2003-2004

ENVIRONMENTAL REVIEW COMMISSION

MINUTES

DRAFT

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
January 16, 2003

The Environmental Review Commission (ERC) met on Thursday, 16 January 2003 at 9:30 a.m. in Room 544 of the Legislative Office Building.

Senator Fountain Odom presided over the 16 January 2003 meeting. The following members were present: Senators Albertson, Clodfelter, Kinnaird and Odom and Representatives Gibson, Hackney, Hill, Warwick and Weiss. Mr. George Givens, Commission Counsel, Jeffrey Hudson, Assistant Commission Counsel, Susan Iddings, Assistant Commission Counsel, Tim Dodge, Research Assistant, Kevin Howell, Research Intern, and Mary Watson, Commission Clerk were also present.

On 18 December 2002, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice was included in the attachments to these minutes as **Exhibit A**. A copy of the visitor registration and the agenda for the meeting are included in the attachments as **Exhibits B and C**.

Senator Odom called the meeting to order. Senator Odom called on Representative Gibson for his remarks.

Representative Gibson thanked Senator Odom for all he had done for the ERC over the past years, serving as Co-Chair.

George Givens, Commission Counsel, was asked to explain the agenda.

Mr. Givens asked visitors to sign the visitor registration sign-in sheet and asked members to sign and send forward their reimbursement forms. He also asked visitors who were not currently on the mailing list to fill out a mailing list form if they wanted to receive meeting notices via e-mail or regular mail.

Mr. Givens announced that the planning meeting for this meeting was held at 10:00 a.m. on Wednesday, 8 January 2003 in Room 605 of the Legislative Office Building.

Mr. Givens announced that Rick Zechini, Assistant Commission Counsel, left the General Assembly in November to go to work for the North Carolina Realtor's Association. They are in the process of selecting a replacement and hope to have someone on board by February 2003.

Mr. Givens also recognized Kevin Howell, a senior at N. C. State University, majoring in political and biological sciences, who is interning with the research division and will be assigned to a member during the session.

Mr. Givens also noted the absence of Susan Iddings, Assistant Commission Counsel, who is on vacation.

Mr. Givens recognized several visitors present. He said that in May, Allen Klimeck, Air Quality Division of DENR, was appointed Director of the Division of Water Quality; Keith Overcash, former Deputy Director of Air Quality was appointed Division Director in October; and in November Jim Simons, former Chief Engineer of Land Quality Section was made Director of the Division of Land Resources.

Mr. Givens said that the ERC would meet again next week on Wednesday, 28 January 2003.

Mr. Givens called attention to a handout that lists final disposition of bills recommended by the Commission during the Short Session of the 2001 General Assembly. This handout is listed as **Exhibit D**.

Mr. Givens also recognized and thanked outgoing members of the Commission, Senator Odom and Representative Warwick for their past service on the ERC.

Dr. David H. Moreau, Chairman, Environmental Management Commission, DENR, gave the quarterly report by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress. A copy of Dr. Moreau's presentation is listed as **Exhibit E**.

Dr. Moreau reported first on the area of air quality, saying that the activities of the EMC over the past quarter have been largely limited to relatively minor changes to the air quality regulations. A lot of technical changes have been made; however, no major issues have emerged.

Dr. Moreau said that in the area of groundwater, permanent pay for performance rules were adopted. There were initiated actions to establish groundwater standards for nine particular substances.

Representative Hackney asked Dr. Moreau to explain the pay for performance rules that were adopted.

Dr. Moreau said that these rules change the procedures by which the cleanup of the underground contamination sites is conducted. The pay, based on performance, is an agreement that specifies a series of cleanup milestones, generally percentage reduction in the contamination as the basis for payment in the cleanup instead of an open-ended contract.

Dr. Moreau said that with regard to water quality, review of the water quality standards have been completed and changes were proposed to a few of the items for which standards have been written; i.e. arsenic, cyanide, methylene and blue active substances, total residual chlorine and MTBE. The MTBE standard was referred back to water quality for further information based on new research prepared by EPA.

Dr. Moreau said that the most controversial issue they have dealt with is the Phase II stormwater regulations. Phase I was the initial steps taken by the EPA under the Clean Water Act, requiring stormwater management programs in communities of over 100,000 persons. The second part of those regulations now covers all urbanized areas of the country, where urbanized areas are defined as any area in the census for which the density is greater than 1,000 persons per square mile. Those regulations had to be met by March 2000 for the application of that program.

Dr. Moreau said that temporary rules were adopted that was narrowly tailored to deal with the federal program. There is a problem with the federal program as it affects North Carolina. The implicit assumption in those federal rules is that a county would cover any program that is not covered by a municipality. Under the assumption that, if a public storm sewer system exists outside of a municipality, the county owns it. This is not true in North Carolina because of the way the State's Department of Transportation is set up. This has created a problem because some of the urbanized areas to which the program applies fall outside of municipal boundaries and the EMC has been struggling to develop a set of rules where the program can be implemented fairly.

Senator Kinnaird asked Dr. Moreau if President Bush's changes to the Environment and regulations would cause a review and changes of the standards.

Dr. Moreau said that there had been no discussion about changing the stormwater regulations. The changes made by the Bush administration deals with isolated wetlands and performance for power plants.

Dr. Moreau then referred to his handout on buffers. He commented about questions on buffers on the Catawba River. The proposal will come before the EMC in February.

Senator Odom asked Dr. Moreau about the variances on buffers and asked if they were contained in his report.

Dr. Moreau said it was the handout entitled Riparian Buffer Rules-2002 Summary, included in Exhibit E.

Dr. Moreau concluded by saying that the Basinwide Planning Program was progressing on schedule. A report of detailed activities is also included with Exhibit E.

Senator Odom asked why Orange County is referenced in the buffer rules handout. Coleen Sullins, Chief, Water Quality Section, Division of Water Quality, DENR, answered by saying that Orange County is the only county that has adopted and implemented the program for the EMC and division within Orange County.

Coleen Sullins, Chief, Water Quality Section, Division of Water Quality, DENR, gave a PowerPoint report on the development and implementation of rules and programs to control stormwater runoff. A copy of Ms. Sullins presentation is listed as **Exhibit F**.

Senator Clodfelter asked Ms. Sullins if there were any differences in the requirements for Phase II from Phase I.

Ms. Sullins said the main difference associated with Phase II is the post construction stormwater management controls. The regulations under Phase I did not specifically require for that to be dealt with. However, when the federal government adopted the Phase II regulations, they said not only did they expect the Phase II communities to implement them, but that the Phase I permits would come in for renewal.

Ms. Sullins said that most of the Phase I permits are in for renewal this year and the smaller communities have to make their application by March of 2003, depending on the census data.

Senator Odom asked Ms. Sullins to give specific examples of what would be required under the post construction stormwater management for new development.

Ms. Sullins said the way the regulations are set up for the post construction stormwater controls require that the new development and redevelopment control the one year, twenty-four hour storm runoff. This is a first step in the process. The temporary rules also have in them a level at which you do not have to implement controls.

Senator Kinnaird asked Ms. Sullins if maintenance was a concern around post construction. Ms. Sullins said that it was and required that the BMP's be operated and maintained.

Senator Clodfelter asked Ms. Sullins if the regulations define what constitutes redevelopment.

Ms. Sullins said that the regulations do indeed define what is redevelopment and it is modeled on regulations that are in place in the coastal areas. Typically what they are looking for is no net increase in impact associated with redevelopment.

Representative Gibson asked Ms. Sullins if anyone was working on the fiscal impact.

Ms. Sullins said there was a fiscal note developed under the federal regulations and it was in the process of being updated in regards to this new set of rules.

Representative Gibson asked if this model was based on what Phase I cost and commented that Phase II would experience a whole new set of problems.

Ms. Sullins said that as far as she knows, there is no federal money available; however, the federal government is providing for a broader use of the monies.

Ms. Sullins said that in 1991, the statutes were amended to enable local governments to set up utilities associated with stormwater. There is an issue of the level of the community's ability to step in and varies significantly across the State with local governments.

Ms. Sullins said that the program at the federal level provides for a five-year window of implementation to get the program set up. In North Carolina there are a number of things that have been done to make things easier for local governments.

Ms. Sullins said that the collection system issues have been a hot button item and there has been an ongoing initiative to get these under permits.

Ms. Sullins said that another aspect of the program that the department is looking to provide assistance on is the educational aspect and developing a program at the state level.

Representative Gibson asked if the State had any choice in doing this program.

Ms. Sullins said that it was a federal requirement under the Clean Water Act.

Ms. Sullins said the temporary rules were approved by the EMC in 2002 and the local governments are required to make application by 2003.

Ms. Sullins said that the permanent rulemaking process is underway. These permanent rules will be taken out for public notice in February.

Mr. Givens followed up on Representative Gibson's question on legal authority of local governments to set up the stormwater utilities. He said this was dealt with in HB1602 in the 2000 Session. He asked Ms. Sullins to provide information on river basins and the sequence they would be in for the Phase II program.

Mr. Givens also said that the permanent rules would be subject to review by the ERC in 2004.

Mr. Givens said that the following organizations have requested time on our agenda for next week regarding the rulemaking process. North Carolina League of Municipalities, the North Carolina Association of County Commissioners, the North Carolina Homebuilders Association and the North Carolina Coastal Federation.

Representative Hackney asked Mr. Givens if there was any litigation remaining over the rulemaking process.

Both Mr. Givens and Ms. Sullins said they were not aware of any.

Mr. Givens said that although this is a federal requirement, there is some controversy as to whether and to what extent the State should exceed or go beyond the federal mandate.

Dr. Moreau commented that out of all of the requirements, the one that is really the greatest matter of concern is the post construction responsibility.

Mr. John N. Morris, Director, Division of Water Resources, DENR, gave the annual report on the development of the State Water Supply Plan. A status report on Water Supply Planning for January 1, 2002 through September 30, 2002 is listed as **Exhibit G**.

Mr. Morris stated that the drought over the past year has caused significant economic damage. The 2002 drought was a record-breaking drought in the Piedmont and Western Piedmont. Fortunately, the weather took a turn for the better and reservoirs are beginning to rapidly recover.

Mr. Morris said that the shallow groundwater in the mountains and around our streams is what keeps them going when there is no rainfall. In 2002, many of the monitoring wells hit an all-time low. Mr. Morris said that the forecast is still favorable for above average rainfall through March.

Mr. Morris said that the drought held some valuable lessons for us. For instance, some water supply systems are more vulnerable than they should be and steps are underway to take care of that problem. Governor Easley has made funds available on a priority basis to help some of these communities connect to a more stable water supply source.

Mr. Morris said that another lesson learned was that some communities are not prepared for droughts. Every community needs a good emergency plan and steps are underway to make sure that this is done.

Mr. Morris said that the most alarming part of the 2002 drought was the water stored in our major River Basins could be depleted with the result that we could have a drastic falloff in flows in our rivers causing severe problems.

Mr. Morris said that the Catawba and Yadkin River Basins caused the most concern. Re-licensing in these two basins is going on now and it is especially critical that we develop the information we need to work within the federal process to assure a sound water supply in those two basins.

Mr. Morris said that we have to work with our neighboring states as well as the federal government to develop a long-range basin plan.

Mr. Morris said, that while we cannot predict when a drought will occur, we need to deal with the long-range water supply needs of the State. We

need to assure that North Carolina's water supply will not have a limit on economic growth.

Mr. Morris added that we need for local governments to have plans in place by having emergency water sources available and have plans for reducing water use on an increasingly severe basis so that the most important health and safety needs can be met.

Mr. Morris said that much of this work is underway. In 2003, we will be giving our local government water supply plans their five-year update.

Mr. Morris said that another thing needed was to plan for water supply on a river basin basis. Water is a local and regional issue rather than a statewide issue. Water is too heavy and cheap to move a long distance. For example, Greensboro was one of the hardest hit communities by the drought and they took a proactive approach to avoid a problem by purchasing water from their neighbors. Greensboro purchased water from Winston-Salem, Kernersville and High Point and they are planning to purchase water from Burlington.

Mr. Morris said that there is legislation that came through ERC in 1989 created a sound basis for local government water supply plans. There are over 500 of these plans and he suggested looking at their website, www.ncwater.org.

Mr. Morris said that question has been asked about how much water do we have left in North Carolina and how much do we need. Mr. Morris said that both the amount of water that is available and the amount of water needed are not fixed numbers but are subject to management. This issue has to be attached on a river basin basis with good objective information and with the participation of those people who are using the water and depending on it.

Mr. Morris said there was a pilot project in the Cape Fear Basin that was successful toward this approach. A river basin plan was developed that projected water needs for 50 years in the future using a hydrologic model.

Mr. Morris said that the Cape Fear model, done before 2002, identified three communities in the basin that were particularly vulnerable to water supply problems—Vass, Robbins and Carthage.

Mr. Morris said that what we need to do is expand this basin planning approach to other basins with the participation of municipalities and others who were involved in water use.

Mr. Morris said the third thing we need to do is to have sustainable groundwater management. This is similar to the basin management concept but has to be crafted on the water groundwater behaves. There is a sixteen-year schedule to development management strategies for aquifers.

Mr. Morris said the fourth thing North Carolina needs to do is to achieve better efficiency of water use. This can be a big part of the solution to our water supply needs.

Mr. Morris added that water reuse is an important part of water use efficiency. Treated wastewater can be used for irrigation, some industrial processes and other uses. Mr. Morris said that his department is preparing recommendations for the 2003 General Assembly session.

Mr. Morris said that North Carolina has a relatively generous supply of water and feels like we can keep our water supply if we do the right things in the future.

Representative Gibson asked Senator Albertson and Representative Warwick if they were happy with the way the Rural Center was handling our water supply problem.

Senator Albertson said that we were moving in the right direction, but there was work to be done.

Representative Warwick said that the Rural Center had done a good job in engaging local people in the process.

Senator Albertson added that this past year was a wake-up call for us and we need to keep moving in this direction and we need to be good stewards of our water supply.

Senator Odom said he appeared to him that the Department is in a good position to use the drought as a foundation for the ways in which we treat our water even before we have a drought.

Senator Odom asked Mr. Morris if there was ever any effort to enlarge the reservoirs for handling more water.

Representative Gibson added that there were 37 different federal and state agencies involved with changing any natural limit to any standing water body.

Mr. Morris added that in the Yadkin Basin, they found that as the hydroelectric projects operated by Alcoa and CP&L followed their federal licenses and they discovered that High Rock and Badin Lakes would be drained completely which mean a severe fish kills and a health problem.

Mr. Morris said that they got together in 2002 with the South Carolina authorities with the two utilities and with the Federal Energy Regulatory Commission who decided that it would not be a good idea to drain the two lakes and completely run out of water. The solution was that South Carolina agreed to a much smaller supply of water out of the lakes.

Senator Clodfelter asked if part of the Catawba problem was due to the water disappearing naturally to replenish the groundwater rather than withdrawal.

Mr. Morris said there might have been some of that but the major demand on the Catawba lakes was meeting the minimum flow requirements for South Carolina.

Mr. Morris added that Duke Power did a great job of detecting this drought trend early and maintained higher water levels than normal to have a margin of safety.

Representative Gibson complimented Alcoa and Progress Energy for communicating with the six county regions on this water supply problem.

Representative Weiss added to suggestion of additional ability of adding water to the reservoirs that our sedimentation laws have a lot to do with that, because we have this runoff, it fills up our reservoirs. She said that the ERC recommended legislation to strengthen our sedimentation laws. She said she hoped we would remember that when we try to make progress with drought control and other things.

Senator Albertson said that the way we have water when we need it is to add to the reservoirs when they are full.

Mr. Givens said that Mr. Morris, Dr. Moreau and he attended a daylong conference on resource management sponsored by Z. Smith Reynolds. He asked Mr. Morris about page 3 of his report regarding the paragraph indicating that some 14 local governments and others have failed to submit a water supply plan as August 31, 2003. He asked if this was typical and what was being done about it.

Mr. Morris said they generally had excellent compliance with the water supply plans and is now starting on the third generation of these plans. Usually the smaller communities with not much staff were the ones who were delinquent in completing their plans. There are some incentives for some to complete their plans.

Mr. Grover C. Nicholson, III, Chief, Underground Storage Tank Section, Division of Waste Management, DENR, gave a report on the Leaking Petroleum Underground Storage Tank Cleanup Program. A copy of Mr. Nicholson's remarks and a copy of the Status Report are listed as **Exhibit H**.

Mr. Nicholson said that a typical clean-up cost of a 550-gallon home-heating oil tank costs about $20,000. If the soil contamination extends under the house, and the foundation of the house is shored up, the price goes up to $80,000. So, a policy decision was made that it was neither reasonable nor necessary at a low-risk site to shore-up a house and endanger the foundation. The solution to that is a notice of residual petroleum on the property coupled with a notice of no further action required from the Department.

Senator Kinnaird asked Mr. Nicholson if it takes some time for the petroleum to dissipate where it is not of any danger to the soil.

Mr. Nicholson said that petroleum does degrade in soil and groundwater over time. Sometimes it takes 10 years 100 years depending on soil types. Even with a notice of residual petroleum on a property, the property is not put out of use indefinitely. If someone wants to dig a basement or a well on contaminated soil, there is some chance that natural continuation has occurred and the levels of contamination have fallen below unrestricted use.

Mr. Nicholson said there is also always an opportunity for someone to do remediation for that specific project.

Senator Odom asked Mr. Nicholson if heating oil does naturally dissipate with time.

