have to address some stop gap interim measures in the ERC so that the cities and counties are protected with EPA during the short session.

Mr. Givens added that what the Administrative Procedures Oversight Commission hopes is that it can deal with the substitutive matter here and that APO matters can be dealt with there. The legislature has it, within its capacity, to resolve some of the outstanding issues.

Dr. Charles M. "Mike" Williams, Director, Animal Waste Management Center, North Carolina State University, gave a report on issues related to the evaluation of alternative animal waste management technologies to determine whether those technologies are environmentally superior and economically feasible. A copy of Dr. Williams' slide presentation is listed as **Exhibit H**.

Dr. Williams said that he would be reporting on the results of three agreements that were put into place in the year 2000 between the Attorney General of North Carolina, Smithfield Food and Premium Standard Farms. Those agreements provided a total of $15 million and $2.3 million respectively for NCSU to pursue the environmental superior technology research and development component.

Dr. Williams said that in 2002, the Attorney General also entered into an agreement with Frontline Farmers. This organization came into the agreement representing the contract growers and independent growers in the state. They brought with them a spirit of cooperation and have provided farms for conducting technology performance evaluations.

Dr. Williams said NCSU is responsible for the technology determinations, which is the actual report, which defines whether the technology meets the performance, and economic criteria that are defined in the agreements and also sets a schedule for implementation. The companies, through these agreements, have agreed to install any of the technologies that are deemed to be environmentally superior technologies onto the company owned farms.

Dr. Williams said that each of the technologies then have to meet performance standards that have been ratified by the General Assembly relative to the conditions that a farm or technology must meet for waste management for implementation for a moratorium.

Dr. Williams said that NCSU is mandated by the agreement to measure each of the parameters for each technology. The agreements also incorporated economic feasibility standards for each technology. A cost benefit analysis was also added as a component as the economic feasibility analysis.

Dr. Williams said that a 23 member advisory panel that is providing input and oversight of this process. This panel represents the companies that have entered into this agreement; it represents government, environmental interest, community interest as well as the academic areas of public health, waste management, economics and business administration.

Dr. Williams said that there are 16 plus candidate technologies in this process. Two have fallen off of the table because of the lack of technology required to be able to put it on the ground for evaluation per the resources and deadlines they are under with this agreement. The agreement specifically indicates that at the end of this process, they have the authority to take different unit processes to build an environmentally superior technology based on the performance in the economic data.

Dr. Williams added that 13 of the 16 technologies are either operational or concluded. A task schedule and a timeline was been presented on March 5, 2004 to the advisory panel outlining what has to occur between now and the end of this process to make the technology determinations. The technologies are on commercial scale farms around the state in areas in which swine are produced with the exception of a few technologies on University property in Wake County.

Dr. Williams then showed slides of several of the working technologies. He asked members to keep in mind that similar data is being collected for each of the sites. He explained in detail the Anaerobic Digester being used on the Barham Farm.

Dr. Williams said that the ambient digest/greenhouse technology is a covered digester and the affluent from that digester goes into a secondary holding pond and is further treated in nitrification tanks. Some of the affluent is used for re-flushing in the buildings and in additional there is a greenhouse vegetable production facility on that property.

Senator Clodfelter asked Dr. Williams what percentage of the affluent is reused.

Dr. Williams said that most of affluent is used for reflux and a small percentage used for the greenhouse vegetable production.

Senator Horton asked Dr. Williams is the affluent used as a fertilizer or heat in the greenhouse.

Dr. Williams said it was used for fertilizer. Because it is an anaerobic digester there is energy and heat generated with this system. On this particular farm, it is a sow furrowing operation and there is appreciable heat needed.

Dr. Williams said that one of the performance criteria is that the systems have to substantially eliminate atmospheric conditions of ammonia. Any type of anaerobic digester system will conserve ammonia so it has to be further treated in some way that will prevent it from being volatilized into the atmosphere.

Representative McComas asked Dr. Williams if the tomatoes grown in the greenhouse would qualify for organically grown vegetables.

Dr. Williams said that they should qualify and the total amount of marketable tomatoes produced is approximately 1500 pounds per day.

Senator Horton asked if there was a resistance to this type of fertilizer therefore creating a marketing problem.

Dr. Williams said that it wasn't really a resistance but it could be an issue. The availability and competitiveness of tomatoes coming from other locations has been an issue with this producer.

Senator Forrester asked Dr. Williams if these technologies are ones used in other countries or are they ones developed here through NCSU or through private entrepreneurs.

Dr. Williams said that these technologies are developed largely through private entrepreneurs. However, some other countries are represented. Of the 16 technologies, some were developed in Australia, Spain, France and Germany. Most of these technologies are from private technology suppliers from the United States and/or academic institutions.

Dr. Williams said that one of the criteria is odor. It must be measured for each technology. For odor, Sue Shiffman's group at Duke University is doing this work.

Dr. Williams then showed a slide of a technology for solids separation, nitrification, de-nitrification and phosphorous removal. This is an example of a technology that would eliminate the need for any type of earthen containment facility.

Dr. Williams said that the solids produced by this system are then further treated in another technology located on a separate site that does not contain any animals. It is also an anaerobic digester technology. The results from that particular type of technology are very good.

Senator Horton asked what happens to the solids.

Dr. Williams said that the solids are transported to the high solids anaerobic digester and further digested.

Senator Horton asked what would happen next.

Dr. Williams said that after the solids are digested, they are dried. Dr. Williams said that DOT is interested in seeing what nutrient value would be in these solids that would be of value to roadside vegetation projects.

Senator Horton asked Dr. Williams if they had a solution as to what to do with the solids after they are dried.

Dr. Williams said that there are other processes he would show but they are not able to say they have the answer for the solids.

Senator Forrester asked Dr. Williams if, in the present lagoon system, what do they do with the pathogens and how much reduction is there in pathogens in the lagoon system.

Dr. Williams said that the current system is a biological treatment and according to their data, there is up to 2 and 3 percent reduction in the pathogens.

Senator Kinnaird asked why these solids couldn't be sold as fertilizer.

Dr. Williams said they could be sold as fertilizer but the market development is the real key. The real issue with animal manure solids has been the ability to consistently deliver a product that has a low variability of NPK and also has no odor.

Senator Kinnaird asked if Millorganite smells.

Dr. Williams said it has an earthy type smell. The issue there is that the organization has incorporated a quality control to deliver a consistent product. Where limited success has been seen with animal manure systems is where that type of control has been incorporated.

Dr. Williams showed a technology developed in France, which separates solids at a high dry matter content. In this particular project, the solids have actually been combined with poultry litter and processed in a fluidized bed production process that exceeds 1,000 degrees Fahrenheit.

Dr. Williams showed another digester process using larvae. Because of the BSE issue, there will be issues with this process. This project also involves a water reuse project, further treating the water so that it is drinking water quality to be consumed by the animals.

Dr. Williams said that we do not want to restrict these technologies that are only funded by these agreements. Last year an additional technology was

added that involves water reuse. Smithfield Foods in the State of Utah has committed approximately $20 million to develop a process in which they are using the mesophillic digester design. They are taking the methane produced and putting it through a chemical process in a bio refinery. The methane is converted into methanol. The manure from approximately 125,000 animals is projected to generate about 7,500 gallons of methanol per day. That methanol is then railed to a facility in Texas and converted into bio diesel fuel.

Dr. Williams said that Smithfield Foods is cooperating with them in the North Carolina project to conduct a performance verification of this technology in Utah and see how and if it may fit the North Carolina model. This gives us another option for a value added product.

Dr. Williams concluded by saying that after all the data is collected; he hopes to have his recommendations to the panel ready by 2005.

Senator Clodfelter asked Dr. Williams what month in 2005 would he expect to have the report ready.

Dr. Williams said that a lot has to happen to get to the technology determination process but it is feasible that he would have it by July 2005.

Senator Kinnaird asked Dr. Williams if, when all of this is finished, would it be better to go back to a lot of small farmers who are raising a few hundred animals, which might cost the same as the $1 million we would have spent on this technology.

Dr. Williams said that if their objective is to produce a quality product at a low price, he feels very strongly that with the proper technology, that this can be done with animals in concentrated environments. But it has to be done with the proper technology.

Dr. Williams said that he did not feel that the current system is long term sustainable and that we need this technology change if we are serious about keeping animal production agriculture in this state and within the U.S..

Dr. Williams said that the technologies are meeting the performance criteria relative to odor, ammonia emissions, pathogen reductions and nutrients. Beginning in April, the economical analysis will be ready and he is not as optimistic about this. These systems will cost more than the current systems and someone will have to pay for them.

Senator Horton asked Dr. Williams if five or six of the 16 most promising technology methods would be analyzed and presented in 2005.

Dr. Williams said this was correct.

Senator Horton asked Dr. Williams why this had to be done all at one time. Why couldn't some of the promising ones be rushed on through and get certification so that the industry could decide where it wants to go rather than holding everybody back until mid 2005.

Dr. Williams said that at the March 5, 2004 meeting, this process was outlined in two phases: with phase one, beginning as early as July 2004. A lot has to happen for that to occur but it could be done in phases. The argument from many stakeholders to this is that when the determination is made, it is more fair to see what happens when all of the technologies are completed in the event that a technology determination is a thumbs up for one that comes later in the process that may be more effective in reducing the environmental impacts as well as being more cost effective. Once the data is in, a phased approach is one he would be pursuing.

Mr. Givens added that many observers of this process had speculated as to whether any of these technologies would be viewed as economically feasible, particularly in the short run, as the current technology. This would lead to the question as whether the legislature would have to take some steps to assist in the economic feasibility.

Mr. Givens asked Dr. Williams about the thermal depolinerization process and if it was one of the technologies being considered.

Dr. Williams said that it was not being considered. However, it is one that Premium Standard Farms has had as part of their process in Missouri. This facility has been improved but is not at 100 percent operation yet. The economics of this system is a lot more favorable if you can generate oil as compared to biogas.

Senator Kinnaird asked Mr. Givens if the taxpayers may have to subsidize this project.

Mr. Givens said that what he said was that there may have to be some assistance in achieving economic feasibility.

Senator Kinnaird asked Mr. Givens if this was not a taxpayer subsidy.

Senator Clodfelter said that it was something for the legislature to decide when we get the report.

Mr. Joseph Rudeck, Senior Scientist, Environmental Defense, gave a presentation on what happens after an environmentally superior technology for hog waste treatment is designated. A copy of Mr. Rudeck's comments, in full, and a handout outlining his presentation are listed as **Exhibit I**.

Representative Weiss asked if there was someone specific at DENR who is currently leading the way to help with this transition or planning ahead for this.

Senator Clodfelter said that he did not know but was thinking during the presentation that this could fall into our laps to set the policy framework before DENR could launch off into doing anything about implementation.

Senator Clodfelter asked Robin Smith, Deputy Secretary of DENR, if there was a captain for the conversion process at DENR.

Robin Smith, DENR, said that their staff had worked closely with Dr. Williams during the entire process and like everyone else; they are taking it one step at a time. As they get to each step, they are prepared to play an appropriate role but right now they are focusing on identification and testing of technologies and issuing the permit required.

Senator Horton commented that we have a number of things that need to be on our plate. One of the obvious and least expensive by-products would be electrical energy, from these farm conversions, but that will not work unless the power companies are required to pay a fair price for the energy sold to them.

Mr. Forest R. Westall, Regional Supervisor, Asheville Regional Office, Division of Water Quality, DENR, and Thomas A. Reeder, Supervisor Classification and Standards Unit, Division of Water Quality, DENR, presented a report on the study conducted by the Department of Environment and Natural Resources (DENR) regarding the use of general no discharge permits for animal waste management systems for swine, cattle, and poultry operations on the land application and potential discharge of nitrogen and phosphorous to surface water and groundwater in the State. A copy of the slides, a summary sheet of the major issues of the advisory group, and a final report on the Activities and Findings of DWQ Animal Feeding Operations Non-discharge General Permit Advisory Group are listed as **Exhibit J**.

Mr. Westall said he was asked, along with Tom Reeder, to facilitate an advisory group under Senate Bill 733 to evaluate the state non-discharge permitting process.

Mr. Westall said that the permits that DENR uses to regulate these activities are where the rubber meets the road. It is a list of requirements instructing people how to conduct their business. Sometimes when there is feedback from people being regulated or impacted, there is a process to respond to them.

Mr. Westall said that his office gets a lot of telephone complaints from citizens about animal operations. All animal waste operations have some regulatory oversight; all operations under the threshold numbers can operate by permit without any regulatory document from DENR as long as they don't have a discharge.

Mr. Westall said that approximately 1041 facilities are covered by NPDES Federal Permits and 1437 facilities are covered by state Nondischarge Permits. Of the pounds of animals in an operation at any given time, the NPDES permits cover about 70 percent of all poundage.

Mr. Westall explained that deemed permitting is for operations using dry litter.

Mr. Westall said that from 1998 until 2003, DENR had learned a lot about the regulatory process and some changes were made in the permitting process.

Mr. Westall said that the original nondischarge permits were issued in May of 1998 and were set to expire on April 30, 2003. DWQ began a process of drafting those permits and put them out in January for the permits that would be expiring.

Mr. Westall said that he and Mr. Reeder were the hearing officers for the public hearings held in February 2003. The comments from these hearings helped them to draft the new permits.

Mr. Westall said that the general permit was adopted in May 2003 but Senate Bill 733 stayed the implementation of the new general permit and directed DENR to go through a process that would allow coverage after October 2004. This would require DENR to evaluate use and impacts of general permits for animal waste management and would also involve interest groups.

Mr. Westall said that the advisory group met four times in 2003 and have issued the report of their findings in Exhibit J.

Mr. Westall said that fourteen out of sixteen issues were settled in a concensus. The issue of phosphorus on land was one of the major issues of contention. Since phosphorus is not retained on the site and does leach away after a time, a tool was adopted by NRCS, called the plat tool, to be used on these sites to evaluate phosphorus. Any new or expanding facility is required to evaluate phosphorus on their application site, but do not have to comply with it in order to get a certificate of coverage. The AG's office felt that this was the most appropriate way to deal with this in the permit.

Mr. Westall said there might have to be some proposed revisions to the statute to specifically include phosphorous. The statutes include nitrogen but not phosphorus.

Mr. Westall said that the rainbreaker requirements are devices set up on irrigation equipment that regulates water going out of the system. These are required on some operations but the smaller operations use on-site personnel to make this determination. Automatic devices are required in the permit only if there is trouble with compliance. If this is done on-site, it has to be done every two hours.

Mr. Westall said that frequency of calibration of testing equipment is once every year in the NPDES permit. In smaller operations, it was revised to once every two years.

Mr. Westall said that precipitation event, measuring rainfall, was a very important issue. It was determined that measuring rainfall should be done at the farm site with someone reading a rain gauge and documenting the information.

Mr. Westall said that the frequency of sludge surveys in the lagoons that hold the waste is required within one year with the NPDES permit. With the smaller operations, they are given two years to do the initial evaluation and yearly after that.

Mr. Westall said that the manual monitoring of lagoons is better than automated lagoon monitoring equipment. The permit requires someone to read the gauge and report it. Automated monitoring systems are required only if there is a compliance problem.

Mr. Westall said that there should be no land application activity within 100 feet of active water supply wells used for human consumption.

Mr. Westall said that annual certification is not required in the new permit. This was the most contentious issue on which consensus was not reached. The producers felt very strongly that this annual reporting requirement was a burden; however, the environmental and public interest groups felt this was a necessary requirement. It is required in the NPDES permits but not in the new permit.

Mr. Westall said that the recommendation was that a permit cycle would be given for five years, 2004-2009, to allow producers to learn about how submission works on the NPDES permits and to get them comfortable with the permitting form.

Mr. Westall concluded by saying that consensus was reached on all but two of the issues—the issue of phosphorus requirements and the issue of annual certification. The requirements for SB733 were met and the permit developed by DWQ is should be approved by October 2004.

Senator Clodfelter said that the ERC is not required to take any further action with SB733.

Senator Horton asked Mr. Westall if the permits allow opportunity for the operator to provide information or does the permit it just list regulations.

Mr. Westall referred to attachments six and seven in Exhibit J, which show regulations as well as reporting requirements by operators. The permits are the written description of what they are supposed to do.

Representative Hackney asked Mr. Westall to remind members of the two issues on which they did not reach consensus.

Mr. Westall said that the phosphorus requirement and the issue of annual certification were the two issues on which they did not reach consensus.

Senator Clodfelter asked if the phosphorus requirement would require additional legislative action.

Mr. Westall said that the General Counsel office is working on some proposed changed that would be submitted to the legislature for clarifying the role of phosphorous.

Senator Clodfelter asked Mr. Westall if the phosphorus issue would be brought back to the ERC as a separate item.

Mr. Westall answered in the affirmative.

Mr. M. Paul Sherman, Environmental Engineer, Division of Water Quality, DENR, gave a report on the resolution by the 605 Working Group of issues related to Notices of Violation (NOVs) and Notices of Deficiency (NODs) for lagoon freeboard violations due to chronic rainfall conditions. A copy of Mr. Sherman's slide presentation and a copy of the final report on the resolution of issues related to notices of violation and notices of deficiency due to lagoon freeboard violations due to chronic rainfall conditions, is listed as **Exhibit K**.

Mr. Sherman said that this working group was convened under the direction of the ERC.

Mr. Sherman said that in April 2003, DWQ issued approximately 385 notices of violation to animal facilities with high freeboard levels. And, on June 25, 2003 a memo from Secretary Ross (DENR) initiated a working group to resolve the issue of high freeboard enforcement during chronic rainfall events. The memo directed DWQ to divert back to using a previous guidance document in order to make the process of determining the enforcement on high freeboards.

Mr. Sherman said that the Chronic Rainfall Working Group met five times between October 28, 2003 and March 15, 2004. Several stakeholder group meetings were also held.

Mr. Sherman said that several of the major items discussed in the working group were lagoon design, DWQ's enforcement guidance utilized after Secretary Ross' memo and conditions in the DWQ guidance.

Mr. Sherman showed a slide of a lagoon design. He said that in 1996, NRCS also included a heavy rainfall factor, an additional 25-year, 24-hour storm event storage that was initiated for periods of heavy rainfall.

Mr. Sherman said that those lagoons that were built after 1996, most lagoons in use now were built before 1996, did not have that heavy rainfall factor built into them.

Mr. Sherman said there was also a study now to allow facilities to go below the permanent treatment level, approximately 8 inches. This allows facilities that do not have the heavy rainfall factor built in to pump their lagoons lower to compensate for not having that extra storage at the top.

Mr. Sherman said that DWQ devised its own plan of action forms and submitted them to the working group. They included these forms in the guidance document.

Mr. Sherman said that the working group discussed that there should only be one compliance action taken during any single rainy period. There was concern that facilities, during a single rainy period, could rise up to where they wert out of compliance with their permit, pump for a few days, but could become out of compliance again until the rainy season was over. Any action taken by DWQ prior to this guidance must be considered as if it was based on the new guidance.

Senator Clodfelter asked Mr. Sherman if any violations would be withdrawn as a result of the new guidance criteria.

Mr. Sherman said that none would be withdrawn.

Mr. Sherman concluded by saying that the Chronic Rainfall Working Group reached consensus on resolving issues related to chronic rainfall. The resulting recommended guidance document sets a clear and consistent guidance for making enforcement determinations and the recommended guidance will replace the Freeboard section of the current DWQ Compliance/Enforcement Procedures dated April 2, 2003.

Representative LaRoque asked Mr. Sherman if there would be any type of monetary penalty to the farmers who had NODs in excess of three years.

Mr. Sherman said that as long as the farmers are properly operating and maintaining their facility then this would not be a possibility.

Senator Horton asked Mr. Sherman how many actual penalties had been assessed against the hog farmers and what is the monetary cost.

Mr. Sherman deferred this question to Coleen Sullins.

Senator Clodfelter told Senator Horton that Ms. Sullins would be addressing these questions in her presentation, later in the agenda.

Ms. Beth Anne Mumford, Director of Public Affairs, North Carolina Pork Council and Mr. Daniel J. Whittle, Senior Attorney, Environmental Defense, gave their comments on the general nondischarge permit study and on the resolution of issues related to freeboard violations due to chronic rainfall.

Ms. Mumford said that the Pork Council does support the use of general permits. The new permit is the sixth permit the producers have had to operate under since the State began permitting in the mid 1990s.

Ms. Mumford said the goal of the Pork Council has been and will continue to be in developing permits around those well managed farms with

available management tools and regulatory enforcement where necessary to deal with situations where compliance is difficult on the farm.

Ms. Mumford said that they hear quite a bit from their producers about the increased paperwork required with the new permits that keeps them off the farm and in an office filling out paperwork.

Ms. Mumford said that as we move through the public hearing process, we would continue to hear from producers on some of those concerns.

Mr. Whittle said he was representing the Sierra Club, the North Carolina Perg, the Alliance for Responsible Swine Industry, and Southern Environmental Law Center. All of these groups participated in one or both of these working groups.

Mr. Whittle emphasized that the two groups focused on issues surrounding the current lagoon system. The resolution of these issues does not obviate the need to continue to make progress on conversion that Dr. Williams and Dr. Rudek talked about this morning.

Mr. Whittle said that DWQ did an excellent job on the state permit issue. The process was constructive and consensus was reached on 14 of 16 issues.

Mr. Whittle said that they believed the federal and state permits should be the same; however, dairy farmers and others said that the federal permit was too cumbersome.

Mr. Whittle said that the two issues they could not reach consensus on were annual certification and the phosphorus standard.

Mr. Whittle said that on annual certification, their view was that it is common sense that it is not a burden for farmers to certify the compliance status of their farms and also maintain the annual certification is routine and is important in compliance monitoring and reporting. Filling out a form is an incentive for doing things right.

Mr. Whittle said they had worked with other stakeholders to come up with a simplified form but some rejected this.

Mr. Whittle said that DWQ was recommending that we drop the annual certification and work with groups with the hope that in the future the certification can be restored.

Mr. Whittle said that the other issue, which was less contentious, but was arguably more important, was the issue of phosphorus. One is with new operations of swine, poultry, dairy should have to comply with a future phosphorus standard being currently developed by USDA and the other was whether or when existing operations should evaluate their capacity to comply with a future phosphorus standard. There are currently no limits on phosphorus applications to land from livestock operations. Phosphorus, in

excessive amounts, poses a serious threat to our river streams and coastal waters.

Mr. Whittle said that with respect to new operations of complying with future standards, there was disagreement as to whether DWQ had the statutory authority to do so. The AG and DENR's Assistant General Counsel offered an informal opinion that the statute does not address phosphorus and therefore it is not clear as to whether DWQ has the authority. In the Environmental Defense's opinion, Under the Clean Water Act of North Carolina, authority is there and hopes that DWQ will exercise its discretion to require new operations to comply with the phosphorus standard.

Mr. Whittle said that with regard to existing operations, they firmly believe that no time should be lost in evaluating capacity to comply with a future standard, if and when a standard is developed.

Mr. Whittle said that permit violations are inevitable, using the current lagoon and sprayfield system. They focused on how to work with farmers who manage their lagoons by the book.

Mr. Whittle concluded by saying that they do agree with the final recommendations and will support them in the public hearings and hope for a timely adoption of that permit. On the enforcement issue, he commended Mr. Givens and his colleagues on a productive 605 process and accept the final outcome of that working group. The shared goal of all stakeholders is to keep hog waste out of rivers and streams and their highest priority is to make enforcement policy actually work with farmers to avoid problems and to fix them once they occur.

Mr. Whittle said he felt there was widespread acknowledgement within the group that the lagoon technology is not here to stay and we will do the best we can with it until the conversion begins, hopefully in July.

Senator Clodfelter suggested to the co-chairs that we might refer the stormwater phase to these two working groups and let them work it out.

Mr. Givens added that Mr. David McCloud asked him to read the following statement to the ERC. "With regard to general nondischarge permits, the Department of Agriculture and Consumer Services (DACS) participated in the study and supports the consensus of the group that the new proposed permit is much improved. With regard to the 605 working Group on Chronic Rainfall, DACS participated in this process and supports the new compliance and enforcement procedure."

Mr. Givens said that the milder treatment for violations is available only to those farmers who voluntarily and in a timely fashion report when they are getting into trouble. It does not offer any protection to those who fail to report as required by their permit. That was the consensus of all parties.

Mr. Gary Hunt, Director, Division of Pollution Prevention and Environmental Assistance, DENR, gave a report on the development of

environmental management systems (EMS) for pork producers. A copy of three handouts Mr. Hunt provided is listed as **Exhibit L**.

Mr. Hunt said that an environmental management system (EMS) is a systematic approach to managing an organization of environmental affairs using quality principals. It is the plan due check act based on continual improvement. This is what every business uses to increase their profitability and become more effective.

Mr. Hunt said that in the 1990s that was international recognition that organizations needed a more holistic approach to managing environmental impacts and requirements. This is when international standards were developed of what a model EMS would be based on quality principals. Since that time there has been a steady growth in implementation of the standard by industry, businesses and government agencies.

Mr. Hunt listed the North Carolina Zoo, wastewater treatment plants in Gastonia and a number of facilities in North Carolina currently meeting the international standard.

Mr. Hunt said that studies have shown that EMS's improved the environmental performance of the regulated facilities. There is also a growing interest from the agricultural and agribusiness to start looks at EMS's. In 2000, Smithfield and Premium Standard agreed to put third party, certified EMS's on all of their company-owned swine farms. In 2001, Murphy Brown was the first livestock company to be certified to the international standard.

Mr. Hunt said that for small contract farms and for independent farms, there was really no assistance to put an EMS into place. So, they partnered with cooperative extension and their knowledge of animal operations, obtained some federal funding to do a local project to work with small farms to develop materials they could use to put an EMS into place. This project was coordinated with the Division of Soil and Water, Water Quality, the Pork Council, NRCS and anyone else who wanted to participate in the project.

Mr. Hunt said they had recently completed working with eight contractors and independent swine farms with their staff on site, one from cooperative extension and one from DENR to see what parts of EMS would work and be most beneficial to a small organization.

Mr. Hunt said that out of that project, which was started in 2001 and just completed, a set of comprehensive, web-based tools that provided a step-by-step process to develop an effective EMS for small farms.

Mr. Hunt said that Murphy Brown also developed a series of hard copy EMS documents that a farm can use to step themselves through the process. There is also an electronic system that is very extensive that can reach all farmers.

Mr. Hunt said that some results were increased overall farm efficiency, improved documentation, improved environmental preparation and enhanced response to emergency problems.

Mr. Hunt said that a full-blown EMS is probably not doable for a small farm operation; however, parts of the model work very well and can help farms. The farms need assistance to put an EMS into place. They have proven to be beneficial and have a great potential to really help swine farms meet environmental regulations.

Mr. Hunt said that his office would be training the trainer. The have obtained federal funding that would help with the six swine farms they have just signed on with to help with putting EMS into place and monitoring compliance.

Mr. Hunt said there was a national effort to look at other sectors in agribusiness; such as poultry, to put EMS's into place. DENR thinks that EMS is where the industry is going and have established a program called environmental stewardship initiative which companies sign up for to help put environmental management systems into place. Those that have systems into place are awarded stewardship awards. They have over 40 companies signed up and more are coming in everyday.

Mr. Hunt concluded by saying that Chuck Stokes and Don Butler had helped develop the EMS manuals and were in the audience today.

Senator Dorsett asked Mr. Hunt what percentage of companies in North Carolina does the 40 represent.

Mr. Hunt said there are 150 certified companies in the state with 40 signed up for the EMS program.

Senator Clodfelter asked if funding was predominantly federal funding at this time.

Mr. Hunt answered in the affirmative.

Mr. Hunt introduced two farmers, Don Butler and Chuck Stokes, in the audience. Senator Clodfelter asked if either of them would like to address the ERC.

Mr. Don Butler, producer and employee of Murphy Brown spoke. He said he was the project manager for the EMS. They started the process in 1997 and are pleased to report that all of the company farms nationwide are certified to the international standard. It is proven to be a great tool for them. Their farms are cleaner and their employees are better informed, the neighbors are happier and they have less conflict with regulatory agencies. They have decided to make it available to anyone in the country who wants to use it, free of charge.

Mr. Chuck Stokes, hog farmer from Aiden, North Carolina, in Greene County, spoke to the Commission. He said he installed an EMS as a form of being proactive. They have identified many problems and have initiated some outreach they didn't have before in the form of a newsletter for the community and opened a website for farmers to have an opportunity to engage in discussions.

Senator Clodfelter asked Mr. Hunt if we are connecting the EMS program to the regulatory program appropriately so that the word is getting out.

Mr. Hunt said that they were. They just had a training program to get the word out.

Ms. Coleen H. Sullins, Deputy Director, Division of Water Quality, DENR, gave an annual report on permitting and inspecting animal waste management systems/Animal Waste Compliance Report and the annual report on the compliance/enforcement of water quality laws for facilities that discharge into surface waters. A copy of Ms. Sullins presentation in its entirety, as well as a copy of her slides and status reports for both presentations, is listed as **Exhibit M**.

Senator Kinnaird asked Ms. Sullins about repeat offenders with regard to penalties and violations if they were just paying a fine as a cost of doing business and not changing their ways.

Ms. Sullins said there were some who were doing that but it is getting to be a costly part of doing business. They are working with those repeat offenders, trying to help them find solutions to their problems. One of the reasons they revamped the escalation for those repeat offenders was to not allow it to continue it to be a cost of doing business.

With regard to moratoriums on sewer systems, Senator Clodfelter asked Ms. Sullins how many are system wide moratoriums and would most of them be on a line basis.

Ms. Sullins said that of the 34 sewer systems on a moratorium, about 13 of them are associated with problems at the wastewater plant or system wide.

Senator Kinnaird asked Ms. Sullins if the Clean Water Management Trust Fund is putting the money into some of the more severe problems.

Ms. Sullins said that a number of organizations are providing some resources to address these problems including the Clean Water Management Trust Fund. However, the resources are not there to address all of the needs.

Ms. Sullins said that most of the resources had been dedicated to water main issues rather than toward the wastewater collection system issue.

Senator Kinnaird asked Ms. Sullins if she was familiar with a report that stated there are large amounts of lead in drinking water supplies.

Ms. Sullins said she was not familiar with that report.

Senator Swindell asked Ms. Sullins how the $356,000 fine levied against swine and poultry operations compares with the $800,000 levied against principalities. He also asked Ms. Sullins to explain the range of fines from $5 to $22,000.

Ms. Sullins said that the fines ranged from $500 to $22,000.

Ms. Sullins said that the assessments against municipalities are based on their monthly reports. With the swine operations, the assessments are made on an annual basis. She also said that with the number of NPDES facilities, there are 1454 with close to $1 million worth of penalties assessed to them and over 50 percent of them were municipalities. Most of the noncompliance problems are with the smaller municipalities.

Representative Justice asked Ms. Sullins if there is any data shows that municipalities are educating the public as to how to prevent problems with the municipal sewer systems.

Ms. Sullins said there is probably some data on that but she would need to go to the municipalities to ask for their help on providing this information.

Representative Justice stated that, if we had that data and it was making a difference, maybe we could come up with a plan that would help reduce the number of spills in municipal systems.

Ms. Sullins said that where a strong grease campaign was initiated, they were seeing fewer problems.

Mr. Givens asked if there were 1800 inspections and 2461 operations, how would that square with the statutory requirement that they all be inspected once a year.

Ms. Sullins said that obviously it did not square with the statutory requirement that they all be inspected. Those inspections she reported on were strictly the ones done by DWQ. The Division of Water and Soil Conservation also go out and do annual inspections. Also, some of the facilities not inspected could be in the pilot programs.

Mr. Givens asked Ms. Sullins what the total gallons were for spills in sanitary sewer systems.

Ms. Sullins said it was 151 million gallons.

Representative Weiss asked Ms. Sullins to go into a little more detail about why there were fewer inspections in 2003 than in 2001.

Ms. Sullins said that they were down significantly in staff and they had tremendous difficulty in hiring new staff. One of the reasons the number of NPDES inspections had been reduced was that they were trying to devote resources to some of those issues where they have significant problems such as the sanitary sewer system overflows.

Mr. Robert M. Zarzecki, Environmental Specialist, Wetlands 401 Certification Unit, Division of Water Quality, DENR, gave a report on the Effectiveness of the Surface Water Identification Training and Certification Program (SWITC). A copy of Mr. Zarzecki's slide presentation and a copy of information regarding the SWITC program are listed as **Exhibit N**.

Senator Horton asked Mr. Zarzecki to define a stream. He had a situation where a stream does not appear on any local maps, not on any soil conservation maps and asked if there is siltation in that sort of a water course, is it a violation of our current methodology.

Mr. Zarzecki said that it possibly is a violation. The Neuse River Basin and Tar Pamlico River Basin buffer rules only apply to intermittent streams shown on USGA and Soil Survey maps. The streams that are not shown on those maps could very well be jurisdictional waters of the United States and the State of North Carolina and may still hold water quality standards and other federal regulations.

Senator Horton asked if a landowner finds that some of his topsoil has washed over onto a neighbor and into a dry watercourse, would he be subject to civil penalties.

Mr. Zarzecki said that they have no jurisdiction over dry watercourses, called femoral streams or channels. However, if the sediment got into an intermittent stream, it would be in violation.

Mr. David L. Penrose, Environmental Biologist, Wetlands 401 Certification Unit, Division of Water Quality, DENR, gave a report on the Effectiveness of the Surface Water Identification Training and Certification Program (SWITC), gave a PowerPoint presentation on a stream mapping grant initiative.

Mr. Penrose said that as much as the small headwater streams drain 85 percent of the land surface in North Carolina and the current maps do not illustrate the occurrence of those streams at an alarming rate.

Mr. Penrose said that 25 percent of the streams in the Piedmont are not mapped or are mapped inaccurately. This number increases in the mountains.

Mr. Penrose said that the DOT and WQ are joining efforts to come up with a model driven, computer devised mapping program of small streams in North Carolina.

Mr. Penrose recognized Mr. Steve Kroeger who has been hired by DWQ to administer this grant for the next couple of years. Private contractors will conduct most of the fieldwork. Computer models will be completed and other funding will be continued and the final map will be complete by winter of 2004. There will be a Phase II of the mapping process, which will map the entire state.

Senator Horton asked Mr. Penrose where the map would be available.

Mr. Penrose said that he assumed it would be a web based product which could be downloaded from DWQ's website or that an interactive website would be developed for that purpose.

Senator Horton said that he had a real problem with our citizens having penalties imposed on them out of bureaucracy out of a stream that is not mapped anywhere.

Mr. Penrose said that he was frequently asked to go into the field to assess the type of the stream and what people have called intermittent streams in the past is frequently inaccurate. Many of these small streams are perennial channels.

Mr. Givens said that he was pleased to hear that we do have a program and that there is a schedule to get this mapping done.

Ms. Sullins said that mapping has been an issue for some time and that with the small funding they have available, they would see if good results could be achieved. If so, they would look into other grants and resources to take the program statewide and make it available with the GIS mapping system.

Senator Kinnaird asked if this program could be coordinated with the mapping of floodplains.

Mr. Penrose said that he was sure it would be.

Mr. Paul S. Crissman, Head, Planning and Program Management Branch, Solid Waste Section, Division of Waste Management, DENR, Mr. James C. Coffey, Chief, Solid Waste Section, Division of Waste Manaqgement, DENR, and Mr. Scott B. Mouw, Chief, Community and Business Assistance Section, Division of Pollution Prevention and Environmental Assistance, DENR gave a report on the status of solid waste management efforts.

Mr. Crissman gave a slide presentation and handed out a copy of the Annual Report on Solid Waste and a copy of his slides listed as **Exhibit O.**

Mr. Crissman reported that North Carolina relies heavily on out of state facilities to manage our waste and we export nearly ten percent of our waste.

Mr. Crissman said that North Carolina produces about one and one quarter ton of solid waste per person each year. The implications of this with regard to our landfill capacity are very surprising.

Mr. Crissman said that landfill capacity is a difficult concept, which can be considered in three different ways. It can be considered in absolute airspace or cubic yards and landfills are permitted according to airspace.

Mr. Crissman said that in North Carolina we have used up 83 million cubic yards of airspace with garbage. Almost 300 million cubic yards of airspace have been permitted. The total permitted does not include what an owner/operator may envision for a site.

Mr. Crissman said that another way to consider landfill capacity is by weight. The statewide average is about .57 percent of a ton to fill a cubic yard of airspace or about 1100 pounds.

Mr. Crissman said that in 2003, about 604,000 cubic yards of waste were put into landfills. There is room for 118 million tons of waste.

Mr. Crissman said that the third way to consider landfill capacity is how long will it take to put 1,000 pounds into a cubic yard. There is about 16 years of permitted time left before our landfills are full if we continue to fill at the same rate that we filled in 2003.

Mr. Crissman said that our forecasting is historically based. The individual analysis of each landfill is included in Exhibit O.

Senator Kinnaird asked Mr. Crissman if Orange County was the only county that had reduced their waste by 40 percent.

Mr. Crissman said that there were a few other counties that had reduced their waste but Orange County was the largest county to do so.

Senator Swindell said that this is a critical problem that the legislature will be addressing in the near future.

Mr. Coffey gave his presentation on the status of municipal solid waste landfills both unlined and unlined. A copy of his presentation and slides is listed as **Exhibit P**.

Mr. Coffey said that of the 128 unlined landfills closed since 1990, 122 of those have detected chemical contaminants in groundwater monitoring and 71 of them have detected contamination at or beyond the property boundary.

Senator Kinnaird asked Mr. Coffey whose liability it is if it goes beyond the boundary.

Mr. Coffey said it was the owner of the landfill.

Mr. Coffey said that there were 42 landfills that are currently being monitored and eight of those have detected contaminants in the groundwater monitoring wells with only one having contamination at the property boundary.

Representative McComas asked Mr. Coffey if the chemical contaminant at the property boundary had been determined as coming from the landfill.

Mr. Coffey said that it had.

Senator Kinnaird asked Mr. Coffey what the answer is for getting people to cut down on their waste disposal.

Mr. Coffey said that we make land filling fairly inexpensive and is one reason why people may not choose to recycle.

Mr. Coffey concluded by saying that the Division has decided to make substantial changes to the proposed C&D landfill rules and will not ask for approval of these rules in the upcoming session.

Representative McComas asked Mr. Coffey if the New Core facilities in Hertford's numbers were accounted for in his graphs.

Representative McComas asked if the automobile recycling facility proposed for Brunswick County would have their numbers included in the new C&D report.

Mr. Crissman said that these numbers would be included in those for an industrial landfill and just municipal C&D numbers.

Representative Fox asked Mr. Coffey if recycling by local governments had an effect.

Mr. Coffey said that recycling by some local governments does have an effect.

Representative McComas asked Mr. Crissman if most of the newspapers in the State were using vegetable ink for printing.

Mr. Crissman said that he did not know.

Representative McComas asked if this is data we may be looking for.

Mr. Crissman said that ink on paper is not a problem with recycling.

Mr. Scott Mouw responded by saying that most manufacturers are using soy-based ink that does help the recycling process.

Mr. Givens asked Mr. Coffey if he anticipates that the C&D landfill rules would be ready in 2005.

Mr. Coffey said that they would probably not be ready at least until 2005.

Senator Horton asked Mr. Coffey if there is anyway that we have quantified our percentage of waste that has come from packaging.

Mr. Mouw answered Senator Horton by saying that about 30 percent of our waste is C&D waste and about one quarter of recycling comes from packaging.

Senator Kinnaird asked if most retail people are doing cardboard recycling.

Mr. Mouw said that cardboard is the most widely recycled item.

Mr. Mouw said that North Carolina has made really good progress on recycling with local governments and in the private sector.

Mr. Mouw reviewed his handout on Options for Reducing Waste in North Carolina. A copy of this handout is listed as **Exhibit Q**.

Senator Kinnaird asked if they were suggesting a statewide tipping fee in addition to a local surcharge.

Mr. Mouw said that they were 22 other states that were doing this and it would be a 22 percent surcharge on disposal facilities.

Representative McComas asked Mr. Mouw if we could also consider an incentive rather than a mandate if a recycler or a hauler performs better.

Mr. Mouw said that there are options that could be looked at with regard to this. For example, the State of Iowa has a tipping fee surcharge but the community is not obliged to send in their surcharge proceeds if they are meeting their waste reduction quota.

Mr. Mouw said that North Carolina estimates an overall generation of 50,000 tons per year of electronics disposals.

Mr. Mouw said that there are six communities that have permanent collection programs for electronics. All 100 counties have collection programs for white good and tires.

Mr. Mouw said that the economic benefits of recyling are more jobs, capacity growth for electronic recycling. The biggest challenges for recyclers is competing disposal rate and inability to get the supply that they need.

Mr. Mouw said that some of the manufacturers that rely on recycled materials are glass plants and paper mills.

Representative McComas asked for hard copies of Mr. Mouw's slide presentation and asked Mr. Mouw to provide them to all Commission members.

Mr. Larry E. Shirley, Director, gave a report on the Energy Policy Council and the revision of the State Energy Plan. A copy of Mr. Shirley's report is listed as **Exhibit R.**

Mr. Shirley told members that he would provide copies of the full State Energy Plan upon request.

Mr. Shirley recognized Senator Kinnaird, Senator Horton and Representative Tolson who serve on the Energy Policy Council and have put in long days and hours on the Energy Plan.

Mr. Shirley said that the State Energy Office (SEO) is located in the Department of Administration. Many years they were in the Department of Commerce and celebrated their 30th anniversary in 2003. The State Energy office was created as a result of the Arab Oil Embargo.

Mr. Shirley said that in 2000, the General Assembly moved the State Energy office to the Department of Administration. They are the lead agency for programs in the State and focus on energy efficiency programs, renewable energy programs and by creating jobs for our state. They also work with the Utility Commission and Emergency Management when there is an energy emergency. Mr. Shirley said that the SEO is the lead agency if there is a supply cutoff of petroleum or fuels.

Mr. Shirley said that the first thing they did in the development of the SEP was to look at where the energy was flowing. Electric power generation, coal and nuclear power, supply half of our energy along with half of our emissions in the state.

Mr. Shirley said that we use a lot of petroleum; natural gas and the emissions coming from these are significant in terms of sulfur dioxide, nitrous oxide and greenhouse gases like carbon dioxide.

Mr. Shirley said that the state imports $7 billion worth of energy per year in terms of fuels. The more we can keep and develop in the State, the more jobs and the stronger our economy will be.

Mr. Shirley said that the SEP focuses on cutting our growth of consumption of energy out to year 2020. Some of the savings in transportation, some in industrial, some in residential and some in commercial will result in using 13 percent less energy if the SEP is followed.

Mr. Shirley said that the SEP was an eighteen month process with many public hearings which came up with 92 recommendations of which 15 were taken and made top priority for the next two years, beginning in September 2003.

Mr. Shirley said that the SEO is the lead agency for implementation of these programs, which will be overseen by the Energy Policy Council. The SEP will be revisited every two years and revised as is appropriate. A report will be made to the General Assembly as well as to the Governor.

Mr. Shirley said that one of the big reasons to develop energy efficiency is that it strengthens our economy. The SEO's has 36 existing renewable energy related manufacturing firms spread out over the state.

Mr. Shirley said that one of the primary recommendations of the SEO is creating a greenhouse gas registry to encourage reduction of greenhouse gasses in industry.

Mr. Shirley said that DENR and the SEO have developed a list of policy options and are now under consideration by DENR. These options focus on setting goals for reduction of greenhouse gases, including all of the area and point sources involved.

Mr. Shirley said that these emissions are likely to create credit and will be tradable.

Mr. Shirley said that alternative fuels and biomass are great renewable energy resources. A recommendation was made to develop this industry through matching grants and funding. It was suggested that some form of infrastructure be put into place for alternative fuels in each of our counties by 2007.

Mr. Shirley said there was also a recommendation of a $1 to $2 increase of vehicle registration fee to provide some of these matching grants and incentives.

Mr. Shirley said there was a lot of activity in this area. Pilot programs have begun to refund rebates and matching grants statewide. The State Motor fleet has over 1500 alternative fuel vehicles in its fleet.

Mr. Shirley concluded by saying that the State is working with Advanced Energy Corporation to develop hybrid school buses. They now have clean city programs established in the Triangle, the greater Charlotte region and in Asheville. These programs bring all of the stakeholders together to formulate the strategies as to where the fueling stations should go and how they should be developed locally.

Mr. Shirley said that DOT has become the leader in the use of bio diesel, which is 20 percent soybean oil mixed with diesel and is better for the environment than straight diesel.

Mr. Shirley continued by saying that some of our schools are working with model fuel cell cars and are converting full sized vehicles to electric vehicles so that the students can learn more about this technology and what is involved.

Mr. Shirley said that in the biomass area, one of the things the Council was concerned about is animal waste. They have started a project at NCSU to get ethanol from swine waste.

Mr. Shirley said that the Energy Policy Council suggested that the General Assembly consider adopting net metering for all utilities. The North Carolina Utilities Commission has an open docket on this issue and the North Carolina GreenPower Program is also considering the many issues related to interconnection to the grid.

Mr. Shirley said that negotiations are underway between renewable energy producers and our electric utility suppliers to see if they can work out a strategy that will be good for the State.

Mr. Shirley said that the Council also recommended that the General evaluate a renewable portfolio standard that compliments the GreenPower program. This program will be the way to launch renewable energy in our State.

Mr. Shirley said that the State had contracted with Appalachian State University Energy Center to evaluate the options and look at the job and economic impacts of various scenarios.

Mr. Shirley said that the Council also called on the General Assembly to look at the Mountain Ridge Protection Act of 1983 as it pertains to wind energy. There is an specific exclusion of windmills in the law but there is a wide variety of controversy about whether or not the turbines used today are what was intended under that law.

Mr. Shirley said that ASU has developed wind maps for the mountain region and is now developing them for the coastal region.

Mr. Shirley said that a lot of effort and funding had been put into the GreenPower program. The State Energy Office is one of the largest contributors to this program, along with the Attorney General's office and Smithfield Farms settlement.

Mr. Shirley said that the Solar Center at NCSU has started a residential green building program and has formed a consortium of people involved in day lighting to encourage natural lighting in our schools, office buildings and other public facilities.

Mr. Shirley said that they are looking at the economic impacts of incorporating solar water heating in new housing.

Mr. Shirley said that there are about 20 states that have laws relating to disclosure, which the GreenPower program may address.

Mr. Shirley said that the government buildings have been the major focus for the last eighteen months in North Carolina. An ambitious goal was

set to reduce our energy consumption by 4 percent a year over the next five years, or a 20 percent total reduction in our energy uses.

Mr. Shirley said that the state now has strategic energy plans for nearly every university campus and most of our state agencies. We have saved $1 million in the last year.

Mr. Shirley said that the General Assembly passed a bill in 2003 that allows performance contractors to go out to state facilities and engage in contract where energy measures are performed and paid for out of the energy savings generated. Sixteen firms have been qualified and applications are in from four universities and agencies.

Mr. Shirley said it is the law in North Carolina that when you build a building, you do an analysis of life cycle costs and have that certified by the State Construction office before building begins. They are now evaluating a random sample of plans of recently constructed buildings with the State Construction office.

Mr. Shirley said that they have now turned their attention to local governments and finding financing alternatives for them. They have developed with the DPI a program to do strategic energy plans in the school systems. Seventy school systems have already been signed up.

Mr. Shirley said that in the residential sector, focus has been on what can be done with affordable housing. With the help of the General Assembly, $1 million has been provided from petroleum escrow funds for low-income housing programs.

Mr. Shirley said that one way of funding for the renewable energy programs in the state is through a public benefit fund, which is being evaluated by the Energy Policy Council. There are 14 other states with public benefit funds which is a small charge on your electric and gas bills which funds these programs.

Representative McComas asked Mr. Shirley if the State Energy Office was trying to adopt and promote an energy efficiency plan service for new homebuilders.

Mr. Shirley said that most of their services have been on low-income housing. Some of the utilities have an audit service for industrial clients but not for residential housing.

Representative McComas asked Mr. Shirley to bring this issue up to the Energy Policy Council and find ways to promote this.

Representative Hackney said that he and Senator Kinnaird have a constituent who is interested in bio fuels and burning vegetable oils at the State level and asked Mr. Shirley if the State Energy office would be interested in this project.

Mr. Shirley said that the State Energy office issued three requests in the last year for proposals for alternative fuels in sustainable communities and one for clean energy technologies. Bio diesel has a lot of promise in the state and would assist with environmental emissions.

Mr. Shirley said that a major bio diesel conference was planned in North Carolina to highlight and raise awareness of what bio diesel can do for the State.

Representative McComas asked Mr. Shirley if his office had discussed bio diesel with the engine manufacturers.

Mr. Shirley said that his office had not had those discussions with manufacturers but it is something that should be looked into.

The report on the implementation and initial findings of the NC GreenPower program by Carl L. Wilkins was deferred to the next meeting on 20 April 2004.

Representative McComas announced the field trip to Belews Creek in Stokes County and said that members had been provided with directions to the facility.

The meeting was adjourned at 3:45 p.m.

RE: **Notice of Meetings; Additional Information**

COMMISSION MEETING:

The Environmental Review Commission will meet at 9:30 a.m. Thursday 25 March 2004 in Room 643 of the Legislative Office Building in Raleigh.

At this meeting, the Commission will hear reports from State agencies, consider studies for which the Commission is responsible, discuss topics to be considered at future meetings, and attend to other matters. Listed below are potential agenda topics for this meeting. More specific information regarding the agenda for the 25 March meeting of the Commission will be developed at the staff planning meeting discussed below.

1) Interim Report on the Effectiveness of Surface Water Identification Training and Certification Program. (S.L. 2001-404, Sec. 2).

2) Annual Report on permitting and inspecting animal waste management systems/Animal Waste Compliance Report (G.S. 143-215.10M).

3) Annual Report on the compliance/enforcement of water quality laws for facilities that discharge into surface waters (G.S. 143-215.9A).

4) Report on the study conducted by the Department of Environment and Natural Resources regarding the use of general nondischarge permits for animal waste management systems for swine, cattle, and poultry operations on the land application and potential discharge of nitrogen and phosphorous to surface water and groundwater in the State (S.L. 2003-28, Sec. 2).

5) Annual report on the effectiveness of projects funded under the Agricultural Cost Share Program for Nonpoint Source Pollution Control (G.S. 143-215.74(e)).

6) Discussion of issues related to the evaluation of alternative animal waste management technologies to determine whether those technologies are environmentally superior and economically feasible.

7) Report on the resolution of issues related to Notices of Violation and Notices of Deficiency due to lagoon freeboard violations related to chronic rainfall conditions.

8) Information items on the State Energy Plan and NC GreenPower Program.

9) Information item on the Transportation Demand Management Program.

10) Annual report on the status of solid waste management efforts (G.S. 130A-309.06(c)).

11) Semiannual report on agency litter enforcement, litter prevention, and litter removal efforts (G.S. 147-12(b))

12) Annual report on the status of leaking petroleum underground storage tanks, the State cleanup funds, and the Groundwater Protection Loan Fund (G.S. 143-215.94M)

SITE VISIT:

The Commission may tour Duke Energy's Belews Creek Steam Station in Stokes County on **Friday 26 March 2004**. Belews Creek is being upgraded to control emissions pursuant to the S.L. 2002-4 (Clean Smokestacks Act) and is currently perhaps the largest construction project in the State. Detailed information about this possible site visit is being developed.

PLANNING MEETING:

To facilitate development of the agenda for the 25 March meeting of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel will hold an informal planning meeting at **10:00 a.m. on Friday 12 March 2004 in Room 605 of the Legislative Office Building**. Persons who wish to participate in the development of the agenda for meetings of the Commission, or who are interested in any matter before the Commission, are invited to attend.

SCHEDULE OF FUTURE MEETINGS:

Below is a schedule of meetings of the Commission for April through May 2004. Please note the following:

1. This schedule provides for a two-day meeting in April. In some months it may be desirable to have a two-day meeting to accommodate the workload. This also allows for the possibility of one or more out of town meetings that could include field trips. Thus this schedule is tentative and subject to adjustment. For planning purposes, however, please reserve these dates.

2. Meetings normally begin at 9:30 a.m., include a lunch break, and run until mid-afternoon. Please plan on meeting from 9:30 a.m. until 3:30 p.m.

3. To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel holds informal planning meetings for staff and interested parties. Commission members are not expected to attend these meetings.

4. The 2004 Regular Session is scheduled to begin at 12:00 noon on Monday 10 May. The Commission normally meets shortly after the beginning of the session to complete work on legislative proposals prior to the commission/committee bill request deadline, which in 2004 is 4:00 p.m. Wednesday 12 May. The Tuesday 11 May meeting date is tentatively scheduled for this purpose.

Commission Meeting	Staff Planning Meeting
9:30 a.m. Tuesday 20 April (tentative)	10:00 a.m. Tuesday 13 April
9:30 a.m. Thursday and Friday 22 and 23 April	10:00 a.m. Tuesday 13 April
9:30 a.m. Wednesday 5 May	
2:30 p.m. Tuesday 11 May	

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Leaking Petroleum Underground Storage Tank Working Group
10:00 a.m. Friday 12 March 2004– 605 Legislative Office Building

Chronic Rainfall Working Group
2:00 p.m. Monday 15 March 2004 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, please feel free to contact the Commission Counsel at (919) 733-2578.

AGENDA
9:30 a.m. Thursday 25 March 2004
Room 643 – Legislative Office Building

1. Call to order
   Senator Daniel G. Clodfelter, Presiding

2. Introductory remarks by Cochairs
   Senator Daniel G. Clodfelter
   Senator Charles W. Albertson
   Representative Pryor A. Gibson
   Representative Daniel F. McComas

3. Report to the Commission and explanation of agenda items
   George F. Givens, Commission Counsel

4. Status of petitions to the Administrator of the United States Environmental Protection Agency (EPA) filed by North Carolina under Section 126 of the federal Clean Air Act for purposes of reducing interstate transport of ozone and its precursors
   James C. Gulick, Senior Deputy Attorney General
   Environmental Division, North Carolina Department of Justice

5. Update on issues related to the Phase II stormwater rules
   George F. Givens, Commission Counsel

   James C. Gulick, Senior Deputy Attorney General
   Environmental Division, North Carolina Department of Justice

   Donnell "Trip" Van Noppen, III, Carolinas Office Director
   Southern Environmental Law Center

6. Discussion of issues related to the evaluation of alternative animal waste management technologies to determine whether those technologies are environmentally superior and economically feasible
   Charles M. "Mike" Williams, Director
   Animal Waste Management Center, North Carolina State University

Joseph Rudek, Senior Scientist
Environmental Defense

7a. Report on the study conducted by the Department of Environment and Natural Resources (DENR) regarding the use of general nondischarge permits for animal waste management systems for swine, cattle, and poultry operations on the land application and potential discharge of nitrogen and phosphorous to surface water and groundwater in the State (S.L. 2003-28, Sec. 2)

Forrest R. Westall, Regional Supervisor
Asheville Regional Office, Division of Water Quality, DENR

Thomas A. Reeder, Supervisor
Classification and Standards Unit, Division of Water Quality, DENR

7b. Report on the resolution by the 605 Working Group of issues related to Notices of Violation (NOVs) and Notices of Deficiency (NODs) for lagoon freeboard violations due to chronic rainfall conditions

M. Paul Sherman, Environmental Engineer
Division of Water Quality, DENR

7c. Comments on the general nondischarge permit study and on the resolution of issues related to freeboard violations due to chronic rainfall

Beth Anne Mumford, Director of Public Affairs
North Carolina Pork Council

Daniel J. Whittle, Senior Attorney
Environmental Defense

8. Report on the development of environmental management systems (EMS) for pork producers

Gary Hunt, Director
Division of Pollution Prevention and Environmental Assistance, DENR

9. Annual report on permitting and inspecting animal waste management systems/Animal Waste Compliance Report (G.S. 143-215.10M)

Coleen H. Sullins, Deputy Director
Division of Water Quality, DENR

10. Annual report on the compliance/enforcement of water quality laws for facilities that discharge into surface waters (G.S. 143-215.9A)

Coleen H. Sullins, Deputy Director
Division of Water Quality, DENR

LUNCH BREAK – Estimated for 12:30 p.m. to 1:15 p.m.

11. Report on the effectiveness of the Division of Water Quality's program to train and certify individuals to determine the presence of surface waters that would require the application of

rules adopted by the Environmental Management Commission for the protection of riparian buffers (S.L. 2001-404, Sec. 2); Report on efforts to update maps and other tools used to indicate the presence of surface water

Robert M. Zarzecki, Environmental Specialist
Wetlands/401 Certification Unit, Division of Water Quality, DENR

David L. Penrose, Environmental Biologist
Wetlands/401 Certification Unit, Division of Water Quality, DENR

12. Annual report on the status of solid waste management efforts (G.S. 130A-309.06(c))

James C. Coffey, Chief
Solid Waste Section, Division of Waste Management, DENR

Paul S. Crissman, Head
Planning and Program Management Branch, Solid Waste Section, Division of Waste Management, DENR

Scott B. Mouw, Chief
Community and Business Assistance Section, Division of Pollution Prevention and Environmental Assistance, DENR

13. Report on the Energy Policy Council and the revision of the State Energy Plan

Larry E. Shirley, Director
State Energy Office, Department of Administration

14. Report on the implementation and initial findings of the NC GreenPower program

Carl L. Wilkins, Program Manager
NC GreenPower, Advanced Energy

15. Commission discussion and announcements

16. Adjourn

SCHEDULE OF FUTURE MEETINGS:

Friday 26 March 2004 -- Site Visit to Belews Creek Steam Station
On Friday 26 March 2004, those members and staff of the Commission who can participate will tour Duke Power's Belews Creek Steam Station. The Belews Creek Steam Station is located north of Winston-Salem in southeastern Stokes County. The tour will begin at 11:30 a.m. and should finish by approximately 2:00 p.m. No business meeting will be held in connection with this tour.

Tuesday 13 April 2004 -- Staff Planning Meeting
To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel will hold an informal public planning meeting for staff and interested parties at 10:00 a.m. on Tuesday 13 April 2004 in room 605 of the Legislative Office Building. This meeting will serve as the public

Commission Staff Planning Meeting for the Commission meetings scheduled for 20 April 2004, 22 April 2004, 5 May 2004 and 11 May 2004.

Tuesday 20 April 2004 -- Regular Business Meeting
Time: 9:00 a.m.
Location: 1228 Legislative Building

Thursday 22 April and Friday 23 April 2004 – Special business meeting in Brevard; Site visit to Gorges State Park and Dupont State Forest
The Commission will hold a special business meeting in Brevard on Thursday 22 April 2004 at a time to be determined. This special meeting will focus primarily on various matters related to land conservation and preservation of open spaces and will be held in conjunction with a tour of Gorges State Park, Dupont State Forest, and other sites on Thursday 22 April 2004 and Friday 23 April 2004. Specific directions, information on accommodations, and a more detailed itinerary will be provided at a later date.
Time: To be determined
Location: Specific location in Brevard to be determined

Wednesday 5 May 2004 -- Regular Business Meeting
Time: 9:30 a.m.
Location: 643 Legislative Office Building

Tuesday 11 May 2004 -- Regular Business Meeting
Time: 2:30 p.m. (tentative)
Location: 643 Legislative Office Building

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

March 23, 2004

Mr. George Givens
Commission Counsel
Room 541 Legislative Office Building
300 North Salisbury Street
Raleigh, North Carolina 27611

Dear Mr. Givens:

Pursuant to Senate Bill 352, Section 15.14, the General Assembly required that the Cape Fear River Assembly, Inc., report to the Environmental Review Commission regarding uses of funds appropriated to the Cape Fear River Assembly by the 1997 Session of the General Assembly. Although, this reporting requirement was repealed in House Bill 1006 of Session 2001, a Cape Fear River Funds status report was considered appropriate due to a reallocation of funds. This report on the Cape Fear River Program includes the twenty-fifth quarter of activity.

If you have any questions, please contact me at (910)-223-4601.

Sincerely,

Don Freeman

Don Freeman
Executive Director

CAPE FEAR RIVER ASSEMBLY

QUARTERLY REPORT TO THE NORTH CAROLINA GENERAL ASSEMBLY

REPORT PERIOD: October 1, 2003 through December 31, 2003

Fiscal disbursements for the twenty fifth quarter of activity after the N.C. General Assembly 1997 appropriation of $1,500,000 to the Cape Fear River Assembly were $0.

Measures/Actions taken during the report period were as follows:

1) All Lower and Middle Basin projects supported by this appropriation have been completed.

2) All Upper Basin projects supported by this appropriation were completed except for the Comprehensive Monitoring project, the GIS support services project, the Upper Storm Event Sampling project, and the Upper Watershed Management project.

3) The Upper Basin Comprehensive Monitoring project was approved to be conducted through April 30, 2004 and $35,914 remain to be applied therein.

4) The GIS support services project, the Upper Storm Event Sampling project, and the Upper Watershed Management project were to have been completed approximately two or more years ago. Of the $285,432 approved for these three projects, $194,185 has been paid for work completed. Requests for project extensions have not been received, and, accordingly, the $91,247 remaining from these three expired projects will be applied to other Cape Fear River Basin water resource research projects/efforts.

DRY-CLEANING SOLVENT CLEANUP ACT ANNUAL REPORT

Executive Summary

As required by the Dry-Cleaning Solvent Cleanup Act (DSCA) of 1997 and amendments (G.S. 143-215.104A *et seq.*), this report provides an annual update on activities conducted in the Dry-Cleaning Solvent Cleanup Act Program in 2003. The DSCA of 1997 and its amendments created a fund for assessment and cleanup of drycleaning solvent environmental contamination at dry-cleaning and wholesale distribution facilities.

Significant progress has been made in all aspects of program implementation. Areas of program development showing the most progress are Prioritization Assessment Agreements, work authorizations, Prioritization Assessments, priority ranking, guidance development, database development, outreach and contracting.

The Department of Environment and Natural Resources (DENR) has identified152 operating or abandoned drycleaning facilities with environmental contamination by drycleaning solvent. Of these, 85 have voluntarily petitioned for acceptance, and 82 have been certified into the DSCA Program. During 2003, assessment and/or remediation have been authorized at 23 sites and 17 sites have been assigned a priority ranking score.

Currently, the majority of claims against the Fund are for "past costs." The DSCA Program is authorized to reimburse petitioners for reasonable, necessary and documented costs incurred between October 1997 and June 2001 in certain situations. Petitioners have submitted past cost reimbursement claims for 13 sites totaling $2,612,290. These claims are currently under review. Once all 13 sites have been ranked as to priority, reimbursements will be made in the order of highest to lowest priority. The cost of the authorized work is $318,920.60. Of that amount, approximately $110,000 will exceed site deductibles and will be reimbursed to petitioners.

With the infusion of the sales tax monies, which began in July 2003, DSCA now appears to have sufficient financial resources to assess and clean up the contaminated drycleaning facilities identified to date by DENR. New discoveries will continue to be reported, largely due to property transactions. However, with 14 new sites reported in 2003, if the rate of discovery remains steady, the influx of new sites into the program should not overwhelm the DSCA Fund.

Program Status

The DENR has made significant progress in implementing the DSCA. DENR has solicited input from members of the DSCA Stakeholders Working Group (DSCA Stakeholders) and other interested parties to develop new policies and procedures. This group includes the following:

- DENR representatives and its attorney from the Department of Justice,

- Drycleaners from leadership of the North Carolina Association of Launderers and Cleaners,
- Environmental consultants,
- Representatives from environmental advocacy organizations,
- Drycleaners using alternative dry-cleaning technologies,
- North Carolina State University's School of Textiles faculty, and
- Private attorneys representing drycleaners and shopping centers.

A summary of DSCA program status is provided in Table 1 and a discussion of significant achievements follows. Specific areas of discussion include rule making, program development, contracting, work authorizations, prioritization assessments, site priority ranking, database development and outreach.

Table 1. Summary of DSCA Program Status

DSCA Process	Status as of October 1, 2003
Step 1. The drycleaner or property owner petitions DENR for certification.	To date, 85 sites have petitioned for entry into the Program. The main motivating factors for petitioning have been real estate transactions and redevelopment.
Step 2. DENR certifies the site and checks for imminent threats.	Of the 85 sites that have petitioned, 82 sites have been certified into the Program. The 3 sites that have not yet been certified are currently under review. Each petition is reviewed for imminent threats to human health and the environment. Drinking water sources have been identified in proximity to several sites. Evaluation of potential imminent threats has been expedited for these sites.
Step 3. The drycleaner signs an assessment agreement with DENR.	The Prioritization Assessment Agreement (PAA) is a legally binding agreement between DENR and the petitioner that commits the Petitioner to conduct a prioritization assessment (PA) at the site. DSCA has prepared 78 PAAs, of which 71 have been executed.
Step 4. The drycleaner conducts a prioritization assessment.	Following execution of the PAA, petitioners have 30 days to submit a detailed PA work plan and corresponding cost proposal to DSCA for approval. To date, 23 PA proposals have been negotiated and approved; 15 PAs are complete.
Step 5. DENR ranks the site and checks again for imminent threats.	Information collected during the PA is used by DSCA to rank each site in terms of risk to human health and the environment. The DSCA Prioritization Ranking System and supporting database application were developed to efficiently assign priority ranking scores to sites. To date, 17 sites have been prioritized and both higher and lower priority sites have been identified. Monitoring is being conducted of public and private supply wells at several higher priority sites.
Step 6. DENR contracts for comprehensive assessment and cleanup.	After the PA stage is complete and the site is ranked, the drycleaner will typically no longer have to contract for additional site work. DENR will contract directly for site investigation and cleanup using four state-lead environmental and engineering firms. These four firms will be granted initial contracts totaling $2.4 million.

Rule Making

DENR has been delegated the task of developing proposed rules that establish a risk-based approach to assess, prioritize and clean up dry-cleaning solvent contamination that resulted from releases at certified facilities or abandoned sites. DSCA is developing a two-fold framework to create the risk-based rules. First, there are ongoing discussions with the DSCA Stakeholders. Second, review of risk-based rules developed by other states with drycleaning solvent cleanup programs is taking place. DSCA will begin drafting proposed rules in late fall of 2003.

Program Development

The primary objective of DSCA in 2003 was to fully implement the program. To attain this goal, DSCA staff directed significant energy towards the development of needed policies and procedures. In addition, staff focused on reviewing petitions, determining site eligibility, executing agreements with petitioners, screening sites for imminent hazards, supply well sampling and prioritizing sites for corrective action.

DSCA has created several new procedural forms and guidance documents for use by petitioners and others (e.g., attorneys, developers, environmental consultants.) To reduce resource consumption and optimize customer service, DSCA uses its Web site (www.ncdsca.org) and e-mail as the primary means to deliver program documents to its customers. Procedures, forms and documents that were finalized during 2003 include the following:

- Prioritization Assessment (PA) Work Plans and Cost Proposals Guidance
- Prioritization Assessment Agreements (PAAs)
- Work Authorization Forms
- Change Order Forms
- Prioritization Ranking Form (PRF)
- Prioritization Scoring Letter Form
- Certification of Cost Forms
- Disbursement Request Forms
- Professional Services Rate Table

Work Authorizations

Work plan review has been an especially important and labor intensive task for DSCA during 2003. Guidance was developed in 2002 to assist environmental contractors in developing work plans and cost proposals (proposals) and to streamline DSCA's review. However, work plans submitted to DSCA have required detailed technical and financial review and negotiations with consultants. DSCA has reviewed and approved proposals for assessment or remediation at 23 sites.

At this phase of program development, it is critical that the review process focuses on continuity and consistency in terms of work plan scope and work plan costing. This is

being achieved using a multi-phased approach. Each DSCA project manager reviews work plans for cost effectiveness and technical soundness. The DSCA Program Manager is then responsible for the final review of each authorized work plan. This ensures consistency between project managers and individual projects. The DSCA database has been expanded to allow for input of all work plan costing details. Access to this data helps the DSCA project managers maintain consistency in approved costs. In the future, reasonable rates may be developed from the database. DSCA considers the time devoted to current work plans as essential; decisions made now may well drive future policies.

Prioritization Assessments

DSCA uses information collected during the PA to rank sites in terms of their relative threat to human health and the environment. DSCA has reviewed work plans and issued work authorization for consultants to complete PAs at 23 sites. Additionally, DSCA project managers prepared Prioritization Ranking Forms (PRFs) and ranked 3 sites with files containing sufficient information. To date, 14 PAs have been completed.

Prioritization Assessment Ranking

Environmental contractors are required to report their PA findings in a Prioritization Assessment Report (PAR) and complete a PRF. DSCA uses the PRF to assign a numeric ranking score to each site. Currently, 17 sites are ranked. Both higher and lower priority sites have been identified. DSCA will address sites based on their score and the availability of monies in the DSCA Fund.

Contracting

DSCA made progress toward establishing state-lead contracts for environmental services in 2003. The State Building Commission approved DSCA to award four contracts in November 2002. These four firms will be granted initial contracts totaling $2.4 million. Contract negotiations are currently in progress and contracts should be in place by January 2004.

Database Application

DSCA has invested significant time and effort to develop and refine its database/GIS application. Rapid application development techniques have been used to ensure DSCA's ability to manage data is flexible and can grow with the program. Technical and financial information has been entered into the database. Its programmatic tracking and reporting applications are frequently revised to respond to changing information management needs.

Major improvements in 2003 focused on refining the database so that it could track project account details. Reporting capabilities include project status, planned site actions, site deductibles, costs applied toward the deductible, past cost reimbursements, invoices, payments, work authorized on a per cost basis, and change orders.

Outreach

DENR continues its outreach efforts to educate drycleaners about the Minimum Management Practices Rules (15A NCAC 2S) and DSCA procedures and policies. DSCA staff have spoken at North Carolina Association of Launderers and Cleaners (NCALC) and local Korean drycleaners association meetings. DSCA has published several articles in the NCALC newsletters in an effort to reach all drycleaners in North Carolina. Outreach efforts have also been made to shopping mall owners, environmental service providers and the legal community.

DSCA uses its web address, www.ncdsca.org, to provide programmatic information, guidance documents, applicable laws, rules and downloadable forms to assist the public and the regulated community.

Finally, DSCA has continued its association with dry-cleaning programs in other states through its participation in the State Coalition for the Remediation of Drycleaners. This work group is sponsored by the EPA's Technology Innovation Office. DSCA has benefited greatly from this organization by learning from the experiences of other states.

Annual Report Elements Required by G.S. 143-215.104U

(1) DRY-CLEANING SOLVENT CONTAMINATION REPORTED TO THE DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

DSCA maintains files and a database inventory of 152 sites that are contaminated by drycleaning solvent. This number represents all drycleaning solvent releases known to DENR, assuming other agencies have forwarded notices of release to DSCA. However, it has been estimated that over 900 contaminated current or former dry cleaning sites exist in North Carolina. Table 2 provides a list, by county, of all sites contaminated with dry cleaning solvent. A total of 14 new drycleaning solvent releases were reported to DSCA in 2003. The new reports appear to have resulted from real estate transactions and redevelopment projects.

(2) SITES CERTIFIED BY THE COMMISSION

DSCA must review a petition and the site file to determine if the site and the petitioner meet the statutory criteria for certification into the Program. Of the 85 sites that have petitioned for Program entry, 82 have been certified into the Program. The three sites that have not yet been certified have newly received petitions that are currently under review. The certified sites, along with the dates of certification, are shown in Table 2.

Distribution and Classification of Petitions[1]		
Property Owners	68	64
Dry Cleaning Business Owners/Operator	39	36

(3) COST ESTIMATE FOR ASSESSMENT AND REMEDIATION OF CERTIFIED SITES

Comprehensive assessment and cleanup at certified sites is pending as sites are prioritized and contracts with state-lead contractors are executed. Therefore, there is no reason to revise the cost estimates from previous annual reports. For the purpose of estimating, it is assumed that 30 percent of sites that enter the program will require active cleanup and that the remainder will require monitored natural attenuation prior to risk-based closure. An active remedy is estimated to require a capital outlay of approximately $300,000 and operating costs of $50,000 annually after the first year. Natural attenuation demonstrations and groundwater monitoring for sites where a less active remedy is warranted are estimated to cost $50,000 per year.

Actual site costs are anticipated to vary widely from site to site. Costs will vary depending on site geology, age of release, the chemical nature of the solvents released, and threats posed to potential receptors. However, there is an annual spending cap of $200,000 per site unless they pose an imminent threat to public health. In these cases, annual expenditures are capped at $400,000 per site.

DSCA's efforts to control costs have been quite successful. Project cost control measures are applied at the beginning of site work in the PA stage. Since every DSCA site must have a PA to be ranked, it is important that these cost control measures be applied

[1] Reflects multiple petitioners for some sites.

effectively. DSCA reviews, negotiates and pre-approves all proposals. Staff analyze proposed costs using their professional knowledge and experience. They also compare proposals using DSCA's cost tracking database. DSCA also refers to cost control policies developed by the Underground Storage Tank Section for general guidance. All proposals are required to provide sufficient detail (e.g., unit costs, subcontractor bids) to allow for an effective pre-approval review.

Thus far, the cost of a PA appears to average about $13,000. This figure falls within the $10,000 to $15,000 range DENR originally estimated for these initial assessments. This cost typically includes soil sampling, installation of three to four monitoring wells, a thorough receptor survey, and preparation of the PA Report and Prioritization Ranking Form.

(4) RECEIPTS AND DISBURSEMENTS FOR THE FUND

The primary funding sources for the dry-cleaning solvent cleanup fund are a tax on dry-cleaning solvents and, beginning in July 2003, the state portion of the current sales tax on dry-cleaning. The DSCA Fund's finances through August 2003 are summarized below:

Collections FY 97-98	$ 474,717.47
Collections FY 98-99	$ 927,004.50
Collections FY 99-00	$ 968,993.09
Collections FY 00-01	$ 863,772.16
Collections FY 01-02	$1,061,298.70
Collections FY 02-03	$1,076,826.57
Collections YTD (8/03)	$2,330,693.82
Total Collections as of September 2003	$7,703,306.31
Less Dept. of Revenue Expenses (all years)	$ 13,986.10*
Less Contractor Expense	$ 490.00
Fund Balance	$7,688,830.21
DENR Administrative Allowance	$1,960,323.27
Balance for Assessment and Cleanup of Sites	**$5,728,506.94**

* This represents the actual amount charged by the Department of Revenue for its expenses. The Department of Revenue is authorized to charge no more than $125,000 per year by DSCA.

(5) CLAIMS AGAINST THE FUND

There are two types of claims against the DSCA Fund. The majority of claims come from petitioners that incurred past investigative/remedial costs in response to an order or notice of violation from DENR prior to DSCA implementation. Reasonable, necessary and documented costs in excess of $50,000, incurred from October 1, 1997 through June 30, 2001, are reimbursable. Thirteen petitioners submitted claims for reimbursement of past cost expenditures totaling $2,612,290.79. As per DSCA, claims will be paid in order

of site priority. Payout for past cost claims is limited by DSCA to 10 percent of the DSCA Fund's income in the previous year.

In addition, the law allows petitioners to apply past costs toward the site's deductible in some circumstances. Fifteen petitioners submitted claims for application toward their site's deductible totaling $336,948.99.

The second type of claim against the DSCA Fund is for approved costs for site work which exceed the site's deductible. To date, 23 sites have at least one authorized work plan for site work. The total amount authorized to date is $318,920.60. Of the 23 sites with authorized work, six have approved costs that exceed the site's deductible and will require payout from the DSCA Fund. It is estimated that this payout will not exceed $115,000.

In 2003, DSCA created the infrastructure to support accurate and timely reimbursement payments to petitioners and/or environmental consultants for costs incurred which exceed the site's deductible. Three reimbursement checks have been issued to date and other invoices are currently under review.

(6) RECOMMENDATIONS TO ASSURE THE SOLVENCY OF THE FUND

The DENR has no recommendations regarding fund solvency at this time. Prior to passage of statutory amendments to the DSCA in 2000 (S.L.2000-19), it was clear that the fund balance was inadequate to address all of the dry-cleaning sites in the state. However, with the passage of the DSCA Amendments that established a second funding mechanism, the General Assembly took the most important step necessary to assure future fund solvency. With the infusion of the sales tax monies, which began July 2003, DSCA now appears to have sufficient financial resources to assess and remediate the contaminated drycleaning facilities on a priority basis.

The Fiscal Note on the DSCA Amendments (S.L. 2000-19) anticipated that the funding mechanisms would provide the fund with $8 million to $10 million annually. This estimate has been borne out by our first quarter 2003 installment of sales tax of $2,159,258.40. As a direct result, the DSCA Program is solvent.

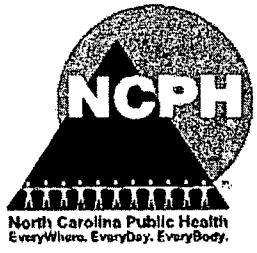
It is of interest to note that other state dry-cleaning solvent cleanup programs are examining sales tax earmarking funding mechanisms, similar to that employed by the North Carolina General Assembly in the DSCA Amendments (S.L. 2000-19) to ensure their state fund's solvency.

March 25, 2004 ERC Meeting
EXHIBIT E

THE NORTH CAROLINA PUBLIC HEALTH TASK FORCE 2004 PUBLIC HEALTH IMPROVEMENT PLAN

PRELIMINARY RECOMMENDATIONS

Strengthening public health infrastructure is important. Either we are all protected or we are all at risk.
The Public Health Foundation



PART I: CORE INFRASTRUCTURE

Structure & Organization Committee

7. Create three (3) public health "incubators" to support regional collaboration by sharing resources and developing economies of scale. $375,000 one time funding
8. Reunite the Division of Environmental Health from the Department of Environment and Natural Resources (DENR) with the Division of Public Health under the leadership of the State Health Director in the Department of Health and Human Services (DHHS).
9. Require that the position of State Health Director report directly to the Secretary of the DHHS.
10. Drive collaboration of local health departments and any related structural changes at the local and state level through the accreditation process.
11. Perform and distribute a Self Assessment of the Division of Public Health using National Performance Standards.

Planning & Outcomes Committee

12. Improve the data and epidemiology to drive state and local decision-making and allocation of resources.

    ⇒ Establish a common set of core health indicators.
    ⇒ Build capacity to conduct the Behavioral Risk Factor Surveillance Survey (BRFSS) to provide county specific or county cluster specific data. $300,000
    ⇒ Enhance the opportunities to collect and report county or county cluster health information on children (e.g. Youth Risk Behavior Survey).
    ⇒ Identification and analysis of existing state and local public health problems, health disparities, and potential threats. $100,000
    ⇒ Identify the best scientific and evidence-based strategies to address identified public health problems at the local level. $200,000
    ⇒ Provide epidemiology training for local partners. $200,000

GENERAL ASSEMBLY OF NORTH CAROLINA
SESSION 1997

SESSION LAW 1998-76
HOUSE BILL 1433

AN ACT TO EXTEND THE STUDY OF THE ORGANIZATIONAL STRUCTURE AND ADMINISTRATIVE PLACEMENT OF THE PROGRAMS IN THE DIVISION OF ENVIRONMENTAL HEALTH OF THE DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES AND TO EXPAND THE SCOPE OF THE STUDY TO INCLUDE THE ORGANIZATION, FUNCTIONS, POWERS, AND DUTIES OF THE VARIOUS BOARDS, COMMISSIONS, AND COUNCILS HAVING JURISDICTION OVER ENVIRONMENTAL, PUBLIC HEALTH, AND NATURAL RESOURCES PROGRAMS, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION.

Section 1. Section 11A.127 of S.L. 1997-443 reads as rewritten:

"Section 11A.127. Pending ~~the results of~~ action by the General Assembly on the recommendations of the Environmental Review Commission resulting from the study to be undertaken by the Environmental Review Commission as provided in this Part, on-site wastewater functions, public drinking water programs, and environmental health programs shall remain in the Department of Environment and Natural Resources, the Division of Environmental Health, shall remain intact in the Department of Environment and Natural Resources, and the Department of Environment and Natural Resources shall not consolidate on-site wastewater functions or drinking water programs in the Division of Water Quality."

Section 2. Section 11A.128 of S.L. 1997-443 reads as rewritten:

"Section 11A.128. The Environmental Review Commission shall study the following issues and report its findings to the ~~1997 General Assembly, Regular Session 1998,~~ 1999 General Assembly, along with any legislation it proposes to address these issues:

(1) The appropriate roles and financing of local and state agencies in reviewing, permitting, inspecting, and monitoring private wells, community wells, municipal wells, and municipal surface water supplies;

(2) The appropriate roles and financing of local and State agencies in reviewing, permitting, inspecting, monitoring, and maintaining septic tanks, package wastewater treatment plants, municipal wastewater treatment plants, industrial treatment plants, and animal waste operations;

(3) The appropriate roles and financing of local and State agencies in administering the various environmental health programs;

(4) The integration of State's review of the financial integrity of applicants for drinking water and wastewater discharge permits;
(5) Policies to monitor the quality and prevent and reduce pollution of groundwaters;
(6) Consistent State policies for cleaning up contaminated groundwater and soils;
(7) Coordination of adoption and development of policies by the Coastal Resources Commission, Environmental Management Commission, Commission on Health Services, Marine Fisheries Commission, and other commissions having roles in water quality or wastewater issues;
(8) Policies to monitor the quality and prevent and reduce pollution of surface waters;
(9) Organization of the State's water planning agencies;
(10) Technical and financial assistance to business, industry, local governments, and citizens;
(11) Policies to encourage water conservation;
(12) Policies to encourage regional water supply and wastewater treatment planning; and
(13) The role of the North Carolina Cooperative Extension Services, North Carolina Department of Agriculture, and the North Carolina Department of Transportation in the protection of water supplies.
(14) The organization, functions, powers, and duties of the various boards, commissions, and councils having jurisdiction over environmental, public health, and natural resources programs, including whether those functions, powers, and duties should be consolidated in a single commission."

Section 3. Section 11A.129 of S.L. 1997-443 reads as rewritten:

"Section 11A.129. The Secretary of Health and Human Services may reorganize the Department of Health and Human Services in accordance with G.S. 143B-10 and shall report as required by that section. In addition, the Department of Health and Human Services shall do the following:

(1) Report to the Joint Legislative Commission on Governmental Operations by December 31, 1997, on the Department's progress in incorporating health functions and agencies into the Department;
(2) Report to the General Assembly by ~~May 1, 1998,~~ 1 February 1999 on additional changes, including proposed legislation necessary to effectuate the purposes of this Part including the findings of the Environmental Review Commission's study.
(3) Report to the Joint Legislative Commission on Governmental Operations by ~~October 31, 1998,~~ 1 February 1999 on any proposed changes in the Department's structure of boards and commissions not already implemented as a result of the Environmental Review Commission's study or necessary to effectuate the purposes of this Part and to deliver services more efficiently;

(4) Report to the General Assembly by February 1, 1999, on the Department's progress in adopting any rule changes necessary to effectuate the purposes of this Part and any proposed legislation necessary to change the structure of any boards and commissions as reported to the Joint Legislative Commission on Governmental Operations."

Section 4. This act is effective when it becomes law.

In the General Assembly read three times and ratified this the 30th day of July, 1998.

Approved 11:55 a.m. this 6th day of August, 1998

GENERAL ASSEMBLY OF NORTH CAROLINA
1997 SESSION

S.L. 1997-443
SENATE BILL 352

AN ACT TO MAKE APPROPRIATIONS FOR CURRENT OPERATIONS AND FOR CAPITAL IMPROVEMENTS FOR STATE DEPARTMENTS, INSTITUTIONS, AND AGENCIES, AND FOR OTHER PURPOSES.

PART I. INTRODUCTION AND TITLE OF ACT

INTRODUCTION

Section 1. The appropriations made in this act are for maximum amounts necessary to provide the services and accomplish the purposes described in the budget. Savings shall be effected where the total amounts appropriated are not required to perform these services and accomplish these purposes and, except as allowed by the Executive Budget Act, or this act, the savings shall revert to the appropriate fund at the end of each fiscal year.

TITLE OF ACT

Section 1.1. This act shall be known as "The Current Operations and Capital Improvements Appropriations Act of 1997."

PART II. CURRENT OPERATIONS/GENERAL FUND

Section 2. Appropriations from the General Fund of the State for the maintenance of the State departments, institutions, and agencies, and for other purposes as enumerated are made for the biennium ending June 30, 1999, according to the following schedule:

Current Operations - General Fund	1997-98	1998-99
General Assembly	$ 31,226,277	$ 34,642,598
Judicial Department	327,814,503	327,102,308
Office of the Governor		
01. Office of the Governor	5,232,934	5,150,352
02. Office of State Budget and Management	13,923,220	10,930,838
03. Office of State Planning	1,802,450	1,815,850

Section . Pending the results of the study to be undertaken by the Environmental Review Commission as provided in this Part, on-site wastewater functions, public drinking water programs, and environmental health programs shall remain in the Department of Environment and Natural Resources, the Division of Environmental Health, shall remain intact in the Department of Environment and Natural Resources, and the Department of Environment and Natural Resources shall not consolidate on-site wastewater functions or drinking water programs in the Division of Water Quality.

Section 11A.128. The Environmental Review Commission shall study the following issues and report its findings to the 1997 General Assembly, Regular Session 1998, along with any legislation it proposes to address these issues:

(1) The appropriate roles and financing of local and state agencies in reviewing, permitting, inspecting, and monitoring private wells, community wells, municipal wells, and municipal surface water supplies;

(2) The appropriate roles and financing of local and State agencies in reviewing, permitting, inspecting, monitoring, and maintaining septic tanks, package wastewater treatment plants, municipal wastewater treatment plants, industrial treatment plants, and animal waste operations;

(3) The appropriate roles and financing of local and State agencies in administering the various environmental health programs;

(4) The integration of State's review of the financial integrity of applicants for drinking water and wastewater discharge permits;

(5) Policies to monitor the quality and prevent and reduce pollution of groundwaters;

(6) Consistent State policies for cleaning up contaminated groundwater and soils;

(7) Coordination of adoption and development of policies by the Coastal Resources Commission, Environmental Management Commission, Commission on Health Services, Marine Fisheries Commission, and other commissions having roles in water quality or wastewater issues;

(8) Policies to monitor the quality and prevent and reduce pollution of surface waters;

(9) Organization of the State's water planning agencies;

(10) Technical and financial assistance to business, industry, local governments, and citizens;

(11) Policies to encourage water conservation;

(12) Policies to encourage regional water supply and wastewater treatment planning; and

(13) The role of the North Carolina Cooperative Extension Services, North Carolina Department of Agriculture, and the North Carolina Department of Transportation in the protection of water supplies.

Section 11A.129. The Secretary of Health and Human Services may reorganize the Department of Health and Human Services in accordance with G.S. 143B-10 and shall report as required by that section. In addition, the Department of Health and Human Services shall do the following:

(1) Report to the Joint Legislative Commission on Governmental Operations by December 31, 1997, on the Department's progress in incorporating health functions and agencies into the Department;

(2) Report to the General Assembly by May 1, 1998, on additional changes, including proposed legislation necessary to effectuate the purposes of this Part including the findings of the Environmental Review Commission's study.

(3) Report to the Joint Legislative Commission on Governmental Operations by October 31, 1998, on any proposed changes in the Department's structure of boards and commissions not already implemented as a result of the Environmental Review Commission's study or necessary to effectuate the purposes of this Part and to deliver services more efficiently;

(4) Report to the General Assembly by February 1, 1999, on the Department's progress in adopting any rule changes necessary to effectuate the purposes of this Part and any proposed legislation necessary to change the structure of any boards and commissions as reported to the Joint Legislative Commission on Governmental Operations.

SUBPART 3. CHANGE THE TERM "AMBULANCE ATTENDANT"TO "MEDICAL RESPONDER"AND CHANGE THE STATUTES RELATING TO MEDICAL RESPONDERS.

Section 11A.129A. G.S. 14-34.6 reads as rewritten:

"**§ 14-34.6. Assault or affray on an emergency medical technician, ~~ambulance attendant,~~ medical responder, emergency department nurse, or emergency department physician.**

(a) A person is guilty of a Class A1 misdemeanor if the person commits an assault or an affray on an emergency medical technician, ~~ambulance attendant,~~ medical responder, emergency department nurse, or emergency department physician while the technician, attendant, nurse, or physician is discharging or attempting to discharge official duties.

(b) Unless a person's conduct is covered under some other provision of law providing greater punishment, a person is guilty of a Class I felony if the person violates subsection (a) of this section and (i) inflicts bodily injury or (ii) uses a deadly weapon other than a firearm.

(c) Unless a person's conduct is covered under some other provision of law providing greater punishment, a person is guilty of a Class F felony if the person violates subsection (a) of this section and uses a firearm."

Section 11A.129B. G.S. 14-276.1 reads as rewritten:

"**§ 14-276.1. Impersonation of firemen or emergency medical services personnel.**

or private grants, receipts becoming a part of special funds by act of the General Assembly or any other funds available to a State department or institution may be utilized for advance planning through the working drawing phase of capital improvement projects, upon approval of the Director of the Budget. The Director of the Budget may make allocations from the Advance Planning Fund for advance planning through the working drawing phase of capital improvement projects, except that this revolving fund shall not be utilized by the Board of Governors of The University of North Carolina or the State Board of Community Colleges.

Requested by: Senators Plyler, Perdue, Odom, Representatives Russell, G. Wilson

APPROPRIATIONS LIMITS/REVERSION OR LAPSE

Section 34.16. Except as permitted in previous sections of this act, the appropriations for capital improvements made by the 1997 General Assembly may be expended only for specific projects set out by the 1997 General Assembly and for no other purpose. Construction of all capital improvement projects enumerated by the 1997 General Assembly shall be commenced, or self-liquidating indebtedness with respect to them shall be incurred, within 12 months following the first day of the fiscal year in which the funds are available. If construction contracts on those projects have not been awarded or self-liquidating indebtedness has not been incurred within that period, the direct appropriation for those projects shall revert to the original source, and the self-liquidating appropriation shall lapse; except that direct appropriations may be placed in a reserve fund as authorized in this act. This deadline with respect to both direct and self-liquidating appropriations may be extended with the approval of the Director of the Budget up to an additional 12 months if circumstances and conditions warrant such extension.

PART XXXV. MISCELLANEOUS PROVISIONS

Requested by: Senators Plyler, Perdue, Odom, Representatives Holmes, Creech, Esposito, Crawford

EXECUTIVE BUDGET ACT APPLIES

Section 35. The provisions of the Executive Budget Act, Chapter 143, Article 1 of the General Statutes, are reenacted and shall remain in full force and effect and are incorporated in this act by reference.

Requested by: Senators Plyler, Perdue, Odom, Representatives Holmes, Esposito, Creech, Crawford

COMMITTEE REPORT

Section 35.1. (a) The Conference Report on the Continuation, Expansion and Capital Budgets, dated August 27, 1997, which was distributed in the Senate and the House of Representatives and used to explain this act, shall indicate action by the General Assembly on this act and shall therefore be used to construe this act, as provided in G.S. 143-15 of the Executive Budget Act, and for these purposes shall be considered a part of this act and as such shall be printed as a part of the Session Laws.

(b) The budget enacted by the General Assembly for the maintenance of the various departments, institutions, and other spending agencies of the State for the 1997-99 fiscal biennium is a line item budget, in accordance with the Budget Code Structure and the State Accounting System Uniform Chart of Accounts set out in the Administrative Policies and Procedures Manual of the Office of the State Controller. This budget includes the appropriations made from all sources including the General Fund, Highway Fund, special funds, cash balances, federal receipts, and departmental receipts.

The General Assembly amended the itemized budget requests submitted to the General Assembly by the Director of the Budget and the Advisory Budget Commission, in accordance with the steps that follow and the line item detail in the budget enacted by the General Assembly may be derived accordingly:

(1) The negative reserve set out in the submitted budget was deleted and the totals were increased accordingly.

(2) The base budget was adjusted in accordance with the base budget cuts and additions that were set out in the Conference Report on the Continuation, Expansion and Capital Budgets, dated August 27, 1997, together with any accompanying correction sheets.

(3) Transfers of funds supporting programs were made in accordance with the Conference Report on the Continuation, Expansion and Capital Budgets, dated August 27, 1997, together with any accompanying correction sheets.

The budget enacted by the General Assembly shall also be interpreted in accordance with the special provisions in this act and in accordance with other appropriate legislation.

In the event that there is a conflict between the line item budget certified by the Director of the Budget and the budget enacted by the General Assembly, the budget enacted by the General Assembly shall prevail.

Requested by: Senators Plyler, Perdue, Odom, Representatives Holmes, Creech, Esposito, Crawford

MOST TEXT APPLIES ONLY TO 1997-99

Section 35.2. Except for statutory changes or other provisions that clearly indicate an intention to have effects beyond the 1997-99 fiscal biennium, the textual provisions of this act apply only to funds appropriated for, and activities occurring during, the 1997-99 fiscal biennium.

Requested by: Senators Plyler, Perdue, Odom, Representatives Holmes, Creech, Esposito, Crawford

EFFECT OF HEADINGS

Section 35.3. The headings to the parts and sections of this act are a convenience to the reader and are for reference only. The headings do not expand, limit, or define the text of this act, except for effective dates referring to a Part.

Requested by: Senators Plyler, Perdue, Odom, Representatives Holmes, Creech, Esposito, Crawford

SEVERABILITY CLAUSE

Section 35.4. If any section or provision of this act is declared unconstitutional or invalid by the courts, it does not affect the validity of this act as a whole or any part other than the part so declared to be unconstitutional or invalid.

Requested by: Senators Plyler, Perdue, Odom, Representatives Holmes, Creech, Esposito, Crawford

EFFECTIVE DATE

Section 35.5. Except as otherwise provided, this act becomes effective July 1, 1997.

In the General Assembly read three times and ratified this the 28th day of August, 1997.

March 24, 2004

Mr. George Givens
Environmental Review Commission
N.C. General Assembly
Legislative Office Building
300 N. Salisbury St.
Raleigh, N.C. 27603

Dear Mr. Givens:

This letter is to acknowledge the invitation from the Environmental Review Commission to address the commission concerning the status of litigation against the Rules Review Commission over its decision and the Phase II stormwater runoff rules. Jennie Hayman, our commission chairman, does not feel it appropriate to discuss the lawsuits at this time other than as I will set out in this letter.

The commission has been sued, along with the commissioners in their official capacity, over its decision involving the EMC's Phase II stormwater runoff rules. Since the letter has not gone to the attorney general's office concerning representation in this matter and the desires of the commission, I do not feel it appropriate to discuss what the RRC wishes to do until that has been communicated in writing to Mr. Grayson Kelly, the Chief Deputy A.G. The Commission does intend to defend both these lawsuits as vigorously as possible.

Thank you for the invitation. Please convey our appreciation to the ERC for the opportunity to address them concerning this issue, but I am sure they understand why we must decline at this time.

Sincerely,

Joseph J. DeLuca
Staff Director

ENVIRONMENTAL REVIEW COMMISSION
MARCH 25, 2004

SUMMARY OF LEGAL CHALLENGE BROUGHT BY 4 CONSERVATION GROUPS TO THE NORTH CAROLINA RULES REVIEW COMMISSION'S VETO OF THE EMC'S PHASE II STORMWATER RULES

Submitted by Donnell Van Noppen III
Southern Environmental Law Center

1. Case filed in Wake County Superior Court by NC Shellfish Growers Association, NC Coastal Federation, NC Trout Unlimited, and Environmental Defense

2. Two categories of claims: challenges to the legality of the particular RRC action of vetoing the stormwater rules, and challenge to the constitutionality of the RRC's powers under the APA.

3. Challenges to the legality of the RRC action regarding the rules:

    a. EMC complied with all procedural requirements of the APA in its rulemaking, so return of the rules was wrong.
    b. RRC failed to carry out its statutory duty to explicitly determine whether the changes made by the EMC in response to prior RRC objections satisfied the RRC objections.
    c. RRC failed to state the reasons for objecting to all of the rules, as required by the APA.
    d. The EMC acted within its statutory authority in adopting the rules, so the RRC was wrong to object on that grounds.
    e. The rules are not impermissibly ambiguous, so the RRC was wrong to object on that grounds.

4. Constitutional challenges:

    a. The RRC's power to veto rules in the current version of the APA is an unconstitutional exercise of legislative authority without following the requirements for legislative

action of presenting a bill to both houses and having the bill pass both houses.

b. The RRC's power to veto rules is an unconstitutional intrusion into the powers and duties of the executive branch to carry out the laws passed by the General Assembly.

c. The RRC's power to veto rules based on lack of statutory authority is an unconstitutional intrusion into the powers and duties of the judicial branch.

5. Judicial relief sought

a. Declaration that the Phase II stormwater rules are lawful and valid.

b. Declaration that the APA provisions granting the RRC a veto power over executive branch rules are unconstitutional.

Environmentally Superior Technology Initiative - concise status report

Prepared by: C.M. (Mike) Williams March 2004

Agreements between the Attorney General of North Carolina and Smithfield Foods (SF), Premium Standard Farms (PSF), and Frontline Farmers[1] provided resources for the development and performance verification of "Environmentally Superior Technologies" (EST). Performance standards defined in the Agreements mandate that the technologies target environmental variables including the discharge of animal waste to surface waters and groundwater; emission of ammonia; emission of odor; release of disease-transmitting vectors and airborne pathogens; and nutrient and heavy metal contamination of soil and groundwater. Detail progress reports describing this initiative between the dates of July 25, 2000 and July 25, 2003 have been previously published.[2]

The following table shows the current field status of the candidate technologies.

Technology candidate	Construction status	Operation status
Ambient digester / greenhouse tomato production	Complete	Operational
Constructed wetlands	Complete	Operational
Upflow biofilter	Complete	Decommissioned (data procurement completed)
Reciprocating wetland	Complete	Under decommission
Solids and P removal / nitrification – denitrification	Complete	Operational
Belt / gasification	Complete	Operational
Belt / insect biomass	Complete	Decommissioned
High solids anaerobic digester	Complete	Operational
Solids separation / ash recovery	Complete	Operational
Mesophilic digester / microturbine / permeable cover / water reuse	Complete	Operational
Sequencing batch reactor	Complete	Operational
Mesophilic digester	Permitted/construction underway	May 2004
Ultrasonic plasma resonator	Spring 2004	Summer 2004
Dewatering drying system	Spring 2004	Summer 2004

Environmental performance data procurement and economic assessment has occurred for several of the candidate technologies[3] – that work is in progress for the remaining operational technologies. Based on progress to date, this initiative is projected to conclude in 2005.

Agreements (3) Overview

- Smithfield Foods - $15 million for development of "Environmentally Superior Technologies" (EST); $50 million for "environmental enhancement" activities
- Premium Standard Farms – $2.5 million ($2.3 for EST)
- Frontline Farmers - "..use its best efforts and influence to encourage its members to convert to economically feasible EST"
- NCSU responsible for Technology Determinations
- Install Environmentally Superior Technologies on each company owned farm in NC

NC STATE UNIVERSITY

Environmentally Superior Technologies

- "permittable by the appropriate governmental authority
- determined to be technically, operationally, and economically feasible for identified categories of farms
- meets the following performance standards..."

NC STATE UNIVERSITY

Performance Standards

- "Eliminate the discharge of animal waste to surface waters and groundwater through direct discharge, seepage, or runoff;
- Substantially eliminate atmospheric emissions of ammonia;
- Substantially eliminate the emission of odor that is detectable beyond the boundaries of the parcel of land on which the swine farm is located;
- Substantially eliminate the release of disease-transmitting vectors and airborne pathogens;
- Substantially eliminate nutrient and heavy metal contamination of soil and groundwater"

NC STATE UNIVERSITY

Economic Feasibility Determination

- Projected 10 year annualized cost of the technology (including capital, operation and maintenance) per 1000 # steady state live weight for each category of farm system
- Compared to lagoon and spray-field system
- Projected revenues, including income from byproducts
- Available cost-share monies or other financial assistance from federal, state or other public sources
- Impact that the adoption of the technology may have on the competitiveness of the NC pork industry
- ID/quantification (if possible) of emissions to environmental media from each category of farm system implementing the technology as compared to lagoon and spray-field system
- Estimate of the economic benefits to NC households arising from the changes in emissions to environmental media resulting from implementation of the technology

ERC Presentation: March 25, 2004
Joe Rudek, Ph.D.
Environmental Defense

Intro:
I want to thank the Environmental Review Commission for the opportunity to speak today. I am Joe Rudek, a senior Scientist with Environmental Defense. I am on the technical advisory panel for the AG's Agreement. I am also on the advisory committee of the NC State Animal and Poultry Waste Management Center, which Dr. Williams Directs, and the USDA Agricultural Air Quality Task Force, appointed by the Secretary of Agriculture.

Let me take a moment to compliment Dr. Williams on the fine job he has done in assuring that a sound scientific process is being employed in the evaluations of alternative hog waste treatment technologies. I feel confident that the process which Dr. Williams is leading will result in the designation of ESTs to better treat hog waste.

But what happens after an EST is designated? I'm here to urge the General Assembly to prepare for the efficient conversion of the Pork Industry's waste management systems as Environmentally Superior Technologies are identified. This is a complex challenge, but as you think about this issue, it's important to bear in mind three key elements:

A. The General Assembly should adopt a timeline for conversion of the majority of the industry not included in the AG's Agreement. Such a timeline will drive the process ensuring that necessary policies are adopted and necessary resources allocated in a timely fashion. Timelines can be revisited, but they are critical to planning and implementation of conversion.
B. Funding mechanisms need to be identified for conversion and remediation of existing systems on contract and independent farms, including removing obstacles to business opportunities that many EST's will offer to hog operations (e.g. Energy production and sale).
C. DENR must develop the capacity to quickly and thoroughly review a large number of permits, including evaluating potential EST's that come from outside the Smithfield process.

The industrywide conversion of hog waste treatment systems to ESTs can be viewed as Two Phase process.

I. Determination of ESTs and subsequent installation on SF- and PSF-owned farms
II. Conversion of the remainder of the industry in NC.

Phase I is essentially the focus of the AG's Agreement. However, what is not often discussed is that once an EST is designated and the 3 year clock starts, somewhere near

300 permits will need to be issued by DENR on new waste technologies. This brings up numerous issues:

- DENR must be prepared for this workload, including an honest assessment of its capacity, and of additional resources needed.
- Numeric performance standards for ESTs should be codified.
- Actions should be taken to assure that sufficient resources will be available in the private sector to handle to construction of these systems within the 3 year conversion period.
- Administrative processes which handle the building permits, oversight and inspections associated with such construction projects also must prepare for this workload

Phase II is envisioned in the Agreement, as the AG's office has committed to undertaking efforts to convert the entire industry in NC to ESTs. The conversion of the entire hog industry to ESTs is also highly desirable for the benefits it brings in decreased environmental and public health risks.

- Once again, DENR must be prepared for the workload of permitting approximately 2000 conversions to ESTs over a reasonable time period.
- Construction resources and the associated administrative processes will face an even greater task than faced in the conversion of company owned farms.
- In addition, funds for conversion to ESTs by contract farmers will be needed. Innovative methods should be explored to provide funding without an undesirable increase in the control the large industry interests have on contract farmers?
- The development of markets for the value-added products created by ESTs is critical to their financial success. The GA, NCDA, Dept of Commerce, DOT, and other parts of the government should work together to support market development for manure value-added products.
- In essence, the conversion of the hog industry to ESTs will produce an array of value-added products, including energy production, concentrated fertilizers and animal feed. It can be viewed as an economic enhancement program for eastern NC. While it is my belief that the industry should pay the majority of the costs associated with conversion to ESTs, given the potential for economic advancement in eastern NC, as well as the environmental and public health benefits, the state could provide some level of support for this process. An evaluation of how the state can best do this is needed.

In conclusion, NC can lead the country in the effort to achieve conversion of the pork production industry. The benefits to local economies can be enhanced, environmental and public health risks can be minimized, and quality of life can be protected. Clearly DENR has a major role to play in the conversion to ESTs. There are many challenges which the GA could tackle in making such a conversion more efficient. In addition, the Governor's office and other offices of government such as the AG's office, the Dept of Ag, the Dept of Commerce, and the Dept of Transp. can and should also play key roles in leading or supporting this conversion.

The time to begin to plan in earnest for the conversion of the NC pork industry is upon the state. If delays are to be avoided or minimized, discussions and actions to prepare for conversion should begin very soon. The GA can play a major role first, by mandating the conversion of the entire industry, and second, by helping to set the stage for a smooth conversion program.

Thank you.

Report on the Activities of the DWQ CAFO General Permits Advisory Group

Environmental Review Commission
March 25, 2004

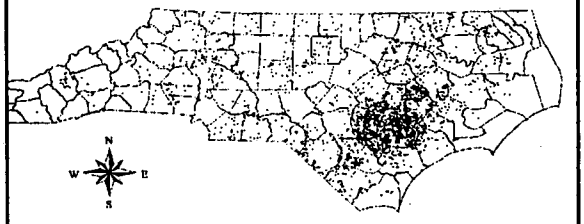
Introduction

- Report of the Advisory Group mandated by SB 733 (SL 2003-28).
- Required DENR to Study and Evaluate State Non-Discharge General Permit for Animal Operations
- State Permit Addresses Smaller Facilities Not Covered Under Federal National Pollutant Discharge Elimination System (NPDES) Permit
- At least 100 Confined Cattle, 250 Swine, or 30,000 Birds w/Liquid Manure System

Water Quality Related Animal Operation Permits in NC

- **NPDES Permit - Federal Permit**
  - 2500 swine/1000 cattle/30,000 birds & liquid waste.
  - Approximately 1041 facilities in NC
- **State Nondischarge Permit - Subject of SB 733**
  - 250 swine/100 cattle/30,000 birds & liquid waste.
  - Approximately 1437 facilities in NC.
- **Deemed Permitted**
  - Dry waste and/or under the number thresholds above.
  - No data on the number of these facilities in NC.

CAFO Locations in NC



Background

- Original State Non-Discharge Permits issued May 1998
- Original Permits were set to expire on April 30, 2003
- DWQ Proposed New, Draft Replacement Non-Discharge Permits in January 2003
- Draft Permits were the subject of 3 Public Meetings in February 2003
- Based upon public comments received, the proposed draft permits were substantially modified and revised.

SB 733

- Stayed Implementation of New General Permit
- Extended Effective Date of Original General Permit and Certificates of Coverage to Oct 2004
- Required DENR to evaluate use & impacts of General Permits for Animal Waste Management
- Required DENR to consult w/NCDA&CS, NCSU, industry reps, reps of env. & conservation groups
- Prepare revised, draft permits and forms & circulate among interested parties
- Report to ERC by March 1, 2004

Advisory Group Membership

- Forrest Westall / Tom Reeder - NC DWQ
- Jim Cummings - NCDA&CS
- Robert Evans - NCSU
- Tommy Stevens / Jake Barrow - NC Pork Council
- Neil Strother - Frontline Farmers
- Jimmy Randolph - NC Poultry Federation
- Anne Coan - NC Farm Bureau
- Dan Whittle - Environmental Defense
- Courtney Washburn - NC Sierra Club
- Michelle Nowlin - Southern Env Law Center
- Don Webb - Alliance for a Responsible Swine Industry
- Rick Dove - Waterkeepers Alliance

Advisory Group Activities

- Advisory Group Meetings
  - Sept 23 / Oct 14 / Oct 28 / Nov 13
- Fulfilled All Requirements of SB 733
  - Circulated draft permits and forms among members.
  - Issued a detailed report of proceedings.

Review of Major Issues

- More flexibility for required phosphorous evals.
  - Flexibility provided in proposed permits.
- Compliance with phosphorous standard?
  - Legal discussion in final report.
- "Amendments" to Animal Waste Plans submitted?
  - "Major Changes" and "Revisions" submitted to DWQ.

Review of Major Issues

- Rainbreakers required?
  - Required only for noncompliance.
- Frequency of inspection of application sites.
  - Every 120 minutes during application.
- Frequency of testing and calibration of application equipment.
  - Once every two years.

Review of Major Issues

- Precipitation event monitoring.
  - Daily monitoring of precipitation events.
- Frequency of sludge surveys.
  - Within 2 years, then annually.
- Automated lagoon monitoring equipment.
  - Required only for noncompliance.
- Pre-notification to DWQ of burial.
  - Not required.

Review of Major Issues

- Land application in proximity to wells.
  - No land application within 100' of wells.
- Crop management.
  - Crops managed in accordance with the Certified Animal Waste Management Plan.
- Annual certification form requirement.
  - Not required for compliant operations in this permitting cycle.

Summary

- Consensus reached on all but 2 major issues.
- Proposed permits and associated forms circulated among all group members.
- Proposed permits now ready for public notice and issuance.

CAFO Advisory Group Major Issues / Questions Summary Table

Issue	Resolution	Complete Consensus Among Group Members?
Provide more flexibility for performing the required phosphorous standard evaluation during this permit cycle.	Flexibility is provided in the proposed permits in language drafted by producer group representatives.	Yes
Do the NC General Statutes preclude DWQ from requiring compliance with the NRCS phosphorous standard?	Specific language regarding this issue is contained in the final report.	N/A
Do "amendments" to the Certified Animal Waste Management Plans (CAWMP) need to be submitted to DWQ?	The proposed permits only require "major changes" and "revisions" to the CAWMP to be submitted to DWQ.	Yes
Do "major changes" and "revisions" to the CAWMP need to be submitted to DWQ within 15 working days?	The proposed permits require "major changes" and "revisions" to the CAWMP to be submitted within 30 calendar days.	Yes
Should "rainbreakers" (to automatically cease land application during rain) only be required on a case-by-case basis for noncompliant farms?	The proposed permits only mandate "rainbreaker" devices on a case-by-case basis for noncompliant farms.	Yes
Frequency of inspection of land application sites.	The proposed permits require the inspection of land application sites every 120 minutes during application.	Yes
Frequency of testing and calibration of land application equipment.	The proposed permits require testing and calibration of land application equipment once every two years.	Yes
Crop management.	The proposed permits require crops to be managed in accordance with the applicable CAWMP.	Yes
Precipitation event monitoring.	The proposed permits require daily monitoring and recording of precipitation events at a site that is reflective of the farm's land application sites. These records must be maintained and available for Departmental review.	Yes

Frequency of required sludge surveys.	The proposed permits require sludge surveys to be performed within two years after the permits are issued and then annually thereafter.	Yes
Automated lagoon monitoring equipment.	Required only for noncompliant operations.	Yes
Was swine afterbirth factored into the design criteria for the CAWMP?	Yes	N/A
Does DWQ need to be pre-notified prior to the burial of animals that exceed normal mortality rates?	No. Burial activities are regulated under State veterinarian regulations and the farm's mortality plan.	Yes
Land application in proximity to groundwater wells.	The proposed permits specify that animal waste shall not be applied within 100 feet of any well with the exception of monitoring wells.	N/A
Inclusion of Annual Certification Form in final permit requirements.	An Annual Certification Form is not a requirement for compliant operations in the proposed permits.	No[2]
Mandatory compliance with the NRCS Phosphorous standard for new and expanding animal operations.	In the proposed permits new and expanding operations are required to conduct the phosphorous standard evaluation, but not demonstrate compliance with the standard, in order to receive a Certificate of Coverage (COC).	No[2]

Footnotes:

1. New legislation may be required to clarify this issue.
2. Representatives from Environmental Defense, Sierra Club, Waterkeepers Alliance, Alliance for a Responsible Swine Industry, and the Southern Environmental Law Center did not concur with this resolution.

FINAL REPORT ON THE ACTIVITES AND FINDINGS OF THE DIVISION OF WATER QUALITY ANIMAL FEEDING OPERATION NON-DISCHAGE GENERAL PERMIT ADVISORY GROUP

I. Introduction

This document contains the final written report of the proceedings and findings of the NC Division of Water Quality (DWQ) Animal Feeding Operation (AFO) State Nondischarge General Permit Advisory Group (Advisory Group) for the DWQ Director. The Advisory Group was established and this report has been developed in order to fulfill the mandate of Senate Bill 733 (Session Law 2003-28), which required the Department of Environment and Natural Resources (DENR) to consult with affected parties and study the use of general nondischarge permits for animal waste management and report back to the Environmental Review Commission with its findings and recommendations by March 1, 2004. Included in this document are detailed minutes of all the meetings of the Advisory Group, an analysis of the major permitting issues reviewed by the group, and revised draft State Nondischarge General Permits for swine, cattle, and wet waste poultry operations. In addition, this report contains a number of recommendations. It should be noted that while every effort was made to reach consensus with the Advisory Group on all issues discussed, these recommendations in this summary report incorporate all agreements reached by consensus and the recommendations of the DWQ-appointed Advisory Group facilitators, Forrest Westall and Tom Reeder.

II. Background

Senate Bill 733 (SB 733), which was signed by Governor Easley on April 30, 2003, directed DENR to study the use of Nondischarge General Permits for animal waste management systems and to evaluate the impacts of using general permits for these operations on the land application and potential discharge of nitrogen and phosphorus to surface waters and groundwater in the state. (A copy of SB 733 is included as Attachment 1 of this document.)

In conducting this study, DENR was directed to consult with the Department of Agriculture and Consumer Services; the College of Life Sciences at NCSU; representatives of swine, cattle, and poultry farmers; representatives of environmental protection and natural resource conservation groups; and other interested parties. In addition, as part of the study, DENR was directed to prepare draft revised general permits for animal waste management systems that serve swine, cattle and poultry operations and to circulate these draft permits, along with drafts of any forms that farmers would be required to use in connection with these permits among interested parties. Furthermore, SB 733 required DENR to report its findings and recommendations to the Environmental Review Commission (ERC) on or before 1 March 2004.

In order to meet these requirements DENR chose to establish an Advisory Group to review the subject permits and to help develop the required recommendations and findings. Forrest Westall, the DWQ Supervisor in the Asheville Regional Office, and Tom Reeder, a member of the DWQ Planning Branch in the Raleigh Central Office, were appointed to facilitate the discussions of this Advisory Group. It is the results of the efforts of this Advisory Group that are contained in this document.

The membership of the Advisory Group is represented in the following table:

Name	Affiliation
Forrest Westall	NC DWQ
Tom Reeder	NC DWQ
Jim Cummings	NCDA & CS
Robert Evans	NC State University
Tommy Stevens	NC Pork Council
Jake Barrow	NC Pork Council
Neil Strother	Frontline Farmers
Jimmy Randolph	NC Poultry Federation
Anne Coan	NC Farm Bureau
Dan Whittle	Environmental Defense
Courtney Washburn	NC Sierra Club
Michelle Nowlin	Southern Env Law Center
Don Webb	Alliance for a Responsible Swine Industry
Rick Dove	Waterkeepers Alliance

The group included five representatives from producer organizations and five representatives from environmental advocacy groups. In addition, the group was advised on legal issues by representatives from the North Carolina Attorney General's Office. Other interested parties, including officials of the Department of Environment and Natural Resources, which were not formal members of the group, often attended some or all of the meetings. The attached meeting minutes reflect the attendance at the sessions.

III. Activities of the Advisory Group

The Advisory Group met on four occasions between September 23rd and November 13th, 2003 to review the draft general permits, seek resolution of the major outstanding issues, and fulfill the other requirements of its charter. Detailed minutes of these meetings, and all the supporting documentation discussed and reviewed at these meetings, are contained in this report in the following attachments:

Advisory Group Meeting Date	Meeting Minutes and Associated Supporting Material Presented In
September 23, 2003	Attachment 2
October 14, 2003	Attachment 3
October 28. 2003	Attachment 4
November 13, 2003	Attachment 5

IV. Major Issues and Recommendations

The following is a synopsis and analysis of the major issues reviewed and discussed by the Advisory Group. The recommendations presented represent the work of the Advisory Group and the recommendations of facilitators Forrest Westall and Tom Reeder.

1. Issue: Annual Certification Form Requirement

Discussion: By far the most contentious issue discussed by the Advisory Group concerned whether the proposed State General Permits would contain a requirement for the regulated farmers to complete an Annual Certification Form, certifying the compliance status of the animal operation during the preceding year. The completion of this form is currently a provision of the NPDES General Nondischarge Permits for CAFOs. The representatives from the producer organizations felt that it was highly inequitable to include this Federal requirement in the permit for farms of a much smaller size than those covered under the NPDES permits. In addition, the farming representatives explained that there was much apprehension and misunderstanding regarding this form among the regulated community and that the form added no, or negligible, value to the actual permit. Furthermore, producer representatives explained that 71% of the swine steady state live weight was already covered under the NPDES requirements so, therefore, it would be wise to observe how the implementation of this form proceeded under the NPDES Permit requirements before levying this requirement on the smaller, State-permitted farms. In general, the producer group representatives were resolute in their opinion that the inclusion of this form in the State General Permit was a non-negotiable issue.

Representatives of the environmental advocacy groups felt just as strongly that this requirement was necessary to create viable and useful State permits. Advocacy group representatives pointed out that the requirement for an Annual Certification Form was a key issue and that they felt that the certification would be an important and critical public policy tool for the regulation of these facilities. These representatives insisted that the form was not punitive in nature and that law-abiding, honest farmers had nothing to fear from the completion of this requirement. They felt that an increased educational campaign by DWQ and the producer organizations could allay the fears of the regulated community. Although, the environmental interest group representatives could agree to a

"phased-in" approach for this form requirement, they felt that its inclusion in the permit at some point was extremely important.

An important element that was considered during this discussion is the fact that the affected animal operations are presently subject to two annual reviews by DENR representatives. One is an annual inspection conducted by DWQ personnel. The second is an annual "operational review" performed by Division of Soil and Water Conservation personnel. During these annual inspections/operational reviews all the farm's records and self-inspection results must be available for review. These are the same records upon which the annual certification would be based. Therefore, from the producers' perspective, an additional annual certification by the farmer is unnecessarily redundant since a farm's records have already been subject to review by DENR representatives on two occasions during the calendar year. Furthermore, the advisory group discussed the level of "self-reporting" already required in the proposed permit. If the draft permits contained in this document are implemented, the affected animal operations would be required to self-report to the appropriate Regional Office on the following matters:

- Any discharge to ditches, surface waters or wetlands.
- Any discharge that poses a serious threat to the environment or human safety or health.
- Failure to maintain storage capacity in a lagoon/storage pond greater than or equal to that required in Condition V. 3. of the proposed permit.
- Over applying waste either in excess of the limits set out in the CAWMP or where runoff enters surface waters or wetlands.
- Failure of any component of the animal waste collection, treatment, storage and land application system resulting in a discharge to surface waters or wetlands.
- Any failure of the waste treatment and disposal system that renders the facility incapable of adequately receiving, treating or storing the waste and/or sludge.
- A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge to surface waters or wetlands.
- A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge that poses a serious threat to surface waters or wetlands.
- Any deterioration or leak in a lagoon/storage pond that poses an immediate threat to the environment or human safety or health.

In light of the above, representatives from the producer organizations stated that with the two annual inspections/operational reviews, the level of self-reporting already mandated in the proposed permits, and in consideration of the amount of anxiety and apprehension that the certification form was generating in the regulated community, that

the annual certification form requirement was an unnecessary and redundant burden on the affected farmers.

Recommendation: There was not overall consensus among the group on the resolution of this issue. After reviewing all aspects of this discussion and considering the self-reporting and inspections already required in the proposed permits, we recommend the following:

1) Require the annual certification form only on a case by case basis for non-compliant operations during the permitting cycle covered by the proposed permits.
2) Study the process and impact of the annual certification form requirement as the Division manages this process for the NPDES-permitted operations over the life of the current NPDES General Permit. The first of these forms are due beginning in March 2004. Based on this evaluation, the agency would develop a plan to implement the annual certification form requirement for the State-permitted facilities in their next five-year permitting cycle (beginning in 2009). This will allow the Division and the regulated community an opportunity to review the effects of the form on the NPDES-permitted operations prior to making a future decision for non-NPDES facilities.

2. Issue: Phosphorous Standard Compliance for New and Expanding Operations

Discussion: The original, draft permits contained a provision that would have required new and expanding operations covered under the State Permit to demonstrate compliance with the Natural Resource Conservation Service (NRCS) Phosphorous (P) Standard before receiving a Certificate of Coverage (COC) from DWQ. Poultry Federation representatives, in particular, questioned the legality of this requirement in light of the fact that the General Statutes only list Nitrogen as a rate determining nutrient for State AFO Permits. For their part, the environmental advocacy groups asserted that G.S. 143-215.1(b) does provide the State with the discretion to require compliance with a phosphorous standard if compliance with this standard is deemed appropriate.

Recommendation: There was not consensus among the group on the resolution of this issue. However, based upon advice from the NC Attorney General's Office representatives, our recommendation is that the requirement for new and expanding operations to demonstrate compliance with the P standard before receiving a COC should be removed from the proposed permits. New and expanding operations will still be required to complete a phosphorous evaluation, but will not be required to demonstrate compliance in order to receive a COC unless demonstration of compliance at some future date becomes a Statutory requirement for COC issuance.

3. **Issue: Mandatory Phosphorous Standard Evaluation and Flexibility for Existing Facilities**

Discussion: There was considerable discussion among the group about the proposed permit provision that would require all existing covered animal operations to perform an evaluation using the Phosphorous Loss Assessment Tool (PLAT) to evaluate the farms' ability to comply with the NRCS P Standard. This is already a requirement in the NDPES CAFO Permits. According to the original draft state permit requirement, this evaluation would have to be completed within 6 months of a covered farm receiving notification from DWQ that the evaluation was required.

The environmental advocacy group representatives felt strongly that the phosphorous evaluations should be performed during this permit cycle, but understood that the Division would need flexibility in determining when the evaluations should take place due to the limited resources available to perform the evaluations and the need to gain experience with this process through the NPDES permitting program. The advocacy group representatives were in favor of requiring the evaluations to be completed within six months following receipt of notification from the Division, but were willing to support a phased in approach.

There was considerable concern among the representatives of the producer groups about the language in this original provision. These representatives felt that because the PLAT had never been utilized on North Carolina's farms, more flexibility should be incorporated into this requirement to allow all parties to gain valuable experience in conducting these evaluations first on the NPDES-covered farms. In addition, the producer representatives felt that 6 months was not enough time to complete the evaluations considering the extremely limited resources (external technical specialists) that would be available to assist the regulated farmers in performing the PLAT evaluation. In response to a general request from the group, Tommy Stevens, of the Pork Council, drafted language that he felt was more acceptable to the regulated farmers.

Recommendation: We recommend that the proposed permits include the following language regarding this requirement:

"During the period of this general permit, the Division of Water Quality may notify the permittee to conduct an evaluation of the facility and its CAWMP to determine the facility's ability to comply with the NRCS nutrient management standard as it relates to phosphorus. The Division will make its decision as whether to notify permittees based on experience gained through the NPDES permit implementation.

This evaluation will not be required until such time as the permittee is notified to conduct the evaluation by the Division of Water Quality. The evaluation must be documented on forms supplied by or approved by the Division and must be submitted to the Division. This evaluation must be completed by existing facilities within (12) months of receiving notification from the Division."

4. Issue: NC General Statues and Phosphorous Standard Compliance

Discussion: During the course of the group's discussion of the phosphorous-related issues, Dan Whittle of Environmental Defense requested informal guidance from the NC Attorney General's Office representatives as to whether the existing General Statutes actually preclude DWQ from requiring compliance with a P standard, or whether the statutes simply do not mandate this compliance. He further requested that this information be included in the group's final report.

Response: The following information was provided to the Advisory Group by Mary Penny Thompson, the Assistant General Counsel for DENR:

"DWQ has broad authority to protect water quality from pollutants, such as phosphorus, through its permitting requirement, see N.C. Gen. Stat. § 143-215.1, and its administration of federally-mandated programs, see N.C. Gen. Stat. §§ 143-211 and 143-215.3. Although the animal waste permitting statute allows the development of "individual and general permits based on the number of animals *and other relevant factors*," it does not specifically mention phosphorus (unlike its specific mention of nitrogen). N.C. Gen. Stat. § 143-215.10C (emphasis added). The Attorney General's Office has advised DWQ that the omission of a specific reference to phosphorus in the animal waste permitting statute may preclude requiring compliance with a specific phosphorus standard. Therefore, at this point, DWQ will not include a specific compliance standard for phosphorus in the animal waste permits, but will monitor the status of standards and the effect of phosphorus on water quality."

5. Issue: Submission of Amendments to the CAWMP to DWQ

Discussion: The original, proposed draft permits contained a provision that required regulated farmers to submit any amendments to their Certified Animal Waste Management Plans (CAWMP) to the appropriate DWQ Regional Office within 15 working days. The group discussed whether DWQ really needed to receive all "amendments" to the CAWMP, as these are normally very minor in nature, or whether it would be more appropriate for the Division to only receive "major changes" and "revisions." All these terms are specifically defined in Guidance Memos from the Senate Bill 1217 Interagency Group and the Advisory Group reviewed these definitions in detail to determine which of these items would be most appropriate for DWQ review.

Recommendation: There was general consensus among the group on the resolution of this issue. We recommend that the proposed permits require that only "major changes" and "revisions," as defined in the SB 1217 Guidance Memos, to the CAWMP be forwarded to the appropriate DWQ Regional Office for review. We further recommend that the SB 1217 Guidance Memo definitions of "amendments," "revisions," and "major changes" be included in the proposed permits.

6. Issue: Timeliness of Submission of "Major Changes" and "Revisions" to the CAWMP to the DWQ Regional Office

Discussion: When discussing the issues surrounding the submission of changes, revisions, and amendments to the CAWMP to the Regional Office for review, the Advisory Group also reviewed the issue of the timeliness of those submissions. The original, draft permits required these submissions within 15 working days. The producer group representatives discussed whether this was a reasonable requirement in light of the fact that these submissions must be formulated by a limited number of technical specialists serving a large number of animal operations and it is sometimes physically impossible for these specialists to compile and forward all the major changes and revisions within 15 working days. In addition, the producer representatives asserted that there would be very little lost, from a regulatory perspective, if more time was provided.

Recommendation: There was general consensus from the group on the resolution of this issue. We recommend that the proposed permits require "major changes" and "revisions" to the CAWMP to be submitted to the DWQ Regional Office within 30 calendar days of the changes.

7. Issue: Rainbreaker Requirement

Discussion: The group agreed that the implementation of devices designed to terminate the land application of wastewater in the event of rain, the so-called "Rainbreaker" devices, would only be required on a case by case basis for those farms found to be out of compliance with the permit requirement to cease land application during precipitation events.

Recommendation: There was general consensus from the group on this issue. We recommend that the proposed permits mandate on a case by case basis the Rainbreaker devices only for those farms found to be out of compliance with the permit requirement to cease land application during precipitation events.

8. Issue: Inspection of Land Application Sites

Discussion: The group agreed that land application sites should be inspected by the Operator in Charge (OIC), the back-up OIC or a person under the supervision of the OIC or the designated back-up OIC at least every 120 minutes.

Recommendation: There was consensus among the group on this issue. We recommend that the proposed permit require that land application sites be inspected by the Operator in Charge (OIC), the back-up OIC or a person under the supervision of the OIC or the designated back-up OIC at least every 120 minutes.

9. Issue: Testing and Calibration of Land Application Equipment

Discussion: The group spent some time discussing how often the proposed permit should require the testing and calibration of land application equipment. The options discussed by the group included whether this testing and calibration should be required on an annual basis or once every two years. The producer group representatives asserted that annual testing was an unnecessary expense for the farmers and added little value in terms of protection of the environment. Furthermore, these representatives noted that annual testing and calibration was a requirement of the NPDES CAFO Permits and that in recognition of the smaller size of the farms regulated under the State Permit that testing every other year was a more equitable solution. Robert Evans, of NC State, noted that land application equipment that has not been calibrated recently tends to spray or apply less waste instead of more. Also, he noted that available data support testing and calibration every other year. Environmental interest group representatives were interested in determining from the producer group representatives what additional costs would be incurred by the farmers with an annual testing and calibration requirement.

Recommendation: There was general consensus among the group on the resolution of this issue. We recommend that the proposed permits require testing and calibration of the land application equipment once every two years.

10. Issue: Crop Management

Discussion: The group noted that the draft permits clearly require covered crops to be managed in strict accordance with the CAWMP. The group determined that this provision was adequate in order to require regulated farmers to account for any nitrogen that may be introduced into the environment by allowing harvested crops to become unusable.

Recommendation: There was general consensus among the group on this issue. The proposed permits should require regulated crops to be managed in accordance with the applicable CAWMP and that no additional language was necessary.

11. Issue: Precipitation Event Monitoring

Discussion: The group clarified that the intention of the provision in the permits requiring daily monitoring and recording of precipitation events was that this activity should occur at a site that is reflective of the general meteorological conditions of the farm's application sites. Furthermore, the group specified that this daily monitoring and recording is only required for precipitation events. Finally, the group clarified that the permits should require that the records of these precipitation events should be maintained on site for Departmental review.

Recommendation: There was general consensus among the group on this issue. We recommend that the proposed permits require daily monitoring and recording of all precipitation events, that this monitoring be conducted at a single facility site that is reflective of the general conditions of the farm's land application sites, and that these records of precipitation events be maintained on site and be available for review by Departmental Inspectors. The permit condition should also note that precipitation events would be required to be recorded only on days when rainfall or other precipitation occurred.

12. Issue: Sludge Survey Requirement

Discussion: The group felt that due to existing resource limitations that sludge surveys on the State-permitted farms should be required within two years after the proposed permits are issued and then on an annual basis thereafter, unless some other more flexible agreement is reached with DWQ on a case-by-case basis.

Recommendation: There was general consensus on this issue. We recommend that the proposed permits require sludge surveys to be performed within two years after the proposed permits are issued and then on an annual basis thereafter, unless some other more flexible agreement is reached with DWQ on a case-by-case basis. This permit condition should clarify that sludge survey results are only required for lagoon facilities and not manure storage areas (this is specifically in reference to cattle operations and other animal waste management facilities that use such storage areas).

13. Issue: Automated Lagoon Monitoring Equipment

Discussion: There was discussion among the group regarding the provision in the draft permits that specifies that mandatory installation of automated lagoon monitoring equipment at non-compliant farms may be waived if "the Permittee can demonstrate to the satisfaction of the Director that the violations were due to conditions beyond its control." There was discussion regarding what would be required to successfully demonstrate that conditions were beyond the Permittee's control and whether this would excuse non-compliance as a result of chronic rainfall. In response, alternate language was proposed by representatives of the environmental advocacy groups.

Recommendation: There was general agreement on the wording developed. We recommend that the previous language be replaced in the proposed permits with *"The Director may determine that installation of automated waste level monitors is not required if the Permittee can demonstrate that preventative measures were taken to avoid the violation and that it resulted from conditions beyond the Permittee's control."*

14. Issue: Swine Afterbirth

Discussion: There was some discussion within the group as to the management of the afterbirth associated with swine reproduction and whether it was considered as part of the lagoon loading in the NRCS lagoon design standards. Research by group members determined that the design criteria for the lagoons were originally developed under the assumption that swine afterbirth was included in the waste samples utilized to establish these NRCS lagoon design criteria.

Recommendation: We recommend that no further action be taken on this issue at this time.

15. Issue: Pre-Notification to DWQ Prior to Burial Above Normal Mortality

Discussion: The Advisory Group reviewed the permit requirements pertaining to the burial of dead animals whose numbers exceed the normal mortality rates. Normal mortality disposal is covered as a part of the CAWMP. A provision in the draft, proposed State Permits required notification of DWQ before a regulated operation proceeds with the burial of animals exceeding normal mortality rates. However, representatives from the producer organizations questioned the benefit of this requirement, due to the fact that the permit already requires this burial to be executed in accordance with appropriate NCDA & CS and State Veterinarian regulations and requirements. Furthermore, representatives from NCDA & CS pointed out to the group that a facility's Mortality Plan must already plan for burial activities such as this and must ensure that designated burial sites are protective of groundwater and other resources.

Recommendation: There was general consensus among the group on this issue. We recommend that the requirement to notify DWQ prior to the burial of animals exceeding normal mortality rates be deleted and that instead a provision be added to the proposed permits that would require the regulated operation to submit a map designating burial sites within 15 calendar days after the burial takes place.

16. Issue: Land Application in Proximity to Groundwater Wells

Discussion: A provision in the draft, proposed permits mandated that animal waste could not be land applied within 100 feet of wells. The Advisory Group reviewed this requirement and discussed whether this 100-foot set-back should apply to all types of wells or just drinking water wells.

Recommendation: We recommend that the proposed permit specify that "Animal waste shall not be applied within 100 feet of any well with the exception of monitoring wells. The allowable distance to monitoring wells shall be established on a case by case basis by the Division."

V. Final Recommendation

It is recommended that General Permits continue to be used as the main permit type at all animal facilities. General Permits are the most effective and efficient tool for the permitting of these facilities. The General Permits being proposed along with the individualized Certified Animal Waste Management Plans for each facility provide the regulated facilities with a comprehensive list of required activities needed to protect both surface and groundwater quality.

Proposed North Carolina General Nondischarge Permits for swine, wet waste poultry, and cattle operations are contained in Attachment 6 of this document. These revised permits incorporate all of our recommendations and the Advisory Group's findings, which have been presented previously in this report. In accordance with Senate Bill 733, these proposed permits and this final report have been circulated among all the members of the Advisory Group for their review.

The Draft forms needed to document the required record keeping requirements associated with the proposed Draft General Permits were also evaluated and shared with the Advisory Group. Following this review, it was determined that many of the forms currently being used by the NPDES permitted animal facilities were also appropriate for use by facilities that would be covered by the Draft Non-Discharge General Permits. Therefore it is recommended that forms FRBD-1, IRR-1, IRR-2, SLUR-1, SLUR-2, SOLID-1, SOLID-2, STOCK-1, TRAN-1, and CROP-1 be approved for use by these facilities. Copies of these forms can be found in Attachment 7. While some of these forms will be required at all facilities, the exact number of forms required to be kept at an individual facility will need to be determined on a case by case basis, dependent upon an individual facility's type of manure management system. It is also recommended that the Division continue to work with producers to develop and approve alternative forms that can be demonstrated to meet all the permit's record keeping requirements.

We recommend that the Director and the Department forward these proposed General Permits, along with this Final Report, to the Environmental Review Commission for further review and consideration.

Attachment 1

GENERAL ASSEMBLY OF NORTH CAROLINA
SESSION 2003

SESSION LAW 2003-28
SENATE BILL 733

AN ACT TO PROVIDE FOR EXTENSIONS OF THE EXPIRATION DATES OF CERTAIN GENERAL NONDISCHARGE PERMITS FOR ANIMAL WASTE MANAGEMENT SYSTEMS THAT SERVE SWINE, CATTLE, AND POULTRY OPERATIONS AND TO DIRECT THE DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES TO STUDY THE USE OF GENERAL NONDISCHARGE PERMITS FOR ANIMAL WASTE MANAGEMENT SYSTEMS THAT SERVE SWINE, CATTLE, AND POULTRY OPERATIONS TO PROTECT WATER QUALITY.

The General Assembly of North Carolina enacts:

SECTION 1. Notwithstanding 15A NCAC 2H.0225(e), the Department of Environment and Natural Resources, pursuant to the powers relative to general permits and to permits for facilities not discharging to the surface waters of the State that are granted to the Environmental Management Commission under G.S. 143-215.1 and G.S. 143-215.10C and delegated by the Commission to the Department, shall extend the expiration of general permits AWG100000 (Swine), AWG200000 (Cattle), and AWG300000 (Poultry) until 1 October 2004. Subject to the provisions of 40 Code of Federal Regulations Part 123 (1 July 2002 Edition) and of subsections (g) and (h) of 15 NCAC 2H.0225, the Department of Environment and Natural Resources shall extend the expiration of individual certificates of coverage issued under these general permits until 1 October 2004.

SECTION 2. The Department of Environment and Natural Resources shall study the use of general nondischarge permits for animal waste management systems for swine, cattle, and poultry operations to protect water quality, including the impact of the use of general permits for swine, cattle, and poultry operations on the land application and potential discharge of nitrogen and phosphorous to surface water and groundwater in the State. In conducting this study, the Department shall consult with the Department of Agriculture and Consumer Services; the College of Agriculture and Life Sciences at North Carolina State University; representatives of swine, cattle, and poultry farmers; representatives of environmental protection and natural resources conservation groups; and other interested parties. In the course of the study required by this section, the Department of Environment and Natural Resources shall prepare draft revised general permits for animal waste management systems that serve swine, cattle, and poultry operations and shall circulate these draft permits, along with drafts of the forms that farmers would be required to use in connection with these permits, among interested parties for comment. Consistent with water quality protection goals and strategies, the Department of Environment and Natural Resources may further revise the draft revised general permits and associated forms on the basis of comment from interested parties. The Department of Environment and Natural Resources shall report its findings and recommendations to the Environmental Review Commission on or before 1 March 2004.

SECTION 3. This act becomes effective 30 April 2003.

In the General Assembly read three times and ratified this the 28th day of April, 2003.

s/ Beverly E. Perdue
President of the Senate

s/ James B. Black
Speaker of the House of Representatives

s/ Michael F. Easley
Governor

Approved 10:18 a.m. this 30th day of April, 2003

Initial Meeting of DWQ CAFO General Permit Advisory Group
September 23, 2003

The meeting commenced at approximately 1:00 pm on September 23rd in Conference Room #3 on the 14th Floor of the Archdale Building, Raleigh, NC.

Those in attendance for all or part of the meeting were:

Name	Affiliation
Forrest Westall	NC DWQ
Tom Reeder	NC DWQ
Tom Ellis	NCDA & CS
Jimmy Randolph	NC Poultry Federation
Henry Jones	NC Poultry Federation (Attorney)
Megan Brown	Southern Env Law Center
Neil Strother	Frontline Farmers
Tommy Stevens	NC Pork Council
Jake Barrow	NC Pork Council
Amy Pickle	NC Dept of Justice
Anita LeVeaux	NC Attorney General's Office
Kathryn Jones Cooper	NC Attorney General's Office
Joe Rudek	Environmental Defense
Sheryl Stevens	DENR / Legislative Affairs
Robert Evans	NC State University
Courtney Washburn	NC Sierra Club
Molly Diggins	NC Sierra Club
Chester Lowder	NC Farm Bureau
Boyd DeVane	NC DWQ
Dennis Ramsey	NC DWQ
Kim Colson	NC DWQ

The meeting commenced with Forrest welcoming those in attendance, thanking them for their participation, and briefly reviewing Senate Bill 733 and the reason for the establishment of this advisory group.

Introductions were conducted. All members introduced themselves and their affiliation.

A short list of meeting ground rules were presented and adopted by the group. These ground rules are:

- Respect others
- Listen
- One person speaks at a time
- Participate
- Focus on interests / ideas not positions

- Stay on subject
- Focus on issues at hand
- Consensus – ***If possible***

A comprehensive briefing was presented that provided an overview of the following subjects:

- Senate Bill 733
- the goals and charter of this advisory group
- the types of CAFO permitting programs regulated by NC DWQ
- the evolution of the National Pollutant Discharge Elimination System (NPDES) and State General Non-Discharge CAFO Permits
- a contrast and comparison of the NPDES and State CAFO Permits
- the major issues regarding the development of a new State General CAFO Permit

An electronic copy of this PowerPoint brief has been provided to all the recipients of these meeting minutes.

Issues and Discussion Points

Tom Ellis suggested that the new permit needed to address the 25-year, 24-hour storm issue. He feels that this provision, which does not allow overflows except in the event of a 25-year, 24-hour storm, is too restrictive as it does not address chronic rainfall situations when one rain event does not meet the statistical 25-year, 24-hour storm. This is the situation NC farmers find themselves in this year. Kathy Cooper noted that the 25-year, 24-hour storm provision is a statutory requirement that DWQ is not free to change on its own. Dennis Ramsey noted that DWQ is currently reviewing the chronic rainfall issue under a process separate from this advisory group and hopes to develop some recommendations on this issue by the end of 2003.

Joe Rudek asked if DWQ could provide some statistics that would approximate what percentage of the State's swine population is regulated under the NPDES permit and what percentage is regulated under the State permit.

Action Item: DWQ thought that it could provide some figures based on steady state live weights at the next meeting that would answer Joe's question.

There was considerable discussion regarding the phosphorous (P) loss standard evaluation requirement contained in Paragraph 5 of the Performance Standards of the draft State General Permits. Dennis Ramsey explained to the group that the Natural Resource Conservation Service (NRCS) has published the phosphorous loss standard so that the mandatory evaluation to determine if a farm could comply with this new standard would now be a requirement for any farm covered under the new NPDES General Permits for animal facilities and the Draft State General Permits. Dennis stated that the evaluation will need to be completed 6 months after a farm receives notification from the Division by mail that it is required to perform the evaluation. Dennis explained that the

notification to conduct this evaluation would be mailed to the covered farms in a staggered fashion (that has yet to be determined) so that local technical specialists would not be overwhelmed by requests for assistance in conducting these evaluations. Dennis further explained that even if this evaluation requirement became part of the final Non-Discharge General Permits that notification for this requirement would be first mailed to farms covered under the NPDES General CAFO Permit before notifying farms covered under the State General permit. Representatives from the Poultry Federation questioned why existing farms and new and expanding farms are treated differently in this provision. Dennis explained that the NRCS P loss standard would probably become a requirement in the next round of NPDES and State Permits so, therefore, the State would be negligent in issuing a Certificate of Coverage (COC) to a new or expanding farm that it knew would be incapable of meeting this impending requirement. Furthermore, Dennis explained that existing farms would want to conduct the evaluation because if it was determined that the farm would not be able to comply with the new P loss standard, the farm owners would have several years to try to find a solution before the next round of permits (containing the P standard) are implemented. The Poultry Federation Reps asked for an interpretation of the meaning of the phrase "phosphorous loss standards that are applicable to land application activities" in Paragraph 5. Dennis explained that this was the NRCS P loss standard. Several representatives from the regulated community questioned the legality of requiring an evaluation for a phosphorous standard when only compliance with a nitrogen standard is mandated in the General Statutes. Dennis explained that it is imperative that DWQ be able to gauge the magnitude of the phosphorous loss problem in the State and that these evaluations were the best method to accomplish this. Although the legality issue was never completely resolved, most in the meeting agreed that if the P loss standard is to become a requirement of the next round of NPDES and State CAFO Permits it is a good idea for all the affected farms to get some idea if they will be able to comply with this standard and to seek a solution if it can not.

An issue raised by representatives from the swine producers concerned the requirement to forward all amendments to the Certified Animal Waste Management Plan (CAWMP) to the DWQ Regional Office within 15 working days. Swine producer representatives noted that often these amendments are very minor issues, such as a change in crops in an application field, and the requirement to have these changes to the Regional Office in 15 working days often can not be met. Neil, Tommy, and Jake explained that often these minor changes are worked out at the farm with the local technical specialist on the hood of a truck. These changes are annotated on the existing plan and are initialed by the farmer and the technical specialist. At this point in time the farmer is authorized to proceed to implement the amendments. However, the technical specialist must go back to office, input the changes into the applicable CAWMP and then forward this revised smooth plan to the farmer and the Regional Office. Tommy, Jake, and Neil explained that it was often physically impossible to accomplish this within 15 working days due to the high workload of the technical specialists. They felt that a 30 to 45 day requirement would be more realistic. Several members of the group noted that most DWQ regulatory requirements (outside of the CAFO arena) allow regulated parties 30 days to respond to requests. It was the consensus of the group that this provision should be amended to provide 30 calendar days for amendments to the CAWMP to be forwarded to the

Regional Office, although some members from the regulated community requested that this be 30 working days.

There was a brief discussion regarding Paragraph #9 in the Performance Standards of the draft permit. This requirement states "Animal waste shall not be applied within 100 feet of wells." After some discussion regarding monitoring vs. drinking wells and abandoned vs. active wells it was the general consensus of the group that this provision should be considered for change to "Animal waste shall not be applied within 100 feet of *potable drinking water* wells."

Action Item: Contacts will be made with the Division's Groundwater Section to determine the appropriate language for this condition.

There was a brief discussion regarding Provision #9 in the Operation and Maintenance Requirements of the draft State permit. The question was raised as to what constituted an exceedance of the normal mortality rate. Dennis explained that this was any mortality that exceeded the normal average annual mortality for animals at a specific farm. Joe Rudek suggested that some consideration be given to requiring animal operations to have designated, pre-selected burial sites that would be capable of holding large numbers of animal carcasses in the event of a natural disaster.

Action Item:

Forrest requested that all members of the group consider and review the outstanding issues with the proposed State General Permit (as delineated in the briefing) and any other issues that they may want to raise during the course of the Advisory Group. The group members should send these issues / concerns electronically to forrest.westall@ncmail.net and to tom.reeder@ncmail.net so that a master list can be compiled.

Next Meetings:

The group established the following dates and times for the next meetings:

October 14, 1:00 to 4:00
October 28, 1:00 to 4:00
November 13, 1:00 to 4:00
November 25, 1:00 to 4:00

Tom Ellis stated that he would investigate securing a conference room in the NCDA&CS facility on Blue Ridge Road for future meetings as this would make the parking situation more convenient.

The group recognized that all the meetings scheduled may not be required, dependent upon the progress made at future meetings.

The meeting adjourned at approximately 4:00.

Any comments, concerns, or questions regarding these meeting minutes should be directed to Tom Reeder at 919-733-5083 ext. 557 or to the e-mail address noted above.

NC CAFO General Permits Advisory Group

Introductory Meeting
September 23, 2003

Introduction

- Study and Evaluate State Non-Discharge General Permit for Animal Operations
- State Permit Addresses Facilities Not Covered Under Federal NPDES Permit
- At least 100 Confined Cattle, 250 Swine, or 30,000 Birds w/Liquid Manure System

Background

- Original State Non-Discharge Permits issued May 1998
- Original Permits were set to expire on April 30, 2003
- DWQ Proposed New, Draft Replacement Non-Discharge Permits in January 2003
- Draft Permits were the subject of 3 Public Meetings in February 2003
- Based upon public comments received, draft permits were substantially modified and revised.

Background (Continued)

- SB 733 Introduced in General Assembly
- Subsequently Ratified by Legislature and Signed by Governor
- SB 733 Stayed the Implementation of New, Proposed General Permits and extended the effective date of original permits from May 1, 2003 to Oct 1, 2004.

SB 733

- Stayed Implementation of New General Permit
- Extended Effective Date of Original General Permit and Certificates of Coverage to Oct 2004
- Required DENR to evaluate use & impacts of General Permits for Animal Waste Management
- Required DENR to consult w/NCDA&CS, NCSU, industry reps, reps of env. & conservation groups
- Prepare revised, draft permits and forms & circulate among interested parties
- Report to ERC by March 1, 2004

CAFO General Permits Advisory Group

- Composed of Reps as mandated by SB 733
- Goals:
  - Study and evaluate the use of general non-discharge permits for animal operations
  - Prepare draft, revised general permits.
  - Review and circulate draft, revised permits w/associated monitoring forms
  - Report to ERC by March 1, 2004

Review of CAFO Permitting Programs in North Carolina

Permitting Programs for Animal Operations in NC

- NPDES General Permit
  - Liquid manure system with:
  - Swine: 2,500 or more > 55 lbs or 10,000 < 55 lbs
  - Cattle: 1,000 confined beef or 700 mature dairy
  - Poultry: 30,000 laying hens or broilers
  - Federal permit
  - Not a subject of these discussions
  - Includes approximately 1041 facilities in NC

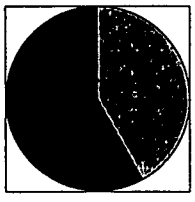
Permitting Programs for Animal Operations in NC

- State General Non-Discharge Permit
  - Not covered under NPDES Permit
  - Liquid manure system with at least:
  - 250 Swine
  - 100 Confined Cattle
  - 30,000 Birds
  - Subject of SB 733 and these discussions
  - Includes approximately 1437 facilities in NC

Permitting Programs for Animal Operations in NC

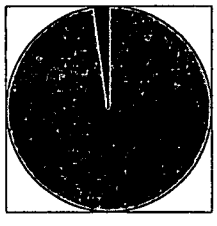
- Deemed Permitted
  - Dry waste management systems or
  - Under the animal threshold for State permit
  - Includes all animal facilities that are not covered under NPDES or State Permits
  - Not a subject of these discussions
  - No data on the number of these facilities in NC

NPDES vs. State Permit for CAFOs



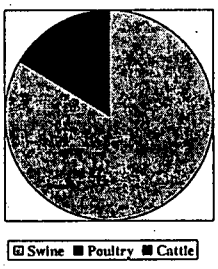
- NPDES General Permit for CAFOs = 1041
- State General Permit for CAFOs = 1437

Breakdown of NPDES CAFO Permits



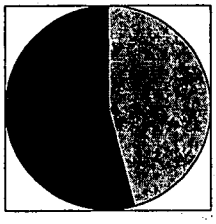
- Swine - 1019
- Poultry - 17
- Cattle - 5

Breakdown of State CAFO Permits



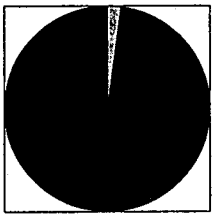
- Swine - 1203
- Poultry - 9
- Cattle - 225

Breakdown of Permitted Swine Facilities in NC



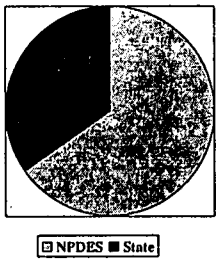
- NPDES - 1019
- State - 1203

Breakdown of Permitted Cattle Facilities in NC



- NPDES - 5
- State - 225

Breakdown of Permitted Poultry Facilities in NC



- NPDES - 17
- State - 9

Evolution of CAFO Permits in North Carolina

First State General Non-Discharge Permit

- Adopted on January 14th, 1997
- SB 1217 Required General permits for:
  - Swine
  - Cattle & Dairy
  - Poultry
- Covered all CAFOs w/Liquid Waste Systems except those "deemed permitted."
- Implemented first basic permit requirements for animal operations in NC.

First State General Non-Discharge Permit - Performance Standards

- Performance Standards
  - No discharge except for 25 yr / 24 hr storm
  - Expansions must be permitted
  - Initiated record maintenance requirement
  - Implemented Certified Animal Waste Management Plan & Component Requirements

First State General Non-Discharge Permit - O & M Requirements

- General Operation & Maintenance Requirements
  - Proper maintenance
  - Vegetative cover required
  - Agronomic and hydraulic application rates
  - Limits on the timing of application
  - Restrictions on other wastes
  - Basic dead animal disposal
  - Stormwater & solid waste restrictions

First State General Non-Discharge Permit - Monitoring & Reporting

- General Monitoring & Reporting Requirements
  - Regular inspections
  - Maintenance records
  - Testing requirements
  - Lagoon level gauge monitoring
  - Site inspection
  - Regional notification

First State General Non-Discharge Permit - General Conditions

- General Conditions
  - Certified operator requirement
  - Storage control requirement
  - Monitoring
  - Enforcement upon non-compliance
  - Compliance obligation

Revision of Original General Non-Discharge Permit

- Original general permits revised as a result of legislative mandate - Senate Bill 352
- Revised permits adopted in May 1998
- Revisions of some requirements were intended to provide clarification, increase flexibility, and make administrative corrections to previous permits.

NPDES General Non-Discharge Permit for Animal Operations

- Federal mandates required NC DWQ to develop and implement a NPDES General Permit
- NPDES Permit was adopted in March 2003
  - Lawsuit filed to block implementation of this permit.
  - Judge has not yet ruled on motion to dismiss.
- Affected only "large" operations
- Included new permit requirements not contained in State General Permits.

Major Changes in NPDES General Permit for CAFOs

- Federally enforceable
- Amendments to CAWMP w/explanation submitted to Regional Office within 10 days
- Determine ability to comply with P loss standard
- No ponding or runoff from land application
- More stringent burial site requirements
- Testing and calibration of application equipment
- Required monthly stocking records

Major Changes in NPDES General Permit for CAFOs

- Increased management of crops at land app sites
- Installation of rain gauges & precipitation records
- Sampling and analysis of discharges
- Annual certification form
- Sludge survey requirement
- Rainbreakers or ORC on site during land app
- Lagoon monitoring and recording

Proposed New State General Non-Discharge Permit

- Existing State permits set to expire in April 2003
- DWQ developed proposed new State permits to replace expiring permits
- Proposed permits noticed to public in January '03
- DWQ had gained much experience in permitting animal operations in the ensuing 5 years
- DWQ needed to incorporate this refined knowledge in new proposed permits.

Proposed New State General Non-Discharge Permit

- Proposed permit contained many NPDES permit requirements not in existing State general permits:
  - Amendments to CAWMP to Reg Off within 15 days
  - Evaluate ability to comply w/P loss stnd within 6 mos.
  - Restrict land application by water wells
  - Ponding or runoff during land application forbidden
  - Restrict dead animal burial above normal mortality
  - Rainbreakers or operator on site during land app
  - Testing and calibration of land application equipment

Proposed New State General Non-Discharge Permit

- Differences between the existing and proposed State General Permits continued:
  - Increased crop management on land application sites
  - Automated lagoon monitoring and recording
  - Monitoring and recording of precipitation events
  - Stocking records required
  - Annual certification report required
  - Sludge survey required

Proposed State Permits Reviewed at Public Meetings

- Meetings were conducted to solicit public input regarding the proposed permits in February 2003
- Much input regarding the proposed changes was provided during the comment period
- This input resulted in Meeting Officer revisions to the proposed permits

Major Issues & Meeting Officers Recommendations for Proposed State Permit

- Annual testing and calibration requirement
  - MO Rec: Once every two years
- Annual certification report requirement
  - MO Rec: Remove, require only on case-by-case basis
- Annual sludge survey requirement
  - MO Rec: Once every 2 yrs, or case-by-case basis
- Phosphorous evaluation requirement
  - MO Rec: Retain, grant extension to 6 mos. if nec.

Major Issues & Meeting Officers Recommendations for Proposed State Permit

- Rainbreaker or operator on-site for land application equipment
  - MO Rec: No rainbreakers, but inspect every 120 mins.
- Increased frequency of inspection of land app.
  - MO Rec: Retain, see above
- Automated rain gauges and recorders
  - MO Rec: Only required if problems are noted
- Daily recording of precipitation
  - MO Rec: Retain

Major Issues & Meeting Officers Recommendations for Proposed State Permit

- Stocking records
  - MO Rec: Retain, but make as flexible as possible
- Do not forward records to DWQ regional Offices
  - MO Rec: Forward amendments to CAWMP

Side-by-Side Comparison of Existing, NPDES, Proposed, & Meeting Officer General Permits

Requirement	Existing	NPDES	Proposed	Mtg Off
Forward amendments to CAWMP to DWQ	No	Yes	Yes	Yes
P Loss standard evaluation required	No	Yes	Yes	Yes
No land app within 100 feet of wells	No	No	No	Yes
No ponding or runoff from land app	No	Yes	Yes	Yes

Side-by-Side Comparison of Existing, NPDES, Proposed, & Meeting Officer General Permits

Requirement	Existing	NPDES	Proposed	Mtg Off
Restricted burial over normal mortality	No	Yes	Yes	Yes
Frequency of inspection of land app	Every 4 hours	Rainbrkr & 120 mins.	Rainbrkr & 120 mins.	Every 120 mins.
Rainbreaker required for land app equipmnt	No	Yes or Op. on-site	Yes or Op. on-site	No
Testing & calibration of land app equipment	Not required	Annually	Annually	Every 2 years

Side-by-Side Comparison of Existing, NPDES, Proposed, & Meeting Officer General Permits

Requirement	Existing	NPDES	Proposed	Mtg Off
More stringent crop management	Not addressed	Yes	Yes	Yes
Automated lagoon monitoring/recording	Not addressed	Only with violations	DWQ Dir. discretion	DWQ Dir. discretion
Monitoring/recordng of precipitation	Not addressed	Yes	Yes	Yes
Stocking records	No	Yes	Yes	Yes, but flexible

Side-by-Side Comparison of Existing, NPDES, Proposed, & Meeting Officer General Permits

Requirement	Existing	NPDES	Proposed	Mtg Off
Annual certification report	No	Yes	Yes	No
Sludge survey	Not required	Annually	Annually	Within 2 yrs, then annually

Discussion Starting Points and Summary

- SB 733 has "chartered" the Department, in consultation with the Advisory Group, to review the State General Permit conditions
- We suggest that the Group look at the SB 733 "extended" State General Permits as the starting point of the discussions.
- We recommend that the Group consider the NPDES Permit conditions as the requirements for "large" animal operation systems

Discussion Starting Points and Summary

- We would "offer" the State General Non-Discharge Permits as at least one effort to develop a permit with conditions "between" the original State GP and the NPDES GP for animal operations.
- Please consider that SB 733 "requires" a report by DENR to the ERC by March 1, 2004.

Meeting of DWQ CAFO General Permit Advisory Group
October 14, 2003

The meeting commenced at approximately 1:00 pm on October 14th in the Conference Room of the NCDA & CS Agronomics Lab, Raleigh, NC.

Meeting attendance is represented in the following table:

Name	Affiliation	Present (Yes or No)
Forrest Westall	NC DWQ	Yes
Tom Reeder	NC DWQ	Yes
Dennis Ramsey	NC DWQ	Yes
Paul Sherman	NC DWQ	Yes
Anita LeVeaux	NC Attorney General's Office	Yes
Tommy Stevens	NC Pork Council	Yes
Jake Barrow	NC Pork Council	Yes
Neil Strother	Frontline Farmers	Yes
Jim Cummings	NCDA & CS	Yes
Tom Ellis	NCDA & CS	Yes
Jimmy Randolph	NC Poultry Federation	Yes
Dan Whittle	Environmental Defense	Yes
Courtney Washburn	NC Sierra Club	Yes
Ann Coan	NC Farm Bureau	Yes
Chester Lowder	NC Farm Bureau	Yes
Robert Evans	NC State University	Yes
Michelle Nowlin	Southern Env Law Center	No
Don Webb	Alliance for a Resp. Swine Ind.	No
Rick Dove	Waterkeepers	No

The meeting began with Forrest briefly reviewing what had been covered at the initial meeting of this group, and briefly reviewing the attached slides that delineated Animal Permitting Percentages based on Steady State Live Weight.

Forrest then directed the group's attention to the Side-by-Side Permitting Comparison slides. The issues presented on these slides were covered and discussed for the remainder of the meeting.

The first issue dealt with the forwarding of amendments to the Certified Animal Waste Management Plan (CAWMP) to the DWQ Regional Offices. Ann Coan questioned whether the Division actually read these amendments and what were they used for by the Regional Offices (ROs). Forrest and Dennis explained that all the amendments were looked at as they were received by the ROs and that they were utilized to organize, prioritize, and maximize the effectiveness of the limited personnel resources available to conduct field inspections. There was considerable discussion, initiated by Jim Cummings, as to whether DWQ really wanted "amendments" forwarded to the ROs, or whether they were interested in the "revisions" and "major changes" to the CAWMPs,

which are more substantial changes than the amendments. This significant discussion was resolved when Jim Cummings retrieved a copy of the "1217 Guidelines" that defined the terms "major changes," "revisions," and "amendments" to the CAWMPs. Following a review of these definitions the group concurred that "revisions" and "major changes" to the CAWMPs should be forwarded to the DWQ Reg. Offices within 30 calendar days and that amendments (the lowest form of CAWMP changes) would not be forwarded.

Action Item: NC DWQ will revise the draft permits to indicate that only "revisions" and "major changes" to the CAWMP are required to be forwarded to the DWQ Reg. Offices within 30 calendar days of the changes. Furthermore, NC DWQ will include definitions for "major changes," "revisions," and "amendments" to the general permits as defined in the 1217 Guidelines.

There was substantial discussion at the meeting regarding the DWQ proposal to include a requirement for animal operations covered under the draft permit to conduct the Phosphorous (P) standard evaluation during the next permitting cycle. This would require all animal operations covered under the proposed permit to perform this evaluation sometime in the next 6 years. Ann Coan suggested that due to the fact that the P loss tool is brand new and has not been used previously and due to the fact that all the animal operations covered under the NPDES Permit are already required to do this evaluation, and due to the fact that there are limited resources at the county level to assist all the permitted farmers in performing these evaluations, that DWQ should wait until the next cycle of the State General Permit to require this evaluation for non-NPDES covered farms. Forrest and Dennis pointed out that conducting the evaluations within the next 5-6 years was imperative so that the Division could determine if P loss to surface waters was a serious problem in the State. Dennis further noted that the DWQ Director had the flexibility to not send out the notifications to perform the evaluations, thus not requiring the evaluation, dependent upon how the evaluation in the NPDES facilities progresses and dependent upon whether these evaluations indicate problems in certain specific counties. Dennis noted that the Division understood the workload concerns and that is why this flexibility has been built into the process. Several of the producer representatives noted that they would feel much better about this requirement if the Division explicitly and clearly stated in the permit the inherent flexibility provisions that had been just discussed by Dennis. Forrest suggested that the producers provide this draft language that DWQ could use in the proposed permit.

Action Item: Representatives from the Producer Organizations agreed to provide the Division with draft language concerning the Director's discretion and flexibility in requiring notification and completion of the phosphorous standard evaluation to the covered facilities. This discretion and flexibility is to be utilized dependent upon the progress with the evaluations on the NPDES covered farms and workload considerations.

Jimmy Randolph stated that he was still concerned about the legality of holding operators to a P standard that is not a statutory requirement. Jimmy noted that the draft permits, as written, will not allow new or expanded poultry or cattle operations until these operations

can demonstrate compliance with the NRCS P standard through the P loss evaluation. Jimmy wondered if the Division could legally stop a new poultry or cattle facility from operating because of a failure to comply with a standard that is not a statutory requirement.

Action Item: Forrest requested that Anita conduct an evaluation as to whether DWQ has the authority to retain the language that the Division will not issue a Certificate of Coverage (COC) to a new or expanding animal operation until that facility can demonstrate compliance with the NRCS P standard.

In regards to this discussion Ann noted that she did not think that a 700 cow dairy and a 100 cow dairy should be required to comply with the same requirements.

In regards to the proximity of land application to groundwater wells issue, Ann noted that she would like the 100 foot restriction to apply only to potable water wells where the potable water is intended for human consumption. Dennis noted that DWQ is still waiting for guidance from the Groundwater Section as to what the appropriate language should be in this requirement.

Ann stated that she thought there was too much redundancy in the draft permit and that many of the permit requirements are already contained in the farm's CAWMP. Forrest noted that he felt there was no harm in reinforcing proper management techniques but that if Ann felt that there were redundant statements that might cause some problem or confusion to please identify these and the Division would consider deleting those conditions from the proposed permit. Ann simply requested that the Division not add additional, extraneous requirements in the permit.

There was some discussion regarding the requirements associated with the burial of dead animals over normal mortality as delineated in II.9 of the draft, proposed general permit. In particular, this discussion centered around the rationale and the purpose of notifying the Division ***prior*** to burial if this burial is being conducted in accordance with the facility's CAWMP and the State Veterinary Statutes.

Action Item: DWQ will remove requirement #2 from provision II.9 of the draft permit. This is the requirement that states "the Division shall be notified prior to burial." Furthermore, DWQ will modify requirement #4 of provision II.9 to state "the map is submitted to the appropriate Regional Office Groundwater Section within 15 days of burial."

The group agreed that "rainbreaker" devices for land application equipment would only be required for those farms found to be out of compliance with the requirement to cease application during precipitation events. Furthermore, the group agreed that inspections of land application activities should occur at least every 120 minutes.

Action Item: DWQ will ensure that in the cattle general permit under provision II.16 it will specify that the inspection of land application equipment can be

conducted by a "person under the supervision of the OIC or a designated back-up OIC."

There was considerable discussion as to whether the new permit should require testing and calibration of land application equipment every year or once every two years. Dan Whittle requested to know why the original requirement of every year was changed to once every two years. Ann Coan noted that the spreader trucks used by the poultry and cattle industry require specialized equipment for testing and calibration and that this procedure is no small matter. This assertion was supported by Bob Evans. Producer representatives noted that most technical specialists consider once every two years to be a reasonable requirement. Forrest noted that this requirement was modified from an annual requirement is order to recognize that the farms that are regulated under the general permit are much smaller than those under the NPDES permit and that the Division felt that this was a fair and equitable concession that would have only a negligible, if any, impact on the environment. Producer reps noted that, in general, land application equipment that has not been calibrated recently tends to spray less, not more. Therefore, theoretically, longer periods between testing and calibration will result in less land application of wastes, not over-application. Courtney Washburn requested that the producers groups be prepared to quantify what extra costs and impacts might be incurred by the farmers if this remained an annual requirement.

Bob Evans also observed that having the calibration requirement of once every two years would still provide a beneficial effect on making sure land application equipment was working properly. Forrest noted again that the annual requirement was seen by the farmers/producers in this size category as "excessive" and that he and Tom had recommended the "every two years" standard as a reasonable concession that had little potential to harm the environment, but significant benefits over the existing permit that requires no calibration requirement.

Action Item: Pending any additional information that would establish some specific data that shows that the longer period between calibration efforts would significantly impact the environment , the Division plans to retain the longer calibration period in the proposed non-discharge permit.

Forrest noted that the crop management requirements in the proposed permit, provision II.26, are primarily narrative in nature. After some discussion regarding whether these requirements adequately protected the environment from increased nitrogen loads if the crops are improperly managed, the group decided to leave this provision essentially as it is currently written. The group noted that the current provision clearly requires crops to be managed in accordance with the provisions of the CAWMP, but Anne pointed out that the last sentence in this condition implied that allowing harvested crops to become unusable would be a permit violation. The intention of this condition was to see that any crops "left" on an application site would require the owner to "adjust" nitrogen application rates to take into consideration the "reintroduction" of nitrogen in the crops that should have been harvested. Since the first statement in condition II 26 covers this

by requiring crops to be removed and managed in accordance with the CAWMP, the second sentence was not necessary.

Action Item: Condition II 26 of the proposed permit would be modified by DWQ to remove the second sentence.

Jim Cummings noted that provision II.23 requires a Mehlich 3 Soil Test for zinc and copper, but Jim felt that the Mehlich 2 Soil Test was also appropriate for this requirement, and less expensive.

Action Item: Jim is going to check with the appropriate personnel in NCDA & CS and determine if the Mehlich 2 Soil Test should be added as an allowable test to meet this requirement, or if more appropriate, to recommend modification of the condition to reflect zinc and copper limits on an application site, not a specific analysis procedure.

There was some discussion regarding the requirement to install automated lagoon monitoring equipment at the Director's discretion. Producer representatives requested that the permit explicitly state what manner of non-compliance would lead to the Director's decision to require automated lagoon monitors at an individual farm.

Action Item: DWQ will ensure that the language of the General Permit specifically states what non-compliant activities shall result in the notification to install automated lagoon monitoring equipment. As a guide, DWQ will use similar language utilized for the mandated installation of "rainbreaker" equipment on land application equipment or the language used in the NPDES Permit.

There was some discussion regarding the requirement to conduct monitoring and recording of precipitation events. Forrest and Dennis clarified that this monitoring should be conducted at a site that is reflective of the conditions at the land application site and that the mandatory daily recording was only required for precipitation events.

Action Item: DWQ will include additional language in this condition to clarify that precipitation data reflective of the general conditions at the farm's application sites and that only one monitoring site would be required. Further, the condition will reflect that daily recording is required only for precipitation events.

Forrest reiterated to the group that DWQ was willing to make the mandatory stocking records as a flexible as possible to meet the unique requirements of dairy, poultry, swine, or other cattle operations.

Near the end of the meeting, Forrest noted to the group that the only two identified outstanding issues that remained to be discussed at the next meeting were the **annual certification report issue** and the **frequency of sludge survey issue.** It was agreed by the participants that the next session would look only at those issues not addressed to this point of the process, and that focus would turn toward developing a new draft permit that

reflected the work of this group and that would be placed before the group prior to the next session.

Action Item: DWQ will make the revisions to the draft general permit that were agreed upon at this meeting and send this out to everyone for their review prior to our next gathering.

It is hoped that if progress continues , the next meeting may prove to be the last meeting needed to develop a report to the ERC for March of 2004. One additional session to finalize a recommended permit and to outline the report planned for the ERC may be needed after October 28, but this can be discussed at that time.

Group members were reminded that the next meeting was scheduled for **October 28th from 1:00 to 4:00 pm** in the **NCDA & CS Agronomics Lab on Reedy Creek Road, Raleigh, NC.**

The meeting ended at 4:00 pm.

Animal Permitting Percentages Based on Steady State Live Weight (SSLW)

- Swine
  - NPDES Permit Covered - 71%
  - State Permit Covered - 29%
- Cattle
  - NPDES Permit Covered - 19%
  - State Permit Covered - 81%
- Poultry
  - NPDES Permit Covered - 100%
  - State Permit Covered - 0%

Meeting of DWQ CAFO General Permit Advisory Group
October 28, 2003

The meeting commenced at approximately 1:00 pm on October 28th in the Conference Room of the NCDA & CS Agronomics Lab, Raleigh, NC.

Meeting attendance is represented in the following table:

Name	Affiliation	Present (Yes or No)
Forrest Westall	NC DWQ	Yes
Tom Reeder	NC DWQ	Yes
Dennis Ramsey	NC DWQ	Yes
Kim Colson	NC DWQ	Yes
Paul Sherman	NC DWQ	Yes
Michelle McKay	NC DWQ	Yes
Daryl Merritt	NC DWQ	Yes
Robin Smith	DENR	Yes

Anne Coan	NC Farm Bureau	Yes
Chester Lowder	NC Farm Bureau	Yes
Robert Evans	NC State University	Yes
Garry Grabow	NC State University	Yes
Michelle Nowlin	Southern Env Law Center	No
Don Webb	Alliance for a Resp. Swine Ind.	Yes
Rick Dove	Waterkeepers	Yes

Forrest commenced the meeting by reviewing the minutes of the previous (Oct 14) meeting of this group and, in particular, reviewing the completion of the Action Items delineated in those meeting minutes.

In response to an Action Item Jim Cummings stated that he was advised that due to implications associated with the analysis process, that the General Permit should retain the Mehlich 3 Soil Test requirement as currently specified in provision II.23.

Representatives from the producer organizations stated that they were still in the process of drafting their proposed language regarding the flexibility of the Director to require the phosphorous standard evaluation.

Action Item: Representatives from the Producer Organizations agreed to provide the Division with draft language concerning the Director's discretion and flexibility in requiring notification and completion of the phosphorous standard evaluation to the covered facilities. This discretion and flexibility is to be utilized dependent upon the progress with the evaluations on the NPDES covered farms and workload considerations.

Following a report from Anita LeVeaux, the group concluded that the language in provision I.5 that states that no Certificate of Coverage (COC) will be issued to a new or expanding facility until it demonstrates compliance with the phosphorous standard should probably be removed from the draft permit. This conclusion was based on the fact that there is not currently a NC statutory requirement for CAFOs to comply with a phosphorous standard.

Action Item: DWQ should delete the requirement to demonstrate compliance prior to receiving a COC from the draft permit. The language should be modified to require a PLAT evaluation but not a demonstration of compliance.

Accordingly, Anne requested that the parenthetical language containing phosphorous be deleted from provision II.4 of the draft permit.

Action Item: DWQ will delete this parenthetical language.

Forrest noted that in response to comments received from the Groundwater Section that the DWQ Staff will need to conduct some internal discussions regarding the land application of waste in proximity to wells provision, provision I.9, and the burial provision, provision II.9.

Action Item: DWQ Staff will conduct internal discussion with representatives of the Groundwater Section to clarify their comments concerning these two provisions.

Rick Dove noted that he had a problem with the proposed burial requirements in that there was no requirement for a veterinarian inspection of the site prior to burial and no requirement for notification of the local health departments. Forrest noted that the permit required farmers to mark and record all sites that are used for burial above normal mortality only after consultation with the State Veterinarian's Office. Forrest then explained the rationale that was discussed at the previous meeting to remove the requirement for DWQ notification prior to burial. Jim Cummings noted that the State Vet's Office had upgraded its burial requirements in response to the aftermath of Hurricane Floyd. Don Webb asked why the burial sites were not pre-approved and pre-checked before they are required. Jim noted that all farms are required to have an up to date Mortality Management Plan that discusses such matters as a requirement of the 1217

Guidelines and the overall CAWMP. Jim noted that this mortality plan requires farmers to designate where their animals will be buried and specifies the requirements that must be met by designated burial sites. Don Webb questioned whether there were any requirements regarding the management of after-birth. Several members of the group noted that they would investigate this matter, particularly as related to the impacts of managing this after-birth is having on the waste management system and how it is being managed today. Don Webb felt strongly that this material should be managed as part of the mortality management process.

Action Item: Dennis Ramsey, Jim Cummings and Bob Evans will consult on the current practices of after-birth disposal and its impacts on the CAWMP and report back at the next meeting.

Anne noted that she would submit a list of items currently contained in the draft permit that she feels are redundant and extraneous and should be deleted to DWQ Staff. Forrest noted that staff would then forward this list to all the members of the group for consideration and review for the next meeting.

The group spent most of the remainder of the meeting discussing the issue regarding whether the General Permit should contain a requirement for farmers to submit an Annual Certification Form.

Forrest explained why this requirement was previously removed from the draft permit. He stated that the meeting officers had determined that this reporting requirement added little value to the protection of the environment and appeared to be a great source of apprehension and aggravation to the regulated farmers. Don stated that he felt strongly that this requirement should be returned to the permit to require the self-reporting of permit violations. Dan Whittle noted that the certification report encourages stronger compliance and can be effectively used as an "aggravating factor" in penalty determinations associated with deliberate violations. Rick Dove stated that we should put into the permit whatever we can that encourages lax operators to comply with the permit requirements. Rick noted that falsification of the certification form would incur two violations: false official statement and the permit violation and that this should encourage better compliance.

Anne noted that the dairy farmers felt strongly that the certification report was just another opportunity to be tripped up by paperwork and that this certification report is an NPDES requirement that should not be required of small farmers. Don Webb questioned who was looking out for common American citizens that want environmental regulations that will protect their rights to a healthy environment. Tommy Stevens noted that the swine farmers objected to the inclusion of NPDES requirements into the State permit. Tommy noted that he did not see how a certification statement would improve regulatory compliance.

Forrest noted that the certification form requirement was removed because the draft Permit Meeting Officers (Forrest & Tom) were trying to be responsive to the requests of the citizens that attended the Public Meetings and objected vehemently to this provision. Forrest noted that this was an overwhelming concern at the Public Meetings. Dan noted that he felt it was a DWQ responsibility to dispel the liability concerns associated with the certification form through an education program. Dan noted that this form was the most important requirement to the environmental advocacy groups. Courtney Washburn noted that the certification form should be retained in the permit because there is an important benefit from public access to and review of these completed forms.

Don Webb questioned why the producers were afraid of self-monitoring and reporting. Rick Dove noted that since much of the permit called for self-monitoring there must be an annual requirement for self-reporting. Rick stated that accountability is a requirement that must be retained in the final permit. Chester Lowder noted that he felt that the certification form was an extraneous requirement on top of the requirement for farmers to comply with their CAWMP. Tommy stated that additional monitoring and reporting requirements are already contained in the new draft permit and that these forms are part of the official record. Tommy noted that if these forms are not completed correctly that there are already consequences associated with that. However, Tommy said that the certification form is one form that the farmers feel strongly that they should not be required to complete.

Jim Cummings asked the group to imagine the fear of being a dairy farmer that is worried about inadvertently filling out the form incorrectly. Jim noted that there are already many reporting and monitoring requirements in the draft permit and what good is the certification form if the benefit is out weighed by the fear it creates.