Mr. Nicholson answered in the affirmative.

Senator Odom told Mr. Nicholson that he agreed with a notice opposed with removing a foundation and spending money on remediation and said he was pleased with this.

Senator Odom suggested that some of the low risk sites have nothing done to them and to have some type of notice given with potential for problems. And, if down the road there was a problem, it could be revisited and some of the money from the Non-Commercial Fund could be used.

Senator Albertson said he had more concerns from UST's in the past year. He said that one of his constituents had been trying to have a site cleaned up for the past four years and he was having trouble doing so. He wanted to know why it takes so long to get anything done.

Representative Gibson asked Mr. Givens if the UST working group was headed toward the right way in addressing pay for performance.

Mr. Givens said that a new series of meetings would be held soon to identify these concerns including pay for performance.

Representative Warwick asked Mr. Nicholson what who receives the notices that are sent out when contamination is found on a site.

Mr. Nicholson said the tank owner files the notice of residual petroleum in the chain of title on a property in the Register of Deeds office. The Department also has the authority to do this if the tank owner does not.

Representative Warwick asked what the potential number of residential sites was in the State that were contaminated.

Mr. Nicholson said that he estimated 250,000 home heating oil tanks in the state; however, all of them were not low-risk and/or leaking.

Representative Warwick asked Mr. Nicholson how many times thus far had notices been sent out.

Mr. Nicholson said that so far they had used notices twice.

Representative Hill asked Mr. Nicholson on low-risk commercial sites is there some point and time that they could be released.

Mr. Nicholson said that as a resource focusing mechanism, what they are doing is not working on low-risk sites unless there is a property transfer involved. They have their hands full with the medium and high-risk sites. So, they are typically not issuing "no further action" letters on low-risk sites.

Representative Hill asked Mr. Nicholson if Wilmington is in his area.

Mr. Nicholson answered in the affirmative.

Representative Hill suggested that Mr. Nicholson notify residents in the Wilmington area that they are typically not issuing "no further action" letters on low-risk sites.

Mr. Nicholson said that one of the problems with controlling the UST Program Funds, the way they are presently set up. He said that the Commercial Fund is set up with a deductible amount. Typically, when a leak is discovered, the first $20,000 is paid toward the assessment and remediation of that leak. A typical price tag on a clean up is $100,000 to $125,000 on a site. That means that the Fund picks up the balance. For the non-commercial fund, there is no deductible, so the fund picks up the entire amount of assessment and remediation.

Mr. Nicholson said that the tank owner becomes physically uninvolved in the process very early. Once they hit their deductible, it is of no concern to them how much money it costs to do the job and they are hiring the contractor.

Mr. Nicholson said that what they would like to see is a co-payment in both instances and probably eliminate the deductible, which would keep the tank owner involved in watching the contractor to get the best price from start to finish of the clean up.

Senator Odom said that this seemed logical but suggested this be pursued with caution.

Senator Kinnaird said that there was some program that had problems with contractors charging for very little work and asked if this was the UST program.

Mr. Givens answered by saying that consultants and contractors have been an issue in this program for some time.

Mr. Givens said that one of the factors that affect the availability of reimbursement rate under the non-commercial fund is the transfer of $2 million out of that Fund to the General Fund.

Mr. Givens said that he had asked the Department to assemble a list of all such transfers for the ERC's information.

Senator Kinnaird asked if the UST Funds were some that the Governor had access to last year.

Senator Odom said that both the Governor and the Appropriations Committee had access to these funds.

Mr. Nicholson concluded by saying that trying to implement secondary containment on commercial tanks would help catch the leak before it hit soil and groundwater and save a lot of money.

Mr. Nicholson said that part of the fix is a legislative fix that eliminates the 50 percent restriction on use of funds.

Senator Odom asked Mr. Nicholson about page 2 of the report with regard to inspection. He said it did not make sense that it would take one day for one person to make an inspection. He asked that someone follow up on this.

Mr. Givens told Senator Odom that the Working Group would address this issue in their meetings.

Mr. Richard E. Rogers, Jr., Director, Office of Conservation and Community Affairs, DENR, gave an update with regards to the Department's land and water conservation initiative and reports on land acquisition and million-acre initiative. Three handouts, the 2001-2002 Annual Report on North Carolina Parks and Recreation Trust Fund, the Award Report on the Natural Heritage Trust Fund, and the 2002 Annual Report on the NC Million Acre Initiative are listed as **Exhibit I**.

Mr. Rogers said that there have been meeting across the state to get feedback on the issue of protecting and conserving our natural resources. They are currently in the process of compiling a draft map with regard to conservation in the State and also compiling a report to be presented at a statewide conference on land and water conservation on April 16-17, 2003 to be held at the Raleigh Convention Center.

Mr. Rogers reviewed the handout on the Parks and Recreation Trust Fund.

Senator Kinnaird asked Mr. Rogers what happened to the Jocasse Gorges purchase.

Dr. Phil McKnelly, Director of Parks and Recreation Division of DENR, was called on to answer this question. He said that the Jocasse Gorges land

had been purchased and a master plan was being developed for this purchase. When that master plan was completed and accepted, they would begin on the development of the land.

Next, Mr. Rogers reported on the Natural Heritage Trust Fund and the Conservation Tax Credit Program.

Mr. Rogers commented that the Conservation Tax Credit Program was one of the great programs in state government, which provides tax credit for the donation of property for conservation easements.

Mr. Rogers added that the total acres donated since the conception of this program in 1983, has been 98,800 acres with a total value of $252 million dollars. In the tax year of 2001, 15,600 acres were donated at a value of $80 million and a total of 86 donations made by individual and corporations.

Senator Odom asked Mr. Rogers if there was a handout on this subject and Mr. Rogers assured Senator Odom that a report would be ready next week.

Mr. Rogers then covered the report on the Million Acre Initiative. He noted that while great things are going on, they are not happening at the rate that is needed. The Institute of Government reported that it would take $125 million in additional funds if the proper amount of acreage was acquired per year. Right now, an additional $180 million is needed in order to make our goal with regard to this program.

Senator Odom asked Mr. Rogers if for the calendar year 1999-2000, there was 112,000 and calendar year 2001 there was 863 for a total of 175,000 acres that has been added as a credit toward the one million acres.

Senator Odom asked Mr. Rogers if that included what was already under protection.

Mr. Rogers said that it was not.

Senator Odom asked Mr. Rogers how many acres they expected to acquire in 2002.

Mr. Rogers said they expected about 80,000 acres.

Senator Clodfelter asked Mr. Rogers how much of that 175,000 acres would have been acquired without the million acre initiative.

Mr. Rogers said that considering there was new funding in the program, he would imagine the same amount would have been acquired.

Senator Odom recognized and welcomed Mr. D. G. Martin and Mrs. Catherine Bauman, Director of Government Affairs for the Southeast Region for the Trust for Public Land.

Mr. William E. Holman, Executive Director, Clean Water Management Trust Fund, gave the annual report on implementation of the Clean Water Management Trust Fund. A copy of this report is listed as **Exhibit J**.

Mr. Holman said that the longer annual report is available for any members who would like to have one.

Mr. Holman said that the major water issue in the past year was the drought. The General Assembly took positive action on this issue with recognition of connection between water quantity and water quality. He said that some of the projects they have funded have enhanced the State's efforts of dealing with water supply.

Mr. Holman said that wastewater reuse projects had also been started, one in Chatham County.

Mr. Holman also said that about half of the funding the General Assembly provided was in turn provided to local governments.

Mr. Holman highlighted some of the successes of calendar year 2002. He said that Trustees approved 89 grants for a total of $65 million. They were able to fund about one-third of the requests. Projects were spending half of their money on acquisition of lands or easements for buffers and wetlands and about one fourth for restoration and storm water projects and another quarter for wastewater projects.

Mr. Holman concluded by saying that he looked forward to working with the General Assembly again this year. He said that they partner with other trust funds and hoped that funding would continue.

Senator Kinnaird asked Mr. Holman if the Bush Administration's changes in regulations on wetland affect us locally.

Mr. Holman said that if the federal regulations are rolled back, the state regulations on isolated wetlands would remain in place.

Senator Kinnaird asked if this affected us, would our targets be slightly different.

Mr. Holman said that they would look for opportunities in protecting both regulated and unregulated wetlands.

Representative Hackney added that it was the Supreme Court of the United States that created the gap and the Bush Administration was trying to fill in the gap. They are promulgating regulations that would allow part of the field that was taken off the table by the Supreme Court to come under regulation.

Senator Odom encouraged members to be in attendance at next week's meeting on 23 January 2003.

The meeting was adjourned at 12:00 Noon.

RE: **Notice of Meetings; Additional Information**

COMMISSION MEETING:

The Environmental Review Commission will meet at 9:30 a.m. Thursday 16 January 2003 and at 9:30 a.m. Thursday 23 January 2003 in Room 544 of the Legislative Office Building in Raleigh.

At these meetings, the Commission will hear reports from State agencies, consider studies for which the Commission is responsible, discuss topics to be considered at future meetings, and attend to other matters.

PLANNING MEETING:

To facilitate development of the agenda for the 16 and 23 January 2003 meetings and subsequent meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel will hold an informal planning meeting at **10:00 a.m. on Wednesday 8 January 2003 in Room 605 of the Legislative Office Building**. Persons who wish to participate in the development of the agenda for meetings of the Commission, or who are interested in any matter before the Commission, are invited to attend.

FUTURE MEETINGS:

The General Assembly will convene for the 2003 Session of the General Assembly at 12:00 noon on Wednesday 29 January 2003.

The Commission may meet at other times while the General Assembly is in session (G.S. 120-70.44). If the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representatives as provided by G.S. 143-318 (b). The Commission will resume a schedule of regular monthly meetings following adjournment of the 2003 Session of the General Assembly. Mailed notices of Commission meetings will resume at that time.

ADDITIONAL INFORMATION:

Persons who have questions about the Commission meeting, the planning meeting for the Commission meeting, or other matters related to the Commission may contact the Commission Counsel at (919) 733-2578.

Mary R. Watson, Commission Clerk

RE: **Notice of Meetings; Additional Information**

COMMISSION MEETING:

The Environmental Review Commission will meet at 9:30 a.m. Thursday 16 January 2003 and at 9:30 a.m. Thursday 23 January 2003 in Room 544 of the Legislative Office Building in Raleigh.

At these meetings, the Commission will hear reports from State agencies, consider studies for which the Commission is responsible, discuss topics to be considered at future meetings, and attend to other matters.

RETIRING MEMBERS PLEASE NOTE:

During the 2002 Regular Session, the General Assembly amended G.S. 120-70.42 (Membership; cochairs; vacancies; quorum) by adding the following:

> "Except as otherwise provided in this subsection, a member of the Commission shall continue to serve for so long as the member remains a member of the General Assembly and no successor has been appointed. A member of the Commission who does not seek reelection or is not reelected to the General Assembly may complete a term of service on the Commission until the day on which a new General Assembly convenes. A member of the Commission who resigns or is removed from service in the General Assembly shall be deemed to have resigned or been removed from service on the Commission."

The purpose of this amendment is to allow members of the Commission who are not returning as members of the General Assembly in the 2003 Regular Session to complete their term of service on the Commission. Members to whom this provision applies will be paid travel expenses as though they were public (non-legislative) members of the Commission.

FUTURE MEETINGS:

The General Assembly will convene for the 2003 Session of the General Assembly at 12:00 noon on Wednesday 29 January 2003.

The Commission may meet at other times while the General Assembly is in session (G.S. 120-70.44). If the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representatives as provided by G.S. 143-318 (b). The Commission will resume a schedule of regular monthly meetings following adjournment of the 2003 Session of the General Assembly. Mailed notices of Commission meetings will resume at that time.

ADDITIONAL INFORMATION:

Persons who have questions about the Commission meeting, the planning meeting for the Commission meeting, or other matters related to the Commission may contact the Commission Counsel at (919) 733-2578.

AGENDA
9:30 a.m. Thursday 16 January 2003
Room 544 – Legislative Office Building

1. Call to order
   Senator Fountain Odom, Presiding

2. Introductory remarks by Cochairs
   Senator Fountain Odom
   Representative Pryor Gibson

3. Report to the Commission and explanation of agenda items
   George F. Givens, Commission Counsel

4. Quarterly report by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress (G.S. 143B-282(b))
   Dr. David H. Moreau, Chairman
   Environmental Management Commission, DENR

5. Report on the development and implementation of rules and programs to control stormwater runoff (G.S. 143-214.7(e))
   Coleen Sullins, Chief
   Water Quality Section, Division of Water Quality, DENR

6. Annual report on the development of the State Water Supply Plan (G.S. 143-355(n))
   John N. Morris, Jr., Director
   Division of Water Resources, DENR

7. Annual report on the Leaking Petroleum Underground Storage Tank Cleanup Program (G.S. 143-215.94M)
   Grover C. Nicholson, III, Chief
   Underground Storage Tank Section, Division of Waste Management, DENR

8. Update on the State's land and water conservation initiatives
   Annual report on allocations from the Parks and Recreation Trust Fund from the prior fiscal year (G.S. 113-44.15(c))

   Semiannual report on acquisitions made with funds from the Natural Heritage Trust Fund (G.S. 113-77.9(e)); Biennial report on the Natural Heritage Trust Program (G.S. 113A-164.4(7))

   Annual report on implementation of the Conservation Easements Program and inventory of all conservation easements held by the Department of Environment and Natural Resources (G.S. 113A-235(c))

   Annual report on progress towards attaining the State's goal of protecting one million acres of farmland, open space, and conservation lands (G.S. 113A-241(c))

   Richard E. Rogers, Jr., Director
   Office of Conservation and Community Affairs, DENR

9. Annual report on implementation of the Clean Water Management Trust Fund (G.S. 113-145.6A(a))
   William E. Holman, Executive Director
   Clean Water Management Trust Fund

10. Commission discussion and announcements

11. Adjourn

FUTURE MEETINGS:

9:30 a.m. Thursday 23 January 2003
Location: 544 Legislative Office Building

OTHER MEETINGS:

MEMORANDUM
January 16, 2003

To: Environmental Review Commission
From: Tim Dodge, Research Assistant for Environmental Issues
Re: Handouts

Attached to this memorandum you will find copies of the following documents:

1. List of the final disposition of bills recommended by the Commission during the 2002 Short Session of the 2001 General Assembly.

2. Reports submitted to the Environmental Review Commission (Commission) since the last report distribution in May 2002 that will not be presented orally in January 2003:
   - *Annual Report on Implementation of the Resident Inspectors Program at Commercial Hazardous Waste Facilities.* Division of Waste Management, DENR. October 2002. Statutory Authority: G.S. 130A-295.02(m).
   - *Quarterly Status Report on Permitting and Inspecting Animal Waste Management Systems for the Period Beginning April 1, 2002, and ending June 30, 2002.* Division of Water Quality, DENR. October 2002. Statutory Authority: G.S. 143-215.10M.

3. Spreadsheet summary of reports to be submitted to the Commission.

4. Spreadsheet summary of studies to be conducted by the Commission.

Please contact George Givens, Jeff Hudson, or me if you have any questions or comments.

Michael F. Easley, Governor

William G. Ross Jr., Secretary

October 4, 2002

Mr. George Givens, Commission Counsel
Environmental Review Commission
Room 545
Legislative Office Building
Raleigh, NC 27601-1096

Dear Mr. Givens:

In 1990, the General Assembly ratified Senate Bill 1631, AN ACT TO REQUIRE RESIDENT INSPECTORS AT COMMERCIAL HAZARDOUS WASTE FACILITIES. As a result, Article 9, G.S. 130A-295.02 requires the Division of Waste Management to employ resident inspectors to monitor the activities of all the commercial hazardous waste facilities within the state to ensure their compliance with laws and rules administered by the Department of Environment and Natural Resources.

The act further requires that reports be submitted to the Environmental Review Commission and the Joint Legislative Commission on Governmental Operations regarding the implementation of this program. On July 20, 1992, the General Assembly ratified House Bill 528 [Article 9, G.S. 130A-295.02(m)], which requires the program to make an annual report beginning September 1, 1992.

The Resident Inspector Program's 2002 Annual Report covering FY 2001-2002 is attached. If you have any questions, please contact Michael Brailsford, program supervisor for the Resident Inspector Program, Hazardous Waste Section at (919) 733-4996, ext. 359.

Sincerely,

William Ross
Secretary

RESIDENT INSPECTOR PROGRAM
2002 ANNUAL REPORT

This annual report is presented to the Joint Legislative Commission on Governmental Operations and the Environmental Review Commission pursuant to Article 9; G.S. 130A 295.02(m). The report covers the activities of the Resident Inspector Program from July 1, 2001 through June 30, 2002.

I. OVERVIEW

The Resident Inspector Program has been operating for more than 11 years in the Division of Waste Management. This program monitors all aspects of the commercial hazardous waste facilities in North Carolina and assures compliance with all laws and rules administered by the Department of Environment and Natural Resources. It may also enforce laws or rules administered by any other state agency through a memorandum of agreement.

The Resident Inspector Program was established "... to enhance the ability of the Department to protect the public health and the environment by providing the Department with the authority and resources necessary to maintain a rigorous inspection and enforcement program at commercial hazardous waste facilities" [G.S. 130A-295.02(f)].

II. PROGRAM STAFFING

For this fiscal year, the program was comprised of two resident inspectors, one administrative assistant and a program supervisor (See Attachment 1 for Organization Chart). The Resident Inspector Program resides within the Hazardous Waste Section's Compliance Branch.

III. THE RESIDENT INSPECTOR

Most state agencies perform their compliance monitoring inspections as required from their respective regulations. The Resident Inspector Program, however, is unique in that its inspection strategy is a multi-media approach; which covers all regulatory responsibilities for which DENR is authorized, such as hazardous waste management and treatment requirements, air emission requirements, water treatment and discharge requirements, etc.

There are inherent overlaps of DENR's regulatory requirements inherently overlap regulations administered by other departments. Two examples include the Department of Labors Occupational Safety & Health Act, and the Department of Transportation's hazardous materials transportation regulations. Deviations from these various departments' regulations could adversely affect public health and the environment, as well as a facility's compliance with air, water or hazardous waste management regulations. As part of the Resident Inspector Program's comprehensive approach to monitoring commercial hazardous waste facilities, resident inspectors also evaluate these sites for potential violations in other regulatory areas. When necessary, they make recommendations to the facilities and/or make referrals to the authorized agency or agencies. The mandated frequency of inspection at each facility gives resident inspectors the time needed to achieve this degree of oversight.

To prepare resident inspectors for their multimedia approach to inspections, initial training typically consists of Hazardous Waste Operations and Emergency Response (24 or 40 hours), Environmental Surveillance, RCRA Hazardous Waste Training, Hazardous Materials Transportation and the care and use of Level B / Personal Protective Equipment.

Annual training for resident inspectors includes an eight-hour Health & Safety Basic Refresher, Level B Update and Environmental Surveillance Update. Depending upon the inspector's area of expertise and responsibility, other miscellaneous training may be received, including Hazardous Waste Incineration, Ambient Air Monitoring, Air Pollution Control Devices, Chemical Safety Audit, OSHA Inspector's Course, Hazardous Materials Management and various EPA regulatory workshops.

IV. SUBJECT FACILITIES

To be subject to oversight by the Resident Inspector Program, the facility must be a commercial hazardous waste facility. The term "commercial," as it relates to a hazardous waste facility is defined as a facility " ... that accepts hazardous waste from the general public or another person for a fee" [G.S. 130A-290(a)(3)]. Presently, there are 12 permitted and one "interim status" commercial hazardous waste facilities in North Carolina under the jurisdiction of the Resident Inspector Program. The "interim status" facility (Carolina Solite Corporation) and two permitted facilities (Giant Resource Recovery and EnviroChem Environmental Services) continue with their previously announced intention to close all hazardous waste operations at their North Carolina locations.

V. FACILITY CATEGORY RANKINGS

Each commercial hazardous waste facility is ranked to determine its program fees and minimum inspection frequency. The frequency of the inspections at each facility is dependent upon its qualification as a "special purpose" commercial hazardous waste facility and the category ranking assigned to it.

Currently, all existing commercial hazardous waste facilities in North Carolina qualify as special purpose facilities. (See Attachment 2 for current category rankings and primary waste management activities for these facilities.) The designated Categories of 1, 2 or 3 correspond to a minimum inspection frequency of two, four or six times per month, respectively.

VI. FUNDING & EXPENSES

The Resident Inspector Program is completely funded by fees collected from the commercial hazardous waste facilities that require a permit. These fees are based upon each facility's category ranking and the volume of hazardous waste handled. The category ranking system is designed to be an indirect measure of the costs associated with the oversight at each commercial hazardous waste facility. With the overall reduction of hazardous waste generation by industry, the commercial hazardous waste facilities tonnage throughput has decreased. Consequently, the fees received from these facilities have decreased.

For FY 2001-2002, the budget was developed using anticipated revenues from the Resident Inspector Program . The fees estimate was approximately $275,000. Due to the impact to general industry by the "September 11" disaster, the actual hazardous waste tonnage received by many of the commercial facilities was significantly lower than projected. A detailed list of the individual tonnage received by each of the commercial hazardous waste facilities in FY 2001-2002 can be found in Attachment 3.

The Actual Program receipts in FY 2001-2002 totaled $252,616. Anticipating the economic downturn resulting from "9-11," budget restrictions for travel, training and supplies were imposed and expenses were held to a minimum of $232,756 in accordance with state budget mandates. Consequently, the program supervisor has taken on inspection responsibilities in order to meet program mandates.

VII. INSPECTION GOALS & ACHIEVEMENT

During the past fiscal year, the program staff conducted a total of 570 inspections. The additional 66 inspections over the required minimum of 504 were performed to monitor closure activities at two facilities and to stem poor compliance performance at other facilities. A detailed list of the inspections performed by program staff at the commercial hazardous waste facilities in FY 2001-2002 can be found in Attachment 4.

VIII. ENFORCEMENT & COMPLIANCE

Enforcement Activities

Excessive personnel turnover at two of the commercial TSDF facilities relates directly to poor compliance. However, the commercial hazardous waste facilities generally continue to be cooperative. In most cases, they have rapidly responded with corrective action when deficiencies or violations were cited or recommendations were made.

When either of these actions do not result in timely and consistent compliance, more severe enforcement action, such as compliance orders with administrative penalties, is taken.

During the past fiscal year, resident inspectors issued seven Notices of Violation to the commercial facilities (see Attachment 5). Additionally, one compliance order with an administrative penalty of $27,500 was issued to Heritage Environmental Services. This translates to an overall compliance rate of 98.4 percent.

Compliance Assistance Activities

Compliance assistance activities offered under this program are conducted routinely during the inspectors' site visits. Since the inspectors visit these facilities at least twice a month, they have the opportunity to become familiar with each facility's operation and may offer compliance assistance in several ways.

Inspectors identify past trouble areas and work with the facility toward a permanent solution. They also increase scrutiny of these areas during each visit to keep the facility's compliance awareness high. Inspectors communicate frequently with facility management and front-line workers to clarify the permit and current regulatory requirements, the reasons for the requirements, and the potential risks incurred at noncompliance. Inspectors continue to schedule customized roundtable-training workshops at each specific facility. These workshops cover the most frequent violations observed at commercial facilities, the most frequent violations observed at their particular facility, any potential areas of concern, and positive facility operations.

If a facility repeats a violation, the primary inspector and program supervisor will set up an informal enforcement conference with the local facility compliance managers, the plant manager and, if applicable, the corporate compliance officers. They discuss the facility's current compliance issues and work with the facility to find a permanent solution which may include formal enforcement.

IX. PUBLIC MEETINGS / HEARINGS & PERMIT RENEWALS

Resident Inspector Program staff continue to attend public meetings/hearings that involve existing and proposed commercial hazardous waste facilities in this state. A continuing program goal is for the staff to be fully aware of public concerns and to be conscious of these concerns during oversight efforts at these facilities. Program staff have provided assistance in facility compliance audits by generators, consultants, other agencies and the public. Program staff also work with area schools to provide information in the classroom about environmental responsibility and how the facilities help with that responsibility.

Resident Inspector Program staff members continue to work with the Facility Management Branch, the permitting arm of the Hazardous Waste Section, and the commercial hazardous waste facility during the permit application process and permit renewal review periods. Working closely together provides clarification for both programs, addresses areas of mutual concern and assists in ensuring the permit application accurately reflects the facility as it is operated, or vice-versa.

X. SUMMARY

At the conclusion of the program's 11 year history, Resident Inspector staff continue to provide rigorous oversight of the commercial hazardous waste facilities in this state. This is reflected in the facilities' overall compliance rate of 98.4 percent. Staff constantly seek new approaches and initiatives to improve the department's ability to protect public health and the environment. Staff also work to ensure that new regulatory requirements are fully understood by the facilities so they can be rapidly and correctly implemented. Proactive approaches, such as workshops, program oversight and compliance assistance efforts, have clearly demonstrated a heightened level of compliance at the commercial hazardous waste facilities in North Carolina.

RE: Quarterly Status Report on Permitting and Inspecting Animal Waste Management Systems for Period Beginning April 1, 20021 and Ending June 30, 2002

Pursuant to Chapter 15, Section 15.2(a) of the 1997 Session Laws, the Department of Environment and Natural Resources submits the subject quarterly report.

This report details the inspections and operational reviews completed in North Carolina during the second quarter of 2002 for both the Division of Water Quality and the Division of Soil and Water Conservation. The tables show the type of inspection and the number of inspections completed quarterly and year to date. The Pilot Project conducted by the Division of Soil and Water Conservation is still in effect for 2002. The tables also show the number of permits issued as well as violations and deficiencies by region.

The enclosed tables list totals for each of the Department's Regional Offices as well as state totals. The Regional Offices are noted as follows: ARO – Asheville Regional Office, FRO – Fayetteville Regional Office, MRO – Mooresville Regional Office, RRO – Raleigh Regional Office, WARO – Washington Regional Office, WIRO – Wilmington Regional Office, and WSRO – Winston-Salem Regional Office.

If there is a need for any additional information or clarification, please do not hesitate to contact us.

Other inspections	0	0	0	0	0	1	0	1
Other Agency Total number of operation reviews completed***	0	0	0	0	0	0	0	0
Routine operation reviews	0	0	0	0	0	0	0	0

*Quarterly numbers are reported as of 06/30/02 and may vary from actual due to delays in data entry and continued refinements to database.

** Pilot Project. Compliance Inspections will only be conducted in Brunswick, Columbus, and Jones County by DSWC. Operation reviews are normally conducted in the Pilot Counties in the spring and compliance inspections are conducted in the fall. As of July 1, 1999, Brunswick County became part of the Pilot Project.

***Other Agencies include Soil and Water Conservation Districts and NRCS.

Average time to complete a compliance inspection or operation review is approximately 6 hours. It is anticipated that this time will increase as the number of farms that have certified animal waste management plans and permits increases.

For Period Beginning April 1, 2002 and Ending June 30, 2002

	ARO	FRO	MRO	RRO	WARO	WIRO	WSRO	State Totals
Number of Permits Issued to Animal Operations	0	21	2	8	9	19	5	64

Cattle	0	0	1	2	0	0	3	6
Poultry	0	0	0	0	0	0	0	0
Horses	0	0	0	0	0	0	0	0

For Period Beginning April 1, 2002 and Ending June 30, 2002

	ARO	FRO	MRO	RRO	WARO	WIRO	WSRO	State Totals
Deficiencies and Violations[1] found during DSWC operation reviews and DWQ inspections*	0	13	6	16	32	29	14	110
Number of facilities receiving a deficiency or violation from inspections	0	10	0	10	16	26	12	74
Enforcement actions initiated for violations noted during this quarter**	0	4	1	2	0	1	0	8

*Violation totals include violations noted during both operation reviews and compliance inspections and may include multiple violations at a single facility.

**Enforcement actions being developed by the regional staff are normally not shown as actions initiated during that quarter. These actions will be included in the next year to date totals.

Deficiencies and Violations Identified[1]	Total number of inspections with identified problem	Percent of total problems identified	Percent of total inspections completed (1,394)
Discharges from Animal Waste Management System	13	11.8	0.9
Of the total discharges identified, the number of discharges that reached surface waters of the state	(6)***	(5.5)	(0.4)
Inadequate Freeboard (Certified Farms)	8	7.3	0.6
Of the total inspections identified with inadequate freeboard, the number of inspections with freeboard noted at less than 1 foot	(1)	(0.9)	(0.1)
No Certified Operator in Charge	16	14.5	1.1
Evidence of over application	46	41.8	3.3
Does not meet setbacks	2	1.8	0.1
Inadequate land	4	3.6	0.3
Crop differs from that stated in Certified Animal Waste Management Plan	21	19.1	1.5
Totals	110****	100	

***Of the discharges to surface waters, 2 were from cattle operations, and 4 were from swine operations and 0 were from poultry operations.

****1,394 inspections and reviews were conducted. There were 7 potential problems evaluated on each report. Therefore the total possible deficiencies and violations that could have been noted was 9,758. The 110 problems identified represents 1.1% of the total potential number.

[1] From the period of 01/01/02 through 06/30/02, DWQ has issued roughly 22 Notice of Deficiencies, approximately 59 Notice of Violations. This number can only be estimated due to the slight time delay between the issuance of a NOD or NOV from the DWQ regional staff, and the receiving of the copy of the letter by the DWQ Central Office.

For Period Beginning April 1, 2002 and Ending June 30, 2002*

Studies to be Conducted by the Environmental Review Commission

Organized by topics: air quality, coastal issues, environmental health, fishing, general, hazardous substances, land quality, parks and conservation, solid waste, water quality, water quantity, wetlands

air quality

ERC	Report To/ Authority	Report Due
Study and recommend ways to reduce fee for motor vehicle emissions inspection, including the option of requiring biennial inspections rather than annual inspections.	General Assembly SL 2001-504(20)	2003 General Assembly

coastal issues

ERC	Report To/ Authority	Report Due
Study the standards for the granting of variances by the Coastal Resources Commission under the Coastal Area Management Act (G.S. 113A-120.1).	General Assembly SL 2001-494, Sec. 5	2002 Regular Session of the 2001 General Assembly.

general

ERC	Report To/ Authority	Report Due
Availability and use of alternative energy sources in the state, including the use of biomass resources.	General Assembly SL 2001-491, Part XIV	2002 Regular Session or 2003 General Assembly

ERC (in consultation with Public Health Study Commission)	Report To/ Authority	Report Due
Local Health Directors: Issues related to the appointment of local health directors and the potential benefits of expanding to all 100 counties the authority that certain boards of county commissioners have under G.S. 153A-77.	General Assembly S.L. 2001-491, Part XIV	2002 Regular Session or 2003 General Assembly

parks and conservation

ERC	Report To/ Authority	Report Due
Strategies to attain the State's goal of preserving one million acres of open space over the next ten years, and the long-term protection and restoration of water quality.	General Assembly SL 2001-491, Part XIV	2002 Regular Session or 2003 General Assembly

* "oral" indicates oral report was given to ERC or S+A; "mail" indicates the report was mailed to members; "in" indicates that the report has been received but not yet distributed.

solid waste

ERC	Report To/ Authority	Report Due
Abandoned Mobile Homes: strategies to discourage or prevent the abandonment or improper disposal of mobile homes and facilitate the environmentally friendly disposal of mobile homes.	General Assembly SL 2001-491, Part XIV	2002 Regular Session or 2003 General Assembly

water quality - general

ERC	Report To/ Authority	Report Due
Stormwater Programs and Policies; strategies necessary to attain the goal of preventing environmental degradation of the State's water and groundwater resources, particularly due to stormwater.	General Assembly SL 2001-491, Part XIV	2002 Regular Session or 2003 General Assembly

water quality - ground

ERC	Report To/ Authority	Report Due
Evaluate the appropriation from the Leaking Petroleum Underground Storage Tank (LUST) Cleanup Funds to the LUST Cleanup Program to determine whether adjustments in the amount of the appropriation should be made.	General Assembly SL 2001-454, Sec. 2	2003 General Assembly

water quantity

ERC (in consultation with the Joint Legislative Growth Strategies	Report To/ Authority	Report Due
Interconnection of public water systems or wastewater systems to regional systems and requiring that reasonable alternatives be reviewed before constructing or altering a public water system.	General Assembly SL 2001-491, Part XIV	2002 Regular Session or 2003 General Assembly

* "oral" indicates oral report was given to ERC or S+A; "mail" indicates the report was mailed to members; "in" indicates that the report has been received but not yet distributed.

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

III. Quarterly Report On **Surface Water Quality** Activities

A. Major EMC Agenda Items During Quarter

B. Future EMC And Committee Agenda Items

I. AIR QUALITY ACTIVITIES

AGENDA ITEM _____: Hearing Officer's Report on the Adoption of and Amendments to Various Rules.

EXPLANATION:

On August 20, 2002, Mr. Dan Besse held a public hearing on the adoption of and amendments to various air quality rules.

Three rules are proposed to be amended to correct addresses, and division or department names.

The visual emission standard is proposed to be changed for hot mix asphalt batch plants from an allowable 40 percent opacity for older plants to 20 percent opacity.

Rules on emissions of particulates are proposed to be amended to make the wording in the rules consistent.

The general sulfur dioxide emission standard rule is proposed to be amended to exclude incinerators covered under incinerator rules with sulfur dioxide emission standards.

The visible emission rule is proposed to be amended to revise requirements for determining compliance when continuous opacity monitors are used and to exempt from this rule sources that have specific opacity standards in other rules.

An alternate coal sampling collection methodology "sampling as fired" is proposed to be added to two rules on monitoring sulfur dioxide emissions. The rules require a demonstration that sampling as fired provides a more accurate estimation of sulfur dioxide emissions than sampling each shipment.

The rule concerning the control of gasoline vapor emissions at bulk terminals is proposed to be modified to include the control of emissions resulting from storage tank degassing operations. The modification includes a requirement for 90 percent control of total emissions, which is based on uncontrollable emissions being released to the atmosphere during the time it takes to float the floating roof during refilling of the storage tank.

A new rule is proposed to establish a process to certify gasoline truck tank tester facilities by the Division of Air Quality, which replaces a federal self-certification program. All gasoline truck tanks will be required to be certified leak tight by a certified testing facility.

The rule for petitioning for an alternative operational is proposed to be amended to remove obsolete language and the requirement for approval of the U.S. Environmental Protection Agency (EPA) of alternative control.

A new rule is proposed to allow controls superior to the required control for volatile organic compounds.

A permitting rule is proposed to be amended to correct a filing error by removing language that had been removed as a result of an earlier hearing but was subsequently reinserted.

The hearing record was sent to you earlier.