Dan Whittle stated that he understood that the fear is real, however, he noted that the form is not "strict liability." Dan noted that if a farmer did not know he was out of compliance, that erroneously certifying compliance on the form would not be a violation. Dan suggested that the next state permit cycle exempt cattle producers from the certification form but that the hog producers be required to comply with this provision because they have a strong support system that can educate them about the true nature of this certification requirement.

Don Webb asked whatever happened to accountability. Don suggested that hog farms should be held accountable.

Forrest noted that in his experiences that most people are sincerely trying to do the right thing. He asked Tommy how the hog producers felt about an exemption from the certification form for the cattle producers only. Tommy noted that there is a great fear in the hog producing community as a result of a lack of understanding regarding the certification forms.

Forrest asked the group how it felt about the idea of giving the non-NPDES farms several years into the next permitting cycle before they would be required to comply with the

annual certification form requirement. Dan noted that the remedy to the confusion surrounding the form is better education. He felt that efforts should be made in this direction.

Forrest noted that the Division had clearly heard and understood both sides of the discussion concerning the inclusion or removal of the certification form requirement from the next State permit and that it was now up to the DWQ Staff to make a final recommendation to the Director. Forrest noted that the issue is whether there will be some form of annual affirmative statement from the farmers that declares if the facility is in compliance with the applicable permit requirements or not. Forrest stated that this affirmative statement may be quite useful, but not necessarily essential. He noted that educational workshops will probably be required during the implementation of this certification form, if it is included in the next permit.

Tommy stated that there is already too much confusion and education required for other aspects of the draft permit. He noted that 71% of the steady state live weight for swine in North Carolina is covered under the NPDES permit requirements and is therefore already subject to an annual certification form requirement.

Forrest and Dennis noted that the first series of annual certification forms required under the NPDES CAFO Permits would be due in March 2004 and that it would be interesting to see if any issues arise during the submission of these initial forms. Tommy noted that we do not have any previous experience with this requirement in the NPDES CAFO process, and that he did not know what type of problems may be encountered when the first forms become due.

Bob Evans offered that making the form shorter and simpler might improve the acceptability of an annual certification to the producers. Following this discussion, Dan suggested that the group should consider a "reduced" the form for the State permit to make it more clear and manageable, to still accomplish the objective of the certification, and if problems are encountered during the NPDES submissions, delay the initial submittals under the State permit until these problems are sorted out.

Action Item: Forrest requested that Dan Whittle and Bob Evans draft a reduced version of the certification form that can be reviewed by the group at the next meeting. Following the completion of this discussion at the next session, the Department would then be in a position to make a recommendation to the ERC in March.

The final issue discussed was the sludge survey requirement. Forrest clarified that this requirement as it presently appears in the draft permit is for the farmers to perform a sludge survey within the first two years after the permit is issued and then on an annual basis thereafter, unless some other more flexible agreement is reached with DWQ on a case-by-case basis. Forrest explained that the regulated parties were provided two years to complete the initial sludge survey due to resource issues. There was consensus among the group that this requirement did not need to be modified.

Forrest requested that anyone having comments about the draft permit that was distributed at the meeting should forward those comments to Forrest and Tom before the next scheduled meeting so they could be shared prior to the November 13 session.

The next meeting of this group will be **November 13 from 1:00 to 4:00 pm at the Agronomics Lab.**

The meeting concluded at 3:30 pm.

Attachment 5

Meeting of DWQ CAFO General Permit Advisory Group
November 13, 2003

The meeting commenced at approximately 1:00 pm on November 13th in the Conference Room of the NCDA & CS Agronomics Lab, Raleigh, NC.

Meeting attendance is represented in the following table:

Name	Affiliation	Present (Yes or No)
Forrest Westall	NC DWQ	Yes
Tom Reeder	NC DWQ	Yes
Dennis Ramsey	NC DWQ	Yes
Paul Sherman	NC DWQ	Yes
Daryl Merritt	NC DWQ	Yes
Anita LeVeaux	NC Attorney General's Office	Yes
Tommy Stevens	NC Pork Council	Yes
Jake Barrow	NC Pork Council	Yes
Neil Strother	Frontline Farmers	Yes
Jim Cummings	NCDA & CS	Yes
Jimmy Randolph	NC Poultry Federation	Yes
Dan Whittle	Environmental Defense	Yes
Courtney Washburn	NC Sierra Club	Yes
Anne Coan	NC Farm Bureau	Yes
Chester Lowder	NC Farm Bureau	Yes
Robert Evans	NC State University	No
Garry Grabow	NC State University	Yes
Michelle Nowlin	Southern Env Law Center	No
Don Webb	Alliance for a Resp. Swine Ind.	Yes
Rick Dove	Waterkeepers	Yes

The meeting commenced with a review of the minutes of the previous (Oct 28) meeting of this group. In response to the change in the permit that would allow new or expanded poultry or cattle operations without demonstrated compliance with the new phosphorous standard, Dan Whittle asked whether the statutes actually ***preclude*** DWQ from requiring compliance with the P standard for new or expanding operations, or simply do not mandate this compliance.

Action Item: Dan stated that he is satisfied with this proposed language in the revised permit, however, he would like the final report of this group to include an evaluation as to whether DWQ is actually precluded from requiring compliance with the P standard as the statutes are currently written.

The group discussed the phosphorous evaluation language that was proposed by Tommy Stevens (which is attached). The group noted that the major substantive change in this proposed language is to extend the time allowed to complete the phosphorous evaluation after notification from 6 to 12 months. The group discussed the time it would actually

take to complete these evaluations and Anne Coan noted that this is a major resource issue. Forrest noted that only when the evaluations are actually conducted under the requirements of the NPDES permits will it become clear how long these evaluations will take and how difficult they will be to complete. Forrest stated that DWQ needs this knowledge base in requiring the P evaluation on the state-permitted CAFOs.

Dan Whittle asked whether the resource issues for completing this evaluation were internal or external (technical specialists) to the permitted farms. Dan noted that in many instances the problem of a lack of resources is used to weaken permit requirements. He further noted that the state needed additional resources to properly enforce these permits. Courtney Washburn requested that Tommy's draft language be added to the final revised permit for the group to review. After further discussion of the resource issues, which included clarification that the limiting factor was the availability of the technical specialists external to the permitted farms, Dan agreed that 12 months was a reasonable time to complete the required P evaluations. Courtney noted that she would hope that all these mandatory evaluations would be completed by the end of this 5-year permitting cycle. Forrest responded that this was certainly the Division's goal but that no one would know for sure until the evaluations were actually performed on the farms.

The question was raised regarding the acceptability of the draft phosphorous language for new and expanding facilities. There was no objection to the language addressing this requirement in the draft permit dated November 4, 2003.

Dan expressed his hope that the producer organizations would not try to overturn all the progress that had been made at these Advisory Group meetings by opposing these proposed changes at the Legislature. Anne noted that the recommendations of this group would be reported to the ERC. Forrest then clarified that it was the charter of this group to advise the DWQ Director and the Department leadership on this matter, and then DENR would to report to the ERC. Dan asked if the group would get a chance to review the final group recommendations before they are forwarded to the DWQ Director. Forrest explained that he and Tom would produce a draft final report of the group's activities (including all the meeting minutes) along with a final, draft, proposed permit and that the Advisory Group would have the opportunity to review these final documents and comment on them before they are forwarded to the Division Director. Forrest noted that another meeting of the group may be scheduled in the future to discuss these final draft documents if group members expressed such an interest.

There was a brief discussion regarding the two items noted in the correspondence from the Groundwater Section: 1) the notification prior to the burial of dead animals issue and 2) the proximity of land application to wells issue. Forrest noted that DWQ will resolve these questions internally prior to the drafting of the final report.

There was a brief discussion of the proper management of swine after-birth. Forrest asked whether the management of this was already factored into and accounted for in a farm's CAWMP. Don Webb questioned as to whether it was proper for this material to be disposed of in a waste lagoon and if it should be buried with dead animals.

Action Item: Forrest requested Dennis Ramsey to look into the proper management of after-birth on swine farms and whether it was already accounted for in the CAWMP. The results of this evaluation would be included in the final report.

Anne Coan noted that in Provision III.8 of the draft permit the word "Department" should be changed to "Division of Water Quality" for consistency. Forrest requested that any errors in the permit be brought to the group's attention for consideration in making final modifications to the draft permit.

The group then discussed comments regarding the draft permit that had been submitted by Courtney Washburn (Attached). The group quickly agreed with Courtney's suggestion that the definitions of "major changes," "revisions," and "amendments" to the CAWMP should be moved from Section I of the draft permit to Section VII, Definitions.

Action Item: DWQ Staff will moved the subject definitions in the next revision of the draft permit.

Courtney also questioned the current language in provision III.2.b which stated that "the installation of automated waste level monitors is not required if the Permittee can demonstrate to the satisfaction of the Director that the violations were due to conditions beyond its control." Courtney wondered how an individual would successfully demonstrate that a violation was beyond their control. Dan Whittle noted that he could not support this provision if it was provided to excuse violations that may have been the result of chronic rainfall. Forrest responded that the provision as it is currently written is there to provide the Director some discretion in regards to mitigating factors before requiring the installation of automated lagoon waste-level monitors at facilities with violations. Dan noted that if this language was allowed to remain unchanged in the final permit, exceptions could become the rule. Neil Strother observed that in his experiences automated waste level monitors don't work properly and are often inaccurate.

Don Webb stated that farmers must be on site and observe their lagoons with their own eyes in order to properly manage their waste levels. Don requested that the final permit not contain loopholes that compensate for farmers that can not properly manage their farms. Forrest noted that the mandatory installation of automated monitors is considered to be a punitive measure and that visual observation is still considered to be the best method.

Rick Dove observed that the CAFO animal waste management systems are fundamentally flawed because these systems were designed to handle the historic average rainfall and the actual rainfall is greater than average. Rick noted that the permits contain these exceptions because the waste management systems are fundamentally flawed. Rick stated that the systems need to get away from average rainfall and the permits must not provide relief from violations that lead to the destruction of the environment. In response, Forrest noted that permits are a regulatory device to indicate violations and that some exceptions will always be necessary.

Action Item: Courtney Washburn and Dan Whittle will compose some draft language for the group to consider in this provision.

Courtney questioned where the rain data was submitted in provision III.3.a of the draft permit. Forrest and Dennis noted that this information is retained on site for review by DWQ inspectors.

Action Item: Modify provision III.3.a to read "The precipitation type and amount must be recorded daily for all precipitation events and maintained on site for Department review."

The group then resumed its discussion of the Annual Certification Form issue from the previous meeting.

Forrest noted that Bob Evans and Dan Whittle had both submitted simplified versions of the original certification form for the group's consideration. Forrest asked the group if some consensus was possible regarding these simplified forms?

Don Webb asked what accountability the signer of the certification form will be held to. He noted that the owner of the farm should be required to sign the form to prevent loopholes.

Tommy Stevens noted that for the people he represents and for the people that attended the public meetings regarding these permits he can not agree to the inclusion of any annual certification form in the final permit. Tommy noted that the form adds no value to the permit and that he could not negotiate this issue. It was noted that the agriculture community in general was not if favor of a solution that would exempt some producers (like cattle farms) from the form requirement and require it of others.

Courtney observed that the group would obviously not reach a consensus decision on the certification form issue.

Forrest presented a possible two-part solution to this issue:
1) Require the annual certification form for non-compliant operations.
2) Study the impact of the annual certification form requirement on the NPDES-permitted operations when it becomes due beginning next March. Plan to implement the annual certification form requirement for the State-permitted facilities in their next five-year permitting cycle (beginning in 2009). This will allow the Division and the regulated community to review the effects of the form on the NPDES-permitted operations.

Dan Whittle noted to the group that obviously DWQ believes that the form serves a valid purpose and that, therefore, it should be implemented in the State-permitted facilities over time. If the Division feels that these operations are not ready, then DWQ should give more time for implementation. Forrest observed that there are many concerns in the

producer community about DWQ's true intentions in regards to the certification form, however, at some point in time this form (in some manner) is likely to be included in the State permits.

Courtney noted that the form is not a punishment tool. It is an extremely useful public policy tool and should be represented as such to the producers.

Don observed that honest American farmers will not have a problem with signing the truth.

Forrest noted that permitting moves very fast in relation to other regulatory programs. The Division understands the concerns of the farmers, however, it also understands the value of the certification form as a public policy tool.

Anne noted that many farmers are concerned that citizen action groups will initiate citizen enforcement actions based solely on the certification form. She did not think this was fair to put small, non-NPDES farmers at such risk.

Rick noted that law-abiding citizens have nothing to fear from citizen action groups.

Forrest observed that there is much concern about enforcement actions related to these forms. Don stated that many government employees must take an oath to support the Constitution of the Untied States. He added that there is nothing wrong with requiring farmer certification.

Forrest felt that there is so much misunderstanding regarding the true nature of these certification forms that both sides of this discussion may be over-reacting slightly. Forrest noted that in other permitting arenas outside of the CAFO regulations there is often misunderstanding regarding the true nature of the permit requirements.

Dan Whittle remarked that he does not expect the producers to ever fully endorse the implementation of the certification form in the State permit. He understands that there is a lot of confusion among the regulated community surrounding this form and noted that he was agreeable with a phased-in approach for the certification form that would allow us to learn from our experiences with the certification form and the NPDES-permitted facilities. However, Dan remarked that he felt that producer concerns should not be allowed to completely remove the form requirement. He stated that the form should definitely be phased in over a 2-year, 3-year, or some other period unless the Division determined that there are problems with the form through the NPDES experiences.

Don added that honorable farmers should not have a problem with the form.

Tommy Stevens remarked that he appreciated the proposed changes to the form that would simplify it and make it more understandable to the farmers. However, Tommy noted that the farmers are truly anxious about this requirement and are afraid that it may significantly alter their way of doing business. Tommy remarked that over time the

NPDES experiences with the certification form may help to alleviate the fears associated with this form.

Forrest noted that in most permitting instances forms that are incorrectly filled out are done so through misunderstanding and not willful negligence.

Forrest added that, in all likelihood, the Division Director will have to make a final recommendation on this issue.

Forrest stated that he and Tom would work on the meeting minutes and final report and would note in these documents that complete consensus was not reached with the Advisory Group on this issue. Furthermore, Forrest added that he and Tom would make every effort to ensure that their final report and recommendations to the Division Director would be as balanced as possible. Forrest noted that, traditionally, DWQ has always had more responsibilities to regulate that it had personnel to do so.

Forrest extended his appreciation to everyone in the Advisory Group for their attendance and participation at these meetings.

Rick Dove asked if it was possible to add a requirement to the permit for the routine inspection of application fields by the farmer to determine if there is run-off during application. Forrest noted that the existing draft permit already requires inspection of the application site at least every 120 minutes.

Rick asked if there is anything in the existing or proposed permits that allows the spraying of waste above the lagoon to facilitate evaporative discharge. Forrest noted that the permits are silent on this issue.

Dennis added that some non-discharge systems are equipped with aerators.

Anne added that she would provide some draft language that she would like to see added to the stocking record form for the cattle producers.

Dan Whittle asked if the group would be able to meet again after being provided with an opportunity to review the draft of the final report.

Forrest stated that the current plan was for the Division to produce a draft of the final report on the activities of the Advisory Group and to produce final draft permits by the beginning of January 2004. These drafts will then be distributed to the entire group for review. Forrest stated that after the group has had an opportunity to review these final draft document that he and Tom would be happy to meet with the Advisory Group members in a group setting or on an individual basis to listen to their comments and concerns. Forrest noted that draft versions of all three permits (swine/cattle/poultry) will be included with the draft final report.

The meeting ended at approximately 3:30 pm.

ATTACHMENTS TO NOVEMBER 13 MEETING MINUTES

Tommy Stevens' Comments on the Phosphorous Condition

The following comments relate to the stakeholder discussions on issues with the General Permit and specifically regarding the current wording on and/or inclusion of phosphorus in the permit.

There is still much uncertainty with regard to the technical resource effort that will be needed to assist farmers with running PLAT. Currently the software is not ready to run PLAT and there will be a significant workload associated with running this tool on the farms that fall under coverage of the NPDES permit. Based on the numbers that you provided to us, 71% of the steady state live weight in swine is covered by an NPDES permit and will be required to run PLAT during the current permit cycle. Once this evaluation process is underway for NPDES facilities, there will be more certainty as to the resource requirements and the resource needs associated with making adjustments to waste management plans.

The first choice would be to remove the condition from the current general permit and evaluate the results from the NPDES facilities to determine the resource needs and impact to animal operations prior to including this on the non-NPDES facilities. If the condition remains in the permit, I would offer the following language for consideration.

During the period of this general permit, the Division of Water Quality may notify the permittee to conduct an evaluation of the facility and its CAWMP to determine the facility's ability to comply with the NRCS nutrient management standard as it relates to phosphorus. The Division will make its decision as whether to notify permittees based on experience gained through the NPDES permit implementation.

This evaluation will not be required until such time as the permittee is notified to conduct the evaluation by the Division of Water Quality. The evaluation must be documented on forms supplied by or approved by the Division and must be submitted to the Division. This evaluation must be completed by existing facilities within (12) months of receiving notification from the Division.

Courtney Washburn's Comments on the Draft Permit

I have reviewed the draft permit from Nov 4, 2003 and have some clarification comments. These are just some items that raised questions in my mind.

Page 2, Item 3- I believe the definitions of Major changes, Revisions, and Amendments should be moved to the definition section of the permit. Defining these terms in the performance section seems to be confusing and detracts from the purpose of the performance standard. I would also eliminate the quotations marks on these terms.

Page 7, Item b.- I am unclear regarding the basis on which the Director would determine that freeboard violations were beyond the Permittee's control. I think the demonstration that freeboard violations were beyond control needs to be defined and the basis the Director would make that determination needs to be explained.

Page 7, Item a.- This indicates that precipitation events need to be recorded but does not indicate if this information needs to be submitted to DWQ or what the Permittee needs to do with it once they collect it. Would monthly, or twice a year submittal of this information to DWQ be appropriate?

I look forward to commenting further in the future.

Thanks

Attachment 5

ANIMAL FACILITY ANNUAL CERTIFICATION FORM

Certificate of Coverage or Permit Number _____ County _____ Year 200__

Facility Name (as shown on Certificate of Coverage or Permit)_____

Operator in Charge for this Facility _____ Certification #_____

1. Land application of animal waste as allowed by the above permit occurred during the past calendar year _____ YES _____ NO. If No, proceed to the certification (signature lines at bottom).

IF THE ANSWER TO ANY STATEMENT BELOW IS "**NO**", PLEASE PROVIDE A WRITTEN DESCRIPTION AS TO WHY THE FACILITY WAS NOT COMPLIANT, THE DATES OF ANY NON COMPLIANCE, AND EXPLAIN CORRECTIVE ACTION TAKEN OR PROPOSED TO BE TAKEN TO BRING THIS FACILITY BACK INTO COMPLIANCE.

2. Only animal waste generated at this facility was applied to the permitted sites during the past calendar year. Yes No

3. The facility was operated in such a way that there was no discharge or direct runoff of waste to surface waters from the facility (including the houses, lagoons/storage ponds and the application sites) during the past calendar year. Yes No

4. All required monitoring and reporting was performed in accordance with the facility's permit during the past calendar year. Yes No

5. All operations and maintenance requirements in the permit were complied with during the past calendar year or, in the case of a deviation, prior authorization was received from the Division of Water Quality. Yes No

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations."

Signature of Permittee Date

_____ _____
Signature of Operator in Charge (if different from Permittee) Date

Attachment 5

ANIMAL FACILITY ANNUAL CERTIFICATION FORM

Certificate of Coverage or Permit Number _____ County _____ Year 200__

Facility Name (as shown on Certificate of Coverage or Permit)_____

Operator in Charge for this Facility _____ Certification #_____

1. ~~1.~~ Land application of animal waste as allowed by the above permit occurred during the past calendar year _____ YES _____ NO. ~~If No, proceed to the certification (signature lines at bottom).~~ [Even if waste not land applied, other operation and maintenance requirements must still be complied with. Not sure there is any good reason growers should skip questions 2-5?].

IF THE ANSWER TO ANY STATEMENT BELOW IS "**NO**", PLEASE PROVIDE A WRITTEN DESCRIPTION AS TO WHY THE FACILITY WAS NOT COMPLIANT, THE DATES OF ANY NON COMPLIANCE, AND EXPLAIN CORRECTIVE ACTION TAKEN OR PROPOSED TO BE TAKEN TO BRING THIS FACILITY BACK INTO COMPLIANCE.

2. Only animal waste generated at this facility was applied to the permitted sites during the past calendar year. Yes No

3. The facility was operated in such a way that there was no discharge or direct runoff of waste to surface waters from the facility (including the houses, lagoons/storage ponds and the application sites) during the past calendar year. Yes No

4. All required monitoring, analysis and reporting was performed in accordance with the facility's permit during the past calendar year. Yes No

5. All operations and maintenance requirements in the permit, including but not limited to freeboard requirements and PAN application levels, were complied with during the past calendar year or, in the case of a deviation, prior authorization was received from the Division of Water Quality. Yes No

[Note: I think freeboard and PAN application compliance needs to be explicit, as these are among the most important operational requirements in the permit, along with the no discharge requirement. Incorporating them into #5 works for me. Another way would be to create a new #4 for freeboard and PAN compliance.]

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations."

_____

Permittee Name and Title (type or print)

Signature of Permittee — Date

Signature of Operator in Charge (if different from Permittee) — Date

I AGREE WITH MOST OF ROBERT'S EDITS. THE ABOVE CHANGES ARE MINIMAL AND ARE INTENDED TO REINSERT ONLY THOSE PROVISIONS THAT WE CONSIDER TO BE THE MOST IMPORTANT.

I AM COMFORTABLE ELIMINATING MOST OF PART I: FACILITY INFORMATION AS ROBERT HAS DONE.. EXCEPT THE FOLLOWING: **INTEGRATOR INFORMATION** (I.8), AS INTEGRATORS SOMETIMES CHANGE DURING THE YEAR AND IT IS IMPORTANT THAT DWQ HAVE ACCURATE RECORDS. I AM ASSUMING THAT THE OTHER INFORMATION PROPOSED TO BE DROPPED FROM THE CERTIFICATION FORM (E.G. PAN APPLIED) IS AVAILABLE ON FARM IF NEEDED?

NORTH CAROLINA
ENVIRONMENTAL MANAGEMENT COMMISSION
DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

SWINE WASTE MANAGEMENT SYSTEM GENERAL PERMIT

This General Permit is issued pursuant to North Carolina General Statutes 143-215 et seq., may apply to any swine facility in the State of North Carolina, and shall be effective from October 1, 2004 until September 30, 2009.

All activities authorized herein shall be consistent with the terms and conditions of this General Permit.

Holders of Certificates of Coverage (COC) under this General Permit shall comply with the following specified conditions and limitations.

I. PERFORMANCE STANDARDS

1. Any discharge of waste that reaches surface waters or wetlands is prohibited except as otherwise provided in this General Permit and associated statutory and regulatory provisions. Waste shall not reach surface waters or wetlands by runoff, drift, manmade conveyance, direct application, direct discharge or through ditches not otherwise classified as state waters.

   The waste collection, treatment, storage and application system operated under this General Permit shall be effectively maintained and operated as a non-discharge system to prevent the discharge of pollutants to surface waters or wetlands. Application of waste to terraces and grassed waterways is acceptable as long as it is applied in accordance with Natural Resources Conservation Service (NRCS) Standards and does not result in a discharge of waste to surface waters or wetlands.

   Facilities must be designed, constructed and operated to contain all waste plus the runoff from a 25-year, 24-hour rainfall event for the location of the facility. A facility that has a discharge of waste that results because of a storm event more severe than the 25-year, 24-hour storm will not be considered to be in violation of this General Permit if the facility is in compliance with its Certified Animal Waste Management Plan (CAWMP) and this General Permit.

   Any discharge or application of waste to a ditch that drains to surface waters or wetlands is prohibited except as follows: (a) discharges from the ditches are controlled by best management practices (BMPs) designed in accordance with NRCS standards; (b) the BMPs have been submitted to and approved by the Division of Water Quality (Division); (c) the BMPs were implemented as designed to prevent a discharge to surface waters or wetlands; (d) the waste was removed immediately from the ditch upon discovery; and (e) the event was documented and reported in accordance with Part III.13. of this General Permit. Nothing in this exception shall excuse a discharge to surface waters or wetlands except as may result because of rainfall from a storm event more severe than the 25-year, 24-hour storm.

2. No discharge of waste shall result in a violation of the water quality standards established for the receiving waters as per Title 15A, Subchapter 2B, Section .0200 of the North Carolina Administrative Code and Title 15A, Subchapter 2L of the North Carolina Administrative Code.

3. The facility's COC and its CAWMP are hereby incorporated by reference into this General Permit. The CAWMP must be consistent with all applicable laws, rules, ordinances, and standards (federal, state and local) in effect at the time of siting, design and certification of the facility.

   The Permittee must assess, on an ongoing basis, the effectiveness of the implementation of the CAWMP. The Permittee must make "major changes," "revisions," or "amendments" to the CAWMP, as defined in Section VII, "Definitions," of this Permit, in order to address any changes needed to maintain compliance with the facility's COC and this General Permit. "Major changes," "revisions," and "amendments" to the CAWMP must be documented, dated, and included as part of the CAWMP. "Major changes " and "revisions" to the CAWMP shall be submitted to the appropriate Division Regional Office within thirty (30) calendar days of the "major change" or "revision." "Amendments" are not required to be submitted to the Division Regional Office unless specifically requested by the Division. If field, riser or pull numbers are changed, an explanation shall also be submitted and include a description of how the new numbers relate to the old numbers. Any violation of the COC or the CAWMP shall be considered a violation of this General Permit and subject to enforcement actions. A violation of this General Permit may result in the Permittee having to take immediate or long-term corrective action(s) as required by the Division. These actions may include but are not limited to: modifying the CAWMP; ceasing land application of waste; removing animals from the facility; or the COC being reopened and modified, revoked and reissued, and/or terminated.

4. Any proposed increase or modification to the annual average design capacity from that authorized by the COC will require a modification to the CAWMP and the COC prior to modification of the facility.

5. During the period of this General Permit, the Division of Water Quality may notify the permittee to conduct an evaluation of the facility and its CAWMP to determine the facility's ability to comply with the NRCS nutrient management standard as it relates to phosphorous. The Division will make its decision as whether to notify permittees based on experience gained through the NPDES permit implementation. This evaluation will not be required until such time as the permittee is notified to conduct the evaluation by the Division of Water Quality. The evaluation must be documented on forms supplied by or approved by the Division and must be submitted to the Division. This evaluation must be completed by existing facilities within twelve (12) months of receiving notification from the Division.

   No COC will be issued to any new or expanding facility to operate under this General Permit until the applicant has completed and submitted a phosphorous loss assessment to determine if the new or expanding facility can comply with the NRCS phosphorous standards. This assessment shall not be a basis for denial of a COC to operate under this permit unless that demonstration of compliance is a Statutory requirement for COC issuance.

6. If prior approval is received from the Director of the Division of Water Quality (Director), facilities which have been issued a COC to operate under this General Permit may add treatment units for the purpose of removing pollutants before the waste is discharged into the lagoons/storage ponds. Prior to any approval, the Permittee must demonstrate to the satisfaction of the Director that the new treatment unit will not interfere with the operation of the existing treatment system and that a process is in place to properly manage and track the pollutants removed.

7. If prior approval is received from the Director, facilities which have been issued a COC to operate under this General Permit may add innovative treatment processes to the systems on a pilot basis in order to determine if the innovative treatment process will improve how the waste is treated and/or managed. Prior to any approval, the Permittee must demonstrate to the satisfaction of the Director that the innovative treatment process will not interfere with the operation of the existing treatment system and that a process is in place to properly manage and track the pollutants removed.

8. For all new and expanding operations, no collection, treatment or storage facilities may be constructed in a 100-year flood plain.

9. Animal waste shall not be applied within 100 feet of any well with the exception of monitoring wells. The allowable distance to monitoring wells shall be established on a case by case basis by the Division.

10. Existing swine dry lots may remain in wetlands as long as the wetlands uses are not removed or degraded as a result of the swine. The swine however may not be confined within 100 feet of an adjacent surface water or a seasonally-flooded area. The swine also must not cause a loss of more than 10% of the existing tree canopy. Where trees do not exist, the area must be managed to include crop rotation.

II. OPERATION AND MAINTENANCE REQUIREMENTS

1. The collection, treatment, and storage facilities, and the land application equipment and fields shall be properly operated and maintained at all times.

2. A vegetative cover shall be maintained as specified in the facility's CAWMP on all land application fields and buffers in accordance with the CAWMP. No waste shall be applied upon areas not included in the CAWMP.

3. Soil pH on all land application fields must be maintained in the optimum range for crop production.

4. Land application rates shall be in accordance with the CAWMP. In no case shall land application rates exceed the agronomic rate of the nutrient of concern for the receiving crop. In no case shall land application rates result in excessive ponding or any runoff during any given application event.

5. Animal waste shall not be directly applied onto crops for direct human consumption that do not undergo further processing (e.g., strawberries, melons, lettuce, cabbage, apples, etc.) at any time during the growing season, or in the case of fruit bearing trees, following breaking dormancy. Application of animal wastes shall not occur within thirty (30) days of the harvesting of fiber and food crops for direct human consumption that undergoes further processing.

6. If manure or sludges are applied on conventionally tilled bare soil, the waste shall be incorporated into the soil within two (2) days after application on the land. This requirement does not apply to no-till fields, pastures, or fields where crops are actively growing.

7. Pesticides, toxic chemicals and petroleum products shall not be disposed of in the animal waste collection, treatment, storage or application systems.

8. Domestic and/or industrial wastewater from showers, toilets, sinks, etc. shall not be discharged into the animal waste collection, treatment, storage and application system. Washdown of stock trailers owned by and used to transport animals to and from the facility only, will be permissible as long as the system has been evaluated and approved to accommodate the additional volume. Only those cleaning agents and soaps that are EPA approved according to their label, will not harm the cover crop, and will not contravene the groundwater standards listed in 15A NCAC 2L may be utilized in facilities covered by this General Permit. Instruction labels are to be followed when using cleaning agents and soaps.

9. Disposal of dead animals resulting from normal mortality rates associated with the facility shall be done in accordance with the facility's CAWMP and the North Carolina Department of Agriculture and Consumer Services (NCDA&CS) Veterinary Division's Statutes and regulations.

   Disposal of dead animals whose numbers exceed normal mortality rates associated with the facility shall also be done in accordance with the facility's CAWMP and NCDA&CS Veterinary Division's Statutes and regulations provided that: 1) burial of such animals shall be done in consultation with the State Veterinarian of the NCDA&CS Veterinary Division's Statutes and in compliance with NCDA&CS regulations; 2) all such burial sites must be mapped, and the dates and numbers of the animals buried by type must be recorded; and 3) the map is submitted to the appropriate Regional Office Groundwater Section within 15 calendar days of burial.

   In the event of a state of emergency declared by the Governor, disposal of dead animals shall be done in accordance with requirements and guidelines dictated by the State Veterinarian according G.S. §106-339.4. The Division may require groundwater monitoring when there is massive burial of animals. All burial sites of such animals must be mapped, and the dates and numbers of the animals buried by type must be recorded.

10. Unless accounted for in temporary storage volume, all uncontaminated runoff from the surrounding property and buildings shall be diverted away from the waste lagoons/storage ponds to prevent any unnecessary addition to the liquid volume in the structures.

11. A protective vegetative cover shall be established and maintained on all earthen lagoon/storage pond embankments (outside toe of embankment to maximum pumping elevation), berms, pipe runs, and diversions to surface waters or wetlands. Trees, shrubs, and other woody vegetation shall not be allowed to grow on the lagoon/storage pond embankments. All trees shall be removed in accordance with good engineering practices. Lagoon/storage pond areas shall be accessible, and vegetation shall be kept mowed.

12. At the time of sludge removal from a lagoon/storage pond, the sludge must be managed in accordance with the CAWMP. When removal of sludge from the lagoon is necessary, provisions must be taken to prevent damage to the lagoon dikes and liner.

13. Lagoons/storage ponds shall be kept free of foreign debris including, but not limited to, tires, bottles, light bulbs, gloves, syringes or any other solid waste.

14. The facility must have at least one of the following items at all times: (a) adequate animal waste application and handling equipment, (b) a lease, or other written agreement, for the use of the necessary equipment, or (c) a contract with a third party applicator capable of providing adequate waste application.

15. The Permittee shall designate a certified animal waste management system operator with a valid certification to be in charge of the animal waste management system. The waste management system shall be operated by the OIC or a person under the OIC's supervision.

16. In accordance with 15A NCAC 8F .0203(b)(2), the Operator in Charge (OIC) or a designated back-up OIC of a Type A Animal Waste Management System shall inspect, or a person under the supervision of an OIC or designated back-up OIC shall inspect, the land application site as often as necessary to insure that the animal waste is land applied in accordance with the CAWMP. In no case shall the time between inspections be more than 120 minutes during the application of waste. A record of each inspection shall be recorded on forms supplied by, or approved by, the Division and shall include the date, time, sprayfield number and name of the operator for each inspection.

    The Permittee may assert as an affirmative defense in any enforcement action alleging noncompliance with the requirements imposed in this condition that such noncompliance was due to circumstances beyond the Permittee's control. A notation shall be made on the form indicating the inspection affected by such circumstance and an explanation setting forth the circumstances claimed to have been beyond the Permittee's control shall be submitted with the form.

17. The Director may require any permittee to install, operate and maintain devices on all irrigation pumps/equipment designed to automatically stop irrigation activities during precipitation. This decision will be based on the facility's compliance history for irrigation events.

18. The Director may require any permittee to install and operate flow meters with flow totalizers based on the facility's violations and/or incomplete or incorrect record keeping events.

19. No waste shall be applied in wind conditions that might reasonably be expected to cause the mist to reach surface waters or wetlands.

20. The Permittee shall maintain buffer strips or other equivalent practices as specified in the facility's CAWMP near feedlots, manure storage areas and land application areas.

21. Waste shall not be applied on land that is flooded, saturated with water, frozen or snow covered at the time of land application.

22. Land application of waste is prohibited during precipitation events. The Permittee shall consider pending weather conditions in making the decision to land apply waste and shall document the weather conditions at the time of land application on forms supplied by or approved by the Division.

23. Land application activities shall cease on any application site that exceeds a Mehlich 3 Soil Test Index for Copper of greater than 3,000 (108 pounds per acre) or Zinc of greater than 3,000 (213 pounds per acre).

24. All waste application equipment must be tested and calibrated once in the first two years after issuance of the COC and then at least once every two years thereafter. The results must be documented on forms provided by, or approved by, the Division.

25. Any major structural repairs to lagoons/storage ponds must have written documentation from a technical specialist certifying proper design and installation. However, if a piece of equipment is being replaced with a piece of equipment of the identical specifications, no technical specialist approval is necessary [i.e. piping, reels, valves, pumps (if the gallons per minute (gpm) capacity is not being increased or decreased), etc.] unless the replacement involves disturbing the lagoon/storage pond embankment.

26. Crops for which animal waste is land applied must be removed from the land application site and properly managed and utilized unless other management practices are approved in the CAWMP.

III. MONITORING AND REPORTING REQUIREMENTS

1. An inspection of the waste collection, treatment, and storage structures, and runoff control measures shall be conducted and documented at a frequency to insure proper operation but at least monthly and after all storm events of greater than one (1) inch in 24 hours. For example, lagoons/storage ponds, and other structures should be inspected for evidence of erosion, leakage, damage by animals or discharge.

2. Monitoring and Recording Freeboard Levels

   a. Highly visible waste-level gauges shall be maintained to mark the level of waste in each lagoon/storage pond that does not gravity feed through a free flowing transfer pipe into a subsequent structure. The gauge shall have readily visible permanent markings.

      The waste level in each lagoon with a waste level gauge shall be monitored and recorded weekly on forms supplied by or approved by the Division.

      The Director may require more frequent monitoring and recording on lagoon levels based on the facility's compliance history for freeboard violations.

   b. The freeboard levels of lagoons serving any facility which experiences freeboard violations in any two consecutive years following the issuance of this General Permit, or as determined necessary by the Director, shall be monitored and recorded as follows:

      In addition to the facility's existing lagoon waste-level gauges, automated lagoon/storage pond waste-level monitors and recorders (monitored and recorded at least hourly) must be installed on all treatment and storage lagoons covered by a COC issued under this General Permit to measure and record lagoon freeboard. This equipment must be properly maintained and calibrated in a manner consistent with manufacturer's operation and maintenance recommendations. This automated equipment must be in place no later than ninety (90) days following notification from the Director. The Director may determine that installation of automated waste level monitors is not required if the Permittee can demonstrate that preventative measures were taken to avoid the violations and that the violations resulted from conditions beyond the Permittee's control.

      If an automated level monitor(s) becomes inoperable, the Permittee shall:

      i. report the problem by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than 24 hours following first knowledge of the problem; and,

      ii. make any needed repairs to the equipment as quickly as possible, and take and record daily lagoon levels at the same time every day until such time as the automated equipment is placed back into operation.

   c. The Director may require new or modified waste-level gauges at any facility if he determines that the existing gauges are not adequate to accurately indicate actual lagoon levels, or the various lagoon levels required to be maintained by this General Permit or the facility's CAWMP.

3. Monitoring and Recording Precipitation Events

   a. Precipitation events at facilities issued a COC to operate under this General Permit shall be monitored and recorded as follows:

A rain gauge must be installed at a site that is representative of the weather conditions at the farm's land application site(s) to measure all precipitation events. The precipitation type and amount must be recorded daily for all precipitation events and maintained on site for Department review. Daily records do not need to be maintained for those days without precipitation events.

b. The Director may require that an automated rain gauge and recorder must be installed on site to measure and record all precipitation events. This equipment must be properly maintained and calibrated in a manner consistent with manufacturer's operation and maintenance recommendations. This automated equipment must be in place no later than ninety (90) days following receipt of notice from the Director.

If an automated rain gauge(s) becomes inoperable, the Permittee shall:

i. report the problem by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than twenty four (24) hours following first knowledge of the problem; and,

ii. make any needed repairs to the equipment as quickly as possible, and take and record all rainfall events until such time as the automated equipment is placed back into operation.

4. A representative Standard Soil Fertility Analysis, including pH, phosphorus, copper, and zinc, shall be conducted on each application field receiving animal waste in accordance with NCGS 143-215.10C(e)(6). As of the effective date of this General Permit, the Statute requires that the analysis be conducted at least annually.

5. An analysis of the animal waste shall be conducted in accordance with recommended laboratory sampling procedures as close to the time of application as practical and at least within sixty (60) days (before or after) of the date of application. Every reasonable effort shall be made to have the waste analyzed prior to the date of application and as close to the time of waste application as possible. This analysis shall include the following parameters:

Nitrogen	Zinc
Phosphorus	Copper

6. The Permittee shall record all irrigation and land application event(s) including hydraulic loading rates, nutrient loading rates and cropping information. The Permittee shall also record removal of solids and document nutrient loading rates if disposed on-site or record the off-site location(s). These records must be on forms supplied by, or approved by, the Division.

7. A record shall be created and maintained of all transfers of waste between lagoons/storage ponds on the same site not typically operated in series. Such record shall include at least the identity of the lagoon from which the waste was transferred, the identity of the lagoon receiving the waste, the date and time of transfer and the total volume of waste transferred.

8. The Permittee must maintain monthly stocking records for the facility and make the records available to Department of Environment and Natural Resources (Department).

9. If, for any reason, there is a discharge from the waste collection, treatment, storage and application systems (including the land application sites), to surface waters or wetlands, the Permittee is required to make notification in accordance with Condition III. 13. The discharge notification shall include the following information:

a. Description of the discharge: A description of the discharge including an estimate of the volume discharged, a description of the flow path to the receiving surface waters or wetlands and a site sketch showing the path of the waste. Also, an estimation of the volume discharged.

b. Time of the discharge: The length of time of the discharge, including the exact dates and times that it started and stopped, and if not stopped, the anticipated time the discharge is expected to continue.

c. Cause of the discharge: A detailed statement of the cause of the discharge. If caused by a precipitation event, detailed information from the on-site rain gauge concerning the inches and duration of the precipitation event.

d. All steps being taken to reduce, stop and cleanup the discharge. All steps to be taken to prevent future discharges from the same cause.

e. Analysis of the waste: A copy of the last waste analysis conducted as required by Condition III. 5. above.

10. A copy of this General Permit, the facility's COC, certification forms, lessee and landowner agreements, the CAWMP and copies of all records required by this General Permit and the facility's CAWMP shall be maintained by the Permittee in chronological and legible form for a minimum of three (3) years. Records include but are not limited to: soil and waste analyses, rain gauge readings, freeboard levels, irrigation and land application event(s), past inspection reports and operational reviews, animal stocking records, records of additional nutrient sources applied (including but not limited to sludges, unused feedstuff leachate, milk waste, septage and commercial fertilizer), cropping information, waste application equipment testing and calibration, and records of removal of solids to off-site location(s). These records shall be maintained on forms provided or approved by the Division and shall be readily available at the facility (stored at places such as the farm residence, office, outbuildings, etc.) where animal waste management activities are being conducted for the life of this General Permit, unless otherwise specified in this General Permit.

11. Within fifteen (15) working days of receiving the request from the Division, the Permittee shall provide to the Division one (1) copy of all requested information and reports related to the operation of the animal waste management system. Once received by the Division, all such information and reports become public information, unless they constitute confidential information under NC G.S. 132-1.2, and shall be made available to the public by the Division as specified in Chapter 132 of the General Statutes.

12. The Division may require any additional monitoring and reporting (including but not limited to groundwater, surface water or wetland, waste, sludge, soil, lagoon/storage pond levels and plant tissue) necessary to determine the source, quantity, quality, and effect of such waste upon the surface waters, groundwaters or wetlands. Such monitoring, including its scope, frequency, duration and any sampling, testing, and reporting systems, shall meet all applicable Division requirements.

13. Regional Notification:

The Permittee shall report by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than twenty-four (24) hours following first knowledge of the occurrence of any of the following events:

a. Any discharge to ditches, surface waters or wetlands.

b. Any discharge that poses a serious threat to the environment or human safety or health.

c. Failure to maintain storage capacity in a lagoon/storage pond greater than or equal to that required in Condition V. 3. of this General Permit.

d. Over applying waste either in excess of the limits set out in the CAWMP or where runoff enters surface waters or wetlands.

e. Failure of any component of the animal waste collection, treatment, storage and land application system resulting in a discharge to surface waters or wetlands.

f. Any failure of the waste treatment and disposal system that renders the facility incapable of adequately receiving, treating or storing the waste and/or sludge.

g. A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge to surface waters or wetlands.

h. A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge that poses a serious threat to surface waters or wetlands.

i. Any deterioration or leak in a lagoon/storage pond that poses an immediate threat to the environment or human safety or health.

For any emergency, which requires immediate reporting after normal business hours, contact must be made with the Division of Emergency Management at 1-800-858-0368.

The Permittee shall also file a written report to the appropriate Division Regional Office within five (5) calendar days following first knowledge of the occurrence. This report shall outline the actions taken or proposed to be taken to correct the problem and to ensure that the problem does not recur. The requirement to file a written report may not be waived by the Division Regional Office.

14. The Director may require any permittee to file an annual certification report based on the compliance history of the facility. If required, the report must be filed on forms provided by the Division.

15. The Director may require facilities to submit additional reports and/or certifications based on the facility's compliance history.

16. In the event of a discharge of 1,000 gallons or more of waste to surface waters or wetlands, the Permittee must issue a press release to all print and electronic news media that provide general coverage in the county in which the discharge occurred setting out the details of the discharge. The press release must be issued within forty-eight (48) hours after it is determined that the discharge has reached the surface waters or wetlands. A copy of the press release and a list of the news media to which it was distributed must be kept for at least one (1) year after the discharge and must be distributed to any person upon request.

17. In the event of a discharge of 15,000 gallons or more of animal waste to surface waters or wetlands, a public notice is required in addition to the press release described in Condition III 13. The public notice must be placed in a newspaper having general circulation in the county in which the discharge occurred and the county immediately downstream within ten (10) days of the discharge. The minimum content of the notice is the name of the facility, location of the discharge, estimated volume of waste entering state waters, time and date discharge occurred, duration of the discharge, identification water body that was discharged into including creek and river basin if applicable, actions taken to prevent further discharge, and a facility contact person and phone number.

18. If a discharge of 1,000,000 gallons of wastewater or more reaches surface waters or wetlands, the appropriate Division Regional Office must be contacted to determine in what additional counties, if any, a public notice must be published. A copy of all public notices and proof of publication must be sent to the Division within thirty (30) days of the discharge.

19. All facilities, which are issued a COC to operate under this General Permit, shall conduct a survey of the sludge accumulation in all lagoons within two (2) years of receiving the COC and every year thereafter. This survey shall include but not be limited to a sketch showing the depth of sludge in the various locations within each lagoon. This survey frequency may be reduced if it can be demonstrated to the satisfaction of the Division that the rate of sludge accumulation does not warrant an annual survey.

    If the sludge accumulation is such that it is greater than the volume for which the lagoon was designed or the accumulation reduces the lagoon's minimum treatment volume to less than the volume for that which the lagoon was designed, a sludge removal or management plan must be submitted to the appropriate Division Regional Office within ninety (90) days of the determination. The plan shall describe removal and waste utilization procedures to be used.

IV. INSPECTIONS AND ENTRY

1. The Permittee shall allow any authorized representative of Department, upon the presentation of credentials and other documents as may be required by law and in accordance with reasonable and appropriate biosecurity measures, to:

    a. Enter the Permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this General Permit;

    b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this General Permit;

    c. Inspect, at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this General Permit; and,

    d. Sample or monitor, at reasonable times, for the purpose of assuring permit compliance, any substances or parameters at any location.

V. GENERAL CONDITIONS

1. The issuance of a COC to operate under this General Permit shall not relieve the Permittee of the responsibility for compliance with all applicable surface water, wetlands, groundwater and air quality standards or for damages to surface waters, wetlands or groundwaters resulting from the animal operation.

2. The maximum waste level in lagoons/storage ponds shall not exceed that specified in the facility's CAWMP. At a minimum, maximum waste level for lagoons/storage ponds must not exceed the level that provides adequate storage to contain the 25-year, 24-hour storm event plus an additional one (1) foot of structural freeboard except that there shall be no violation of this condition if: (a) there is a storm event more severe than a 25-year, 24-hour event, (b) the Permittee is in compliance with its CAWMP, and (c) there is at least one (1) foot of structural freeboard.

   In addition to the above requirements, for new and expanding farms with lagoon and storage pond designs completed after September 1, 1996, storage must also be provided for the heavy rainfall factor for the lagoons/storage pond. In case of lagoons/storage ponds in series that are gravity fed, the 25-year, 24-hour storm event and/or the heavy rainfall factor storage requirement for the system may be designed into the lowest lagoon/storage pond in the system. However, adequate freeboard must be designed into the upper lagoons/storage ponds to allow sufficient storage to prevent the waste level from rising into the structural freeboard while the storm water is draining into the lowest lagoon in the system.

3. Any containment basin, such as a lagoon or a storage pond, used for waste management shall continue to be subject to the conditions and requirements of this General Permit until properly closed. When the containment basin is properly closed in accordance with the "Natural Resource Conservation Service (NRCS) North Carolina Standard for Closure of Waste Impoundments," March 2002 or any subsequent amendment, the containment basin shall not be subject to the requirements of this General Permit. The Permittee must submit a letter to the Division to request rescission of the COC by providing documentation of closure of all containment basins.

   Closure shall also include a minimum of 24 hours pre-notification of the Division and submittal of the Animal Waste Storage Pond and Lagoon Closure Report Form to the address identified on the form within fifteen (15) days of completion of closure.

4. This General Permit allows for the distribution of up to four cubic yards of manure per visit to individuals for personal use. The Permittee provide the recipient(s) with information on the nutrient content of the manure. Distribution of greater quantities must be to individuals or businesses permitted to distribute the waste, or to be land applied to sites identified in the Permittee's CAWMP.

5. The Permittee must inform the recipient(s) of his/her responsibilities to properly manage the land application of manure. Record keeping for the distribution of manure up to four (4) cubic yards per visit to individuals for personal use is not required.

6. The annual permit fee shall be paid by the Permittee within thirty (30) days after being billed by the Division. Failure to pay the fee accordingly constitutes grounds for revocation of its COC to operate under this General Permit.

7. Failure of the Permittee to maintain, in full force and effect, lessee and landowner agreements, which are required in the CAWMP, shall constitute grounds for revocation of its COC to operate under this General Permit.

8. A COC to operate under this General Permit is not transferable. In the event there is a desire for the facility to change ownership, or there is a name change of the Permittee, a Notification of Change of Ownership form must be submitted to the Division, including documentation from the parties involved and other supporting materials as may be appropriate. This request will be considered on its merits and may or may not be approved.

9. A COC to operate under this General Permit is effective only with respect to the nature and volume of wastes described in the application and other supporting data. The Permittee shall notify the Division immediately of any applicable information not provided in the permit application.

10. If the Permittee wishes to continue an activity regulated by this General Permit after the expiration date of this General Permit, the Permittee must apply for and obtain a new COC. Renewal applications must be filed at least 180 days prior to the expiration of the General Permit.

11. The issuance of a COC to operate under this General Permit does not prohibit the Division from reopening and modifying the General Permit or COC, revoking and reissuing the General Permit or COC, or terminating the General Permit or COC as allowed by the appropriate laws, rules, and regulations.

12. The Director may require any person, otherwise eligible for coverage under this General Permit, to apply for an individual permit by notifying that person that an application is required.

13. The Groundwater Compliance Boundary is established by 15A NCAC 2L and 15A NCAC 2H .0225. An exceedance of Groundwater Quality Standards at or beyond the Compliance Boundary is subject to the requirements of 15A NCAC 2L and the Division in addition to the penalty provisions applicable under the North Carolina General Statutes.

VI. PENALTIES

1. Failure to abide by the conditions and limitations contained in this General Permit; the facility's COC; the facility's CAWMP; and/or applicable state law; may subject the Permittee to an enforcement action by the Division including but not limited to the modification of the animal waste management system, civil penalties, criminal penalties and injunctive relief.

2. The Permittee must comply with all conditions of this General Permit. Any permit noncompliance constitutes a violation of state law and is grounds for enforcement action; for permit coverage termination, revocation and reissuance, or modification; or denial of a permit coverage renewal application.

3. It shall not be a defense for a Permittee in an enforcement action to claim that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

VII. DEFINITIONS

25-year, 24-hour rainfall or storm event means the maximum 24-hour precipitation event with a probable recurrence interval of once in 25 years, as defined by the National Weather Service in Technical Paper Number 40, "Rainfall Frequency Atlas of the United States," May 1961, and subsequent amendments, or equivalent regional or state rainfall probability information developed therefrom.

Agronomic rates means the amount of animal waste and/or other nutrient sources to be land applied to lands as contained in the nutrient management standard of the USDA Soil Conservation Service Technical Guide Section IV or as recommended by the North Carolina Department of Agriculture and Consumer Services and the North Carolina Cooperative Extension Service at the time of certification of the Animal Waste Management Plan by the appropriate technical specialist.

Amendment to the CAWMP means a change and/or addition to a part(s) of the plan, and requires that the change and/or addition adhere to current applicable standards. The following are examples of amendments to the CAWMP:

- In an existing CAWMP, a change in crops and/or cropping pattern that utilizes 25% or less of the N generated is considered a plan amendment. Additional acreage needed to facilitate the change in crops and/or cropping pattern is permissible and considered part of the amendment.

- The addition of winter crops and/or interseeded perennial crops are considered amendments to an existing CAWMP when the operation does not require additional acreage and/or crops for N utilization, and does not exceed the 25% criteria stated above.

- When a CAWMP cannot meet N utilization requirements due to land lost to irrigation inefficiency (useable versus total acres), then the CAWMP may be amended to increase available acreage and/or change the crop for N utilization. This is the only exception to the 25% N criteria for plan revision.

- Inclusions of emergency action plans, and insect, odor and mortality checklists are considered CAWMP amendments.

- Including additional acreage for land application beyond what is required in the existing CAWMP is considered a plan amendment.

Animal feeding operation means a lot or facility (other than an aquatic animal production facility) where the following conditions are met: (i) animals (other than aquatic animals) have been, are, or will be stabled or confined and fed or maintained for a total of forty five (45) days or more in any twelve (12) month period, and (ii) crops, vegetation, forage growth, or post-harvest residues are not sustained in the normal growing season over any portion of the lot or facility. Two or more animal feeding operations under common ownership are considered to be a single animal feeding operation if they adjoin each other, or if they use a common area or system for the disposal of wastes.

Ditch means any man made channel for the purpose of moving water off a site to the surface waters.

Excessive Ponding means any area of the application field where visible liquid waste is ponded on the surface of the land application site more than four (4) hours following the application of waste. Excessive ponding also means any areas where the ponding of waste has resulted in crop failure.

Groundwaters means any subsurface waters, as defined in 15A NCAC 2L .0102.

Land application means the application of wastewater and/or waste solids onto or incorporation into the soil.

Major changes to the CAWMP means changes in the number of animals, type of operation (feeder to finish to wean to feeder), retrofit of a lagoon, installation of a new irrigation system, and similar type changes. Recertification is only required for major changes to the CAWMP. Major changes to a facility must first be approved by DWQ. The new CAWMP and the certification shall be submitted with a request that the COC be amended to reflect the changes. The facility may not make the changes until a new or amended COC has been issued.

Revision to the CAWMP means a change to an entire CAWMP to meet current applicable standards. A CAWMP must be revised if the operation cannot utilize all N nitrogen generated by the animal production in accordance with the existing CAWMP, except for the specific conditions noted in the CAWMP amendment criteria as previously defined. For an existing CAWMP, a change in crops and/or cropping pattern that utilizes more than 25% of the N generated by the operation is considered a plan revision. Any change to an existing CAWMP, whether an amendment or revision, must be signed and dated by both the producer and a technical specialist for the new CAWMP to be valid. A revision of the CAWMP does not require recertification.

State Waters means all surface waters, wetlands, groundwaters and waters of the United States located in the State.

Surface Waters means any stream, river, brook, swamp, lake, sound, tidal estuary, bay, creek, reservoir, waterway, or other surface body or surface accumulation of water, whether public or private, or natural or artificial, that is contained in, flows through, or borders upon any portion of the State of North Carolina, including any portion of the Atlantic Ocean over which the State has jurisdiction as well as any additional Waters of the United States which are located in the State.

Waste means manure, animal waste, process wastewater and/or sludge generated at an animal feeding operation.

Wetlands means areas that are inundated or saturated by an accumulation of surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support a prevalence of vegetation typically adapted for life in saturated soil conditions, as defined in 15A NCAC 2B .0202.

This General Permit issued the XXth day of XXX, 2004.

NORTH CAROLINA ENVIRONMENTAL MANAGEMENT COMMISSION

_____, Director

Alan W. Klimek, P.E.
North Carolina Division of Water Quality
By Authority of the Environmental Management Commission

Permit Number AWG100000

NORTH CAROLINA
ENVIRONMENTAL MANAGEMENT COMMISSION
DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

CATTLE WASTE MANAGEMENT SYSTEM GENERAL PERMIT

This General Permit is issued pursuant to North Carolina General Statutes 143-215 et seq., may apply to any cattle facility in the State of North Carolina, and shall be effective from October 1, 2004 until September 30, 2009.

All activities authorized herein shall be consistent with the terms and conditions of this General Permit.

Holders of Certificates of Coverage (COC) under this General Permit shall comply with the following specified conditions and limitations.

I. PERFORMANCE STANDARDS

1. Any discharge of waste that reaches surface waters or wetlands is prohibited except as otherwise provided in this General Permit and associated statutory and regulatory provisions. Waste shall not reach surface waters or wetlands by runoff, drift, manmade conveyance, direct application, direct discharge or through ditches not otherwise classified as state waters.

   The waste collection, treatment, storage and application system operated under this General Permit shall be effectively maintained and operated as a non-discharge system to prevent the discharge of pollutants to surface waters or wetlands. Application of waste to terraces and grassed waterways is acceptable as long as it is applied in accordance with Natural Resources Conservation Service (NRCS) Standards and does not result in a discharge of waste to surface waters or wetlands.

   Facilities must be designed, constructed and operated to contain all waste plus the runoff from a 25-year, 24-hour rainfall event for the location of the facility. A facility that has a discharge of waste that results because of a storm event more severe than the 25-year, 24-hour storm will not be considered to be in violation of this General Permit if the facility is in compliance with its Certified Animal Waste Management Plan (CAWMP) and this General Permit.

   Any discharge or application of waste to a ditch that drains to surface waters or wetlands is prohibited except as follows: (a) discharges from the ditches are controlled by best management practices (BMPs) designed in accordance with NRCS standards; (b) the BMPs have been submitted to and approved by the Division of Water Quality (Division); (c) the BMPs were implemented as designed to prevent a discharge to surface waters or wetlands; (d) the waste was removed immediately from the ditch upon discovery; and (e) the event was documented and reported in accordance with Part III.13. of this General Permit. Nothing in this exception shall excuse a discharge to surface waters or wetlands except as may result because of rainfall from a storm event more severe than the 25-year, 24-hour storm.

2. No discharge of waste shall result in a violation of the water quality standards established for the receiving waters as per Title 15A, Subchapter 2B, Section .0200 of the North Carolina Administrative Code and Title 15A, Subchapter 2L of the North Carolina Administrative Code.

3. The facility's COC and its CAWMP are hereby incorporated by reference into this General Permit. The CAWMP must be consistent with all applicable laws, rules, ordinances, and standards (federal, state and local) in effect at the time of siting, design and certification of the facility.

   The Permittee must assess, on an ongoing basis, the effectiveness of the implementation of the CAWMP. The Permittee must make "major changes," "revisions," or "amendments" to the CAWMP, as defined in Section VII, "Definitions," of this Permit, in order to address any changes needed to maintain compliance with the facility's COC and this General Permit. "Major changes," "revisions," and "amendments" to the CAWMP must be documented, dated, and included as part of the CAWMP. "Major changes" and "revisions" to the CAWMP shall be submitted to the appropriate Division Regional Office within thirty (30) calendar days of the "major change" or "revision." "Amendments" are not required to be submitted to the Division Regional Office unless specifically requested by the Division. If field, riser or pull numbers are changed, an explanation shall also be submitted and include a description of how the new numbers relate to the old numbers.

   Any violation of the COC or the CAWMP shall be considered a violation of this General Permit and subject to enforcement actions. A violation of this General Permit may result in the Permittee having to take immediate or long-term corrective action(s) as required by the Division. These actions may include but are not limited to: modifying the CAWMP; ceasing land application of waste; removing animals from the facility; or the COC being reopened and modified, revoked and reissued, and/or terminated.

4. Any proposed increase or modification to the annual average design capacity from that authorized by the COC will require a modification to the CAWMP and the COC prior to modification of the facility.

5. During the period of this General Permit, the Division of Water Quality may notify the permittee to conduct an evaluation of the facility and its CAWMP to determine the facility's ability to comply with the NRCS nutrient management standard as it relates to phosphorous. The Division will make its decision as whether to notify permittees based on experience gained through the NPDES permit implementation. This evaluation will not be required until such time as the permittee is notified to conduct the evaluation by the Division of Water Quality. The evaluation must be documented on forms supplied by or approved by the Division and must be submitted to the Division. This evaluation must be completed by existing facilities within twelve (12) months of receiving notification from the Division.

   No COC will be issued to any new or expanding facility to operate under this General Permit until the applicant has completed and submitted a phosphorous loss assessment to determine if the new or expanding facility can comply with the NRCS phosphorous standards. This assessment shall not be a basis for denial of a COC to operate under this permit unless that demonstration of compliance is a Statutory requirement for COC issuance.

6. If prior approval is received from the Director of the Division of Water Quality (Director), facilities which have been issued a COC to operate under this General Permit may add treatment units for the purpose of removing pollutants before the waste is discharged into the lagoons/storage ponds. Prior to any approval, the Permittee must demonstrate to the satisfaction of the Director that the new treatment unit will not interfere with the operation of the existing treatment system and that a process is in place to properly manage and track the pollutants removed.

7. If prior approval is received from the Director, facilities which have been issued a COC to operate under this General Permit may add innovative treatment processes to the systems on a pilot basis in order to determine if the innovative treatment process will improve how the waste is treated and/or managed. Prior to any approval, the Permittee must demonstrate to the satisfaction of the Director that the innovative treatment process will not interfere with the operation of the existing treatment system and that a process is in place to properly manage and track the pollutants removed.

8. For all new and expanding operations, no collection, treatment or storage facilities may be constructed in a 100-year flood plain.

9. Animal waste shall not be applied within 100 feet of any well with the exception of monitoring wells. The allowable distance to monitoring wells shall be established on a case by case basis by the Division.

II. OPERATION AND MAINTENANCE REQUIREMENTS

1. The collection, treatment, and storage facilities, and the land application equipment and fields shall be properly operated and maintained at all times.

2. A vegetative cover shall be maintained as specified in the facility's CAWMP on all land application fields and buffers in accordance with the CAWMP. No waste shall be applied upon areas not included in the CAWMP.

3. Soil pH on all land application fields must be maintained in the optimum range for crop production.

4. Land application rates shall be in accordance with the CAWMP. In no case shall land application rates exceed the agronomic rate of the nutrient of concern for the receiving crop. In no case shall land application rates result in excessive ponding or any runoff during any given application event.

5. Animal waste shall not be directly applied onto crops for direct human consumption that do not undergo further processing (e.g., strawberries, melons, lettuce, cabbage, apples, etc.) at any time during the growing season, or in the case of fruit bearing trees, following breaking dormancy. Application of animal wastes shall not occur within thirty (30) days of the harvesting of fiber and food crops for direct human consumption that undergoes further processing.

6. If manure or sludges are applied on conventionally tilled bare soil, the waste shall be incorporated into the soil within two (2) days after application on the land. This requirement does not apply to no-till fields, pastures, or fields where crops are actively growing.

7. Pesticides, toxic chemicals and petroleum products shall not be disposed of in the animal waste collection, treatment, storage or application systems.

8. Domestic and/or industrial wastewater from showers, toilets, sinks, etc. shall not be discharged into the animal waste collection, treatment, storage and application system. Washing machines located in the milking parlors and used exclusively for washing rags used during milking; and wash vats required to be connected to the animal waste collection, treatment, storage and application system by Grade A Pasteurized Milk Ordinance Part II, Section 7, Item 5r are exempt from this requirement. Washdown of stock trailers owned by and used to transport animals to and from the facility only, will be permissible as long as the system has been evaluated and approved to accommodate the additional volume. Only those cleaning agents and soaps that are EPA approved according to their label, will not harm the cover crop, and will not contravene the groundwater standards listed in 15A NCAC 2L may be utilized in facilities covered by this General Permit. Instruction labels are to be followed when using cleaning agents and soaps.

9. Disposal of dead animals resulting from normal mortality rates associated with the facility shall be done in accordance with the facility's CAWMP and the North Carolina Department of Agriculture and Consumer Services (NCDA&CS) Veterinary Division's Statutes and regulations.

   Disposal of dead animals whose numbers exceed normal mortality rates associated with the facility shall also be done in accordance with the facility's CAWMP and NCDA&CS Veterinary Division's Statutes and regulations provided that: 1) burial of such animals shall be done in consultation with the State Veterinarian of the NCDA&CS Veterinary Division's Statutes and in compliance with NCDA&CS regulations; 2) all such burial sites must be mapped, and the dates and numbers of the animals buried by type must be recorded; and 3) the map is submitted to the appropriate Regional Office Groundwater Section within fifteen (15) calendar days of burial.

   In the event of a state of emergency declared by the Governor, disposal of dead animals shall be done in accordance with requirements and guidelines dictated by the State Veterinarian according G.S. §106-339.4. The Division may require groundwater monitoring when there is massive burial of animals. All burial sites of such animals must be mapped, and the dates and numbers of the animals buried by type must be recorded.

10. Unless accounted for in temporary storage volume, all uncontaminated runoff from the surrounding property and buildings shall be diverted away from the waste lagoons/storage ponds to prevent any unnecessary addition to the liquid volume in the structures. Runoff from lounging areas to the waste storage ponds or lagoons shall be prevented unless approved in the CAWMP.

11. A protective vegetative cover shall be established and maintained on all earthen lagoon/storage pond embankments (outside toe of embankment to maximum pumping elevation), berms, pipe runs, and diversions to surface waters or wetlands. Trees, shrubs, and other woody vegetation shall not be allowed to grow on the lagoon/storage pond embankments. All trees shall be removed in accordance with good engineering practices. Lagoon/storage pond areas shall be accessible, and vegetation shall be kept mowed.

12. At the time of sludge removal from a lagoon/storage pond, the sludge must be managed in accordance with the CAWMP. When removal of sludge from the lagoon is necessary, provisions must be taken to prevent damage to the lagoon dikes and liner.

13. Lagoons/storage ponds shall be kept free of foreign debris including, but not limited to, tires, bottles, light bulbs, gloves, syringes or any other solid waste.

14. The facility must have at least one of the following items at all times: (a) adequate animal waste application and handling equipment, (b) a lease, or other written agreement, for the use of the necessary equipment, or (c) a contract with a third party applicator capable of providing adequate waste application.

15. The Permittee shall designate a certified animal waste management system operator with a valid certification to be in charge of the animal waste management system. The waste management system shall be operated by the OIC or a person under the OIC's supervision.

16. In accordance with 15A NCAC 8F .0203(b)(2), the Operator in Charge (OIC) or a designated back-up OIC of a Type B Animal Waste Management System shall inspect, or a person under the supervision of an OIC or designated back-up OIC shall inspect, the land application site as often as necessary to insure that the animal waste is land applied in accordance with the CAWMP. In no case shall the time between inspections be more than 120 minutes during the application of waste. A record of each inspection shall be recorded on forms supplied by, or approved by, the Division and shall include the date, time, sprayfield number and name of the operator for each inspection.

    The Permittee may assert as an affirmative defense in any enforcement action alleging noncompliance with the requirements imposed in this condition that such noncompliance was due to circumstances beyond the Permittee's control. A notation shall be made on the form indicating the inspection affected by such circumstance and an explanation setting forth the circumstances claimed to have been beyond the Permittee's control shall be submitted with the form.

17. The Director may require any permittee to install, operate and maintain devices on all irrigation pumps/equipment designed to automatically stop irrigation activities during precipitation. This decision will be based on the facility's compliance history for irrigation events.

18. The Director may require any permittee to install and operate flow meters with flow totalizers based on the facility's violations and/or incomplete or incorrect record keeping events.

19. No waste shall be applied in wind conditions that might reasonably be expected to cause the mist to reach surface waters or wetlands.

20. The Permittee shall maintain buffer strips or other equivalent practices as specified in the facility's CAWMP near feedlots, manure storage areas and land application areas.

21. Waste shall not be applied on land that is flooded, saturated with water, frozen or snow covered at the time of land application.

22. Land application of waste is prohibited during precipitation events. The Permittee shall consider pending weather conditions in making the decision to land apply waste and shall document the weather conditions at the time of land application on forms supplied by or approved by the Division.

23. Land application activities shall cease on any application site that exceeds a Mehlich 3 Soil Test Index for Copper of greater than 3,000 (108 pounds per acre) or Zinc of greater than 3,000 (213 pounds per acre).

24. All waste application equipment must be tested and calibrated once in the first two years after issuance of the COC and then at least once every two years thereafter. The results must be documented on forms provided by, or approved by, the Division.

25. Any major structural repairs to lagoons/storage ponds must have written documentation from a technical specialist certifying proper design and installation. However, if a piece of equipment is being replaced with a piece of equipment of the identical specifications, no technical specialist approval is necessary [i.e. piping, reels, valves, pumps (if the gallons per minute (gpm) capacity is not being increased or decreased), etc.] unless the replacement involves disturbing the lagoon/storage pond embankment.

26. Crops for which animal waste is land applied must be removed from the land application site and properly managed and utilized unless other management practices are approved in the CAWMP.

III. MONITORING AND REPORTING REQUIREMENTS

1. An inspection of the waste collection, treatment, and storage structures, and runoff control measures shall be conducted and documented at a frequency to insure proper operation but at least monthly and after all storm events of greater than one (1) inch in 24 hours. For example, lagoons/storage ponds, and other structures should be inspected for evidence of erosion, leakage, damage by animals or discharge.

2. Monitoring and Recording Freeboard Levels

   a. Highly visible waste-level gauges shall be maintained to mark the level of waste in each lagoon/storage pond that does not gravity feed through a free flowing transfer pipe into a subsequent structure. The gauge shall have readily visible permanent markings.

      The waste level in each lagoon with a waste level gauge shall be monitored and recorded weekly on forms supplied by or approved by the Division.

      The Director may require more frequent monitoring and recording on lagoon levels based on the facility's compliance history for freeboard violations.

   b. The freeboard levels of lagoons serving any facility which experiences freeboard violations in any two consecutive years following the issuance of this General Permit, or as determined necessary by the Director, shall be monitored and recorded as follows:

      In addition to the facility's existing lagoon waste-level gauges, automated lagoon/storage pond waste-level monitors and recorders (monitored and recorded at least hourly) must be installed on all treatment and storage lagoons covered by a COC issued under this General Permit to measure and record lagoon freeboard. This equipment must be properly maintained and calibrated in a manner consistent with manufacturer's operation and maintenance recommendations. This automated equipment must be in place no later than ninety (90) days following notification from the Director. The Director may determine that installation of automated waste level monitors is not required if the Permittee can demonstrate that preventative measures were taken to avoid the violations and that the violations resulted from conditions beyond the Permittee's control.

      If an automated level monitor(s) becomes inoperable, the Permittee shall:

      i. report the problem by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than 24 hours following first knowledge of the problem; and,

      ii. make any needed repairs to the equipment as quickly as possible, and take and record daily lagoon levels at the same time every day until such time as the automated equipment is placed back into operation.

   c. The Director may require new or modified waste-level gauges at any facility if he determines that the existing gauges are not adequate to accurately indicate actual lagoon levels, or the various lagoon levels required to be maintained by this General Permit or the facility's CAWMP.

3. Monitoring and Recording Precipitation Events

   a. Precipitation events at facilities issued a COC to operate under this General Permit shall be monitored and recorded as follows:

      A rain gauge must be installed at a site that is representative of the weather conditions at the farm's land application site(s) to measure all precipitation events. The precipitation type and amount must be recorded daily for all precipitation events and maintained on site for Department review. Daily records do not need to be maintained for those days without precipitation events.

   b. The Director may require that an automated rain gauge and recorder must be installed on site to measure and record all precipitation events. This equipment must be properly maintained and calibrated in a manner consistent with manufacturer's operation and maintenance recommendations. This automated equipment must be in place no later than ninety (90) days following receipt of notice from the Director.

      If an automated rain gauge(s) becomes inoperable, the Permittee shall:

      i. report the problem by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than twenty four (24) hours following first knowledge of the problem; and,

      ii. make any needed repairs to the equipment as quickly as possible, and take and record all rainfall events until such time as the automated equipment is placed back into operation.

4. A representative Standard Soil Fertility Analysis, including pH, phosphorus, copper, and zinc, shall be conducted on each application field receiving animal waste in accordance with NCGS 143-215.10C(e)(6). As of the effective date of this General Permit, the Statute requires that the analysis be conducted at least annually.

5. An analysis of the animal waste shall be conducted in accordance with recommended laboratory sampling procedures as close to the time of application as practical and at least within sixty (60) days (before or after) of the date of application. Every reasonable effort shall be made to have the waste analyzed prior to the date of application and as close to the time of waste application as possible. This analysis shall include the following parameters:

Nitrogen	Zinc
Phosphorus	Copper

6. The Permittee shall record all irrigation and land application event(s) including hydraulic loading rates, nutrient loading rates and cropping information. The Permittee shall also record removal of solids and document nutrient loading rates if disposed on-site or record the off-site location(s). These records must be on forms supplied by, or approved by, the Division.

7. A record shall be created and maintained of all transfers of waste between lagoons/storage ponds on the same site not typically operated in series. Such record shall include at least the identity of the lagoon from which the waste was transferred, the identity of the lagoon receiving the waste, the date and time of transfer and the total volume of waste transferred.

8. The Permittee must maintain monthly stocking records for the facility and make the records available to Department of Environment and Natural Resources (Department). Pastured animals not contributing waste to the animal waste management systems should not be counted on the monthly stocking records.

9. If, for any reason, there is a discharge from the waste collection, treatment, storage and application systems (including the land application sites), to surface waters or wetlands, the Permittee is required to make notification in accordance with Condition III. 13. The discharge notification shall include the following information:

   a. Description of the discharge: A description of the discharge including an estimate of the volume discharged, a description of the flow path to the receiving surface waters or wetlands and a site sketch showing the path of the waste. Also, an estimation of the volume discharged.

   b. Time of the discharge: The length of time of the discharge, including the exact dates and times that it started and stopped, and if not stopped, the anticipated time the discharge is expected to continue.

   c. Cause of the discharge: A detailed statement of the cause of the discharge. If caused by a precipitation event, detailed information from the on-site rain gauge concerning the inches and duration of the precipitation event.

   d. All steps being taken to reduce, stop and cleanup the discharge. All steps to be taken to prevent future discharges from the same cause.

   e. Analysis of the waste: A copy of the last waste analysis conducted as required by Condition III. 5. above.

10. A copy of this General Permit, the facility's COC, certification forms, lessee and landowner agreements, the CAWMP and copies of all records required by this General Permit and the facility's CAWMP shall be maintained by the Permittee in chronological and legible form for a minimum of three (3) years. Records include but are not limited to: soil and waste analyses, rain gauge readings, freeboard levels, irrigation and land application event(s), past inspection reports and operational reviews, animal stocking records, records of additional nutrient sources applied (including but not limited to sludges, unused feedstuff leachate, milk waste, septage and commercial fertilizer), cropping information, waste application equipment testing and calibration, and records of removal of solids to off-site location(s). These records shall be maintained on forms provided or approved by the Division and shall be readily available at the facility (stored at places such as the farm residence, office, outbuildings, etc.) where animal waste management activities are being conducted for the life of this General Permit, unless otherwise specified in this General Permit.

11. Within fifteen (15) working days of receiving the request from the Division, the Permittee shall provide to the Division one (1) copy of all requested information and reports related to the operation of the animal waste management system. Once received by the Division, all such information and reports become public information, unless they constitute confidential information under NC G.S. 132-1.2, and shall be made available to the public by the Division as specified in Chapter 132 of the General Statutes.

12. The Division may require any additional monitoring and reporting (including but not limited to groundwater, surface water or wetland, waste, sludge, soil, lagoon/storage pond levels and plant tissue) necessary to determine the source, quantity, quality, and effect of such waste upon the surface waters, groundwaters or wetlands. Such monitoring, including its scope, frequency, duration and any sampling, testing, and reporting systems, shall meet all applicable Division requirements.

13. Regional Notification:

The Permittee shall report by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than twenty-four (24) hours following first knowledge of the occurrence of any of the following events:

a. Any discharge to ditches, surface waters or wetlands.

b. Any discharge that poses a serious threat to the environment or human safety or health.

c. Failure to maintain storage capacity in a lagoon/storage pond greater than or equal to that required in Condition V. 3. of this General Permit.

d. Over applying waste either in excess of the limits set out in the CAWMP or where runoff enters surface waters or wetlands.

e. Failure of any component of the animal waste collection, treatment, storage and land application system resulting in a discharge to surface waters or wetlands.

f. Any failure of the waste treatment and disposal system that renders the facility incapable of adequately receiving, treating or storing the waste and/or sludge.

g. A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge to surface waters or wetlands.

h. A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge that poses a serious threat to surface waters or wetlands.

i. Any deterioration or leak in a lagoon/storage pond that poses an immediate threat to the environment or human safety or health.

For any emergency, which requires immediate reporting after normal business hours, contact must be made with the Division of Emergency Management at 1-800-858-0368.

The Permittee shall also file a written report to the appropriate Division Regional Office within five (5) calendar days following first knowledge of the occurrence. This report shall outline the actions taken or proposed to be taken to correct the problem and to ensure that the problem does not recur. The requirement to file a written report may not be waived by the Division Regional Office.

14. The Director may require any permittee to file an annual certification report based on the compliance history of the facility. If required, the report must be filed on forms provided by the Division.

15. The Director may require facilities to submit additional reports and/or certifications based on the facility's compliance history.

16. In the event of a discharge of 1,000 gallons or more of waste to surface waters or wetlands, the Permittee must issue a press release to all print and electronic news media that provide general coverage in the county in which the discharge occurred setting out the details of the discharge. The press release must be issued within forty-eight (48) hours after it is determined that the discharge has reached the surface waters or wetlands. A copy of the press release and a list of the news media to which it was distributed must be kept for at least one (1) year after the discharge and must be distributed to any person upon request.

17. In the event of a discharge of 15,000 gallons or more of animal waste to surface waters or wetlands, a public notice is required in addition to the press release described in Condition III 13. The public notice must be placed in a newspaper having general circulation in the county in which the discharge occurred and the county immediately downstream within ten (10) days of the discharge. The minimum content of the notice is the name of the facility, location of the discharge, estimated volume of waste entering state waters, time and date discharge occurred, duration of the discharge, identification water body that was discharged into including creek and river basin if applicable, actions taken to prevent further discharge, and a facility contact person and phone number.

18. If a discharge of 1,000,000 gallons of wastewater or more reaches surface waters or wetlands, the appropriate Division Regional Office must be contacted to determine in what additional counties, if any, a public notice must be published. A copy of all public notices and proof of publication must be sent to the Division within thirty (30) days of the discharge.

19. All facilities, which are issued a COC to operate under this General Permit, shall conduct a survey of the sludge accumulation in all lagoons within two (2) years of receiving the COC and every year thereafter. This survey shall include but not be limited to a sketch showing the depth of sludge in the various locations within each lagoon. This survey frequency may be reduced if it can be demonstrated to the satisfaction of the Division that the rate of sludge accumulation does not warrant an annual survey.

    If the sludge accumulation is such that it is greater than the volume for which the lagoon was designed or the accumulation reduces the lagoon's minimum treatment volume to less than the volume for that which the lagoon was designed, a sludge removal or management plan must be submitted to the appropriate Division Regional Office within ninety (90) days of the determination. The plan shall describe removal and waste utilization procedures to be used.

IV. INSPECTIONS AND ENTRY

1. The Permittee shall allow any authorized representative of Department, upon the presentation of credentials and other documents as may be required by law and in accordance with reasonable and appropriate biosecurity measures, to:

    a. Enter the Permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this General Permit;

    b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this General Permit;

    c. Inspect, at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this General Permit; and,

    d. Sample or monitor, at reasonable times, for the purpose of assuring permit compliance, any substances or parameters at any location.

V. GENERAL CONDITIONS

1. The issuance of a COC to operate under this General Permit shall not relieve the Permittee of the responsibility for compliance with all applicable surface water, wetlands, groundwater and air quality standards or for damages to surface waters, wetlands or groundwaters resulting from the animal operation.

2. The maximum waste level in lagoons/storage ponds shall not exceed that specified in the facility's CAWMP. At a minimum, maximum waste level for lagoons/storage ponds must not exceed the level that provides adequate storage to contain the 25-year, 24-hour storm event plus an additional one (1) foot of structural freeboard except that there shall be no violation of this condition if: (a) there is a storm event more severe than a 25-year, 24-hour event, (b) the Permittee is in compliance with its CAWMP, and (c) there is at least one (1) foot of structural freeboard.

   In addition to the above requirements, for new and expanding farms with lagoon and storage pond designs completed after September 1, 1996, storage must also be provided for the heavy rainfall factor for the lagoons/storage pond. In case of lagoons/storage ponds in series that are gravity fed, the 25-year, 24-hour storm event and/or the heavy rainfall factor storage requirement for the system may be designed into the lowest lagoon/storage pond in the system. However, adequate freeboard must be designed into the upper lagoons/storage ponds to allow sufficient storage to prevent the waste level from rising into the structural freeboard while the storm water is draining into the lowest lagoon in the system.

3. Any containment basin, such as a lagoon or a storage pond, used for waste management shall continue to be subject to the conditions and requirements of this General Permit until properly closed. When the containment basin is properly closed in accordance with the "Natural Resource Conservation Service (NRCS) North Carolina Standard for Closure of Waste Impoundments," March 2002 or any subsequent amendment, the containment basin shall not be subject to the requirements of this General Permit. The Permittee must submit a letter to the Division to request rescission of the COC by providing documentation of closure of all containment basins.

   Closure shall also include a minimum of 24 hours pre-notification of the Division and submittal of the Animal Waste Storage Pond and Lagoon Closure Report Form to the address identified on the form within fifteen (15) days of completion of closure.

4. This General Permit allows for the distribution of up to four cubic yards of manure per visit to individuals for personal use. The Permittee provide the recipient(s) with information on the nutrient content of the manure. Distribution of greater quantities must be to individuals or businesses permitted to distribute the waste, or to be land applied to sites identified in the Permittee's CAWMP.

5. The Permittee must inform the recipient(s) of his/her responsibilities to properly manage the land application of manure. Record keeping for the distribution of manure up to four (4) cubic yards per visit to individuals for personal use is not required.

6. The annual permit fee shall be paid by the Permittee within thirty (30) days after being billed by the Division. Failure to pay the fee accordingly constitutes grounds for revocation of its COC to operate under this General Permit.

7. Failure of the Permittee to maintain, in full force and effect, lessee and landowner agreements, which are required in the CAWMP, shall constitute grounds for revocation of its COC to operate under this General Permit.

8. A COC to operate under this General Permit is not transferable. In the event there is a desire for the facility to change ownership, or there is a name change of the Permittee, a Notification of Change of Ownership form must be submitted to the Division, including documentation from the parties involved and other supporting materials as may be appropriate. This request will be considered on its merits and may or may not be approved.

9. A COC to operate under this General Permit is effective only with respect to the nature and volume of wastes described in the application and other supporting data. The Permittee shall notify the Division immediately of any applicable information not provided in the permit application.

10. If the Permittee wishes to continue an activity regulated by this General Permit after the expiration date of this General Permit, the Permittee must apply for and obtain a new COC. Renewal applications must be filed at least 180 days prior to the expiration of the General Permit.

11. The issuance of a COC to operate under this General Permit does not prohibit the Division from reopening and modifying the General Permit or COC, revoking and reissuing the General Permit or COC, or terminating the General Permit or COC as allowed by the appropriate laws, rules, and regulations.

12. The Director may require any person, otherwise eligible for coverage under this General Permit, to apply for an individual permit by notifying that person that an application is required.

13. The Groundwater Compliance Boundary is established by 15A NCAC 2L and 15A NCAC 2H .0225. An exceedance of Groundwater Quality Standards at or beyond the Compliance Boundary is subject to the requirements of 15A NCAC 2L and the Division in addition to the penalty provisions applicable under the North Carolina General Statutes.

VI. PENALTIES

1. Failure to abide by the conditions and limitations contained in this General Permit; the facility's COC; the facility's CAWMP; and/or applicable state law; may subject the Permittee to an enforcement action by the Division including but not limited to the modification of the animal waste management system, civil penalties, criminal penalties and injunctive relief.

2. The Permittee must comply with all conditions of this General Permit. Any permit noncompliance constitutes a violation of state law and is grounds for enforcement action; for permit coverage termination, revocation and reissuance, or modification; or denial of a permit coverage renewal application.

3. It shall not be a defense for a Permittee in an enforcement action to claim that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

VII. DEFINITIONS

25-year, 24-hour rainfall or storm event means the maximum 24-hour precipitation event with a probable recurrence interval of once in 25 years, as defined by the National Weather Service in Technical Paper Number 40, "Rainfall Frequency Atlas of the United States," May 1961, and subsequent amendments, or equivalent regional or state rainfall probability information developed therefrom.

Agronomic rates means the amount of animal waste and/or other nutrient sources to be land applied to lands as contained in the nutrient management standard of the USDA Soil Conservation Service Technical Guide Section IV or as recommended by the North Carolina Department of Agriculture and Consumer Services and the North Carolina Cooperative Extension Service at the time of certification of the Animal Waste Management Plan by the appropriate technical specialist.

Amendment to the CAWMP means a change and/or addition to a part(s) of the plan, and requires that the change and/or addition adhere to current applicable standards. The following are examples of amendments to the CAWMP:

- In an existing CAWMP, a change in crops and/or cropping pattern that utilizes 25% or less of the N generated is considered a plan amendment. Additional acreage needed to facilitate the change in crops and/or cropping pattern is permissible and considered part of the amendment.

- The addition of winter crops and/or interseeded perennial crops are considered amendments to an existing CAWMP when the operation does not require additional acreage and/or crops for N utilization, and does not exceed the 25% criteria stated above.

- When a CAWMP cannot meet N utilization requirements due to land lost to irrigation inefficiency (usable versus total acres), then the CAWMP may be amended to increase available acreage and/or change the crop for N utilization. This is the only exception to the 25% N criteria for plan revision.

- Inclusions of emergency action plans, and insect, odor and mortality checklists are considered CAWMP amendments.

- Including additional acreage for land application beyond what is required in the existing CAWMP is considered a plan amendment.

Animal feeding operation means a lot or facility (other than an aquatic animal production facility) where the following conditions are met: (i) animals (other than aquatic animals) have been, are, or will be stabled or confined and fed or maintained for a total of forty five (45) days or more in any twelve (12) month period, and (ii) crops, vegetation, forage growth, or post-harvest residues are not sustained in the normal growing season over any portion of the lot or facility. Two or more animal feeding operations under common ownership are considered to be a single animal feeding operation if they adjoin each other, or if they use a common area or system for the disposal of wastes.

Ditch means any man made channel for the purpose of moving water off a site to the surface waters.

Excessive Ponding means any area of the application field where visible liquid waste is ponded on the surface of the land application site more than four (4) hours following the application of waste. Excessive ponding also means any areas where the ponding of waste has resulted in crop failure.

Groundwaters means any subsurface waters, as defined in 15A NCAC 2L .0102.

Land application means the application of wastewater and/or waste solids onto or incorporation into the soil.

Major changes to the CAWMP means changes in the number of animals, type of operation (feeder to finish to wean to feeder), retrofit of a lagoon, installation of a new irrigation system, and similar type changes. Recertification is only required for major changes to the CAWMP. Major changes to a facility must first be approved by DWQ. The new CAWMP and the certification shall be submitted with a request that the COC be amended to reflect the changes. The facility may not make the changes until a new or amended COC has been issued.

Revision to the CAWMP means a change to an entire CAWMP to meet current applicable standards. A CAWMP must be revised if the operation cannot utilize all N nitrogen generated by the animal production in accordance with the existing CAWMP, except for the specific conditions noted in the CAWMP amendment criteria as previously defined. For an existing CAWMP, a change in crops and/or cropping pattern that utilizes more than 25% of the N generated by the operation is considered a plan revision. Any change to an existing CAWMP, whether an amendment or revision, must be signed and dated by both the producer and a technical specialist for the new CAWMP to be valid. A revision of the CAWMP does not require recertification.

State Waters means all surface waters, wetlands, groundwaters and waters of the United States located in the State.

Surface Waters means any stream, river, brook, swamp, lake, sound, tidal estuary, bay, creek, reservoir, waterway, or other surface body or surface accumulation of water, whether public or private, or natural or artificial, that is contained in, flows through, or borders upon any portion of the State of North Carolina, including any portion of the Atlantic Ocean over which the State has jurisdiction as well as any additional Waters of the United States which are located in the State.

Waste means manure, animal waste, process wastewater and/or sludge generated at an animal feeding operation.

Wetlands means areas that are inundated or saturated by an accumulation of surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support a prevalence of vegetation typically adapted for life in saturated soil conditions, as defined in 15A NCAC 2B .0202.