RECOMMENDATION:

The Director recommends that the Commission adopt the proposed amendments and rules contained in Chapter II of the hearing record and authorize the Chair to sign the certifications on behalf of the Commission.

EMC ACTION: Approved all but the rule on source categories whose permits are to be noticed for public comment. The hearing officer did not present this rule for adoption; he wanted to further evaluate the public comments on it.

Agenda Item _____ :

Reconsideration of the Amendments to Particulates from Hot Mix Asphalt Plants

At its October meeting, the Commission adopted amendments to 15A NCAC 2D .0506, Particulates from Hot Mix Asphalt Plants, which were a subject of a public hearing held on August 20, 2002. Mr. Dan Besse was the hearing officer.

As a result of public comment, a paragraph was added to the rule to limit fugitive emissions not covered elsewhere under the rule to 10 percent opacity averaged over one minute.

The Carolina Asphalt Pavement Association has asked for withdrawal of this amendment based on the rule differing substantially from the proposed rule. This additional requirement differs substantially from the proposed rule. It affects the interest of person who could not have reasonably have determined that the rule would affect their interest based on the proposed text of the rule or the hearing notice. It addresses a subject matter or an issue not addressed in the proposed text of the rule. It produces an effect that could not reasonably have been expected based on the proposed text.

Recommendation:

The Director recommends that the Commission return the rule to the Air Quality Committee to decide the appropriate action to take on the amendment to the hot mix asphalt plant rule.

EMC ACTION: EMC approved renoticing rule for additional comment.

AGENDA ITEM _____: Consideration of Re-certification of Mecklenburg County Local Program

EXPLANATION:

Mecklenburg County has reorganized its environmental program. As a result of the reorganization, the Board of County Commissioners, which also serves as the air pollution control board for the Mecklenburg County local air quality program, has requested that the Mecklenburg County local program be re-certified to reflect the reorganization.

The new certification reflects the current and future Mecklenburg County organizational structure. The new certification certifies the Mecklenburg County Board of Commissioners and its designated administrative unit to operate the local air quality program. The current certification certifies the Mecklenburg County Department of Environmental Protection, which has been reorganized into a larger Mecklenburg County administrative unit.

Other changes in the certification are that the new certification records the dates of previous re-certifications and that the EMC retains jurisdiction over facilities owned and operated by Mecklenburg County.

Attached are a letter from the chairman of the Mecklenburg County Board of Commissioners requesting re-certification and the new certification.

RECOMMENDATION:

The Director recommends that the Commission approve the new certification for Mecklenburg County.

EMC ACTION: Approved by the EMC.

AGENDA ITEM : Request to Proceed to Public Hearing on the Amendments to Various Air Quality Rules

The Environmental Management Commission is requested to approve one or more public hearings to consider amendments to seven nitrogen oxide emission standard rules and two permitting rules.

Seven nitrogen oxide rules are proposed to be amended to make clarifications. The U.S. Environmental Protection Agency has asked for several clarifications to the nitrogen oxide rules. Clarifications are being made for monitoring requirements, stationary internal combustion engines, using the trading program, and using the compliance supplement pool. Three corrections are also proposed to be made. They are correcting the location of Duke's Cliffside plant, the name of a boiler at Blue Ridge Paper Products, and an allocation for a combustion turbine at Butler Warner Generating.

Definitions for "minor modification" and "significant modification" are proposed to be added to the permit fee definition rule.

The exclusionary rule for cotton gins is proposed to be amended to remove specifying the ginning seasons and the requirement for the Commissioner of Agriculture to request extending the ginning season if it exceeds the length specified in the rule. Instead of using the bales ginned during the ginning season, the bales ginned during a calendar year is used to determine if the cotton gin qualifies for this rule.

RECOMMENDATIONS: The Director recommends that the Commission authorize a public hearing(s) on these amendments and that the Chairman appoint a member(s) of the Commission to serve as hearing officer(s).

EMC ACTION: Approved by the EMC.

Agenda Item _____: Response to Objections by the Rules Review Commissions to Several Volatile Organic Compound Emissions Rules

Explanation:

The Rules Review Commission has objected to five rules:

- 15A NCAC 2D .0912, General Provisions On Test Methods And Procedures
- 15A NCAC 2D .0952, Petition For Alternative Controls For RACT
- 15A NCAC 2D .0959, Petition For Superior Alternative Controls
- 15A NCAC 2D .0960, Certification Of Leak Tightness Tester

Rule 15A NCAC 2D .0912 was objected to based on lack of statutory authority and ambiguity. There were two objections. The first objection is on the language that requires stack testing to be done by a person qualified by training or experience in the field of air pollution testing. In response to this objection, the qualification language is proposed to be removed. The second objection deals with the Director approving a source test. The rule current does not specify the criteria that the Director will use to approve a test. In response to this objection, criteria is proposed to be added. The criteria are that all the information required to be included in the notification is included and that the correct testing procedures are used.

Rule 15A NCAC 2D .0952 was objected to based on ambiguity. It is unclear what the agency would consider a nuisance condition. In response to this objection, the nuisance language is proposed to be removed.

Rule 15A NCAC 2D .0959 was objected to based on ambiguity. It is unclear what the agency would consider a nuisance condition. In response to this objection, the nuisance language is proposed to be removed.

Rule 15A NCAC 2D .0960 was objected to based on ambiguity. It is unclear what the Division's standard is for a sticker. The rule requires stickers provided by the testing facility to meet the Division's standard. (A testing facility may use its own stickers or sticker provided by the Division.) In response to this objection, the Division's standard is removed and is replaced with language requiring the sticker to contain the same information that is on the stickers provided by the Division and to have the same dimensions.

Recommendation: The Director recommends that the Commission approve the revised rules in response to the objections of the Rules Review Commission.

EMC ACTION: Approved by the EMC.

FUTURE EMC AND AIR QUALITY COMMITTEE AGENDA ITEMS

December 2002 EMC Agenda Item # 02-59:

ACTION ITEM FROM THE DIVISION OF WASTE MANAGEMENT – UNDERGROUND STORAGE TANK SECTION ***(Item went to the EMC in three parts)*:**

ACTION ITEM A: Request to Waive the Groundwater Committee 30-Day Review Period To Allow the Committee To Consider Approval Of The Proposed Permanent Pay For Performance Rule.

ACTION ITEM B: Request To Adopt the Permanent Pay For Performance Rule.

EXPLANATION:

On March 15, 2002, the Environmental Management Commission adopted temporary rules to specify pay-for-performance cleanups for underground storage tank releases. Sections 1 and 2 of House Bill 1063 gave the Commission the authority to allow performance-based cleanups of sites where petroleum has been discharged or released from underground storage tanks. A performance-based or pay-for-performance contract is an agreement that specifies a series of cleanup milestones (generally, percentage reductions in contaminant levels) that must be achieved before payments can be made to the cleanup firm. Tank owners, operators, and landowners of sites eligible for reimbursement from the Commercial and Noncommercial Leaking Petroleum Underground Storage Tank Cleanup Funds may allow their sites to be considered by the Division for this pilot program. The Division of Waste Management may also utilize money from the Cleanup Funds and other sources specifically intended to be used for performance-based cleanups at state-lead cleanup sites. Sites selected by the Division for performance-based cleanups will be posted for competitive bidding in the North Carolina Interactive Purchasing System. A performance-based contract will be awarded to the qualified environmental services firm that submits the lowest bid for an acceptable remedial proposal for the advertised site.

On November 1, 2002, permanent Pay for Performance Rules were published in the North Carolina Register with a hearing date of November 18, 2002. The public comment period ended on December 2, 2002. No comments were received regarding this rulemaking.

On December 11, 2002, the EMC Groundwater Committee recommended that the full Commission adopt the rule as published in the NC Register.

EMC Action:

On December 12, 2002, the Environmental Management Commission combined Action Items 02-59 (A) through 02-59 (B) into one action item and approved the Pay for Performance Rule from the Division of Waste Management – Underground Storage Tank Section. This rule can now proceed with the remaining steps in the rulemaking process contained in NCGS 150B.

December 2002 EMC Agenda Item # 02-63:

ACTION ITEM FROM THE DIVISION OF WATER QUALITY – GROUNDWATER SECTON: Request for Approval to Proceed with Public Notice and Hearing to Establish Groundwater Quality Standards for Nine Substances in title 15A NCAC 2L .0202 (*Benzoic Acid, Bis(chloroethyl)ether (BCEE), Dibenzofuran, Dibromochloromethane, Ethyl Acetate, Hexachlorobutadiene, 2-Hexanone, 1,1,2,2-Tetrachloroethane, 1,2,4-Trichlorobenzene)*

EXPLANATION:

This amendment to 15A NCAC 2L .0202, Groundwater Quality Standards, will establish groundwater standards for nine substances in title 15A NCAC 2L .0202. The proposed rule changes are being made to incorporate the most updated health information and concentration levels as Groundwater Quality Standards in 15A NCAC 2L .0202. The concentrations shown in this agenda item are currently in place as interim maximum allowable concentrations established pursuant to 15A NCAC 2L. 0202 (c).

Pursuant to a recommendation by the Groundwater Committee at the July 2002 meeting, a 60-Day Notice of Rulemaking Proceedings was published the North Carolina Register on August 1, 2002. A Notice of Rulemaking Proceedings is to give the public advanced notice that rulemaking is in progress and to allow them to comment on the proposed activity. The Groundwater Section received no comments in response to this notice to add these standards to title 15A NCAC 2L .0202.

These substances are shown with the proposed Groundwater Quality Standard and unless otherwise noted, numeric standards for these substances are shown in milligrams per liter as follows:

SUBSTANCE	PROPOSED CONCENTRATION
Benzoic Acid	28.0
Bis(chloroethyl)ether (BCEE)	3.1×10^{-5}
Dibenzofuran	0.028
Dibromochloromethane	4.1×10^{-4}
Ethyl Acetate	2.60
Hexachlorobutadiene	4.4×10^{-4}
2-Hexanone	0.28
1,1,2,2-Tetrachloroethane	1.7×10^{-4}
1,2,4-Trichlorobenzene	0.07

EMC Action:

On December 12, 2002, the Environmental Management Commission gave the Division permission to proceed with public notice and hearing on these nine substances. In making this recommendation, the Commission understood that the names, concentrations, and descriptions of substances that are proposed in the amendment that will appear at public hearing are those specified by the Division of Public Health.

III. SURFACE WATER QUALITY ACTIVITIES

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request for Approval of Proposed Temporary NPDES Phase 2 Stormwater Rules

Explanation:

In July 2002 the EMC and DWQ held five public hearings to gather public input on draft NPDES Phase 2 Stormwater Rules. These hearings were held in Asheville, Kernersville, Smithfield, Washington and Wilmington. The hearing officers have reviewed comments received and worked with the Division on development of a final draft of the rules that will be presented to the full EMC for review and approval. The rules will be presented for approval as temporary rules to allow for implementation of the federal phase 2 NPDES stormwater program. A permanent rulemaking process will follow and will be brought back to the WQC and EMC at a later meeting.

Recommendation:

The Hearing Officers recommend that the Commission approve the proposed temporary NPDES Phase 2 Stormwater Rules.

EMC ACTION:

The EMC approved the proposed temporary NPDES Phase 2 Stormwater Rules with minor modifications.

Agenda Item:

Hearing Officer's Report on the Proposed Changes to the Surface Water Quality Standards and Classification Rules for the Triennial Review

Explanation:

In April and May, the Water Quality Committee (WQC) and the Environmental Management Commission (EMC), respectively, approved proceeding to Public Hearings with the proposed rule changes for the 2000 to 2003 Triennial Review of surface water quality standards. The Triennial Review of water quality standards is mandated to occur every three years by the Clean Water Act. The proposed changes approved for public hearings by the EMC included modifications to the arsenic, cyanide, methylene blue active substances (MBAS), and total residual chlorine (TRC) standards, and the addition of a methyl tert-butyl ether (MTBE) standard. In addition, the EMC solicited public comments on the existing water quality and thermal variances and possible future changes to the bacteriological and nutrient criteria at the Triennial Review hearings.

The public hearings were conducted in Raleigh and Wilmington on July 30 and August 1, respectively. Ten individuals elected to make comments at the public hearings. In addition, 14 written comments regarding the Triennial Review were received prior to the close of the public comment period on August 15th. These oral and written comments covered a wide range of topics including all the proposed standard modifications, the variances, the possible bacteriological and nutrient criteria changes, and other subjects and issues. Numerous comments were received from the regulated community regarding the proposed change to the TRC standard. Numerous comments were received from the environmental interest groups regarding the variances and the subject of modifications to the bacteriological and nutrient criteria. A complete summary of these, and all the submitted comments, and a response to each by DWQ Staff are included in the Hearing Officer's Report of Proceedings (ROP), which was mailed to the members of the EMC.

Recommendation:

The Hearing Officer recommends that the Commission adopt the recommendations that are contained in the ROP. These recommendations are:

1. That the EMC adopt changes to the surface water quality standards as summarized below:

    - Adopt a human health standard for arsenic of 10 ug/l for all waters of the State (both salt and fresh). In addition, adopt an instream standard for arsenic of 10 ug/l for all water supply (WS) classified waters of the State.

- Remove the current freshwater action level standard of 17 ug/l for TRC and replace this with an instream surface water quality standard of 17 ug/l of TRC for all freshwaters of the State.

- Modify the existing freshwater cyanide standard of 5 ug/l to allow dischargers the option of developing a site-specific standard based upon the aquatic life at the site in accordance with EPA procedures.

- Establish a new surface water quality standard for MTBE. This standard is proposed to be 12 ug/l for all water supply (WS) classified waters. In addition, establish a human health standard for MTBE of 1,158 ug/l for all other waters (both salt and fresh).

- Remove the existing MBAS surface water quality aquatic life standard of 500 ug/l and replace this with an aesthetic MBAS standard of 500 ug/l for water supply (WS) classified waters.

2. Forward all the submitted comments regarding water quality and thermal variances to the NPDES Permitting Unit of DWQ for further review and consideration by appropriate parties at the time of the next scheduled renewal of these variances.

3. Forward to the appropriate individuals all the submitted comments concerning the implementation of nutrient criteria and the establishment of new (*E. coli* or enterococci) bacteriological criteria for further review and consideration at the time these criteria are developed.

If approved, the effective date of these rule amendments would be April 1, 2003.

EMC ACTION:

The EMC approved all the Hearing Officer's recommendations, except for the proposed change to the MTBE water quality standard. The Commission referred this proposal back to the Water Quality Committee for further review, based upon the latest data available from the Environmental Protection Agency.

Agenda Item:

Hearing Officer's Report on the Proposed Permanent Amendments to Rule 2B .0234, Neuse River Basin Nutrient Sensitive Waters Management Strategy: Wastewater Discharge Requirements

Explanation:

The Water Quality Committee (WQC) and the Environmental Management Commission (EMC) approved proceeding to Public Hearing in April and May, respectively with the proposed permanent amendments to Rule 2B .0234. In addition to corrections and revisions previously approved with the temporary rule, the proposed amendments include minor adjustments in the group total nitrogen allocations (subsection (5)) and a permit requirement for the group compliance association (subsection (9)).

The Public Hearing was conducted in Goldsboro on August 21, 2002. There were nine individuals present, but no one signed up to speak. The hearing record remained open until September 3, 2002. Written comments were received from the North Carolina Wildlife Resources Commission, Contentnea Metropolitan Sewerage District, Heater Utilities and the Carolina Chapter of the National Association of Water Companies, The Lower Neuse Basin Association and the Neuse River Foundation

The Hearing Officer has reviewed the proposed rule amendments and the comments received and has identified minor changes to be included in the rule as proposed.

Recommendation:

The Hearing Officer recommends that the Commission adopt the revised rule text contained in the Report of Proceedings. If approved, the effective date of these rule amendments would be April 1, 2003.

EMC ACTION:

The EMC approved the proposed rules as contained in the Report of Proceedings with minor modifications.

Agenda Item:

Tar-Pamlico Agriculture Rule Annual Report and Request for Approval of Accounting Method

Explanation:

One of several rules adopted under the Tar-Pamlico nutrient strategy was the agriculture rule, 15A NCAC 2B .0256, which was effective September 1, 2001. The rule requires that within one year, the EMC approve an accounting method that is to track implementation of BMPs and associated nitrogen loading reductions relative to the 30 percent reduction goal. Staff will present the Basin Oversight Committee's recommendation that the EMC approve the Nitrogen Loss Estimation Worksheet, a spreadsheet-based empirical modeling tool that was developed for the Neuse Basin by a team of university, agency, and industry participants over several years and was recently adapted for the Tar-Pamlico Basin. The rule also requires the BOC to summarize annual reports of the county-level Local Advisory Committees and present them to the EMC each October. Staff will provide the Commission with the first annual report on rule implementation, which does not require any action. Materials for these items were mailed to the members of the EMC.

Recommendation:

Staff requests that the Commission approve the Nitrogen Loss Estimation Worksheet tool as the accounting method for nitrogen under the Tar-Pamlico agriculture rule.

EMC ACTION:

The EMC approved the Nitrogen Loss Estimation Worksheet tool as the accounting method for nitrogen under the Tar-Pamlico agriculture rule as requested by Staff.

SURFACE WATER QUALITY WQC/EMC FUTURE AGENDAS

	WQC Agenda	EMC Agenda
Jan 2003	No Meeting Scheduled.	No Meeting Scheduled.
Feb 2003	• Request Approval of Water Supply Ordinance for Johnston County • Request Sending Final Draft of Broad River Basinwide Plan to EMC for Approval • Report on the Sign-up and Approval for the Tar-Pamlico Agricultural Accounting Method • Tar-Pamlico Model Stormwater Plan • Reclassifications: Request Permission to Proceed to EMC for: Dan River, from C to WS-IV; Calabash River, from SA to Class C. • Stormwater Phase II Rules: Request Approval of Permanent Rule Text for Public Hearings • Catawba Buffer Rule: Request Approval of Sending Permanent Rule Text for Public Hearings • Recommendation to Modify the Major Variance Request Procedures • Request Consideration of Approval of Several Major Variances to the Riparian Protection Area Rules. • NC Coastal Habitat Protection Plan/Update on Shellbottom and Hardbottom Options • Turbidity Info Item: Update WQC on Joint discussion of WQC/SCC representatives or of joint agreement between DLR and DWQ regarding Turbidity Issues..	• Request Final Approval of Draft Broad River Basinwide Plan • Stormwater Rules: Request Approval of Sending Permanent Rule Text to Public Hearings (Request 30-day waiver, as recommended by WQC) • Catawba Buffer Rule: Request Approval of Sending Permanent Rule Text to Public Hearings (Request 30-day waiver, as recommended by WQC) • Declaratory Rulings: Request Approval of Sending Permanent Rule Text to Public Hearings (recommendation for 30 d waiver needed from the Steering Committee, as recommended by the Dec EMC)
March 2003	• Mercury Items: New Mercury methodology will be in use by Sep 2003. Grant for research in Lumber River Basin to try and assess source of Hg. (Presentation requested by Dec 02 WQC) • ESB Monitoring Program for Basinwide Planning: At Dec 02 WQC, questions were asked about how the monitoring program is designed, what waters included, excluded, etc. Info item presentation is to be planned. • Possible Item: Request Approval of Greensboro's Use of Special Studies WS Watershed Map for WS Buffers • Request Consideration of Approval of Major Variances to the Riparian Protection Area Rules for Dominion Energy Person County Site	• No items have been formalized at this time for the March EMC meeting.

*Dates shown are current projections. Actual schedules are subject to changes.

II. GROUNDWATER ACTIVITIES

July 2002 EMC Agenda Item # 02-34:

ACTION ITEM FROM THE DIVISION OF WASTE MANAGEMENT – UNDERGROUND STORAGE TANK SECTION: Request to Proceed with Permanent Rulemaking for the Pay For Performance Rule and Publishing of Permanent Rule in the NC Register.

EXPLANATION:

The Environmental Management Commission adopted a temporary rule on May 14, 2002 that became effective July 1, 2002. The temporary rulemaking adopted 15A NCAC 2P .0408 that specifies performance-based cleanups of releases from underground storage tanks. A performance-based or pay-for-performance contract is an agreement that specifies a series of cleanup milestones (generally, percentage reductions in contaminant levels) that must be achieved before payments can be made to the cleanup firm. Tank owners, operators, and landowners of sites eligible for reimbursement from the Commercial and Noncommercial Leaking Petroleum Underground Storage Tank Cleanup Funds may allow their sites to be considered by the Division for this pilot program. The Division may also utilize money from the Cleanup Funds and other sources specifically intended to be used for performance-based cleanups at state-lead cleanup sites. Sites selected by the Division for performance-based cleanups will be posted for competitive bidding in the North Carolina Interactive Purchasing System. A performance-based contract will be awarded to the qualified environmental services firm that submits the lowest bid for an acceptable remedial proposal for the advertised site. No comments were received by the agency when the temporary rule was given notice in the North Carolina Register.

EMC Action:

On July 11, 2002, the Environmental Management Commission gave the Division permission to proceed with permanent rulemaking including a notice of the text of the rule and public hearing. This rule will proceed with the remaining steps in the rulemaking process contained in North Carolina General Statute 150B.

III. SURFACE WATER QUALITY ACTIVITIES

SURFACE WATER QUALITY ACTIVITIES

Agenda Item:

Request for Approval of the Final *Neuse River Basinwide Water Quality Plan*

Explanation:

The *Neuse River Basinwide Water Quality Plan* is the first in the third cycle of basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Neuse River Basinwide Water Quality Plan was approved by the Water Quality Committee in April 2002 to be taken to public meetings. Three public meetings were held in Goldsboro, Raleigh and New Bern in May 2002 with 75 people in attendance. Revisions were made and some information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members in the EMC package.

This Basinwide Plan is a planning document that will guide the Division's management actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Neuse River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in this river basin.

EMC ACTION:

The EMC approved the *Neuse River Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request for Approval of the Final *Chowan River Basinwide Water Quality Plan*

Explanation:

The *Chowan River Basinwide Water Quality Plan* is in the second cycle of basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Chowan River Basinwide Water Quality Plan was approved by the Water Quality Committee in December 2002 to be taken to public meetings. One public meeting was held in Ahoskie in May 2002 with 40 people in attendance. Revisions were made and some information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members in the EMC package.

This Basinwide Water Quality Plan is a planning document that will guide the Division's management actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Chowan River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in this river basin.

EMC ACTION:

The EMC approved the *Chowan River Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request for Approval of the *Final Pasquotank River Basinwide Water Quality Plan*

Explanation:

The *Pasquotank River Basinwide Water Quality Plan* is in the second cycle of basinwide plans that the Division is preparing for all 17 of the state's major river basins.

The draft Pasquotank River Basinwide Water Quality Plan was approved by the Water Quality Committee in December 2002 to be taken to public meetings. One public meeting was held in Elizabeth City in May 2002 with 25 people in attendance. Revisions were made and some information was added to the draft plan based on comments. Copies of the revised plans were sent to EMC members in the EMC package.

This Basinwide Water Quality Plan is a planning document that will guide the Division's management actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policy. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation:

It is recommended that the *Pasquotank River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in this river basin.

EMC Action:

The EMC approved the *Pasquotank River Basinwide Water Quality Plan* as recommended.

Agenda Item:

Request for Approval of the Nutrient Response Model For Jordan Lake

Explanation:

Staff sought EMC approval of the Jordan Lake Nutrient Response Model. The nutrient response model was developed by the seven municipalities that requested an extension to the TN compliance date under conditions outlined in SB1366. The seven municipalities were the City of Burlington, City of Graham, City of Greensboro, City of Mebane, Orange Water and Sewer Authority, Town of Pittsboro, and the City of Reidsville. The model has been completed and was presented to the Water Quality Committee in April, 2002. After EMC approval, staff will use the model to develop a management strategy for the Jordan Lake watershed.

Recommendation:

That the EMC approve the Jordan Lake Nutrient Response Model.

EMC ACTION:

The EMC approved the Jordan Lake Nutrient Response Model.

Agenda Item:

Request for Adoption of Rules for Discharges to Isolated Wetlands and Waters (15A NCAC 2H .1300)

Explanation:

Four public hearings were held in April 2002 across the state to present proposed permanent rules for discharges to isolated wetlands and waters and to receive public comment on the proposed rules as well as 14 specific issues included with the Notice. Most comments supported the rules primarily because the rules are designed to replace the federal wetland permitting system that was in place in 1996 (401 Water Quality Certification rules) but were subsequently changed by federal court cases in January 2001. Many comments from the environmental community stated that many isolated wetlands are small and therefore may need more protection than non-isolated wetlands. In contrast, those forwarding comments from the development community believe that the EMC does not have authority to adopt wetland rules or a wetland permitting system. Many in the development industry also stated that if the EMC proceeds to adopt rules that the rules should be as clear as possible and as close to the existing wetland permitting processes as possible. In response, the Hearing Officers and staff have made changes for clarity. The Hearing Officers' Report, sent under separate cover, explains the detail of each proposed change, contains a summary of the process, and also includes all comments received.

Recommendation:

That the EMC adopt the permanent rules as recommended in the Hearing Officers' Report to become effective April 1, 2003. In the meantime, the existing temporary rule will remain in effect.

EMC ACTION:

The EMC voted to adopt the rules as recommended in the Hearing Officers' Report.

Agenda Item:

Hearing Officer's Report on the Proposed Reclassification of the Swift Creek Watershed (Edgecombe, Franklin, Nash, Vance and Warren Counties; Tar-Pamlico River Basin) to Class C ORW NSW (Nutrient Sensitive Waters), Class C NSW+, Class B NSW+ and Water Supply-IV (WS-IV) NSW+

Explanation:

The Pamlico-Tar River Foundation staff requested that Swift Creek in the Tar Pamlico River Basin be reclassified to Outstanding Resource Waters (ORW). The reason given for the request was to provide protection for the resources and quality of these waters.

DWQ water quality studies conducted in 1996 and 1997 indicated that only an approximately 14-mile stretch of surface water, which traverses from S.R. 1003 to S.R. 1004 in Nash County, has excellent water quality. This 14-mile stretch is comprised of a portion of Sandy Creek, which is a tributary to Swift Creek, and a portion of Swift Creek. These studies combined with additional data revealed that this stretch contains many important animal species, such as the federally and state listed endangered Tar River spiny mussel. There is also a portion of a significant natural heritage area that is of national significance located in this stretch. Thus, based on the water quality and existing resource values, this 14-mile stretch of surface water qualifies for the ORW designation.

The remainder of the creek's watershed also contains several important resource values. There are five significant natural heritage areas in addition to the remainder of the above-mentioned area, four natural communities recognized by the Natural Heritage Program (NHP), a special animal habitat, a natural area registered with the NHP, and several important species including the red cockaded woodpecker and dwarf wedgemussel, which are federally (and in the case of the woodpecker also state) listed as endangered.

Due to the presence of the resource values in the watershed and the excellent water quality of the 14-mile stretch, the 14-mile stretch is proposed to receive both the ORW classification and the ORW management strategy (to be signified by the addition of the ORW designation to the classifications of these waters), and the remainder of the watershed is proposed to receive the ORW management strategy without the ORW classification (to be signified by the addition of a "+" symbol to the classifications of these waters).

If reclassified, regulations that affect new development activities, landfills, USTs and DOT activities as well as new and expanding wastewater discharges would apply. However, there are no new proposed discharges, no proposed expansions of existing discharges, and no proposed significant development (including landfills and USTs) with one exception: a portion of one development project may be impacted by the proposed reclassification. Furthermore, DOT regulations for their planned activities in the proposed watershed will require use of Best Management Practices (BMPs). Forestry, animal, dam/resource, and agricultural

practices will not be affected. Please also note that all new activities within 50 feet of NSW waters in the Tar-Pamlico River Basin are subject to the currently existing Tar-Pamlico Basin Riparian Buffer Protection rules.

In September and October 2001, the Water Quality Committee and the Commission, respectively, approved the request to proceed with rule-making for the proposed reclassification. A public hearing was held in February 2002 in Rocky Mount. 26 written comments and seven verbal comments regarding the proposed reclassification were received. One verbal comment and two written comments were against the proposed reclassification; the remaining comments were in favor of the proposed reclassification. The Hearing Officer's Report of Proceedings sent to the members of the EMC includes further details.

Recommendation:

The Hearing Officer recommends that the proposed reclassification be approved by the Commission. If reclassified as proposed, the effective date will be April 1, 2003.

EMC ACTION:

The EMC approved the proposed reclassification as recommended by the Hearing Officer.

Agenda Item:

Request for Adoption of Proposed Amendments to the Wastewater Discharge Rules (15A NCAC 2H .0103 & .0106)

Explanation:

The EMC enacted temporary amendments to 15A NCAC 2H .0103 and .0106 in May 2001 in response to the potential for an outbreak of Foot and Mouth Disease and the realization that such an outbreak would create decontamination wastewater. The permanent rules were broadened to deem permitted discharges associated with biological or chemical decontamination activities performed as a result of an emergency declared by the Governor or the Director of the Division of Emergency Management and conducted by or under the direct supervision of the federal or state on-scene coordinator. The permanent amendments also outline additional requirements and conditions, such as that the discharge is not radiologically contaminated. The rulemaking was appropriately noticed and a public hearing was scheduled. However, no persons, other than agency staff, attended. No written comments were received regarding the proposed permanent amendments. The Hearing Officer's report, sent under separate cover, contains full details.

Recommendation:

That the EMC adopt the permanent amendments as recommended in the Hearing Officer's Report to become effective April 1, 2003.

EMC ACTION:

The EMC voted to adopt the permanent amendments as recommended in the Hearing Officer's Report.

SURFACE WATER QUALITY WQC/EMC FUTURE AGENDAS

	WQC AGENDA	EMC AGENDA
Oct 2002	• Request for Approval of Jordan Lake Nutrient Management Strategy Schedule • Request for Approval of Water Supply Watershed Protection Ordinance (Town of Lillington) • Request for Consideration of a Major Variance for Piedmont Triad International Airport (FedEx Site) • Tar-Pam Ag Rule Annual Report & Approval of Accounting Method • Annual Progress report on Neuse Ag Rule • Revised Natural Resources Conservation Service Nutrient Management Standard	• Request for Approval of Proposed Surface Water Quality Standards for the 2000-2003 Triennial Review • Request for Approval of Proposed Amendments to the Neuse River Basin Nutrient Sensitive Waters Management Strategy: Wastewater Discharge Requirements • Request for Approval of Proposed Temporary NPDES Phase 2 Stormwater Rules • Tar-Pam Ag Rule Annual Report & Approval of Accounting Method

ERC UPDATE

IMPLEMENTATION OF THE NEUSE RIVER BASIN NSW (NUTRIENT SENSITIVE WATER) MANAGEMENT STRATEGY

JANUARY 16, 2003

The Environmental Management Commission adopted rules in December of 1997 requiring that point source discharges and nonpoint source discharges reduce nitrogen contributions to the Neuse River basin by 30% by the year 2003. The attached documents:

- "Annual Progress Report on the Neuse Agricultural Rule" and
- A letter from the Lower Neuse Basin Association

provide information supporting the conclusion that the 30% reduction has occurred in the basin.

Annual Progress Report on the Neuse Agricultural Rule
(15A NCAC 2B .0238)

A report to Environmental Management Commission by the Neuse Basin Oversight Committee

Summary

The Neuse Basin Oversight Committee (BOC) has received and approved annual reports from 17 Local Advisory Committees (LACs) in September 2002. As a result, for the basin as a whole, the agricultural community has achieved a 34% nitrogen (N) reduction compared to the overall baseline. Eleven LACs have achieved their nitrogen reduction goal established by the BOC, which is a 30 percent N reduction from their baselines. Nitrogen loss from agricultural land has been reduced by over 40 percent compared to the baseline numbers for Carteret, Craven, Johnston, Wake/Franklin and Wilson counties. Nitrogen loss reduction from agricultural land was accomplished through best management practice (BMP) installation, fertilizer application reduction and cropland attenuation. The BOC continues to encourage counties that have already achieved their N reduction goal to implement additional BMPs to reduce N loss. The BOC will focus additional efforts to assist counties that currently have not met their reduction goals to implement additional BMPs and to seek alternative BMPs to achieve the N reduction goals.

Background

In December 1997, the N.C. Environmental Management Commission (EMC) adopted the Neuse River Basin Nutrient Sensitive Waters (NSW) Management Strategy. For the first time in state history, mandatory controls are applied not only on point source pollution but also on nonpoint source pollution in the Neuse River basin. The strategy has 8 rules that affect both urban and rural areas. The strategy is aimed at reducing the average annual load of nitrogen delivered to the Neuse River Estuary from point and nonpoint sources by a minimum of 30 percent of the average annual load from the period 1991 through 1995 by the year 2003.

The Neuse agricultural rule provides each farmer with the option of becoming part of a collective local strategy for implementing BMPs or implementing standard BMPs as specified in the rule. A Basin Oversight Committee and 17 Local Advisory Committees were established to implement the Neuse agricultural rule and to assist farmers with complying with the rule.

The BOC is made up of eight individuals appointed by the Secretary of the Department of Environment & Natural Resources (DENR). The BOC includes representatives from the following agencies and interest groups: Division of Water Quality (DWQ), Division of Soil and Water Conservation (DSWC), Natural Resource Conservation Service (USDA-NRCS), North Carolina Department of Agriculture and Consumer Service (NCDA&CS), North Carolina Cooperative Extension Service (NCCES), agricultural community, scientific community and environmental community. Responsibilities of the

BOC include developing a method to track and account for net nitrogen reductions from agricultural operations in the basin, approving local nitrogen reduction strategies, and presenting annual reports to the EMC on the progress toward reaching the goal.

Each of the 17 county-level LACs is made up of seven or more individuals representing local agricultural agencies and farmers. The local agricultural agencies include DSWC, NCDA&CS, local NRCS, NCCES and local Soil and Water Conservation District (SWCD). Responsibilities of LACs include conducting farmer sign-up, establishing county agricultural baseline, developing local nitrogen reduction strategy, and preparing annual progress report. Several of the LACs cover more than one county.

Community meetings about the Neuse agricultural rule were held in 17 counties in the basin with assistance from NCCES. A fact sheet about the rule was developed and distributed to all counties within the basin. The sign-up process for farmers to enroll in the local option started in 1998. Both agricultural and mass media publications targeting farmers in the basin carried announcements about the sign-up process. The LACs successfully conducted the farmer sign-up between 1998 and 1999 with assistance from DSWC. Approximately 90 percent of cropland (estimated 800,000 acres) in the Neuse River Basin representing about 3,400 farmers was enrolled in the local option between 1998 and 1999.