This General Permit issued the XXth day of XXX, 2004.

NORTH CAROLINA ENVIRONMENTAL MANAGEMENT COMMISSION

_____, Director

Alan W. Klimek, P.E.
North Carolina Division of Water Quality
By Authority of the Environmental Management Commission

Permit Number AWG200000

NORTH CAROLINA
ENVIRONMENTAL MANAGEMENT COMMISSION
DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

POULTRY WASTE MANAGEMENT SYSTEM GENERAL PERMIT

This General Permit is issued pursuant to North Carolina General Statutes 143-215 et seq., may apply to any poultry facility in the State of North Carolina, and shall be effective from October 1, 2004 until September 30, 2009.

All activities authorized herein shall be consistent with the terms and conditions of this General Permit.

Holders of Certificates of Coverage (COC) under this General Permit shall comply with the following specified conditions and limitations.

I. PERFORMANCE STANDARDS

1. Any discharge of waste that reaches surface waters or wetlands is prohibited except as otherwise provided in this General Permit and associated statutory and regulatory provisions. Waste shall not reach surface waters or wetlands by runoff, drift, manmade conveyance, direct application, direct discharge or through ditches not otherwise classified as state waters.

   The waste collection, treatment, storage and application system operated under this General Permit shall be effectively maintained and operated as a non-discharge system to prevent the discharge of pollutants to surface waters or wetlands. Application of waste to terraces and grassed waterways is acceptable as long as it is applied in accordance with Natural Resources Conservation Service (NRCS) Standards and does not result in a discharge of waste to surface waters or wetlands.

   Facilities must be designed, constructed and operated to contain all waste plus the runoff from a 25-year, 24-hour rainfall event for the location of the facility. A facility that has a discharge of waste that results because of a storm event more severe than the 25-year, 24-hour storm will not be considered to be in violation of this General Permit if the facility is in compliance with its Certified Animal Waste Management Plan (CAWMP) and this General Permit.

   Any discharge or application of waste to a ditch that drains to surface waters or wetlands is prohibited except as follows: (a) discharges from the ditches are controlled by best management practices (BMPs) designed in accordance with NRCS standards; (b) the BMPs have been submitted to and approved by the Division of Water Quality (Division); (c) the BMPs were implemented as designed to prevent a discharge to surface waters or wetlands; (d) the waste was removed immediately from the ditch upon discovery; and (e) the event was documented and reported in accordance with Part III.13. of this General Permit. Nothing in this exception shall excuse a discharge to surface waters or wetlands except as may result because of rainfall from a storm event more severe than the 25-year, 24-hour storm.

2. No discharge of waste shall result in a violation of the water quality standards established for the receiving waters as per Title 15A, Subchapter 2B, Section .0200 of the North Carolina Administrative Code and Title 15A, Subchapter 2L of the North Carolina Administrative Code.

3. The facility's COC and its CAWMP are hereby incorporated by reference into this General Permit. The CAWMP must be consistent with all applicable laws, rules, ordinances, and standards (federal, state and local) in effect at the time of siting, design and certification of the facility.

   The Permittee must assess, on an ongoing basis, the effectiveness of the implementation of the CAWMP. The Permittee must make "major changes," "revisions," or "amendments" to the CAWMP, as defined in Section VII, "Definitions," of this Permit, in order to address any changes needed to maintain compliance with the facility's COC and this General Permit. "Major changes," "revisions," and "amendments" to the CAWMP must be documented, dated, and included as part of the CAWMP. "Major changes" and "revisions" to the CAWMP shall be submitted to the appropriate Division Regional Office within thirty (30) calendar days of the "major change" or "revision." "Amendments" are not required to be submitted to the Division Regional Office unless specifically requested by the Division. If field, riser or pull numbers are changed, an explanation shall also be submitted and include a description of how the new numbers relate to the old numbers.

   Any violation of the COC or the CAWMP shall be considered a violation of this General Permit and subject to enforcement actions. A violation of this General Permit may result in the Permittee having to take immediate or long-term corrective action(s) as required by the Division. These actions may include but are not limited to: modifying the CAWMP; ceasing land application of waste; removing animals from the facility; or the COC being reopened and modified, revoked and reissued, and/or terminated.

4. Any proposed increase or modification to the annual average design capacity from that authorized by the COC will require a modification to the CAWMP and the COC prior to modification of the facility.

5. During the period of this General Permit, the Division of Water Quality may notify the permittee to conduct an evaluation of the facility and its CAWMP to determine the facility's ability to comply with the NRCS nutrient management standard as it relates to phosphorous. The Division will make its decision as whether to notify permittees based on experience gained through the NPDES permit implementation. This evaluation will not be required until such time as the permittee is notified to conduct the evaluation by the Division of Water Quality. The evaluation must be documented on forms supplied by or approved by the Division and must be submitted to the Division. This evaluation must be completed by existing facilities within twelve (12) months of receiving notification from the Division.

   No COC will be issued to any new or expanding facility to operate under this General Permit until the applicant has completed and submitted a phosphorous loss assessment to determine if the new or expanding facility can comply with the NRCS phosphorous standards. This assessment shall not be a basis for denial of a COC to operate under this permit unless that demonstration of compliance is a Statutory requirement for COC issuance.

6. If prior approval is received from the Director of the Division of Water Quality (Director), facilities which have been issued a COC to operate under this General Permit may add treatment units for the purpose of removing pollutants before the waste is discharged into the lagoons/storage ponds. Prior to any approval, the Permittee must demonstrate to the satisfaction of the Director that the new treatment unit will not interfere with the operation of the existing treatment system and that a process is in place to properly manage and track the pollutants removed.

7. If prior approval is received from the Director, facilities which have been issued a COC to operate under this General Permit may add innovative treatment processes to the systems on a pilot basis in order to determine if the innovative treatment process will improve how the waste is treated and/or managed. Prior to any approval, the Permittee must demonstrate to the satisfaction of the Director that the innovative treatment process will not interfere with the operation of the existing treatment system and that a process is in place to properly manage and track the pollutants removed.

8. For all new and expanding operations, no collection, treatment or storage facilities may be constructed in a 100-year flood plain.

9. Animal waste shall not be applied within 100 feet of any well with the exception of monitoring wells. The allowable distance to monitoring wells shall be established on a case by case basis by the Division.

II. OPERATION AND MAINTENANCE REQUIREMENTS

1. The collection, treatment, and storage facilities, and the land application equipment and fields shall be properly operated and maintained at all times.

2. A vegetative cover shall be maintained as specified in the facility's CAWMP on all land application fields and buffers in accordance with the CAWMP. No waste shall be applied upon areas not included in the CAWMP.

3. Soil pH on all land application fields must be maintained in the optimum range for crop production.

4. Land application rates shall be in accordance with the CAWMP. In no case shall land application rates exceed the agronomic rate of the nutrient of concern for the receiving crop. In no case shall land application rates result in excessive ponding or any runoff during any given application event.

5. Animal waste shall not be directly applied onto crops for direct human consumption that do not undergo further processing (e.g., strawberries, melons, lettuce, cabbage, apples, etc.) at any time during the growing season, or in the case of fruit bearing trees, following breaking dormancy. Application of animal wastes shall not occur within thirty (30) days of the harvesting of fiber and food crops for direct human consumption that undergoes further processing.

6. If manure or sludges are applied on conventionally tilled bare soil, the waste shall be incorporated into the soil within two (2) days after application on the land. This requirement does not apply to no-till fields, pastures, or fields where crops are actively growing.

7. Pesticides, toxic chemicals and petroleum products shall not be disposed of in the animal waste collection, treatment, storage or application systems.

8. Domestic and/or industrial wastewater from showers, toilets, sinks, etc. shall not be discharged into the animal waste collection, treatment, storage and application system. Washdown of stock trailers owned by and used to transport animals to and from the facility only, will be permissible as long as the system has been evaluated and approved to accommodate the additional volume. Only those cleaning agents and soaps that are EPA approved according to their label, will not harm the cover crop, and will not contravene the groundwater standards listed in 15A NCAC 2L may be utilized in facilities covered by this General Permit. Instruction labels are to be followed when using cleaning agents and soaps.

9. Disposal of dead animals resulting from normal mortality rates associated with the facility shall be done in accordance with the facility's CAWMP and the North Carolina Department of Agriculture and Consumer Services (NCDA&CS) Veterinary Division's Statutes and regulations.

   Disposal of dead animals whose numbers exceed normal mortality rates associated with the facility shall also be done in accordance with the facility's CAWMP and NCDA&CS Veterinary Division's Statutes and regulations provided that: 1) burial of such animals shall be done in consultation with the State Veterinarian of the NCDA&CS Veterinary Division's Statutes and in compliance with NCDA&CS regulations; 2) all such burial sites must be mapped, and the dates and numbers of the animals buried by type must be recorded; and 3) the map is submitted to the appropriate Regional Office Groundwater Section within fifteen (15) calendar days of burial.

   In the event of a state of emergency declared by the Governor, disposal of dead animals shall be done in accordance with requirements and guidelines dictated by the State Veterinarian according G.S. §106-339.4. The Division may require groundwater monitoring when there is massive burial of animals. All burial sites of such animals must be mapped, and the dates and numbers of the animals buried by type must be recorded.

10. Unless accounted for in temporary storage volume, all uncontaminated runoff from the surrounding property and buildings shall be diverted away from the waste lagoons/storage ponds to prevent any unnecessary addition to the liquid volume in the structures.

11. A protective vegetative cover shall be established and maintained on all earthen lagoon/storage pond embankments (outside toe of embankment to maximum pumping elevation), berms, pipe runs, and diversions to surface waters or wetlands. Trees, shrubs, and other woody vegetation shall not be allowed to grow on the lagoon/storage pond embankments. All trees shall be removed in accordance with good engineering practices. Lagoon/storage pond areas shall be accessible, and vegetation shall be kept mowed.

12. At the time of sludge removal from a lagoon/storage pond, the sludge must be managed in accordance with the CAWMP. When removal of sludge from the lagoon is necessary, provisions must be taken to prevent damage to the lagoon dikes and liner.

13. Lagoons/storage ponds shall be kept free of foreign debris including, but not limited to, tires, bottles, light bulbs, gloves, syringes or any other solid waste.

14. The facility must have at least one of the following items at all times: (a) adequate animal waste application and handling equipment, (b) a lease, or other written agreement, for the use of the necessary equipment, or (c) a contract with a third party applicator capable of providing adequate waste application.

15. The Permittee shall designate a certified animal waste management system operator with a valid certification to be in charge of the animal waste management system. The waste management system shall be operated by the OIC or a person under the OIC's supervision.

16. In accordance with 15A NCAC 8F .0203(b)(2), the Operator in Charge (OIC) or a designated back-up OIC of a Type A Animal Waste Management System shall inspect, or a person under the supervision of an OIC or designated back-up OIC shall inspect, the land application site as often as necessary to insure that the animal waste is land applied in accordance with the CAWMP. In no case shall the time between inspections be more than 120 minutes during the application of waste. A record of each inspection shall be recorded on forms supplied by, or approved by, the Division and shall include the date, time, sprayfield number and name of the operator for each inspection.

The Permittee may assert as an affirmative defense in any enforcement action alleging noncompliance with the requirements imposed in this condition that such noncompliance was due to circumstances beyond the Permittee's control. A notation shall be made on the form indicating the inspection affected by such circumstance and an explanation setting forth the circumstances claimed to have been beyond the Permittee's control shall be submitted with the form.

17. The Director may require any permittee to install, operate and maintain devices on all irrigation pumps/equipment designed to automatically stop irrigation activities during precipitation. This decision will be based on the facility's compliance history for irrigation events.

18. The Director may require any permittee to install and operate flow meters with flow totalizers based on the facility's violations and/or incomplete or incorrect record keeping events.

19. No waste shall be applied in wind conditions that might reasonably be expected to cause the mist to reach surface waters or wetlands.

20. The Permittee shall maintain buffer strips or other equivalent practices as specified in the facility's CAWMP near feedlots, manure storage areas and land application areas.

21. Waste shall not be applied on land that is flooded, saturated with water, frozen or snow covered at the time of land application.

22. Land application of waste is prohibited during precipitation events. The Permittee shall consider pending weather conditions in making the decision to land apply waste and shall document the weather conditions at the time of land application on forms supplied by or approved by the Division.

23. Land application activities shall cease on any application site that exceeds a Mehlich 3 Soil Test Index for Copper of greater than 3,000 (108 pounds per acre) or Zinc of greater than 3,000 (213 pounds per acre).

24. All waste application equipment must be tested and calibrated once in the first two years after issuance of the COC and then at least once every two years thereafter. The results must be documented on forms provided by, or approved by, the Division.

25. Any major structural repairs to lagoons/storage ponds must have written documentation from a technical specialist certifying proper design and installation. However, if a piece of equipment is being replaced with a piece of equipment of the identical specifications, no technical specialist approval is necessary [i.e. piping, reels, valves, pumps (if the gallons per minute (gpm) capacity is not being increased or decreased), etc.] unless the replacement involves disturbing the lagoon/storage pond embankment.

26. Crops for which animal waste is land applied must be removed from the land application site and properly managed and utilized unless other management practices are approved in the CAWMP.

III. MONITORING AND REPORTING REQUIREMENTS

1. An inspection of the waste collection, treatment, and storage structures, and runoff control measures shall be conducted and documented at a frequency to insure proper operation but at least monthly and after all storm events of greater than one (1) inch in 24 hours. For example, lagoons/storage ponds, and other structures should be inspected for evidence of erosion, leakage, damage by animals or discharge.

2. Monitoring and Recording Freeboard Levels

a. Highly visible waste-level gauges shall be maintained to mark the level of waste in each lagoon/storage pond that does not gravity feed through a free flowing transfer pipe into a subsequent structure. The gauge shall have readily visible permanent markings.

The waste level in each lagoon with a waste level gauge shall be monitored and recorded weekly on forms supplied by or approved by the Division.

The Director may require more frequent monitoring and recording on lagoon levels based on the facility's compliance history for freeboard violations.

b. The freeboard levels of lagoons serving any facility which experiences freeboard violations in any two consecutive years following the issuance of this General Permit, or as determined necessary by the Director, shall be monitored and recorded as follows:

In addition to the facility's existing lagoon waste-level gauges, automated lagoon/storage pond waste-level monitors and recorders (monitored and recorded at least hourly) must be installed on all treatment and storage lagoons covered by a COC issued under this General Permit to measure and record lagoon freeboard. This equipment must be properly maintained and calibrated in a manner consistent with manufacturer's operation and maintenance recommendations. This automated equipment must be in place no later than ninety (90) days following notification from the Director. The Director may determine that installation of automated waste level monitors is not required if the Permittee can demonstrate that preventative measures were taken to avoid the violations and that the violations resulted from conditions beyond the permittee's control.

If an automated level monitor(s) becomes inoperable, the Permittee shall:

i. report the problem by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than 24 hours following first knowledge of the problem; and,

ii. make any needed repairs to the equipment as quickly as possible, and take and record daily lagoon levels at the same time every day until such time as the automated equipment is placed back into operation.

c. The Director may require new or modified waste-level gauges at any facility if he determines that the existing gauges are not adequate to accurately indicate actual lagoon levels, or the various lagoon levels required to be maintained by this General Permit or the facility's CAWMP.

3. Monitoring and Recording Precipitation Events

a. Precipitation events at facilities issued a COC to operate under this General Permit shall be monitored and recorded as follows:

A rain gauge must be installed at a site that is representative of the weather conditions at the farm's land application site(s) to measure all precipitation events. The precipitation type and amount must be recorded daily for all precipitation events and maintained on site for Department review. Daily records do not need to be maintained for those days without precipitation events.

b. The Director may require that an automated rain gauge and recorder must be installed on site to measure and record all precipitation events. This equipment must be properly maintained and calibrated in a manner consistent with manufacturer's operation and maintenance recommendations. This automated equipment must be in place no later than ninety (90) days following receipt of notice from the Director.

If an automated rain gauge(s) becomes inoperable, the Permittee shall:

i. report the problem by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than twenty four (24) hours following first knowledge of the problem; and,

ii. make any needed repairs to the equipment as quickly as possible, and take and record all rainfall events until such time as the automated equipment is placed back into operation.

4. A representative Standard Soil Fertility Analysis, including pH, phosphorus, copper, and zinc, shall be conducted on each application field receiving animal waste in accordance with NCGS 143-215.10C(e)(6). As of the effective date of this General Permit, the Statute requires that the analysis be conducted at least annually.

5. An analysis of the animal waste shall be conducted in accordance with recommended laboratory sampling procedures as close to the time of application as practical and at least within sixty (60) days (before or after) of the date of application. Every reasonable effort shall be made to have the waste analyzed prior to the date of application and as close to the time of waste application as possible. This analysis shall include the following parameters:

Nitrogen	Zinc
Phosphorus	Copper

6. The Permittee shall record all irrigation and land application event(s) including hydraulic loading rates, nutrient loading rates and cropping information. The Permittee shall also record removal of solids and document nutrient loading rates if disposed on-site or record the off-site location(s). These records must be on forms supplied by, or approved by, the Division.

7. A record shall be created and maintained of all transfers of waste between lagoons/storage ponds on the same site not typically operated in series. Such record shall include at least the identity of the lagoon from which the waste was transferred, the identity of the lagoon receiving the waste, the date and time of transfer and the total volume of waste transferred.

8. The Permittee must maintain monthly stocking records for the facility and make the records available to Department of Environment and Natural Resources (Department).

9. If, for any reason, there is a discharge from the waste collection, treatment, storage and application systems (including the land application sites), to surface waters or wetlands, the Permittee is required to make notification in accordance with Condition III. 13. The discharge notification shall include the following information:

a. Description of the discharge: A description of the discharge including an estimate of the volume discharged, a description of the flow path to the receiving surface waters or wetlands and a site sketch showing the path of the waste. Also, an estimation of the volume discharged.

b. Time of the discharge: The length of time of the discharge, including the exact dates and times that it started and stopped, and if not stopped, the anticipated time the discharge is expected to continue.

c. Cause of the discharge: A detailed statement of the cause of the discharge. If caused by a precipitation event, detailed information from the on-site rain gauge concerning the inches and duration of the precipitation event.

d. All steps being taken to reduce, stop and cleanup the discharge. All steps to be taken to prevent future discharges from the same cause.

e. Analysis of the waste: A copy of the last waste analysis conducted as required by Condition III. 5. above.

10. A copy of this General Permit, the facility's COC, certification forms, lessee and landowner agreements, the CAWMP and copies of all records required by this General Permit and the facility's CAWMP shall be maintained by the Permittee in chronological and legible form for a minimum of three (3) years. Records include but are not limited to: soil and waste analyses, rain gauge readings, freeboard levels, irrigation and land application event(s), past inspection reports and operational reviews, animal stocking records, records of additional nutrient sources applied (including but not limited to sludges, unused feedstuff leachate, milk waste, septage and commercial fertilizer), cropping information, waste application equipment testing and calibration, and records of removal of solids to off-site location(s). These records shall be maintained on forms provided or approved by the Division and shall be readily available at the facility (stored at places such as the farm residence, office, outbuildings, etc.) where animal waste management activities are being conducted for the life of this General Permit, unless otherwise specified in this General Permit.

11. Within fifteen (15) working days of receiving the request from the Division, the Permittee shall provide to the Division one (1) copy of all requested information and reports related to the operation of the animal waste management system. Once received by the Division, all such information and reports become public information, unless they constitute confidential information under NC G.S. 132-1.2, and shall be made available to the public by the Division as specified in Chapter 132 of the General Statutes.

12. The Division may require any additional monitoring and reporting (including but not limited to groundwater, surface water or wetland, waste, sludge, soil, lagoon/storage pond levels and plant tissue) necessary to determine the source, quantity, quality, and effect of such waste upon the surface waters, groundwaters or wetlands. Such monitoring, including its scope, frequency, duration and any sampling, testing, and reporting systems, shall meet all applicable Division requirements.

13. Regional Notification:

The Permittee shall report by telephone to the appropriate Division Regional Office as soon as possible, but in no case more than twenty-four (24) hours following first knowledge of the occurrence of any of the following events:

a. Any discharge to ditches, surface waters or wetlands.

b. Any discharge that poses a serious threat to the environment or human safety or health.

c. Failure to maintain storage capacity in a lagoon/storage pond greater than or equal to that required in Condition V. 3. of this General Permit.

d. Over applying waste either in excess of the limits set out in the CAWMP or where runoff enters surface waters or wetlands.

e. Failure of any component of the animal waste collection, treatment, storage and land application system resulting in a discharge to surface waters or wetlands.

f. Any failure of the waste treatment and disposal system that renders the facility incapable of adequately receiving, treating or storing the waste and/or sludge.

g. A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge to surface waters or wetlands.

h. A spill or discharge from a vehicle transporting waste or sludge to the land application field which results in a discharge that poses a serious threat to surface waters or wetlands.

i. Any deterioration or leak in a lagoon/storage pond that poses an immediate threat to the environment or human safety or health.

For any emergency, which requires immediate reporting after normal business hours, contact must be made with the Division of Emergency Management at 1-800-858-0368.

The Permittee shall also file a written report to the appropriate Division Regional Office within five (5) calendar days following first knowledge of the occurrence. This report shall outline the actions taken or proposed to be taken to correct the problem and to ensure that the problem does not recur. The requirement to file a written report may not be waived by the Division Regional Office.

14. The Director may require any permittee to file an annual certification report based on the compliance history of the facility. If required, the report must be filed on forms provided by the Division.

15. The Director may require facilities to submit additional reports and/or certifications based on the facility's compliance history.

16. In the event of a discharge of 1,000 gallons or more of waste to surface waters or wetlands, the Permittee must issue a press release to all print and electronic news media that provide general coverage in the county in which the discharge occurred setting out the details of the discharge. The press release must be issued within forty-eight (48) hours after it is determined that the discharge has reached the surface waters or wetlands. A copy of the press release and a list of the news media to which it was distributed must be kept for at least one (1) year after the discharge and must be distributed to any person upon request.

17. In the event of a discharge of 15,000 gallons or more of animal waste to surface waters or wetlands, a public notice is required in addition to the press release described in Condition III 13. The public notice must be placed in a newspaper having general circulation in the county in which the discharge occurred and the county immediately downstream within ten (10) days of the discharge. The minimum content of the notice is the name of the facility, location of the discharge, estimated volume of waste entering state waters, time and date discharge occurred, duration of the discharge, identification water body that was discharged into including creek and river basin if applicable, actions taken to prevent further discharge, and a facility contact person and phone number.

18. If a discharge of 1,000,000 gallons of wastewater or more reaches surface waters or wetlands, the appropriate Division Regional Office must be contacted to determine in what additional counties, if any, a public notice must be published. A copy of all public notices and proof of publication must be sent to the Division within thirty (30) days of the discharge.

19. All facilities, which are issued a COC to operate under this General Permit, shall conduct a survey of the sludge accumulation in all lagoons within two (2) years of receiving the COC and every year thereafter. This survey shall include but not be limited to a sketch showing the depth of sludge in the various locations within each lagoon. This survey frequency may be reduced if it can be demonstrated to the satisfaction of the Division that the rate of sludge accumulation does not warrant an annual survey.

    If the sludge accumulation is such that it is greater than the volume for which the lagoon was designed or the accumulation reduces the lagoon's minimum treatment volume to less than the volume for that which the lagoon was designed, a sludge removal or management plan must be submitted to the appropriate Division Regional Office within ninety (90) days of the determination. The plan shall describe removal and waste utilization procedures to be used.

IV. INSPECTIONS AND ENTRY

1. The Permittee shall allow any authorized representative of Department, upon the presentation of credentials and other documents as may be required by law and in accordance with reasonable and appropriate biosecurity measures, to:

    a. Enter the Permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this General Permit;

    b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this General Permit;

    c. Inspect, at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this General Permit; and,

    d. Sample or monitor, at reasonable times, for the purpose of assuring permit compliance, any substances or parameters at any location.

V. GENERAL CONDITIONS

1. The issuance of a COC to operate under this General Permit shall not relieve the Permittee of the responsibility for compliance with all applicable surface water, wetlands, groundwater and air quality standards or for damages to surface waters, wetlands or groundwaters resulting from the animal operation.

2. The maximum waste level in lagoons/storage ponds shall not exceed that specified in the facility's CAWMP. At a minimum, maximum waste level for lagoons/storage ponds must not exceed the level that provides adequate storage to contain the 25-year, 24-hour storm event plus an additional one (1) foot of structural freeboard except that there shall be no violation of this condition if: (a) there is a storm event more severe than a 25-year, 24-hour event, (b) the Permittee is in compliance with its CAWMP, and (c) there is at least one (1) foot of structural freeboard.

In addition to the above requirements, for new and expanding farms with lagoon and storage pond designs completed after September 1, 1996, storage must also be provided for the heavy rainfall factor for the lagoons/storage pond. In case of lagoons/storage ponds in series that are gravity fed, the 25-year, 24-hour storm event and/or the heavy rainfall factor storage requirement for the system may be designed into the lowest lagoon/storage pond in the system. However, adequate freeboard must be designed into the upper lagoons/storage ponds to allow sufficient storage to prevent the waste level from rising into the structural freeboard while the storm water is draining into the lowest lagoon in the system.

3. Any containment basin, such as a lagoon or a storage pond, used for waste management shall continue to be subject to the conditions and requirements of this General Permit until properly closed. When the containment basin is properly closed in accordance with the "Natural Resource Conservation Service (NRCS) North Carolina Standard for Closure of Waste Impoundments," March 2002 or any subsequent amendment, the containment basin shall not be subject to the requirements of this General Permit. The Permittee must submit a letter to the Division to request rescission of the COC by providing documentation of closure of all containment basins.

   Closure shall also include a minimum of 24 hours pre-notification of the Division and submittal of the Animal Waste Storage Pond and Lagoon Closure Report Form to the address identified on the form within fifteen (15) days of completion of closure.

4. This General Permit allows for the distribution of up to four cubic yards of manure per visit to individuals for personal use. The Permittee provide the recipient(s) with information on the nutrient content of the manure. Distribution of greater quantities must be to individuals or businesses permitted to distribute the waste, or to be land applied to sites identified in the Permittee's CAWMP.

5. The Permittee must inform the recipient(s) of his/her responsibilities to properly manage the land application of manure. Record keeping for the distribution of manure up to four (4) cubic yards per visit to individuals for personal use is not required.

6. The annual permit fee shall be paid by the Permittee within thirty (30) days after being billed by the Division. Failure to pay the fee accordingly constitutes grounds for revocation of its COC to operate under this General Permit.

7. Failure of the Permittee to maintain, in full force and effect, lessee and landowner agreements, which are required in the CAWMP, shall constitute grounds for revocation of its COC to operate under this General Permit.

8. A COC to operate under this General Permit is not transferable. In the event there is a desire for the facility to change ownership, or there is a name change of the Permittee, a Notification of Change of Ownership form must be submitted to the Division, including documentation from the parties involved and other supporting materials as may be appropriate. This request will be considered on its merits and may or may not be approved.

9. A COC to operate under this General Permit is effective only with respect to the nature and volume of wastes described in the application and other supporting data. The Permittee shall notify the Division immediately of any applicable information not provided in the permit application.

10. If the Permittee wishes to continue an activity regulated by this General Permit after the expiration date of this General Permit, the Permittee must apply for and obtain a new COC. Renewal applications must be filed at least 180 days prior to the expiration of the General Permit.

11. The issuance of a COC to operate under this General Permit does not prohibit the Division from reopening and modifying the General Permit or COC, revoking and reissuing the General Permit or COC, or terminating the General Permit or COC as allowed by the appropriate laws, rules, and regulations.

12. The Director may require any person, otherwise eligible for coverage under this General Permit, to apply for an individual permit by notifying that person that an application is required.

13. The Groundwater Compliance Boundary is established by 15A NCAC 2L and 15A NCAC 2H .0225. An exceedance of Groundwater Quality Standards at or beyond the Compliance Boundary is subject to the requirements of 15A NCAC 2L and the Division in addition to the penalty provisions applicable under the North Carolina General Statutes.

VI. PENALTIES

1. Failure to abide by the conditions and limitations contained in this General Permit; the facility's COC; the facility's CAWMP; and/or applicable state law; may subject the Permittee to an enforcement action by the Division including but not limited to the modification of the animal waste management system, civil penalties, criminal penalties and injunctive relief.

2. The Permittee must comply with all conditions of this General Permit. Any permit noncompliance constitutes a violation of state law and is grounds for enforcement action; for permit coverage termination, revocation and reissuance, or modification; or denial of a permit coverage renewal application.

3. It shall not be a defense for a Permittee in an enforcement action to claim that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

VII. DEFINITIONS

25-year, 24-hour rainfall or storm event means the maximum 24-hour precipitation event with a probable recurrence interval of once in 25 years, as defined by the National Weather Service in Technical Paper Number 40, "Rainfall Frequency Atlas of the United States," May 1961, and subsequent amendments, or equivalent regional or state rainfall probability information developed therefrom.

Agronomic rates means the amount of animal waste and/or other nutrient sources to be land applied to lands as contained in the nutrient management standard of the USDA Soil Conservation Service Technical Guide Section IV or as recommended by the North Carolina Department of Agriculture and Consumer Services and the North Carolina Cooperative Extension Service at the time of certification of the Animal Waste Management Plan by the appropriate technical specialist.

Amendment to the CAWMP means a change and/or addition to a part(s) of the plan, and requires that the change and/or addition adhere to current applicable standards. The following are examples of amendments to the CAWMP:

- In an existing CAWMP, a change in crops and/or cropping pattern that utilizes 25% or less of the N generated is considered a plan amendment. Additional acreage needed to facilitate the change in crops and/or cropping pattern is permissible and considered part of the amendment.

- The addition of winter crops and/or interseeded perennial crops are considered amendments to a existing CAWMP when the operation does not require additional acreage and/or crops for N utilization, and does not exceed the 25% criteria stated above.

- When a CAWMP cannot meet N utilization requirements due to land lost to irrigation inefficiency (usable versus total acres), then the CAWMP may be amended to increase available acreage and/or change the crop for N utilization. This is the only exception to the 25% N criteria for plan revision.

- Inclusions of emergency action plans, and insect, odor and mortality checklists are considered CAWMP amendments.

- Including additional acreage for land application beyond what is required in the existing CAWMP is considered a plan amendment.

Animal feeding operation means a lot or facility (other than an aquatic animal production facility) where the following conditions are met: (i) animals (other than aquatic animals) have been, are, or will be stabled or confined and fed or maintained for a total of forty five (45) days or more in any twelve (12) month period, and (ii) crops, vegetation, forage growth, or post-harvest residues are not sustained in the normal growing season over any portion of the lot or facility. Two or more animal feeding operations under common ownership are considered to be a single animal feeding operation if they adjoin each other, or if they use a common area or system for the disposal of wastes.

Ditch means any man made channel for the purpose of moving water off a site to the surface waters.

Excessive Ponding means any area of the application field where visible liquid waste is ponded on the surface of the land application site more than four (4) hours following the application of waste. Excessive ponding also means any areas where the ponding of waste has resulted in crop failure.

Groundwaters means any subsurface waters, as defined in 15A NCAC 2L .0102.

Land application means the application of wastewater and/or waste solids onto or incorporation into the soil.

Major changes to the CAWMP means changes in the number of animals, type of operation (feeder to finish to wean to feeder), retrofit of a lagoon, installation of a new irrigation system, and similar type changes. Recertification is only required for major changes to the CAWMP. Major changes to a facility must first be approved by DWQ. The new CAWMP and the certification shall be submitted with a request that the COC be amended to reflect the changes. The facility may not make the changes until a new or amended COC has been issued.

Revision to the CAWMP means a change to an entire CAWMP to meet current applicable standards. A CAWMP must be revised if the operation cannot utilize all N nitrogen generated by the animal production in accordance with the existing CAWMP, except for the specific conditions noted in the CAWMP amendment criteria as previously defined. For an existing CAWMP, a change in crops and/or cropping pattern that utilizes more than 25% of the N generated by the operation is considered a plan revision. Any change to an existing CAWMP, whether an amendment or revision, must be signed and dated by both the producer and a technical specialist for the new CAWMP to be valid. A revision of the CAWMP does not require recertification.

State Waters means all surface waters, wetlands, groundwaters and waters of the United States located in the State.

Surface Waters means any stream, river, brook, swamp, lake, sound, tidal estuary, bay, creek, reservoir, waterway, or other surface body or surface accumulation of water, whether public or private, or natural or artificial, that is contained in, flows through, or borders upon any portion of the State of North Carolina, including any portion of the Atlantic Ocean over which the State has jurisdiction as well as any additional Waters of the United States which are located in the State.

Waste means manure, animal waste, process wastewater and/or sludge generated at an animal feeding operation.

Wetlands means areas that are inundated or saturated by an accumulation of surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances do support a prevalence of vegetation typically adapted for life in saturated soil conditions, as defined in 15A NCAC 2B .0202.

This General Permit issued the XXth day of XXX, 2004.

Report on the Activities and Recommendations of the Chronic Rainfall Working Group

NC Division of Water Quality
March 25, 2004

Introduction

- The Chronic Rainfall Working group was established to resolve issues related to NOVs and NODs due to freeboard violations during chronic rainfall conditions
- The working group was convened under the direction of the ERC

Background

- In April 2003, DWQ issued approximately 385 Notices of Violation (NOV) to animal facilities with high freeboard levels
- A June 25, 2003 memo from Secretary Ross (DENR) initiated a working group to resolve the issue of high freeboard enforcement during chronic rainfall events
- The Chronic Rainfall Working Group met five times between October 28, 2003 and March 15, 2004

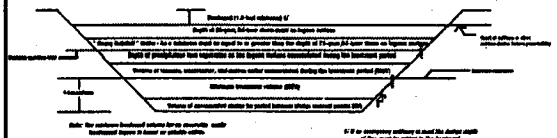
Working Group Stakeholders

DWQ	NCSU
DENR	NC Climate Office
Murphy-Brown	NC Environmental Defense
Goldsboro Hog Farm	Frontline Farmers
Coharie Farms	NC Sierra Club
Prestage Farms	Waterkeeper Alliance
NC Pork Council	Southern Environmental Law Center
NC Farm Bureau	Alliance for a Responsible Swine Industry
NCDA&CS	

Major Discussion Items

- Lagoon Design
- DWQ Enforcement guidance utilized after Secretary Ross' memo
- Conditions in the DWQ guidance

Lagoon Design



DWQ Enforcement Guidance

- DWQ enforcement guidance implemented after the Secretary's memo was similar to what would satisfy the working group process
- This guidance included a review of records and contained the possibility for issuance of a NOD
- Through a thorough review of facility operation and maintenance, "chronic rainfall" would not have to been defined
- DWQ formalized this guidance as a working document for the group

Conditions in the DWQ Guidance

- Examples were produced of what constituted proper operation and maintenance
- Plan of Action forms were provided and submission of these forms is included as a guidance criteria
- Previous history is a guidance criteria, one NOV or two or more NODs are considered as a previous history. Receipt of a second NOD in three years will trigger a review of the CAWMP

Conditions (continued)

- Regular reporting intervals are required by facilities that are out of compliance. Weekly for storm storage, Daily for structural
- Only one compliance action can be taken against a facility during a single rainy period, this period determined by the Director and should not normally exceed 365 days
- Any action taken by DWQ prior to the effective date of the new guidance must be considered as though they were based on the new guidance

Example from the Guidance

- If lagoon/storage pond's available storage capacity is greater than 12 inches (for structural stability) but less than that required to also retain the 25 year-24 hour rainfall event:
  - Notice of Deficiency if the following criteria are met:
    - The producer contacted DWQ to report the inadequate storage in a lagoon/storage pond, and
    - The producer has been effectively operating and maintaining their waste treatment system, and
    - The producer has no previous NOV(s) or no more than one (1) NOD for freeboard violations resulting from events less than 25 year-24 hour storm events in the past three years, and
    - The producer has submitted to the DWQ Regional Office within 48 hours (two business days) a Plan of Action as to how they propose to lower and maintain the lagoon level to a point below that needed for both structural stability and the 25 year-24 hour rainfall event within 30 days.

Summary

- The Chronic Rainfall Working Group reached consensus on resolving issues related to chronic rainfall conditions
- The resulting recommendation sets a clear, consistent, and fair guidance for making enforcement determinations
- The recommended guidance will replace the Freeboard section of the current DWQ Compliance/Enforcement Procedures dated April 2, 2003

FINAL REPORT ON THE ACTIVITIES AND RECOMMENDATIONS OF THE CHRONIC RAINFALL WORKING GROUP

I. Introduction

This document contains the final written report of the proceedings and findings of the Chronic Rainfall Working Group. This Working Group was established to resolve issues related to Notices of Violation and Notices of Deficiency due to inadequate lagoon freeboard levels related to chronic rainfall conditions. The Division of Water Quality (DWQ) participated in the Working Group as requested by the Secretary of the Department of Environment and Natural Resources (DENR) in a memo to the Director of DWQ dated June 25, 2003 and prepared this report. The Working Group was convened under the direction of the Environmental Review Commission (ERC).

II. Background

As the result of the heavy rainfall received in North Carolina during the period starting in October 2002 and ending in September 2003, many animal facilities experienced lagoon freeboard levels in violation of their permits. In April 2003, DWQ issued approximately 385 Notices of Violation (NOV) to facilities with inadequate lagoon freeboard levels. These NOVs were issued by DWQ consistent with the Compliance/Enforcement Procedures guidance document signed and dated April 2, 2003 by the Director of DWQ.

The 2003 Compliance/Enforcement Procedures guidance document changed the way DWQ issued enforcement for inadequate freeboard levels. The previous guidance document dated September 6, 2000, had provisions for issuing Notices of Deficiencies (NOD) for inadequate freeboard if a facility met certain requirements. The 2003 guidance document discontinued the use of NODs in an effort to insure consistency among the different regional offices and water quality permitting programs.

The change in the DWQ enforcement guidance and subsequent issuance of NOVs for inadequate freeboard caused many facility owners to feel that they had been treated unfairly. As a result, the Secretary of DENR issued a memo, dated June 25, 2003, to the Director of DWQ directing the reclassification of NOVs sent in April 2003 as NODs if the violation would have been addressed through an NOD based on the September 2000 guidance document (memo provided as an attachment to this report). In the same memo, the Secretary instructed DWQ of the pending Chronic Rainfall Working Group under the direction of the ERC. This working group was intended as an informal process to evaluate DWQ's enforcement policy during rainy periods.

The following stakeholders were typically represented in the working group meetings:

DWQ	NC Climate Office
DENR	NCSU
Murphy-Brown, LLC	NC Environmental Defense
Goldsboro Hog Farms	Frontline Farmers
Coharie Farms	Waterkeeper Alliance
NC Pork Council	NC Sierra Club
NC Farm Bureau	Prestage Farms
NCDA&CS	Southern Environmental Law Center
Alliance for a Responsible Swine Industry	

The Chronic Rainfall Working Group met on five occasions between October 28, 2003 and March 15, 2004.

III. Major Discussion Items and Recommendations

The following is a synopsis of the major items reviewed and discussed by the Chronic Rainfall Working Group. The recommendations presented represent the consensus of the working group.

Lagoon Design

Animal facility treatment/storage lagoons are designed based on North Carolina Natural Resource Conservation Service (NRCS) Standard 359. All lagoons are designed to contain at least a permanent treatment volume, a temporary storage volume, a 25-year 24-hour storm volume, and one foot of structural freeboard. Lagoons designed after September 1996 must be constructed with an additional heavy rainfall factor. Lagoons can be designed with an emergency spillway that protects the one-foot of structural freeboard. A small percentage of lagoons in use in North Carolina have been constructed with the heavy rainfall factor or emergency spillway. The compliance level is the 25-year, 24-hour storm volume plus the one-foot of structural freeboard. The compliance level is typically 19 inches from the top of the lagoon dike wall. This information was presented to the working group as a fact sheet and lagoon design diagram and is provided as an attachment to this report.

DWQ Enforcement after Secretary's Memo

Industry representatives stated that they were not seeking to change the 19-inch standard, but rather not be issued NOVs or civil penalties during rainy periods that preclude proper land application (given that the facility is following proper management). The DWQ enforcement guidance, following the Secretary's June 25th memo, was very similar to what the industry representatives had stated. This guidance included a review of the facility's records to determine if proper operation and maintenance was followed, a review of the facility's previous compliance history, and review of the facility's proper notification to DWQ. If the facility had met the criteria, a NOD could be issued rather than an NOV. The industry representatives agreed that the

post June 25th memo guidance was fair and equitable. The environmental advocacy groups agreed that this guidance would fit the industry requests, but added that a mechanism for determining the necessary actions of the operators to satisfy issuance of a NOD still needed to be discussed.

There was group consensus that formalizing the current DWQ guidance could satisfy the working group process without defining "chronic rainfall". This could be achieved because it is implied that through proper operation and maintenance only a "chronic rainfall" or 25-year 24-hour storm could cause an inadequate freeboard level. DWQ agreed to provide the current guidance as a working document.

Conditions in the DWQ Guidance

The DWQ enforcement guidance listed proper operation and maintenance as criteria for determining the response to inadequate freeboard levels. There was discussion within the working group surrounding the characterization of proper operation and maintenance. A formal definition was not possible because of the site-specific variability of each facility. DWQ provided examples of facility records that would indicate how operation and maintenance could be used in making a determination for enforcement. Three examples of facility records were provided with a narrative, one each for a facility that was issued a NOD, NOV, and NOV with consideration for civil penalty. These examples are provided as an attachment to this report.

The DWQ enforcement guidance referenced a Plan of Action as a required submission for facilities with inadequate freeboard. There were questions from the working group as to what constituted a Plan of Action, when must the Plan of Action be submitted, and what were the consequences for non-submittal. DWQ provided the working group with the approved Plan of Action forms, these forms are included as an attachment to this report. It was agreed that the Plan of Action must be submitted with two business days for facilities in the storm storage and one business day for facilities in the structural freeboard. The submittal of the Plan of Action was included in the review criteria for making an enforcement determination.

The DWQ enforcement guidance referenced NOVs issued during the last three years for consideration as previous a compliance history. There was discussion within the working group as to when to consider NODs as a previous compliance history. In keeping with the need to project a clear incentive to self-report, it was decided that NODs would be considered as a previous history only when two or more NODs for freeboard violations had been issued during the last three years. In addition, after issuance of a second NOD within three years, the facility will be required to obtain a review of the Certified Animal Waste Management Plan (CAWMP) by a Technical Specialist and submit this review to DWQ. Multiple NODs can indicate that there is an ongoing issue with the facility that can be reviewed and corrected to prevent future freeboard violations. An example of the instances requiring a CAWMP review and NOD versus NOV issuance due to previous history is included as an attachment to this report.

The working group discussed the issue of a facility's reporting requirements. In order for DWQ to have current information regarding a facility's freeboard levels, a regular reporting requirement was needed. Conditions were added to the guidance that required weekly freeboard

level updates to DWQ for freeboard levels that were in the storm storage and daily updates for freeboard levels in the structural freeboard.

The working group discussed the issue of the appropriate length of a rainy period for consideration of a compliance action. It was agreed that only one action should be taken against a properly operated and maintained facility during a single rainy period. There was additional discussion about the Director's discretion of the effective timeframe of the rainy period. The industry representatives felt that there should not be a limit to the timeframe, whereas, the environmental advocacy groups felt that a maximum limit should be set. Consensus was reached by stating that the maximum duration of a rainy period should not normally exceed 365 days.

It was decided that when making a determination for the appropriate response to inadequate freeboard levels, any action taken by DWQ prior to the effective date of the new guidance must be considered as though they were based on the new guidance.

IV. Summary

The Chronic Rainfall Working Group, convened under the direction of the ERC, reached consensus on resolving issues related to Notices of Violation and Notices of Deficiency due to inadequate lagoon freeboard levels related to chronic rainfall conditions. The resulting report sets a clear, consistent, and fair guidance for making a determination as to the appropriate response to inadequate lagoon freeboard levels. The final recommended guidance will replace Section 4. Freeboard of the current Compliance/Enforcement Procedures dated April 2, 2003. The final recommended guidance is included as an attachment to this report.

William G. Ross Jr., Secretary

TO: Alan Klimek, Director
Division of Water Quality

FROM: William G. Ross, Jr. WGRjr

RE: Notice of Violation Letters for Swine Farms

DATE: June 25, 2003

I appreciate the Division of Water Quality (DWQ) staff's hard work and quick response to the problems of high lagoon levels resulting from a rainy spring. As we have discussed, actual rainfall amounts have varied from place to place, but some locations have experienced one of the wettest springs on record. Your staff's diligence, with the cooperation of farmers who met their responsibility to report high lagoon levels, kept the number of discharges to a minimum and almost certainly averted further impacts on water quality.

In April, DWQ began sending "Notice of Violation" letters rather than "Notice of Deficiency" letters to farmers with freeboard violations in an effort to insure consistency among the different regional offices and water quality permitting programs. I understand that the difference in language does not reflect any change in enforcement policy or in the farmers' responsibilities with respect to management of lagoons. Since 1993, farmers have had an obligation – reflected in state rules and in the permits for animal operations – to maintain 19 inches of freeboard in the lagoons except in the event of a 25-year storm.

Even so, the change from sending "Notice of Deficiency" (NOD) letters to sending "Notice of Violation" (NOV) letters for freeboard violations caused many farmers to feel angry and upset. In the absence of any communication about the reason, farmers viewed it as a major change in enforcement policy. Not having advance notice of the change also caused farmers to feel that they had been treated unfairly. The fact that the change occurred in the midst of a wet spring when many farmers were having difficulty managing lagoon levels probably aggravated those concerns.

It is my understanding that there will be further stakeholder discussion of the chronic rainfall issue under the direction of the Environmental Review Commission (ERC). The stakeholder group will be asked to report back to the ERC by November 1, 2003 on alternatives for managing lagoon levels with respect to chronic rainfall. I have

committed to begin implementing, by January 1, 2004, any consensus recommendations of the stakeholder group that can be implemented without further legislative action.

In order to have the benefit of that discussion and address concerns about the meaning of the change to NOVs, I am directing that DWQ reclassify violation letters sent between January 1, 2003 and today as a Notice of Deficiency if the violation would previously have been addressed through an NOD. From this date forward, DWQ should also send Notices of Deficiency for violations that would have resulted in a Notice of Deficiency prior to April 1, 2003. This approach should continue until recommendations have been received from the stakeholder group. Before implementing any changes in the use of NODs and NOVs based on stakeholder recommendations, farmers should be given notice of the proposed change.

Returning to use of NODs does not alter the rules applicable to animal operations, the content of the permits, or enforcement policy. I expect DWQ to continue to pursue appropriate enforcement action with respect to any violation already identified or identified in the future. You have told me that the Division is exercising its enforcement discretion with respect to whether a violation requires a civil penalty. I agree with your judgment that among the factors to be considered in making that decision should be the farmer's reporting of high lagoon levels; timely action to reduce lagoon levels; and the responsible operation and maintenance of the animal waste management system in the preceding weeks and months. I understand that, in deciding whether a system has been responsibly operated and maintained, DWQ considers whether unusually heavy local rainfall limited the farmer's opportunities to spray in the preceding weeks or months.

I believe that allowing this additional time for discussion of the issues will allow DWQ to move beyond this controversy and again focus on the more important matters of insuring proper management of these systems and taking strong, fair and effective enforcement action when appropriate. This additional time will also provide the Division an opportunity to have further discussion of strategies to manage chronic rainfall that will be consistent with requirements of the Clean Water Act.

Thanks to you and to the Division staff for all of your efforts to resolve this controversy in a fair and even-handed way.

LAGOON DESIGN

Prepared for:
Chronic Rainfall "605" Stakeholder Workgroup

1. Animal facility treatment/storage lagoons are designed based on NRCS Standards.

2. All lagoons are designed to hold:

    a. A permanent storage volume for sludge storage and treatment volume (both based on the number and types of animals at the facility), plus

    b. Temporary storage used to hold the waste generated over the design period for the facility (usually from 90-180 days) and the excess rainfall (precipitation minus evaporation) for the design period, plus

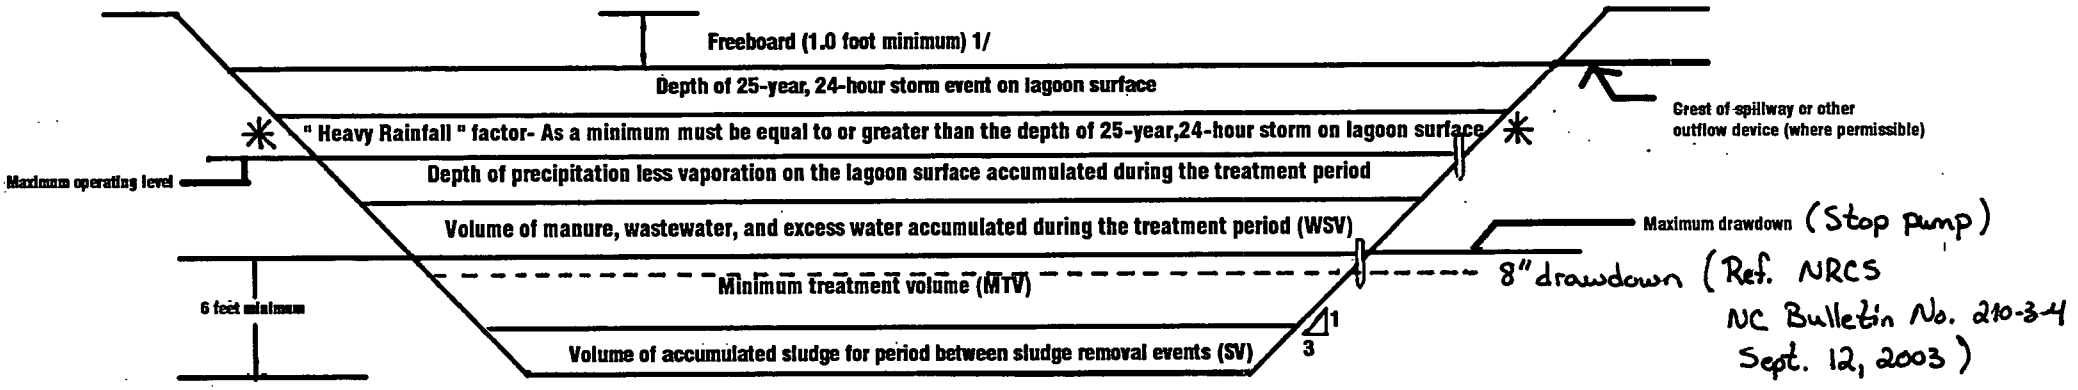
    c. A storage volume large enough to hold the 25 year, 24 hour storm event (to be used only during the period of the 25 year, 24 hour storm), plus

    d. One foot of freeboard that should always be free of liquid due to structural stability issues (cannot be considered storage). Lagoons can crest without encroaching the one foot of freeboard if designed with a spillway (small percentage with spillways).

3. Lagoons designed after September 1996 must be constructed with an additional heavy rainfall factor. This was intended to be a chronic rainfall factor, but since agreement could not be reached in 1996 on what qualified as chronic rainfall, the term heavy rainfall factor was used. Also since the volume of excess rainfall attributed to chronic rainfall was not determined in 1996, the heavy rainfall factor was defined as equal to another 25 year, 24 hour storm event. The majority of permitted facilities do not have the "Heavy Rainfall" factor designed into the lagoon.

4. Lagoon dimensions are relative to the operation type and size of the facility that it is designed for, however, a typical lagoon ranges from 10 to 13 feet deep.

* "Heavy Rainfall" factor added to lagoons designed after September 1996.



Note: The minimum treatment volume for an anaerobic waste treatement lagoon is based on volatile solids.

1/ If an emergency spillway is used the design depth of flow must be added to the freeboard.

February 9, 2004

Subject: Compliance/Enforcement 2002-2003 Examples
Inadequate Lagoon/Storage Pond Freeboard Levels

Based on questions raised during the 14 January 2004 "Chronic Rainfall" Working Group meeting, the Division of Water Quality is providing examples of facilities that were evaluated for compliance enforcement due to inadequate freeboard levels during the period around April 2003. Three examples are being provided that show a facility that received a Notice of Deficiency, a Notice of Violation, and a Notice of Violation with consideration for civil penalty. Information was gathered from records submitted by the facilities and transferred to typed forms for easier viewing. Brief explanations for each facility are as follows:

Notice of Deficiency- Feeder to Finish Swine-2,320 head

This facility was out of compliance for freeboard levels on March 28, 2003 and back into compliance on April 4, 2003. Examination of the freeboard levels from March 2002 through April 2003 indicate that the facility was near stop pump level for the lagoon in July, August, and November 2002. Examination of the land application records for April 2002 through October 2002 indicate that this facility utilized all fields in the Waste Utilization Plan. Land application was done fairly uniformly across these fields. No waste applications were made outside of the allowed pumping windows or in excessive amounts. This facility had no previous history is the past three years of inadequate freeboard levels and the facility notified DWQ of the inadequate freeboard level.

Notice of Violation- Feeder to Finish Swine-3,520 head

This facility was out of compliance for freeboard levels on March 19, 2003 and April 12, 2003. Examination of the freeboard levels from May 2002 through May 2003 indicate that the facility was closest to stop pump level for the lagoon in July 2003, still 16 inches from the stop pump level. Examination of the land application records for April 2002 through September 2002 indicate that this facility had additional PAN that could have been applied during Summer 2002. Several fields were not used during Summer 2002 for land application. No waste applications were made outside of the allowed pumping windows or in excessive amounts. This facility had no previous history in the past three years of inadequate freeboard levels and the facility notified DWQ of the inadequate freeboard level. A NOV was issued to this facility due to improper operation and maintenance because of the lack of pumping in Summer 2002 and freeboard levels not lowered to near stop pump level in Summer 2002.

Notice of Violation w/ consideration for penalty- Feeder to Finish Swine-6,700 head

This facility was out of compliance for freeboard levels on March 17, 2003 through April 28, 2003 and on April 7, 2003 and April 14, 2003 the freeboard levels were in the structural stability area. Examination of the freeboard levels from April 2002 through April 2003 indicate that the facility was closest to stop pump level for the lagoon in June 2002, still 14 inches from the stop pump level. Examination of the land application records for March 2002 through April 2003 indicate that this facility had additional PAN that could have been applied during Summer 2002. Approximately 25 acres of land application fields were not utilized during Summer 2002. Land application occurred on several instances outside of the allowed dates in the Waste Utilization Plan. This facility had no previous history of inadequate freeboard levels and the facility notified DWQ of the inadequate freeboard level. A Plan of Action form was also submitted to DWQ. A NOV with consideration for civil penalty was issued to this facility due to improper operation and maintenance because of the lack of pumping in Summer 2002 and freeboard levels not lowered to near stop pump level in Summer 2002. This facility was also in the structural level of the lagoon and did not properly follow the application windows in the Waste Utilization Plan.

Subject: Compliance/Enforcement NOD Examples
Inadequate Lagoon/Storage Pond Freeboard Levels

Based on questions raised during Chronic Rainfall Working Group meeting, the Division of Water Quality is providing examples of situations when NODs should be issued for inadequate freeboard. The following are three examples of a facility that has inadequate freeboard levels during subsequent rainy periods:

1. If a producer entered a rainy period without a NOD from a previous rainy period and the lagoon's available storage capacity is greater than 12 inches but less than 19 inches. If following the new guidance:
    a. The producer reported the freeboard violation to DWQ, and
    b. The producer was properly operating and maintaining the facility, and
    c. The producer had submitted an adequate POA, then

   DWQ should issue a NOD to this facility.

2. If a producer entered a rainy period with a NOD from a previous rainy period and the lagoon's available storage capacity is greater than 12 inches but less than 19 inches. If following the new guidance:
    a. The producer reported the freeboard violation to DWQ, and
    b. The producer was properly operating and maintaining the facility, and
    c. The producer had submitted an adequate POA, then

   DWQ should issue a second NOD to this facility and the facility would be required to obtain a review of the CAWMP.

3. If a producer entered a rainy period with two NODs from previous rainy periods and the lagoon's available storage capacity is greater than 12 inches but less than 19 inches. If following the new guidance:
    a. The producer reported the freeboard violation to DWQ, and
    b. The producer was properly operating and maintaining the facility, and
    c. The producer had submitted an adequate POA, then

   DWQ should issue a NOV to this facility.

ATTACHMENT 5

DRAFT

March 17, 2004

Subject: Compliance/Enforcement Procedures
Inadequate Lagoon/Storage Pond Freeboard Levels
Animal Waste Management Facilities

In order to insure consistency throughout the state, the following compliance and enforcement guidelines are to be implemented by both the central office and the regional office staff when working with inadequate freeboard levels on animal waste facilities.

Whenever a high freeboard is identified at an animal facility, the producer will be given the opportunity to provide information to the Division of Water Quality (DWQ) that will enable DWQ to make a determination as to the appropriate response to the incident. This request for information may be either in the form of a Request for Information Letter or the DWQ staff may meet with the producer at the facility. Once any additional information has been evaluated, the producer will be issued a Notice of Deficiency (NOD), a Notice of Violation (NOV), and/or a Civil Penalty Assessment. DWQ may also initiate other enforcement actions as appropriate.

The guidelines to be followed in making the determination as to the appropriate response will be as follows:

A) **If lagoon/storage pond's available storage capacity is greater than 12 inches (for structural stability) but less than that required to also retain the 25 year-24 hour rainfall event:**

1. Notice of Deficiency if the following criteria are met:
   a. The producer contacted the Division of Water Quality (DWQ) to report the inadequate storage in a lagoon/storage pond, **and**
   b. The producer has been effectively operating and maintaining their waste treatment system, **and**
   c. The producer has no previous NOV(s) or no more than one (1) NOD for freeboard violations resulting from events less severe than 25 year-24 hour storm events in the past three years, **and**
   d. The producer has submitted to the DWQ Regional Office with 48 hours (two business days) a Plan of Action as to how they propose to lower and maintain the lagoon level to a point below that needed for both structural stability and the 25 year-24 hour rainfall event within 30 days.

2. Notice of Violation if the following criteria are met:
   a. The producer contacted DWQ to report the inadequate storage in a lagoon/storage pond, **and either of the following:**
      i. The producer has not been effectively operating and maintaining their waste treatment system, **or**
      ii. The producer has previous NOV(s) or two (2) or more NODs for freeboard violation resulting from events less severe than 25 year-24 hour storm events in the past three years, **or**
      iii. The producer has not submitted to the DWQ Regional Office with 48 hours (two business days) a Plan of Action as to how they propose to lower and maintain the lagoon level to a point below that needed for both structural stability and the 25 year-24 hour rainfall event within 30 days.

3. Notice of Violation with consideration for civil penalty if any of the following criteria are met:
   a. Any time that DWQ becomes aware of inadequate storage in a lagoon/storage pond that was not reported by the producer or their representative, **or**
   b. DWQ may also initiate additional enforcement actions including but not limited to Civil Penalties based on the severity of the operation and maintenance problems and/or the history of previous high freeboards.

4. Facilities will be required to submit weekly freeboard level updates to the Regional Office until the lagoon/storage pond levels are back into compliance. Failure to submit the updates will be an aggravating factor in consideration for civil penalty assessment.

5. Upon receipt of a second NOD for high freeboard within a three-year period, the permittee will be required to obtain a review of the CAWMP by a Technical Specialist. This review must be submitted to the appropriate DWQ Regional Office in writing within 60 days of receipt of the second NOD. The review must contain any corrective action taken or proposed to be taken to improve the facility's compliance.

B) **If the lagoon/storage pond's storage capacity is less than 12 inches (for structural stability):**

1. Notice of Violation if the following criteria are met:
   a. The producer contacted the Division of Water Quality (DWQ) to report the inadequate storage in a lagoon/storage pond, **and**
   b. The producer has been effectively operating and maintaining their waste treatment system, **and**
   c. The producer has no previous NOV(s) or no more than one (1) NOD for freeboard violations resulting from events less severe than 25 year-24 hour storm events in the past three years, **and**
   d. The producer has submitted to the DWQ Regional Office within 24 hours (one business day) a Plan of Action as to how they propose to lower and maintain the lagoon level to a point below that needed for structural stability within 5 days.

2. Notice of Violation with consideration for civil penalty if any of the following criteria are met:
   a. At any time that DWQ becomes aware of inadequate storage in a lagoon/storage pond that was not reported by the producer or their representative, **or**
   b. The producer has not been effectively operating and maintaining their waste treatment system, **or**
   c. The producer has previous NOV(s) or two (2) or more NODs for freeboard violations resulting from events less severe than 25 year-24 hour storm events in the past three years, **or**
   d. The producer has not submitted to the DWQ Regional Office within 24 hours (one business day) a Plan of Action as to how they propose to lower and maintain the lagoon level to a point below that needed for structural stability within 5 days.

3. Memo to the Director requesting that the Attorney General review facility file for a Temporary Restraining Order or other Injunctive Relief:
   a. If the submitted Plan of Action is deemed not adequate, **or**
   b. Plan of Action is not promptly implemented, **or**
   c. Immediate Threat to the Environment.

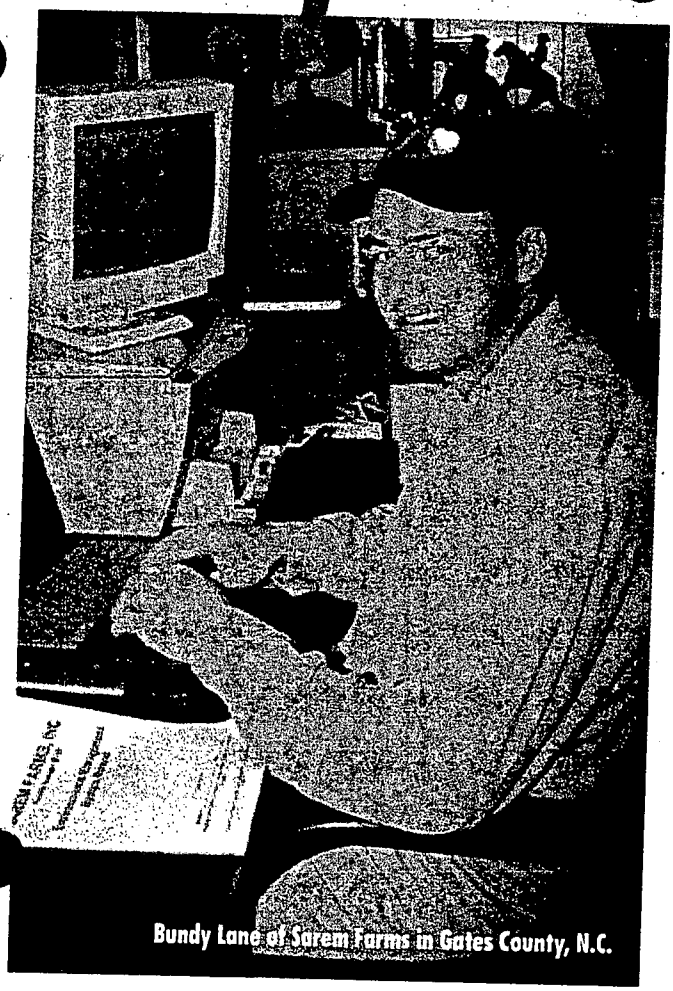
4. Facilities will be required to submit daily freeboard level updates to the Regional Office until the lagoon/storage pond levels are below 12 inches (for structural stability). Facilities will then be required to submit weekly freeboard level updates until the lagoon/storage pond levels are back into compliance. Failure to submit the weekly updates will be an aggravating factor in consideration for civil penalty assessment.

C) Only one (1) compliance action for inadequate freeboard levels should be taken against a properly operated and maintained facility during a single rainy period. The effective timeframe of a single rainy period will be determined at the Director's discretion based on cumulative rainfall amount, duration, and seasonal variability. The maximum duration of a single rainy period should not normally exceed 365 days.

D) When making a determination for the appropriate response to inadequate freeboard levels after (effective date), any action taken by DWQ prior to (effective date) must be considered as though they were based on the guidance set forth in this document.

March 25, 2004 ERC Meeting
EXHIBIT L

EMS Offers Multiple Payoffs



Bundy Lane of Sarem Farms in Gates County, N.C.

"My business management and herd performance have improved since implementing our Environmental Management System," says Bundy Lane of Sarem Farms in Gates County, N.C. He has a 4,800-sow operation that produces feeder pigs on contract with Murphy-Brown.

"While designed primarily to protect the environment, an EMS applies to all aspects of a livestock operation. The basic goal is to protect the environment, but an EMS goes far beyond that," says Lane.

Simply put, "an EMS is a tool that allows an organization to apply the proven business managemnet approach – plan, do, check and act – to environmental considerations that affect producers' operations," says Lesa Call, director of EMS' for Environmental management Solutions, Des Moines, Iowa.

Lane developed the first pilot EMS in North Carolina, for which he received a $3,000 state grant. Nationwide, he was among the first 10 livestock producers to implement an EMS.

Working on his EMS plan at night off and on for 2 years, he admits the process took longer than he expected it would.

"It was good to step back and take a close look at all aspects of our hog operation. I spotted and fixed quite a few little things to improve efficiency and performance," says Lane. "Details make the difference between producing 18 pigs per sow per year and 22.5."

He points to water use as a specific example where the EMS project improved the operation's efficiency. Since implementing the system Lane and his employees are paying closer attention to water used within the operation and they are taking steps to reduce waste.

A side benefit of the process is the peace of mind that all employees are familiar with the EMS plan. Because of this, Lane knows they can carry on appropriately when he is away. "Should something happen to me, it would not be devastating to the operation," he notes.

Having more structured operating procedures has improved communication with employees. He says his 13 employees like the EMS plan because it gives each one direction for his or her job.

"In 3 or 4 weeks," he adds, "a new employee can learn most of a job's procedures because the steps are spelled out in the manual." In the past, it used to take at least 6 months.

By having the manual on his computer, Lane can easily make changes as needed and print out hard copies for employees.

"Following an EMS that includes odor control improves neighbor relations," he adds. "I firmly believe if every producer in the country had an EMS plan and followed it, the pork industry's image with

the general public would improve dramatically."

For fellow producers who are interested in developing an EMS, Lane suggests taking a close look at the process and your operation. Recognize that it will take some time and concentration. But he adds, that the process has become more user friendly since the time that he prepared his.

Here are some questions to ask yourself before delving into an Environmental Management System for your operation.

- Do you have the time and patience to develop it?
- Will you follow it as much as possible and practical?
- Are you willing to make changes in your operation?
- Can you convince others in your operation to follow it?

"It's our own plan and we are not required to follow it. We can do what we want with it. We could toss it out if we ever became so inclined." Lane says he intends to continue following his EMS plan religiously. ■

By Bill Raufer

Finding EMS Help

A step-by-step method of creating an Environmental Management System for your swine operation is now available free on the Internet. The package includes instructions, worksheets, checklists and a fill-in-the-blanks computer template. It also provides answers to a number of "what-if" scenarios that may occur along with appropriate responses.

The tool was developed jointly by the North Carolina state environmental agency, Department of Environment and Natural Resources, and Murphy-Brown. It is a management aid, covering all aspects of a hog operation — not just environmental management. The on-line package is designed to fit a swine farm operated by one or two people.

You can access the do-it-yourself EMS package on the North Carolina DENR's Web site at *www.p2pays.org*. Click on "Hot Topics." If you have questions, call (919) 715-6500. The package also is available at these Web sites: *www.smithfieldfoods.com* (Murphy-Brown), and *www.ncpork.org* (North Carolina Pork Council).

While this tool is a starting point, there is still a lot of uncertainty in terms of what an effective EMS program needs to include on a state or national level, says Lesa Call, director of EMS for Environmental Management Solutions.

"Several states and private companies are working on programs for livestock. Producers should watch what's happening in their state," says Call. For example, Environmental Management Solutions is working with the state of Missouri on a pork-specific pilot project.

There is not yet a unified approach to EMS plans for livestock. A national project involving nine states will offer a report this month in Washington, D.C. The "Agricultural Environmental Management Systems" project worked specifically on dairy, beef and poultry needs. You can go to *www.uwex.edu/AgEMS* for more information on that project.

APPLY TO THE PROGRAM

Environmental Partner applications can be submitted at any time and are reviewed quarterly, during the first month of each quarter. Applications must be received at least two weeks preceding the first day of each review month to be considered during that review cycle. Specific dates may be found on the Web site. Steward applications are accepted in April (beginning on Earth Day) each year for a 2-month period.

You can find both the Environmental Partner and Environmental Steward applications at: **http://www.p2pays.org/esi/apply.htm#apply**

MORE INFORMATION

For a list of current Partner and Steward participants or more detailed program information, please visit our Web site at **http://www.p2pays.org/esi/** or contact:

NORTH CAROLINA DIVISION OF POLLUTION PREVENTION AND ENVIRONMENTAL ASSISTANCE

N.C. Department of Environment and Natural Resources
Michael F. Easley, Governor • William G. Ross Jr., Secretary

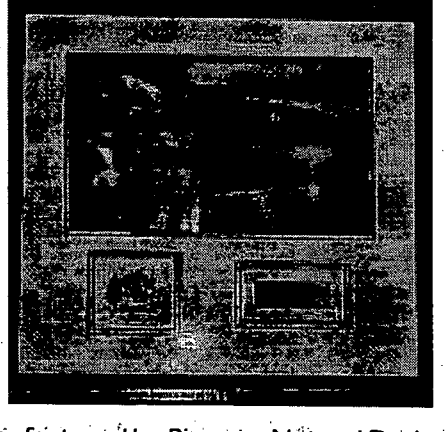
DPPEA-FY03-11

A SUSTAINABLE AWARD

In keeping with the spirit of the ESI, Environmental Stewards are presented with an award that is unique both for its content as well as its construction. The award is constructed from 100 percent reclaimed wood. The antique poplar frame is carefully salvaged from abandoned barns, kiln-drained, re-sawn and re-milled in preparation for its new purpose. Nail holes, wormholes, and other signs of wear enhance the frame's appearance. The frame's paint is an oil-based finish made from naturally derived raw materials. The raw materials for this finish are low in toxic substances, renewable and have a minimal environmental impact.

The mat boards are made from reclaimed wood pulp fibers, and the middle boards have the highest percentage of recycled fibers available.

The photo displays Polk County's Pearson's Falls, the Linn Cove Viaduct on the Blue Ridge Parkway, and a sunrise taken at Atlantic Beach. (Courtesy of N.C. Division of Tourism, Film and Sports Development)



(Manufactured by Rivanna Natural Designs)

N.C. DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

"IN AN IDEAL WORLD, REGULATION IS REPLACED BY STEWARDSHIP; AN INHERENT RESPECT FOR THE ENVIRONMENT. IN THIS CONCEPT OF STEWARDSHIP, EVERYONE TAKES RESPONSIBILITY FOR THEIR ACTIONS AND THE USE OF RESOURCES FOR THE BENEFIT OF THE COMMUNITY."

- excerpt from Department of Environment and Natural Resources Principles of Enforcement

www.p2pays.org/esi

What is the Environmental Stewardship Initiative?

The Environmental Stewardship Initiative (ESI) is designed to promote and encourage superior environmental performance by North Carolina's regulated community. This voluntary program establishes incentives and seeks to reduce the impact on the environment beyond measures required by any permit or rule, producing a better environment, conserving natural resources and resulting in long-term economic benefits.

The ESI has 2 levels of participation – Partner and Steward. Each level has its own criteria for participation and benefits. Both Partners and Stewards agree to report annually on progress towards the organization's environmental performance goals, net reductions of releases, emissions and disposal, use of energy and water, and any reportable non-compliance events.

"We're looking to recognize companies that integrate the environment into their day-to-day business practices. We view companies that seek to go beyond compliance and move toward environmental sustainability as true stewards who know that in return these practices save money, materials and resources"

- DENR Secretary William G. Ross Jr.

THE ENVIRONMENTAL PARTNER

The "Environmental Partner" level is designed for regulated organizations interested in developing a systematic approach to improving their environmental performance.

WHAT DOES IT TAKE TO BECOME A PARTNER?

An organization must:

- Not be under any environmental criminal indictment or conviction;
- Document commitment to compliance;
- Set environmental performance goals that include pollution prevention; and
- Commit to developing, implementing and maintaining an environmental management system (EMS) based on ISO 14001 or a functionally equivalent model.

WHAT ARE THE BENEFITS OF BECOMING A PARTNER?

- Technical assistance on developing an EMS, pollution prevention approaches, environmental management and treatment technologies, and achieving/maintaining compliance with local, state and federal regulations;
- Networking opportunities;
- Specialized training;
- Access to Environmental Steward mentors;
- Recognition of program participation;
- Coverage by U.S. EPA and DENR self-reporting policies;
- Single point of contact within DENR; and
- Other benefits as deemed appropriate by the Secretary based on recommendations from the advisory workgroup

THE ENVIRONMENTAL STEWARD

The "Environmental Steward" level is for those organizations that already display a commitment to exemplary environmental performance beyond what is required by law and have implemented an EMS.

WHAT DOES IT TAKE TO BECOME A STEWARD?

An organization must:

- Set aggressive environmental performance goals;
- Have a functional EMS based on ISO 14001 or a functionally equivalent model;
- Not have had any significant violations in the preceding two years;
- Have an interactive process for communicating with the local community on program activities and progress towards performance goals; and
- Demonstrate how the EMS is integrated into core business functions.

WHAT ARE THE BENEFITS OF BECOMING A STEWARD?

- All Partner benefits;
- Formal public recognition from the governor/Secretary of DENR including use of a program logo, an award ceremony, and public announcements/press releases;
- Participation in the ESI Forum chaired by the Secretary and including key department policy makers;
- Established time frames for permit decisions, (does not change existing public comment opportunities); and
- Consideration for regulatory innovations.

DPPEA is a ***non-regulatory*** agency that provides ***free*** technical assistance.

Please contact DPPEA if you are:

- Interested in receiving more information about EMS,
- Have questions on how to use the online tools, or
- If you would like to create an EMS for your organization.

Environmental Management Systems for Pork Producers

N.C. Division of Pollution Prevention and Environmental Assistance
Department of Environment and Natural Resources

Environmental Management Systems for Pork Producers

What is an EMS?

An environmental management system (EMS) is an organized approach to managing and preventing environmental impacts through a continual cycle of planning, implementing, reviewing and improving all farm activities. An EMS is ***voluntary*** and ***non-regulatory*** assistance is available.

How can an EMS benefit my operation?

- Helps organize regulatory requirements;
- Aids in NOV and NOD reductions;
- Encourages pollution prevention;
- Addresses all environmental impacts;
- Improves record-keeping;
- Helps prevent environmental accidents;
- Advances overall administrative efficiency;
- Reduces potential liability;
- Streamlines everyday activities;
- Increases employee awareness/accountability;
- Improves public image;
- Strengthens community relationships;
- Enhances customer trust;
- Reduces operating costs; and
- Increases access to international markets.

"Although the EMS has not instantaneously corrected all of my problems, it has given me the vision needed to address environmental impacts related to my farm. I feel confident that my overall operation will be dramatically enhanced by the implementation of an EMS."

Chuck Stokes
Little Creek Hog Farms

EMS Assistance Tools

The Division of Pollution Prevention and Environmental Assistance (DPPEA) created an online guidance tool to assist pork producers with EMS development. This tool includes:

- EMS explanation;
- Step-by-step instructions;
- Sample standard operation procedures (SOPs);
- Checklists; and
- Sample EMS manual to customize with your farm's information.

The online guidance also includes the **Aspects/Impacts Manager (AIM)**. Using AIM, a producer can identify all the farm activities that impact the environment. From that, a table is created to rank the most significant environmental impacts from highest to lowest. Identification of the significant impacts of your operations is an important building block for the EMS. This prioritization is essential in identifying the activities of farm operations where you will need to focus improvement efforts.

Visit: http://xapps.enr.state.nc.us/survey/index.jsp

Documents in the online guidance can be downloaded from a computer and customized to your specific operation. These tools were developed from working with eight North Carolina pork producers who voluntarily designed and implemented an EMS on their farm.

Visit: http://www.p2pays.org/porktool/

Compliance and Inspection Reports

NC Division of Water Quality
March 25, 2004

As many of you will recall, the Division of Water Quality has responsibility for providing you with annual reports on the status of permitting and compliance for both the Animal Feeding Operations and the National Pollutant Discharge Elimination System for wastewater dischargers. In addition, we are responsible for reporting on the sanitary sewer or wastewater collection system program. This presentation will encompass all those reports.

Animal Feeding Operations

- Animal Operations 2461
- Inspections Completed 1800
- Inspections w/Identified Problems 878
  - Discharges 103/50 to surface waters
  - Inadequate freeboard 537
  - Evidence of over application 145
  - Crops different than approved 70

I am going to start my report by talking about the animal operations. This slide shows a brief overview of the statistics for 2003. We obviously were significantly under the required number of inspections. There are multiple reasons, significant wet weather issues requiring that we focus our resources on the facilities with problems, and we were down 50% of staffing in the animal inspectors in 2003. We are still short three inspectors at the regional office.

Of the 1800 inspections, we only managed to do ~1400 routine inspections

As you can see, we devoted the bulk of our time to working with the problems that arose last year as a result of the extremely wet weather. I have broken down the identified problems into the major problem areas that we saw. The number of discharges from these systems is the highest we have seen since 2000. Of the 537 facilities with inadequate freeboard, 93 had less than a foot of freeboard (into the structural integrity).

Animal Waste Notices

- 4th Quarter 2002
  - Notices of Deficiency (NOD): 7
  - Notices of Violation (NOV): 32
  - NOV / Notices of Intent for Enforcement: 6
- Calendar Year 2003
  - Notices of Deficiency (NOD): 309
  - Notices of Violation (NOV): 205
  - NOV / Notices of Intent for Enforcement: 89

As you are well aware, the wet weather problems that we saw in 2003 really started in the last quarter of 2002.

I am going to try to not repeat the previous discussion on the chronic rainfall.

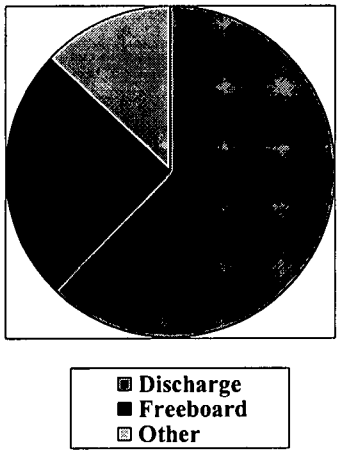
I am showing the 4th quarter of 2002 as that is the start of the prolonged period of above average rainfall. Farms should have gone into this period with low levels in their lagoons. As you can see by the numbers of notices of deficiencies and violations, some farms entered that period without the appropriate level of storage capacity. It is interesting to note that despite the prolonged wet weather from October to June, only 439 facilities (less than 20%) got into the "red", had less than the minimum required freeboard. Of those 439, 72% had been properly operating their farms (including having pumped down to the stop pump elevation). 110 farms had not done so.

6 Enforcements: 4 were for discharges, 1 failure to notify freeboard, 1 long list of permit violations,

89 Failure to report, discharges

2003 Animal Enforcement Cases

(By Type of Case)



77 Total Cases

- 48 Discharge
- 19 Freeboard Violations without Discharge
- 10 Other Violations

Of the 89 notices of Intent for enforcement, 77 enforcement actions were taken. There are several potential reasons why a notice on enforcement does not result in a civil penalty action. For example, the permittee may provide information that was not previously available to the inspector that after consideration results in the cessation of the enforcement action. Of the 48 discharges, 44 were to surface waters. Of the 19 freeboard violations, 15 did not notify us. The total civil penalties assessment was $356,972. Ranging from $500 to ~$22,000 (multiple discharges from the facility). Of the $356,972 assessed, ~$150,000 has been collected. The remainder are under payment plans, have requested remission from the EMC or have contested the penalty through the Office of Administrative Hearings (the largest penalty case has been paid).

The other types of violations include such things as over application of wastewater (exceeding the nitrogen loading on the crops), failure to maintain records, ponding and application to saturated fields, incorrect crops.

2003 Animal Operations Freeboard Letters

- Total Notices of Deficiency (NOD): 316
- Total Notices of Violation (NOV): 110
- Total Considerations for Assessment: 13

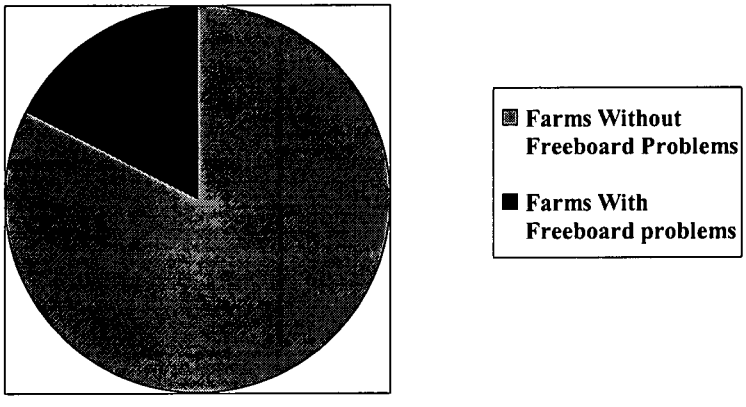
Paul has described the process by which the Division determined whether to issue an NOD or NOV, so I am not going to repeat that presentation. I just wanted to briefly mention that during this period of wet weather, the regional staff reviewed all the farm records from 439 farms, to determine whether the operator had appropriately lowered the lagoons going into the wet winter months, and had then taken appropriate actions as weather allowed to applying during the wetter periods. The 13 cases considered for further enforcement were situations where the operator of the system neglected to exercise care and due diligence in managing the farm.

Breakdown of NODs and NOVs

Swine: 407 / Cattle: 18 / Poultry: 1

All Considerations for Assessment are Swine Farms

Farms with Freeboard Problems in 2003



Less than 20% of the permitted facilities had freeboard problems in 2003.

This slide is a pictorial representation of the same information I have been presenting. As a percentage of the whole, about 17% of the facilities had freeboard problems. A high percentage of those with the problems called the regions to advise of the problems. In fact, we have record of 1253 calls with respect to freeboard problems. As you can see by that number and the number of farms that had insufficient freeboard (537), the regional inspectors worked closely with the facilities in their management of the problems.

The Historical Perspective

	2000	2001	2002	2003
Inspections	3162	2610	2760	1800
Discharges	152	58	51	103
Freeboard Violations	285	102	49	537
Civil Penalties	$404,850	$149,500	$107,440	$356,972

The number of freeboard violations increased dramatically in 2003, as a result of the extended wet weather period. The freeboard violations were also high in 2000, these numbers reflect both the aftermath of Hurricane Floyd and the large winter storms that we had in 1999-2000. However, the positive point I wanted to make was that while the freeboard violations were significantly higher in 2003, the numbers of discharges were not as high that year as the year 2000. We believe this to be a result of the continued efforts from the operators to manage the farms and the continued compliance oversight efforts.

National Pollutant Discharge Elimination System Permits
(NPDES)

• Major Municipalities	149
• Major Industries	94
• Minor Municipalities	158
• Minor Non-Municipalities	1053
»**TOTAL**	1454

The National Pollutant Discharge Elimination System Program is the Clean Water Act permitting program for facilities that discharge wastewater to surface waters. I am capturing here the universe of permitted facilities.

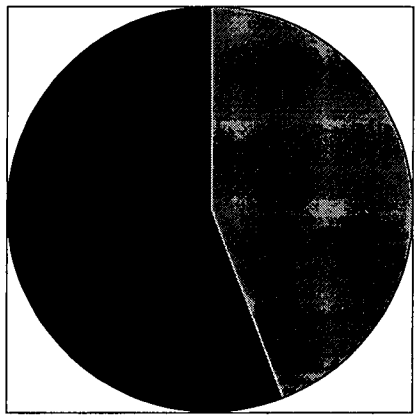
These numbers are the numbers of individually permitted wastewater treatment plants. The minor municipalities are usually small towns and they have permitted flows of less than 1 million gallons and minimal to no industrial contribution to their waste stream. Larger municipalities have permits ranging up to 64 MGD.

Minor non-municipal systems serve such entities as school systems, mobile home parks, subdivisions, shopping centers, rest homes, etc.

The number of permitted facilities at the end of 1998 was 1629 (a reduction in 175 facilities at the end of 2003). The numbers of discharging facilities are dropping through consolidation of facilities, eliminating through other options (non-discharge), electing to drop permits, etc.

Many of our compliance problems come from the smaller facilities – they have less resources to manage their systems and lesser

Breakdown of Assessment Cases



Total Assessments: 838
Municipalities: 371
Other: 467

The 838 civil penalty assessments totaled $954,248 in 2003. $557,663 of those penalties were assessed against municipalities (55% of the overall penalties assessed against NPDES facilities). 73% of the overall penalties have been collected. During the same period, the Division performed 846 inspections of NPDES facilities.

Problem facilities – small municipalities and private package plants serving subdivisions, schools, ...

The Historical Perspective

	2001	2002	2003
# Permits	1485	1444	1454
Inspections	1172	1100	846
Penalties	$828,470	$856,832	$954,248

Come back to the issue of the declining number of inspections.

Sanitary Sewer Permitting

- 130 Active Collection System Permits
  - 20 Issued in 2003
- 156 Additional System Permits Required
- Subject Systems Permitted by June 30, 2005

From the discharge arena, I want to jump to the issue of sanitary sewer overflows and collection system permitting. This is truly a significant issue for the state from a water quality perspective to an economic growth perspective. Our sewer infrastructure in North Carolina is facing some serious challenges. This issue is a challenge to us all. In round numbers, North Carolina has approximately 30,000 miles of sanitary sewer in the ground and is growing on a daily basis. We handle about 1300 permitting requests per year for extensions to that system. Just for comparison sake, we have approximately 100,000 miles of paved roads in North Carolina. The sewer system is mainly out of sight and for that reason, has also been a lower priority in past years. However, with the number of spills that have been occurring from these systems, that is no longer the case. Many towns are finding that they have large sewer trunk line systems that are at their hydraulic capacity and overflowing with large rain events. Additionally, they are finding older systems are in terrible shape and needing to be replaced as they can no longer carry the flow to the treatment plant. In addition, our behavior, as citizens, is creating problems by the flushing of grease and objects down sinks and toilets that creates clogs in the lines and geysers in someone else's back yard. How big is the problem?

How Big is the Problem?

- 2,000 – 3,000 spills per year
- Infrastructure Needs (2000 Survey)
  - Infiltration/Inflow Repair $291 Million
  - Sewer System Replacement $205 Million
  - New Interceptors $1.535 Billion
  - New Collection Systems $1.725 Billion

The problem is big. In 2003, we had 3206 reported spills. An estimated 151 million gallons spilled.

These numbers, both the spills and infrastructure needs are very large.

So what is being done about this problem?

Permit Conditions for Collection Systems

- Operation to prevent overflows
- Compliance Schedules
- Moratoriums
- Capital Improvement Plans
- Contingency planning and minimum maintenance requirements

I mentioned the permits just a moment ago, in terms of the number of permits we have issued for collection systems. I wanted to talk about what those permits contain, how they are assisting us in addressing the problems. The permits being issued to collection system owners contain a myriad of conditions aimed at maintenance and operation of the systems. I have highlighted a few to bring to your attention. The permits require that they system be effectively managed to prevent sanitary overflows from the system. In cases where there are identified problems, compliance schedules are being developed to require the owners to address the identified problems with specific actions and within specified timelines. Failure to meet the requirements may result in a moratorium being placed on the town, preventing them from being able to add additional wastewater to the system, until it is capable of handling the volume without overflows. Of the 130 permits, 60% (78) of them contain schedules to address problems that have been identified.

Moratoriums are another tool that we have used to address systems with continuing sanitary sewer overflow problems, particularly when they are in repeat locations and no actions are being taken to address the problem. Currently there are a total of 34 moratoriums imposed. These may be partial within a specific sewer-shed of a municipality or system-wide, depending on the extent of the problems. 19 of these moratoriums are related to sewer over flows, the remainder have been instituted as a result of capacity issues at the wastewater treatment plant itself.