Neuse Agricultural Baseline and Local Reduction Strategies

The Nitrogen Loss Evaluation Worksheet (NLEW) was developed to meet the requirement of a scientifically valid accountability method for nitrogen reduction. The NLEW tool, which was based on soil loss, was initially developed in 1995 by the USDA - Natural Resource Conservation Service (NRCS) as a field-based procedure to estimate and report nitrogen loading from agricultural fields. As the need for a nitrogen accounting tool became more important, a multiagency team was formed in 1996 under the leadership of researchers from N.C. State University (NCSU) to begin a critical reevaluation of NLEW. The NLEW committee also included representatives from DWQ, NCSU, DSWC, and NRCS. As a result of the review, NLEW was completely redesigned, including significant research results. The algorithms for NLEW were completely modified. The NLEW tool was developed to serve the following purpose:

1. Estimate nitrogen loading from agricultural sources into the Neuse River during the baseline period of 1991 to 1995;
2. Facilitate local BMP planning and implementation; and
3. Track and account for reduction in nitrogen loss due to the implementation of BMPs, crop and land use changes throughout the basin.

In March 2000, the EMC approved the accountability process of which NLEW is the critical part. Two major training sessions, conducted by DENR and NCSU, were held in central locations for the upper and lower basin. Over 200 LAC members including local agricultural agency staff and farmers attended the training.

Before the county agricultural baselines could be developed, NLEW was computerized. After developing the county agricultural baselines, the baseline N levels were reported to and examined by the BOC then reported to the EMC. To verify the county baseline numbers, a statistical sampling project in the Neuse River Basin was funded. The primary results of this study were reported to the BOC in February 2002. Early information indicates that the baseline figures are high in some counties due to lack of information about existing buffers. The BOC will compare this statistical analysis and work with LACs to make any needed adjustment to county baseline estimates.

NLEW was also used to prepare the local nitrogen reduction strategies. Each strategy is a consensus determination by the LAC. Each is based on the types and amounts of the approved BMPs that they believe need to be implemented to collectively produce the required 30 percent reduction from baseline numbers. The LACs determined which practices would be most acceptable to participating farmers and predicted the number of acres to which they felt these practices could be applied. Table 1 summarizes the BMP implementation goals from the approved local nitrogen reduction strategies.

Table 1. BMP Implementation Goals for all 17 Neuse Basin LACs to Achieve 30% Reduction in Agriculture Nitrogen

BMPs	Acreage (ac)
20' vegetated buffer	1,100
30' vegetated buffer	700
20' forested buffer	270
50' riparian buffer	2,000
Cover Crop	5,200
Nutrient management	280,000
Water control structure	42,000

Current Status

Nitrogen Reduction from Baseline in 2001

All seventeen LACs submitted their first annual reports to the BOC in May 2002. Eleven LACs have achieved their nitrogen reduction goal established by the BOC, which is a 30 percent N reduction from their baseline. Nitrogen loss from agricultural land has been reduced by over 40 percent compared to the baseline numbers for Carteret, Craven, Johnston, Wake/Franklin and Wilson counties. As a result, for the basin as a whole, the agricultural community has achieved a 34% N reduction compared to the overall baseline. Nitrogen loss reduction from agricultural land was accomplished through BMP installation, better management of fertilizer and loss of cropland acreage to development. Table 2 lists each county baseline within the basin, its proposed reduction goal and N reduction from baseline in 2001.

Table 2. Summary of County Baseline and its N Reduction from Baseline in 2001

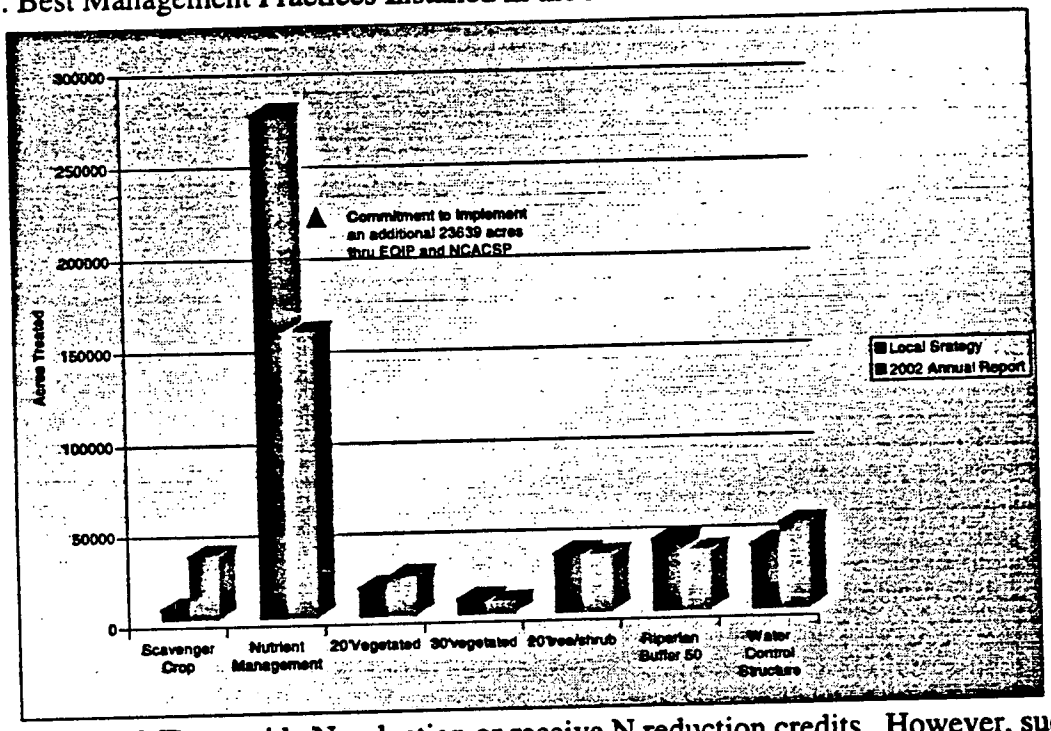
County	Baseline N Loss* in lbs.	Proposed Percent Reduction	2001 N Loss* in lbs.	Percent of N Reduction From Baseline in 2001
Carteret	1284833	>30%	700893	45.4%
Craven	3928696	>30%	2106696	46.4%
Durham	81542	>30%	60009	26.4%
Granville	60057	20.5%	46627	22.4%
Greene	4034046	30%	2542740	37.0%
Johnston	6094690	30%	3194085	47.6%
Jones	2736562	>30%	1808779	33.9%
Lenoir	3994989	>30%	3421915	14.3%
Nash	872259	30%	609184	30.2%
Orange	181276	18%	146034	19.4%
Pamlico	2043961	>30%	1257096	38.5%
Person	339822	30%	231542	31.9%
Pitt	2892783	30%	2230805	22.9%
Wake/Franklin	597078	30%	339857	43.1%
Wayne	5816298	30%	4354422	25.1%
Wilson	1939073	>30%	1133232	41.6%
Collectively for the entire Neuse River Basin	37414381		24927010	34.5%

* The total nitrogen loss value is for comparative purposes only. It represents fertilizer that was applied and neither used by crops nor intercepted by BMPs in a Soil Management Unit, based on NLEW calculations. It may not represent the actual loss from the Soil Management Unit.

BMP Installation

A significant number of BMPs have been installed since 1996. It is estimated that approximately half of enrolled croplands received treatment from the installed BMPs. Figure 1 indicates that farmers installed more water control structures, planted more scavenger crops, and established more 20 foot vegetated buffers and 20 foot tree buffers than were proposed by LACs in their local N reduction strategies. The BOC is confident that all BMP installation targets will be exceeded during the next year with the assistance of the CREP program and expected increase of financial and technical assistance provided in the 2002 Farm Bill.

Figure 1. Best Management Practices Installed in the Neuse River Basin from 1996 to 2001



Not all types of BMPs provide N reduction or receive N reduction credits. However, such BMPs do have water quality benefits. Many BMPs are designed to reduce sediment and other nutrients, such as phosphorus, from agricultural lands to surface water and shallow groundwater. Table 3 lists these other types of BMPs installed from 1996 to 2001. Units of BMPs reported in the table are the actual BMP footprint acreage, not acreage treated by these BMPs. Approximately 480 thousand tons of soil has been saved from installation of these BMPs.

Table 3. Additional BMPs Installed in the Neuse River Basin from 1996 to 2001

Best Management Practice	Units
Conservation Tillage	52202 acres
Conservation Tillage 3 Yr.	2086 acres
Long Term No Till	7377 acres
Terraces	3711 ft
Diversion	121530 ft
Sod Based Rotation	1550 acres
Strip Cropping	44 acres
Field Border	342 foot print acres
Grassed Waterway	237 foot print acres
Livestock Exclusion	10029 ft
Streambank Stabilization	50 ft
Filter Strip	53 foot print acres

* Information obtained from NC Agricultural Cost Share Reports 12/1995 through 4/2002. This does not include Best Management Practices that were voluntarily installed through various federal programs or without government assistance.

Implementation Cost

In large measure, the success of this program is due to funding from both traditional and non-traditional sources to pay for cost-share, best management practices; fund informational literature and workshops for farmers; and to cover some of the expense of developing our accountability process. These figures do not include the extensive staff time from the DSWC, local SWCD, NCDA&CS, NCCES, and USDA-NRCS.

Listed below are the major sources that we have identified. These figures are for work done through 2001. This is a comprehensive but not complete list. Most of projects or programs listed are continuing items and will fund this work through the next year or more.

Please note that this does not include the cost to Neuse Basin farmers. We do not have the ability to calculate the out-of-pocket expense to farmers for their portion of cost-share projects or for the practices that they pay for entirely. However, we know that this amount is very substantial and should be acknowledged.

1. Federal Cost Share Funding through the Natural Resource Conservation from the Environmental Quality Incentives Program (EQIP) -$ 2,690,134

2. The NC Agriculture Cost Share Program – including federal funds sent to the state with state match for the Conservation Reserve Enhancement Program $ 2,782,915

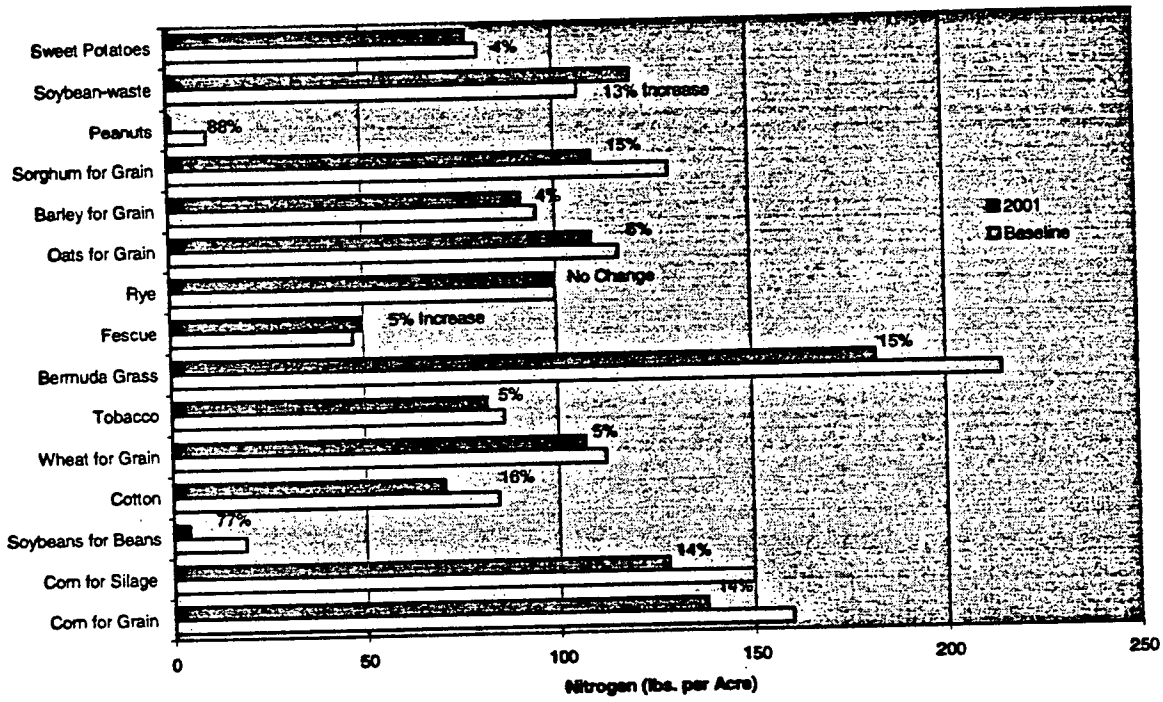
3. Clean Water Management Trust Fund $1,160,000. This amount is not grant totals, but actual amounts spent thus far for practices installed on farms.

4. The "Neuse Crop Management Project" conducted by NCSU received primary funding from the Pew Charitable Trust and the US Environmental Protection Agency. That funding paid for nutrient management demonstrations, over 113,000 acres of nutrient management, produced a variety of educational fact sheets for Neuse Basin farmers, and covered the $50,000 computer programming cost for NLEW (the nutrient accountability program approved by the EMC for the Neuse Agricultural Rule), and $30,000 for nutrient management training (mandated in Neuse Rule .0239) which is also required for most farmers. The total funding for this project including the portion that came from the Clean Water Management Trust Fund was $967,000.

Fertilizer Management

With greater nutrient management and increased costs of fertilizer, farmers in the Neuse River Basin have reduced their fertilizer application since 1996. Figure 2 indicates that fertilization rates for most major crops in the basin have been reduced.

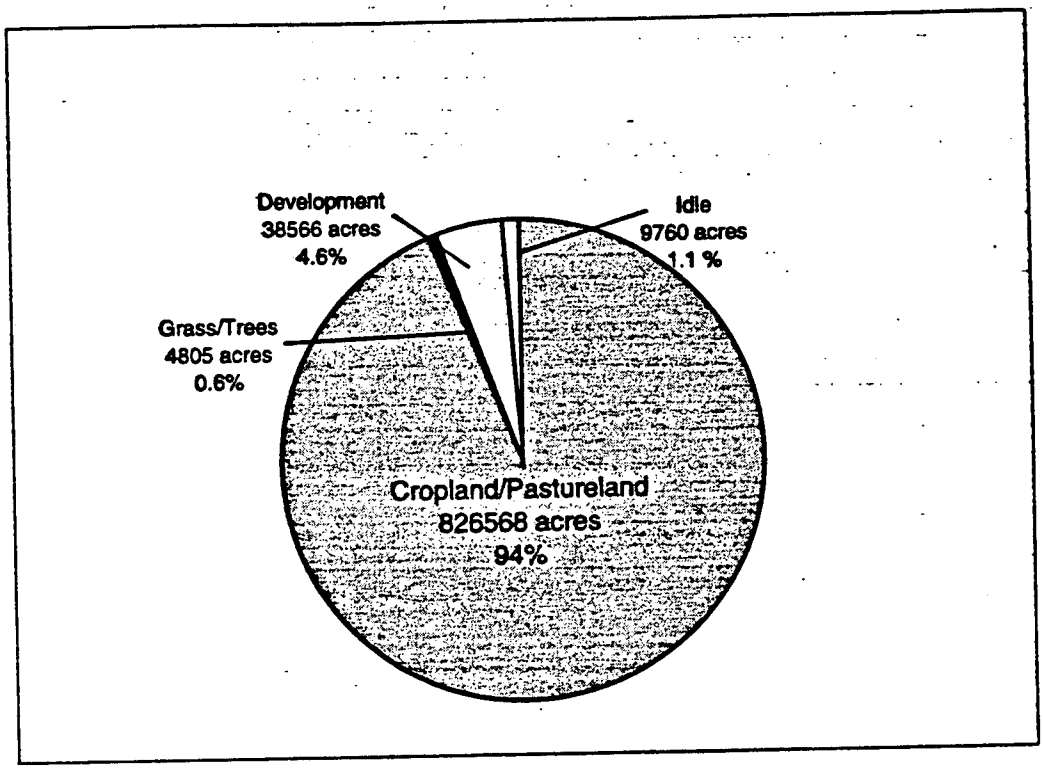
Figure 2. Average Fertilization Rate for Major Crops in the Neuse River Basin in 2001 Compared to the Baseline Period (1991-1995)



Cropland Loss

The Neuse River Basin has experienced significant growth since the 1980s. Durham, Johnston and Wake Counties are growing the fastest in the upper basin, with Pitt County growing fastest in the lower basin. Approximately 5 percent of the cropland in the basin has been lost to development since 1996 (Figure 3). Cropland loss has contributed significant N reductions for Johnston, Wake and Wayne Counties.