Permittees are also required to adopt and implement a Capital Improvement Plan designating funding for reinvestment into the infrastructure of the collection system. The permit requires that the plan address the short term and long term needs (3-5 years).

Other conditions of the permit require contingency planning for pump failure at each pump station and a minimum of 10% cleaning of the lines each year.

What Actions Are Being Taken?

- Improved tracking of spills
- Increased compliance oversight emphasis
- Municipal actions
  - Comprehensive assessments
  - Increased emphasis on cleaning & repairs
  - Dramatically increased pace

We have been working on a data management tool to collect better information on the sanitary sewer overflows. Additionally, we are in process of launching a web interactive process for the municipalities to be able to log the information in electronically themselves on the size, location, cause, etc. This will give us all better to tools to assess the problems more quickly and determine if additional actions might be needed in specific locations.

We sent a letter to all owners of the collection systems this fall, detailing that every sanitary overflow is a violation and makes them subject to potential enforcement action – notice of violation, civil penalty action and potential moratorium. The reporting requirements have gotten more stringent (in terms of having to speak to a live person and the timing of follow up). You will have noticed on earlier slides that our number of inspections of WWTP's is down. This is due to several things, staff turnover has been significant for us in the past several years. However, we are also devoting more time to addressing the sanitary sewer overflow problems. These are complex issues both for us and for the owners of the system to sort through. However, we are making progress and the regional office staff advise that they see the towns are taking this issue more seriously than ever in the past with performing comprehensive assessments of the systems, putting more emphasis on cleaning and repairs and increasing dramatically the pace at which they pursuing improvements. As an example, Greensboro is spending over $42 million to repair their system and replacing entire sewer mains; Eden is proceeding with upgrades to three of their pump stations; High Point has completed several phases of mainline replacement and is in the midst of several others, Wadesboro has upgraded a pump station, several thousand feet of line and removed roof drains and eliminated their recurring sanitary sewer overflows.

Questions?

NCDENR
North Carolina Department of Environment and Natural Resources

Michael F. Easley, Governor

William G. Ross Jr., Secretary

Environmental Review Commission Counsel

Jim Johnson
Director of Fiscal Research

FROM: William G. Ross, Jr.

DATE: December 4, 2003

RE: Status Report on Individually Permitted Discharging Systems
Beginning July 1, 2002 and Ending June 30, 2003
Fiscal Year 2002-2003

Pursuant to G.S. 143-215.9A, the Department of Environment and Natural Resources submits the subject fiscal year report.

The enclosed report details the inspections completed and the enforcement actions taken in North Carolina during fiscal year 2002-2003 by the Division of Water Quality. In addition, information on Special Orders by Consent is included. The report also includes a table showing the number of permits issued by region.

The enclosed tables list totals for each of the Department's regional offices as well as State totals. The regional offices are noted as follows:

- ARO – Asheville Regional Office
- FRO – Fayetteville Regional Office
- MRO – Mooresville Regional Office
- RRO – Raleigh Regional Office
- WARO – Washington Regional Office
- WIRO – Wilmington Regional Office
- WSRO – Winston-Salem Regional Office

If any additional information or clarification is needed, please do not hesitate to contact us.

* Fiscal Year numbers are reported as of 10/14/2003 and may vary from actual due to delays in data entry.

ADDENDUM

The following is provided to support the information in the above status report.

- The Division of Water Quality does not have the data or management system in place to currently track information on the number of violations found during each inspection, the date of the violation, or the nature of the violation. A Basinwide Information Management System is, however, under development to address these needs. Funding has been allocated for the initial development phase. Completion of the system will require further funding. Therefore, at this time, the Division is unable to provide such information as requested in the amended G.S. 143-215.9A(a)(3).
- As found in Table 2, "Other Inspections" include:
  - **Audit Inspections**, a comprehensive review of all elements of a municipal's pretreatment program including a records review & an inspection of an industrial facility conducted once every 5 years;
  - **Bioassay Compliance Inspections**, evaluates the biological effect of a permittee's effluent discharge on test organisms using acute and chronic toxicity testing;
  - **Compliance Sampling Inspections**, a sampling inspection designed to verify the permittee's compliance with applicable permit self-monitoring requirements -- analytical results from representative samples collected during the inspection are used to evaluate the permittee's compliance;
  - **Diagnostic Inspections**, focuses on Publicly Owned Treatment Works that have not achieved permit compliance – the purpose is to identify the causes of noncompliance, suggest immediate remedies, and support current or future enforcement action;
  - **Operation & Maintenance Inspections**, focuses on the operation and maintenance aspect of a facility;
  - **Performance Audit Inspections**, inspections that include actual observation of the permittee performing the self-monitoring process from sample collection and flow measurements through laboratory analyses, data work-up and reporting;
  - **Pre-Treatment Inspections**, an annual inspection of a municipal's pretreatment program; and
  - **Toxicity Sampling Inspections**, same as CSI – however, increased emphasis is placed on toxic substances regulated by the NPDES Permit.
- Effective July 1, 1998, the Director of the Division of Water Quality delegated each Regional Water Quality Supervisor the authority to sign all Civil Penalty Assessments for fast-track enforcement actions for violations of NPDES Permit effluent limitations and/or monitoring frequencies in accordance with NCGS 143-215.6A.
- As found in Table 1, "Other Permit Condition Violations" may include
  - discharge violations (resulting from collection system overflows);
  - submitting late Discharge Monitoring Reports;
  - submitting late Toxicity Tests; and
  - permit condition violations (examples, violations of pre-treatment program, improper operation & maintenance of treatment works, or by-pass of treatment works)
- Due to the length of the post assessment process, total civil penalties assessed and total civil penalties collected will not coincide.

FROM: William G. Ross Jr., Secretary

DATE: October 2, 2003

RE: Status of permitting and inspecting animal waste management systems/Animal Waste Compliance Report for Period Beginning January 1, 2002 and Ending June 30, 2003

Pursuant to G.S. 143-215.10M, the Department of Environment and Natural Resources submits the subject annual report.

This report details the inspections and operational reviews completed in North Carolina during the year 2002 and the first two quarters of 2003 for both the Division of Water Quality and the Division of Soil and Water Conservation. The tables show the type of inspection and the number of inspections completed quarterly and year to date. The Pilot Project conducted by the Division of Soil and Water Conservation is still in effect for 2003. The tables also show the number of permits issued as well as violations and deficiencies by region.

The enclosed tables list totals for each of the Department's Regional Offices as well as state totals. The Regional Offices are noted as follows: ARO – Asheville Regional Office, FRO – Fayetteville Regional Office, MRO – Mooresville Regional Office, RRO – Raleigh Regional Office, WARO – Washington Regional Office, WIRO – Wilmington Regional Office, and WSRO – Winston-Salem Regional Office.

If there is a need for any additional information or clarification, please do not hesitate to contact us.

Other Agency Total number of operation reviews completed****	0	0	0	5	0	0	17	22
Routine operation reviews	0	0	0	5	0	0	17	22

*Year to date numbers are reported as of 6/30/03 and may vary from actual due to delays in data entry and continued refinements to database.

**Pilot Project. Compliance Inspections will normally only be conducted in Brunswick, Columbus, and Jones County by DSWC. Operation reviews are normally conducted in the Pilot Counties in the spring and compliance inspections in the fall. As of July 1, 1999, Brunswick County became part of the Pilot Project.

***Inspections and operation reviews may include facilities that are no longer in operation and/or multiple inspections or operation reviews at one facility.

****Other Agencies include Soil and Water Conservation Districts and NRCS.

Average time to complete a compliance inspection or operation review is approximately 6 hours. It is anticipated that this time will increase as the number of farms that have certified animal waste management plans and permits increases.

Year to Date Totals for 2003

Year to Date Totals for 2003

	ARO	FRO	MRO	RRO	WARO	WIRO	WSRO	State Totals
Deficiencies and Violations[1] found during DSWC operation reviews and DWQ inspections*	9	198	13	102	170	229	59	780
Number of facilities receiving a deficiency or violation from inspections	2	149	3	64	124	187	27	556
Enforcement actions initiated for violations noted in 2003 Calendar Year**	0	3	0	16	14	24	4	61

*Violation totals include violations noted during both operation reviews and compliance inspections and may include multiple violations at a single facility. 456 of the deficiencies and violations were self-reported high-freeboard and not the result of an inspection.

**Enforcement actions being developed by the regional staff are normally not shown as actions initiated during that quarter. These actions will be included in the next year to date totals.

Deficiencies and Violations Identified[1]	Total number of inspections with identified problem	Percent of total problems identified	Percent of total inspections completed (1,754)
Discharges from Animal Waste Management System	59	7.6	3.4
Of the total discharges identified, the number of discharges that reached surface waters of the state	(29)***	(3.7)	(1.7)
Inadequate Freeboard	610****	78.2	34.8
Of the total inspections identified with inadequate freeboard, the number of inspections with freeboard noted at less than 1 foot	(72)	(9.2)	(4.1)
No Certified Operator in Charge	11	1.4	0.6
Evidence of over application	67	8.6	3.8
Does not meet setbacks	1	0.1	0.1
Inadequate land	3	0.4	0.2
Crop differs from that stated in Certified Animal Waste Management Plan	29	3.7	1.7
Totals	780*****	100	

***Of the discharges to surface waters, 5 were from cattle operations, 19 were from swine operations and 5 were from poultry operations.

****456 of the Inadequate Freeboard violations were self-reported and not the result of an inspection.

*****1,754 inspections and reviews were conducted. There were 7 potential problems evaluated on each report. Therefore the total possible deficiencies and violations that could have been noted was 12,278. The 780 problems identified represents 6.4% of the total potential number.

Compliance and Inspection Reports

NC Division of Water Quality
March 25, 2004

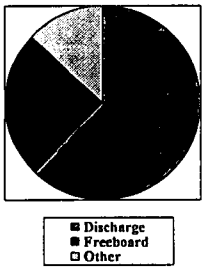
Animal Feeding Operations

- Animal Operations 2461
- Inspections Completed 1800
- Inspections w/Identified Problems 878
  - Discharges 103/50 to surface waters
  - Inadequate freeboard 537
  - Evidence of over application 145
  - Crops different than approved 70

Animal Waste Notices

- 4th Quarter 2002
  - Notices of Deficiency (NOD): 7
  - Notices of Violation (NOV): 32
  - NOV / Notices of Intent for Enforcement: 6
- Calendar Year 2003
  - Notices of Deficiency (NOD): 309
  - Notices of Violation (NOV): 205
  - NOV / Notices of Intent for Enforcement: 89

2003 Animal Enforcement Cases
(By Type of Case)



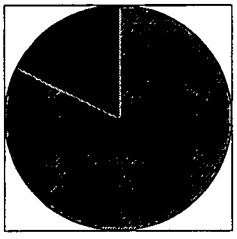
77 Total Cases

- 48 Discharge
- 19 Freeboard Violations without Discharge
- 10 Other Violations

2003 Animal Operations Freeboard Letters

- Total Notices of Deficiency (NOD): 316
- Total Notices of Violation (NOV): 110
- Total Considerations for Assessment: 13

Farms with Freeboard Problems in 2003



Less than 20% of the permitted facilities had freeboard problems in 2003.

The Historical Perspective

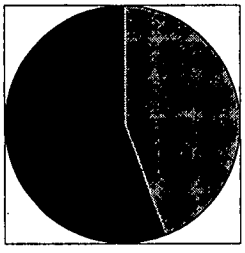
	2000	2001	2002	2003
Inspections	3162	2610	2760	1800
Discharges	152	58	51	103
Freeboard Violations	285	102	49	537
Civil Penalties	$404,850	$149,500	$107,440	$356,972

National Pollutant Discharge Elimination System Permits
(NPDES)

- Major Municipalities 149
- Major Industries 94
- Minor Municipalities 158
- Minor Non-Municipalities 1053

»**TOTAL** 1454

Breakdown of Assessment Cases



Total Assessments: 838
Municipalities: 371
Other: 467

The Historical Perspective

	2001	2002	2003
# Permits	1485	1444	1454
Inspections	1172	1100	846
Penalties	$828,470	$856,832	$954,248

Sanitary Sewer Permitting

- 130 Active Collection System Permits
  - 20 Issued in 2003
- 156 Additional System Permits Required
- Subject Systems Permitted by June 30, 2005

How Big is the Problem?

- 2,000 – 3,000 spills per year
- Infrastructure Needs (2000 Survey)
  - Infiltration/Inflow Repair $291 Million
  - Sewer System Replacement $205 Million
  - New Interceptors $1.535 Billion
  - New Collection Systems $1.725 Billion

Permit Conditions for Collection Systems

- Operation to prevent overflows
- Compliance Schedules
- Moratoriums
- Capital Improvement Plans
- Contingency planning and minimum maintenance requirements

What Actions Are Being Taken?

- Improved tracking of spills
- Increased compliance oversight emphasis
- Municipal actions
  - Comprehensive assessments
  - Increased emphasis on cleaning & repairs
  - Dramatically increased pace

Questions?

Interim Report on the Effectiveness of the Surface Water Identification Training and Certification Program

N.C. Division of Water Quality
March 25, 2004

Background

- Surface Water Identification and Certification (SWITC) Program established HB 1257 in 2001
- Require training and certification of state DWQ and DFR staff
- Require training and certification of local delegated programs

Training Classes Held

- Four classes for agencies in 2002 and 2003
  - Twice each in Kinston and Crossnore
    - DWQ - 45 certified
    - DFR - 27 certified
    - Orange County - 4 certified
    - DOT - 34 trained
    - Others - 8 trained
    - **Total 118 individuals**

Training Classes held (cont.)

- Two classes held for private sector in 2002-2003
  - Same class as for private sector
  - Taught in conjunction with NCSU - Educational Outreach
  - Classes in Raleigh and Lenior
  - about 60 students trained

Future classes

- Public agencies - fall 2004?
- Private individuals - summer 2004
- Other local government staff
  - For future delegated programs
  - Local stream buffer protection programs
  - Phase II and other state rules

Other benefits of SWITC

- Encourage local governments to use State's methodology
- US Army Corps of Engineers has agreed to use State's methodology

Stream Mapping Effort

- Joint effort of DOT and DWQ to improve quality of stream maps in NC.
- Purpose - develop computer map of stream locations for planning and mitigation purposes.
- Useful for various local, state and federal agencies.

Outline of Planned Work

• DOT and DWQ funding	Completed
• Steering committee meet	Meet monthly, twice to date
• Hire DWQ staff	Done
• Establish Advisory Committee	Spring 2004
• Hire and train contractors	Winter 2004
• Map stream origins	Spring 2004
– Initially for 1/8 of state	

Outline of Planned Work (cont.)

• Prepare computer models	Summer 2004
• Determine accuracy of models	Fall 2004
• Determine other funding sources	Summer 2004
• Prepare final map	Winter 2004
• Begin phase II of mapping	Winter 2004
• Complete stream map for state	Summer 2006?
• Maintain and update map	Ongoing

Date: September 18, 2003

Background –

The Division of Water Quality (DWQ) was mandated under House Bill 1257 (HB1257), Session Law 2001-404, General Statute 143-214.25 to develop the Surface Water Identification Training and Certification (SWITC) Program. The SWITC Program was developed to train and certify individuals to determine the presence of surface waters that would require the application of rules adopted by the Commission for the protection of riparian buffers. These rules include the Neuse River Riparian Buffer Protection Rules (15A NCAC 2B .0233, the Tar-Pamlico Riparian Buffer Protection Rules (15A NCAC 2B .0259), the Randleman Lake Riparian Buffer Protection Rules (15A NCAC 2B .0250) and the Catawba River Basin Riparian Buffer Protection Rules (15A NCAC 2B .0243).

Classes held during 2002 and 2003-

A total of three classes have been held for this training in response to House Bill 1257 including classes in Kinston and Crossnore. Another class will be held in Crossnore from September 14 –18, 2003 mainly for DWQ and DOT staff. To date, these classes have trained and certified a total of 112 individuals as follows: NC Division of Water Quality – 38; NC Division of Forest Resources – 29; NC Department of Transportation – 33; Orange County – 5; Town of Cary – 5; North Carolina State University – 1; US Environmental Protection Agency – 1; NC Division of Land Quality – 1; and NC Wildlife Resources Commission – 1. These individuals have all taken and passed a written and field test for the training although some individuals had to retake the field and/or written test. Those individuals that are allowed to be certified by House Bill 1257 have been certified while the others have received Certificates of Training.

The class drew a great amount of outside interest from the private environmental consultants and engineers. In response to this demand, Dr. James Gregory developed (with DWQ oversight and participation) a 4-day course at NCSU based on the SWITC Program. The course was taught once in January 2003 (New Bern, NC) to 36 students. DWQ personnel assisted in teaching the course. Dr. Gregory intends to teach the course again in October 2003 in Lenoir, NC.

Division of Water Quality (DWQ) staff–

HB1257 required that DWQ staff be trained and certified to make surface water determinations along with staff from the DFR and delegated local governments. The majority of the DWQ staff trained and certified under the SWITC Program already had years of experience making surface water determinations and implementing the rules. Therefore, the training that they received through the SWITC Program was mostly a refresher course for them. However, the SWITC Program provided an opportunity to ensure better coordination on the implementation of the rules and surface water determinations.

Division of Forest Resources (DFR) staff–

The majority of the individuals within the DFR trained under the SWITC Program were Water Quality Foresters already familiar with the DWQ rules. These individuals already worked very closely with the DWQ. Since the SWITC Program became operational in February 2002, the DFR has conducted 105 surface wat determinations that would have otherwise been conducted by the DWQ staff. Sixty-one of these determinations were in the Neuse River basin and forty-four were in the Tar-Pamlico basin. Counties which had the most stream determinations made for forestry purposes were Nash (19), Craven (10), Wilson (9) and Johnston (9).

This delegation of authority has relieved the DWQ workload significantly. Also this certification process was helpful to landowners requesting DFR assistance with their Forest Management Plans since DWQ staff no longer had to verify stream determinations made by the DFR. It also prevented the DFR from having to visit a site on more than one occasion.

Delegated Local Governments –

To date only one local government (Orange County) has requested delegation of the Neuse or Tar-Pamlico Buffer Rule. In October 2001, the N.C. Environmental Management Commission (EMC) delegated implementation of the Neuse Buffer Rule to Orange County. Approximately half of Orange County lies within the Neuse River Basin. The other half is within the Cape Fear River Basin (which currently doesn't have DWQ implemented buffer rules). Since the implementation of the SWITC Program, Orange County has evaluated nine (9) sites for the presence of surface waters subject to the Neuse Buffer Rule in 2002 and six (6) sites in 2003. The delegation of the buffer rule to Orange County did not relieve a great amount of workload from DWQ staff. However, Orange County has done an excellent job implementing the Rule. Training received through the SWITC Program and additional County specific training provided by DWQ has benefited their implementation of the Rule by integrating these rules into their land use management programs such as zoning and site plan approval. Indirectly, the training that Orange County received unde the SWITC Program has lead towards re-evaluation of their existing programs and some of the local municipalities' programs (such as the Town of Chapel Hill) have pursued measures to further protect the waters of NC.

Other municipalities (such as the Town of Cary) have evaluated their potential for delegation of the rules, but have not yet requested delegation from the EMC. The training received by staff of the Town of Cary under the SWITC Program has been positive in that it has aided in the implementation of the Neuse Buffer Rule within the Town's jurisdiction through improved correspondence between the Town and DWQ staff.

Department of Transportation Staff

Although HB1257 did not authorize the certification of DOT staff in making determinations for the presence of surface waters, providing training to the DOT through the SWITC Program has directly improved coordination between DWQ and DOT staff with respect to stream protection since DOT staff better understands what surface waters are protected under the rules. This has prevented unnecessary site visits that would have been requested by DOT prior to receiving this training. It has also aided the DOT in understanding how surface waters are regulated under other DWQ regulations (such as the 401 Certification Program).

Randleman Buffer Rule –

The Randleman Buffer Rule was created in response to the reclassification of waters within the watershed to "Water Supply" (WS). It is part of a unique management strategy to address the potential for nutrient problems within the watershed. The Rule was based on a previous version of the Neuse Buffer Ru that has since been modified. It does not include many of the practicable allowances as does the current version of the Neuse Buffer Rule. The Rule is in the process of being modified to resemble the Neuse Buffer

Rule. Currently, only the DWQ has the authority under the Rule to determine the presence of surface waters even though the local municipalities were required to create water supply ordinances including protected buffers. Once the Rule is changed to resemble the current Neuse Buffer Rule, then we expect that additional training of the local government officials will be necessary.

Other Local Buffer Protection Programs –

Other municipalities (notably Hendersonville, Cary, Durham and Charlotte) have developed and implemented stream buffer protection programs over the past several years. In addition, other municipalities (such as Monroe and Union County and Greensboro and Guilford County) are working with DWQ to develop buffer protection programs in order to address cumulative impacts from large development projects. There will be a real need for DWQ to train staff of these local governments using the SWITC program in order to keep the stream identification method consistent across the state. This effort will take considerable amounts of DWQ staff time in the next year.

Conclusions and Recommendations:

The SWITC Program successfully trained and certified 112 individuals within the DWQ, DFR and delegated local governments (Orange County) as well as other agencies on how to determine the presence of surface waters subject to the Neuse, Tar-Pamlico and Randleman Buffer Rules. In addition, the SWITC Program trained individuals within the DOT, EPA and potential, future delegated local governments and led to the development of an independent course taught at NCSU for private environmental consultants and engineers. DWQ intends to conduct a more detailed evaluation of the SWITC Program in the Winter of 2003/2004. DWQ intends to conduct detailed reviews of determinations made of individuals certified under the SWITC Program. As a direct result of HB 1257, the NC Division of Forest Resources has made over one hundred stream determinations for the Neuse and Tar-Pamlico Basin buffer rules. This has relieved DWQ staff of a significant workload and provided a rapid response to the needs of the forestry community.

DWQ believes that the SWITC Program has successfully fulfilled the requirements mandated under HB1257. In addition, DWQ believes that an additional staff position would be needed to expand this (and other) training programs in order to more fully implement the SWITC program. This position could provide needed on-going training of DWQ regulations and implementation procedures to the regulated public, local governments and other interested groups across the State. The DWQ currently does not have funds or positions specifically set aside to meet such a demand. As such, existing state wetland and stream regulatory programs have already been affected by having to devote resources towards the implementation of the SWITC Program.

1991-1992	6,822,890	6,781,321	1.01	
1990-1991	7,161,455	6,632,448	1.08	

*The 1996-1997 and 1999-2000 fiscal years are adjusted by subtracting the tonnage estimated to be a result of Hurricanes Bertha, Fran (1996-1997) and Floyd (1999-2000).

**The tons managed figure was determined by adding the total amount of municipal solid waste disposed in landfills and incinerators to the amount of waste managed through local governments' recycling, composting and mulching efforts in FY 91-92. Recycling, composting and mulching were added to the tons disposed in recognition of the fact that some local governments had begun waste reduction before 1991.

Municipal Solid Waste Landfill Capacity

Analysis Date: November 1, 2003

TOTAL LANDFILL CAPACITY FOR NORTH CAROLINA

Date Landfill Operation Began:

Date of Survey:

County:

Volume Airspace Used (yd^3)	83,439,238.00

SOLID WASTE MANAGEMENT

Annual Report

JULY 1, 2002 - JUNE 30, 2003

State of North Carolina
Michael F. Easley, Governor

Department of Environment and Natural Resources
William G. Ross Jr., Secretary

Reduce--Reuse--Recycle

Acknowledgements

This is the thirteenth annual status report prepared by the Solid Waste Section, Division of Waste Management and the Business and Community Assistance Section, Division of Pollution Prevention and Environmental Assistance. This report could not have been completed without staff assistance. Special thanks go to the following staff for providing data and information for this annual report:

Jim Coffey, Solid Waste Section, Chief
Paul Crissman, Solid Waste Section, Branch Head
Mark Fry, Solid Waste Section
Cheryl Hannah, Solid Waste Section
Jim Hickman, Pollution Prevention & Environmental Assistance
Brian Ketchem, Department of Transportation
Dexter Matthews, Division of Waste Management, Director
Pam Moore, Solid Waste Section
Scott Mouw, Community & Business Section, Chief
Bill Patrakis, Solid Waste Section
Percy Richardson, Department of Administration
Brent Rockett, Solid Waste Section
Rebecca Sluder, Solid Waste Section

The Solid Waste Section would like to thank the county managers, solid waste directors and recycling coordinators that provided much of the information used in this report. We would also like to thank two interns, Erin Rainny of North Carolina State University and Roxanne Thomas of Duke University.

CHAPTER 1
PAST, PRESENT AND FUTURE: SOLID WASTE FINDINGS AND RECOMMENDATIONS

This Consolidated Annual Report is required by the North Carolina General Assembly in G.S. 130A-309.06, as amended in 2001. The information presented is from 521 (100 county and 421 municipal) local government annual reports, 310 (including 12 out-of-state) permitted solid waste management facilities and 191 state agencies, institutions and schools. These reports represent activities related to the management of solid waste for the period July 1, 2002 through June 30, 2003.

This report combines several annual reports that were once issued separately by the Department of Environment and Natural Resources. The reports were the Comprehensive Solid Waste Management Report, the Scrap Tire Disposal Account Report, the White Goods Management Report and the Solid Waste Management trust fund Report. This report also includes information from the Department of Transportation regarding its use of recycled materials in contracts and data from the Department of Administration on bid procedures, the purchase of materials with recycled content and a summary of items purchased with recycled content.

Key Findings

- The state per capita disposal rate was 1.23 tons per person per year, a 1 percent increase over the 1.22 rate from last fiscal year or an increase of 14 percent from the base year of FY 91-92.
- North Carolina disposed of 10,236,960 tons of waste in North Carolina and out-of-state facilities. This represents an increase of 237,676 tons from the previous fiscal year.
- A total of 9,399,418 tons of solid waste was received at North Carolina permitted solid waste management landfills during FY 02-03. Almost 133,145 tons originated from other states, an increase of 15,164 import tons over the previous period. South Carolina and Virginia accounted for all imported waste.
- Ten North Carolina counties accounted for 49 percent of the solid waste disposed in the state. Sixty-one counties exported waste to landfills in Virginia, South Carolina, Tennessee and Georgia.
- Major materials recovered by North Carolina local governments during FY 02-03 were paper (57%), metals (23%) and glass (11%).

Recommendations

Once again, most North Carolina counties have not halted the trend of increased waste generation and disposal. The state has moved forward with improvements to the state's solid waste management methods. Gains include better record keeping, the ability to calculate landfill capacity, enhanced public participation and more strategic planning. However, no overall progress has been made toward the primary goal of decreasing per capita waste disposal. For this reason, the recommendations in this report are the same as those in last year's report. These goals must be achieved to decrease future waste disposal.

- Increase source reduction, municipal solid waste recycling and source-separated composting of organics to reduce the need for additional municipal solid waste disposal capacity as the population grows and predicted per capita disposal amounts increase.
- Enhance infrastructure and markets to increase source reduction and both MSW and special waste recycling to reduce the need for additional disposal capacity.
- Reissue and enforce Executive Order 156 [http://www.p2pays.org/ref/03/02221.pdf], which first passed in July 1999.

Solid Waste Disposal

This past year, the amount of waste disposed in North Carolina increased as it has for the past nine years. Despite the long trend, the increase was surprising because waste disposal amounts typically

decrease during economic recessions. This did not happen. Both the total amount of waste disposed and the amount disposed on a per capita basis increased.

The state measures changes in waste disposal rates by comparing the current per capita waste disposal base year (FY 91-92) per capita rate. (**Formula: Total Tons Disposed ÷ Population = Per Capita Disposal Rate**). Negative numbers indicate a decrease in the per capita disposal rate; positive numbers an increase. Changes from year to year are no longer measured as waste reduction, but as a change from the base year. As seen in the following table, North Carolina continues to increase the absolute amount of waste disposed. The per capita increases have continued for *seven consecutive years*.

Fiscal Year	Tons Disposed		Population	Per Capita Disposal Rate		Change from 1991-1992
2002-2003		10,236,960	8,323,375		1.23	14 %
2001-2002		9,999,284	8,188,008		1.22	13 %

*The 1996-1997 and 1999-2000 fiscal years are adjusted by subtracting the tonnage estimated to be a result of Hurricanes Bertha, Fran (1996-1997), and Floyd (1999-2000).

**The tons managed figure was determined by adding the total amount of municipal solid waste disposed in landfills and incinerators to the amount of waste managed through local governments' recycling, composting and mulching efforts in FY 91-92. Recycling, composting and mulching were added to the tons disposed in recognition of the fact that some local governments had begun waste reduction before 1991.

Statewide solid waste disposal reporting began in FY 90-91. The state made slight reductions in per capita waste rates in the early 1990s. Several factors caused this reduction. Tipping fees were established and the additional cost created an incentive to explore alternatives to municipal solid waste or construction and demolition landfills. Strong public and private interest helped local governments start recycling and waste reduction programs in response to state mandates and a perceived disposal crisis. During the early part of the decade, the state and country were in recession. Many waste professionals cite the depressed economy as the primary cause of the waste reduction.

In the mid 1990s, state waste disposal rates increased significantly. Even when allowances for two natural disasters were factored in, the disposal increase was considerable. The rebounding economy was one cause, but when both the state and nation entered a recession the expected waste reduction did not occur. The reporting period that ended on June 30, 2003 closed with a 238,000-ton increase over the previous period. The recession analysis model no longer appears useful when analyzing waste management changes.

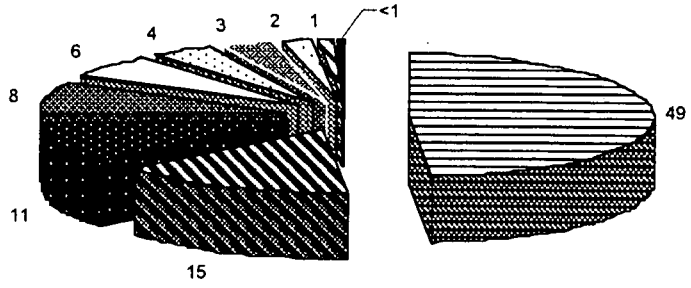
The estimated amount of waste attributed to Hurricane Fran in FY 96-97 was based upon past waste and per capita disposal trends. Counties reported actual totals following Hurricane Floyd in FY 99-00, so the figure is more precise. Hurricane Isabel debris data will appear in the next Annual Report because landfall occurred in September 2003.

In FY 99-00, a total of 329,782 tons of disaster debris was reported. After reviewing 13 years of waste disposal data, the adjusted figures for FY 99-00 still remain higher than expected. The discrepancy is probably due to under-reporting of hurricane-related disposal amounts.

No discernible pattern appeared when individual counties' year-to-year trends were analyzed. In FY 02-03, the 10 North Carolina counties that hold 41 percent of the state's population produced nearly 49 percent of the waste. These large counties dramatically impact North Carolina disposal totals.

Four counties disposed of less waste this reporting period than last. Cumberland was close to a 20 percent decrease. The decrease is attributed to an 80,000 ton drop in construction and demolition material from military base renovations and a substantial military deployment.

North Carolina Waste Distribution by County FY 2002-2003



Counties grouped into 10 county increments by descending order of waste disposal

Ten Largest Waste Producing Counties Ranked by Volume

Landfill Capacity Needs

North Carolina has 41 operational MSW landfills. The total capacity of all North Carolina landfills measures approximately 206 million cubic yards with room for approximately 118 million tons of MSW waste. The estimate was obtained using the state's average utilization factor of .57 tons of waste per cubic yard of air space. The estimate does not include waste exported to other states.

If North Carolina's rate of landfill use remains steady at last year's rate of 605,000/tons per month, one might assume the state has 16 years of landfill capacity. However, the capacity figure is misleading. (Please see the next table) Much of the state's capacity is not widely available due to permit conditions, franchise arrangements, political decisions and distance.

Limiting factors include the fact that the Camp Lejeune landfill is for Marine Corps base use only; the Alamance County landfill is permitted to accept only Alamance County waste; and the Upper Piedmont landfill is permitted for a maximum 600 tons per day. Many landfills' franchise agreements only allow them to accept waste from a particular distance around the landfill; other landfills chose not to accept waste from other jurisdictions, although their permit and franchise allow it. Additionally, landfill owner/operators may elect not to construct or use all of their permitted space.

The primary limiting factor is accessibility. In North Carolina the maximum distance that waste travels averages just under 100 miles one-way. Minor exceptions exist, but the average is supported by an examination of "waste sheds" or service areas that was developed from 2001-2002 data.

Clearly, the concept of statewide capacity does not translate into statewide access. Regions of the state have limited capacity. If out-of-state capacity is eliminated, the capacity numbers shrink further. At present, statewide capacity does not appear to be a problem. However, regions may experience disruptions and additional costs as facilities close, open, change jurisdictions or alter the average distance waste is transferred.

The last "new" landfills permitted by the state *that are still in operation* received permits in 2000. They are located in Anson, Sampson and Mecklenburg Counties. One landfill that was permitted in 2003 is under construction in Lenoir County. No other landfill permits issued since 2000 have resulted in a landfill being constructed and becoming operational.

Total MSW Landfill Capacity Analysis for North Carolina

Volume Airspace Used (yd^3)	83,439,238.00
Tons Disposed	47,936,314.57
2002-2003 Tons Disposed	7,258,143.68
Months of Operation	
Utilization Factor (tons/yd^3)	0.57
Lifetime Ave. Tons Disposed Per Month	537,311.92
2002-2003 Ave. Tons Disposed Per Month	604,845.31

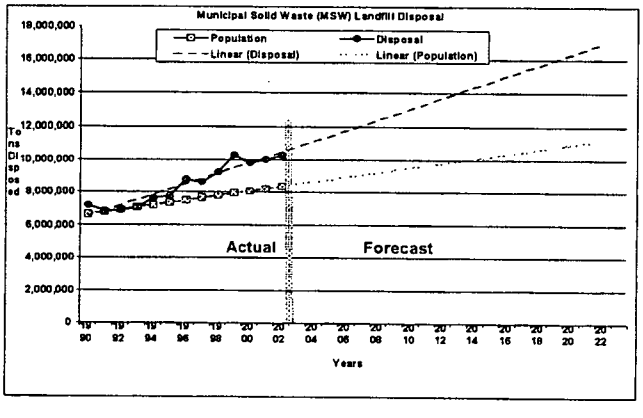
	Permitted	*Total*
Original Available Airspace (yd^3)	125,748,044.00	289,211,652.00
Remaining Airspace (yd^3)	42,308,806.00	205,772,414.00
Remaining Capacity for Tonnage (tons)	24,306,648.55	118,217,416.69
Remaining Capacity in Months	40.19	195.45
Remaining Capacity in Years	3.35	16.29

Includes data from the forty-one active MSW landfills in the state

Calculations

- Avg. Tons Disposed Per Month = Tons Disposed / Months of Operation
- 2002-2003 Avg. Tons Disposed Per Month = 2002-2003 Tons Disposed / 12 months
- Utilization Factor = Tons Disposed / Volume of Airspace Used
- Remaining Airspace = Original Available Airspace – Volume of Airspace Used
- Remaining Capacity for Tonnage = Remaining Airspace x Utilization Factor
- Remaining Capacity in Months = Remaining Capacity for Tonnage / 02-03 Avg. Tons Disposed Per Mo.
- Remaining Capacity in Years = Remaining Capacity in Months / 12 months

Note: See capacity analysis for state and each MSW landfill at end of this report.

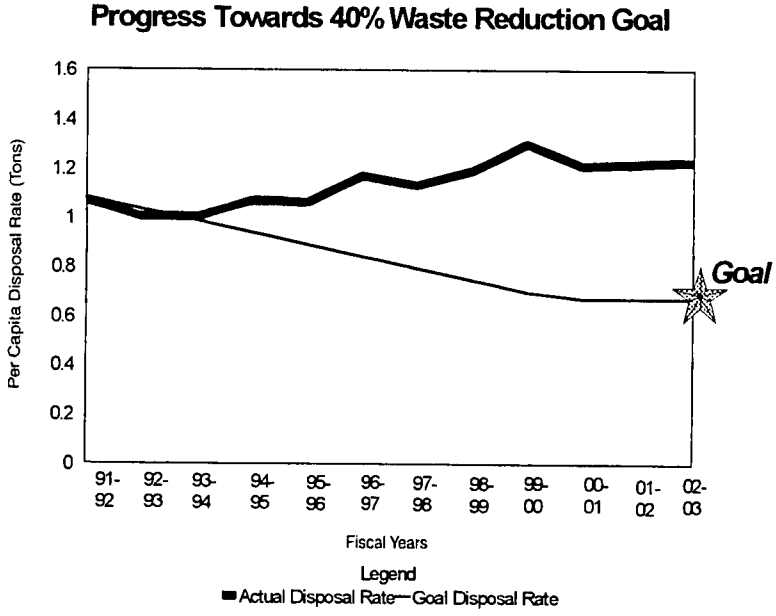


Future Waste Disposal Needs

Future waste disposal forecasts are created by regression analysis. In other words, historical trends are used to predict future amounts. When absolute population growth is factored in, North Carolina is predicted to dispose of approximately 14 million tons in 10 years and close to 18 million in 20 years. This amount equals nearly a ton and a half of waste for every resident by 2012. The forecast does not include the impact of natural disasters, such as hurricanes. The obvious implication of this trend is that demand for landfill space will increase with time.

State Waste Reduction Goal

The 1991 amendment to the Solid Waste Management Act of 1989 (Senate Bill 111), established a statewide goal to reduce the amount of waste landfilled 40 percent by 2001. This reduction was to be measured on a per capita basis from FY 91-92. Since then, *waste disposal has increased 14 percent - from 1.08 to 1.23 tons per person per year.* The statewide goal was not met and the state per capita rate continues to increase, although several counties achieved the state's waste reduction goal.



Alleghany, Cleveland, Martin and Orange counties all recorded 40 percent or better reductions from the base year of FY 91-92. Orange County's reduction is remarkable because its population numbers over 100,000, the area is part of the rapidly growing Research Triangle Park, and it has achieved large waste reductions over a long period of time. This county, and the municipalities in the county, have very aggressive, long-standing recycling and waste reduction programs that divert a variety of materials. Some innovative programs include providing local bars and restaurants with a recycling service, salvaging construction and demolition waste, banning non-residential corrugated cardboard from the landfill and a food waste diversion program. The other counties that reached the goal do not appear to have aggressive programs, but they have experienced decreased economic activity. In the absence of aggressive recycling programs, the goal may have been attained through reduced economic activity or the counties' base year data may not be accurate.

Statewide, the reasons for not achieving the goal are complex and interrelated. Three fundamental reasons that contributed to the failure are: changes in the dynamics of waste disposal, a lack of commitment to waste diversion, and economics.

Waste management dynamics changed dramatically after the goal was established. Alternative technologies, such as incineration and mixed waste composting, did not develop as anticipated. Despite a great deal of interest and significant investment in these technologies, they did not impact landfill disposal as expected. Additionally, the U.S. Supreme Court overturned legislation on flow control and prohibited local governments from directing waste to certain disposal facilities. Waste is legally considered a commodity and must be allowed free movement.

The commitment to reduce waste has waned over the years. The 40 percent goal came to be perceived as "just a goal" and not a mandate. Funding and resources for waste reduction activities never occurred at the levels required or anticipated for waste reduction success. Also, anticipated landfill bans did not get enacted. Other environmental issues took center stage as the "solid waste crisis" of the late 1980s appeared to be solved.

The economics of landfill disposal have changed since the goal was adopted. As more private landfill owners competed for tonnages, tipping fees remained low. Landfills did not become as expensive to operate as initially projected. Landfill customers readily adapted to the tip fees and did not pursue waste reduction as a way to control costs. The combination of the strong state and national economies of the early 90s, coupled with moderate disposal costs, reduced the motivation to divert materials from landfills. Surprisingly, the recent economic downturn did not result in a statewide waste disposal decrease.

Landfills Remain Difficult to Site

Efforts to gain local government approval to site or expand landfills continue to be difficult. Despite the fact that landfills are an essential component of any comprehensive program that safely and economically manages solid waste, recent decisions for new MSW landfills have been challenged under various legal procedures. For many years, North Carolina's landfills were mostly county owned and operated. These facilities primarily served the county where they were located. Today, most of North Carolina's municipal solid waste goes to regional landfills located inside or outside of the state. These regional landfills may be owned by local governments, private waste management companies, or a combination of the two. Compared to local landfills, they serve much larger geographic areas.

Current requirements to obtain a landfill permit require local governments to certify to the state that they have jurisdiction over the proposed location and that they have given approval for the facility. The local approval process includes a number of opportunities for public participation. The state permit review process, which follows local approval, considers the local government approval process. The state also conducts additional review procedures. These review considerations make up a significant portion of the legal challenges.

Public response to landfills is intensely negative, especially from citizens who would neighbor proposed sites. The response is consistent and applies equally to regional facilities and "local" facilities that only serve the county where they are located. Most local, elected officials cite negative public response as their primary reason for denying approval for proposed landfills.

The Solid Waste Section has initiated a program to offer residents - especially those impacted by a potential landfill permit decision - more opportunities to participate in the permitting process. After the section receives a site suitability application or a request to modify an existing permit, it holds a series of public meetings. The process has two steps. The first meeting is open to residents and businesses that neighbor the landfill. The goal is to reduce the large crowds that commonly attend public meetings so that neighbors can ask questions and engage in dialogue with permitting staff. The second, larger meeting targets the entire county. Where necessary, concerns expressed in the meetings are forwarded to the appropriate government or non-government agency.

Imports & Exports

North Carolina continues to export more waste than it imports. Approximately 9.5 percent, or a total of 971,286 tons of the total waste disposed in FY 02-03, was exported. This 23,000 ton drop compared to FY 01-02 represents a minor decrease.

Waste Imports and Exports FY 2002-2003

	FY 95-96	FY 96-97	FY 97-98	FY 98-99	FY 99-00	FY 00-01	FY 01-02	FY 02-03
Imports	88,982	103,510	87,393	74,185	41,840	21,614	117,981	133,145
Exports	111,097	280,400	629,415	1,166,875	1,106,897	900,743	994,678	971,286

In FY 95-96, North Carolina exported waste to one South Carolina landfill. Now, sixty-one North Carolina counties export waste to eleven out-of-state landfills and two transfer stations. Back and forth movement - where waste leaves the state only to re-enter it - has continued for the second consecutive year. A transfer station in South Carolina received 77,217 tons of waste from Mecklenburg County, then sent the waste back to North Carolina for disposal. For this reason, the amount has not been included in the report's import or export totals. Imports continued to increase because some North Carolina landfills are located near state borders. In FY 95-96 only one landfill located in Forsyth County received imported waste. Currently nine landfills in North Carolina receive some out-of-state waste. North Carolina transfer station reports and voluntary reports from out-of-state facilities provide the data used to track imports.

CHAPTER 2
GOVERNMENT WASTE REDUCTION ACTIVITIES

Local governments provide annual reports on source reduction, reuse, recycling and composting activities statewide. They also provide data on other aspects of solid waste management. The data are used to determine the scope and effectiveness of North Carolina's waste reduction efforts. It also helps planners spot trends in program implementation.

Source Reduction and Reuse Programs

The number of local governments with source reduction and/or reuse programs increased slightly from 109 to 112. The minor increase is probably due to fluctuations in reporting methods. The stagnation shows reduction and reuse programs continue to be overlooked by most governments as cost-effective components of a comprehensive waste reduction program.

On a more positive note, the number of swap shop programs in North Carolina has grown consistently over the past six years, although the FY 02-03 total dropped by one. Again, the fluctuation is probably due to inaccurate reporting. One government reported adding a swap shop program, but the Division of Pollution Prevention and Environmental Assistance found two local governments had improperly reported operating swap shop programs.

Currently, 33 local government programs host 69 swap shops. These swap shops account for almost 1,400 tons of cost-effective reuse each year. Although the number of swap shop programs has been steady in recent years, a new DPPEA grant round should increase the number of programs over the next few years.

Source Reduction and Reuse Programs Operated By Local Governments

Program Type	FY 96-97	FY 97-98	FY 98-99	FY 99-00	FY 00-01	FY 01-02	FY 02-03

Local Government Recovery Programs

Despite a drop in the number of curbside and drop-off recycling programs, material recovery grew 23.6 percent in FY 02-03. Most growth is related to increased yard waste recovery, but the non-yard waste category grew almost 6 percent compared to population growth of 1.65 percent. The bulk of the non-yard waste increase was due to more pallets being ground for boiler fuel. The two ice storms in the last fiscal year had a significant impact. Organic material recovery rose over 220,000 tons. Yard waste, which includes ice storm debris, and pallets are reported under the organics category.

Paper product recovery grew by roughly 2.5 percent in FY 02-03. With five years of continued growth, paper is definitely the bellwether commodity of local government programs. The strong market infrastructure for paper commodities should allow continued growth at a similar rate.

Metal recovery decreased slightly. White goods stockpiled during 2000 appear to have been processed during FY 01-02, which created an artificial spike. Metal recovery returned to more normal levels in FY 02-03. Plastics and other recyclable were the only other two categories to decline in FY 02-03.

Local Government Recovery (Tons) and Performance Measures

Material	FY 93-94	FY 94-95	FY 95-96	FY 96-97	FY 97-98

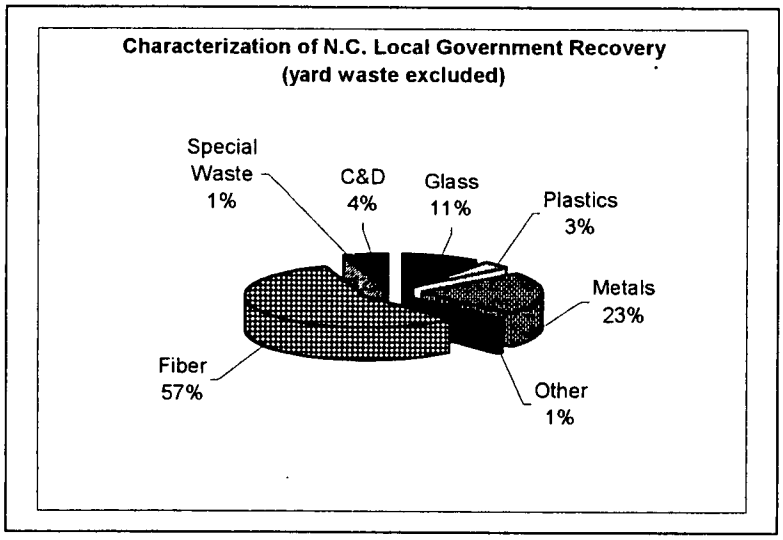
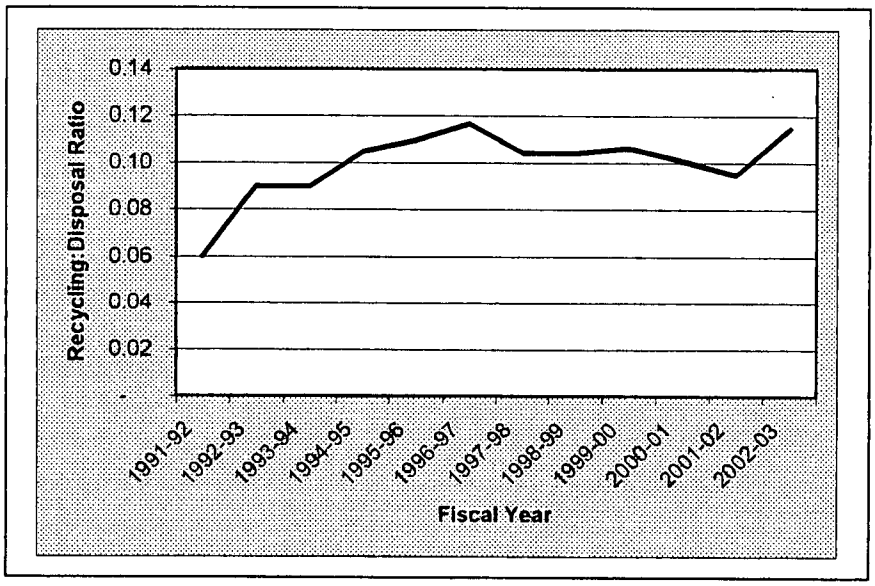
* Includes white goods, aluminum cans, steel cans and other metals.
** Includes yard waste, pallets and wood waste.
*** Includes electronics, used oil, oil filters, antifreeze and batteries.

For a breakdown of materials recovered by local governments during FY 02-03, excluding yard waste, see the following figure. Fiber (paper products) makes up 57 percent of the material recovered by local governments. Metals comprise about 23 percent of the mix. The metals category includes white goods, which account for more than 65 percent of local government metal recovery. The third largest category is glass, followed by construction & demolition, plastics, special wastes - like electronics and used oil – and other wastes.



The ratio of recycling to disposal increased this year to slightly more than 0.11. An increasing slope in the figure below indicates that recycling grew more than disposal on a percentage basis. The sharp increase in this year's ratio is due to the high quantities of yard waste managed after two ice storms. A similar spike occurred in 1996-97 following Hurricane Fran.

Ratio of Recycling to Disposal – FY 91-92 to FY 02-03



North Carolina's top 10 waste producing counties continued to represent almost half of all waste disposed in the state. Although recycling dropped slightly, these counties represent 44.6 percent of all local government recycling. Of the top 10, only Guilford, Durham and Buncombe counties contributed a greater percentage of state's recycled tonnage than their share of the disposed tonnage, in part because of excellent municipal programs in those counties.

Disposal vs. Recycling in Ten Largest Waste Producing Counties FY 02-03

County	Disposal	Recycling	Contribution to Disposal	Contribution to Recycling*
Mecklenburg	1,278,129	52,084	12.5 %	10.0 %
Wake	856,043	39,612	8.4 %	7.6 %
Guilford	709,579	45,828	6.9 %	8.8 %
Forsyth	501,034	19,193	4.9 %	3.7 %
Cumberland	337,375	2,675	3.3 %	0.5 %
Durham	298,420	18,673	2.9 %	3.6 %

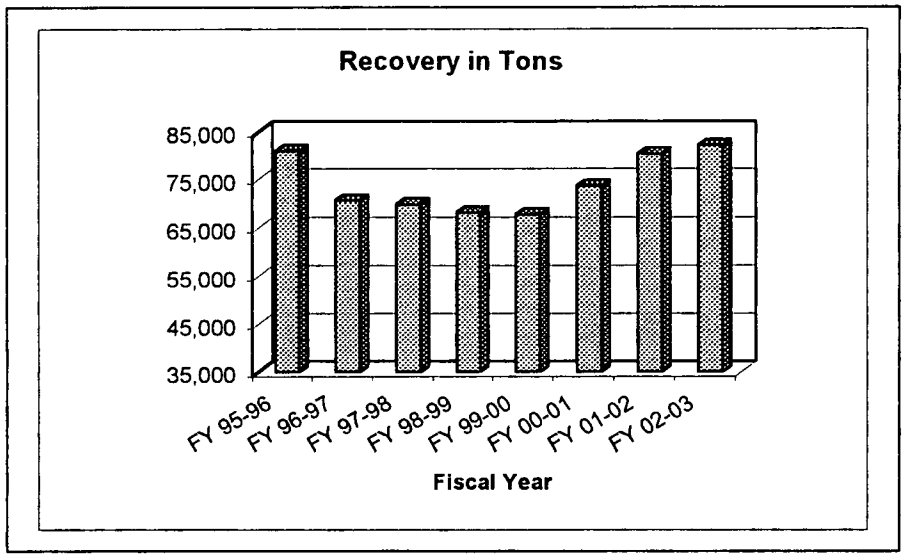
Gaston	216,267	4,813	2.1 %	0.9 %
Total	**4,952,448**	**232,179**	**48.4 %**	**44.6 %**

*Includes recovery from county and municipal sources. Yard waste and special waste (e.g., used oil) recycling are excluded.

Recovery of Traditional Materials

Container recovery (glass, plastic and metal) grew by more than two percent in FY 02-03. This represents the third consecutive year of growth in this category and indicates good program participation. At 82,210 tons, container recovery finally surpassed the all-time high reported in FY 95-96. Despite this positive trend, recovery rates closely matched population growth. This indicates that population growth, instead of increased recovery, is the most likely reason for the increase.



Despite positive trends in the recovery of traditional materials, there is significant concern that falling participation rates have seriously hurt local government recovery efforts. Statewide, the average participation rate for curbside recycling programs is 56.3 percent. An increase to 70 or 75 percent would greatly improve recovery and local programs' cost-effectiveness.

Local Government Recycling Program Management

Citing continued fiscal concerns, 15 local governments dropped curbside recycling programs in FY 02-03. Seven local governments discontinued drop-off location programs. The programs account for almost 2,000 tons of material that might have been recovered if the programs were operating.

Contributions from curbside and drop-off recycling programs changed slightly during FY 02-03. After years of steady numbers, overall contribution to recycling by curbside programs dropped from 42 to 38 percent, but drop-off contributions to recycling tonnages increased from 40 to 44 percent. This change is likely due to the decrease in curbside recycling programs and improved white goods recycling reports. The amounts recovered by other programs (17 percent) and mixed waste processing (1percent) stayed steady.

Counties continue to rely on publicly operated drop-off collection systems and municipalities routinely use curbside collection programs. Of the 94 reported county drop-off programs, 50 percent were publicly operated, 33 percent contracted operations and 17 percent were a hybrid of public and contracted operations. Most municipal curbside programs (77 percent) are operated by contractors.

Local recovery fluctuations were minimal during FY 02-03. Fifty-eight percent of local governments with recycling programs collected roughly the same amount this period as last. The remaining 42 percent collected less than the previous year.

Total Recovery by Program Type

Program Type	Total Tons		% of Total Recovery	
	FY 01-02	FY 02-03	FY 01-02	FY 02-03
Curbside	204,173	198,432	42%	38%
Drop-off	198,516	227,838	40%	44%
Mixed Waste Processing	3,544	3,545	1%	1%
Other Programs	83,934	89,765	17%	17%

Special Waste Management

FY 02-03 saw slow growth in the collection of special wastes like motor oil, oil filters, lead acid batteries, and household hazardous waste (HHW). Although local government programs make a significant contribution, many North Carolina residents are unserved or underserved with regard to the collection of these materials. In eight North Carolina counties, no oil recycling programs exist. In 29 counties, only one collection site exists. Very few jurisdictions collect oil filters and antifreeze. Residents in more than 70 counties have no alternative to landfilling or stockpiling their household hazardous wastes.

On a more positive note, 68 local governments reported FY 02-03 participation in the North Carolina Department of Agriculture & Consumer Services' pesticide container recycling program. Another 25 communities collected paint, although they did not accept any other HHW waste.

Local Government Special Waste Management, FY 98-99 - FY 02-03

	FY 98-99	FY 99-00	FY 00-01	FY 01-02	FY 02-03
Used Motor Oil					
Number of programs	127	126	125	127	125
Gallons collected	736,436	873,548	839,234	903,951*	907,123
Oil Filters					
Number of programs	11	14	18	20	21
Tons collected	6.61	10.34	16.15	17.79	18.64
Antifreeze					
Number of programs	46	49	54	56	58
Gallons collected	9,568	15,977	33,304	27,668	26,308
Lead Acid Batteries					
Number of programs	79	90	90	86	86
Number collected	58,237	74,737	82,043	80,912	92,292
Household Haz. Waste					
Number of programs	17	24	24	28	31
Number of permanent sites	10	13	12	17	17
HHW tons collected	1,017.78	931.82	1315.3	1483.97	1540.59
Total cost reported	**$1,672,271 ($1,643/ton)**	**$1,644,818 ($1,765/ton)**	**$1,792,125 ($1,363/ton)**	**$2,180,355 ($1,469/ton)**	**$2,161,359 ($1,403/ton)**

*Data adjusted from FY 01-02 Annual Report.
Conversion Key: Oil, 1 gallon = 7.4 lbs.; Antifreeze, 1 gallon = 8.42 lbs.; Lead Acid Battery, 1 battery = 35.9 lbs.

Yard Waste Management

The two large ice storms in FY 02-03 caused yard waste totals to explode. The difference between this year and last was increased by the FY 01-02 drought, which resulted in the lowest yard waste totals in seven years. The table below shows overall FY 02-03 tonnages and the 42 percent increase from the previous year. Ice storms hit the western Piedmont particularly hard – Winston-Salem reported handling more than four times its usual tonnage of yard waste. Increases in other urban areas, such as Greensboro and Orange County, were matched by the impacts on many small and medium-sized towns.

Due to the excellent infrastructure developed in response to the long-standing yard waste disposal ban, the vast majority of ice storm debris was diverted to mulch and composting operations. However, perhaps because local capacities were overtaxed, private facilities also reported a sizable FY 02-03 rise in the amount of locally collected yard waste.

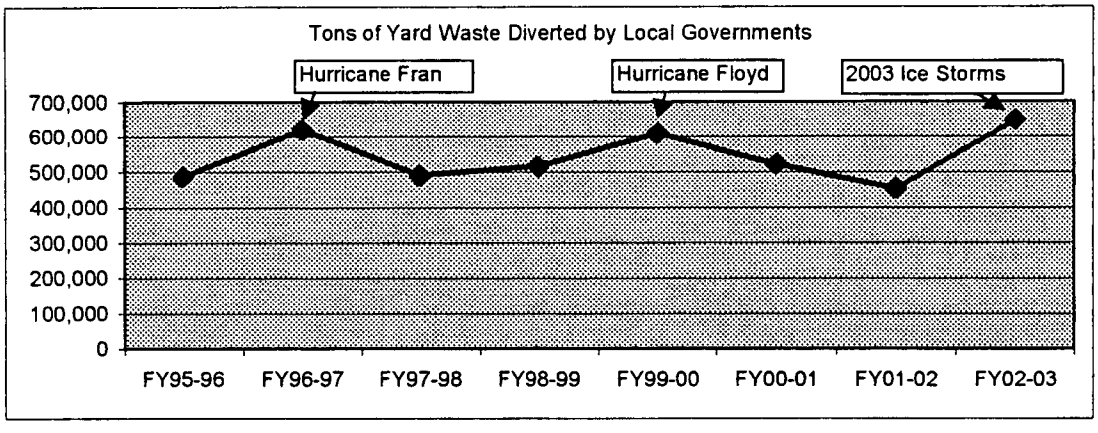
Local Government Yard Waste Management FY 01-02 and FY 02-03

Destination of Materials	FY 01-02 tons managed	FY 02-03 tons managed	% Change
End Users (direct delivery)	31,151	64,164	106%
Local mulch/compost facility	421,340	582,677	38%
TOTAL DISPOSAL DIVERSION	**452,491**	**646,841**	**43%**
Other Public Facility*	87,112	125,990	45%
Private Facility*	49,691	152,567	207%
LCID Landfill*	153,320	133,505	-13%
YARD WASTE TOTALS**	**655,502**	**932,913**	**42%**

* Land Clearing and Inert Debris. The tonnages are not included in the "Total Disposal Diversion" figure to avoid duplicate reporting and due to uncertainty about the wastes' disposal.

** Yard Waste Totals do not include tonnage attributed to "other public facilities" to avoid duplicate reporting.

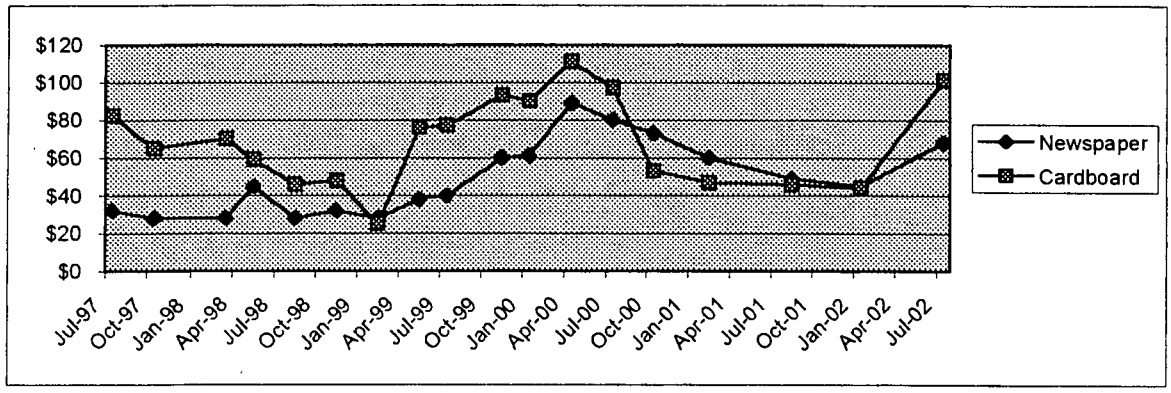
Yard Waste Diverted from Disposal by Local Governments, FY 95-96 – FY 02-03



Recycling Markets, Prices, and Related Developments

Recycling markets for commonly collected materials remained stable in FY 02-03. The following table shows the material price trends experienced by three major processing centers in eastern, central and western North Carolina. The fluctuations noted are normal for recyclable material pricing; no materials experienced major price swings.

Material Price Trends – Price Per Ton, Baled



Green glass remains the only material where the market charges a price to accept material. Glass generally poses a problem for recycling markets located in remote areas of the state. Problems arise due to the high cost of transport relative to the sales price. New Hanover County processes glass on-site for use as aggregate in its landfill. They are the only county known to do this, but the program may begin a trend that saves other community recycling programs money over time.

Composite Recycling Market Prices Received by Major N.C. Processors, FY 02-03

Materials	Summer 2002	Fall 2002	Summer 2003
Aluminum cans, Lbs., loose	$ .45	$ .46	$ .47
Steel cans, Gross Tons, baled	$ 21.00	$ 29.00	$ 40.00
PETE*, Lbs., baled	$ .60	$ .60	$ .90
HDPE**, Lbs., baled	$ .12	$ .12	$ .10
Newsprint, Ton, baled	$ 68.00	$ 79.00	$ 60.00
Corrugated, Ton, baled	$101.00	$ 66.00	$ 73.00
Office paper, Ton, baled	$123.00	$132.00	$127.00
Mixed paper, Ton, baled	$ 48.00	$ 39.00	$ 32.00
Clear glass, Ton	$ 23.00	$ 23.00	$ 18.00
Brown glass, Ton	$ 15.00	$ 15.00	$ 26.00
Green glass, Ton	-$ 4.00	-$ 4.00	-$ 4.00

* Polyethylene teraphalate
** High density polyethylene

There are indications that some areas of the state underutilized their processing capacity for recyclable materials. Material recovery facilities (MRFs) in Greenville and Jacksonville state they could handle additional material. The Greensboro MRF was recently upgraded, and two new MRFs opened in Raleigh and the Asheville area, respectively. However, other areas in the state need processing capacity to foster increased recycling. Fayetteville cites the lack of a nearby MRF as one factor inhibiting them from starting curbside recycling.

Organics recycling received a major boost in FY 02-03 when a large composting facility opened in the Triangle area. Wood fuel users in eastern North Carolina and the upper Piedmont also indicate a healthy demand for material – at times, they struggled to get an adequate supply.

Some significant additions to the state's recycling infrastructure are anticipated in FY 03-04. A glass end-user is scheduled to begin operating in Pasquotank County, a construction waste recycling facility is planned for High Point, and a large composting facility is due to open in the Greenville area. Early indications show that markets for curbside materials will remain stable in FY 03-04. Stable market conditions should give local governments steady demand for their recyclables.

CHAPTER 3
LOCAL GOVERNMENT ASSISTANCE

Solid Waste Management Trust Fund

This report details FY 02-03 Solid Waste Management trust fund activities and expenditures. The trust fund is administered by the Division of Pollution Prevention and Environmental Assistance (DPPEA) in the Department of Environment and Natural Resources. It was created by the Solid Waste Management Act of 1989 (SB 111) and is funded by partial proceeds from a fee on the sale of new tires, a tax on virgin newsprint, and an advance disposal fee (ADF) on white goods (appliances). Additional revenues can come from appropriations and contributions. The purpose of the trust fund is to support a range of solid waste management activities including: technical assistance to local governments, businesses, and other entities on solid waste issues; public educational programs; research and demonstration projects; and recycling market development (G.S. 130A- 309.12).

The Solid Waste Management trust fund received revenues totaling $961,392 in FY 02-03. When added to the beginning balance on July 1, 2002 of $1,694,112, a total of $2,655,504 was managed in the trust fund during FY 02-03. Actual expenditures totaled $503,140, which left a fund balance of $2,152,364 on June 30, 2003. The balance held $527,560 in encumbrances for standing grant contracts (the grants are paid periodically on a reimbursement basis). The unencumbered balance was $1,624,804.

The relatively large, unencumbered balance in the trust fund at the end of FY 02-03 is unusual. It reflects a slowdown or cancellation of normally scheduled grant cycles for the fiscal year. This is a direct result of state budget problems. DPPEA did not proceed with a normal level of grant-making to preserve trust fund assets in the event they were needed to cover overall budgetary shortfalls. Because the trust fund was not used for that purpose, the large end-of-year balance resulted. In normal budgetary circumstances, grant cycles reduce the balance for the fiscal year by at least $600,000. A grant cycle that helped fund local government recycling initiatives was completed in late FY 02-03, but the encumbrances for that cycle did not take place until early FY 03-04.

Trust Fund Expenditures and Revenues

Funds	Total FY 02-03
Beginning Balance	$ 1,694,112
+ Revenue	$ 961,392
- Expenditures	$ 503,140
Ending Balance	$ 2,152,364
Encumbrances	$ 527,560
"Uncommitted" funds - 6/30/03	$ 1,624,804

Trust Fund Revenue Sources

Revenue Source	Total FY 02-03
Tire Tax	$ 543,253
White Goods ADF	$ 356,653
Newsprint Tax	$ 486
Appropriations	$ 0
Contributions and Misc.	$ 61,000
Total Revenues	$ 961,392

Trust Fund Revenue Sources

FY 02-03 trust fund revenues came from four of five possible sources identified in the General Statutes. Activity for each revenue source is described below:

- **2 percent Tire Tax** – Revenues from the tax on new tire sales totaled $543,253, just more than 56 percent of total trust fund revenues in FY 02-03 and up slightly from $536,119 in FY 01-02.
- **White Goods Tax** – Proceeds from the ADF on white goods accounted for $356,653, slightly more than 37 percent of total revenues for FY 02-03. White goods proceeds were 2.7 percent higher in FY 02-03 than in FY 01-02.
- **Virgin Newsprint Tax** – North Carolina newspaper publishers that fail to meet state-required purchasing goals for recycled content newsprint must pay a $15 per ton tax on the virgin newsprint they consume. The law allows wide exemptions for companies unable to purchase recycled content newsprint due to availability or pricing constraints, or who actively recover newspaper for recycling. During FY 02-03, $485.82 was received from this tax. Compliance with the law has been consistent. In 10 years, the annual revenue from the newsprint tax has never been higher than $3,000.

- **General Appropriations** – When the trust fund was first established in 1989, a one-time appropriation of $300,000 was allocated to provide an initial fund balance. There have been no further appropriations since 1989.
- **Contributions to the trust fund and miscellaneous revenues** – DPPEA continued a recycling promotion campaign in FY 02-03 that entailed cost-sharing partnerships with local governments and private sector contributors. Local governments contributed $48,500 toward the campaign and private sources provided $12,500. The list of Recycle Guys partners is provided in Attachment A.

Trust Fund Expenditures

Continuing state budget problems in FY 02-03 confined DPPEA to only one grant cycle. Grant funds awarded in FY 02-03 are actually encumbered in early FY 03-04. The completed grant round is described below. Other major FY 02-03 expenditures fell into two categories: 1) continuing the Recycle Guys promotional campaign and 2) delivering technical assistance to North Carolina communities, recycling businesses and waste generators. These activities are two explicit purposes noted for the trust fund in G.S. 130A- 309.12.

Solid Waste Reduction Assistance Grants

The Solid Waste Reduction Assistance Grants (SWRAGs) are a standard annual grant cycle DPPEA offers to local government and nonprofit recycling programs. The grants support specific projects that enhance the effectiveness of local and nonprofit recovery efforts. SWRAGs usually include targeted grant categories that increase activity in certain program areas or increase the recycling of certain commodities.

The FY 02-03 SWRAGs began when a Request for Proposals was sent to local governments and nonprofit agencies involved in waste reduction. Funding categories included Swap Shops, Backyard Composting, Paper Reduction and Recycling, Mercury Recovery, Buy Recycled activities, Construction & Demolition Salvage and Reuse, Material Recovery Facility funding, and a General category. Nineteen proposals were received and evaluated through "blind vote" scoring that uses specific point criteria. The seventeen proposals selected received a total of $249,222 in grant awards. One grant of $50,000 for MRF development was withdrawn when the grantee's project proved untenable, leaving a total of $199,222 in grant awards for the 2003 cycle. These grants were encumbered and put under contract in early FY 03-04.

Recycle Guys Campaign

In FY 02-03, North Carolina continued the "Recycle Guys" educational campaign to recapture public enthusiasm for recycling and boost participation rates. The Recycle Guys television commercials on cable television make up the foundation of the campaign. Using cable allows specific demographic groups to be targeted. The broadcasts are co-funded by DPPEA and by local government partners. Local governments contributions totaled $48,500 in FY 02-03, which made a $118,000 broadcast contract possible. The commercials will run through March 2004.

DPPEA also used trust fund resources in FY 02-03 to provide local governments with integrated media campaign materials so they could fully implement the Recycle Guys program on a local level. Supported by a generous $12,500 donation from the North Carolina Soft Drink Association, the funds were used to print and distribute Recycle Guys trading cards, which are very popular with children.

After three years, DPPEA and its funding partners are seeing a payoff on the substantial resources invested in the campaign. Both DPPEA and local governments continually receive anecdotal evidence that the characters and their message are widely recognized and understood. When DPPEA surveyed children in classrooms and other group settings where the ads were broadcast, they found an astounding recognition rate of 81 percent, with some classes at 90 to 100 percent. Many children could recite specific messages from the ads. The survey documented a high degree of excitement and enthusiasm

for the campaign. Even if local governments do not see immediate changes in recycling participation rates, the educational component of the Recycle Guys campaign has proven its effectiveness.

Technical Assistance Activities

North Carolina General Statutes direct DPPEA to use trust fund monies to generally promote waste reduction and recycling, generally and specifically provide technical assistance to local governments, and to build recycling markets. Here is a summary of DPPEA's FY 02-03 activities that meet these requirements.

- **Waste Reduction Partners Program**

The Waste Reduction Partners (WRP) is highly successful. It uses retired engineers and business professionals to provide environmental technical assistance to companies and local governments in western North Carolina. In a continuation of funding from FY 00-01 and FY 01-02, DPPEA provided $25,000 to WRP in FY 02-03 to support industrial solid waste audits and other recycling activities. With this funding, WRP helped western North Carolina businesses and other entities divert 13,500 tons of solid waste from landfills. The $25,000 was leveraged to yield estimated savings of $1.3 million in disposal costs. During FY 02-03, WRP conducted solid waste reduction work in 13 western counties.

- **Staff Support**

To accomplish its statutory technical assistance, public education and recycling market development requirements, the trust fund was used to support DPPEA staff positions. A total of $130,769 was paid for salaries, benefits, and limited operational support. The positions are:

Recycling Market Development Specialist- This position provides marketing assistance to local governments and others involved in recyclable materials collection. As a part of DPPEA's Recycling Business Assistance Center, this person strengthens recycling capacity for secondary materials collected statewide. This employee also manages the recycling markets directory required by state statute and performs other duties.

Waste Management Analyst- In addition to work with local recycling coordinators, this position also develops educational materials and programs on solid waste issues for school age to adult audiences. The position implements the integrated "Recycle Guys" campaign statewide to boost North Carolina's recycling participation rates.

Waste Management Analyst- This position provides technical assistance to local governments' waste reduction programs, including solid waste planning and full cost accounting (statutory requirements for local governments). The position also manages recycling program data from state-mandated local waste reduction reports. The data is used to complete the N.C. Solid Waste Management Annual Report.

Organics Recycling Specialist- This position provides technical assistance to local governments, recycling businesses, waste generators and the general public on how to reduce and compost organic waste streams, including yard waste, which is banned from disposal by state statute.

- **Graduate Intern Program**

Through a contract with the Water Resources Research Institute (WRRI) of the University of North Carolina, DPPEA hires student interns for a full year. Student projects in FY 02-03 included: 1) assessing the Recycle Guys campaign, 2) developing best management case studies on local recycling programs, 3) revamping and updating the local government recycling Web page, 4) establishing re-refined oil on state term purchasing contracts, and 5) helping to develop recycling markets and improve local programs.

Product Stewardship Initiative Support

"Product Stewardship" is a growing movement by state and local governments to increase manufacturers' responsibility for their products environmental impacts. Product stewardship includes diverting those products to recycling. Greater manufacturer responsibility for end-of-life products reduces tax burdens on state and local governments who currently manage the waste. In FY 02-03, North Carolina joined the Product Stewardship Institute, the lead coalition of state and local governments working on this issue. DPPEA also providing nominal support for the Carpet America Recovery Effort (CARE), a negotiated national agreement between state governments and the carpet industry that promotes carpet recycling.

Temporary Assistance

North Carolina statutes require solid waste management annual reports from all counties and municipalities. The data is used to create the Solid Waste Management Annual Report. North Carolina Statutes also require operating a recycling market directory. DPPEA hired temporary labor to manage the large set of data required to perform these tasks. The additional staff also allowed DPPEA to increase the amount of technical assistance resources available to local governments.

Publications and Outreach Efforts

DPPEA used trust fund resources for a number of technical assistance and outreach activities. Some of the activities were: printing and distributing the *Recycling Works* newsletter and other fact sheets; conducting workshops and sessions at the Carolina Recycling Association and North Carolina Chapter of the Solid Waste Association of North America conferences; and travel costs incurred so technical assistance could be provided to local governments and trust fund grantees. DPPEA normally uses appropriated funds for these items, but state budget shortfalls eliminated that resource.

Planned Expenditures for FY 03-04

In FY 03-04, the Solid Waste Management trust fund will continue to support local government recycling programs and expand the Recycle Guys campaign. DPPEA will also resume its normal grant cycles, with an emphasis on improving and increasing recycling businesses' capacity to process and use additional materials. The trust fund will also support western North Carolina's Waste Reduction Partners program, and funds will be used to help North Carolina participate in national coalitions that promote product stewardship.

For more information about the North Carolina Solid Waste Management trust fund, contact Scott Mouw, Chief, Community and Business Assistance Section, Division of Pollution Prevention and Environmental Assistance, at (919) 715-6512.

ATTACHMENT A: TRUST FUND REVENUE SOURCES

The North Carolina Solid Waste Management trust fund received 88 percent of its revenues in FY 02-03 from two sources: statewide fees on the purchase of new tires and white goods. The trust fund only receives a small portion of these fees.

Scrap Tire Tax - During this reporting period, a 2 percent fee was levied on the purchase of new tires.

- 68 percent of the revenues were distributed to counties on a per capita basis to pay for proper discarded tire management.
- 27 percent was credited to the Scrap Tire Disposal Account for local government grants and nuisance tire site cleanups.
- 5 percent went to the Solid Waste Management trust fund.

White Goods Tax - During this reporting period, a $3 fee was levied on major appliance purchases.

- 72 percent of revenues were distributed to counties on a per capita basis for proper white goods management.
- 20 percent was credited to the White Goods Management Account for local government grants to manage discarded white goods.
- 8 percent went to the Solid Waste Management trust fund.

FUNDING PARTNERS FOR THE FY 02-03 RECYCLE GUYS CAMPAIGN

Partner Name	Amount Given
Mecklenburg County	$10,000
Town of Cary	$5,000
City of Greensboro	$5,000
City of Winston-Salem	$5,000
City of Raleigh	$5,000
Wake County	$5,000
Davidson County	$2,500
Orange County	$1,000
Johnston County	$5,000
City of Durham	$2,500
City of Burlington	$2,500
North Carolina Soft Drink Association	$12,500
TOTAL	**$61,000**

ATTACHMENT B: 2003 SOLID WASTE REDUCTION ASSISTANCE GRANT PROJECTS

Grant Recipient	Award	Grant Description
Food Bank of North Carolina	$16,770	The Food Bank of North Carolina will purchase equipment to improve sorting efficiency and increase the volume of foodstuffs they distribute to four food bank warehouses throughout the state.
Bladen County	$10,500	Bladen County will install swap shops at several convenience centers.
Coastal Regional Solid Waste Management Authority	$10,200	CRSWMA will implement a latex paint recovery program in Carteret, Pamlico and Craven counties.
Greene County	$15,540	Greene County will purchase new recycling containers and increase signage and educational materials at county convenience sites.
The Scrap Exchange	$11,350	The Scrap Exchange will host a reuse craft booth at the N.C. State Fair to educate visitors about waste reduction.
Classroom Central	$6,420	Classroom Central will purchase equipment to turn reused and donated materials into usable educational tools for needy school children in Mecklenburg County.
New Hanover County	$20,000	New Hanover County and the Town of Wrightsville Beach will add mixed paper to the materials collected at convenience centers.
Town of Kernersville	$19,842	This project will use 35 eight cubic-yard containers to collect cardboard from commercial customers.
Pasquotank County	$19,800	Pasquotank County will install equipment to improve the efficiency of its commercial paper recycling programs. The change allows the county to collect more material and reduce operating costs.
Carolina Recycling Association	$9,800	CRA will develop and conduct three workshops on how to implement local electronics recycling programs.
Town of Beaufort	$4,000	The Town of Beaufort will conduct a reduced-price backyard compost distribution program for town residents.
Wake County	$20,000	Wake County will expand its electronics recycling program to include new items.
Caldwell County	$7,000	Swap sheds will be constructed at three staffed collection centers. The sheds will accept reusable household goods.
Cabarrus County	$4,000	Cabarrus County will hold a compost bin truckload sale, offer composting classes, and upgrade the existing demonstration site.
Albemarle Resource Conservation & Development Council	$20,000	Chowan, Gates, Bertie, Hertford and Northampton counties will participate in an oil recycling program that distributes 85 double-walled plastic recycling containers to area farms. U.S. Filter will pick up the oil directly from the farms.
Keep Gastonia Beautiful	$4,000	KGB will develop a compost demonstration site with educational signage, construct two portable vermicomposting bins and corresponding classroom education materials, and conduct a truckload sale of a minimum of 100 compost bins.

CHAPTER 4
STATE AGENCY WASTE REDUCTION EFFORTS

Executive Order 156,signed in 1999 in support of North Carolina Project Green, the state environmental sustainability initiative, was an update and strengthening of the original initiative of Executive Order 8, signed in 1993.[1] State agencies are directed to use products containing recycled materials by state law and executive order. Purchasing recycled and other environmentally preferable products strengthens recycling markets, helps reduce environmental impacts from waste, and saves energy and natural resources. Many state agencies and local school districts help achieve these goals through thoughtful purchasing decisions and the use of recycled products.

North Carolina state government continues to make progress toward environmental sustainability by offering recycled and environmentally preferable products at affordable prices on state contract. Currently, 11 product categories are available on state term contract that offer products with recycled content materials. Several more available products offer some sort of environmentally preferable attribute, including recycled content packaging or energy efficiency. State agencies and others who can use state term contracts, such as local governments, find they offer a variety of high quality, cost-effective recycled products. The list of products is at http://www.doa.state.nc.us/PandC/recycled.htm.

This chapter summarizes state agencies' efforts to purchase recycled products. The compilation includes purchasing reports required from 28 state government departments and offices, 18 constituent institutions of the University of North Carolina, 58 community colleges, and 117 local public school administrative units. Agency reports meet the reporting mandate of N.C. General Statute 143-58.2(f).

In FY 02-03, 86 percent of agencies (191 out of 221) reported their purchases. With 24 additional agencies reporting, the group of respondents grew by 10 percent. Nine agencies that reported in two previous years did not report for FY 02-03. Most non-reporting agencies have not complied with the regulations for the past four years or longer. Reports were collected online to save paper and postage.

The Division of Pollution Prevention and Environmental Assistance has been charged with compiling the data and publishing an annual summary. To view purchasing reports, visit www.p2pays.org/buyrecycled, call (919) 715-6505 or (800) 763-0136.

Purchases of Recycled Products

Paper and Paper Products- Reported agency purchases for all office paper and paper products (recycled and non-recycled) in FY 02-03 totaled $41,284,807. In FY 01-02, agency purchases were reported at $25,781,557 – a significant decrease from past years. After review and correction, the revised FY 01-02 total was $34,158,947, which is eight percent less than the previous fiscal year. Since FY 99-00, paper purchases have declined steadily, primarily due to waste reduction and increased electronic communication. Spending constraints from the state's budget crisis also played a role in the decrease. This year's total is 17 percent higher than the previous year. Part of the increase is due to better reporting, but it possibly also reflects fewer purchasing restrictions in FY 02-03.

Recycled paper purchases, which totaled $32,420,289, rose 19 percent from the past period. Recycled paper made up 79 percent of all reported paper purchases – a two-year gain over the previous period's revised total. The increase is gradual and may not reflect the changes made on term contracts last year. Last year, all term contracts offered recycled content paper. Purchasers may not have been aware of the 100 percent recycled content offerings. In the next fiscal year, virgin paper will reappear on state term contracts due to a one-dollar per ream price difference. The price difference could easily be neutralized with waste reduction techniques, such as double-sided printing and using one-sided pages for fax

[1]North Carolina Department of Pollution Prevention & Environmental Assistance, Environmental Statutes /Executive Orders for State Agencies, "Executive Order 156, Governor Jim Hunt (1996). <www.p2pays.org/ref/03/02221.pdf> [2 Feb 2004].

machines. Making the virgin paper available once again could significantly hinder the state's effort to reach the goals set in Executive Order 156.

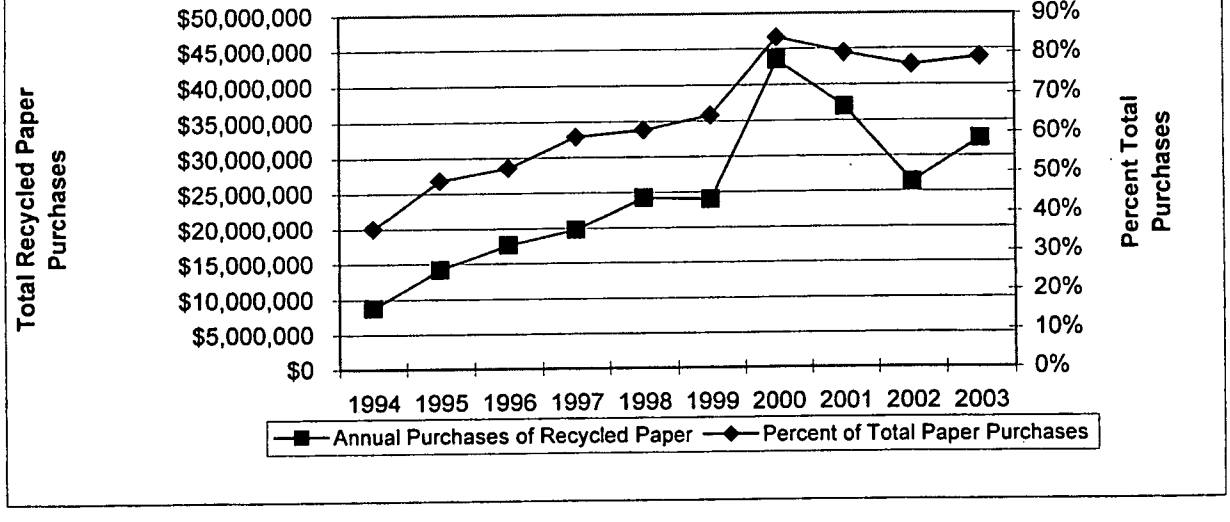
Fiscal Year 02-03 was the second year that agencies failed to meet Executive Order 156's goal, "State agencies shall attempt to meet the goal that, as of Fiscal Year 00-01, 100 percent of the total dollar value of expenditures for paper and paper products be toward purchases of paper and paper products with recycled content."[2] Twenty-three agencies reached the 100 percent goal this fiscal year for all paper purchases; two more than last year. Another 36 agencies achieved recycled content paper purchasing rates of 95 percent or higher; 48 percent had a 90 percent rate - a 5 percent increase over last year. Less than one-fifth of reporting agencies purchased only office paper containing recycled content. Over one-third of the reporting agencies bought recycled content towel/tissue products exclusively.

Of the miscellaneous paper purchased - including legal pads, file folders, labels and continuous feed forms – 50 percent contained recycled content. This percentage could easily grow with education, given many of the same products with recycled content are available on term contracts. Office paper and towel/tissue purchases with recycled content had higher percentages of 84 and 88, respectively.

Reporting agencies also report on whether they specifically request recycled content paper in contracted printing work. Only 53 percent did this consistently in FY 02-03, 15 percent less than in 1997. Reported spending on outside print orders increased 20 percent from the previous year. Of the $14,814,280 reported, 65 percent was spent on jobs using recycled paper, a 2 percent increase over the previous period.

Figure 1 illustrates purchasing trends for overall dollar amounts and percentages of recycled paper purchases over the past 10 fiscal years. The data show greater efforts are needed to achieve the 100 percent goal across all agencies. If top management displayed a renewed emphasis and commitment to meet the statutory and executive goals, compliance would probably rise. Targeted outreach campaigns to agencies using quantities of virgin paper purchased would also help.

Figure 1. State Agency Purchases of Recycled Paper and Paper Products Fiscal Years 1994-2003

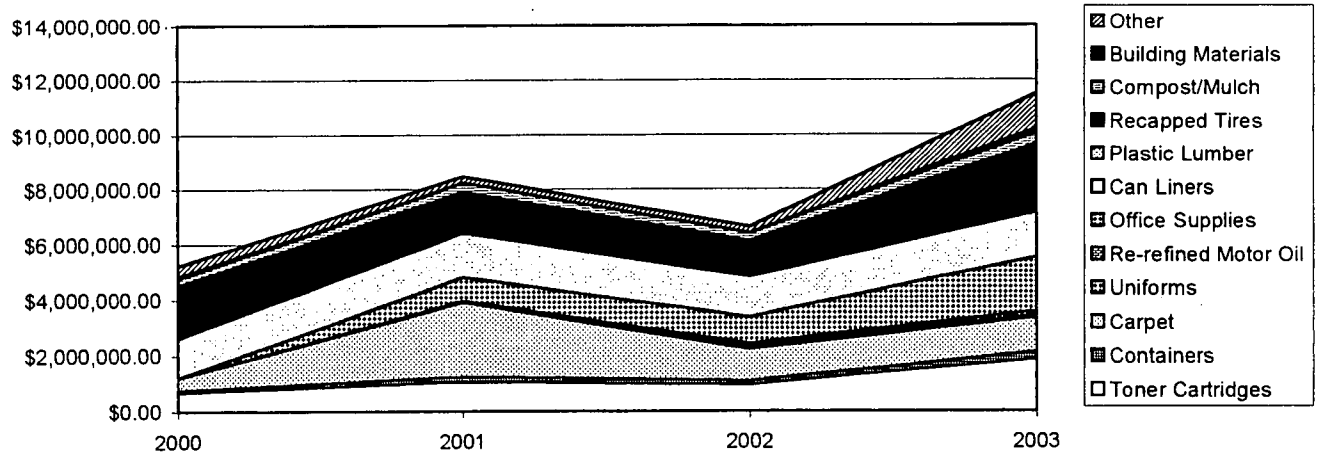


Policy and Administrative Support- When agencies were surveyed regarding buy recycled policies or goals, 36 percent reported having a policy or goal. Agencies also reported fewer administrators communicate the importance of purchasing recycled content products. This finding is consistent with last year's data, when less than two-thirds of agencies reported receiving this information. This percentage is 15 percent lower than that for 1997. Lead coordinators for buy-recycled efforts are also on the decline, with less than half reported in place this year. While agencies are not required to develop a policy by the

general statutes or executive order, such policies could be an effective first step to improve the state's efficiency in recycled content product purchases. However, agencies are specifically required to purchase recycled content products and designate a lead coordinator. Executive Order 156 also requires administrator encouragement, a key component in successful recycled content procurement programs. Improving these factors could significantly increase participation levels.

Non-Paper Products- Agencies report spending $11,486,122 for non-paper recycled products in FY 02-03, a 42 percent gain over the previous period. Figure 2 displays the array of recycled products purchased by agencies: remanufactured laser toner cartridges, plastic can liners, recapped tires, plastic lumber, compost and mulch, re-refined motor oil, carpet and uniforms are a few major categories. Category spending levels reach all-time highs with the exception of carpet, which gained slightly over last year, and uniforms, which were purchased in abundance last fiscal year.

Figure 2. Agency Purchases of Non-Paper Recycled Content Products, FY 2000-2003



Conclusion

Purchasing recycled content products is now a well-established state government practice supported by statutory and executive order requirements. State term contracts offer agencies a number of high quality, affordable choices. However, agencies have not fully complied with the 100 percent recycled content paper goal. Now that 48 percent of state agencies have met their goal, it has been proven feasible with management support and increased awareness of requirements and products.

A few key agencies could substantially increase the state's performance by altering a few significant purchasing decisions. Converting the $8.8 million currently spent on virgin paper to recycled paper purchases would allow state government to substantially improve recycling market strength. State government is a major player among those who collect paper for recycling and could directly benefit from improved markets. Using recycled products also helps North Carolina reach its environmental goals to reduce natural resource, energy and water usage, and to prevent air and water pollution. Re-refined motor oil is an excellent example because the product meets virgin oil specifications exactly, engine manufacturers support its use, and its state contract cost is comparable to virgin oil. Agencies should make purchasing re -refined oil products a standard operating procedure.

The following recommendations may increase future recycled content purchasing and help state government meet the goals set forth in Executive Order 156 and general statutes.

Recommendations

I. Reissue and enforce Executive Order 156. Reissuance will heighten awareness and support recycled content purchasing. It also strengthens DPPEA's ability to collect and manage data related to state agency purchases. Strong and active gubernatorial support will help the state meet its executive and legislatively mandated goals.

II. Increase administrative support and educational programs. Agencies vary wildly in the degree of support and routine communication they receive from top management on this issue. The lack of communication may be the most significant barrier to increased agency participation. Administrative support is crucial to the successful implementing agency sustainability plans under North Carolina Project Green. The plans incorporate waste reduction, recycling and environmentally preferable procurement. Agencies that have not yet made waste reduction and buying recycled a priority should:

- Implement and adhere to the goals of Executive Order 156, which states that all paper purchased will have a minimum of 30 percent post-consumer content by FY 00-01.
- Issue and enforce internal policies, official memoranda and formal declarations that demonstrate administrative leadership and support for buying recycled and Executive Order 156.
- Develop and implement ongoing outreach and education programs for employees and visitors.
- Join North Carolina Project Green and pledge to achieve its goals as part of the agency's overall commitment to environmental sustainability.

III. Increase Procurement of Non-Paper Recycled Content Products. Expenditures for non-paper recycled products continue to lag behind paper purchases. The federal government's purchasing regulations under Executive Order 13101A makes it apparent a wide variety of products with recycled content materials are available. Federal Comprehensive Procurement Guidelines feature over 50 items in eight categories. Categories include paper, non-paper office, construction, landscaping, park and recreational, transportation, vehicles and miscellaneous products. To see the list, visit http://www.epa.gov/cpg/. Purchasing an array of recycled content products strengthens North Carolina recycling markets and helps agencies fulfill their obligation to become more environmentally sustainable. State agencies should take the following steps to improve overall buy recycled efforts:

- Expand the quantity and variety of non-paper recycled products purchased through agency convenience contracts and state term contracts.
- Enforce purchasing rules that mandate buying from state term contract above in-house delegations.
- Establish or upgrade electronic tracking systems for all recycled product purchases.
- Specify or encourage the use of recycled materials and supplies by contracted services, especially in construction, housekeeping and printing.

IV. Base Purchasing Decisions On Full Environmental Impact Versus One-Time Cost. To determine the full environmental impact of a product or service, its full life cycle must be analyzed. The analysis helps state agencies begin purchasing items of benefit in both the short and long term.

- Examine products in terms of broad environmental impacts that include: durability, energy efficiency, performance, recycled content and recyclability, toxicity, biodegradability, manufacturer location (local availability), and packaging.
- Develop guidelines and checklists for purchasing and contractual services that consider environmental impact.
- Reassess accounting procedures so agencies that practice environmental purchasing receive credit for doing so.

CHAPTER 5
WHITE GOODS MANAGEMENT

"White goods" are defined in G.S. 130A-290 (a)(44) as, "refrigerators, ranges, water heaters, freezers, unit air conditioners, washing machines, dishwashers, and clothes dryers and other similar domestic and commercial large appliances."

This interim report is based on information supplied by counties' Annual Financial Information Reports. AFIRs are submitted to the Office of State Treasurer. AFIRs are due by December 1st, but only 70 counties had submitted AFIRs at the time this report was prepared, February 9, 2004. A final, revised report will be issued when the remaining counties submit their AFIRs. It should be noted that, aside from many AFIRs from counties being late, many have blank or erroneous entries.

Counties that did not report as of February 9, 2004

Beaufort	Dare	Jackson	Pamlico	Stokes
Bertie	Durham	Lincoln	Pender	Vance
Caswell	Gates	Macon	Polk	Wake
Chowan	Haywood	Madison	Robeson	Wayne
Columbus	Hertford	Martin	Rutherford	Yadkin
Currituck	Hoke	Montgomery	Sampson	Yancey

Financial Update

- **The white goods management account no longer runs a large surplus**. The number of counties that forfeit their tax proceeds declined while grant requests increased. In FY 98-99, 42 counties forfeited tax proceeds. However, by the fourth quarter of FY 02-03, only 15 counties forfeited their proceeds.
- The amount of forfeited funds available for redistribution dropped 75 percent at the same time that county requests for cost overrun grants doubled - from $450,000 to over $900,000 - per grant cycle. Many counties that allowed reserve funds to accrue in the past are now depleting those funds to pay for daily operations and program infrastructure.

Advance Disposal Fee

Net white goods ADF collections in FY 02-03 totaled $4,460,998.04. Funds were dispersed to:

$ 3,050,499.99	Allocated for direct distribution to counties
$ 847,361.12	Allocated for white goods management account
$ 367,944.43	Solid Waste Management trust fund
$ 184,795.00	N. C. Revenue Department cost of collections
$ 2,146,053.05	Actual amount distributed directly to counties
$ 904,446.94	Forfeited by ineligible counties

Although $3,050,499.99 (72 percent of the net disposal fee collections) was allotted for distribution, ineligible counties forfeited $904,446.94. The forfeited funds went to the white goods management account, which receives 20 percent of net collections.

White Goods Management Account

The White Goods Management Account was established to help counties whose costs exceed their share of ADF revenue. The account receives 20 percent of white goods ADF revenues. It also receives funds forfeited by counties whose surplus exceeds the threshold amount. By the end of FY 02-03, the account balance of $1,075,089.55 was slightly higher than the starting balance of $979,084.93. This account is used to fund counties that incur deficits in their white goods accounts. All but $9,235.50 of this balance was committed for county grants. The counties did not receive all of the proceeds designated for distribution in FY 02-03.

WHITE GOODS DISPOSAL ACCOUNT BALANCE FY 02-03

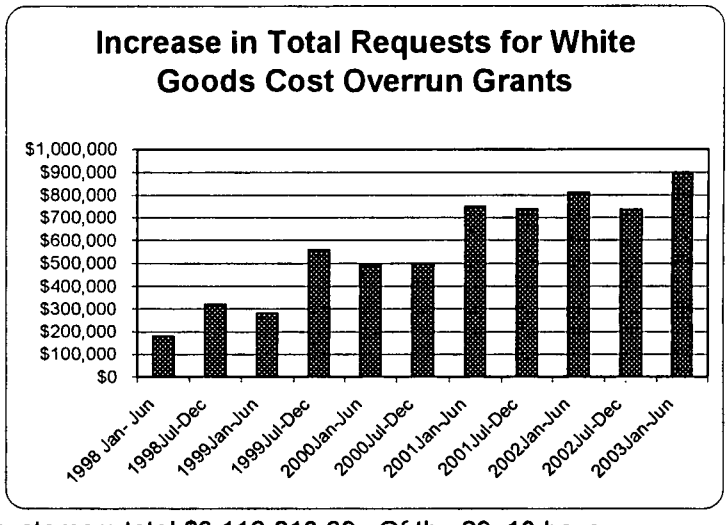
Beginning Balance (July 1, 2002)	$ 979,084.93
Funds Received during FY 02-03	$ 1,403,781.15
Cost Overrun Grants Awarded FY 02-03	$ 1,276,370.70
Ending Balance (June 30, 2003)	$ 1,075,089.55
Monies Reserved for Future Grant Awards*	$ 1,065,854.00
Unencumbered Ending Balance (June 30, 2003)	$ 9,235.50

*Includes $540,854 reserved for capitol improvement grants and $524,000 reserved for next round of overrun grants.

White Goods Management Account Grants

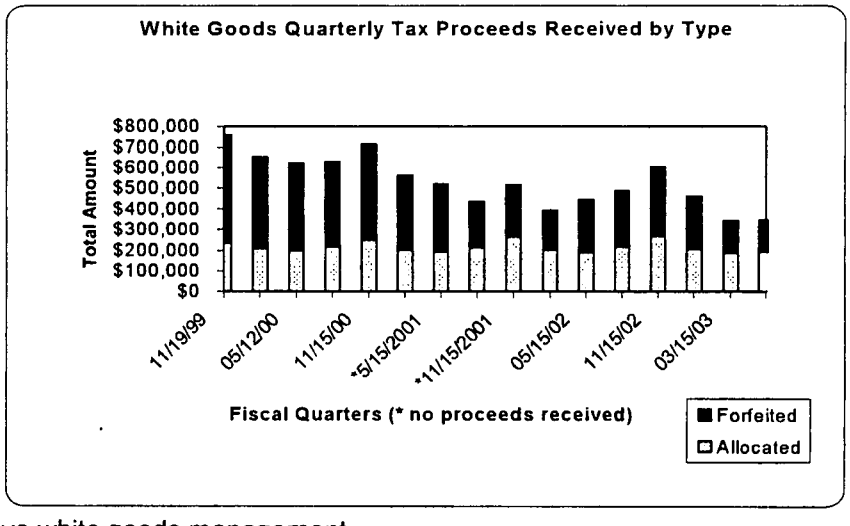
Over $524,000 in grants went to 42 counties for losses incurred January-June 2003; $584,000 was distributed to 34 counties for losses incurred July-December 2002 (Tables 1 and 2).

Capital improvement grants totaling $755,000 were awarded to 15 counties (Table 3). *In FY 02-03, counties requested $2,431,410.97 in cost overrun and capitol improvement grants, but only $1,403,781.15 in revenues was received.*



Very few counties use the grant program to upgrade their infrastructure. Twenty-nine counties repeatedly access the program. To date, program grant awards to "repeat" county customers total $3,116,013.69. Of the 29, 13 have received more than $100,000, and four counties were awarded over $200,000.

As the first graph shows, the total of the amounts requested has significantly increased in recent years. However, as the next graph depicts, the amount of available funds dropped at the same time requests rose.



Program Results

Grant and ADF funding made it possible to clean up illegal dumpsites. Previously, many counties gave white goods a low priority and underfunded their management. The white goods account makes it possible for counties to obtain the specialized equipment or collection/loading areas needed to improve white goods management.

In FY 02-03, 35 county collection sites took in 30,457 tons, or an estimated 761,417 appliances. This compares to the 25,749 tons, or 644,000 appliances, collected in FY 91-92. Without the program, large numbers of appliances would have likely been dumped or stockpiled.

White Goods Management by County Governments

White goods were banned from landfills in 1989 to encourage recycling and better management. Comprehensive white goods management laws enacted in 1993 included an ADF. In 1998, Senate Bill 124 extended the fee for three years but reduced it from $10 to $3. In 2000, the sunset on the fee was removed.

The major accomplishment of the program is a drastic reduction in illegal white goods dumping. The critical factor was requiring local governments to provide collection sites at no cost to the disposers. Counties can use ADF proceeds to clean sites dependent on the percentage of white goods at the site.

Another accomplishment came when counties implemented proper management practices to capture and recycle CFCs. The practice avoids illegal venting into the atmosphere, but also creates a potential profit center.

Though the white goods program has had many accomplishments, some problems remain; these include the limited accountability by counties to assure that tax disbursements and grants are being used exclusively for the management of white goods.

Many local governments are privatizing their white goods management. Overall, privatization does not necessarily mean that programs are more efficient. In many instances privatized white goods management is incorporated into a more comprehensive solid waste contract between a local government and a private firm, making it more difficult to measure program efficiency.

Counties That Forfeited Funds

Counties That Became Ineligible for Advance Disposal Fees In March 2003
(Based on FY 01-02 AFIR Reports)

Alleghany	Franklin	Richmond
Bertie	Guilford	Rowan
Cherokee	Jackson	Sampson
Clay	Jones	Tyrrell
Cumberland	Martin	Wake
Currituck	Mecklenburg	Wilkes
Forsyth	Polk	Yadkin

Counties That Will Become Ineligible for Advance Disposal Fees In March 2004
(Based on FY 02-03 AFIR Reports)

Counties that will not receive ADF distributions because undesignated balances exceed their threshold.

Forsyth	Richmond
Franklin	Tyrrell
Granville	Wilkes
Jones	

Counties that do not submit their AFIR by March 1, 2004 will be ineligible to receive tax proceeds.

White Goods Management Costs

Counties can use the white goods ADF proceeds disbursed quarterly by the Department of Revenue for daily expenses incurred to recycle white goods. Funds can also be used for one-time expenses, such as purchasing specialized equipment and making site improvements for better management. Most county programs are not self-sustaining and require subsidies. Expenses for these programs include fuel, labor and the cost of associated items.

The 70 reporting counties spent $4,331,831 in FY 02-03. Of this total, $3,598,878 was for daily operations, $597,429 for capital improvements, and $144,602 to clean up illegal disposal sites.

Counties with high per unit costs usually have strong programs, a cost allocation plan, lack a strong market, or have a combination of these factors. Counties with little or no disposal costs tend to have minimal programs, poor record keeping, access to a strong market or a combination of these factors. Only a few counties have metals recyclers willing to provide free pickup from county collection sites and/or provide CFC recovery in exchange for access to the scrap metal.

Highest Operating Costs Reported

County	Cost per ton	Cost per appliance*
Wilkes	$561.38	$22.45
Gaston	$410.08	$16.40
Washington	$223.21	$ 8.92
Alexander	$220.88	$ 8.83
Mecklenburg	$214.19	$ 8.56
Graham	$183.93	$ 7.35
Cumberland	$182.02	$ 7.28
Nash	$171.13	$ 6.85
Northampton	$163.34	$ 6.53
Perquimans	$141.17	$ 5.64

Lowest Operating Costs Reported

County	Cost per ton	Cost per appliance*
Transylvania	$25.50	$1.02
Guilford	$23.87	$0.95
Caldwell	$22.97	$0.91
New Hanover	$21.16	$0.84
Cabarrus	$20.89	$0.83
Cherokee	$19.89	$0.79
Person	$17.58	$0.70
Henderson	$14.67	$0.58
Swain	$11.91	$0.47
Wilson	$10.91	$0.43
Surry	$ 9.86	$0.39

*Estimate assumes an average appliance weight of 80 pounds.

Outsourcing loading and transport to the recycler can reduce costs. Other counties use in-house labor to sort and segregate metals, recover CFCs or extract motors or oil.

Tonnage Collected by Counties

In FY 02-03, 70 counties reported processing 52,117 tons of white goods. This translates into 1,302,914 individual appliances (assuming 25 appliances per ton), or about .16 appliances per person in North Carolina.

This map illustrates that operating costs by counties do not seem restricted by geography. Instead, the map suggests that a correlation to distance to markets, extent of programs, record keeping, and cost allocation plans among counties have a greater effect on county costs.

Number of White Goods Cost Overrun Grants Awarded to Counties since 1998

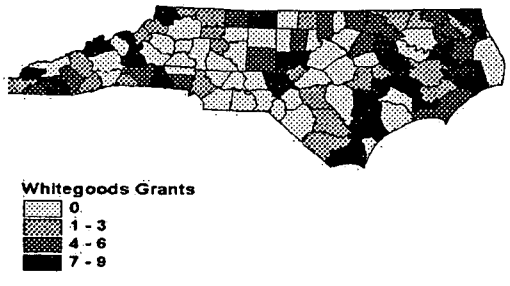


Table 1
Grant Requests & Awards from the White Goods Disposal Account for Losses Incurred January-June 2003

County	ADF Proceeds Received For 6 Month Period	Grant Request For Cost Over-Run	Amount Of Grant Awards
Ashe	$4,105.35	$5,632.24	$2,816.12

Warren	$38,000	Illegal dump clean up --- (Paid)
Totals	**$755,244.00**	

CHAPTER 6
SCRAP TIRE MANAGEMENT

Scrap Tire Disposal Account

The Scrap Tire Disposal Account (STDA) was created by the 1993 General Assembly. It receives 27 percent of its revenues from the Scrap Tire Disposal Tax initiated on October 1, 1993. During the 2002 Session of the General Assembly, the sunset was removed on the Scrap Tire Disposal Tax.

Beginning in October 1992, 25 percent of the STDA fund was allocated for cost overrun grants to counties and 75 percent was allocated for clean up of nuisance tire sites. Starting with the August 12, 1997 distribution, 50 percent of the fund is allocated for cost overrun grants, 10 percent for clean up of nuisance tire sites and 40 percent for processed tire material market development grants.

FY 02-03 Balances

Balance of Funds as of July 1, 2002	$3,666,424.80
Deposits Received FY 2002-2003	$2,246,818.01
Total Funds in Account	$5,913,242.81
Grants to County Scrap Tire Programs	$1,642,268.32
Nuisance Tire Site Cleanup Program	$225,051.75
Processed Tire Material Grants	$501,684.19
Balance of Funds as of June 30, 2003	$3,544,238.55
Obligated funds as of June 30, 2003*	$2,677,398.84
Net Balance of Funds as of June 30, 2003	$866,839.71

* $2,677,398.84 obligated: $338,547.89 for tire cleanup, $2,338,850.95 for tire recycling grants under contract and under negotiation

Tire Tax Distribution

Of the state's 2 percent tire disposal tax revenue, initiated October 1993, 68 percent is distributed to counties on a per capita basis. In the past year, the total amount distributed was $7,491,899.76. This subsidized tire disposal costs for the counties, but did not cover many counties' total expenses. The total distributed to the counties represented 78 percent of the total reported disposal costs of $9,664,630.84. This provided an average of 78 cents for each of the 9.6 million scrap tires handled by the counties.

On January 1, 1994, counties stopped charging fees to dispose of tires that were certified as generated in North Carolina (per G.S. 130A-309.58). Counties may charge a fee for tires presented for disposal that do not present a scrap tire certification form verifying the tires were generated in North Carolina.

Counties whose scrap tire costs exceed the amount they receive in their allocation of the tire tax, can apply for a grant to cover the deficit. For the first grant cycle of FY 02-03, 57 counties requested $1,052,145 and were awarded $820,685. In the second grant cycle, 60 counties requested $1,011,560 and were awarded $821,583.

Historically, the amount of grant funds requested by counties has surpassed availability. Scrap tire legislation requires the waste management division to consider county efforts to avoid free, out-of-state tire disposal and county program efficiency when making decisions about grant awards. The amounts requested and awarded are as follows.

Grant Period	4/97 – 9/97	10/97 – 3/98	4/98 – 9/98	10/98 – 3/99	4/99 - 9/99	10/99 - 3/00
Funds Available	$655,226.57	$976,245.51	$687,847.37	$633,761.66	$699,950.87	$663,467.43
Funds Awarded	$592,165.00	$602,778.28	$644,334.67	$583,093.00	$666,042.36	$786,511.24
Grant Requests	42	41	45	46	56	53
Funds Requested	$665,177.91	$677,682.00	$761,308.00	$781,603.00	$816,004.63	$842,931.37

Grant Period	4/00 – 9/00	10/00 – 3/01	4/01 – 9/01	10/01 – 3/02	4/02 - 9/02	10/02 - 3/03
Funds Available	$751,295.88	$700,221.11	$ 0*	$ 0*	$792,399.37	$694,963.10
Funds Awarded	$799,500.85	$709,226.95	$804,004.00	$811,050.00	$820,685.00	$821,583.00
Grant Requests	53	51	56	53	57	60
Funds Requested	$898,907.67	$730,709.37	$992,564.00	$1,024,935.00	$1,052,145.00	$1,011,560.00

*Used balance in other STDA fund.

Grants Awarded

The goal of the waste management division's grant program is to make scrap tire recycling sustainable in North Carolina. This goal can be met. We anticipate awarding additional grants for manufacturing rubber products such as mats, auto parts, gaskets, flooring material, tire derived fuel, new tire manufacturing and other applications in FY 03-04.

The Processed Scrap Tire Material Market Development Grants program received its first allocation of funding in August 1997. Grants awarded to date are:

- Roll-Tech, Inc., Hickory, N.C. $212,420
  Construct additional molds to increase hard rubber tire manufacture
  COMPLETED
- Continental Tire, Inc., Charlotte, N.C. $1,520,000
  Develop "tire to tire" technology with 25 percent recycled content goal
- Jackson Paper, Inc., Sylva, N.C. $377,000
  Boiler modifications for tire derived fuel
  COMPLETED
- N.C. State University, Raleigh, N.C. $38,291
  Tooling development for scrap tire recycling
  COMPLETED
- TIRES, Inc., Winston Salem, N.C. $320,000
  Produce playground/industrial mats

Within the next year, we anticipate awarding grants to Texas Encore Materials LLC for $983,000 and to Roll-Tech Inc. for $850,000.

Tire Cleanup Program

A total of 357 nuisance tire sites have been identified in North Carolina; 330 have been cleaned and 22 sites have cleanups underway. The remaining five sites are either under investigation or enforcement action. Counties are encouraged to locate and clean all small tire sites through countywide cleanup activities.

Status	Number of Sites	Total Known Tires	Total Tires	Cleared Tires
Cleaned Up	330	7,329,561	96%	7,329,561
Under Clean Up	22	235,990	3%	143,882
Remaining Sites	5	27,500	1%	0
TOTAL	**357**	**7,593,051**	**100%**	**7,473,443**

General Statute 130A 309.50 requires the waste management division to first address nuisance tire sites that pose the greatest threat to public health and the environment. At the program's start, efforts and actions to clean top priority sites were developed and initiated as funds were available. As cleanup funds were received through quarterly distributions, additional priority sites were cleaned.

The division has established and implemented a specific cleanup plan for each known nuisance tire site. As new sites are discovered, prompt investigation leads to a cleanup plan for each site within 30 days. The plan is implemented as soon as possible to minimize potential threats to human health and the environment.

The division is committed to the North Carolina Big Sweep program, with reimbursements going to counties that request funds to dispose of scrap tires collected by the statewide event.

To date 167 nuisance tire sites were cleaned using STDA funds. Cost recovery efforts collected $352,587.19 from responsible parties for nine of these sites. Three sites are under cost recovery action.

As a cost saving measure, minimum-security inmates have removed over 600,000 tires from nuisance sites. Counties utilizing inmate labor in nuisance tire cleanups are: Anson, Bladen, Buncombe, Burke, Camden, Chatham, Chowan, Cleveland, Columbus, Craven, Davidson, Halifax, Harnett, Iredell, Lee, Moore, New Hanover, Northampton, Onslow, Perquimans, Richmond, Robeson, Rockingham, Rutherford, Stokes, Surry, Washington and Yadkin.

Scrap Tire Generation

The U.S. EPA standard to estimate scrap tire generation is one tire per person, per year.[2] The 2002 North Carolina population was about 8.3 million, so it is estimated an equal number of tires were generated. This includes passenger, truck, and tires for special uses, such as off-road equipment and tractors. Counties report tires received in either tons or the number of tires. Tons can be converted to number of tires. A ton of tires consists of 100 passenger tires, 20 truck tires, or four off-road tires (tractors and other large off-road equipment).

In FY 02-03, counties reported receiving tires in three size categories: 81 percent passenger car tires, 15 percent heavy truck tires and 4 percent off-road tires. During FY 02-03 counties disposed of approximately 9,645,000 tires (9,144,000 passenger, 471,000 heavy truck and 30,000 off-road). Comparing tire generation to population results in 1.16 scrap tires per person.

Tire Volume

All counties are required to provide facilities for scrap tire disposal and to report on their management programs. A summary of this data is presented in the Appendix.

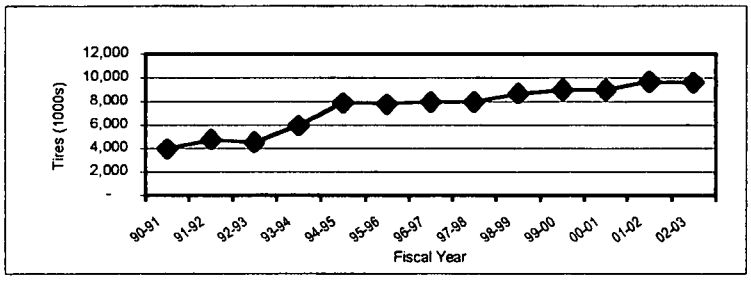
In FY 02-03, North Carolina businesses and individuals disposed of approximately 124,000 tons of tires. These tires were managed by county disposal facilities and private processing facilities as follows:

123,661 tons	Managed by counties and shipped to three processing firms
1,591 tons	Managed by counties and shipped out-of-state
9,000 tons	Tires taken directly to processing firms (not managed by counties)
134,252 tons	**Total**

Counties report receiving approximately 125,000 tons of the total 134,000 tons from North Carolina disposers. The counties shipped about 124,000 tons to three private recycling facilities; the remaining 1,600 tons were shipped to out-of-state processors.

Three private North Carolina processing firms received 125,000 tons from county tire programs and an additional 9,000 tons directly from disposers not participating in county tire programs. These may be individuals involved in privately-funded cleanups or tire dealers not participating in a county program.

Volume of Disposed Tires
FY 90-91 - FY 02-03



[2] "Markets for Scrap Tires," 1991. U.S. EPA, Office of Solid Waste. EPA/530-SW-90-074A. Washington, DC.

The tire program's success is proven by the increase in the number of tires disposed during the past eleven years. Almost all disposed tires are being handled at regulated disposal facilities. However, since free disposal was implemented in 1994, a problem has emerged with illegal disposal of out-of-state tires at county collection sites. The waste management division's Solid Waste Section estimates counties spend about $600,000 per year to manage out-of-state tires that are inappropriately disposed as North Carolina tires.

This cost estimate is based on disposal costs in counties with tire volumes greater than 120 percent of the county population (1.2 tires per person). Some counties are regional retail centers or have other factors that cause them to receive an excess volume of tires.

The waste management division assists counties to help them avoid fraudulent disposal of out-of-state tires. County efforts to deter disposal of out-of-state tires is an eligibility factor when awarding grants from the STDA to cover cost over-runs.

County Tire Disposal Costs

There are 96 county programs, including three regional programs [Carteret, Craven and Pamlico (CRSWMA); Chowan, Perquimans and Gates; Mitchell and Yancey Counties]. These counties report spending a total of $9,664,630.84 for scrap tire disposal. The reported costs for scrap tire disposal varied greatly. Some counties only report disposal costs while other counties include associated costs, such as personnel or equipment. Counties with unusually low costs may stockpile tires during the year rather than sending them for processing. Some of the fluctuation is probably due to recordkeeping errors or county reporting errors. Also, some counties manage tires inefficiently. For example, counties that allow citizens to dispose tires in "green boxes" incur increased labor costs to recover and load tires into trailers.

Tire disposal costs charged by processors are very competitive. North Carolina processors report that county contracts typically charge $70-$80 per ton, including transportation and trailer rental costs. Counties at a distance from processing facilities may pay as much as $80-$100 per ton. The average tire disposal cost in FY 02-03 was $83 per ton.

CHAPTER 7
DEPARTMENT OF TRANSPORTATION

This section summarizes the North Carolina Department of Transportation's recycling and solid waste management efforts for FY 02-03. General Statute 136-28.8(g) mandates that the department prepare an annual report on the amounts and types of recycled materials specified or used in contracts during the previous fiscal year. The types of recycled materials noted in the projects would normally contribute to the consumer and industrial waste streams, compounding the problem of declining space in landfills. All applications of recycled materials are consistent with economic feasibility and applicable engineering and environmental quality standards.

Efforts to use recycled and solid waste materials are in response to G.S. 136-28.8 that specifically mandates the following in highway construction projects:

- rubber from tires for pavements, subbase materials and other appropriate applications,
- general recycled materials for guardrail posts, right of way fenceposts and sign supports,
- recycling technology, including but not limited to, hot in-place recycling.

Highway Construction Projects

- One project let by Division 10 used 754,516 scrap chipped tires as embankment fill material.
- Division 14 re-used 80,000 pounds of steel beams.
- One Division 10 project used 500,000 cubic meters of fly ash as embankment fill.
- The number of recycled plastic offset blocks continues to grow; this year's total is 78,025.
- Pavement marking used 163 tons of recycled glass beads.
- New data capture methods increased the amount of fly ash reported in concrete mixes for bridge approach slabs and other applications. This year's total of 327 tons is a substantial increase over any previous reports. The figure is expected to grow with increased use and improved data collection.
- Fly ash is increasingly used as an alternate borrow material. This year's total of 500,000 cubic meters is much larger than typical and only represents one project.
- The recycling of millings is now being partially calculated using actual mix designs and recycling percentages stated in these designs. This method is more accurate and captures more statewide asphalt recycling for both construction and maintenance operations.
- Products reused in maintenance applications include: 1,200 feet of silt fence and posts; 1,840 feet of reinforced concrete pipe; and 1,250 tons of stockpiled soil, gravel and rubble. These numbers are expected to grow as reporting and tracking systems improve.

Attachment 1 at the end of this report list the quantities of recycled materials used in FY 02-03. Attachment 2 lists the quantities used from 1989 to June 30, 2003.

Next year's report will discuss the development and release of a new, Web-based reporting structure. The system offers user-friendly data entry options and accepts values in several common units. This will simplify data collection and greatly increase the power and flexibility of the final annual report.

Continuous Process Improvement

Four entries were submitted for the 2001 CPI Awards in the Environmental Sustainability category.

- **Early Seeding & Mulching** – The Guilford Bridge Department in Division 7 has been seeding and mulching the area of impact at each bridge replacement site immediately after work completion. This reduces the time Roadside Environmental normally requires to do the work. This process covers disturbed areas faster and speeds germination to reduce erosion and sediment issues or impacts.
- **Recycled Appliances and Cross Line Pipes** – Due to a large reduction in Alamance County litter patrol crews, the Alamance Maintenance and Bridge Unit increased collection and disposal operation efficiency. The unit discovered they could save time by locating a scrap metal collection facility along their litter route. This permitted metal recycling, reduced driving time, and combines scrap metal

cross line pipes from other units. By expanding recycling options, DOT saves money in tip fees and helps extend landfill life.

- **Median Guardrail Turf Conversion** – Placing guardrails in grass medians created new challenges for maintenance crews. The traditionally established turf is Kentucky 31, which requires mowing seven times per year. Division 14's Roadside Environmental Unit 14 identified a more desirable mix of hard fescue and bluegrass. The blend fit their climate and environmental conditions better and the mix provides a pleasing dark green color, good stand density and drought tolerance. It requires mowing half as often as traditional methods, so the DOT saves money and reduces the environmental impact of maintenance activities.
- **Secondary Roads Paving Standards, Context Sensitive Solutions** – The Division 14 Maintenance Unit received frequent inquiries from property owners, local advocacy groups and environmental agencies regarding their secondary pavement standards. All vied for an opportunity to affect the current project's development. The Division needed to establish safe and effective uniform standards that minimized property disturbance and environmental impacts. A team of Division 14 engineers developed a document entitled, "Secondary Road Paving Standards." This document guides engineers to select the least disruptive section that also provides adequate service. This result saves time after standards are established, reduces environmental impacts, and lowers construction costs for secondary roads.

For up-to-date information on North Carolina DOT's use of recycled materials, visit http://www.doh.dot.state.nc.us/preconstruct/highway/dsn_srvc/value/recycle/

CHAPTER 8
DEPARTMENT OF ADMINISTRATION

The Department of Administration continues its efforts to promote the purchase and use of reusable, refillable, repairable, more durable, and less toxic supplies and products. Department progress has allowed more of these products to be added to statewide term contracts, agency specific term contracts, as well as open market bid awards. For more information, visit DOA's Web site at http://www.doa.state.nc.us/PandC/.

Efforts Taken To Comply With The Session Laws 1993 {G.S. 130a-309.14(Al)}

Bids currently advertised in the Division of Purchase and Contract contain a Recycling and Source Reduction paragraph in item #10 of Instructions to Bidders. When developing bid invitation language, requirements and specifications, purchasers continue to look at alternative methods and products. The emphasis is on waste reduction and practicable and cost-effective procurement. More specifically, the Division of Purchase and Contract has taken the following steps.

E-Procurement Project

This multi-agency project strives to incorporate a single statewide business and purchasing module. E-procurement allows individuals to select needed items from an electronic catalog. They can then requisition the item; obtain the necessary approvals (including funds checking); order the item and receive it -- all electronically in a secure system.

E-quote is a tool that enables vendors or prospective suppliers to electronically receive and respond to requests for quotations from North Carolina state agencies and many other public sector buying entities in the country. E-quote is most appropriate for suppliers of goods. For agencies, it eliminates faxing/mailing request-for-quotes; for vendors, it eliminates submitting and mailing hard copies of quotes.

Environmental Benefits

Environmental benefits include:
- Reduction in paper and mailing expenses incurred during non-electronic business transactions.
- Cost reduction to vendor by printing fewer catalogs.
- Elimination of many vendor expenses associated with non-electronic business transactions.

Interactive Purchasing System

The Division of Purchase and Contract continues to promote electronically posting (advertising) IFBs and RFPs. Vendor Link allows vendor registration to receive electronic notification of advertised bids.

Open Market Awards

- Office Panel Systems-It is standard procedure to incorporate refurbished language in the bid document for refurbished panel systems.
- Food Product Packaging- Wooden pallets used for cases of food are exchanged. Also, all cardboard cases are recyclable.
- Used Paint Booth, Bid #200936, $49,519 – 100% Reusable
- Aluminum Stair & Ramp Systems, Bid #201458, $23,217 – 45% Aluminum – Recyclable
- Prefabricated Mobile Homes, Bid #200826 (ASTC), $4,370,150 to $14,553,300 – 70% Wood – Recyclable
- Metal Storage Buildings, Bid #300063 (ASTC), $107,568 –75% Aluminum - Recyclable

Statewide Term Contracts

As existing term contracts are re-bid and new term contracts are developed, the Division of Purchase and Contract continues to improve the contracts by offering more sustainable or environmentally friendly products. These term contracts are listed below:

- **Oil Filters, 060c** - Allows for multipacking, which reduces the number of filters individually boxed. This reduces trash that would otherwise be generated.
- **Domestic Appliances, 045a** - All refrigerators, washers and dishwashers are "Energy Star" qualified. The Department of Energy monitors this stringent measurement of energy efficiency. The payoff is a more efficient appliance, which use less energy over the product's lifetime.
- **Office Paper, 645a** - Contains both 100 percent and 50 percent post consumer and chlorine-free copy paper. In addition, Section 9A is virgin paper and the balance of the contract is recycled paper and envelopes.
- **Remanufactured Toner Cartridges, 207a** - Refillable to avoid being added to the waste stream.
- **Storage Batteries, 060b** - Casings are made from recycled material (80 to 82 percent).
- **Floor Maintenance Machines, 365a** - Includes a category for automatic scrubbers using gel sealed batteries. Gel-sealed batteries exhaust 1/40th the amount of hydrogen and sulfuric acid gases compared to wet-lead batteries. Gel-sealed batteries operate 2 ½ - 3 times longer than the wet/lead acid variety and are less toxic.
- **Lateral Filing Cabinets, 425f** - Cabinets contain five percent recycled content. Corrugated boxes have a minimum 50 percent post consumer waste and are recyclable. Contractors purchase back files at end of their use.
- **Vertical Filing Cabinets, 425g** – Classes B and C cabinets have 10 percent recycled content. Corrugated cardboard boxes contain 50 percent post consumer waste and are 100 percent recyclable after use. Class A cabinets contain 29 percent recycled content, 3 percent post consumer recycled content and are 96 percent recyclable after use.
- **Wood Library Furniture, 420d** - Contractors support sustainability through different practices, even when end products do not contain recycled content but are made from renewable sources. Packaging is recycled and recyclable; wood scraps are turned into mulch; blanket wrapping is used for shipping and the wood is recycled into particleboard. Solid wood furniture is also more durable.
- **Ammunition, 680a** - Brass shell casings can be saved and recycled; others can be reloaded.
- **External Defibrillators, 465b** - Packaging material can be recycled and the defibrillators can be refurbished. This is a co-op contract with the State of South Carolina.
- **Musical Instruments, 580b** - All items, with the exception of rivets, can be recycled at the end of use. Instruments can be traded-in for reconditioning and one company donates trade-ins to the Links Program for the needy. Corrugated containers are 100 percent recyclable.
- **Calculators, 600a** - Packaging material may be recycled.
- **Carpet, 360a** - Contains carpets with recycled content. All carpet that removed per this contract will be recycled or non-landfilled.
- **Cleaning Implements, 485g** – Cotton mops are made of cotton waste. Wooden handles can be re-used as dowels, gardening stakes and banner holders. Shipping cartons are recycled and recyclable.
- **Large & Specialty Lamps, 285a** – Encourages the use of energy-efficient fluorescent lamps and lists products that meet or exceed Federal Energy Management Program recommendations. A link is provided to FEMP that illustrates return-on-investment for retrofitting energy efficient lamps and ballasts. Some lamps contain 65 percent recycled content, are low mercury (TCLP compliant) and non-hazardous. Packaging can contain 73 percent recycled content.
- **Ballasts, 285b** - Encourages the use of energy efficient fluorescent lamps and lists products that meet or exceed FEMP recommendations. A link is provided to FEMP that illustrates return-on-investment for retrofitting energy efficient lamps and ballasts. Ballast contains no PCBs and can be disposed of in the trash. Reduced form factor to minimize packaging.
- **Material Handling Carts/Trucks, 560a** – Very few products are made from virgin steel. Products are not shipped in cartons.
- **Dictation/Transcription Equipment, 600c** – Vendors use recycled items (approx. 10 percent) and comply with the 9000 guideline in the International Organization for Standardization. Packaging contains from 60-100 percent recycled content.

- **Laminators & Laminating Film, 665a** – Some film contains 5 percent post consumer content. Packaging contains 25-80 percent post consumer content.
- **Bio-Diesel Fuel, 405L** - B20 blended fuel contains 80 percent diesel fuel and 20 percent virgin soy or reprocessed vegetable oil.
- **Cameras, Digital & Film, 655A** – The metal camera bodies can be salvaged and reused. Plastic bodies and parts can be recycled. All packaging materials are recyclable.
- **Gasohol, 405M** – E-10 blended fuel contains 90 percent unleaded gasoline and 10 percent ethanol.
- **Passenger Cars, 070A; Law Enforcement Vehicles, 070B; Trucks/Vans/Utility Vehicles, 070G –** Bids included an AFV (alternate fuel vehicle) category for each line item. Three bid lines are solely dedicated to AFV. According to the Steel Recycling Institute, 67.7 percent of a vehicle is steel or iron. Of that steel or iron, 26.6 percent is post consumer material. Therefore, 18 percent of a vehicle is made from post-consumer recycled material.
- **Wiping Cloths, 735A** – All items are second-hand textiles. Reclaimed wiping cloths are offered as well as new cloths. Vendors resell waste instead of sending it to landfills. Vendors use low alkaline content wastewater. All recycled textile rags can be sold to make paper products. All rags can be re-laundered.
- **Furniture, Desks (Wood), Credenzas, Conference Tables, Etc., 425B** – Contractors support sustainability through different practices. Mechanical parts can be recycled or replaced – extending service of item. Packaging is recycled and recyclable. Products may be ground up into particleboard.
- **Office Supplies, 615A** – Contractors are required, to the extent feasible and practical, to offer recycled products and packaging; especially with post-consumer waste content. Wherever possible and practical, products should be identified as such.
- **Chalkboards, Tack boards and Erasers, 785A** – The product packaging has recycled content.

Items Aiding Waste Reduction Purchased By State Agencies through Term Contracts and Open Market

The following items purchased by state agencies meet the criteria to reduce waste by being reusable, refillable, repairable, more durable and/or less toxic than their traditional counterparts:

Reusable
Ammunition, cartridge refills
Digital cameras (reduces need for film & chemicals)
Freon recovery system (reusable filters)
Musical instruments
Plastic tableware
Re-chargeable drycell batteries
Recycled carpet and virgin carpet
Recycled paper
Recycled content furniture (not traditional wood)
Remanufactured toner cartridges for laser printers
Solvent degreaser (reuses solvent)
Tire recapping & repairing service
Uniforms
Vacuum bags
Wiping cloths

Refillable
Ammunition, cartridge refills
Batteries, vehicle & storage
Calendars
Drums, steel
Fire extinguishers
Mechanical pencils/pens

Repairable
Defibrillators
Musical instruments
Pencil sharpeners
Tire recapping & repairing services

More Durable
Above-ground vaulted fuel storage tanks
Classroom furniture
Electronic lamps & ballast
Electronic vacuum cleaners
Flags
Grader blades
Grader slope attachment
Kindergarten furniture
More Durable (continued)
Paint bushes
Plastic lumber
Plastic tableware
Rubber bands
Staplers
Vertical file cabinets
Wood casegoods
Wood library furniture

Less Toxic
Alternative fuel vehicles
Correction fluid
Electronic lamps & ballasts
Fertilizers/farm chemicals
Floor maintenance machine batteries
Inks for printing (non-petroleum-based inks)
Instructional art materials
Markers
Scientific Products (eliminating freon)

Longer Lasting
Floor maintenance machine batteries
Library furniture
Pens

Recyclable
Pens
Carpet
Mops & brooms
Vehicle steel & tires
Vertical filing cabinets
Wiping cloths
Wood casegoods
Wood library furniture

Washable
HVAC filters
Wiping cloths

Attachment #1

N.C. DEPARTMENT OF TRANSPORTATION
RECYCLING & SOLID WASTE MANAGEMENT FY 02-03

Description	Usage	Quantity
Waste Scrap Tires		
Chipped Tires	Roadbed Embankment Component	754,516 TIRES
Tire Sidewalls	Drum Ballasts	2,904 EA
Glass		
Glass Beads	In Paint & Long life pavement markings	163 TONS
Plastic	Guardrail Offset Blocks	78,025 EA
	Plastic Pipe	13,589 LF
	Type III Barricade	720 LF
Fly Ash	Concrete Mix Additive	327 TONS
	Road Embankment Component	500,000 CM
	Flowable Fill	100 CY
Recycled Asphalt Pavements	Asphalt Pavement Millings	3,774,720 SY
	Beneficial Fill Material	191,933 CY
	Cement	23,208 TONS
	ABC	138,675 TONS
Class B Stone	Erosion Control Stone	220 CY
Bark Mulch	Soil Amendment	4,550 CY
	Mulch	200 TONS
*** Recycled Steel**	Steel Beams	80,000 LBS
	Guardrail	235 FT
***Reused Materials**	Silt Fence and Posts	1200 FT
	Reinforced Concrete Pipe	1840 FT
	Gravel and Rubble	1250 TONS

*These items were salvaged and re-used by maintenance operations.

Attachment #2

N.C. DEPARTMENT OF TRANSPORTATION
RECYCLING & SOLID WASTE MANAGEMENT
JANUARY, 1989 THROUGH JUNE, 2003

Description	Usage	Quantity
Waste Scrap Tires		
Chipped Tires	Roadbed Embankment Component	11,187,655 TIRES
Crumb Rubber	Crack Sealant Soil Amendment	500 LB 20 TONS (app. 2,025 TIRES)
Chipped Tires	Sound Wall Panels	8,000 TIRES
Tire Sidewalls	Ballast for Traffic Drums	51,535 EA
Lightweight Fill Chipped Tire Material	Soil substitute in culvert backfill	47,211 TIRES
Crumb (Ground) Rubber	Asphalt pavement component	124,512 TIRES
Whole Tires	Retaining Wall	2,500 TIRES
Rubber Mulch	Wood Mulch	8 TONS (app. 800 TIRES)
		Total 11,424,238 TIRES
Plastics		
Plastic Lumber	Guardrail Offset Block	193,448 EA
Plastic Lumber	Type III Barricades	1320 FT
Recycled Plastic Fence Posts	Right of Way Fencing	7,600 EA
Recycled Plastic Delineator Posts	Roadside Safety Delineators	676 EA
Recycled Plastic Pipe	Subsurface Drain Pipe	32,458 LF
Recycled Plastic Pipe	Fittings (Y, T, & L's)	76 EA
Recycled Plastic Pipe	Temporary Slope Drain	4,723 LF
Recycled Plastic Traffic Separators	Railroad Safety Device	2,922 LF
Glass		
Glass Beads	In Paint & pavement markings	52,292 TONS
Crushed Glass	Aggregate backfill for subdrainage pipe	95 CY
Crushed Glass	Pipe Foundation Conditioning	333 TONS
Crushed Glass	Aggregate Base	203 TONS
Fly Ash	Roadbed Embankment Component	865,186 CY
	Additive to asphalt pavement	40,800 TONS
	Concrete Mix Additive	2,138,398 LB
	Flowable Fill	126 CY
	Sign post w/concrete core	1,350 EA
Steel Slag	Aggregate Stone Base	224 TONS
Bottom Ash	Borrow	2,707 CY
Recycled Asphalt Pavement	Asphalt Mix Additive	1,022, 084 TONS
	Hot-in-Place Recycling	1,459,869 SY

March 25, 2004 ERC Meeting

ENVIRONMENTAL REVIEW EXHIBIT P

PRESENTATION N

MARCH 25, 2004

DIVISION OF WASTE MANAGEMENT
JIM COFFEY, CHIEF, SOLID WASTE SECTION

STATUS OF MUNICIPAL SOLID WASTE LANDFILLS: UNLINED AND LINED LANDFILLS

INTRODUCTION: A perspective on reaching the goal of closing all unlined municipal solid waste landfills and replacing them with lined landfills by January 1, 1998. A brief history of regulations governing landfills:

In March of 1971, the state adopted the first standards for "sanitary" landfills-as a result about 500 old dump sites were closed. In 1982, the state adopted the first comprehensive solid waste management regulations, specifically the requirements for sanitary landfills. These rules reflected the initiatives of EPA and the state of NC in the late 1970s and early 1980s to ensure sanitary conditions at landfills and to address specific health issues such as disease-carrying rats and insects and to prohibit open burning at landfills. Those regulations reflected the concept, commonly held at the time, that as a result of natural dilution and attenuation by the soil and ground water beneath the landfill, the leachate leaving the landfill would not adversely impact the ground water surrounding the landfill.

In 1991, the so-called "98 rule" was adopted. This rule required all new landfills and lateral expansions of existing landfills to be designed with a liner, leachate collection and final cover system and that after Jan 1, 1998, all active sanitary landfills shall be equipped with liners, leachate collection and final cover systems. This rule became necessary because of increasing information based on EPA's national studies and NC own studies that natural dilution and attenuation was not effective at protecting ground water and that the ground water was being seriously contaminated by unlined landfills.

In 1993, based on data published in a final report by EPA that unlined MSWLFs were contaminating ground water, the EPA revised the federal criteria for MSWLFs. The state of NC, in accordance with revised EPA criteria, drafted a new Section .1600 of the rules specifically for MSWLFs. Along with the health issues previously addressed, these comprehensive new rules addressed major environmental concerns, in particular air, ground and surface water impacts, by requiring a high-tech, containment landfill design for MSWLFs.

SLIDES

Slide (1) graphically reflects the impact of these rules and the progress we have made from 1990 to 2003:

LINED LANDFILL DESIGN CONCEPT:

Slide (2) is a diagram of a base liner and leachate collection system at a typical NC landfill—

The two- component base liner system consists of a synthetic liner overlying a compacted clay liner-the system provides containment of contaminated liquid from the decomposition of waste within the landfill cell

Above the base liner system is the leachate collection system, at least 2 foot thick, which consists of a drainage layer and collection pipes – the system collects leachate within the landfill

and removes it from the landfill before it reaches I foot in depth, and transports it to a wastewater treatment plan-

Slide (3) is a cross section of a lined landfill showing the landfill once it has reached capacity and the final cap system has been installed.

When the landfill is active, the base liner system is very important, however; when the landfill is closed, a final cap system consisting of a synthetic liner overlying a clay layer and a vegetative layer overlying the liner greatly minimizes the amount of rain water entering the landfill, decreasing generation of leachate and reducing leachate level in landfill, If the liner was to fail completely at this point, the amount of leachate released to the ground water would be minimal.

This slide also shows the 4-foot vertical separation between waste and ground water and the 300-foot horizontal buffer between the edge of the waste disposal area and property boundary. These buffers create a zone of dilution, attenuation, and monitoring, and if necessary, corrective action should the liner system fail.

The rules also require that an owner/operator have a financial assurance mechanism in place to ensure that the financial resources will be available to cap and close landfill, maintain post-closure (min 30 years) maintenance and, if necessary, for corrective action,

Slide (4) indicates the status of the 128 unlined landfills closed since 1990 and strongly supports NC's decision to close them

Slide (5) indicates the status of 42 lined landfills:

Slide (6) gives us specific information regarding the 8 lined landfills that have detected chemical constituents in ground water monitoring wells:

CONCLUSIONS:

Are lined landfills working? Yes
Are they a big improvement over unlined landfills? Yes
Are they more protective of the public health and environment than unlined landfills? Yes
Are lined landfills fail-safe? No
Is there a contingency plan if liners fail? Yes
As stated earlier, a 300-foot buffer is required from the edge of waste to the property boundary. Ground-water monitoring wells are located midway in the buffer to detect any contaminated ground water leaking out of the landfill. The wells are sampled frequently and if contamination is detected, the rules require assessment and if necessary, corrective action. Since the wells are located midway in a 300-foot buffer, there should be sufficient lead time and area available to prevent the migration of contamination off the landfill property.
Should we continue to look for improvements to landfills? Yes
The Section continues to evaluate failures of lined landfills when they occur and will recommend changes to the rules if necessary to provide better protection to the public health and environment.

RECOMMENDATIONS

The lined landfill concept is sound, a big improvement over unlined landfills, however, they are not perfect-as always we must continue to improve. It is obvious that the landfill performance monitoring systems are working.

- Problems occur when the landfill is not constructed or operated in accordance with the rules
    - Consider strengthening leachate transportation and storage requirements

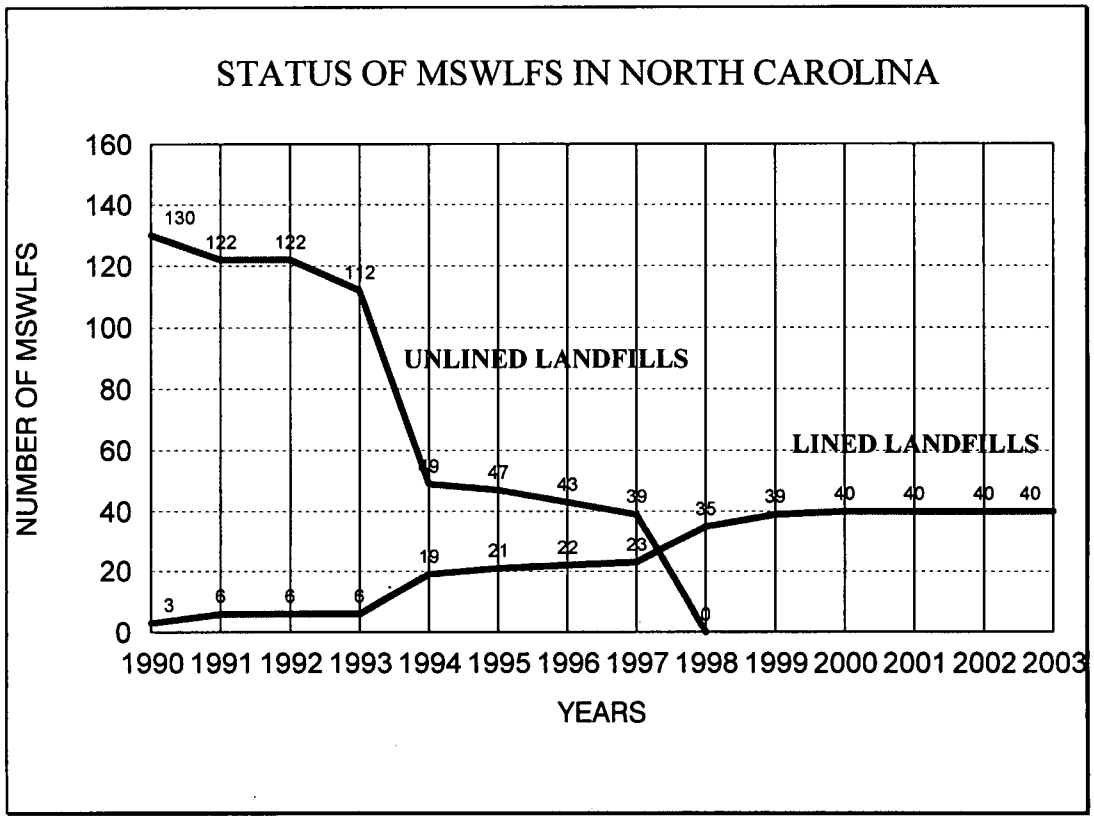
    - Consider strengthening the construction quality assurance requirements:
    - Third-party monitoring of construction
- Consider improving landfill technology such as bioreactor

UPDATE ON PROPOSED CONSTRUCTION AND DEMOLITION LANDFILL RULES:

The Division has decided to make substantial changes to the proposed C&DLF rules 15A NCAC 13B .0531-.0547. Consequently, the Division will not ask the Commission for Health Services to consider adoption of these rules at the May meeting, nor the General Assembly to approve them in this session.

These changes are a result of comments received during the public participation process. As a consequence of the changes to the proposed rules, we will republish the proposed rules with the changes and hold another formal public hearing. No date for publication and the formal hearing has been set though publication of the revised proposed rules is expected to be in late spring or early summer. We anticipate that informal meetings will be held to discuss and hear comments on the revised proposed rules prior to the formal hearing.

Slide 1



*This **first slide (1)** graphically reflects the impact of these rules and the progress we have made —The slide reflects a time period from 1990 to 2003-The red line indicates the number of unlined landfills and the blue line the number of lined landfills. Prior to the adoption of liner requirements in 1991, there were 133 landfills in NC--- 130 unlined and 3 lined. When the more stringent rules, based on the revised federal rules, became effective in 1993, the total number of landfills dropped by almost one half to 68---49 unlined and 19 lined. In 1998 when all unlined landfill were required to close the total number of landfills dropped to 35 all of which were lined. Currently there are 40 lined MSWLFs in operation.*

Slide 2

UNLINED LANDFILLS

- **128 Landfills closed since 1990**
- **122 Landfills with chemical contaminants detected in ground water monitoring wells**
- **71 Landfills with chemical contaminants detected at property boundary**

*This **next slide (4)** indicates the status of the unlined landfills closed since 1990 and strongly supports NC's decision to close them. Of the 128 most recently closed unlined landfills, ground water monitoring wells at 122 of these landfills, which is over 90% of them, have detected chemical contaminants around the landfills. More importantly, 71 0f the128 landfills have contaminated ground water at or beyond the property boundary, necessitating some form of future corrective action.*

Slide 3

LINED LANDFILLS

- **42 Landfills currently monitored (40 operating)**
- **8 Landfills with chemical contaminants detected in ground water monitoring wells**
- **1 Landfill with chemical contaminants detected at property boundary ***

  *** Pre .1600 rules landfill design and construction, 100 foot buffer**

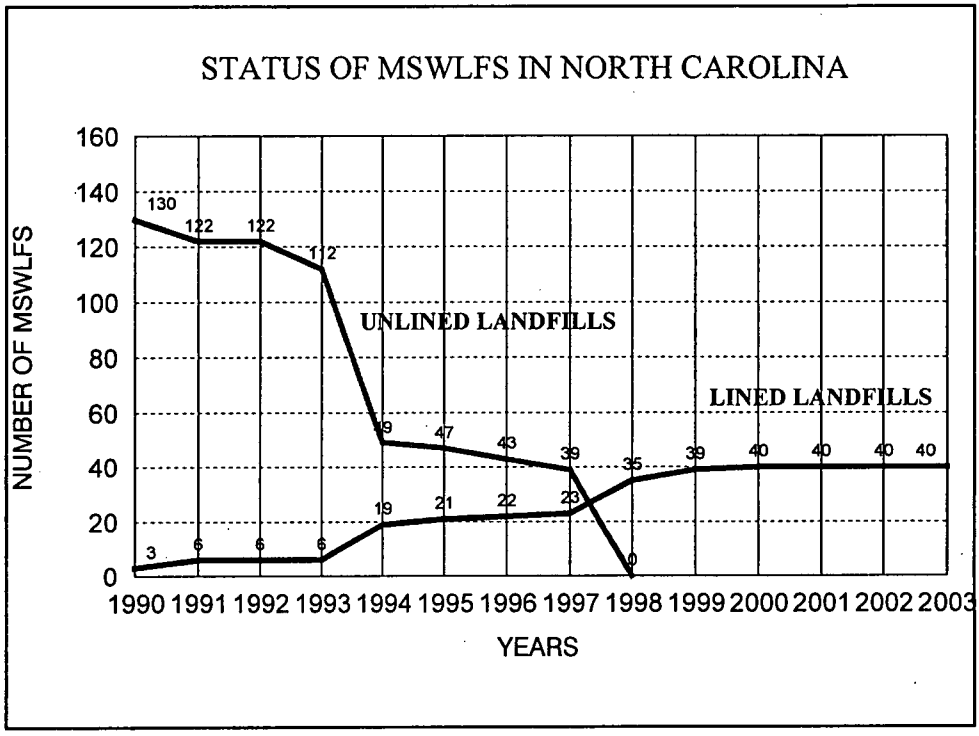
*The **next slide (5)** indicates the status of lined landfills: Of the 42 lined landfills currently being monitored, ground water monitoring wells at 8 have detected chemical contaminants around these landfills. Of these only 1 landfill has detected chemical contaminants at the property boundary. Even though this is a lined landfill, it began operation in 1989 and was not designed or constructed under the current rules. Also, the horizontal buffer from waste to property boundary is only 100 feet, not 300 feet.*

Slide 4

LINED LANDFILLS WITH DETECTED CONTAMINANTS (8)

- **2 leaks in leachate transportation and storage system**
- **2 sources other than landfill**
- **3 assessment monitoring to determine source (2 pre .1600 rule design and construction)**
- **1 chemical contaminants detected at property boundary**

*The **next slide (6)** gives us specific information regarding the 8 lined landfills that have detected chemical constituents in ground water monitoring wells: 1 had a leak in the leachate lagoon and 1 had a leak in the pipe transporting leachate to the lagoon-both have been successfully remedied. In 1 landfill, the contamination was determined to be from an adjacent unlined landfill and 1 from a preexisting source of contamination. 3 landfills are currently in assessment monitoring to determine the source of contamination. Of these 3, only 1was designed and constructed under the .1600 rules*



UNLINED LANDFILLS

- **128 Landfills closed since 1990**
- **122 Landfills with chemical contaminants detected in ground water monitoring wells**
- **71 Landfills with chemical contaminants detected at property boundary**

LINED LANDFILLS

- 42 Landfills currently monitored (40 operating)
- 8 Landfills with chemical contaminants detected in ground water monitoring wells
- 1 Landfill with chemical contaminants detected at property boundary *

* Pre .1600 rules landfill design and construction, 100 foot buffer

LINED LANDFILLS WITH DETECTED CONTAMINANTS (8)

- 2 leaks in leachate transportation and storage system
- 2 sources other than landfill
- 3 assessment monitoring to determine source (2 pre .1600 rule design and construction)
- 1 chemical contaminants detected at property boundary

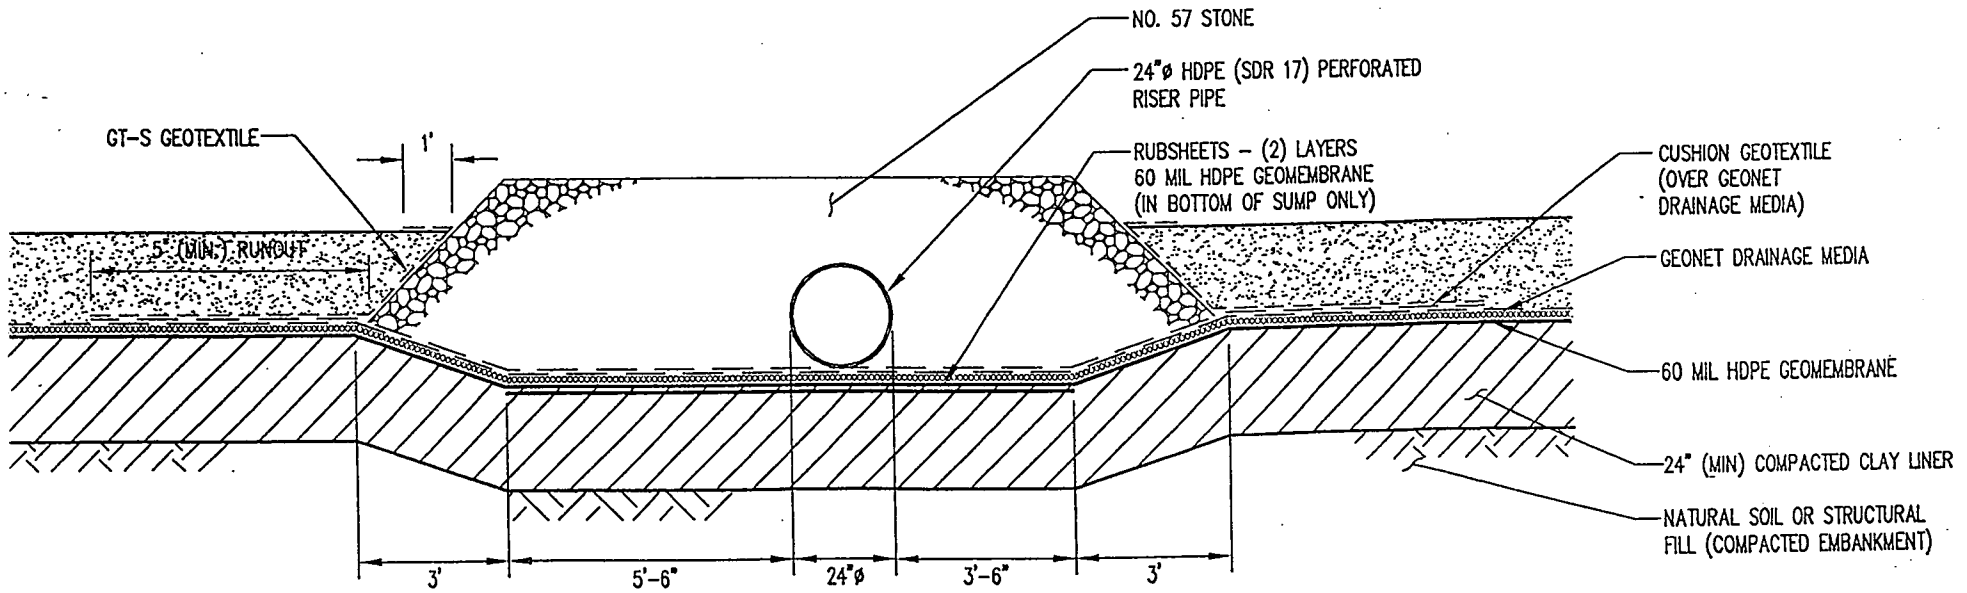


DIAGRAM: BASE LINER AND LEACHATE COLLECTION SYSTEM

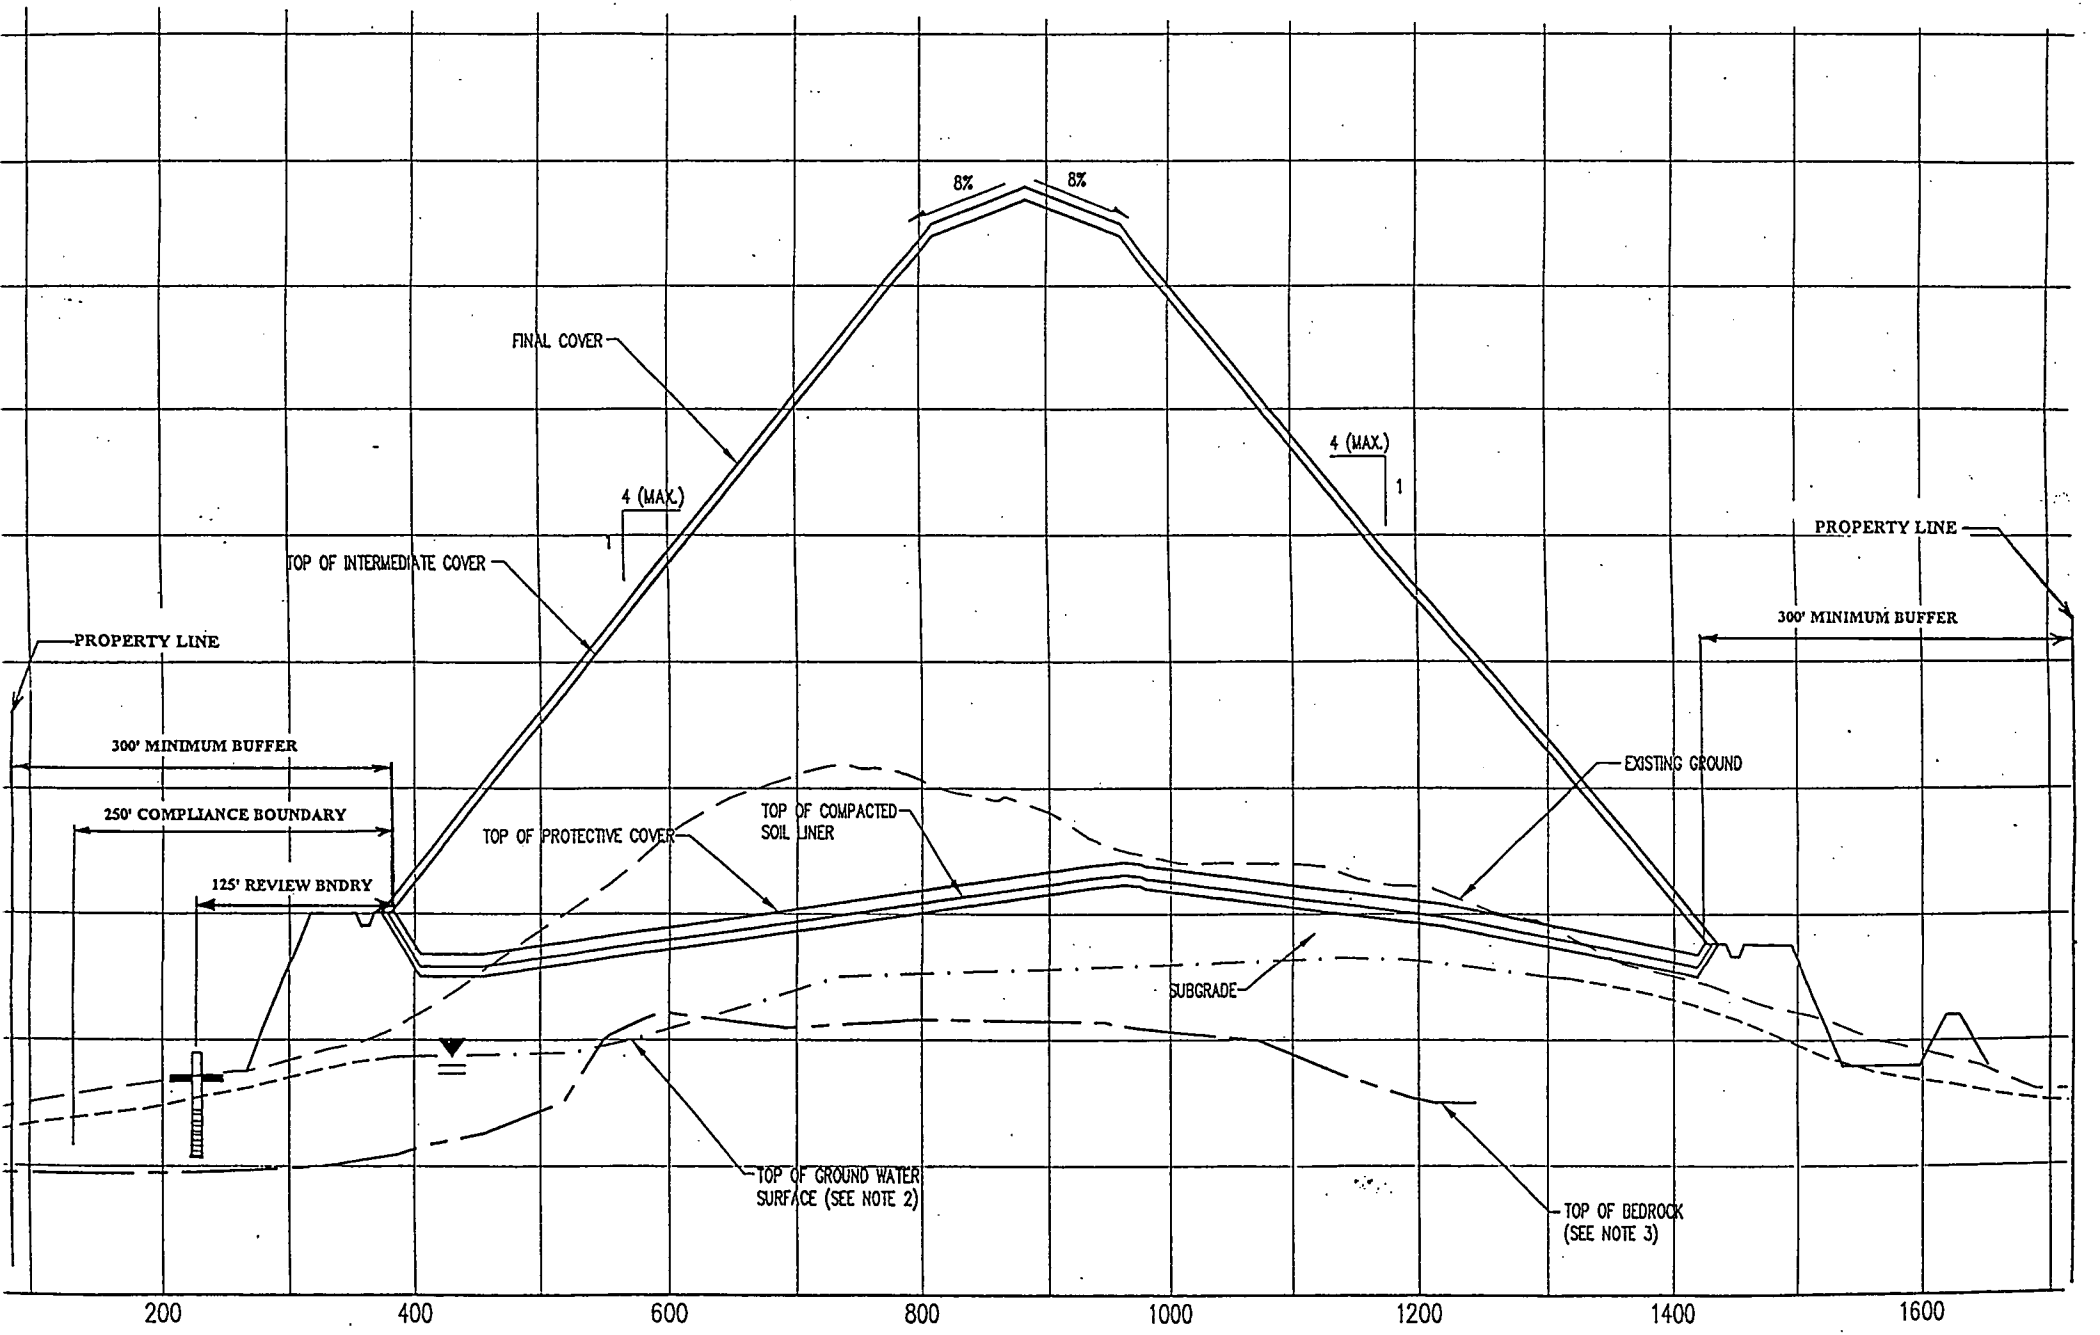
CROSS-SECTION: LINED LANDFILL AND BUFFER ZONES



Options For Reducing Waste in North Carolina

- Enact disposal bans on materials with ample markets.
- Increase local recycling program performance.
- Provide increased financing and financial incentives through tipping fee surcharge.
- Implement recycling mandates on private haulers.
- Enact advanced recycling fees (ARFs) on specific products.

Enact Disposal Bans on Materials with Ample Markets

- Excellent candidates for ban: Clean Wood and Pallets
- Potential diversion – up to 500,000 tons/year.
- Markets adequate and growing.
- Examples of users needing more material:
  - McGill Environmental, Delway and Moncure
  - Corn Products, Winston-Salem
  - Pallet recyclers across NC (average 37 jobs per company):
    - 62 percent plan to expand operations
    - 86 percent could sell more recycled pallets if they had them
- Wide range of uses for pallets and wood wastes.

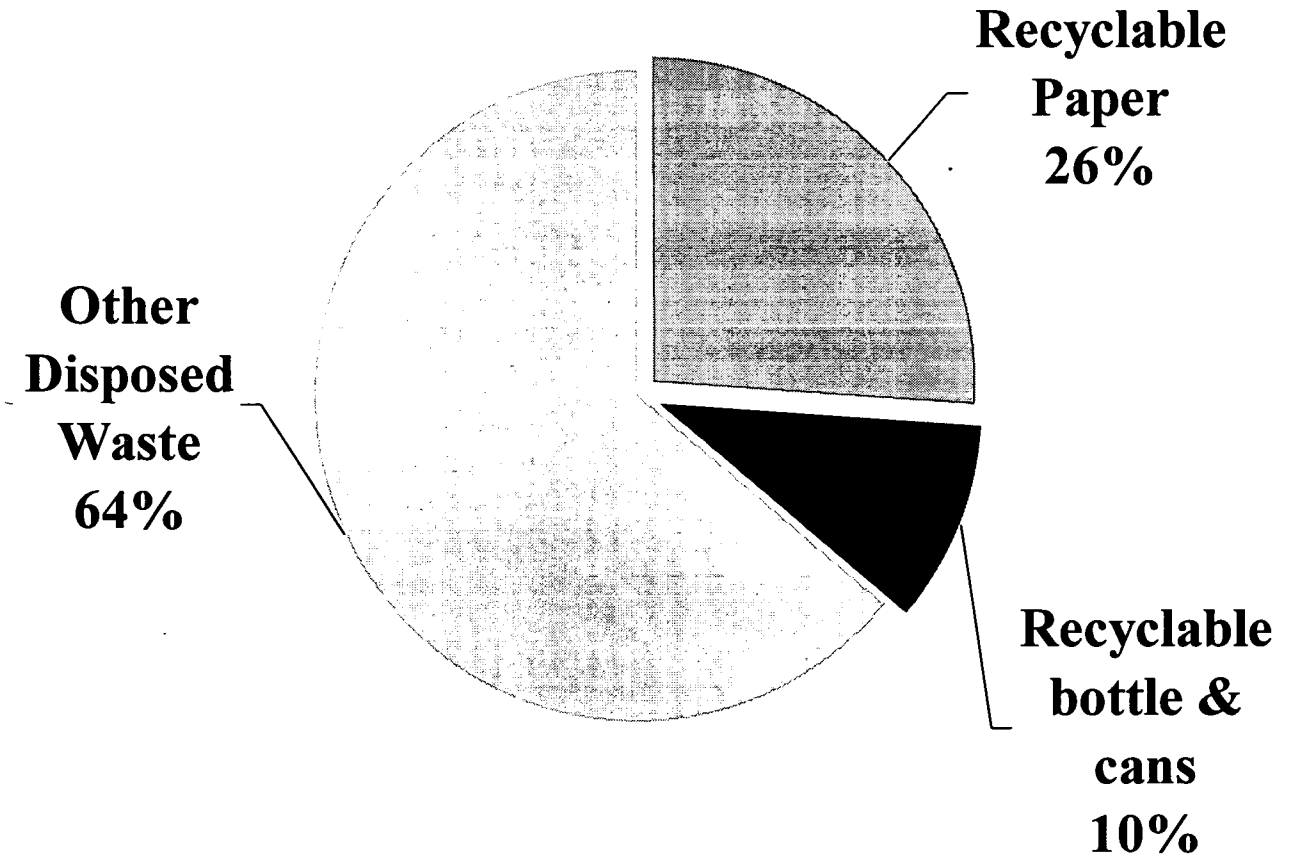
Increase Local Recycling Program Performance

- Uneven level of recycling effort among cities and counties in North Carolina.
- Examples show that it is possible for even small communities to run good programs:
  - Swain and Duplin Counties
  - Nashville, Whiteville, Snow Hill, Lewisville, Laurinburg
- Markets are healthy and stable for household recyclables.
- All communities should be able to achieve a minimum standard of per capita recycling.

Policy Option: Hold Communities to Minimum Recycling Targets

- Consider requiring cities and counties to meet 60 lb. per capita recovery target.
- Annual target of 60 lbs. per capita is achievable:
  - Current municipal average: 92 lbs.
  - Current county average: 79 lbs.
- Could have reduced target for the smaller communities.
- Increase recovery targets 5 lbs. per capita per year.

Over one third of residential waste still disposed could be recycled.



Option: Provide Increased Financing and Incentives with Tip Fee Surcharge

- Surcharge would increase cost of disposal and provide funding for range of uses.
- Proceeds can help fund efforts to achieve per capita recycling targets.
- Proceeds can also help address impact of old landfills, the issue of litter, illegal disposal, permitting, and increasing recycling markets.
- Surcharge can also improve the competitiveness of recycling companies against low tipping fees.

Option: Implement Planning and Recycling Mandates on Private Haulers

- Private haulers not held to same standards or mandates as local governments.
- Private waste facilities can have big impact on ability of communities to meet goals and needs.
- Private haulers are capable of providing the same recycling services as local governments.
- Consider requiring haulers to offer recycling services and to submit solid waste plans
- Would hold haulers to same standards as local governments and close service gaps.

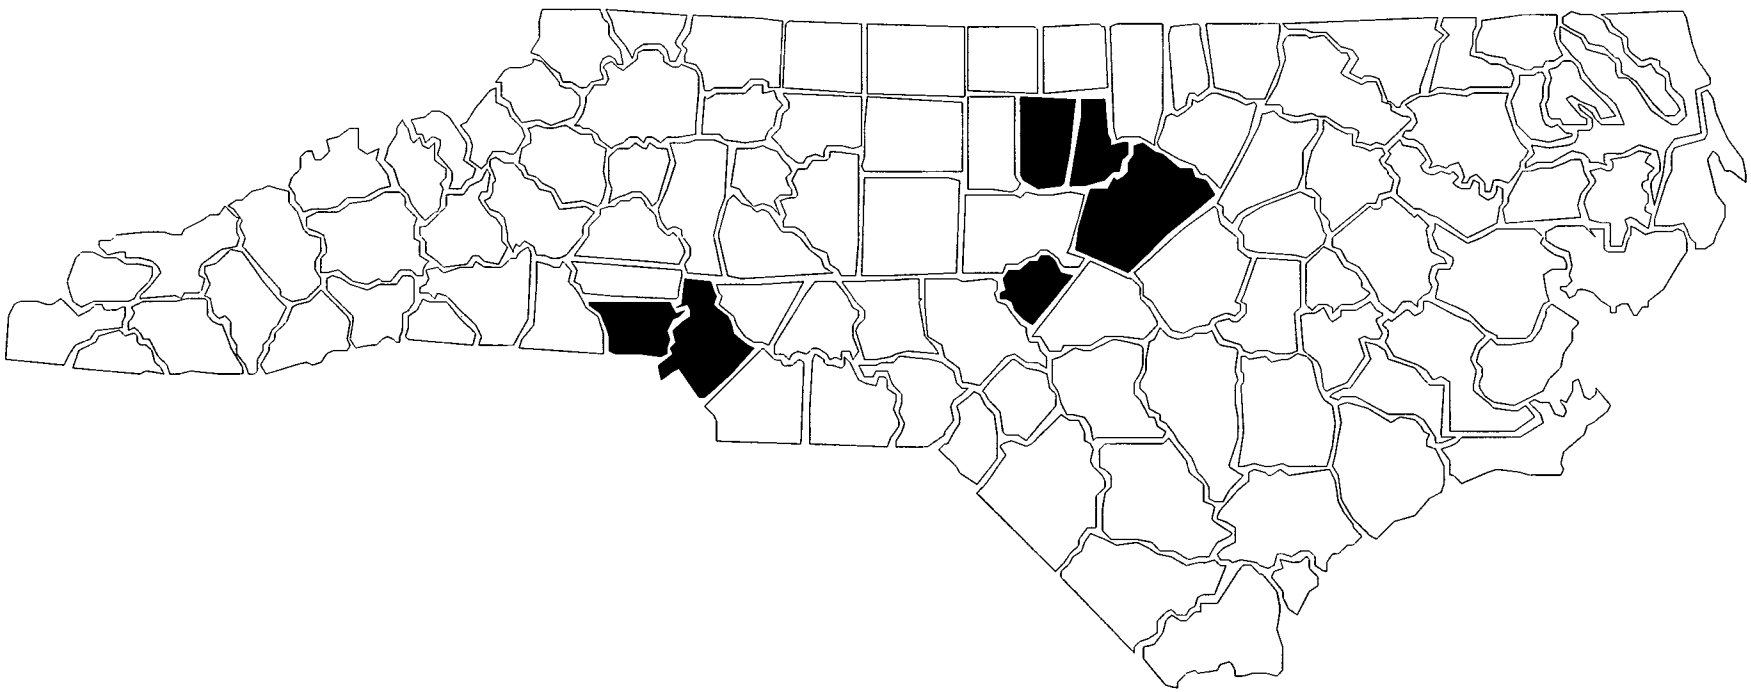
Enact Advanced Recycling Fees (ARFs) on Specific Products: Electronics

- Small but growing and complex waste stream.
- Costly for local communities to handle.
- Most communities will not offer recycling services unless there is a funding sources.
- North Carolina has had notable success with ARFs to address these kinds of waste streams.
- Widespread recovery of electronics will result in environmental and economic benefits.

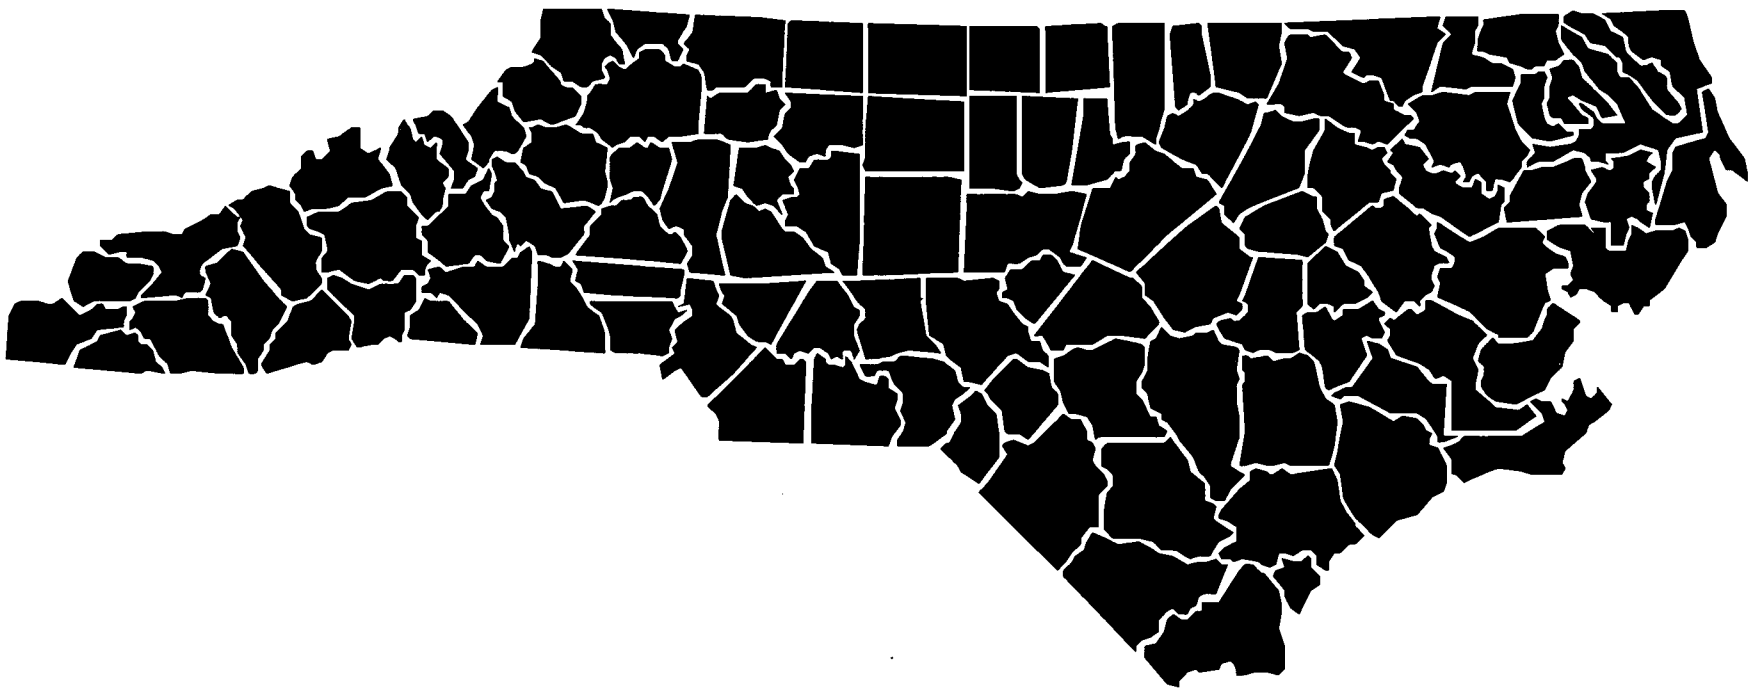
NC Estimate of Use and Generation of Electronics

- Overall generation - 50,000 tons/year.
- 6.3 million televisions in use in households.
- 1.7 million PCs in use in households.
- Between 11,000 and 13,350 tons of CRTs ready for discard annually by households.
- Estimated 320,000 televisions and 170,000 monitors ready for discard by HHs annually.

Counties with Permanent Electronics Collection Programs



Counties with Permanent White Goods and Tire Collection Programs



Another Side of Recycling: Economic Benefits

- Over 12,000 North Carolinians are employed in over 500 different recycling companies.
- Between 1967 and 2000, recycling jobs nationally sustained an annual growth rate of 8.3% (compared to general annual job growth of 2.1%).
- International Association of Electronics Recyclers expect capacity to grow by a factor of 4 or 5 by 2010.
- Biggest challenges for recyclers:
  - Cheap competing disposal rates
  - Supply, supply, supply.