Figure 3. Current (2001) Uses of Land in the Neuse River Basin that was all Agriculture during Baseline Period (1991-1995)



The Basin Oversight Committee recognizes that the business of agriculture and the science of agriculture are under perpetual change as a result of a great number of forces. These forces may include:

- Changes in world economies or trade policies
- Government program changes such as commodity support or environmental regulations
- Weather, i.e., long periods of drought or rain
- New crops brought into production or changes in how crops are grown as a result of research and development
- Plant disease or pest problems such as foreign pest or virus
- Farm location, i.e., large grain grower renting local farms moves to cash crop as rental lands sold to development
- Age of farmer, i.e., as retirement approaches farmer may move from row crops to cattle

The strategies of several LACs were influenced by significant acreage shifts from corn to cotton production. Figure 4 shows changes of crop pattern in the Neuse River Basin between the baseline period (1991-1995) and 2001. This change is significant because corn has a considerably higher nitrogen requirement than does cotton. This change in

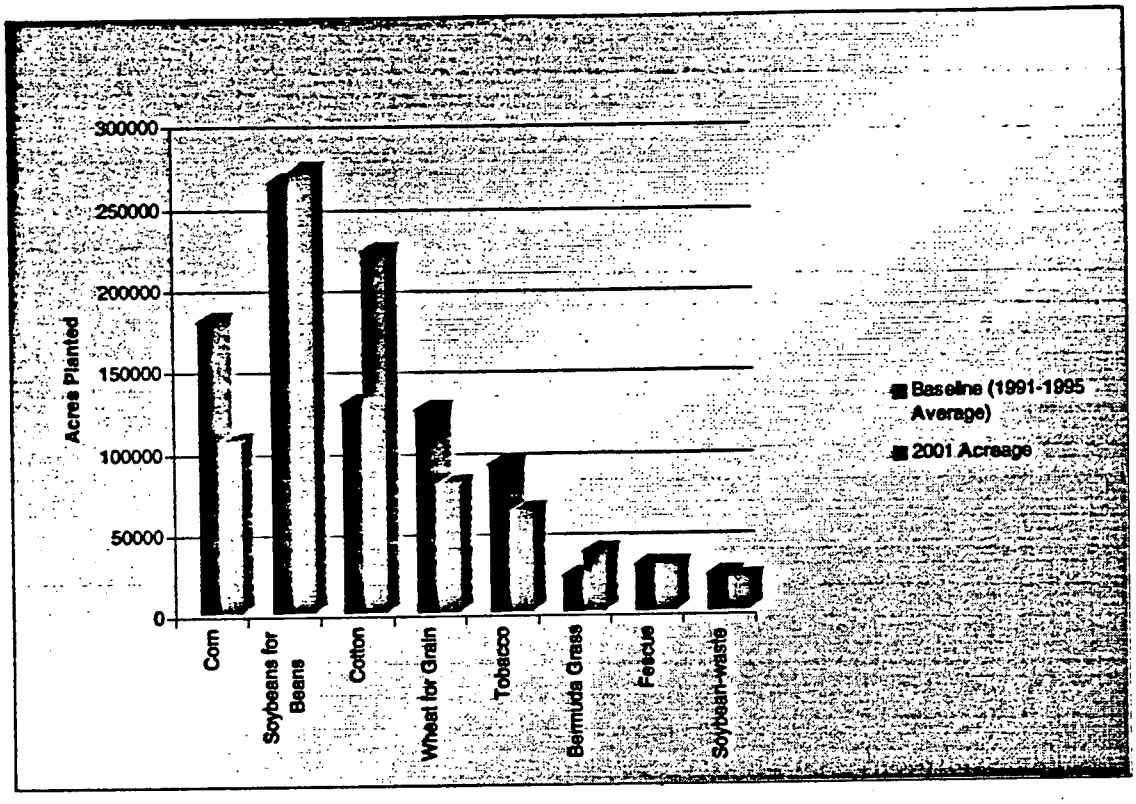
crop production brought about a significant reduction in nitrogen use on agricultural lands since the baseline was established.

It is important to note, however, that nitrogen application rates for corn have dropped significantly relative to the baseline due to intensive nutrient management education efforts and to the increasing cost of nitrogen. This reduction in corn fertilization rates should significantly mitigate the effect of a potential shift back to corn.

Historical farming practices in North Carolina cannot be used as a reliable predictor for the future agricultural picture in the state. Tobacco and peanut program changes have occurred recently that will likely result in major changes for many farms in the Neuse River Basin. Conversion of cropped lands to other agricultural and non agricultural uses also remains a likely scenario in many Neuse River Basin counties. New crops are likely to be grown in the basin as a result of bioenergy and biopharmaceutical production. Agriculture in the Neuse River Basin will continue to change over the next decade.

The Local Advisory Committees have been advised of the need to monitor changes in agriculture for the county and to update strategies to accommodate these changes. These changes could result in the need to implement additional best management practices or to redesign or reimplement existing practices based on changes in the practice itself over time, or based on the changes in crops grown, crop management, BMP management or other factors. Individual farm plans must be updated as any changes occur that will result in changes in nitrogen uses on farmlands

Figure 4. Changes in Crop Pattern in the Neuse River Basin between Baseline Period (1991-1995) and 2001



Future Steps

The Neuse Agricultural Basin Oversight Committee will continue to work with Local Advisory Committees and farmers to reduce N loss from agricultural lands in the Neuse River Basin. The BOC continues to encourage counties that have already achieved their N reduction goal to implement additional BMPs to reduce N loss. The BOC will focus additional efforts to assist counties that currently have not met their reduction goals to implement additional BMPs and to seek alternative BMPs to achieve the N reduction goals.

Re: Success of the Lower Neuse Basin Association in Nitrogen Reduction

Dear Mr. Templeton:

Enclosed is a description of the success achieved by members of the Lower Neuse Basin Association ("LNBA") as a group in reducing their discharge of total nitrogen into the Neuse River and its tributaries. It is remarkable that this group has already reduced its total nitrogen discharge by 40% from the 1995 level. This reduction substantially exceeds the 2003 reduction goal of 30% established under the Neuse River Rules and does so two years ahead of schedule. We thought you would want to see the enclosed summary since success stories sometimes don't get the attention they deserve. We hope that you will help the LNBA find ways to spread the news about this success story.

Should you have any questions or comments about the enclosed materials, please feel free to call me at (252) 753-5774. With kind regards, I am

Very truly yours,

Richard N. Hicks

NITROGEN REDUCTION IN WASTEWATER DISCHARGE

A SUCCESSFUL PROGRAM BY

THE LOWER NEUSE BASIN ASSOCIATION

JANUARY 2001

The Lower Neuse Basin Association (LNBA) is an association of municipalities and industries with wastewater treatment facilities permitted to discharge treated wastewater into the Neuse River below Falls of the Neuse Dam. The association was formed for information exchange and to undertake activities best accomplished by group effort. For example, the LNBA monitors river quality under an agreement with the N.C. Division of Water Quality. Sampling and laboratory testing is done by a commercial laboratory with results provided to DWQ. LNBA members benefit because the requirement for monitoring upstream and downstream from discharge locations is waived. DWQ benefits because sampling can be done at DWQ preferred locations. Also, by having one responsible laboratory, consistency of procedures and results is assured.

The LNBA has been attracted to the concept of a group approach to point source nitrogen control in the Neuse River Basin since the concept was included in House Bill 515 in 1996 and in the Nutrient Sensitive Waters Management Strategy adopted by the Environmental Management Commission in December, 1997.

The Management Strategy mandates a 30% reduction by 2003 from 1995 levels of total nitrogen delivered to the estuary. The LNBA has been supportive of the reduction goal of 30% – pending development of scientific based requirements necessary to maintain water quality – and members have been actively working to reduce nitrogen discharge from their facilities.

The goal for nitrogen reduction has been achieved and substantially exceeded well ahead of the required schedule. Between 1995 and 2000, LNBA members' total pounds of nitrogen discharged into the Neuse River was reduced by 46% at the point of discharge and 40% at the estuary. During the same period, member plants experienced an increase in wastewater flow of 11%.

These results were not achieved without significant effort and expense. The LNBA has completed several studies and seminars to improve members' understanding of nitrogen control methods. Over $16 million was spent on projects for nitrogen control between July 1995 and October 1998 according to a member survey. That survey indicated that members expected to spend an additional $31 million on capital projects for nitrogen reduction prior to 2003. Most nitrogen reduction projects have been completed and are operating successfully as shown in the following detailed performance data.

The LNBA has been tracking nitrogen reduction performance of member facilities since 1995 when water quality problems in the Neuse estuary were determined to be the result of nitrogen enrichment. Nitrogen reduction performance data are periodically documented and presented at membership meetings. Year 2000 results (from Daily Monitoring Reports submitted monthly to the Division of Water Quality) are shown on the following Table. Charts showing monthly TN concentrations and monthly pounds of nitrogen discharged since July 1997 are also included.

Additional reductions will be produced in the near future by facilities with recently completed upgrades and completion of new projects. However, many of the plants are now meeting or exceeding accepted limits of technology and future growth presents a challenge to maintain current discharge levels. According to State Division of Water Quality estimates, point source dischargers were responsible for about 24% of the total nitrogen arriving at the estuary in 1995. LNBA member facilities represent about 80% of all permitted wastewater discharges in the lower Neuse basin. Although reductions in nitrogen discharge by the LNBA members have been dramatic, it is noted that they only represent a small share of the nitrogen enrichment problem in the estuary.

Annual Report from the Basinwide Planning Program

For the Period of October 1, 2001 through September 30, 2002

I. Progress in Developing and Implementing Basinwide Water Quality Plans

A. Public Outreach/Involvement

The Basinwide Planning Program finalized the first cycle of basin plans in May 1998. The second cycle of plans is nearly completed and the third cycle of basinwide water quality plans has begun. Activities related to gathering public input on the basinwide plans during October 2001 through September 2002 are listed below.

River Basin	Plan Approved by EMC	Public Workshops	Public Meetings
Broad		October 2001(3)	
Yadkin-Pee Dee		April 2002 (5)	
Savannah	March 2002		December 2001 (1)
Watauga	February 2002		December 2001 (1)
Little Tennessee	April 2002		December 2001 (2)
Hiwassee	March 2002		December 2001 (1)
Chowan	July 2002		May 2002 (1)
Pasquotank	July 2002		May 2002 (1)
Neuse	July 2002		May 2002 (3)
TOTAL	**7**	**8**	**10**

B. Basinwide Activities

The following bullets, by basin, present some of the more significant activities and accomplishments over the past year to achieve the goals of the Basinwide Planning Program.

Broad River –

- Held three public workshops in October 2001 with approximately 103 people attending.
- Cooperate with the US Army Corps of Engineers' whole basin (NC & SC) water resources study.
- Work with the NC Division of Water Resources regarding minimum flows from the Lake Lure dam.
- Prepared a draft Broad River Basinwide Water Quality Plan, presented the plan to the Water Quality Committee of the EMC, requested and received approval to take the plan to public review and meetings in November 2002.

Cape Fear River –

- Continued participation in interbasin transfer and dam management issues in the Jordan Lake watershed.
- Participation in the Black River Conservation Corridor planning group.
- Remain involved in modeling and TMDL projects in the Jordan watershed, middle Cape Fear River and the Cape Fear River estuary.

Catawba River –

- Participate in quarterly meetings of the Catawba River Bi-State Task Force, often providing a presentation on status of Catawba River Basinwide issues.
- Provide input to the Catawba River Bi-State Task Force by serving on the Executive Committee.
- Conducted basinwide biological sampling in addition to ambient monitoring.
- Participated in a series of meetings with other DENR agency staff and Duke Power representatives to explore the potential for, and develop a concept document for, a FERC relicensing settlement agreement.

Chowan and Pasquotank Rivers –

- Held two public meetings in May 2002 with approximately 65 people attending.
- Received EMC final approval in July 2002 after public input.
- Provided presentations to, and sought input from, the Albemarle-Pamlico National Estuary Program Chowan and Pasquotank Regional Councils.
- Participated in the NC Division of Coastal Management Land Use Plan review process and submitted comments for Dare County, per DWQ/DCM agreement.

French Broad –

- Conducted basinwide biological sampling in addition to ambient monitoring.
- Coordinate with the new River Keeper for the French Broad River, providing information on the basinwide planning program and contacts for other areas within DWQ (i.e. classifications & standards, monitoring, etc.).
- Coordinate with regional office staff on the many local initiatives underway in the basin.

Hiwassee River –

- Held a public meeting in December 2001 with approximately 28 people attending.
- Received EMC final approval in March 2002 after public input.
- Participate in the Hiwassee Interagency Team of state and federal agencies from NC, GA and TN. Team collaborates on water quality restoration and stream habitat enhancement.
- Coordinated biological data collection with the Tennessee Valley Authority and opened communication between several offices within TVA and DWQ for better sharing of data.
- Established partnerships with the Hiawassee River Watershed Coalition and TVA for a special study of biological data in the Valley River watershed.

Little Tennessee River –

- Held two public meetings in December 2002 with approximately 54 people attending.
- Received EMC final approval in April 2002 after public input.
- Provide assistance to the Nonpoint Source Team of local, state and federal agencies and local watershed organizations to conduct education and demonstration projects in the basin.
- Worked with several professors at Western Carolina University to disseminate information and give two presentations to students about water quality and state government jobs.
- Continue to strengthen DWQ's relationship with the Eastern Band of Cherokee Indians through coordination on monitoring locations and nonpoint source pollution education.
- Gave presentation to and supported formation of the Watershed Association for the Tuckasegee River, a citizen-based watershed organization.
- Serve on the technical advisory board for the Little Tennessee Watershed Association.

- Working with the Wildlife Resources Commission and US Fish & Wildlife Service on strategies to improve and sustain water quality to protect federally-listed mussel and fish species in the basin.

Neuse River –

- Held three public meetings in May 2002 with approximately 75 people attending.
- Received EMC final approval in July 2002 after public input.
- Met with Army Corps of Engineers to discuss funding of restoration projects.
- Continued involvement in the Upper Neuse River Basin Association planning process.
- Provided presentations to, and sought input from, the Albemarle-Pamlico National Estuary Program Neuse Regional Council.

Roanoke River –

- Participate on a technical workgroup for FERC relicensing, helping to draft the water quality article of the settlement agreement. The workgroup includes representatives of federal and state agencies from both NC and VA, as well as other organizations such as The Nature Conservancy.
- Participated in meetings in support of the formation of a bi-state commission between VA and NC. As a first step toward coordination, worked with staff of VA Dept. of Environmental Quality to construct a GIS map of the entire basin that includes discharge points, water intakes and monitoring locations in both states.
- Worked on an agreement with the Division of Land Resources to require additional monitoring for instream mining permits in the Dan River watershed due to water quality standards violations and presence of endangered species.
- Provided presentations to, and sought input from, the Albemarle-Pamlico National Estuary Program Roanoke Regional Council.

Savannah River–

- Held a public meeting in December 2001 with approximately 26 people attending.
- Received EMC final approval in March 2002 after public input.
- Provided assistance between concerned public and NPDES Unit on specific discharge of interest.
- Coordinated implementation of the Outstanding Resource Waters management strategy between concerned public, Asheville Regional Office and NPDES Unit.
- Worked with homeowners in Sapphire Valley on projects to improve water quality and raise awareness about water quality issues.
- Coordinated with basinwide planning staff in South Carolina, sharing new data and information.

Tar-Pamlico River–

- Conducted basinwide biological sampling in addition to ambient monitoring.
- Provided presentations to, and sought input from, the Albemarle-Pamlico National Estuary Program Tar-Pamlico Regional Council.

Watauga River –

- Held a public meeting in December 2001 with approximately 22 people attending.
- Received EMC final approval in February 2002 after public input.

White Oak River –

- Continued discussions with Camp Lejeune on environmental initiatives and on reclassifying portions of the New River to Class SA waters.
- Continued discussions on potential modeling and shoreline survey studies in the Newport and North Rivers in support of TMDLs and restoration of shellfish harvesting potential.

Yadkin-Pee Dee River –

- Held five public workshops in April 2001 with approximately 156 people attending.
- Collaborating with several agencies and organizations to draft the basin plan, including the Surry County Soil & Water Conservation District, Mitchell River Watershed Coalition, NC Wetlands Restoration Program, the LandTrust for Central NC, Keep Iredell Clean, and the Mecklenburg County Dept. of Environmental Protection. This collaboration involves exchange of data and information, attending meetings and giving presentations.
- Attend meetings of and provide guidance to the Yadkin-Pee Dee River Basin Association of NPDES permit holders.
- Provided assistance between concerned public and NPDES Unit on proposed discharge of interest. Also provided assistance between concerned public and the Classifications & Standards Unit on reclassification of waters to more protective classification.
- Attend meetings of and provide guidance to the Goose Creek Watershed Advisory Committee of local governments and community representatives.
- Working with the Wildlife Resources Commission and US Fish & Wildlife Service on a strategy to improve and sustain water quality to protect federally-listed mussel species in the Goose Creek watershed.

C. Miscellaneous Activities Related to Basinwide Planning

Many additional activities have occurred over the past year that are not tied to a specific basin, but rather can be applied to the program as a whole. Some of the more significant activities are as follows.

- At least one meeting has been held with each regional office staff to discuss the Implementation Packet for each river basin covered by the regional office. These meetings to discuss implementation needs are held every six months with regional staff. Further coordination is conducted with central office staff as follow-up.
- Basinwide staff coordinate constantly with Wetlands Restoration Program staff on prioritization of targeted watersheds and getting input from local resource professionals.
- Staff coordinated with other state, federal and local agencies to obtain information pertinent to the basinwide plans, increasing the level of coordination and communication with these agencies and their participation in the development of basinwide plans. Discussions between the Basinwide Planning Program and the NC Divisions of Soil and Water Conservation, Environmental Health, Coastal Management, and Marine Fisheries, as well as the Wildlife Resources Commission and US Fish and Wildlife have occurred as a means of improving communication, sharing information and assuring appropriate information is presented in the basin plans.
- Over the past year, many new avenues of coordinating the Basinwide Program and the Albemarle-Pamlico National Estuary Program have occurred. Some of these activities include participation in regional council meetings, coordinating council meetings, obtaining sponsorship and presentations from regional council members at public workshops, and working closely with the APNEP Virginia liaison position to get information for the Chowan and Pasquotank River basin plans.