Examples of NC Manufacturers Relying on Recycled Materials

- St. Gobain, Wilson – glass plant
- Jackson Paper, Sylva – paper mill
- Owen-Illinois, Winston-Salem – glass plant
- Weyerhaeuser, Plymouth – paper mill
- Nucor, Cofield – steel mill
- Caraustar, Charlotte – paper mill
- Laurel Hill Paper, Cordova – paper mill
- Paramount Paper, Maxton – paper mill

Examples of NC Companies Needing More Recycled Materials

- Union Gypsum, Marshville
- Nationwide Recyclers, Polkton
- Synergy, Mayodan
- US Green Fiber, Charlotte
- Green Power, Kenansville
- Pallet One, Butner, Mocksville, and Siler City
- Coastal Enterprises, Jacksonville
- Kamlar, Rocky Mount
- Profile Products, Conover
- Paperstock Dealers, Winston-Salem

North Carolina
State Energy Plan
June, 2003

Prepared for the

North Carolina Energy Policy Council

By the

State Energy Office
North Carolina Department of Administration
And
Appalachian State University Energy Center

North Carolina State Energy Plan

Executive Summary

North Carolina's General Assembly established the Energy Policy Council in 1975 as a means of addressing state-specific energy issues and concerns. The 1992 North Carolina Energy Plan was the Energy Policy Council's last examination of energy use, energy production, and environmental concerns in our state. As state and national energy issues have changed in the past 10 years, a more recent and detailed version of North Carolina's energy plan was requested by the Energy Policy Council.

As a starting point, the Energy Policy Council formed a working group from among its members, representing key energy and environmental interests, to develop updated energy policy and program recommendations. The Energy Policy Working Group began by adopting a set of objectives (listed in the sidebar). North Carolinians from all walks of life provided input to the Energy Policy Working Group in the following ways:

- Nine days of sessions featuring state energy experts, as well as regional and national specialists, on specific energy issues;
- Input from over 25 stakeholders affected by energy consumption and supply, including members of industry, low-income groups, homebuilders, community planners, petroleum suppliers, automobile retailers, bankers, renewable energy experts, and farmers; and
- Written and verbal comments on energy issues from about 300 North Carolinians via 4 public input sessions held across the state.

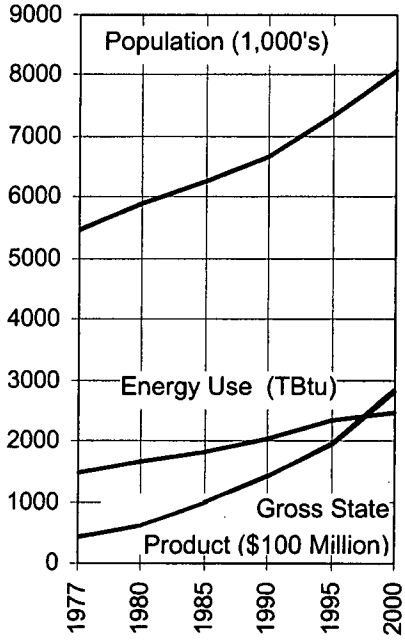
The Energy Policy Working Group recorded and organized the input received and, after months of extensive deliberation, provided a draft set of recommended policies and programs to the Energy Policy Council in January, 2003. The Council discussed the recommended policies and programs and approved 93 measures, as set forth herein, that meet the plan's objectives. The policies and programs approved by the Energy Policy Council primarily addressed the following sectors and issues in the state:

- Energy, Economics, and the Environment
- Fossil and Nuclear Fuels
- Electric Utilities and Energy Use
- Alternative Fuels from Biomass
- Alternative Energy Sources
- Energy Use in the Public Sector

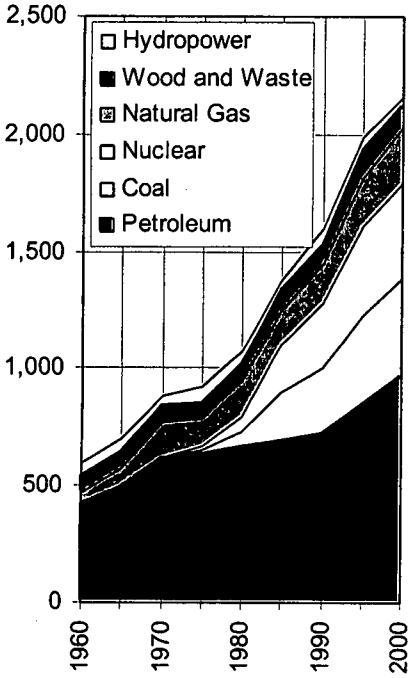
Objectives of the North Carolina State Energy Plan

- Insure energy reliability for North Carolinians;
- Improve the public health and environmental quality of our state;
- Develop policies that promote wise land use;
- Implement strategies supportive of a sound North Carolina economy;
- Develop an achievable sustainable energy strategy for North Carolina; and
- Implement a strategy by which the state can lead by example.

NC Energy Use, Population & Gross State Product



Historic Energy Use in North Carolina by Fuel (TBtu)



- Energy Use in the Residential Sector
- Energy Use in the Commercial Sector
- Energy Use in the Industrial Sector
- Energy Use in the Transportation Sector
- Energy Education and Research
- Funding for Energy Policies and Programs

Immediate Action Items

The Energy Policy Council reviewed the entire list of 93 policies and programs to determine which measures would require action by the Governor, North Carolina General Assembly, North Carolina Utilities Commission, or other regulating or administrative agency. From the entire list, the Energy Policy Council recommends the following 15 key legislative, regulatory, and administrative policies for action in 2003 and 2004:

Energy, Economic, and Environmental Issues

Exec-1 The North Carolina Department of Commerce and the State Energy Office should encourage and support economic development of energy-related enterprises whose products are intended to increase energy efficiency or use renewable resources, such as providers of specialized insulation and window products, heating and air conditioning equipment and controls, distributed generation equipment, solar and wind energy equipment, and fuel cells.

Exec-2 The State Energy Office should communicate the energy research being performed in the state to the North Carolina Department of Commerce for its recruiting and economic development strategy.

Exec-3 The North Carolina Department of Environment and Natural Resources should create a greenhouse gas registry to track emissions of carbon dioxide and other greenhouse gases, to establish baseline greenhouse gas emissions, and to demonstrate reductions in greenhouse gas emissions for potential greenhouse gas trading systems depending upon the availability of funding.

Alternative Fuels from Biomass

Exec-4 North Carolina should support the development of an alternative fuel industry through dedicated funding and grant matching of promising alternative fuel projects. These efforts should include agricultural waste processing facilities, biodiesel and ethanol

refineries, fueling stations for alternative-fueled vehicles, production incentives for farmers and refiners, incentives for highly efficient or alternative-fueled vehicles, and education and awareness programs. Developmental efforts should focus on raising feedstock production levels and insuring all 100 counties in the state have alternative fueling infrastructure by 2007. In particular, the Energy Policy Coun cil supports a state program to pay for alternative fuels development via a $1 to $2 fee applied to annual vehicle registration fees.

Exec-5 Based on the results of ongoing research and development studies, the North Carolina General Assembly should pursue strategies that convert animal waste into environmentally sound energy sources.

Alternative Energy Sources

Exec-6 The General Assembly should consider adopting net metering for application to all electric utilities in the state.

Exec-7 The General Assembly should evaluate a renewable portfolio standard (RPS) that complements the NC GreenPower program and fosters the development of a renewable electricity market. The RPS would require that all electric utilities increase the percentage of total distributed electricity that comes from renewable sources, such as hydroelectric, wind, solar, waste-derived fuels, and agricultural fuels.

Exec-8 The General Assembly should reexamine the Mountain Ridge Protection Act as it pertains to wind energy while still protecting North Carolina's natural beauty.

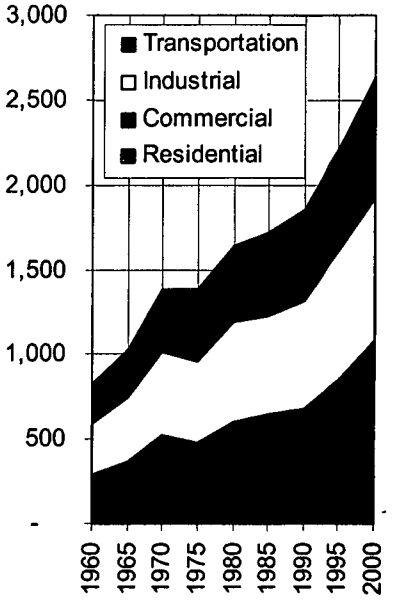
Exec-9 The State Energy Office should assess and propose incentives and regulatory or administrative measures for development of renewable electricity generation facilities, solar water heating, passive and active solar space heating, and daylighting.

Exec-10 The General Assembly should require that all electric utilities in North Carolina provide generation disclosure of fuel mix percentages and emissions statistics on sulfur dioxide, nitrogen oxides, carbon dioxide, and mercury annually by bill insert and via website. The disclosure information should clarify to the consumer the environmental impact of residential electricity use.

Energy Use in the Public Sector

Exec-11 State agencies and universities, with coordination by the North Carolina Department of Administration, should reduce energy

Historic Energy Use in North Carolina by Sector (TBtu)



The largest single sector in terms of total energy use (including the energy consumed to generate electricity for the sector) is industrial at 31% of the total. Transportation is second largest with 28% of total energy use. The residential (23%) and commercial (18%) sectors, if combined, would demonstrate that the largest energy use in the state is in buildings at 41%.

Energy efficiency, although not specifically an energy source, is projected to have reduced national energy needs by 31% between 1975 and 1999.

consumption in existing state buildings to save 20% by 2008, 4% per year or more for the next 5 years. The State Energy Office should submit an annual report to the Energy Policy Council, the Governor's Office, the State University System and other major energy users in North Carolina that provides data on energy saved in state buildings and universities by source and cost, energy efficiency activities undertaken in these buildings, the approximate investment in energy efficiency measures, and the overall economic costs and benefits of the program.

Exec-12 Working in conjunction with the State Construction Office, the State Energy Office should monitor, analyze, and report on the energy savings attributed to the new requirements on life-cycle cost analyses of the $3.1 billion higher education building program currently underway across the state, as well as future projects. The State Energy Office should be responsible for maintaining records that track the consequences of subjecting new public facilities to the newer life-cycle cost procedure.

Exec-13 North Carolina should facilitate efforts of local governments to finance energy efficiency and renewable energy projects; specifically, allow bundling of multi-jurisdictional energy efficiency projects to achieve economies of scale and improve opportunities for financing, restructure the underwriting provisions of the State Energy Office's low-interest energy loan program, and provide training in energy efficiency measures to building managers in local government buildings.

Energy Use in the Residential Sector

Exec-14 North Carolina State Government should continue to support a strong low-income weatherization program. The state should review the effectiveness of energy conservation programs conducted through the weatherization program and analyze opportunities for improvements. The State Energy Office should develop programs, in addition to weatherization, to address energy-efficient housing in the low-income sector.

Funding for Energy Programs

Exec-15 The General Assembly should review options, such as a Public Benefits Fund or other means, to enable funding of the basic services provided by the State Energy Office and the recommendations in the State Energy Plan.

DRAFT

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
April 20, 2004

The Environmental Review Commission (ERC) met on Tuesday 20 April 2004 at 9:00 a.m. in Room 1228 of the Legislative Building.

Representative Pryor Gibson presided over the 20 April 2004 meeting. The following members were present: Senators Clodfelter, Dorsett, Forrester, Horton, Kinnaird, and Weinstein, and Representatives Fox, Gibson, Hackney, Justice, LaRoque, McComas, Weiss and Williams. Mr. George Givens, Commission Counsel, Jeffrey Hudson, Assistant Commission Counsel, Assistant Commission Counsel, Susan Iddings, Assistant Commission Counsel, Jennifer McGinnis, Assistant Commission Counsel, Tim Dodge, Research Assistant, and Mary Watson, Commission Clerk were also present.

On 6 April 2004, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. A copy of the visitor registration and the agenda for the meeting are included in the attachments as **Exhibits B and C**.

Representative Gibson called the meeting to order and welcomed members and visitors attending the meeting.

George Givens, Commission Counsel, was asked to explain the agenda. He asked members to sign their reimbursement forms and asked visitor to sign the attendance sheet.

Mr. Givens said that he had distributed to each member, copies of read only reports that are required by law to be made to the Commission. These reports are listed as **Exhibit D**.

Mr. Givens said that the agenda item on the NC GreenPower Program deferred from 25 March 2004 would be presented at the 5 May 2004 meeting.

Mr. Givens announced that the next meeting of the ERC would be held in Asheville on 22 April 2004 at 1:30 p.m. at the Holiday Inn Asheville Airport. A revised itinerary was handed out to members. Mr. Givens said that the meeting would focus primarily on matters related to land conservation and preservation of open space.

Mr. Givens said that the next business meeting in Raleigh would be on Wednesday 5 May 2004 at 9:30 a.m. in Room 643 of the Legislative Office Building.

Representative Gibson called on Senator Horton to give a report on the Friday 26 March 2004 site visit to Belews Creek Stream Station.

Senator Horton said that the Belews Creek facility is the size of a small skyscraper and is operated by no more than 23 people. The plant brings in 200 railway cars a day. Those railway cars are emptied and returned. These 200 cars produce enough electricity to provide for 2.4 million houses daily.

Dr. David H. Moreau, Chairman, Environmental Management Commission (EMC) gave a quarterly report by the EMC as to its operations, activities, programs, and progress. A copy of his report is listed as **Exhibit E**.

Dr. Moreau said that he had been asked to speak to two issues: hydrogen sulfide and the Swift Creek issue.

Dr. Moreau said there were two items of concern on the Air Quality agenda. A number of minor correction to a long list of regulations included particulates in concrete batch plants, external roof tanks for petroleum storage, changes to the open burning rule, minor changes on the nitrogen oxide rules. Most of these were minor, non-controversial issues.

Dr. Moreau said that there was a change dealing with the effective date for compliance for municipal waste combustors moving from March 2003 to December 1, 2004.

Dr. Moreau said there were no significant groundwater actions during this quarter. The surface water actions were taken to approve the third round of the Tar Pamlico River Basin water quality plan and send to public hearing a proposed rule that deals with the whole issue of ?

Dr. Moreau said it was taken out of the earlier rules because of lack of clarity about exactly what they were. It was decided to come back and deal with all rules.

Dr. Moreau said that the control of hydrogen sulfide comes under North Carolina's toxic air pollutant regulations which covers hydrogen sulfide and 104 other chemicals.

Dr. Moreau said that in 1986, the acceptable ambient level was set at 2,100 micrograms per cubic meter of air. In 2001, the North Carolina Science Advisory Board recommended that the ambient level be changed to between 56 and 120 micrograms per cubic meter. That would have set the level at somewhere between 2.7 and 5.7 percent of the level that was set in 1986.

Dr. Moreau said that the EMC set the entire range from 56 to 120 to public hearing, the hearing officers recommended they adopt the 120 standard over a 24-hour period and this level was adopted unanimously by the EMC.

Dr. Moreau said there was a second issue involved in the hydrogen sulfide that has to do with the exemption of wastewater treatment plants at pulp and paper mills. The toxicant pollution rules provide for the exemption of certain sources or categories of sources to set them aside.

Dr. Moreau said there are two primary sources of hydrogen sulfide in North Carolina. Emissions inspections project that 56 percent of the hydrogen sulfide is emitted from fertilizer plants, 44 percent is emitted from pulp and paper mills. The range of emission from pulp and paper mills is between 50 and 97 percent from the wastewater treatment plants at those facilities.

Dr. Moreau said that the model analysis indicated that we had a maximum concentration at the property line of about 2,600 micrograms per cubic meter, which is 20 times the acceptable ambient level.

Dr. Moreau said that the modeling studies are done strictly as a screening device to indicate whether or not further field study is needed. These levels indicated that further study was necessary, along with how long to grant for that study to be done, what protection there would be for the industry while the study is being conducted and what happens when the results of that study are reported.

Dr. Moreau said that the majority of the hearing officers were convinced that the study should be allowed and completed by the end of calendar year 2008. They were also convinced that the exemption for wastewater treatment plants should be permanent but that the matter should be reviewed after the completion of the study. The EMC adopted that rule by an 11 to 5 vote.

Dr. Moreau said that the opponents of the exemption argued that the exemption should be temporary with an automatic expiration date that could be extended by rulemaking after the study was completed.

Dr. Moreau said that the EMC decided that if there were any evidence produced out of field study that action is necessary, the EMC would have to initiate rulemaking in 2009 to remove that exemption.

Dr. Moreau said there was not much disagreement on setting the acceptable ambient level and the argument as to whether it should be 56 or 120 was judged to be less important than moving from 2100 down to 120.

Dr. Moreau said that if the studies indicate that there is a serious exposure to hydrogen sulfide, there is authority to move on the basis of an emergency situation to deal with that.

Senator Albertson asked if hydrogen sulfide levels were checked out beyond the property lines.

Dr. Moreau said that they levels were not check out beyond the property lines. The issue was what existed at the property line but someone who did the modeling could better answer the question.

Senator Kinnaird asked Dr. Moreau if anyone had considered what the quality of life is for the people living around the property lines.

Dr. Moreau said that the EMC's authority is to determine whether or not any control is necessary for the protection of public health. The assumption is

made is if you meet the standard at the property line, you will meet it beyond the property line because of dilution and dispersion.

Senator Forrester asked Dr. Moreau if any of the contamination from hydrogen sulfide comes from out of state.

Dr. Moreau said that his limited reading on this is that hydrogen sulfide is eventually transformed into sulfuric acid and other products, that it is stable for two or three days, which would suggest that it is not being transported in that form over long distances.

Senator Horton asked about the 2009 completion date of the study and asked why it takes so long for these studies to be completed and what is the lack of urgency.

Dr. Moreau said that the studies have to be done in steps. First, you have to design the sampling program, then you have to do data collection and with the variable atmospheric conditions, you need more than just a one-year period to get a representative picture of what is going on. Then, there is some time built in for the analysis of that data and a report to the Commission.

Dr. Moreau said that there was some disagreement about that timeline and some felt that it should be shortened. Underlying that was the knowledge that both the CDC study and the industry-sponsored study would be underway and if it shows that we have a severe problem, then action could be taken under other authority.

Senator Horton asked Dr. Moreau what the position of the Department with regards to the timeline.

Dr. Moreau said that the recommendation that came from the staff at DENR was to have the study completed by 2007.

Senator Albertson asked Dr. Moreau if the property line is standard as far as air quality is concerned.

Dr. Moreau answered in the affirmative. It is for toxic air pollutants that an effect on the immediate neighborhood of the facility.

Dr. Moreau said that the EMC was also addressing the special management strategies for Swift Creek.

Dr. Moreau said that in July 2004, the EMC approved a 14-mile portion of the Swift Creek watershed in Nash County to be classified as outstanding resource waters. That came to the General Assembly in 2003 and the provision upstream of State Road 1003 was upheld. The provisions downstream of S.R. 1003 were held in advance and the ERC was then authorized to identify and evaluate options for consideration in the upcoming Short Session.

Dr. Moreau said that the water quality committee of the EMC took it upon itself to ask staff to make recommendations for the ERC's consideration. They are not the subject of rulemaking and have not gone to public hearing.

Dr. Moreau said that two key problems in dealing with the section of endangered species are the sediment load that comes in on that stream and the maintenance of adequate flow rates to protect habitat.

Dr. Moreau said there are four recommendations, which consist of a site-specific buffer enhancement, extending the protection throughout the 50 foot buffer to enhance or protect the stream flows, a recommendation on point source control that no new or expanded sources be added to that segment and a recommendation to enhance sediment control by adding to the existing controls certain provisions dealing with ground cover and the time they ground can be exposed to disturbance.

Senator Albertson asked Dr. Moreau if a vote had been taken on these recommendations.

Dr. Moreau said that the vote passed the water quality committee but not the EMC.

Mr. Thomas P. Augspurger, Ecologist, United States Fish and Wildlife Service (USFWS), gave a report on and discussion of options to protect water quality and endangered species in the portion of Swift Creek that is located east of Nash County Road 1003. A copy of Mr. Augspurger's PowerPoint presentation and a handout of ESA Basics are listed as **Exhibit F**.

Mr. Augspurger said that species get on the federal endangered list in one of two ways; either the USFWS can propose them for listing based on information they receive from other agencies or by petition.

Mr. Augspurger said there are two or three publications in the federal register that list endangered species on a species by species basis. The two that are required are the draft rule that requires a 60-day comment period and a final rule.

Mr. Augspurger said that there are 1,260 species on the Federal endangered species list and 68 of them are in North Carolina. Northing has been added to the endangered species list since 2000.

Mr. Augspurger said there is a permit process in the Endangered Species Act that lets people obtain permits for scientific collections for museums and research.

Mr. Augspurger said that the Fish and Wildlife Service really believes in Swift Creek and have provided the State with written statements on its water quality and its diversity of fish and mussels and the importance of trying to protect these waters.

Mr. Augspurger said that he had reviewed the plan that the Division of Water Quality was presenting today and thinks it is based on sound science and that they support its recommendations.

Senator Forrester asked Mr. Augspurger if the plants included on the endangered species list include the Venus flytrap.

Mr. Augspurger said there are 27 plants on the endangered list in North Carolina.

Representative McComas asked Mr. Augspurger if he could provide members with a list of all endangered species in the United States.

Mr. Augspurger said that he would be glad to provide the list.

Representative McComas asked about threatened species.

Mr. Augspurger said that for purposes of regulatory review, endangered and threatened species get the same review.

Senator Kinnaird asked if the Venus flytraps you see sold in stores are propagated or are they illegally harvested.

Mr. Augspurger said it was probably both. He said there is also legal propagation of endangered plants that can be offered for sale legally.

Mr. Scott Van Horn, Research Supervisor, Division of Inland Fisheries, Wildlife Resources Commission (WRC), gave a report on the State listing process and Swift Creek. A copy of his report is listed as **Exhibit G**.

Mr. Van Horn said that the WRC administers the North Carolina State species-listing program and addresses only those portions of a species population that exists within the boundaries of North Carolina.

Mr. Van Horn said that virtually any interested party could propose a listing of species in North Carolina of a "D" listing. The WRC takes those proposals and turns them over to their non-game advisory committee. This committee maintains a number of scientific councils that are structured around types of species. It is at this level where the technical review of the merits of the proposal is presented. This proposal is approved by the WRC and then goes to rulemaking.

Mr. Van Horn said that a fundamental difference between the Fish and Wildlife conservation listing program and the State program is that the State Program provides for no protections for listed animals other than a requirement that allows permitting of a collection. The only protection of species gained by being listed under the State program is the condition that the WRC is given permission to issue permits if you want to collect the animals.

Mr. Van Horn said that the purpose of the State listing process is to help conservation agencies and communities understand where the conservation-needy organisms are located.

Mr. Van Horn said that Swift Creek is a high quality habitat location with 14 mussel species. It is the quality of the habitat that also allows excellent game fish population to exist.

Senator Horton asked Mr. Van Horn to name some other habitats in North Carolina that are similar to Swift Creek in their diversity.

Mr. Van Horn said that in the western part of the State, the Little Tennessee River is another spot where there is a perfusion of mussels, fish and crayfish. Also, Lake Waccamaw is another example of a variety of specie richness.

Senator Kinnaird asked Mr. Van Horn if we are talking about the same area that the legislature enacted last year.

Mr. Van Horn said that the issue is the bottom third of Swift Creek and any resource waters designation was approved for the upper two thirds of the basin.

Senator Kinnaird asked Mr. Givens if Swift Creek was the legislation passed last year that allowed for development of Swift Creek and to take away protection.

Mr. Givens said that the EMC adopted rules to provide protections for Swift Creek on the basis of classifying those waters as outstanding resource waters (ORW). Those rules were subject to legislative review during the 2003 legislative session. Pursuant to the Administrative Procedure Act, a bill was introduced to disapprove the rules. That bill passed the House prior to the crossover deadline and was received in the Senate. The Senate's action was to divide the question and to decline to disapprove or to allow the rules to go into effect with regard to the upper two thirds of the watershed and to disapprove the rule with respect to the lower one-third, which is where the opposition arose. Our discussion today is with regard to the lower one-third. In order to change any decision from last year, the General Assembly would have to enact legislation, which would originate from the ERC, to be considered in the Short Session.

Senator Kinnaird asked if we could undo the legislation passed last year if we put in new legislation this year.

Mr. Givens said that the ERC could recommend legislation that would make it eligible and it would be up to the General Assembly to act on that legislation. One of the possibilities would be to allow the ORW rule to go into effect with respect to the lower third.

Senator Albertson asked if the recommendations from Dr. Moreau were the changes that need to be made in the lower third of Swift Creek.

Mr. Givens said that Dr. Moreau was reporting on the recommendations from the water quality committee of the EMC. The specifics of those recommendations would be the subject of the next presenter, Mr. Reeder. Those recommendations are not to reverse the decisions of last year but to proceed in a different fashion. Both sides would be heard on in this issue.

Senator Albertson asked how many miles are being talked about where they are recommending that we make a change.

Mr. Tom Reeder said that the entire watershed is 270 square miles or about 90 miles in length and the bottom one-third that did not get the ORW is about 30 miles in length or about 90 square miles.

Mr. Thomas A. Reeder Supervisor, Classification and Standards Unit, Division of Water Quality, DENR, gave a slide presentation on a plan that DWQ came up with to protect the federally listed tar spinney mussel in the downstream portion of the Swift Creek watershed. A copy of Mr. Reeder's presentation is listed in two handouts as **Exhibit H**.

Mr. Reeder said the Swift Creek watershed runs from Henderson to Tarboro, a total of 270 square miles.

Mr. Reeder said that in order to classify waters as ORW, there have to meet two criteria. There has to be excellent water quality and there have to be some sort of outstanding resource value.

Mr. Reeder said that only 14 miles of Swift Creek from S.R. 1004 to S.R. 1003 had the excellent water quality necessary with rare and endangered species, including the Tar Spinymussel. The EMC proposed to reclassify the 14 miles to ORW and to provide the ORW protective measure, or the ORW management strategy, to the entire watershed to protect the endangered species located there. This went through the Rules Review Commission and HB 566 was introduced. This bill allowed the ORW protection measure to be implemented in the upper two-thirds of the watershed and directed DWQ to develop a site-specific recommendation to protect the lower one-third.

Senator Kinnaird asked if the single creature, being picked singled out for protection, as opposed to jobs for development, is interfering with everything else and we are missing the entire enriched area. We have to get our emotions down and talk about what it means in the larger arena to protect these areas with enriched species.

Representative Weiss asked Mr. Reeder if the recommendations shown today were adopted would Swift Creek continue to protect the whole ecosystem.

Mr. Reeder said that he believes it would go a long way in protecting it.

Representative Weiss asked what is happening with the bottom third until action is taken and if development was being allowed.

Mr. Reeder said that anything could be done that is allowable with the nutrient sensitive waters rules.

Representative Gibson said that part of the negotiations was as much the concern to protect creatures in the creek, as it was a sincere concern to protect the whole area.

Representative LaRoque asked Mr. Reeder what the spiny mussel does and what benefit is it to the environment.

Mr. Gibson answered Representative LaRoque's question by saying that mussels in general are one of the best indicators of overall water quality because they are filter feeders.

Senator Albertson asked if mussels played the same role in water quality as oysters do in salt water.

Mr. Gibson said this was correct.

Representative Williams asked if there was a great density of wetlands in the lower one-third of Swift Creek.

Mr. Reeder said it is pretty well spread out over the watershed. The whole 100-year floodplain for this creek is basically wetlands.

Representative McComas asked if Mr. Reeder if he could be specific as to the names of the landowners along the Swift Creek.

Mr. Reeder said he could not tell who the landowners were but there is a lot of agriculture off on the tributaries.

Representative Gibson said there were a lot of different landowners along Swift Creek, mostly farmers with land handed down from generation to generation.

Representative McComas asked if there was any one individual landowner who owned the majority of land along Swift Creek.

Representative Gibson said that there was not anyone in particular in the lower third and he believed that Nash County was the largest single owner of property along the bank.

Senator Kinnaird said that when the negotiations were being debated on the floor about the upper two-thirds of Swift Creek, she believed that the county commissioners were against taking away the protections and so were a lot of the other governments.

Representative Gibson said that he thought there were people on both sides of the issue. He asked the presenters to provide him copies on disk to forward to Senator Swindell and Representative Tolson who represent the district in which the lower part of Swift Creek is located.

Because of a time constriction on the part of Dr. Leah M. Devlin, D.D.S., M.P.H. State Health Director, Division of Public Health, Department of Health and Human Services, Dr. Devlin was allowed to present her comments on the proposed modification of the rule setting out the acceptable ambient levels (AAL) for hydrogen sulfide under rules adopted by the Environmental Management Commission that govern the emission of toxic air pollutants out of order on the agenda. A copy of her comments is listed as **Exhibit I**.

Dr. Devlin recognized Dr. Dave Campbell, who heads up the Environmental Epidemiology Section of DHHS, who would be present to answer questions after her report.

Dr. Devlin said that the North Carolina Division of Public Health was glad to see the EMC action to lower the ALL for hydrogen sulfide from the current level of 2100 micrograms per cubic meter to 120 micrograms per cubic meter. Lowering the AAL does reduce the health problems in that area, particularly with asthmatics and eye irritation in the general public.

Dr. Devlin said that the Division had recommended to the EMC that all major sources of hydrogen sulfide, including pulp and paper mills and wastewater treatment plants be required to comply with the hydrogen sulfide AAL standard. Based on the DAQ data, pulp and paper mill wastewater treatment systems are responsible for perhaps as much as 90 percent of the hydrogen sulfide emissions from permitted air pollution sources in the state.

Dr. Devlin said the EMC does need to consider other factors in addition to health when it sets its standards.

Dr. Devlin said that the Division of Public Health is currently collaborating with the U.S. Department of Health and Human Services, the Agency for Toxic Substances and Disease Registry to do a study in North Carolina at one pulp and paper mill. They hope to start this study by fall and have data on the ground at that site in 9 to 12 months.

Dr. Devlin said that her commitment to the ERC was that she would bring that data before the Commission as soon as possible.

Ms. Lisa D. Martin, Director of Regulatory Affairs, North Carolina Home Builders Association, continued the discussion on buffer enhancements to protect water quality and endangered species in the portion of Swift Creek.

Ms. Martin said there is currently a 50-foot buffer requirement in the Tar Pamlico Basin on all perennial and intermittent streams. The local governments have the authority to increase those protections.

Ms. Martin said that sedimentation requirements have gone from a 30-day groundcover requirement to 15 days in the last three years. There is legislation pending that has 10 working days as a requirement.

Ms. Martin said that the State Sediment Pollution Control Act is a purview of the Sediment Control Commission, not the EMC.

Ms. Martin said there is no reason to pursue any further protection of Swift Creek until information shows that it is needed.

Mr. Derb S. Carter, Senior Attorney, Southern Environmental Law Center, said he was here to convey the consensus opinion of the state level environmental organizations that have been involved in the Swift Creek debate going back 10 to 12 years when the Tar Pamlico River Foundation first advocated enhanced river protection.

Mr. Carter said that what they are really talking about is a handful of streams in North Carolina have escaped all of the impacts of 200 years of agriculture sediment industry in the state in which there are few species that are clinging to their last hope for existence.

Mr. Carter said that federal actions in North Carolina include federal highway money that is expended for road construction. This requires compliance with the Endangered Species Act, federal water funding coming down from EPA for water and sewer infrastructure, and reaches private development through federal permits under Section 404.

Mr. Carter said and all of these issues will continue to arise and would do so in a total conflict that will pit endangered species against development with some extremely strong federal law behind it that says the species wins.

Mr. Carter said that Swift Creek is not immune from this. The current proposal in the lower section of Swift Creek in Edgecombe County to extend 100-mile water supply line in the Swift Creek watershed and it is colliding directly with the needed protection of the Tar River spiny mussel that has federal protection.

Mr. Carter said that he feels there is a better way to approach these problems by being proactive. A minimum amount of protection should be put on these waters on the ground against which all of these development proposals would be evaluated. If that protection exists, the issues will not arise as to whether or not it jeopardizes the species in the stream because the protections are fording a baseline that evaluates a project that says there will be no jeopardy. The alternative is to have project after project that goes through years of debate and potential litigation conflict regarding whether they are complying with the protection that is required by federal law.

Mr. Carter said that the ORW rule would allow 12 percent impervious surface or one house per acre lot in the entire watershed with no limit or no requirement to control stormwater. Higher density development could be done if measures were installed to control the first inch of storm.

Mr. Carter said that the correct approach would be to take a look at the entire watershed and put measures into place that left the buffer requirements the way they currently exist under the Tar Pamlico buffer rules, and not put controls on development in the watershed, counting on that buffer to intercept the pollution that is coming off from the development occurring in the surrounding land.

Mr. Carter said that his view is that either way there would be some comparable level of protection. With the new approach, there would be years of rulemaking and investigation and process before these measures would ultimately be put into place.

Senator Forrester asked if there was a proposal to use Swift Creek for a new water supply for a new community and what impact would that have if that were the case.

Mr. Carter said there is a current proposal to extend a 100-mile line to provide water from an existing facility that would extend into the lower part of Swift Creek to existing homes and any new development that may occur in that area. The concern is that with extension of water lines, it facilitates new development in that area and the agencies are saying that we do not have adequate controls on how that development occurs in that area to assure that the runoff from the development, the pollution that is delivered by that development would not adversely affect Swift Creek. This conflict could be resolved if these measures are put into place where agencies could be in a position to say that adequate measures in place on Swift Creek to provide protection so they could allow this water line to go through.

Senator Albertson asked if the ORW rules allowed one house per acre.

Mr. Carter said that under the ORW rules, which were also the basis for management strategy, determined that only the 14-mile segment met the criteria for outstanding resource water. However, because they found the resources upstream and downstream from this 14 mile segment, the proposed applying the same ORW requirements to the other sections. Those requirements are: no new or expanded discharges within that watershed and development limitations for either low density development in which impervious surfaces are kept to 12 percent, or one house per acre, or higher density development if a stormwater control system is installed.

Senator Albertson asked if either of those standards would meet the federal requirement and is this part of the resources available to the state.

Mr. Carter said that what is needed is to put measures in place on like the strategies that you get a consensus from those agencies that make the decisions, especially the Fish and Wildlife Service.

Agenda Item 7, an update on the status of designation of nonattainment areas to comply with the revised national ambient air quality

standard (NAAQS) for ozone (the 8-hour standard) was deferred to a later meeting.

Mr. Jeff Hudson, Assistant Commission Counsel, explained an Effective Date Timeline for Hydrogen Sulfide Rules. A copy of his handout is listed as **Exhibit J.**

Mr. Hudson explained that on April 8, 2004, the EMC adopted the hydrogen sulfide rules. The Administrative Procedures Act requires that within 30 days of this adoption, the EMC must submit these rules to the Rules Review Commission for their review. So, the EMC needs to get the rules to the RRC by May 7, 2004. If those rules were submitted by the EMC to the RRC on or before April 20, 2004 at 5:00 p.m., the RRC would have to review those rules at its May meeting. If, however, those rules are not submitted until after today, the RRC can wait until its June meeting to review those rules.

Mr. Hudson said if the RRC approves the rules at its May meeting and does not receive 10 or more objections from people opposing the rules, within six days of the RRC's approval, the hydrogen sulfide rules would become effective on June 1, 2004. If, however, the RRC approves the rules and receives 10 or more objections from persons within six days of RRC approval, the rules would be subject to legislative disapproval. This period of legislative disapproval would not be during the 2004 Short Session, but because of the lateness of the RRC, it would be held over to the 2005 Long Session.

Mr. Hudson said that the earliest date that the hydrogen sulfide rules could become effective is the 31st legislative day of the 2005 General Assembly, assuming that no bills to disapprove the rules is introduced during the Long Session. If that takes place, the rule would become effective either on the day that unfavorable final action is taken on a bill to disapprove the rule or the General Assembly adjourns without approving the rule.

Mr. Hudson said that another possible complication could be that the Board of Ethics was asked to give an opinion and while they are awaiting an answer from the Board of Ethics, no rules would be reviewed from EMC and Board of Pharmacy which both have lawsuits pending against the RRC. The EMC said they hope to hear from the Board of Ethics before their May meeting.

Mr. Hudson said if the RRC continues this policy beyond its May meeting, it is unclear as to when they would get to the hydrogen sulfide rules.

Mr. Hudson asked the staff director to attend today's meeting and report on the Commission's actions; however, because the Commission had not issued a letter to the Board of Ethics.

Mr. Hackney asked Mr. Hudson if the RRC were taking a position that if anyone sued them, they would stop business.

Mr. Hudson said he was not comfortable speaking for the RRC but he was told that they have sought an opinion from the Board of Ethics on this issue to determine if there is a conflict of interest issue.

Senator Kinnaird asked what would happen if somebody sued the ?

Mr. Hudson said that based on their action, even the hydrogen sulfide rules would not be voted on by the Board of Ethics because they are EMC rules.

Representative Weiss asked Mr. Hudson to explain what the rule that was passed says.

Representative Gibson said that the next presenter would cover this in his comments.

Mr. B. Keith Overcash, Director, Division of Air Quality, DENR, gave some background on the air toxics rule and on the Scientific Advisory Board that helps develop standards they work with. A copy of Mr. Overcash's comments is listed in **Exhibit K**.

Mr. Overcash said that air toxics programs have been around since 1990 by executive order from the Governor to develop the program in the late 1980s. Legislation (SB324) was passed and directed the EMC to go forward in developing an air toxics program. Regulations were put into place in May 1990 for 84 toxic air pollutants and 21 additional carcinogenic pollutants were put into effect in May 1, 1991 for a total of 105. Acceptable ambient limits were established for all 105.

Mr. Overcash said that the toxics program standard is to control the toxic air pollutants for the protection of public health. It is both a proactive and a reactive program.

Mr. Overcash said that features of the toxics program are computer modeling, through screening levels, technical infeasibility and economic hardship provisions and site-specific risk assessment provisions where facilities may need relief.

Mr. Overcash said that the air toxics program is implemented through air permits. Once a facility is triggered into the program, they need a permit from DAQ that have certain limits in them to make sure that compliance standards are met. These permits are based on emissions from that facility.

Mr. Overcash said that DAQ does the screening modeling for the companies that are triggered into the program. If it goes beyond a screening model to a more complex model, the facility is required to cover the cost for the screening.

Mr. Overcash said that the toxics protection branch does community assessment studies, evaluations of control of toxic air pollutants and keep information and the rule updated.

Mr. Overcash said that the Scientific Advisory Board (SAB) is a board established by the Secretary of DENR when the rule went into place in the early 1990s.

Mr. Overcash said that in 1997, there was a working group established by ERC that looked at what that SAB was supposed to do and there was consensus reached on several items, which were brought back to the ERC at that time.

Mr. Overcash said that consensus was reached on the SAB providing a mechanism for bringing good science into air toxics risk assessment.

Mr. Overcash said that the role of the SAB is advisory and not regulatory and its principal function is to conduct risk assessments of compounds and pollutants and bring recommendations to DAQ who in turns brings their recommendations to EMC for appropriate action.

Mr. Overcash said that SAB provides an analysis of the science and may also provide analysis for a single chemical. That is actually what happened with hydrogen sulfide. The SAB brought several different analyses to the Air Quality Committee and EMC based on the different effects that hydrogen sulfide has.

Mr. Overcash said that the final use of the analysis is the responsibility of the EMC.

Mr. Overcash said that the SAB is a voluntary, seven-member body, made up of doctoral level toxicologists, occupational epidemiologist and public health scientists.

Mr. Overcash said that the majority of the air pollutant levels have not been updated; however, a process has been started to re-evaluate levels that the SAP has recommended.

Mr. Overcash said there is some questions as to the validity of the factors being used to calculate these numbers. So, the EMC has approved a study to develop better emissions data from the wastewater lagoons.

Mr. Overcash said that on April 8, 2002, the EMC unanimously voted to change the old AAL from 1500 parts per billion for a one-hour average to 83 parts per billion (120 micrograms per cubic meter) for a 24-hour average.

Mr. Overcash said that, under majority vote, the EMC exempted wastewater treatment lagoons at pulp and paper mills for the toxic air pollutants of hydrogen sulfide and methyl mercaptan.

Mr. Overcash said that the EMC call for further study to better develop the emissions inventory from the wastewater lagoons. The industry will be required to do some testing and measuring to try to develop an emissions standard or to verify the current standard. They will be required to submit that

information to DAQ who will evaluate whether they have done the proper testing and measuring and then it will be determined whether or not they are in compliance.

Mr. Overcash said that if a facility fails to show compliance, there is a requirement in the new rule that requires them to set up a monitoring system to monitor off-site to determine what the effects are on the community. They will bring the results of that study back to the Director in February 2009 for review. The Director will then make a report to the EMC for consideration on the rule at that time.

Senator Forrester asked Mr. Overcash if second hand smoke is considered as one of the 105 toxic pollutants.

Mr. Overcash said that it was not.

Representative Fox asked Mr. Overcash what the change in the AAL's mean.

Mr. Overcash said that the changes make the levels more stringent than before. To put a one-hour number with the 82 would be hard to do, but 83 on a 24-hour average is much tougher than the 1500 was on one-hour.

Representative Fox asked Mr. Overcash if he could give a ballpark number.

Mr. Overcash said it would be tough to do.

Representative Gibson said that it was approximately 3.5 times as stringent.

Representative Weiss asked Mr. Overcash what the percentage of H2S pollution is that is currently coming from the pulp and paper mill industry in North Carolina.

Mr. Overcash said that if you include the wastewater lagoons, it is about 90 percent of the H2S from the permitted facilities.

Representative Weiss asked Mr. Overcash if there was any difference in the health effect of H2S that comes out of pulp and paper mill lagoons in relation to the other 10 percent that comes from other sources.

Mr. Overcash said that it was the same H2S.

Representative Weiss asked if the EMC was presented evidence of the health impacts that H2S would have on our population.

Mr. Overcash said that DHHS did present information throughout the rulemaking process.

Representative Hackney asked Mr. Overcash to name the members on the SAB.

Mr. Overcash said that the Chairman was Dr. George Lucier, and members included Dr. Woodall Stopford, and Dr. Tom Starr, Dr. Ronald Milnick, Dr. Man-Sung Yim, Dr. Elaina M. Kenyon and Dr. Jerry W. Spoo.

Representative Hackney asked if all of these members were academics.

Dr. Lori Cherry, DHHS, Division of Public Health, said that they were not all academics, that some were epidemiologists and family physicians.

Dr. Campbell, head of Occupational and Environmental Epidemiology Branch of Division of Public Health, said that his department was involved in doing the health and risk assessment of these different compounds, along with Air Quality.

Dr. Campbell said that the health effects at the old level were a respiratory irritant, a skin irritant and mucus membrane irritant. H2S also has an objectionable odor.

Dr. Campbell said that the largest concern was that H2S produces asthma symptoms at the old level. At the new level, these concerns are a lot more protected.

Representative Weiss asked Dr. Campbell if any evidence was given to the EMC about the cost of hospital visits for asthmatics. It seems like we have shifted a burden here.

Dr. Campbell said that this was a concern; however, there was no data to support this. However, they would like to conduct a study around one of the pulp and paper mills as to the effects of H2S on asthmatics.

Representative Weiss asked Mr. Overcash if there was any incentive for industry to comply with standards.

Mr. Overcash said that there was no end date for exemptions; however, if the study being done by ATSDR indicates that there are problems, there is ability in the rule for the Director to make a call and decide that something needs addressing immediately. Rulemaking could then be initiated to take action.

Representative Weiss expressed concern that, even with the concerns of health risks associated with H2S, exemptions were still made to 90 percent of the violators.

Mr. Overcash said that it was felt that it was necessary to get more information on the emissions from those plants before they put more money into controls.

Representative Gibson said that there is really no way to measure ambient HS2 effectively--what we are able to measure and what is actually occurring.

Representative McComas asked what constitutes a high level of H2S.

Representative Gibson said that there is no clear answer to this question.

Representative McComas asked Mr. Overcash what counties the paper mills are located that are emitting high levels of H2S.

Mr. Overcash said that the papers mill in question is located in Washington County.

Representative McComas asked if there was any scientific data to look at in other states that have heavy concentrations of H2S.

Mr. Overcash said that staff had looked at data from other states. H2S is treatable; however, the problem with the plants in North Carolina is that the wastewater lagoons are so larger and spread out that it is hard to capture the H2S and treat it. New wastewater treatment plants would have to be built to put in a more activated wastewater treatment system.

Representative Gibson said that given the economics, these plants would have to go overseas where there are no regulations.

Mr. Overcash said that some of the plants have marginal operations and the estimates on what it would cost to do the modifications at these facilities are high.

Representative Williams said that if there is a negative effect on asthma sufferers, have studies been done in other parts of the country that we could base our decisions on or are we going to be the first state to study this.

Dr. Campbell said that there are a lot of studies that have been done but it is difficult to measure H2S by itself because it is usually emitted with other things. Most of the studies done are to look at asthma visits to hospitals around an emitter of H2S and other things.

Representative Williams asked if the data is not accurate in other parts of the country, how could it be accurate in North Carolina.

Dr. Campbell said that other compounds would have to be measured along with H2S.

Mr. Givens added, that with regard to H2S, there is not regulated under the Federal Clean Air Act but under the State Air Toxics Program, a health based program. The federal program is a technology-based program.

Mr. Givens said that Agenda items 7 and 9 were going to be deferred until the 5 May 2004 meeting.

Mr. Michael Shore, Southeast Air Quality Manager, Environmental Defense, addressed concerns about the Hydrogen Sulfide Rulemaking (H2S). A copy of his handout is listed as **Exhibit L**.

Mr. Shore said that not only does H2S trigger asthma attacks or cause eye and skin irritation, it smells really bad and is an embarrassment to our state.

Mr. Shore said that the SAB and the Division of Public Health recommended one standard and the EMC opted for a weaker standard. However, this is not the reason that the rule failed to strike an appropriate balance. The environmental community accepts those as a compromise.

Mr. Shore said that the EMC has failed to protect public health because of its permanent exemption of the wastewater treatment ponds at paper mills. It is one thing to provide the paper mills time to come into compliance or to provide an exemption with a sunset; however, a permanent exemption sells the people of North Carolina short.

Mr. Shore said that he acknowledges the economic issues and that is why the EMC process takes the economics takes into account with the air toxics rule. There is an economic provision in the air toxics rules that states if a company does not meet the standards, it has an opportunity to come to DAQ and negotiate a plant-specific standard. There is a long window for companies to meet the standards.

Mr. Shore said that we, in this state, could have started a long and reasonable process to reduce H2S from the major source of this pollution in a way to be considerate of economic issues. Instead, we have sold the public short with the blessing of the EMC.

Mr. A. Preston Howard, Jr., P.E., President, Manufacturers and Chemical Industry Council of North Carolina, gave a slide presentation on Acceptable Ambient Level Hydrogen Sulfide (H2S). A copy of Mr. Howard's slides and a letter from Dr. Roy N. Everett, Eastern Carolina Internal Medicine, PA, to Mr. Thomas C. Allen, Division of Air Quality, are listed as **Exhibit M**.

Mr. Howard said that the six affected MCIC Members sites, all in economically depressed regions, are Blue Ridge Paper Company in Canton, International Paper in Regal Wood and Roanoke Rapids, PCS Phosphate in Aurora, and Weyerhaeuser in New Bern and Plymouth.

Mr. Howard said that he believes the EMC reached the right decision. All of these facilities are economic hubs. They directly employ from 500 to 1200 people and collectively provide for a total of 9,000 jobs with an annual payroll of $494 million.

Mr. Howard said that there has been much debate about the regulated sources. A large percentage, about 85 percent, of H2S being emitted in this state comes from sources other than the four companies he represents.

Mr. Howard said that the hearing officers for the EMC were Dr. Delila Blanks, UNC-Wilmington, Dr. Frank Shaw, M.D., Fayetteville and Mr. Tommy Jenkins, former State Senator deliberated long and hard about the recommendations to the EMC.

Mr. Howard said that the EMC based their recommendations for a lower AAL on the Jappinen study. The SAB interpreted the results of the Jappinen study by saying there was an asthmatic response.

Mr. Howard made reference to the letter in Exhibit M, from Dr. Roy Everett. He encouraged members to read the letter to see the compelling evidence that the EMC ultimately adopted.

Mr. Howard said there had been 11 different studies on respiratory health residents living near pulp mills and refineries, two of the largest sources of H2S in our country. In those 11 studies, none of them found any evidence of significant increase of asthma or asthma like symptoms due to H2S exposure.

Mr. Howard said that MCIC's position is that there is no scientific evidence to suggest that current AAL's has any impact on the public's health, yet they endorse one of the recommendations that came from the SAB, the reduction of the AAL standard.

Mr. Howard concluded by saying that in the absence of an exemption, we would have to abandon the treatment technologies and build new systems. The cost to do this is about $360 million. This is neither technologically or economically affordable.

Mr. Howard said that studies are being done to conduct air dispersion modeling to determine predicted concentrations beyond the property lines of these plants.

Mr. Howard said that what is missing in the debate is what the real emissions from these lagoons actually are. All the data we have is based on someone's estimates.

Mr. Howard concluded by saying that the SAB are the risk assessors. MCIC thinks that they have weighed all of the merits and looked at the studies done for entire regions of our state and assigned an AAL that affords adequate protection for public health without unnecessarily jeopardizing the working families in our state.

Senator Horton asked Mr. Howard if he would suggest treating all of the hog lagoons with exemptions from regulations as the wastewater treatment lagoons are being exempted.

Mr. Howard said that he was not implying that H2S was not a dangerous chemical. It is indeed dangerous at high concentrations. Whether you choose to regulate the unregulated sources of H2S across our state is the decision of our legislators. However, they believe that the controls are reasonable under the circumstances and are going to do their best to comply with them.

Senator Horton said that if wastewater treatment plants are going to be exempt, maybe we should consider exempting other treatment plants.

Mr. Howard said that the other sources are already exempted from the air toxics rule.

Senator Horton asked who would be subject to the 120 standard.

Mr. Howard said that it would be anybody who holds an air permit would be subject to these standards including chemical and asphalt plants. The only sources exempted are the emissions off the wastewater lagoons. In the actual paper plant operation, there are plants sources of emission that have to be controlled.

Mr. Howard said that PCS Phosphate is probably going to spend more money than any of them to comply with the standards because they do not operate a lagoon. They operate a fertilizer plant that generates the states largest concentration quantity of H2S emissions.

Senator Horton asked why the hog farmers are not exempt.

Mr. Howard said that they are exempt.

Senator Horton asked who isn't exempt.

Representative Gibson said that unless you are a permitted facility, you are not eligible for exemption.

Senator Horton asked if there was any lagoon anywhere in the state that isn't exempt.

Mr. Howard said that there might not be any other lagoon in the state that isn't exempt.

Mr. Howard added that with regard to permanent versus temporary exemptions, there are 28 exemptions to the State Air Toxics Program. None of them have a sunset date in them. They are all permanent as long as the EMC does not ask to amend them.

Mr. Howard said that MCIC's members supported a provision in the draft rule that the hearing officers brought forward that would have mandated a review of these rule in 2009. The EMC chose not to do this.

Senator Kinnaird asked Mr. Howard if the lagoons are ongoing or are they continuing to receive affluent from these facilities.

Mr. Howard said that these lagoons operate every day.

Representative Gibson asked how PCS Phosphate's emissions are measured.

Mr. Howard said that PCS Phosphate's emissions are all through point sources, through emissions scattered throughout a plant.

Representative Williams asked Mr. Howard if MCIC's studies are the only ones that showed no regulatory affect going on.

Mr. Howard said that it was one of two studies done.

Representative LaRoque said that he believes that the members of the MCIC are people who start off with an unbiased opinion.

Representative Weiss asked Mr. Howard if there was anything in this new rule that specified that new companies could not build lagoons. Has anything been done in this state to promote new technology available.

Mr. Howard said that there were give different options that went to public hearing. One of those options would have differentiated the standard for the AAL between the new facilities and existing facilities. The EMC chose not to make that differentiation.

Representative asked if it was possible that a new manufacturing process with create a choice between new technology and retrofitting existing operations.

Mr. Howard said that the EMC only exempted paper mill lagoons. There will be no more paper mills built in the state and we will not see them build this technology if they do build.

Mr. Short added that there were considerable difference in his presentation and Mr. Howard's presentation and he wanted to underscore the poor decision that the EMC made. They all agreed that H2S is a threat and that the 120 standard is a reasonable standard to meet.

Mr. George J. Kapetanakis, Litter Programs Coordinator, Office of Beautification Programs, Department of Transportation, gave a Semiannual report on agency litter enforcement, litter prevention, and litter removal efforts. A copy of his report and a copy of the 2003 Interagency Report on Litter Cleanup, Education/Prevention and Enforcement are listed as **Exhibit N**.

Senator Kinnaird asked Mr. Kapetanakis if his division had considered a bottle deposit/refund program as well as a packaging return program.

Mr. Kapetanakis said that these were good suggestions and he would consider them as good recommendations.

Representative Fox asked why there were less than 60 percent convictions made on littering offenses.

Mr. Kapetanakis said that officers were so busy that they did not show up for the court dates.

Mr. Givens distributed a memorandum to members inviting them to participate in a Phase II Stormwater Management Working Group on 27 April 2004. A copy of this memo is listed as **Exhibit O**.

The meeting was adjourned at 12:50 p.m.

6 April 2004

TO: Interested Parties – Environmental Review Commission

FROM: George F. Givens, Commission Counsel
Mary R. Watson, Commission Clerk

RE: **Notice of Meetings - 20 April and 22 April 2004; Additional Information**

COMMISSION MEETING – 20 APRIL 2004:

The Environmental Review Commission will meet at 9:00 a.m. on Tuesday 20 April 2004 in Room 1228 of the Legislative Building in Raleigh. Please note the change in time and location from the normal meeting schedule.

At this meeting, the Commission will hear reports from State agencies, consider studies for which the Commission is responsible, discuss topics to be considered at future meetings, and attend to other matters. The meeting is expected to conclude around 12:00 noon. Listed below are potential agenda topics for this meeting. More specific information regarding the agenda for the 20 April meeting of the Commission will be developed at the public staff planning meeting.

1) Report on options to protect water quality and endangered species in the portion of Swift Creek that is located east of Nash County Road 1003 (S.L. 2003-433, Sec. 3)

2) Update on issues related to the Phase II stormwater rules

3) Discussion on the proposed modification of the rule setting out the acceptable ambient level (AAL) for hydrogen sulfide under rules adopted by the Environmental Management Commission that govern the emission of toxic air pollutants

4) Status report on the One-Stop Permit Assistance and Coordination Program. (S.L. 2001-424, Sec. 19.6)

5) Report on the Express Review Pilot Program and whether the Pilot Program be continued or expanded (S.L. 2003-284, Sec. 11.4A(e))

6) Annual report on the status of leaking petroleum underground storage tanks, the State cleanup funds, and the Groundwater Protection Loan Fund (G.S. 143-215.94M)

7) Report on issues related to the Leaking Petroleum Underground Storage Tank Cleanup Program (S.L. 2003-352, Sec. 12.(a))

8) Information item on the Transportation Demand Management Program

9) Semiannual report on agency litter enforcement, litter prevention, and litter removal efforts (G.S. 147-12(b))

10) Annual report on recycling efforts of public schools in the State (S.L. 2001-512, Sec. 11)

11) Information item on the NC GreenPower Program

12) Other matters related to the Commission's powers and duties under G.S. 120-10.43

SPECIAL BUSINESS MEETING – 22 APRIL 2004:

The Commission will hold a special business meeting at the Holiday Inn, Asheville Airport in Fletcher, North Carolina at 1:30 p.m. on Thursday 22 April 2004. This special meeting will focus primarily on various matters related to land conservation and preservation of open spaces and will be held in connection with a tour of Gorges State Park and Dupont State Forest on Thursday 22 April 2004 and Friday 23 April 2004. Listed below are potential agenda topics for this meeting.

1) Annual Report on allocations from the Parks and Recreation Trust Fund from the prior fiscal year (G.S. 113-44.15(c))

2) Annual Report on acquisitions made with funds from the Natural Heritage Trust Fund (G.S. 113-77.9(e))

3) Annual report on progress towards attaining the State's goal of protecting one million acres of farmland, open space, and conservation lands (G.S. 113A-241(c))

4) Annual report on implementation of the Conservation Easements Program and inventory of all conservation easements held by DENR (G.S. 113A-235(c))

5) Annual Report on implementation of the Clean Water Management Trust Fund (G.S. 113-145.6A(a))

6) Report by the Land for Tomorrow Coalition on the results of its conservation needs assessment

7) Report on the designation of the Blue Ridge National Heritage Area (S.L. 2001-491, Sec. 18.10)

8) Report on the Waste Reduction Partners Program

9) Other matters related to the Commission's powers and duties under G.S. 120-10.43

Directions to the Holiday Inn, Asheville Airport: From Asheville, take Interstate 26 south to exit 40 (formerly exit 9). At the top of the off ramp, turn left over the bridge. The Holiday Inn will be visible on the left. The hotel telephone number is (828) 684-1213.

PLANNING MEETING:

To facilitate development of the agenda for the 20 April and 22 April meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel will hold an informal public planning meeting at **10:00 a.m. on Tuesday 13 April 2004 in Room 605 of the Legislative Office Building**. Persons who wish to participate in the development of the agenda for meetings of the Commission, or who are interested in any matter before the Commission, are invited to attend. Commission members are not expected to attend these meetings.

FUTURE MEETINGS:

The Commission will hold a regular business meeting at **9:30 a.m. on Wednesday 5 May 2004 in Room 643 of the Legislative Office Building.**

The 2004 Regular Session is scheduled to begin at 12:00 noon on Monday 10 May. The Commission normally meets shortly after the beginning of the session to complete work on legislative proposals prior to the commission/ committee bill request deadline, which in 2004 is 4:00 p.m. Wednesday 12 May. A Commission meeting at 2:30 p.m. on Tuesday 11 May is tentatively scheduled for this purpose.

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Leaking Petroleum Underground Storage Tank Working Group
2:00 p.m. Monday 19 April 2004– 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, please feel free to contact the Commission Counsel at (919) 733-2578.

RE: **Attached Required Report – Strengthen Littering Laws**

S.L. 2001-512, sec. 11 requires the State Board of Education to report to the Joint Legislative Education Oversight Committee and the Environmental Review Commission on the recycling efforts of the public schools in the state.

The attached report was provided to the State Board of Education in an informational mailing in November 2003.

Thank you for your continued service to our State and support for our public schools.

RECYCLING QUESTIONNAIRE RESPONSES

SUMMARY PAGE

Senate Bill 1014 directed the State Board of Education to report to the Joint Legislative Education Oversight Committee and the Environmental Review Commission on the number and types of recycling programs in the public schools of North Carolina.

Number of LEAs Recycling	**103**	**88%**
Number of LEAs Not Recycling	**14**	**12%**

Summary of Recylced Items

Item Recycled	LEA Participation	% of LEAs
Cans	90	77%
Cardboard	73	62%
Computer hard drive	43	37%
Computer keyboard	41	35%
Cooking oil	57	49%
CRT Monitor	30	26%
Glass bottles	23	20%
Motor oil	77	66%
Newspapers	73	62%
Other glass containers	16	14%
Paper	80	68%
Plastic bottles	48	41%
Plastic cafeteria plates/cups	15	13%
Plastic cafeteria utensils	10	9%
Printer	40	34%
Tires	72	62%
Other Items (i.e. ink cartridges, light bulbs, etc.)	64	55%

RECYCLING QUESTIONNAIRE RESPONSES[1]

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
10	Alamance-Burlington	Yes	School (33)[2]	newspapers, other glass containers, cardboard, cans, motor oil, paper, plastic bottles, glass bottles, tires	Sale of computer hard drive, computer keyboard, printer	Working on recycling cooking oil
20	Alexander	Yes	School (10)	newspapers, cardboard, cans, printer, paper	printer cartridges, cans at football games collected by local citizen	
30	Alleghany	Yes	School (4)	(1) newspapers, (1) cardboard, (1) cans, (1) printer, (1) paper, (1) plastic bottles, (1) cooking oil		Alleghany High School is the only school with a recycling program. One school is exploring ways to reinstate a recycling plan for cans, glass & cardboard. One school has boy scouts collecting cans for fund raising. One school has had a recycling program but it has been inactive for three years. The Student Council is interested in starting it back up and are in the process of purchasing bins.
40	Anson	No	School (9)	cans, motor oil, cooking oil, tires	toner cartridges, computer components	Paper - no local sources will take recycled paper products; Computers - the number is too small
50	Ashe	Yes	School (6)	(3) newspapers, (5) cardboard, (2) cans, (3) paper	computers reused for parts only; tires are capped;Central Office recycles paper (not included in school count)	
60	Avery	Yes	School (9) & LEA	(1) newspapers, (1) computer hard drive, (1) computer keyboard, (6) cans, (1) CRT monitor, (4) paper	Copier ink cartridges, telephone books	
70	Beaufort	Yes	School (14)& LEA	Paper	Printer Cartridges	
80	Bertie	Yes	School (10) & LEA	(9) newspapers, (2) computer hard drive, (2) computer keyboard, (5) cans, (2) motor oil, (3) paper, (9) cooking oil, (2) tires	(10) printer cartridges	
90	Bladen	No	(14)			Bladen County does not have recycling plant. No place to process. No program or vendor around.
100	Brunswick	No	School (16)	(1) newspapers, (1) cans, motor oil, (3) paper, (3) plastic bottles, tires	Metal, ink cartridges, flourescent light bulbs, petroleum based fluids	A recycling program has not been implemented system wide due to lack of necessary resources.

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
110	Buncombe	Yes	School (41)	newspapers, computer hard drive, computer keyboard, other glass containers, cardboard, cans, motor oil, CRT monitor, paper, plastic bottles, glass bottles, cooking oil, tires	Scrap metal from maintenance, transportation and vocational classes.	
111	Asheville City	Yes	LEA (8)	computer hard drive, computer keyboard, cardboard, cans, printer, CRT monitor, paper		
120	Burke	Yes	LEA (25)	cardboard, cans, motor oil, paper		
130	Cabarrus	Yes	School (28) & LEA	computer hard drive, computer keyboard, (13) cardboard, printer, motor oil, CRT monitor, (13) paper, (26) cooking oil, tires	Printer cartridges	
132	Kannapolis City	Yes	School (7)	newspapers, computer hard drive (re-use), computer keyboard (re-use), (1) cardboard, (7) cans, (7) paper, (2) cooking oil, motor oil, CRT monitor, tires	Printer ink cartridges, phone books, fluorescent light bulbs	We have begun the process of organizing recycling at the LEA level
140	Caldwell	Yes	LEA (25)	cardboard, cans, paper, plastic bottles		
150	Camden	Yes	LEA (3)	newspapers, cardboard, cans, motor oil, paper, cooking oil, tires	printer ribbons, aluminum cans, motor oil	
160	Carteret	Yes	LEA (16)	(16) cardboard, (1) cans, (16) paper, (16) cooking oil, motor oil, tires		
170	Caswell	Yes	School (6) & LEA	cans (drink - some schools), motor oil, tires		We are exploring options at this time
180	Catawba	Yes	School (25)	(4) newspapers, (12) cardboard, (12) cans, (23) paper, (4) plastic bottles	Ink/toner cartridges (4 schools)	
181	Hickory City	Yes	School (10)	(4) newspapers, (1) other glass containers, (6) cardboard, (5) alum. cans, (2) other cans, (8) paper, (3) plastic bottles, (1) glass bottles, computer hard drive, computer keyboard, printer, CRT monitor, motor oil, tires	Computer items are sold by auction or state surplus; Motor oil and tires are recycled by the vehicle maintenance vendors	
182	Newton-Conover City	Yes	LEA (6)	newspapers, cardboard, cans, motor oil, paper, plastic bottles, glass bottles, tires	Toner cartridges	
190	Chatham	Yes	School (15) & LEA	newspapers, cardboard, cans, motor oil, paper, cooking oil		
200	Cherokee	Yes	School (13)	newspapers, computer hard drive, computer keyboard, other glass containers, cardboard, cans, printer, motor oil, paper, plastic bottles, glass bottles, tires		
210	Edenton/Chowan	Yes	School (4)	newspapers, cardboard, motor oil, paper, tires		
220	Clay	Yes	School (3)	cans, printer, paper, tires	Printer cartridges	
230	Cleveland	Yes	LEA (12)	cardboard, cans, motor oil, tires	Printer cartridges	
231	Kings Mountain City	Yes	LEA (9)	(2) cardboard, (9) cans, (8) cooking oil		

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
232	Shelby City	No	(7)	Not a formal program. Groups involved on a sporadic basis for cans, plastic bottles, other glass containers		Attempts have been made in the past to develop a more comprehensive effort, but resources are not available. City does not collect recycled materials - merely has a drop off point; inadequate for school use. Is the state surveying/encouraging/requiring municipalities to promote/support recycling? If not, why would the legislature expect schools to be able to implement a successful program if the municipality can't accomodate the recycled materials?
240	Columbus	Yes	School (19)	newspapers, plastic cafeteria plates/cups, cardboard, cans, printer, motor oil, cooking oil, tires	bulbs - ballast	
241	Whiteville City	Yes	School (5) & LEA	(LEA) newspapers, (LEA) computer hard drive, (LEA) computer keyboard, (LEA) cardboard, (4) cans, (LEA) printer, (1) motor oil, (LEA) CRT monitor, (LEA) paper, (4) cooking oil		
250	Craven	Yes	LEA (22)	newspapers, cardboard, cans, motor oil, paper, cooking oil, tires	Take computer equipment to a site the county owns. We think they recycle.	
260	Cumberland	Yes	School (85) & LEA	cardboard, cans, motor oil		
270	Currituck	No	School (8) & LEA	cardboard, cans, printer, motor oil, paper, plastic bottles, glass bottles, tires		
280	Dare	Yes	School (9)	(4) newspapers, (1) other glass containers, (3) cardboard, (2) cans, (1) motor oil, (5) paper, (1) plastic bottles, (1) glass bottles, (8) cooking oil, (1) tires	Ink cartridges, toner cartridges, aluminum pop tops, antifreeze	
290	Davidson	Yes	School (29)	newspapers, cardboard, cans, paper		
291	Lexington City	Yes	School (6)	newspapers, cardboard, cans, printer		
292	Thomasville City	Yes	School (4) & LEA	newspapers, computer hard drive, computer keyboard, other glass containers, cardboard, cans, printer, motor oil, paper, plastic bottles, glass bottles, cooking oil	white paper	

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
300	Davie	Yes	Private business (9)	cardboard, motor oil, tires		County commissioners did away with recycling program as of 9/20/03 and dismissed all employees and inmates. It's a shame! We were recycling cans, paper, plastic, metals and glass. Have no one to pick it up; told to put everything in dumpsters. I am very disappointed. Please help.
310	Duplin	Yes	LEA (15)	newspapers, cardboard, cans, motor oil, paper, cooking oil, tires	copier ink cartridges	
320	Durham	Yes	School (43) & LEA	newspapers, plastic cafeteria plates/cups, other glass containers, cardboard, cans, motor oil, paper, plastic bottles, glass bottles, cooking oil, tires		
330	Edgecombe	Yes	School (15)	(15) computer hard drive, (15) computer keyboard, (4) cans, (15) printer, (1) motor oil, (1) paper, (1) tires	Batteries, printer ink cartridges	
340	Winston-Salem/Forsyth	Yes	LEA (69)	newspapers, cardboard, cans, motor oil, paper, plastic bottles, cooking oil, tires		
350	Franklin	Yes	School (14) & LEA	(4) newspapers, (1) plastic cafeteria plates/cups, (1) plastic cafeteria utensils, (1) computer hard drive, (1) computer keyboard, cardboard, cans (aluminum), (1) printer, (5) paper, (2) plastic bottles, (3) glass bottles	(3) Printer/Toner cartridges; Maint. Shop - oil filters, oil, coolant; Cafeteria - cans, steel	We are looking to expand paper to all 14 schools this fall.
360	Gaston	Yes	LEA (52)	plastic cafeteria plates/ cups, computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, CRT monitor, cooking oil, tires		
370	Gates	Yes	LEA (5)	cardboard, cans, printer, motor oil, paper, cooking oil, tires		
380	Graham	Yes	School (3) & LEA	computer hard drive, computer keyboard, motor oil, tires		
390	Granville	Yes	School (14) & LEA	(8) newspapers, (LEA) computer hard drive, (LEA) computer keyboard, (8) cans, (LEA) printer, (LEA) motor oil, (LEA) CRT monitor, (5) paper, (LEA) tires	(LEA) Printer cartridges, computer CPUs, batteries, freon	
400	Greene	Yes	School (4)	newspapers, cardboard, cans, motor oil, cooking oil, tires		
410	Guilford	Yes	School (105)	newspapers, cardboard, cans, motor oil, paper, plastic bottles, cooking oil, tires	computer ink cartridges	Organized by individual schools, administered by school system.
420	Halifax	Yes	LEA (15)	motor oil, tires	print cartridges	

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
421	Roanoke Rapids City	No	School (4)	(1) plastic cafeteria plates/cups, (1) plastic cafeteria utensils, (4) cans	(2) printer ink cartridges	Do not have a comprehensive recycling program. Have just begun a districtwide project called Green Schools. Each school has a team that is coordinating the study of energy conservation in core academic subjects with authentic projects on their school campuses. Several recycling efforts are part of this project.
422	Weldon City	Yes	LEA (3)	computer hard drive, computer keyboard, printer, motor oil, CRT monitor, cooking oil, tires		
430	Harnett	No	(25)			We do not have a recycling program in Harnett County; therefore, we do not have the capability.
440	Haywood	Yes	LEA (15)	newspapers, cardboard, cans, motor oil, paper, plastic bottles, tires	Cafeteria cooking oil, plastic cafeteria food/beverage containers	
450	Henderson	Yes	School (21) & LEA	(4) newspaper, cardboard, (5) cans, motor oil, paper, (2) plastic bottles, (1) glass bottles, cooking oil, tires	Anti-freeze, oil filters, grease, beverage tabs, styrofoam	The recycling program beings with the actions of the LEA. The LEA provides every school 3 diffferent solid waste large containers properly labeled. The containers are for general trash, cardboard and mixed paper. Each school has the responsibility to organize and ensure the proper waste is placed in the containers. The system has the responsibility to contract with a company to have the different waste types removed appropriately. Some individual school are recycling other items other than paper and cardboard.
460	Hertford	Yes	School (5) & LEA	newspapers, computer hard drive, computer keyboard, cans, motor oil, paper, plastic bottles, cooking oil, tires		
470	Hoke	Yes	LEA (11)	computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, CRT monitor, cooking oil, tires		
480	Hyde	Yes	School (4)	newspapers, plastic cafeteria plates/cups, plastic cafeteria utensils, cans, paper, plastic bottles		
490	Iredell-Statesville	Yes	School (32)	newspapers, cardboard, paper, tires		
491	Mooresville City	Yes	School (6)	newspapers, cardboard, cans, cooking oil	Printer cartridges	

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
500	Jackson	No	School (7)			The county has been in transition; changing solid waste disposal and recycling. They are willing to work with us to reinstate a program to haul recyclables.
510	Johnston	Yes	School (34) & LEA	(22) newspapers, (18) cans, (1) paper, (3) plastic bottles.	(10) ink cartridges, (3) magazines	LEA picks up cardboard from all 38 sites. The Bus Garage and Facilities Services pick up all tires and motor oil for LEA.
520	Jones	Yes	LEA (6)	motor oil, cooking oil, tires	Some schools recycle printer cartridges	We contract solid waste. Have only one container at each location. Motor oil and cooking oil at LEA level.
530	Lee	Yes	School (12)	(3) newspapers, (5) cardboard, (11) cans, (2) paper, (1) plastic bottles	(1) Ink cartridges, (1) printer cartridges	
540	Lenoir	Yes	LEA (19)	paper (Central Office), motor oil (bus garage)		
550	Lincoln	Yes	School (21)	newspapers, cans, motor oil, paper	Printer cartridges	
560	Macon	Yes	School (10)	newspapers, computer hard drive, computer keyboard, cardboard, motor oil, paper, cooking oil, tires		
570	Madison	Yes	LEA (6)	newspapers, computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, CRT monitor, paper, plastic bottles, tires		
580	Martin	Yes	School (12) & LEA	newspapers, computer hard drive, computer keyboard, cans, motor oil, paper, cooking oil, tires		
590	McDowell	Yes	School (11)	(4) newspapers, (2) computer hard drive, (2) computer keyboard, (6) cardboard, (7) cans, (3) printer, (2) motor oil, (2) CRT monitor, (5) paper, (2) plastic bottles, (2) glass bottles, (3) cooking oil	Cell phones, printer cartridge, waste paper, pop tops of drink cans, printer ribbons	
600	Charlotte-Mecklenburg	Yes	School (137) & LEA	newspapers, computer hard drive, computer keyboard, cardboard, (15) cans, printer, motor oil, CRT monitor, paper, (15) plastic bottles, cooking oil, tires	Phone books, magazines, catalogs, brochures, post-it notes, file folders, colored paper, stapled paper, junk mail, blueprints. Construction and demolition materials, toner cartridges	The Charlotte-Mecklenburg Bd. Of Ed. and Mecklenburg Co. Bd. Of Commissioners have an Interlocal Agreement for recycling services. (See additional notes on form). The CMS Recycling Program is recognized as a model for school recycling in North Carolina.
610	Mitchell	Yes	LEA (8)	newspapers, cardboard, cans, motor oil, paper, plastic bottles, glass bottles, cooking oil, tires	Any total metal object	
620	Montgomery	Yes	LEA (10)	motor oil, tires		Have checked with BFI about recycling cardboard and newspapers. They do not offer the service in this area.
630	Moore	Yes	School (22)	motor oil, paper, cooking oil, tires		

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
640	Nash-Rocky Mount	Yes	School (29) & LEA	(5) newspapers, (1) plastic cafeteria plates/cups, (1) plastic cafeteria utensils, (4) computer hard drive, (4) computer keyboard, (1) other glass containers, (12) cardboard, (20) cans, (2) printer, (1) motor oil, (3) CRT monitor, (5) paper, (1) plastic bottles, (1) glass bottles), (5) cooking oil, (1) tires	(11) printer cartridges, (1) telephone books, (1) softdrink pop tops	
650	New Hanover	Yes	School (34) & LEA	(7) newspapers, (1) plastic cafeteria plates/cups, (1) plastic cafeteria utensils, (37) computer hard drive, (37) computer keyboard, (3) cardboard, (15) cans, (37) CRT monitor, (13) paper, (6) plastic bottles, (1) glass bottles), (37) cooking oil	(1) Plastic 6-pack rings, (2) telephone books, (1) pop top rings off cans, (3) batteries, (1) aluminum products, (2) cell phones, (1) eye glasses	LEA recycles computers, keyboards, CRT monitors, printer cartridges, and cooking oil on system-wide basis. Several schools recycle additional products on a school level.
660	Northampton	No	School (10)	cans, motor oil, plastic bottles, glass bottles, cooking oil, tires	Printer ink	Some schools recycle. Mostly a club activity. Recycle programs have been investigated and found to be cost prohibiting. ARS, trash collection company for this area, has a charge for service; we cannot afford to pay. Technology dept. does a good job of recycling tech. items. In order for rural areas to address the recycling effort in an effective way there needs to be a program that would not be costly to the school system.
670	Onslow	Yes	School (33) & LEA	(5) newspapers, computer hard drive, computer keyboard, (1) other glass containers, (1) cardboard, (10) cans, printer, motor oil, CRT monitor, (3) paper, tires	Cell phones, printer cartridges	
680	Orange	Yes	School (11) & LEA	newspapers, plastic cafeteria plates/cups, plastic cafeteria utensils, computer hard drive, computer keyboard, other glass containers, cardboard, cans, printer, motor oil, CRT monitor, paper, plastic bottles, glass bottles, cooking oil, tires	All bus batteries and all dry cell batteries	
681	Chapel Hill-Carrboro City	Yes	School (16)	newspapers, computer hard drive, computer keyboard, other glass containers, cardboard, cans, printer, CRT monitor, paper, plastic bottles, cooking oil		District wide program
690	Pamlico	Yes	School (4) & LEA	(CO+ 4) newspapers, (CO+ 4) other glass containers, (LEA+2) cans, (CO+LEA) motor oil, (CO+ 4) paper, (2) glass bottles, (CO+LEA) cooking oil, (CO) tires, (LEA) cardboard		CO - Central Office

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
700	Elizabeth City/Pasquotank	Yes	School (12) & LEA	newspapers, computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, CRT monitor, cooking oil, tires		
710	Pender	Yes	School (15)	newspapers, computer hard drive, computer keyboard, cardboard, cans, printer, cooking oil, tires	Ink printer cartridges, ink and toner copier cartridges.	Amount and consistency varies between schools. Computer hard drives, keyboards, etc. are reused in different schools or used in the classroom for students to learn how to repair computers and to problem-solve computer difficulties.
720	Perquimans	Yes	School (4)	newspapers, computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, CRT monitor, paper, cooking oil		
730	Person	Yes	LEA (10)	newspapers, cardboard, cans, motor oil, paper, plastic bottles, cooking oil, tires, plastic cafeteria plates/cups, plastic cafeteria utensils	printer cartridges, anti-freeze, oil filters	
740	Pitt	Yes	LEA (33)	cardboard, cans, motor oil, paper, cooking oil, tires	oil filters, anti-freeze, batteries	
750	Polk	Yes	School (6)	newspapers, cans, motor oil (bus garage only), tires (bus garage only)		The county does not have a recycling program of any consequence. It makes it very difficult for us to have a broader program.
760	Randolph	Yes	School (28) & LEA	(LEA) newspapers, (LEA) cardboard, (School) cans, (LEA) motor oil, (LEA) paper, (LEA) cooking oil/grease, (LEA) tires recapped	(School) printer cartridges; (LEA) oil filters	We are looking into recycling computers and their components. Currently we sell them as surplus material. We are looking into recycling plastic bottles.
761	Asheboro City	Yes	School (8) & LEA	(5) newspapers, (8 & LEA) cardboard, (7) cans, (2) paper, (1) plastic bottles	(1) magazines, (1) plastic bags, (3) drink top tabs, (1) ink cartridges.	Cardboard at LEA level. All other efforts at school level.
770	Richmond	Yes	School (18) & LEA	cans, motor oil, tires	All refuse in Richmond Co. is sent to a recycling center to be sorted.	
780	Robeson	Yes	School (41)	newspapers, computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, plastic bottles, cooking oil, tires	Metal scrap items from Plant Operations, tin, motors, wood items from remodeling projects	
790	Rockingham	No	(25)			Local schools participate in individually designed site based programs
800	Rowan-Salisbury	Yes	School (30)	newspapers, plastic cafeteria plates/cups, plastic cafeteria utensils, cans, paper, plastic bottles		

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
810	Rutherford	Yes	School (18) & LEA	(10) newspapers, (21) computer hard drive, (21) computer keyboard, (11) cardboard, (11) cans, (21) printer, (3) motor oil, (10) paper, (9) plastic bottles, (20) cooking oil, (1) tires	Tires and motor oil recycled by Transportation Dept. Two high school auto mechanics class recycle motor oil.	LEA level has scheduled pickup. Schools recycle.
820	Sampson	No	(16)			A recycling program has not been formulated as of this time, but Sampson Co. Schools always purchase recycled products whenever possible.
821	Clinton City	Yes	School (4)	cardboard, cans, motor oil, paper, cooking oil		
830	Scotland	Yes	School (15) & LEA	newspapers, other glass containers, cardboard, cans, motor oil, plastic bottles, glass bottles, tires	Automobile batteries, Inkjet cartridges	
840	Stanly	Yes	School (22)	(3) newspapers, (1) plastic cafeteria plates/cups, (2) cardboard, (7) cans, (3) paper, (1) plastic bottles	Ink cartridges, soup labels	
850	Stokes	Yes	School (18) & LEA	(5) newspapers, (LEA) computer hard drive, (LEA) computer keyboard, (6) cardboard, (9) cans, (LEA) printer, (LEA) motor oil, (LEA) CRT monitor, (3) paper, (1) plastic bottles, (1) glass bottles, (LEA) tires		
860	Surry	Yes	School (16) & LEA	newspapers, cmputer hard drive, cardboard, cans, printer, motor oil, CRT monitor, paper, tires	Telephone directories	
861	Elkin City	Yes	LEA (2)	cardboard, cans, paper, cooking oil, tires	Wood pallets	
862	Mount Airy City	Yes	School (4)	newspapers, plastic cafeteria plates/cups, computer hard drive, computer keyboard, cans, printer, paper, plastic bottles		
870	Swain	Yes	School (5) & LEA	cardboard, paper, plastic bottles, glass bottles, other glass containers		
880	Transylvania	Yes	School (9)	cardboard, paper	Printer cartridges	
890	Tyrrell	Yes	School (3) & LEA	newspapers, computer hard drive, computer keyboard, cans, printer, motor oil, CRT monitor, paper, cooking oil, tires	Printer cart	
900	Union	No	School (34)	(7) newspapers, (3) plastic cafeteria plates/cups, (1) plastic cafeteria utensils, (4) computer hard drive, (4) computer keyboard, (5) cardboard, (20) cans, (4) printer, (1) CRT monitor, (6) paper, (5) plastic bottles, (1) glass bottles, (1) cooking oil	(9) Printer/toner cartridtges, (3) cell phones, (1) drink tabs	Left up to individual schools.
910	Vance	Yes	LEA (15)	computer hard drive, computer keyboard, printer, motor oil, CRT monitor, paper, tires	inkjet and laser printer cartridges	

LEA #	LEA	Recycling Program	School or LEA Level	Items Recycled (Number of schools that are recycling in parenthesis)	Other Items	Comments and/or Reason for not Recycling
920	Wake	Yes	School (126) & LEA	newspapers, computer hard drive, computer keyboards, other glass containers, cardboard, cans, printers, motor oil, CRT monitors, paper, plastic bottles, cooking oil, tires	Anti-freeze, ballasts, batteries from backup lights, bricks, curb & paving materials, fluorescent tubes, gypsum, light bulbs, metal, polystyrene, printer cartridges, sheet rock, stone, vehicle batteries	Items are recycled by and on behalf of entire system of 107 schools and 4 administrative sites
930	Warren	No	(6)		Printer ink cartridges	
940	Washington	No	(5)		Printer, computer ink cartridges	No conscious decision was made. We hope to begin a recycling program soon. Please send us guidelines to help us organize our program.
950	Watauga	Yes	School (9) & LEA	newspapers, computer hard drive, computer keyboards, cardboard, cans, printer, motor oil, CRT monitor, paper, cooking oil, tires		
960	Wayne	Yes	School (31) & LEA	other glass containers, cans, motor oil, plastic bottles, glass bottles, cooking oil, tires		We recycle some items but not all (still in progress). We stopped our total recycling program four years ago because local schools did not follow directions as well as the community used our trash bins on the weekends. Constant fines received from the local land fill.
970	Wilkes	Yes	School (24)	newspapers, plastic cafeteria plates/cups, plastic cafeteria utensils, computer hard drive, computer keyboard, cardboard, cans, printer, motor oil, CRT monitor, paper, plastic bottles, tires		
980	Wilson	Yes	LEA (23)	cardboard, motor oil, cooking oil, tires		
990	Yadkin	Yes	School (11)	newspapers, cardboard, motor oil, paper, plastic bottles, cooking oil, tires	Bi-metal	Organized at the school level.
995	Yancey	Yes	School (9)	(3) newspapers, (1) cardboard, (3) cans, (1) motor oil, (2) paper, (1) plastic bottles, (1) tires	Printer cartridges	

[1]Senate Bill 1014 directed the State Board of Education to provide the number and types of recycling programs in the public schools of North Carolina.
[2]Number in parenthesis indicates the number of schools in each LEA

ENVIRONMENTAL MANAGEMENT COMMISSION ACTIVITIES

April 2004

YEAR 2003 – 2004 THIRD QUARTER REPORT TO ERC

I. Quarterly Report On **Air Quality** Activities

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

II. Quarterly Report On **Ground Water Quality** Activities

A. Future EMC And Committee Agenda Items

III. Quarterly Report On **Surface Water Quality** Activities

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

I. AIR QUALITY ACTIVITIES

Agenda Item:

Hearing Officers' report on Amendments and Adoption of Air Quality Rules on Special Orders, Notification in Non-Zone Areas, Ethylene Oxide, And Permit Fees

Explanation:

On October 30 and November 5, 2003, Dr. Delilah Blanks, Dr. Frank S. Shaw, and Mr. Thomas K. Jenkins held public hearings on the adoption of and amendments to various air quality rules.

15A NCAC 2D .0538, Control of Ethylene Oxide Emissions, establishes maximum feasible control technology for facilities that use ethylene oxide as a sterilant in the production or packaging of medical devices (does not apply to hospitals and medical facilities) so that they could avoid having to demonstrate compliance with the air toxic rules for ethylene oxide. Currently, the Rule requires a demonstration of a 99 percent reduction by weight of ethylene oxide emissions. EPA Method 18 has a detection limit of one part per million. Some facilities are unable to demonstrate a 99 percent reduction of ethylene oxide emissions by weight emission concentrations. One of the amendments provide an alternative emission limit for ethylene oxide emission concentrations from all sterilizer unload and backdraft valve exhausts, and degassing rooms of not more than one part per million by volume. Further, the Rule is amended to allow facilities to model all plant ethylene oxide emissions to demonstrate compliance with acceptable ambient levels, and thus avoid compliance with specific standards in the Rule.

One comment was received asking that the require facilities be required to meet both compliance conditions. The purpose of the new option is to allow facilities with after control emissions that are below the EPA Method 18 detection limit to demonstrate compliance. Thus, no change has been made in response to this comment.

15A NCAC 2D .2201 through 15A NCAC 2D .2205 are new rules that define and list requirements for issuing Special Orders. The purpose of writing

the new rules is to rewrite 15A NCAC 2H.1200, Special Orders, used by the old Division of Environmental Management, and that DAQ currently uses to comply with G.S. 143-215.110.

15A NCAC 2Q .0113, Notification In Areas Without Zoning, is a new rule that places an additional permit application requirement on new or expanding facilities located in non-zoned areas in the State. Its purpose is to provide the public living in areas without zoning regulations with notification of a planned plant expansion or new plant construction prior to the facility submitting permit applications. The following rules are required to be amended to include the new Rule requirements: 15A NCAC 2Q .0304, Applications; 15A NCAC 2Q .0305, Application Content; 15A NCAC 2Q .0505, Application Content; and 15A NCAC 2Q .0507, Application. One hearing comment was received that asked for both the notice in newspapers and signage to be required in the new Rule. The proposed Rule does requires a facility to both publish a legal notice and to post a sign on the property.

15A NCAC 2Q .0202, Definitions, is amended to include definitions of "minor modification" and "significant modification" for permit fee purposes. The purpose is to remove uncertainty experienced during interpretation of the meaning of minor and significant modification. No hearing comment was received concerning this Rule.

15A NCAC 2Q .0203, Permit And Application Fees, is amended to correct column titles. Two of the titles in the permit application fee table in .0203 are reversed. "New or Significant Modification", which is the current title of the second column, should be the title of the third column. "New or Modification", which is the current title of the third column, should be the title of the second column. In addition to the phrase "2Q.0300 or" in the forth column is eliminated. Fees for modifications to permitted non-Title V facilities (2Q .0300 facilities) are under the column title "New or Modification."

No hearing comment was received concerning this Rule.

A record of Hearing Two was sent to you earlier.

Recommendation: The Hearing Officers recommend that the proposed new rules and amendments in Chapter II of the hearing record be adopted by the Environmental Management Commission.

EMC Action: EMC adopted amendments and new rules.

Agenda Item: Hearing Officers' Report on Amendments to and Adoption of Air Quality Rules on Concrete Batch Plants, Volatile Organic Compounds, Nitrogen Oxides, Open Burning, and Cotton Gins

Explanation: On October 30 and November 5, 2003, Dr. Delilah Blanks, Dr. Frank S. Shaw, and Mr. Thomas K. Jenkins held public hearings on the adoption of and amendments to various air quality rules. Only four of the 18 proposed amended and new rules included in this hear record generated comments.

A new rule, 15A NCAC 2D .0543, Particulates From Concrete Batch Plants, is proposed to control particulate emissions from concrete batch plants. As a result of this proposed adoption, a definition for $PM_{2.5}$ is proposed to be added to the definition rule (15A NCAC 2D .0101). Also, the visible emission rule (15A NCAC 2D .0521) is proposed to be amended to exempt concrete batch plants as the new rule contains visible emission limits for them.

Seventeen people commented that the new opacity limits will be too expensive to meet without a commensurate environmental benefit. As a result of these comments, the requirement of 15A NCAC 2D .0515 is reinstated, the opacity limit for process emissions and other sources are increased to 20 percent opacity, and opacity requirement for fugitive non-process emissions is replaced by requirement to comply with 15A NCAC 2D .0540.

Laboratory VOC exemption applicability (15A NCAC 2D .0902) is proposed to be modified to change the exemption to be consistent with 15A NCAC 2Q .0102.

The rule for petroleum liquid storage in external floating roof tanks (15A NCAC 2D .0933) is proposed to be amended to clarify the treatment of metallic-type shoe primary seals with shoe-mounted secondary seals.

Several clarifications and other changes are proposed to be made to the open burning rule

(Section 15A NCAC 2D .1900). Purpose, Scope, And Permissible Open Burning (15A NCAC 2D .1901) has been expanded. Several new definitions are proposed (15A NCAC 2D .1902). A prohibition of most types of open burning on days forecast to be code orange or above is also proposed (15A NCAC 2D .1903 and .1904). The new source performance standards for air curtain burners covered under these standards are added to the air curtain burner rule (15A NCAC 2D .1904). These requirements have already been adopted under the new source performance standard rule (they are added here for clarity). The need for temporary air curtain burners to have a certified visible emissions reader onsite is proposed to be removed.
Delegation to County Governments (15A NCAC 2D .1906) has been modified to preclude municipal governments from issuing permits to permanent sited air curtain burners.

Twenty commenters indicated that the amended Rule will require specific permission from State agencies to conduct agriculture or forest management open burning, that State agency anticipated visits to each site will cause unwarranted delays and lost time, and that open burning may require an air quality permit. In addition, many commenters believe they will face an additional liability if they conduct open burning without first verifying that the open burning process is a recommended practice for their particular application.

The proposed rules do not require pre-approval of an open burn or an air quality permit. Regarding additional liability by open burning, using an acceptable versus a recommended practice, a complaint will cause the Division of Air Quality to make an inquiry to establish if open burning for the particular application is a recommended practice. If it is a recommended practice, no further action will be taken. If not, DAQ would take appropriate action.

A new exclusionary rule (15A NCAC 2Q .0809) is proposed for concrete batch plants. This rule

declares concrete batch plants that produce less than 1,210,000 wet cubic yards of concrete to be small for permitting purposes. One commenter asked that the term "wet" be added to each "cubic yards of concrete" phrase used. The term has been added. The commenter asked that an owner or operator of each facility operating under the Rule be required to notify the Director. 15 NCAC 2Q.0801(b) requires written notification from facility not to be covered. Additionally, the commenter asked for a copy of the calculations that document the exemption production limit. A copy of the calculations is included as Attachment 15 of the hearing record.

Seven nitrogen oxide rules are recommended to be amended to make clarifications. The U.S. Environmental Protection Agency has asked for several clarifications to the nitrogen oxide rules. Clarifications are being made for monitoring requirements (15A NCAC 2D .1404), stationary internal combustion engines (15A NCAC 2D .1409), new emission sources (15A NCAC 2D .1418), using the trading program (15A NCAC 2D .1419), and using the compliance supplement pool (15A NCAC 2D .1422). Three corrections are also proposed to be made. They are correcting the location of Duke's Cliffside plant, the name of a boiler at Blue Ridge Paper Products, and an allocation for a combustion turbine at Butler Warner Generating.

The exclusionary rule for cotton gins (15A NCAC 2Q .0806) is proposed to be amended to remove specifying the ginning seasons and the requirement for the Commissioner of Agriculture to request extending the ginning season if it exceeds the length specified in the rule. One commenter pointed out a typographical error that has been corrected.

A record of Hearing Four was sent to you earlier.

Recommendation:

The Hearing Officers recommend that the proposed new rules and amendments as presented in Chapter II of the hearing record be adopted by the Environmental Management Commission, and that

the Chairman be authorized to sign the certification forms on behalf of the Commission.

EMC Action: EMC adopted amendments and new rules — except for amendments to open burning rule, which were postponed until April.

Agenda Item _____: Hearing Officers' Report on an Amendment to the Municipal Waste Combustor Air Quality Rule

Explanation:

On October 30 and November 5, 2003, Dr. Delilah Blanks, Dr. Frank S. Shaw, and Mr. Thomas K. Jenkins held public hearings on the adoption of and amendments to various air quality rules.

In rule 15A NCAC 2D .1205, Municipal Waste Combustors, the final compliance date for small municipal waste combustors is proposed to be changed from March 1, 2003 to December 1, 2004. This change is being made as a result of Session Law 2002-24, Section 2.

The EMC adopted a temporary rule on February 13, 2003, which became effective on March 1, 2003, to change the final compliance date to December 1, 2004. The proposed amendment considered at the public hearing will make permanent the December 1, 2004, final compliance date.

One person opposed changing the final compliance date from March 1, 2003 to on or after December 1, 2004. He questioned the need for the rule change and the legality of the rule as it applies to only one facility. This rule change is being made to comply with Session Law 2202-24, Section 2, which requires the EMC to change the final compliance date for small municipal waste combustors to no earlier than December 1, 2004. Additionally, The EMC has the legal authority to adopt rules that affect only one facility. It has done so on several occasions.

A record of Hearing Four was sent to you earlier.

Recommendation:

The Hearing Officers recommend that the proposed amendment to 15A NCAC 2D .1205, Municipal Waste Combustors, be adopted by the Environmental Management Commission as presented in Chapter II of the hearing record.

EMC Action: EMC adopted amendment.

Future EMC and Air Quality Committee Agenda Items

MONTH	AQC CONCEPTS	AQC DRAFT RULES	EMC ACTION
Apr 04	-Implementation of New Authority: Banking and Trading and Credit for Early Reductions (323c)	-To Revise PSD Rule (393) -Clarification of Facility Permit Exemption in 2Q .0102 (402) -Change Daily Opacity Exceedances for COM from 10 to 4 in 2D .0521 (417)	Adoption -Open Burning Revisions (254, 272, 288) -Revision of AAL for Hydrogen Sulfide and Exempting Wastewater Treatment Systems at Paper Mills (378, 400) Hearing Request -Correct Testing Date for CISWI (413) -Correct Cross-Reference in 2D .1208 (389) -Correct Cross-Reference in 2D .0519 (391) -Portable Crushers (385) -Incorporate Alternative Monitoring Procedures in 2D .0600 and .0608 (398) -Clarify That Transportation Facility Rules Apply Only to Carbon Monoxide (394) -Repeal of 2D .0803 (395) -Clarify When an Acceptable Ambient Level Should Be Changed in a Permit (396) -Change Emergency Generator Exemption in 2Q .0102 (388) -Small Wood Fire Boiler Permit Exemption (285) -Exempt NSPS Dry Cleaners from Permitting (366) -Correction and Clarification in 2Q .0102 (375) -Exempting Space Heaters From Permitting (379) -Correction for Calculating Emissions for 10 Irritant Toxic Air Pollutants to Determine if a Permit Is Needed (386)
May 04			Hearing Request -To Revise PSD Rule (393) -Clarification of Facility Permit Exemption in 2Q .0102 (402) -Change Daily Opacity Exceedances for COM from 10 to 4 in 2D .0521 (417)
July 04		-Amend Definition of AApplicable Requirement@ to add reference to 2D .900,.1400, and .1200 (334)	

MONTH	AQC CONCEPTS	AQC DRAFT RULES	EMC ACTION
		-Implementation of New Authority I/M Codes (323a1) -Implementation of New Authority sales and service of analyzers (323d) -Reporting Requirements Conform with General Statutes (361)

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request for Approval of the Final Tar-Pamlico River Basinwide Water Quality Plan

Explanation:

The *Tar-Pamlico River Basinwide Water Quality Plan* is in the third cycle of basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Tar-Pamlico River Basinwide Water Quality Plan was approved by the Water Quality Committee in October 2003 to be taken to public meetings. Four public meetings were held throughout the basin; Washington, Greenville Louisburg and Nashville in December 2003 with approximately 73 people in attendance. Revisions were made and some information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members in the EMC package.

This Basinwide Water Quality Plan is a planning document that will guide the Division's management actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Tar-Pamlico River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in this river basin.

EMC ACTION:

The EMC approved the *Tar-Pamlico River Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request for Permission to Proceed to Public Hearing with Proposed Division of Water Quality (DWQ) Exceptions Rule

Explanation:

The Environmental Management Commission (EMC) directed DWQ Staff to draft an Exceptions Rule that would establish a uniform set of procedures to provide exceptions from specific DWQ Rules to affected, qualifying parties. Accordingly, staff drafted several versions of a proposed Exceptions Rule, which were presented to the Water Quality Committee (WQC) at its December Meeting. The WQC voted to pass several of the proposed versions on to the full Commission for further consideration. Three versions, or options, of this proposed rule are now provided to the EMC for review. All three of these options contain the following provisions:

- These exception procedures would apply only to DWQ Rules that specifically refer to the proposed Exceptions Rule in their text.
- Local authorities could be delegated the authority to make exception decisions on a case-by-case basis under the authority of this proposed rule.
- "Automatic" exceptions are provided to certain, qualifying DOT projects.

The major differences in the three options are presented below:

Option 1: This is the "basic" version and does not address "vested rights."

Option 2: This version provides an "automatic" exception to projects with vested rights.

Option 3: This version allows projects with vested rights to apply for an exception to the DWQ Director.

Recommendation:

That the EMC determine which of the proposed versions is most appropriate and authorize DWQ Staff to notice the selected text in the *North Carolina Register* and proceed to public hearing.

EMC ACTION:

The EMC authorized DWQ Staff to proceed to public hearing with all three proposed versions of the DWQ Exceptions Rule. The Commission will make its final determination as to which of the proposed versions to adopt as rule based upon the comments received through the formal hearing and comment process.

Once listed, ESA provides for…

FWS and others to develop / implement recovery plans

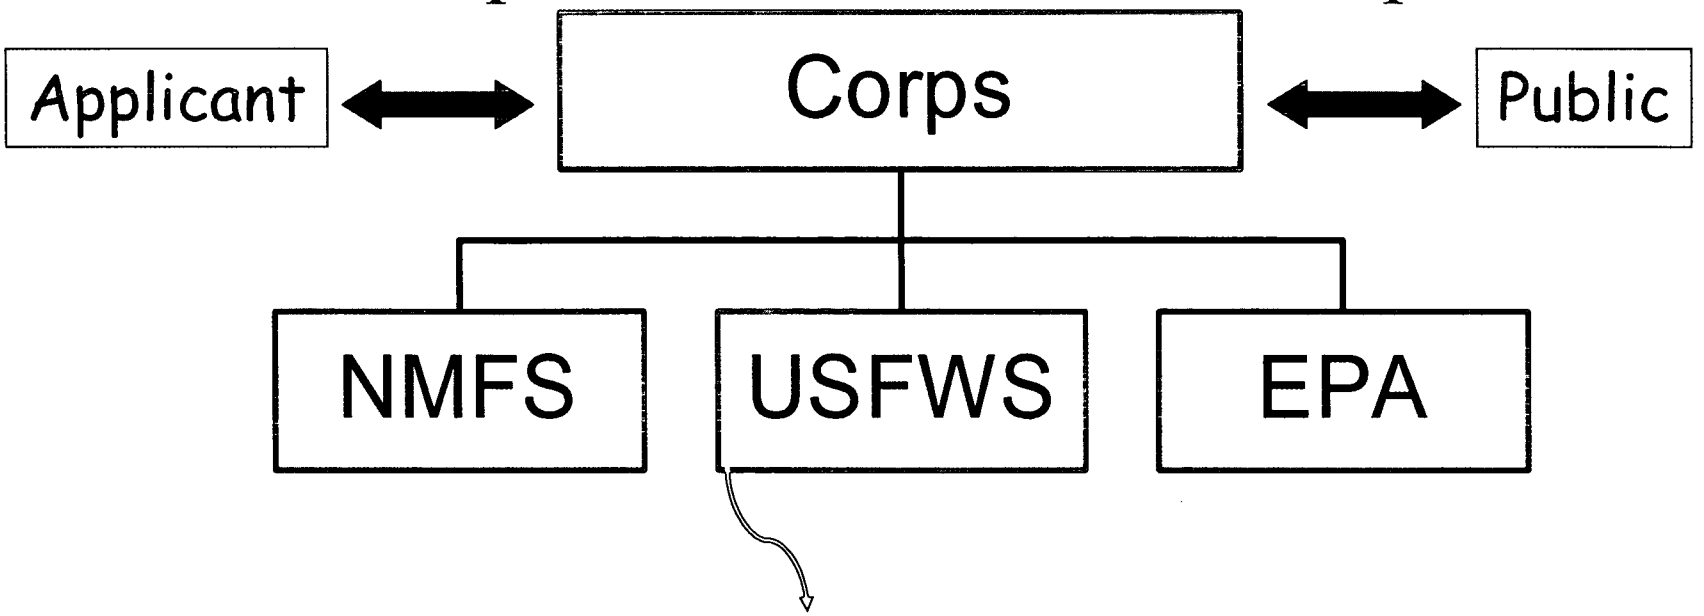
Assistance to States, private landowners

Federal agencies to consult with FWS to ensure actions they authorize, fund, or carry out will not jeopardize species

Prohibition on un-authorized "take" (harass, harm, hunt, pursue, shoot, wound, kill, trap, capture, or collect)

Consultation process, applies when…

- Federal land involved
- Federal money involved
- Federal permit or authorization required:



Including Endangered Species Review

Tar spinymussel

Listed as endangered in 1985

Revised recovery plan in 1992

> 1.4 USFWS should work with North Carolina agencies to "Encourage establishment of mussel sanctuaries, high quality water designations, stream buffer zones, and other protection strategies as a means of protecting present and reintroduced populations."

Known in 7 NC streams, Swift Creek is the best

U.S. Fish & Wildlife Service

ESA Basics

Over 25 years of protecting endangered species

Introduction
When the Endangered Species Act (ESA) was passed in 1973, it represented America's concern about the decline of many wildlife species around the world. It is regarded as one of the most comprehensive wildlife conservation laws in the world.

The purpose of the ESA is to conserve "the ecosystems upon which endangered and threatened species depend" and to conserve and recover listed species. Under the law, species may be listed as either "endangered" or "threatened". Endangered means a species is in danger of extinction throughout all or a significant portion of its range. Threatened means a species is likely to become endangered within the foreseeable future. All species of plants and animals, except pest insects, are eligible for listing as endangered or threatened.

As of August 31, 2002, 1,818 species are listed, of which 1,260 are U.S. species. The list covers mammals, birds, reptiles, amphibians, fishes, snails, clams/mussels, crustaceans, insects, arachnids, and plants. Groups with the most listed species are (in order) plants, mammals, birds, fishes, reptiles, and clams/mussels.

The law is administered by the Interior Department's U.S. Fish and Wildlife Service (FWS) and the Commerce Department's National Marine Fisheries Service. The FWS has primary responsibility for terrestrial and freshwater organisms, while the National Marine Fisheries Service's responsibilities are mainly for marine species such as salmon and whales.

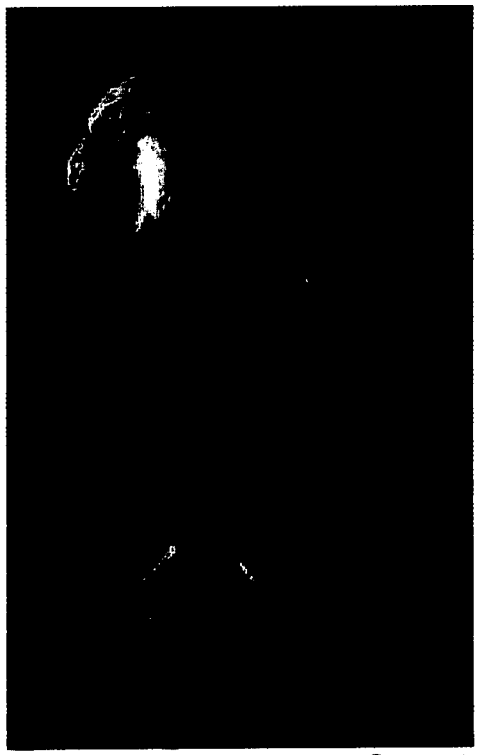
Legislative History
The 1973 Endangered Species Act replaced earlier laws enacted in 1966 and 1969, which provided for a list of endangered species but gave them little meaningful protection. The 1973 law has been reauthorized seven times and amended on several occasions, most recently in 1988. The Endangered Species Act was due for reauthorization again in 1993, but legislation to reauthorize it has not yet been enacted. The Endangered Species program has continued to receive appropriations while Congress considers reauthorization, allowing conservation actions for threatened and endangered species to continue.

The ESA
The Endangered Species Act is a complex law with a great deal of built-in flexibility. Some basics of the law include:

Purpose
When Congress passed the Endangered Species Act in 1973, it recognized that many of our nation's native plants and animals were in danger of becoming extinct. They further expressed that our rich natural heritage was of "esthetic, ecological, educational, recreational, and scientific value to our Nation and its people." The purposes of the Act are to protect these endangered and threatened species and to provide a means to conserve their ecosystems.

Federal Agencies
All federal agencies are to protect species and preserve their habitats. Federal agencies must utilize their authorities to conserve listed species and make sure that their actions do not jeopardize the continued existence of listed species. The FWS and the National Marine Fisheries Service work with other agencies to plan or modify federal projects so that they will have minimal impact on listed species and their habitat.

Working with States —Section 6
The protection of species is also achieved through partnerships with the States. Section 6 of the law encourages each State to develop and maintain conservation programs for resident federally-listed threatened and endangered species. Federal financial assistance and a system of incentives are available to attract State participation. Some State laws and regulations are even more restrictive in granting exceptions or permits than the current ESA.



Bald eagle
Corel Corp. photo

Working with non-Federal landowners, the Service provides financial and technical assistance to landowners to implement management actions on their lands to benefit listed and nonlisted species.

Local Involvement
The protection of federally listed species on Federal lands is the first priority of the FWS, yet, many species occur partially, extensively or, in some cases, exclusively on private lands. Policies and incentives have been developed to protect private landowners' interests in their lands while encouraging them to manage their

lands in ways that benefit endangered species. Much of the progress in recovery of endangered species can be attributed to public support and involvement.

Listing —Section 4
Species are listed on the basis of "the best scientific and commercial data available." Listings are made solely on the basis of the species' biological status and threats to its existence. In some instances, a species which closely resembles an endangered or threatened species is listed due to similarity of appearance. The FWS decides all listings using sound science and peer review to ensure the accuracy of the best available data.

Candidate Species —Section 4
The FWS also maintains a list of "candidate" species. These are species for which the Service has enough information to warrant proposing them for listing as endangered or threatened, but these species have not yet been proposed for listing. The FWS works with States and private partners to carry out conservation actions for candidate species to prevent their further decline and possibly eliminate the need to list them as endangered or threatened.

Recovery —Section 4
The law's ultimate goal is to "recover" species so they no longer need protection under the Endangered Species Act. The law provides for recovery plans to be developed describing the steps needed to restore a species to health. Appropriate public and private agencies and institutions and other qualified persons assist in the development and implementation of recovery plans. Involvement of the public and interested "stakeholders" in development of recovery plans is encouraged. Recovery teams may be appointed to develop and implement recovery plans.

Consultation —Section 7
The law requires federal agencies to consult with the Fish and Wildlife Service to ensure that the actions they authorize, fund, or carry out will not jeopardize listed species. In the relatively few cases where the FWS determines the proposed action will jeopardize the species, they must issue a "biological opinion" offering "reasonable and prudent alternatives" about how the proposed action could be modified to avoid jeopardy to listed species. It is a very rare exception where projects are withdrawn or terminated because of jeopardy to a listed species.

Critical Habitat —Section 4
The law provides for designation of "critical habitat" for listed species when judged to be "prudent and determinable". Critical habitat includes geographic areas "on which are found those physical or biological features essential to the conservation of the species and which may require special management considerations or protection." Critical habitat may include areas not occupied by the species at the time of listing but that are essential to the conservation of the species. Critical habitat designations affect only federal agency actions or federally funded or permitted activities.

International Species —Section 8
The Endangered Species Act is the law that implements U.S. participation in the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), a 130-nation agreement designed to prevent species from becoming endangered or extinct because of international trade. The law prohibits trade in listed species except under CITES permits.

Exemptions —Section 10
The law provides a process for exempting development projects from the restrictions of the Endangered Species Act. This process permits completion of projects that have been determined to jeopardize the survival of a listed species, if a Cabinet-level "Endangered Species Committee" decides the benefits of the project clearly outweigh the benefits of conserving a species. Since its creation in 1978, the Committee has only been convened three times to make this decision.

Habitat Conservation Plans —Section 10
This provision of the ESA is designed to relieve restrictions on private landowners who want to develop land inhabited by endangered species. Private landowners who develop and implement an approved "habitat conservation plan" providing for conservation of the species can receive an "incidental take permit" that allows their development project to go forward.

Definition of "Take" —Section 9
Section 9 of the Endangered Species Act makes it unlawful for a person to "take" a listed species. The Act says "The term take means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in any such conduct." The Secretary of the Interior, through regulations, defined the term "harm" in this passage as "an act which actually kills or injures wildlife. Such act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering."

Compliance with Other Laws
The Endangered Species Act is not the only law to protect species of wild mammals, birds, reptiles, amphibians and fishes, clams, snails, insects, spiders, crustaceans, and plants. There are many other laws with enforcement provisions to protect declining populations of rare species and their habitat, such as the Marine Mammal Protection Act, the Migratory Bird Treaty Act, and the Anadromous Fish Conservation Act. The Lacey Act makes it a federal crime for any person to import, export, transport, sell, receive, acquire, possess, or purchase any fish, wildlife, or plant taken, possessed transported or sold in violation of any Federal, State, foreign or Indian tribal law, treaty, or regulation.

April 20, 2004 ERC Meeting
EXHIBIT G

North Carolina Wildlife Resources Commission

Charles R. Fullwood, Executive Director

April 20, 2004

TO: Members of the North Carolina Environmental Review Commission

FROM: Division of Inland Fisheries

Comments on the Presence of Listed Species in the Lower Swift Creek, Tar River Basin, N. C.

The State of North Carolina has a listing process that indicates endangered, threatened, and special concern status for given species. For example, Swift Creek has four state endangered mussels, four state threatened mussels, and one state special concern mussel.

The state listing process is administered by the NC Wildlife Resources Commission (WRC). Any "interested individual" (which is usually a scientific or conservation organization), can petition for listing with the state. The WRC refers the request to its Non Game Advisory Committee which usually directs the request to a Scientific Council with expertise on that particular species. This Council determines the scientific merits of the request and makes its recommendation to the Non-Game Advisory Committee. In turn, the Advisory Committee provides a recommendation to the WRC, which then votes to accept or reject. If the recommendation is accepted, the WRC advances the proposal through normal rule making processes, which provide opportunities for public comment.

The state law authorizing the listing process provides no special protection for state listed species except to regulate their collection. *No project in this state has ever been denied or delayed due to state listing of any species.* The state listing is useful primarily as a mechanism to identify species needing special conservation measures to ensure their continued existence in North Carolina.

High quality streams (free from sedimentation, poor water quality, physical habitat alterations, modified stream flows, etc.) support diverse biological communities rich in numbers of animals and species. Swift Creek supports at least 14 freshwater mussel species. This number comprises nearly a third of the total mussels recognized in all Atlantic slope rivers across the country making Swift Creek a regionally significant mussel habitat. More than mussels benefit from this high habitat quality. There are seven species of crayfish, 300+ species of aquatic insects, 13 species of snails, and around 60 species of fish which inhabit Swift Creek.

Mailing Address: 1701 Mail Service Center • Raleigh, NC 27699-1701
Office Location: 512 N. Salisbury Street • Raleigh, NC 27604-1188 • **Telephone:** (919) 733-3391

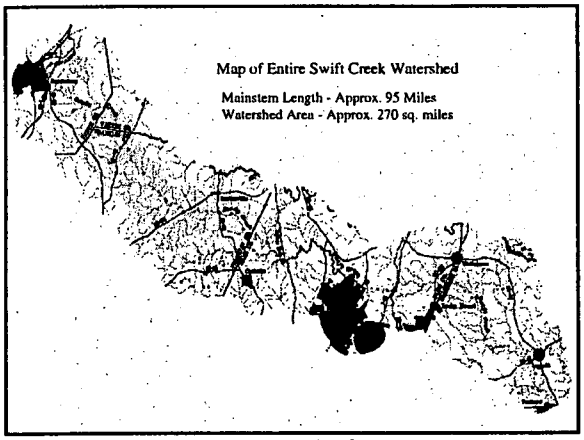
The Tar spiny mussel's presence in lower Swift Creek provides a point of emphasis that a regionally important biological community is present in the stream.

The biological diversity present in the lower Swift Creek provides a reliable, stable aquatic ecosystem that supports a healthy community of animals such as game fish, furbearers and waterfowl. The continued presence of this wildlife population is an important contribution to the quality of human life in our state from both recreational and economic perspectives.

The best chance to conserve the balance that ecology of the habitats requires depends upon managing selected streams for continued high habitat and water quality. Such a strategy applied to the lower Swift Creek could provide important biological, societal, and ultimately economic benefits.

Downstream Swift Creek Site Specific Management Plan

Environmental Review Commission
March 25, 2004

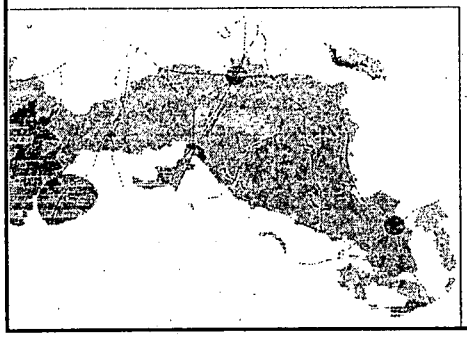


Introduction

- HB 566 allowed downstream protection measures approved by 2004 Session of GA.
- ERC may identify and evaluate protection measures for Swift Creek downstream of SR 1003.
- In September 2003, Water Quality Committee (WQC) directed DWQ to develop plan for submission to ERC.

Swift Creek Watershed - Downstream of SR 1003

Mainstem Length - 33 Miles
Watershed Area - Approx. 90 sq. miles



Plan Development

- Proposed plan developed by:
  - Tom Augspurger - US Fish & Wildlife Service
  - Cam McNutt - NC Division of Water Quality
  - Sarah McRae - NC Natural Heritage Program
  - Judy Ratcliffe - NC Natural Heritage Program
  - Angie Rodgers - NC Wildlife Resources Comm
  - Sara Ward - US Fish & Wildlife Service

Overview of Site-Specific Water Quality Management Strategy for Swift Creek East of SR 1003

Elements of Site-Specific Plan Development

- Issues to consider:
  - What are you trying to protect?
  - Where are you trying to protect it?
  - What are the threats to the species in question?
  - What protection measures are already in place?
- Analysis of these issues results in recommendations for enhanced protection measures.

Tar Spinymussel

(*Elliptio steinstansana*)

- Approximately 2.5 inches in length
- Preferred Habitat: Fast-flowing, well-oxygenated water.
- Adults live on stream bottom in substrate of silt-free, uncompacted gravel & sand.
- Known to occupy 2 river systems in the world: Tar-Pam and Neuse.
- Swift Creek watershed supports the best, remaining population of Tar Spinymussel.

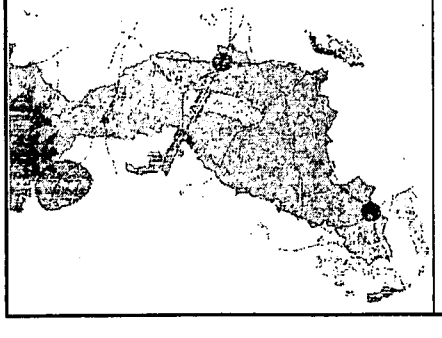
Freshwater mussel life cycle

Mussel larvae (glochidia) on fish gill

Recent Records of Tar Spinymussel in Downstream Swift Creek

SR 1003	July 1989	21 shells between SR 1003 and NC 48
	June 1990	11 shells between SR 1003 and I-95
	August 1990	103 shells upstream and downstream of SR 1003
	August 1990	4 shells between SR1003 and NC 48 following
	May 1991	6 shells between SR 1003 and NC 48
	August 1991	4 live and 29 shells between SR 1003 and NC
	July 1992	3 shells between SR 1003 and NC 48
	June 1996	1 live downstream of SR 1003
	July 1997	1 live and 4 shells between SR 1003 and NC 48
NC 48	June 1991	1 live upstream of NC 48
	July 1995	2 live and 2 shells upstream of the NC 48 xing
NC 97	June 1991	1 live downstream of the NC 97 crossing

Downstream Swift Creek



Species in Downstream Swift Creek

- Besides the Tar Spinymussel other rare aquatic species in Downstream Swift Creek include:
  - 8 other freshwater mussels with varying federal and State designations
  - 1 rare fish - the Carolina Madtom
  - 1 rare amphibian - the Neuse River Waterdog
  - A rare crayfish
- Protection measures developed for the Tar Spinymussel will also benefit these species.

Special Considerations for Endangered Mussels

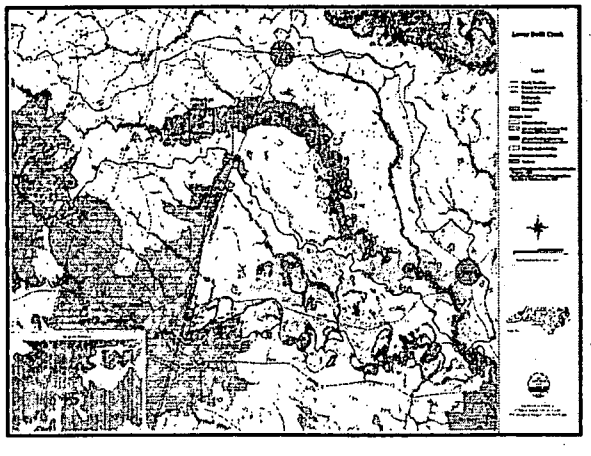
- Sediment
  - Excessive sedimentation smother mussels, affects biological processes & alters habitat.
- Flows
  - Impoundments result in loss of riffle and shoal habitats & exacerbate drought conditions.
  - Spinymussel needs fast-flowing, well-oxygenated water.

Special Considerations for Endangered Mussels

- **Riparian Buffers**
  - Buffers reduce sedimentation & other runoff.
  - Insufficient info exists to definitively state buffer requirements to ensure survival of Tar Spinymussel.
- **Ammonia**
  - Ammonia is extremely toxic to mussels.
  - Concentrations in Downstream Swift Creek are below levels of concern.

Existing Water Quality Protection Measures

- Nutrient Sensitive Waters (NSW) Strategy
  - 50-foot riparian buffers
  - NSW Stormwater Control Program
- Wetland/401 Rules - 15A NCAC 2H .0506
  - prohibits downstream cumulative impacts



Water Quality Management Plan Recommendations

Note: Scientifically-based proposed protection measures that have not been submitted to public review or hearing.

Proposed Protection Measures

- Flow Maintenance
  - No dams or impoundments within the Swift Creek mainstem or named tributaries.
  - No water withdrawals within the Swift Creek mainstem or named tributaries.
- Point Source Controls
  - No new or expanded discharges.
  - Encourage removal of existing point sources.

Proposed Protection Measures

- Sedimentation Control - For all projects that require Stormwater General Construction Permit:
  - Ground cover shall be established on all cleared areas within 7 calendar days of clearing.
  - Point or concentrated discharges to filter strips or protected buffers shall be avoided.
  - Same as sedimentation control requirements in DWQ 401 Certifications for mountain trout streams.

Proposed Protection Measures

- Buffer Enhancements
  - Silviculture: Only allow removal of individual "high value" trees throughout entire 50-foot buffer.
  - Encourage expansion of riparian buffer protection.

Why are some of these proposals different than the Outstanding Resource Waters (ORW) Strategy?

- ORW is a management strategy developed for Statewide implementation and based on the body of knowledge available in the 1980's.
- ORW is intended to protect *water quality.*
- This plan was developed at the request of the Water Quality Committee to protect an individual species (Tar Spinymussel) in a specific watershed.

Next Steps?

- Introduce legislation that would task the Environmental Management Commission to conduct a review of these (and other) proposals and then initiate rulemaking to implement those measures deemed appropriate.

Site-Specific Water Quality Management Strategy for the Swift Creek (East of State Road 1003 in Nash County), Tar-Pamlico Basin

I. Introduction

Swift Creek is generally recognized as having excellent water quality based on chemical and biological measurements (NCDWQ 2002, 2003). In addition, the waters of Swift Creek have been documented as containing a number of unique aquatic species, including one federally and State-listed endangered species. In July, 2002 the North Carolina Environmental Management Commission (EMC) approved a 14-mile portion of the watershed (between SR 1004 and 1003 in Nash County) to be reclassified as an Outstanding Resource Water (ORW), and also approved special protection and management strategies to be implemented throughout the entire Swift Creek watershed. For areas west of SR 1003 (Red Oak Road, Nash County), those rules and management strategies became effective August 1, 2003. Regarding that portion of the watershed east of SR 1003, Session Law (SL) 2003-433 (House Bill 566) allowed only the implementation of those water quality and endangered species protection measures as the 2004 Regular Session of the 2003 General Assembly may provide by law. Furthermore, SL 2003-433 authorized the Environmental Review Commission (ERC) to identify and evaluate options to protect water quality and endangered species in the portion of Swift Creek and its watershed in the Tar-Pamlico River Basin that are located east of Nash County State Road 1003. According to SL 2003-433, the ERC may report its findings, together with any recommended legislation, to the 2004 Regular Session of the 2003 General Assembly. In an effort to facilitate the ERC's evaluation of potential options for the protection of the water quality and endangered species in the Swift Creek watershed east of SR 1003, the EMC directed the Division of Water Quality (DWQ) to develop a site-specific water quality management strategy for those waters that would be protective of both the existing water quality and the endangered species contained within. This document represents the site-specific management strategy developed by the Division to fulfill that tasking.

This strategy presents existing knowledge regarding five important issues: 1) the federally-listed endangered species in Swift Creek; 2) the water quality conditions in the lower portion of Swift Creek; 3) the numeric or narrative standards to be attained for effective water quality management; 4) the existing water quality management framework; and, 5) the overall site-specific water quality management strategy to maintain water quality and protect aquatic life. Each of these factors is discussed below with reference to existing data and studies for brevity.

II. Tar Spinymussel

Because this plan is specifically intended to protect endangered species in the lower portion of the Swift Creek watershed, a summary of information on the listed species in Swift Creek is appropriate. The Swift Creek watershed supports the federally-listed as endangered and State critically endangered Tar spinymussel (*Elliptio steinstansana*). The Tar spinymussel (Figure 1) is a medium-sized mussel reaching about 2.5 inches in length (Johnson and Clarke 1983).

Juveniles may have as many as 12 spines, 6 on each valve. However, adult specimens tend to lose their spines as they mature, and some large adult specimens may not have shell spines (USFWS 1992). The preferred habitat of the Tar spinymussel appears to be relatively fast-flowing, well-oxygenated water, in sites with a substrate comprised of relatively silt-free, uncompacted gravel and coarse sand (USFWS 1992).

Figure 1. Tar spinymussel (*Elliptio steinstansana)*, a federally- and North Carolina-listed endangered freshwater mussel.

Like other freshwater mussels, the Tar spinymussel feeds by filtering food particles from the water column. The specific food habits of the species are unknown, but other freshwater mussels have been documented to feed on detritus, diatoms, phytoplankton, and zooplankton. The reproductive cycle of the species is likely similar to that of other native freshwater mussels. Males release sperm into the water column; the sperm are then taken in by the females through their siphons during feeding and respiration. The females retain fertilized eggs in their gills until the larvae, known as glochidia, fully develop. The mussel glochidia are released into the water, and within a few days they must attach to the appropriate species of fish, which are then parasitized for a short time while the glochidia develop into juvenile mussels. Juvenile mussels then detach from their "fish host" and sink to the stream bottom where they continue to develop, provided they land in a suitable substrate with the correct water conditions. The Tar spinymussel's life span, the fish host species, and many other aspects of its life history are unknown (Bogan 2002).

The Tar spinymussel is known to occupy two river systems in North Carolina. Populations exist in the Tar River (Nash and Edgecombe Counties), Swift Creek and Sandy Creek (Franklin, Nash, and Edgecombe Counties), Little Fishing Creek (Halifax County), Shocco Creek (Warren and Franklin Counties), and Fishing Creek (Warren County). The species has also been documented at one site in the Little River (Johnston County) in the Neuse River system (Bogan 2002, USFWS 2003b).

Swift Creek supports the best remaining population of the Tar spinymussel. Tar spinymussels have been found throughout the lower portion of Swift Creek which is the subject of the current plan (east of SR 1003). Live Tar spinymussels have been recorded in recent surveys of the upper portions of this reach (1 live individual and 4 shells found at the NC48 crossing in July 1997) and in the most recent surveys of the lower portions of this reach (1 live individual found at the NC97 crossing in June 1991) (Alderman et al 1993). Table 1 lists the recent occurrence records for the Tar spinymussel in Swift Creek, with emphasis on those in the lower reach.

Table 1. Recent occurrence records for the Tar spinymussel in Swift Creek, with emphasis on those in the lower portions (east of SR 1003).

Location	Date	Tar spinymussel Records
Upper Swift Creek		
	Pre-2002	36 individual survey records totaling 42 live individuals and over 100 shells found between 1987 and 2002 upstream of SR 1003
	June 2002	1 live downstream from SR 1310
	July 2002	2 shells upstream from SR 1003
Downstream of SR 1003		
SR 1003	July 1989	21 shells between SR 1003 and NC 48
	June 1990	11 shells between SR 1003 and I-95
	August 1990	103 shells upstream and downstream of SR 1003 following a mussel die-off
	August 1990	4 shells between SR1003 and NC 48 following a mussel die-off
	May 1991	6 shells between SR 1003 and NC 48
	August 1991	4 live and 29 shells between SR 1003 and NC 48
	July 1992	3 shells between SR 1003 and NC 48
	June 1996	1 live downstream of SR 1003
	July 1997	1 live and 4 shells between SR 1003 and NC 48
NC 48	June 1991	1 live upstream of NC 48
	July 1995	2 live and 2 shells upstream of the NC 48 crossing (between here and SR 1310)
NC 97	June 1991	1 live downstream of the NC 97 crossing

Historically, the Tar spinymussel likely once existed throughout much of the Tar River system. A decline in the populations likely resulted from water quality degradation in some parts of the system, land clearing for agriculture, impoundments, poor erosion control structures, and point and nonpoint source discharges (USFWS 1994). The Tar River spinymussel was designated as

endangered throughout its entire range in North Carolina in 1985 (USFWS 1985). A recovery plan addressing the Tar spinymussel was originally approved in 1987 and a revised recovery plan was approved in 1992 (USFWS 1987, 1992).

Given the small size of the Tar River and Shocco Creek populations, any factor that adversely modifies habitat or water quality in the short river reaches that the species inhabits could threaten its survival in these areas. In addition, the mainstem population in the Tar River is threatened by sediment loading, point source discharges, and urban runoff from a large upstream community (Rocky Mount). The Little River drainage is subject to declining habitat quality due to extensive timber harvesting resulting in sediment loading, stream bank instability, and deterioration of riparian buffers (NatureServe 2003).

III. A. Lower Swift Creek

The entire Swift Creek subbasin covers approximately 270 square miles and includes about 207 stream miles. About a third of the entire watershed is east of SR 1003 which is the subject of this plan. Land uses and cover types have been listed by others (McGrath 1992, Alderman et al. 1993, NCDWQ 2002, 2003) as have the outstanding ecological resources of the basin (Alderman et al 1993, Smith et al. 1993, NCDWQ 2002). The mainstem of Swift Creek in this reach is part of the Swift Creek Aquatic Habitat, a natural heritage area of national significance as recorded by the North Carolina Natural Heritage Program. In addition, the lower portion of Swift Creek contains the Swift Creek Swamp Forest, an approximately 2,000 acre natural area of regional significance, and a wading bird rookery recognized as an important animal habitat in the region.

Lower Swift Creek and its riparian habitat support significantly rare fish, mussels, and plants in addition to the Tar spinymussel. The federal species of concern and State endangered Atlantic pigtoe (*Fusconaia masoni*), yellow lance (*Elliptio lanceolata*), and yellow lampmussel (*Lampsilis cariosa*) are known to occur in the lower reaches of Swift Creek. Other mussels known from this reach include the State-listed as threatened triangle floater (*Alasmidonta undulata*), creeper (*Strophitus undulatus*), Roanoke slabshell (*Elliptio roanokensis*) and eastern lampmussel (*Lampsilis radiata)*, as well as the notched rainbow (*Villosa constricta*), a State species of concern. A rare fish, the Carolina madtom (*Noturus furiosus*), the Neuse River waterdog (*Necturus lewisi*), a rare crayfish, and two significantly rare insects have also been documented in this portion of the subbasin (Judy Ratcliffe, Natural Heritage Program, pers. comm.). While the site-specific water quality management strategies proposed in this document are aimed at the Tar spinymussel, they will also benefit other rare species in this watershed.

III. B. Water Quality Parameters of Concern in the Lower Swift Creek Subbasin

Swift Creek is generally recognized as having excellent water quality based on chemical and biological measurements (NCDWQ 2002, 2003). The EMC approved a 14-mile portion of the watershed (between SR 1004 and 1003 in Nash County) to be reclassified as an Outstanding

Resource Water (ORW), and they approved special protection and management strategies to be implemented throughout the watershed (NCDWQ 2003). For areas west of SR 1003, those rules and management strategies became effective August 1, 2003. Water quality ratings less than excellent in the lower reaches of Swift Creek (east of SR 1003) ultimately led to a stay on implementing ORW management strategies in those waters. That water quality upstream of SR 1003 is excellent has not been questioned; an examination of data available for areas downstream of SR 1003 is in order.

There is no systematic ambient chemical monitoring of water quality in the lower portion of Swift Creek. The nearest water quality monitoring station is about five miles upstream of State Road 1003 at State Road 1310 near Hilliardston where water quality has routinely been rated excellent.

There are only two small permitted discharges into the lower portion of Swift Creek: 1) Edgecombe County Schools / Phillips Middle School WWTP (NC0050415), a 0.01 million gallon per day (MGD) facility which discharges to Moccasin Creek, east of Battleboro; and, 2) Edgecombe County / North Edgecombe County High School WWTP (NC0050431), a 0.02 MGD facility which discharges into Swift Creek near Leggett. Both of these facilities have a history of violating permit limits, but neither of them conduct water quality monitoring in Swift Creek whereby the significance of those violations could be assessed.

There are very few recent water quality ratings for the lower portion of Swift Creek. A site near the upstream property line for Wake Stone (near I-95) that previously was rated excellent was surveyed by the NCDWQ in 1996. It received a rating of good in 1996, and the difference in ratings from upstream to this site was attributed to winter high flows scouring and burying habitat (NCDWQ 1998). Also, the numerical rating at this site was high within the range of ratings that classify as good (i.e., water quality here was at the upper end of the good range).

More recently, a benthic macroinvertebrate based water quality rating was applied to the downstream portion of lower Swift Creek at State Road 1253, (near NC 97, and near Swift Creek's confluence with the Tar River). This site was also previously rated as excellent (in 1989 and 1997), but it received a good bioclassification after the July 2002 sampling event (NCDWQ 2003). In 2002, however, limited flow and a low dissolved oxygen concentration were observed as this sampling was conducted during a drought. The 2002 good rating was very close to excellent; there was no difference in the EPT metric and a very small difference in the BI score. The drought of 2002 was the suspected cause for the lower water quality rating at State Road 1253 (NCDWQ 2003). Best professional judgment (Dave Lenat, NCDWQ Environmental Science Branch, pers. comm., Trish MacPhearson, NCDWQ Environmental Science Branch, pers. comm.) is that the 2002 rating, because it can be attributed to drought flows, should not be interpreted as a long term change in water quality from excellent to good.

Supporting data for that point are two-fold. First, the drought was significant and short-term impacts to instream fauna following droughts are not unexpected. A good illustration of this

point comes from the best long-term water quality monitoring record for Swift Creek -- that for Hilliardston, a site within the area already designated as ORW. Water quality at that site also was rated as good during a drought, but follow-up sampling in 2003 indicated it returned to excellent. Second, although dissolved oxygen concentrations were very low during the summer 2002 drought, there is no long term decline in dissolved oxygen in Swift Creek (Figure 2). Also, the low dissolved oxygen in Swift Creek in 2002 was no lower than other streams in the area (Figure 3).

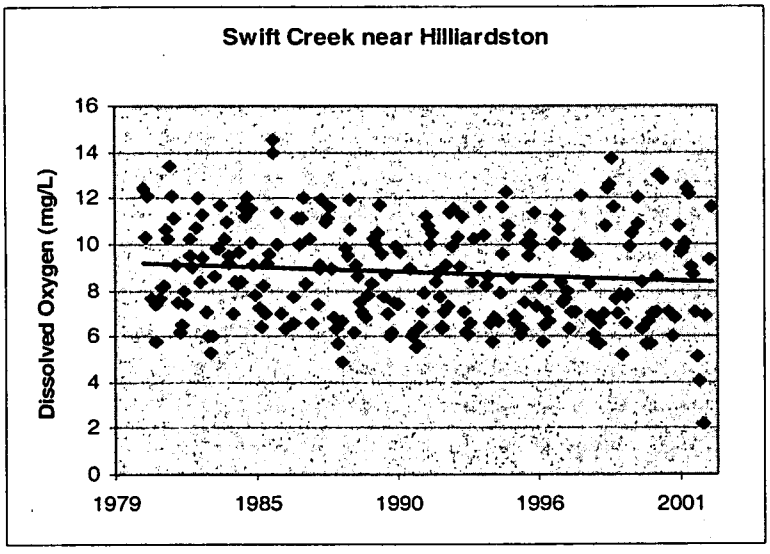


Figure 2. Although very low dissolved oxygen concentrations were recorded in the drought of 2002, there is no long term trend of declining dissolved oxygen in Swift Creek.

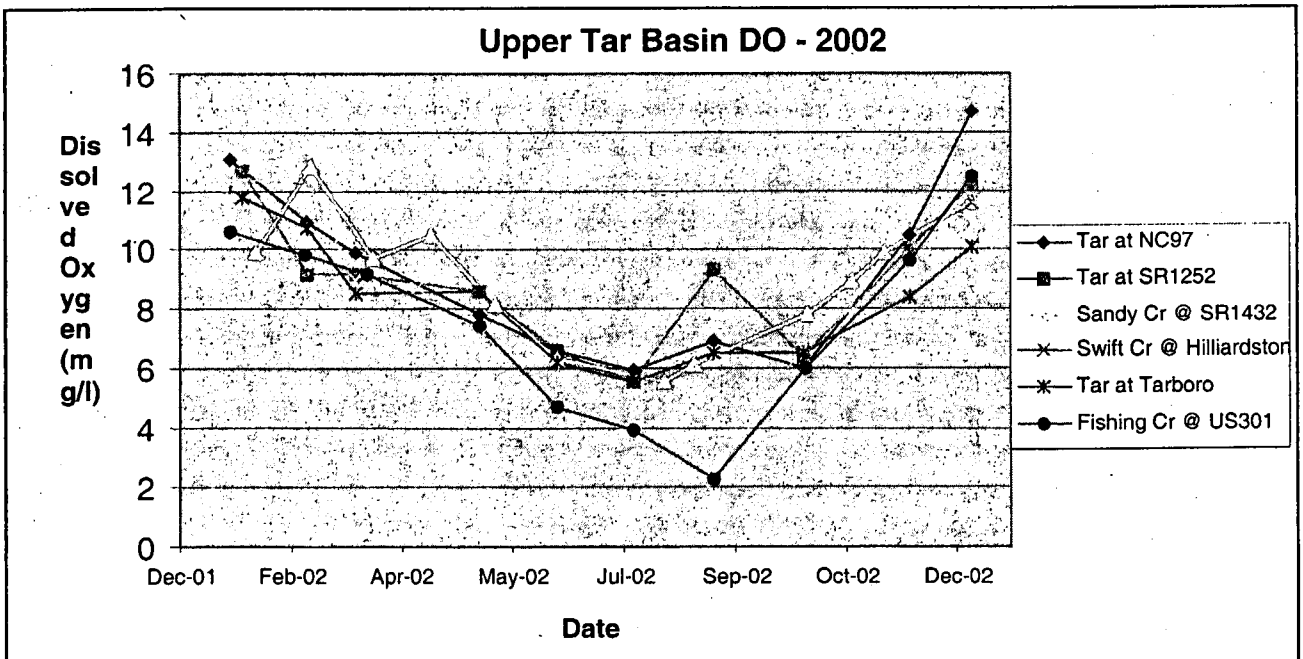

Figure 3. Low dissolved oxygen concentrations observed in Swift Creek during the drought of 2002 were observed in creeks throughout the basin (and not indicative of a local source of impairment).

Based on review of existing data, the 2002 rating of good at State Road 1253, which was attributed to drought conditions, and the 1996 rating of good near Wake Stone, which was attributed to winter flow scour, should not be interpreted as indicative of long term changes in water quality. The data do point to the need to maintain an adequate flow regime for mussels and other benthos, and the site-specific management strategy will be focused on maintaining existing water quality and quantity in the lower portion of Swift Creek.

IV. Special considerations for the endangered mussels

Many factors are cited in the decline of freshwater mussels in North America and for the listing of greater than 70% of native mussels as endangered, threatened, or of special concern (Williams et al. 1993, Neves et al. 1997). Habitat alteration, introduction of exotic species, over-utilization, disease, predation, and pollution are considered causal or contributing factors to the decline of mussel populations in many areas of the United States (Fuller 1974, Havlik and Marking 1987, Richter 1997, Neves 1997, National Native Mussel Conservation Commission 1998). Several aspects of water quality and quantity that will be important to consider in the conservation of the Tar spinymussel in Swift Creek are outlined here.

Flows

Neves et al. (1997) and Watters (2000) reviewed the specific effects of impoundments on freshwater mollusks. Impoundments result in the elimination of riffle and shoal habitats and the subsequent loss of mussel resources. Most of a river's ecological processes are also disrupted, for example, by modifying flood pulses, controlling impounded water elevations, increasing depth, decreasing habitat heterogeneity, and altering water flow, sediment, nutrients, energy input and output (Watters 2000, USFWS 2003a). In additions to permanent changes in hydrology from impoundments, water withdrawals are also a flow concern. Upstream man-induced water diversions, especially during low flow periods, exacerbate natural drought conditions of receiving waters.

Sediment

Sedimentation is the process by which eroded soil is deposited into waters. Soil erosion, transport, and redeposition are among the most essential natural processes occurring in watersheds. However, land-disturbing activities such as the construction of roads and buildings, crop production, livestock grazing, and timber harvesting can accelerate erosion rates by causing more soil than usual to be detached and moved by water, especially during stormwater flows.

Two aspects of sedimentation are important relative to mussels. First, suspended sediment can scour habitat and physically abrade mussels and their fish host species. Also, reduction in water clarity from suspended sediment can limit the ability of sight-feeding fish to find food (Henley et al. 2000). Second, the sediment that settles to, and accumulates on, the bottom of streams can

smother aquatic life and adversely affect the local habitat. Specific biological impacts on mussels from excessive sediment include reduced feeding and respiratory efficiency from clogged gills, disrupted metabolic processes, reduced growth rates, increased substrate instability, limited burrowing activity, and physical smothering (Waters 2000).

The physical characteristics of stream channels are affected when large quantities of sediment are added or removed (Watters 2000). The effects of sediment on mussel habitat have been reviewed by Brim Box and Mossa (1999). Mussels are potentially impacted by changes in suspended and bed material load, bed sediment composition associated with increased sediment production and runoff in the watershed, channel changes in form, position, and degree of stability; actively filling or scouring channels; and changes in channel position that may leave mussels exposed (Brim Box and Mossa 1999, USFWS 2003a). Interstitial spaces in mixed substrates may become clogged with sediment. When clogged, interstitial flow rates and spaces may become reduced, reducing habitat for juvenile mussels and some adults as well.

Sedimentation can be exacerbated when riparian vegetation is not present to filter run off water or when the streambank itself is eroding and contributing sediment to the waterbody. While not specific to the lower portion of Swift Creek, Kenney (1998) reports that sediment loading appeared to be the most widespread cause of water quality concerns in the Upper Tar River basin and the Swift Creek subbasin. Similarly, Paulson (2000) identified sediment from nonpoint sources as the most significant stress to freshwater bivalves in the Upper Tar River basin.

Riparian Buffers

Maintaining vegetated riparian buffers is a well-known method of reducing stream sedimentation and other runoff. Riparian buffers are particularly important for freshwater mussels (Neves et al. 1997). Several recent reviews of riparian buffer widths, extent, and vegetation are available to guide evaluation of buffer design and efficacy (Dodd et al. 1993, Palone and Todd 1998, Wenger 1999, North Carolina Wildlife Resources Commission 2002).

For Swift Creek in particular, Prince (2003) recommended a selectively harvested buffer of 200-feet with a no harvest zone 50-feet in width or greater to prevent sediment export into stream channels. Baker (1999) utilized existing GIS coverages in addition to data gathered through field surveys (along perpendicular transects away from the Swift Creek) for application of three separate models (universal soil loss equation, Detention Time Model, and the Hydraulic Model) to determine appropriate site-specific buffer widths for filtration of nonpoint source runoff in the Swift Creek subbasin. Results indicated that the Piedmont portion of Swift Creek subbasin experiences increased erosion rates based on soil types and current land use. Baker used a reference buffer approach in the Detention Time Model to generate buffer width estimates for each land parcel within 300-feet of streams in the subbasin. Model output indicates that the average buffer required for 90 percent nitrate filtration was approximately 216-feet for the lower (Nash and Edgecombe Counties) Swift Creek Subbasin. Results of the Hydraulic Model used to estimate buffer effectiveness for 90 percent nitrate filtration indicate that a 200-feet buffer would

be adequate for most of the subbasin; however, larger buffers would be necessary along some land parcels in the Piedmont portion of the watershed.

In a recent review of literature and application of professional judgment for protecting North Carolina's endangered fauna, the Wildlife Resources Commission (2002) and partners concluded that insufficient information exists to definitely state the minimum buffer widths needed to ensure the continued survival of federally endangered and threatened aquatic species. They recommended a 200-feet native, forested buffer on perennial streams and a 100-feet forested buffer on intermittent streams, or the full extent of the 100-year floodplain, be required for new developments. They noted that minimum buffer widths may actually need to be more or less stringent depending on local conditions. Other aspects of watershed management were reviewed in that document which influence buffer efficacy (e.g., development densities, stormwater controls, drainage system management, etc).

Ammonia

Ammonia is a natural degradation product of nitrogenous organic matter; significant sources of enrichment include industrial waste, municipal wastewater treatment plants, and agricultural run-off (animal wastes as well as chemical fertilizers). Ammonia is a very important pollutant of waters due to its relatively high toxicity to aquatic life and its relative ubiquity (Russo 1985). Sediment pore water concentrations of ammonia typically exceed those of overlying surface water (Frasier et al. 1996), thereby placing freshwater mussels, which burrow in sediment, in the environmental compartment where ammonia concentrations are frequently elevated. Additionally, freshwater mussels appear very sensitive to ammonia toxicity (Horne and McIntosh 1979, Wade 1992, Goudreau et al. 1993, Sheller 1997, Myers-Kinzie 1998, Augspurger et al. 2003, Mummert et al. 2003). Because it is extremely toxic to mussels, ammonia merits priority attention among the many chemicals to evaluate for effects on mussels.

North Carolina currently does not have a state water quality standard or action level for ammonia, but the concentrations in Swift Creek at Hilliardston are currently well below those of concern (Augspurger et al. 2003) for mussels. Data for the lower portion of the creek are needed to determine if water quality there differs (which is not expected) before any additional point or nonpoint source ammonia controls are recommended.

V. Existing Water Quality Management Framework

A thorough understanding of the existing water quality management framework for the Swift Creek watershed is imperative to determine if any additional water quality management structure is needed. Several NCDWQ water quality classifications and standards apply to Swift Creek, and they are summarized here.

V. A. Nutrient Sensitive Waters Strategy

In December 1989, the EMC designated the Tar-Pamlico River basin as Nutrient Sensitive Waters (NSW). This designation required the State to develop a nutrient management strategy for the basin (and all of Swift Creek lies within this basin).

V.A.1. NSW Strategy - Phase I

The first phase of the strategy largely targeted wastewater treatment plants and other point sources. The Phase I Agreement, from 1990 through 1994, included an innovative nutrient 'trading' program between point and nonpoint sources that served as a nationwide benchmark. A coalition of twelve point source dischargers called the Tar-Pamlico Basin Association (Association), comprising approximately 90 percent of permitted point source flows, agreed to a collective annual, incrementally decreasing, combined nitrogen and phosphorus loading cap.

V.A.2. NSW Strategy - Phase II

Adopted by the EMC in December 1994, Phase II covered the period 1995-2004. A 30 percent reduction in total nitrogen loads to the estuary from 1991 conditions was set as an interim goal for Phase II, along with no increase in phosphorus loads. Based on these goals, the Association received separate, steady nitrogen and phosphorus caps for the duration of Phase II. The Phase II Agreement also placed restrictions on dischargers who chose not to join the Association. Nonpoint sources were also addressed in Phase II through a "voluntary plan" to achieve the goal for nine different nonpoint source categories.

V.A.3. Nonpoint Source Rules

In July 1998, after two years of implementing the voluntary nonpoint source plan, the EMC adopted a series of nonpoint source rules addressing riparian buffers, nutrient management, stormwater management, and agriculture.

Riparian Buffer Rules

A set of three buffer rules was adopted. The main buffer protection rule requires that existing vegetated riparian buffers in the basin be protected and maintained on both sides of intermittent and perennial streams, lakes, ponds, and estuarine waters. This rule does not establish new buffers unless the existing use in the buffer area changes. The footprints of existing uses such as agriculture, buildings, commercial and other facilities, maintained lawns, utility lines, and on-site wastewater systems are exempt. A total of 50-feet of riparian area is required on each side of waterbodies. Within this 50-feet, the first 30-feet (Zone 1) is to remain undisturbed with the exception of certain activities. The outer 20-feet (Zone 2) must be vegetated, but certain additional uses are allowed. Specific activities are identified in the rule as "exempt", "allowable", "allowable with mitigation" or "prohibited". The mitigation rule defines the process applicants would follow

to gain approval for activities that are identified in the buffer protection rule as "allowable with mitigation". The delegation rule lays out the criteria and process for local governments to obtain authority to implement the buffer rules within their jurisdictions.

Nutrient Management Rule

The nutrient management rule requires people who apply fertilizer in the basin, except residential landowners who apply fertilizer to their own property, to either take state-sponsored nutrient management training or have a nutrient management plan for the lands to which they apply fertilizer.

Local Government Stormwater Rule

The stormwater rule requires six municipalities (Greenville, Henderson, Oxford, Rocky Mount, Tarboro, and Washington) and five counties (Beaufort, Edgecombe, Franklin, Nash, and Pitt) in the Tar-Pamlico Basin to develop and implement stormwater programs within two and a half years. The local programs must also identify and remove illicit discharges, educate developers, businesses, and homeowners, and make efforts toward treating runoff from existing developed areas.

Agriculture Rules

The main agriculture rule details the process and options for achieving the nutrient goals which include 1) a 30 percent reduction in nitrogen loading from 1991 baseline levels within five to eight years of the rule's effective date; and 2) control of phosphorus levels at or below 1991 levels within four years of the approval of a phosphorus accounting method called for in the rule. Farmers who are involved in the commercial production of crops or horticultural products, or whose livestock or poultry holdings exceed specified numbers, are subject to the rule. The delivery mechanism to achieve load reductions include application of agricultural best management practices with the assistance of local area committees.

V. B. Stormwater Programs

Stormwater programs affecting the Swift Creek subbasin (03-03-02) include NPDES Phase I and II, ORW stormwater requirements, Tar-Pamlico River basin NSW stormwater requirements (discussed in section V.A.2), and requirements associated with the Water Supply Watershed program.

V.B.1. NPDES - Phase I

Phase I required NPDES permit coverage to address stormwater runoff from medium and large stormwater sewer systems serving populations of 100,000 or more people. Phase I also required ten categories of industrial sources to be covered under stormwater permits and construction activities disturbing greater than five acres to obtain a NPDES stormwater permit. There is 1

individual stormwater permit and 29 facilities that have general permit coverage in the Swift Creek subbasin.

V.B.2. NPDES - Phase II

The Phase II stormwater program extends the Phase I program to include permit coverage for smaller municipalities and covers construction activities disturbing greater than one acre. Three municipalities (Greenville, Rocky Mount, Winterville) and three counties (Edgecombe, Nash, Pitt) are automatically required to obtain a NPDES stormwater permit under the Phase II rules.

V.B.3. Water Supply Watershed Program Stormwater Requirements

The segment of Swift Creek from State Road (SR) 1409 to the Tar River is within the WS-IV protected area for the Tarboro intake. Low density options in this portion of the watershed include 1 dwelling unit / 0.5 acre or 24% built upon area (for projects requiring a sedimentation and erosion control plan) or 1/3 acre lot or 36% built upon area is allowed for projects without a curb and gutter street system. High density development requires control of runoff from the first one inch of rainfall through use of engineered stormwater controls. High density development options allow 24-70% built upon area. Local governments must assume ultimate responsibility for operation and maintenance of stormwater controls. A 30-feet vegetated stream setback for development of low density options is required. High density development requires a 100-foot vegetative setback.

V.B.4. ORW Stormwater Requirements

High density development, which exceeds 12% or 1 dwelling unit per acre, requires control of runoff from the first one inch of rainfall through use of engineered stormwater controls. In Swift Creek, a 30-feet vegetated stream setback for development of low density options is required for areas upstream of State Road 1003.

VI. Water Quality Management Plan Recommendations

The recommendations presented in this plan are proposed only for the lower portion of Swift Creek, to achieve a management objective of protecting local water quality and therefore the Tar spinymussel. The primary goal of this plan and these recommendations is to maintain all water quality parameters, with a particular emphasis on hydraulic loading and sediments that become entrained following excessive hydraulic loading. Accordingly, specific additional water quality management strategies are proposed, and they are outlined here. Note: These recommended management strategies are scientifically-based measures intended to provide additional

protections for the Tar Spinymussel. These proposals have not been submitted to any form of public review or hearing.

VI. A. Proposed Site-Specific Buffer Enhancements

1. To enhance the efficiency and protective aspects of the existing 50 foot riparian buffers, the following additional measure is recommended:

Regarding forest harvesting, in order to maintain the integrity of the buffer in lower Swift Creek it is recommended that the provisions in 15 NCAC 2B .0259(11)(b)(iv)(A) be applied to the entire 50 foot buffer zone. This would allow only the removal of individual "high value" trees in the 50 foot riparian buffers provided that no trees with exposed primary roots visible in the streambank be cut.

2. Encourage expansion of riparian buffer protection. The literature on buffer design indicates that buffers wider than the 50-feet have some water quality and well-recognized wildlife habitat related benefits. Expansion of buffers beyond the existing 50-feet or the extent of the functional floodplain, through voluntary actions, conservation cost sharing programs, and purchase is encouraged. No new rules are proposed for this recommendation which can be pursued via coordination among riparian landowners, private and government natural resources management agencies, and local and county governments.

VI. B. Proposed Maintenance of Instream Flows. Maintaining normal flow regimes appears to be a critical component of sustaining the excellent water quality and related high biological diversity of this system. Based on historic data, the only biological diversity ratings less than excellent have been attributed to extreme flow conditions. While these are relatively infrequent occurrences from which the system can recover, permanent changes in flow characteristics are not prudent here.

1. No dams or other structures that would impound waters on the Swift Creek mainstem or named tributaries within or upstream of this reach should be permitted. The lentic conditions of an impounded reach are not favorable for Tar spinymussel survival and productivity. Further, the physical obstruction generated by any instream structure is not compatible with the survival, reproduction and movement of this species.

2. No water withdrawals from the Swift Creek mainstem or named tributaries should be permitted within or upstream of this reach. Water withdrawal needs are often greatest during extremely dry periods when instream flow conditions are unable to support any additional reduction in water quantity or flow. Given that the Tar spinymussel requires adequate flow for feeding and respiratory needs, maintenance of the natural flow condition is essential to its survival.

VI. C. Proposed Point Source Pollution Controls

1. No new or expanded discharges should be permitted. Existing surface water discharge regulations applicable to these waters, including those already made to address nitrogen reduction goals in the Tar-Pamlico Basin through an offset program, will not be sufficient to maintain the chemical quality of the waters of lower Swift Creek that have fostered excellent water quality ratings. The only ratings below excellent have been attributed to flow related issues and are addressed with the site specific rules proposed above for hydraulic loadings. To maintain the chemical integrity of the waters of lower Swift Creek, no new or expanded surface water discharges should be permitted.

2. Encourage removal of existing point sources. The existing point source discharges in the lower portion of Swift Creek are small and not known to be a concern for water quality. Exceedences of permit limits and noncompliance have been documented, however, for both facilities. Efforts to remove these individual discharges, such as by connection to larger POTWs, are encouraged. In the interim, implementation of additional permit limits for parameters of concern for freshwater mussels is recommended. Downstream monitoring for dissolved oxygen, ammonia, metals and chlorine should also be added as permit conditions to help gauge the significance of permit violations on receiving water quality. No new rules are proposed for this recommendation which can be pursued via coordination between facility owners / operators, water quality permitting agencies, and other stakeholders.

VI. D. Proposed Sediment Controls: The effective control of excessive sedimentation is a critical component in the preservation of the aquatic environment in the lower Swift Creek watershed. Numerous studies have demonstrated that one of the most effective sedimentation controls is the expeditious application of ground cover on disturbed areas. Therefore, for all projects in the lower portion of the Swift Creek watershed that require a Stormwater General Construction Permit from the Division of Water Quality the following additional sedimentation control measures shall be required:

1. Ground cover shall be established on all cleared areas within 7 calendar days of clearing. Hydromulch and/or netting shall be used on all slopes. Matting or gravel cover shall be used for all roads. In areas where straw is applied it must be applied at a rate of at least 4000 lbs. of straw per acre. Mulch may be used in lieu of straw. Sod may be used in lieu of the above ground covers, and

2. Point or concentrated discharges to filter strips or protected buffers shall be avoided. Flow must be diffused throughout the entire filter strip or buffer. This may be achieved using level spreaders on slopes of less than 6% or, on steeper slopes, by using erosion control fencing at intervals of 10 feet perpendicular to the flow. Each end of the fencing shall be turned up slope for a distance necessary to cover one vertical foot of contour to prevent bypass. The erosion control fencing shall be adequately anchored to prevent stormwater from passing beneath.

Comments to the Environmental Review Commission

Leah M. Devlin, DDS, MPH
State Health Director
April 20, 2004

Senator Albertson, Senator Clodfelter, Representative Gibson, Representative McComas, and Commission Members:

The North Carolina Division of Public Health is pleased that the EMC has taken action to lower the Acceptable Ambient Level (AAL) for hydrogen sulfide from the current level of 2,100 mcg/m^3 to the new level of 120 mcg/m^3. This is tremendous progress. Lowering the AAL reduces the risk of health problems including eye irritation and aggravation of health symptoms for people with asthma. We appreciate the opportunity to work with the EMC and to make comment at the public hearings. We had recommended a lower level but again we feel that the 120 mcg/m^3 is significant progress.

The Division of Public Health also recommended to the EMC that all major sources of hydrogen sulfide including pulp and paper mill wastewater treatment systems be required to comply with the hydrogen sulfide AAL. Based on the NC Division of Air Quality data, pulp and paper mill wastewater treatment systems are responsible for more than 90% of the hydrogen sulfide emissions from permitted air pollution sources in North Carolina. However, we recognize the EMC's need to consider other issues besides health in setting the AAL's.

The Division of Public Health is currently collaborating with the US Department of Health and Human Services, Agency for Toxic Substances and Disease Registry to plan a study to measure actual hydrogen sulfide concentrations near a North Carolina pulp and paper mill. The first phase of this project should be completed within nine to twelve months. Our commitment to the EMC and to you is to make the data available to you as soon as possible.

Again, I'd like to thank the EMC for their work and look forward to continuing to work with them on this issue and others in the future as we seek together to shape sound public policy.

EXHIBIT J

Effective Date Timeline for Hydroge

Environmental Review Commission
Jeff Hudson, Assistant Commission Counsel

The Environmental Management Commission (EMC) adopted the Hydrogen Sulfide Rules (H2S Rules) on April 8, 2004.

↓

The EMC must submit the H2S rules to the Rules Review Commission (RRC) by May 7, 2004. (G.S. 150B-21.2(g))

↓

If the H2S Rules are submitted to the RRC <u>on or before April 20</u>, the RRC must review the rules at its May meeting.
(G.S. 150B-21.9(b))

↓

If the RRC approves the H2S Rules at its May meeting and the RRC <u>DOES NOT</u> receive written objections from 10 or more persons within 6 days* of RRC approval, the rules become effective on June 1, 2004.
(G.S. 150B-21.3(b) and (b2))

If the H2S Rules are submitted to the RRC <u>after April 20</u>, the RRC must review the rules at its June meeting.
(G.S. 150B-21.9(b))

↓

If the RRC approves the H2S Rules at its June meeting and the RRC <u>DOES NOT</u> receive written objections from 10 or more persons within 6* days of RRC approval, the rules become effective on July 1, 2004. (G.S. 150B-21.3(b) and (b2))

If the RRC approves the H2S Rules at its May or June meeting and the RRC <u>DOES</u> receive objections from 10 or more persons within 6* days of RRC approval, the rules would be subject to legislative disapproval during the <u>2005 Regular Session</u> of the General Assembly and could not become effective before the 31st legislative day of the 2005 Regular Session.
(G.S. 150B-21.3(b2) and (b1))

↓

If a bill to disapprove the rules is introduced in either house of the General Assembly before the 31st legislative day of the 2005 Regular Session, the rules become effective on the earlier of either the day an unfavorable final action is taken on the bill or the day that session of the General Assembly adjourns without ratifying a bill that disapproves the rule.
(G.S. 150B-21.3(b1))

*Due to a perceived ambiguity in the time frame for receipt of written objections, the RRC established a policy of accepting written objections up to 6 days after RRC approval.

April 20, 2004

Report to the Environmental Revie

Update on Hydrogen Sulfide (H_2S) Acceptable Ambient Level (AAL) Rulemaking

B. Keith Overcash, Director
Division of Air Quality
April 20, 2004

Basic Background Information on the State's Air Toxics Program

- Established via Governor's executive order March 1, 1989 ***AND*** Senate Bill 324 amending North Carolina General Statute 159-96 § 45(a). (This amendment was placed in the revenue bonds section of the G.S. where notation was made that revenue bonds were not to be used for the financing of the low-level radioactive waste management authority or its commission.)
- Regulations effective May 1, 1990 for 84 toxic air pollutants
- Regulations effective May 1, 1991 for 21 carcinogenic pollutants (total = 105)
- Acceptable Ambient Limits (AALs) established for all 105 pollutants
- In 1993 Program was modified to let the Federal Program achieve its control goals first, with the state program being used to
  - o 'fill in the gaps' (federal program misses many small emitters)
  - o 'solve problems' (federal program not designed to address local issues)
  - o 'address excess emissions' that would otherwise not be addressed in a timely manner. (federal program was untimely and uncertain)
- The toxics program's standard is the control of toxic air pollutants for the protection of public health. It is a ***proactive*** program as well as a ***reactive*** program.
- Features screening levels, technical infeasibility and economic hardship provisions and site-specific risk assessment provisions for situations where facilities may need relief.
- It is implemented through air permits, it does air monitoring for toxic air pollutants, it performs community assessment studies, evaluates equipment to control toxic air pollutants and it keeps information in the rule updated

Scientific Advisory Board on Toxic Air Pollutants

- In 1997 consensus was achieved by a working group established by the Environmental Review Commission to study the State and Federal air toxic programs that the role and activities of the Scientific Advisory Board on Toxic Air Pollutants (SAB) are:
  - o The SAB provides a mechanism for bringing good science into air toxics risk assessment. The scientific methodology by which chemicals are evaluated and recommendations made is open and appropriate
  - o The role of the SAB is advisory and not regulatory and its principal function is to conduct risk assessments for adverse health effects of chemicals selected by DENR. The SAB is also available to DENR to assess risks to human health in situations where there is or may be an existing human health threat.
  - o The SAB provides an analysis of the science. It may also provide several analyses for a single chemical depending upon what the science shows. The final use of these analyses is the responsibility of the Environmental Management Commission.

- SAB is a seven-member group composed of nationally recognized, Doctoral level toxicologists, an occupational physician, an epidemiologist, or public health scientists.
- SAB is all-volunteer. The cost to the state was less than $1,000 during the last full year that the SAB met.
- The latest Charter was signed by Secretary Ross on October 3, 2003, and the newest SAB was appointed earlier this month.
- SAB's work is fundamental to the air toxics program. When there is a change in the science upon which one of the toxic air pollutant levels is based, it is the SAB that evaluates the data in conjunction with the Division of Air Quality to determine if a new AAL should be established.
- Since 1993, the majority of the toxic air pollutant levels have not been updated, but the science has. Many of these levels need to be re-evaluated.

Hydrogen Sulfide

- Division determined that the science supporting the old acceptable air toxic pollutant level had changed and requested that the Scientific Advisory Board review the new literature. The old level was based on data from 1986.
- The SAB reviewed the peer-reviewed data that was available. Three analyses of these data were provided to the Division. Each analysis included the health effect that resulted from the study, how the study compared to possible human exposure and the SAB's degree of confidence in the study.
- Nearly simultaneous with the SAB's review, the Division of Air Quality received complaints about foul odors stemming from a liquid asphalt distribution terminal and was requested to investigate further.
- Studies revealed, among other toxic air pollutants, that hydrogen sulfide was being emitted in the largest quantity. The Division took action that required the facility to install control equipment and update its air permit.
- Further evaluation of the emissions inventory for hydrogen sulfide in North Carolina revealed that some facilities that emitted hydrogen sulfide had not been reporting all of these emissions to the state as required.
- The discovery of these new emission sources revealed that an impact of a new hydrogen sulfide AAL would be significant from a technical, economic and emissions control standpoint for a certain industry sector.
- All the information collected was reported to the Environmental Management Commission (EMC) through the Air Quality Committee. Hydrogen sulfide data were presented at committee meetings beginning in March 2002.
- On April 8, the Environmental Management Commission unanimously voted to change the old AAL from 1500 parts per billion for a one-hour average to 83 parts per billion (120 micrograms per cubic meter)for a 24-hour average.
- Additionally, under majority vote, the EMC exempted wastewater treatment lagoons at pulp and paper mills for the toxic air pollutants of hydrogen sulfide and methyl mercaptan.
- The EMC also called for further study by the pulp and paper industry into offsite impacts of hydrogen sulfide by requesting an air dispersion modeling study report to be submitted by July1, 2006, followed by the Director's assessment of that report two months later. If the report is "not favorable", an air monitoring study would be required to be conducted and the results reported to the EMC by February 28, 2009 for further consideration.

April 20, 2004 ERC Meeting
EXHIBIT L

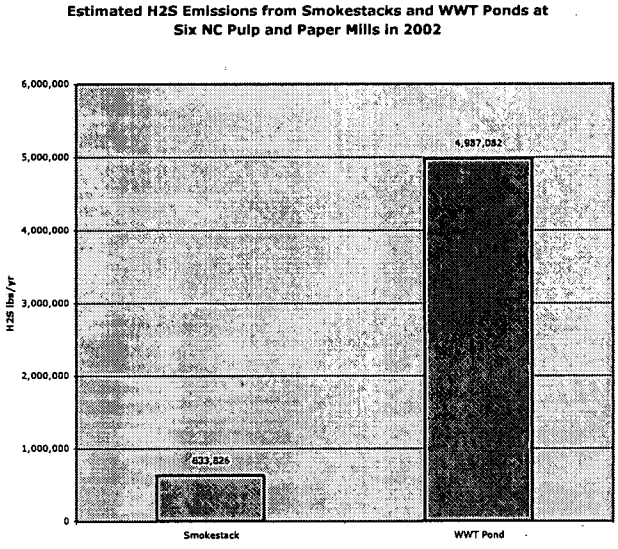
Addressing Concerns about the Hydrogen Sulfide Rulemaking
Environmental Defense- January 5, 2004

1. ***Will setting a health protective standard for hydrogen sulfide (H_2S) place an economic overburden on the pulp and paper industry?***

- No. The Environmental Management Commission (EMC) rules have safeguards in place so that setting a health protective standard does not place an economic overburden on an industry. EMC rules provide economic or technological infeasibility options to the effect that, if an industry (or a facility) can demonstrate that meeting the new standard would be detrimental to the industry's financial well-being, the standard may be relaxed for that particular industry. The Division of Air Quality (DAQ) can develop recommendations for affordable technology for the pulp and paper industry so that this industry can lower their emissions in the most economical way while still providing a public health benefit. This process has been used by DAQ for two other air toxics and can be used for H_2S.
- While EMC rules provide for industries that are unable to meet a new standard, it is the responsibility of the EMC to have the standard in place for those facilities who are able to meet the requirement, or so that all facilities might meet the standard at a later date.
- Paper mills in Canada and six US states, including North Carolina's Blue Ridge Paper plant, have found it advantageous to invest in and have been able to bear the costs of switching to activated sludge systems.

2. ***Why is it important that wastewater treatment (WWT) processes at pulp and paper mills ultimately be required to comply with an Acceptable Ambient Level (AAL) for H_2S?***

- The majority of H_2S emissions from the pulp and paper industry (about 89%) are emitted from WWT ponds. The goal of a tighter AAL for H_2S is not to reduce emissions from one source or another, it is to protect public health from the harmful effects of the toxic pollutant H_2S. Further reducing emissions from industrial sources responsible for only 11% of emissions while letting the sources responsible for 89% of the emissions go unchecked will not protect public health.
- H_2S emissions pose a health threat to NC citizens, regardless of the source. The human respiratory and nervous systems do not differentiate between sources of hydrogen sulfide at a facility and neither should the EMC.



WWT ponds account for an average of 89% of H2S emissions at pulp and paper mills.

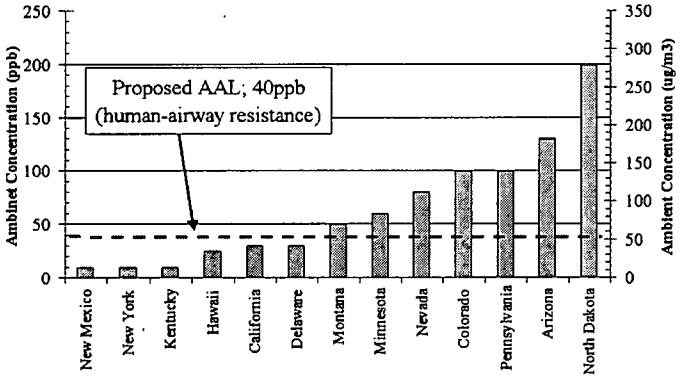
- ***EMC actions to exempt WWT ponds in this rulemaking will simultaneously exempt the ponds from having to meet standards for other dangerous air toxics.***

3. *How do the proposed standards for H_2S compare with standards for H_2S in other states?*

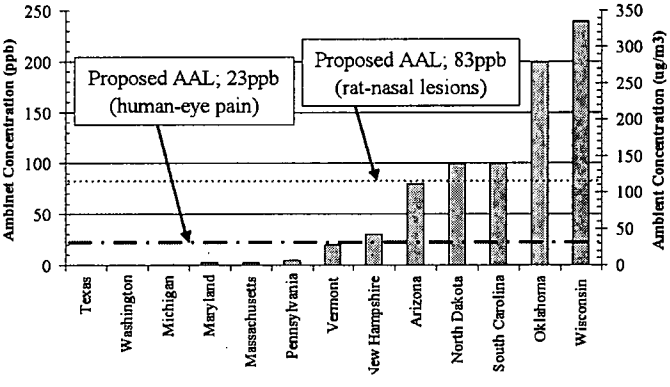
According to DAQ, there are 32 other states with H_2S standards. They vary in averaging times from instantaneous to chronic one-year exposure. The standards that Environmental Defense endorses are the standards recommended by both the Scientific Advisory Board (SAB) and the NC Department of Health and Human Services (NCDHHS): 23 ppb 24-hour and 40 ppb 1-hour. **These standards fall right in the middle of the standards that exist in other states:**

- Of the 13 states that have one-hour averaging standards, 6 have more stringent rules than have been proposed in NC and 7 have less stringent rules (See figure below).
- Of the 12 states that regulate with 24-hour standards, 7 states have more stringent rules than the SAB proposed standard of 23 ppb and 5 have less stringent rules (See figure below).

States with 1-hour standards and proposed NC standard (DAQ)



States with 24-hour standards and proposed NC standard (DAQ)



The dashed lines in the above graphs represent the standards proposed by both the SAB and DHHS (40 ppb and 23 ppb) and the standard proposed only by the SAB (83 ppb). These graphs illustrate that there are many other states with tighter standards than the ones proposed by both the SAB and DHHS. In fact, the NC proposed standards fall right in the middle of the standards that are set in other states.

4. *How can we justify regulating industrial sources of H_2S but not other sources such as hog farms?*

- As indicated by DAQ, most emissions of H_2S in North Carolina are emitted from pulp and paper mills and PCS Phosphate. Emissions of H_2S from the NC hog farming industry are <u>not</u> a major concern. The Manufacturer and Chemical Industry Council (MCIC) erroneously overestimated hog farm H_2S emissions to be roughly 30 million lb/year, or 85% of statewide levels. Since the MCIC's use of the EPA emission factors in February, discussion with EPA indicates that they are in the process of revising the H_2S hog farm emission factors in light of other data. Recent USDA data is consistent with DAQ data indicating that NC statewide hog farm H_2S emissions are <u>less than 850,000 lb/year, or less than 7% of statewide levels.</u> In June 2003 DAQ commissioned NC State University to conduct a study for determining H_2S emissions from a representative hog farm. NCSU expects to report the study results later this year.
- <u>All</u> significant H_2S sources will be subject to the rule, except those exempted by the EMC and those already immune due to other provisions in the toxics program rule. If EMC does not feel comfortable about the gaps and exemptions in its own rules, then EMC clearly has the authority to make whatever changes it feels are warranted. But the rule should not be weakened for other industries simply because some sources are exempted for economic or other reasons.

Acceptable Ambient Level Hydrogen Sulfide

Environmental Review Commission
by
Preston Howard, President
Manufacturers & Chemical Industry Council of North Carolina

MCIC

6 Affected MCIC Members Sites - All in Economically Depressed Regions

- Blue Ridge Paper - Canton
- International Paper
  - Riegelwood
  - Roanoke Rapids
- PCS Phosphate - Aurora
- Weyerhaeuser
  - New Bern
  - Plymouth

MCIC

All are Major Economic Hubs

- Directly employ from 500 to 1200 on-site
- Statewide 9000 total jobs
- Thousands of "spin-off" jobs
- Annual payroll $494 Million
- $750 Million in purchases from NC vendors

MCIC

Regulated Sources

- Six sites owned by MCIC member companies = 14% of all H_2S emissions in NC
- 86% of H_2S emissions would not be subject to the new AAL
- Is it prudent to spend $500 Million to control 14% of the emissions?

MCIC

Jappinen et al. 1990

- "to assess the possible effects of low concentrations of H_2S on respiratory function"
- Exposed 10 asthmatics to 2 ppm for 30 min.
- 2 ppm = 2700 ug/m3
- current AAL is 2100 ug/m3

MCIC

Conflicting Interpretations of Jappinen's results

- SAB
  - Concluded that the bronchial obstruction experienced by 2 of the 10 asthmatics constituted an asthmatic response
- Jappinen
  - noted that the "increase [in bronchial obstruction] was not statistically significant and did not result in clinical symptoms"

MCIC

Bruce Dalton, MD

- "Jappinen study findings are consistent with population studies of residents living near industrial sources of hydrogen sulfide"
- "the SAB's recommendations are based on interpretations of the Jappinen study that are inconsistent with the data as published"

MCIC

Roy N. Everett, MD

- Board certified pulmonologist at ECIM
- Over 40 physicians - practice since 1984
- Receives all respiratory referrals
- "never seen a case of occupationally - related asthma due to employment at Weyerhaeuser"
- "nor have I seen any geographic predilection for asthma in the surrounding area of the plant"

MCIC

"Real world" studies...

- 11 different studies on respiratory health of residents near pulp mills and refineries
- 11 studies found no evidence of significantly increased incidence of asthma or asthma-like symptoms due to hydrogen sulfide exposure

MCIC

MCIC Position

- No scientific evidence to suggest current health impacts at current AAL
- One SAB option - 24 hr AAL of 120 ug/m3
- Almost a 95% reduction from the existing
- Scientifically supportable
- Not out of sync with our closest competitors (SC-140; VA-n/a; TN-n/a)
- Economically achievable

MCIC

Exemption for Wastewater Lagoons at pulp mills

- 100+ acre lagoons
- Must cover lagoons to capture and treat emissions
- Not technically or economically achievable
- Only current option is to abandon lagoons and build new WWTP

MCIC

Study

- Quantify emissions from lagoons
- Conduct air dispersion modeling to determine predicted concentrations beyond the property line
- If model "predicts" violations, install offsite monitors to measure actual off-site H2S concentrations
- None of the exemptions in the rule are "permanent"
- Revisit the exemption in 2009

MCIC

EMC Performed its Job as the "RISK MANAGER"

- Weighed the merits of the scientific arguments and assessed the scientific uncertainty and disagreement
- Considered the significant economic implications for the 4 companies as well as for entire regions of North Carolina
- Assigned an AAL that affords adequate protection for the public health without unnecessarily jeopardizing the jobs of working families

November 13, 2003

Mr. Thomas C. Allen
Division of Air Quality
1641 Mail Service Center
Raleigh, NC 27699-1641

Dear Mr. Allen:

This letter is in follow-up to my oral presentation at the Pitt Community College on October 30, 2003 regarding the public hearing as it specifically relates to proposed rule changes regarding acceptable ambient levels of hydrogen sulfide.

First, let me disclose that I have no financial interest in Weyerhaeuser nor do I own any stock. I have never been employed or retained by Weyerhaeuser, and I am not personal friends with any management or employees.

As a board certified pulmonologist, I have been practicing in Eastern North Carolina since 1984, and I am employed by Eastern Carolina Internal Medicine. We are a large multispecialty group that employees over 40 physicians and has 56 providers. Essentially, all significant respiratory disease is referred to me for evaluation. I have personally never seen a case of occupationally-related asthma due to employment at Weyerhaeuser, nor have I seen any geographic predilection for asthma in the surrounding area of the plant.