- Basinwide information was provided to applicants for CWMTF and Section 319 grants. Basin planners also provide initial technical reviews of applications.
- Staff collaborated with Office of Environmental Education on development of river basin education document and brochures on each river basin.
- Basinwide plans, basin statistics, a river quiz and other relevant information to the basinwide planning program have been put on the web site to provide interested parties with more access to information (see http://h2o.enr.state.nc.us/basinwide/).
- 1,076 copies of basin plans were printed and distributed during 2002 in response to public request for copies of the plans. Since the basin plans can be downloaded from the web page, we believe that several hundred more have been downloaded in this format.
- Over 1,757 people attended the public workshops for the second cycle (includes the third cycle of workshops for the Neuse River basin) and over 1,068 people attended the second cycle of public meetings (does not include the planned meetings for the Yadkin-Pee Dee).
- Basinwide staff continues to coordinate with the Classifications & Standards Unit and other federal and state agencies to develop management strategies for threatened and endangered species per DWQ rule.
- Basinwide staff provided presentations on use support and basinwide planning to the Coastal Resources Commision -Planning and Special Issues Committee. The Committee is especially interested in the development of improved use support methods for assessing shellfish harvesting in Class SA waters.
- Basinwide staff continues to work with USGS, NCDOT and the Center for Geographic Information and Analysis in development of 1:24,000 National Hydrography Data for North Carolina. Methods continue to be developed and tested to incorporate water quality and NCDOT data onto the NHD. The NHD will be a necessary data layer for submittal of future 303(d) impaired waters lists to EPA.
- Basinwide staff heavily participated monthly on the Drought Management Task Force as well other meetings related to the 2002 drought and water quality management.
- Basinwide staff continues to develop information and improve skills related to GIS procedures. The result of these efforts will increase proficiency in use support mapping and analysis.

II. Activities Related to Use Support Methods

A. Changes in Methodologies to Assess Water Quality Conditions

- Key to making determinations of the quality of the waters is a tool to assess the "use support" of a particular water body. Use support is directly related to the classification of the water body. For example, a water body may need to support a quality sufficient to enable the water to be used as a water supply. Staff have revised use support methodologies that assesses up to six categories (Aquatic Life/Secondary Recreation, Primary Recreation, Shellfish Harvesting, Fish Consumption, Water Supply, Other Uses). These methods continue to be revised and improved upon.

  Significant progress has made towards developing methods to better assess shellfish harvest area closures by using a frequency-based closures method to determine impairment, rather than simply using the Division of Environmental Health growing area classifications. A database and GIS related system is currently being developed to facilitate the use of these new methods. Presentations on these new methods have been given to the various commissions (CRC, EMC and MFC) and other interested groups.

B. 305(b) Report

- Submitted electronic update of the *Water Quality Progress in North Carolina Year 2001 305(b) Update* and associated data to EPA by April 2002.
- Incorporated this data into the submittal of the 305(b)/303(d) integrated report to EPA by October 2002. Awaiting EPA approval of the integrated report.

III. Development of Water Quality Educational Materials

- The program has been working with the Office of Environmental Education to produce the *Discover North Carolina's River Basins* document. An insert to this document for each river basin has been developed. The Section 319 funds this project.
- Three water quality education brochures were produced using Section 319 funds for educating the public on a variety of water quality issues and how to reduce water quality impacts.

Riparian Buffer Rules - 2002 Summary
Compiled by NC Division of Water Quality
January 13, 2003

During 2002, the Riparian Buffer Protection Program continued its efforts to protect riparian buffers along water bodies in the Neuse River basin, Tar-Pamlico River basin, Randleman Dam and Catawba River basin (along the lakes and mainstem of the river only). Two major changes occurred in these rules in 2002 -1) training and subsequent delegation of stream origin determinations for forestry operations to staff of the NC Division of Forest Resources (DFR), and 2) delegation of administration of the Neuse River buffer rules to Orange County. We anticipate that these actions by DFR and Orange County will increase in 2003 since the delegations will have been in effect for a longer time. In addition, DWQ staff have continued various measures to streamline and improve the riparian buffer rules including an extensive training and certification effort for DWQ staff and new General Variances.

A total of 1195 stream origin determinations were made in 2002 with 56 of these by DFR or Orange County staff. A majority of these determinations were in the Neuse River basin (864 out of 1195). A total of 638 written approvals for buffer impact were made with approximately equal portions in the Neuse and Catawba River basins. DWQ approved 60 projects under General or Minor Variances from the rules while the Environmental Management Commission approved five major variances

Riparian Buffer Actions during 2002

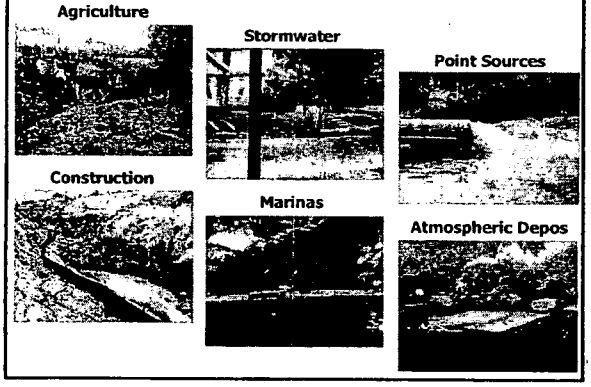
NC Phase II Stormwater Regulations

- Why be concerned about stormwater?
- What is the NPDES Phase II Program?
- Who is covered by these rules?
- What is required by these rules?
- Where can you find more information?

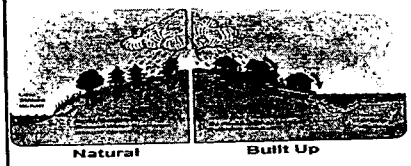
Sources of Pollution



Why be Concerned about Stormwater?

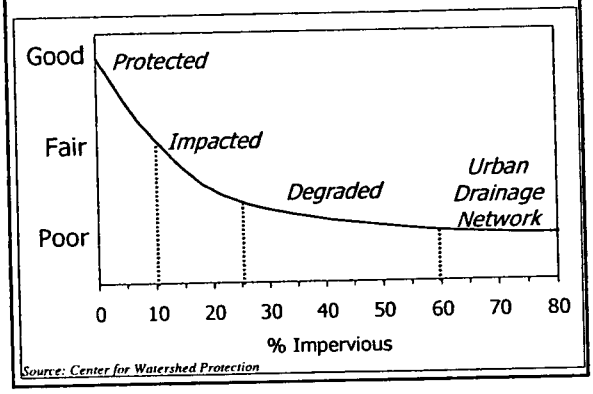
- Declining water quality
- Increasing demand for clean water
- *Urbanization*.
  - Population doubling every 50 years
  - 88% increase in urban area from 1982-1997 (USDA-NRCS)

Land Development Impacts



- Increased Imperviousness
- Increased Runoff
- Increased Pollutants
- Impacts to Streambanks
- Erosion/Sedimentation

Stream Condition Related to Impervious Surface



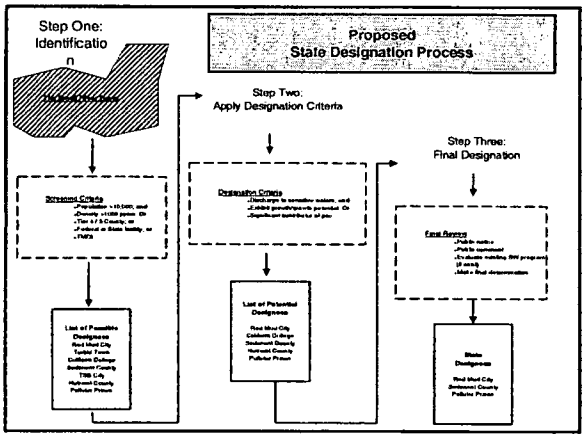
Source: Center for Watershed Protection

What is NPDES Phase II?

- Phase II of the NPDES Stormwater Program was signed into law in December, 1999
- Requires smaller communities to apply for a permit by March 2003
- Permitted communities must implement a comprehensive program including 6 minimum measures

Who is Covered by Phase II?

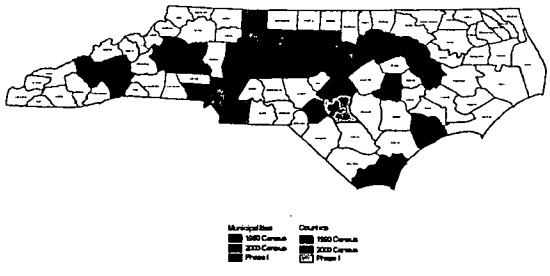
- Automatically Designated - *Urbanized Areas*
- State Designated Public Entities
- Petitioned Entities



North Carolina NPDES Stormwater Program

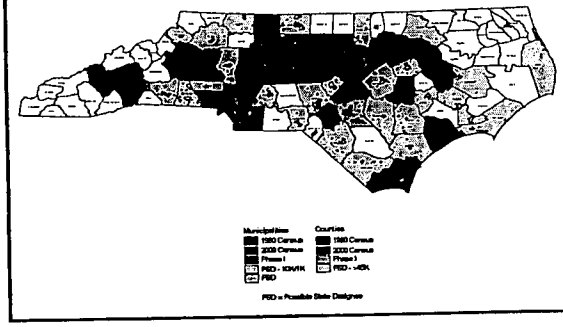
North Carolina - NPDES Stormwater Program

Automatic Coverage



North Carolina NPDES Stormwater Program

Automatic & Possible State Designation



What is Required by Phase II?

- Public education & outreach
- Public involvement & participation
- Illicit discharge detection & elimination
- Construction site stormwater runoff control
- Post-construction stormwater management for new development & redevelopment
- Pollution prevention/good housekeeping for municipal operations

Post Construction Runoff Control

- New development and redevelopment
- 1-year / 24-hour storm control
- 85% average annual TSS removal
- Operation & maintenance of BMPs
- Specific requirements for Class SA, Tr, NSW

NC Rulemaking Process

- Temporary Rules Approved By EMC - Oct 2002
- Temporary Rules Effective Nov. 1, 2002
- Permanent Rulemaking Process Underway
- Notice & Public Hearings - Early 2003

NPDES Phase II Stormwater

January 16, 2003

1. Federal program overview
2. North Carolina temporary rule overview
3. List of N.C. municipalities and counties possibly affected by Phase II program
4. Excerpt from *Rapid Watershed Planning Handbook* (Concepts of watershed protection)
5. Key findings from urban stream studies (Effects of imperviousness)

NPDES Phase II Overview

- The NPDES Phase II Final Rule, published in the Federal Register on December 8, 1999, requires NPDES permit coverage for storm water discharges from:
  - Certain regulated small municipal separate storm sewer systems (MS4s); and
  - Construction activity disturbing between 1 and 5 acres of land (i.e., small construction activities).
- In addition to expanding the NPDES Storm Water Program, the Phase II Final Rule revises the "no exposure" exclusion and the temporary exemption for certain industrial facilities under Phase I of the NPDES Storm Water Program.

Small MS4

What constitutes an MS4 is often misinterpreted and misunderstood. The term MS4 does not solely refer to municipally-owned storm sewer systems, but rather is a term of art with a much broader application that can include, in addition to local jurisdictions, State departments of transportation, universities, local sewer districts, hospitals, military bases, and prisons. An MS4 also is not always just a system of underground pipes – it can include roads with drainage systems, gutters, and ditches. According to 40 CFR 122.26(b)(8), the regulatory definition of an MS4 is:

"***Municipal separate storm sewer*** means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law)...including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the Clean Water Act that discharges into waters of the United States.

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2."

MS4s in Urbanized Areas

Storm water discharges from MS4s in urbanized areas are a concern because of the high concentration of pollutants found in these discharges. Concentrated development in urbanized areas substantially increases impervious surfaces, such as city streets, driveways, parking lots, and sidewalks, on which pollutants from concentrated human activities settle and remain until a storm event washes them into nearby storm drains. Common pollutants include pesticides, fertilizers, oils, salt, litter and other debris, and sediment. Another concern is the possible illicit connections of sanitary sewers, which can result in fecal coliform bacteria entering the storm sewer system. Storm water runoff picks up and transports these and other harmful pollutants then discharges them – untreated – to waterways via storm sewer systems. When left uncontrolled, these discharges can result in fish kills, the destruction of spawning and wildlife habitats, a loss in aesthetic value, and contamination of drinking water supplies and recreational waterways that can threaten public health.

Construction Activity

Uncontrolled runoff from construction sites is a water quality concern because of the devastating effects that sedimentation can have on local water bodies, particularly small streams. Numerous studies have shown that the amount of sediment transported by storm water runoff from construction sites with no controls is significantly greater than from sites with controls. In addition to sediment, construction activities yield pollutants such as pesticides, petroleum products, construction chemicals, solvents, asphalts, and acids that can contaminate storm water runoff. During storms, construction sites may be the source of sediment-laden runoff, which can overwhelm a small stream channel's capacity, resulting in streambed scour, stream bank erosion, and destruction of near stream vegetative cover. Where left uncontrolled,

Source: US EPA

sediment laden runoff has been shown to result in the loss of in-stream habitats for fish and other aquatic species, an increased difficulty in filtering drinking water, the loss of drinking water reservoir storage capacity, and negative impacts on the navigational capacity of waterways.

Municipally Operated Sources Exempted by the Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 Provisions within ISTEA temporarily delayed the deadline for Phase I industrial activities (with the exception of power plants, airports, and uncontrolled sanitary landfills) operated by municipalities with populations of less than 100,000 people to obtain an NPDES storm water discharge permit. Congress delayed the permitting deadline for these facilities to allow small municipalities additional time to comply with NPDES requirements. The Phase II Final Rule ended this temporary exemption from permitting and set a deadline of no later than March 10, 2003 for all ISTEA exempted municipally operated industrial activities to obtain permit coverage.

Phase II Coverage

The final rule "automatically" covers two classes of storm water dischargers on a nationwide basis:

(1) Owners/Operators of small MS4s located in "urbanized areas" as delineated by the Bureau of the Census. A "small" MS4 is any MS4 not already covered by Phase I of the NPDES storm water program.

(2) Operators of small construction activities that disturb equal to or greater than 1 (one) and less than 5 (five) acres of land.

In addition, the federal Rule requires delegated states to develop state designation criteria for bringing entities outside the "urbanized area" into the program. Small MS4s located outside of urbanized areas, construction activity disturbing less than 1 acre, and any other storm water discharges can be designated for coverage if the NPDES permitting authority or EPA determines that storm water controls are necessary.

Petitioning

The federal Rule specifies a petitioning mechanism for inclusion of small MS4s and individual point source discharges into the Phase II program. Under this option, any person may petition the permitting authority to require an NPDES permit for a discharge composed entirely of storm water that contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States. Affected parties/communities are notified when a petition is received. The implementing authority has 180 days from receipt of the petition to determine whether a permit is required.

Phase II Final Rule Requirements

Operators of Phase II-designated small MS4s and small construction activity are required to apply for NPDES permit coverage and to implement storm water discharge management controls (known as "best management practices" (BMPs)). Specific requirements for each type of discharge are listed below.

Small MS4

- A regulated small MS4 operator must develop, implement, and enforce a storm water management program designed to reduce the discharge of pollutants from their MS4 to the "maximum extent practicable," to protect water quality, and to satisfy the appropriate water quality requirements of the CWA. The rule assumes the use of narrative, rather than numeric, effluent limitations requiring implementation of BMPs.
- The small MS4 storm water management program must include the following six minimum control measures: public education and outreach; public participation/involvement; illicit discharge detection and elimination; construction site runoff control; post-construction runoff control; and pollution prevention/good housekeeping.

Source: US EPA

NPDES Phase II Overview

- A regulated small MS4 operator must identify its selection of BMPs and measurable goals for each minimum measure in the permit application. The evaluation and assessment of those chosen BMPs and measurable goals must be included in periodic reports to the NPDES permitting authority.

Construction Activities

- The specific requirements for storm water controls on small construction activity will be defined by the NPDES permitting authority on a State-by-State basis.
- EPA expects that the NPDES permitting authorities will use their existing Phase I general permits for large construction activity as a guide for their Phase II permits for small construction activity.

Source: US EPA

NC NPDES Phase II Implementation Temporary Rule Overview

Why temporary Rules? The federal regulations establish the minimum standards for the Phase II program. A number of items, including designation criteria, needed to be confirmed in state rules so that everyone would know what standard will be applied. Rulemaking also ensures that there was an opportunity for public input on the rule language. This is an important component of the process because DWQ has a limited number of staff to dedicate to Phase II. Public forums such as workshops, stakeholder meetings and comment periods increase the number of people working on the project. This brought a wealth of experience and different points of view to the table and results in a better program for everyone.

The North Carolina NPDES Phase II implementation Rule (15A NCAC 2H .0126) covers 5 basic areas:

Program Applicability

- Federal Design
  - The Federal intent is for a seamless program of coverage for urbanized areas
  - Federal specificity - Applies to small MS4's, owners and operators who would have control over the small MS4's
- State Design
  - Addresses NC's uniqueness while capturing the intent/specificity of the federal program and ease implementation. State program designed for differences in counties and municipalities, different approaches developed to account for these differences
  - Municipalities - straight forward permitting approach, where the permitted entity can take credit for existing programs to meet permit requirements in whole or in part.
  - Counties - Various voluntary options developed to address the unique situation in NC. Options developed through negotiations with affected parties.

Designation

- Auto Designation - Based on decennial census
- State Designation – Defined process is required by Federal rules.
  - Administered on Basinwide Schedule starting in 2004
  - Rule Sets Up A Two Step Process
    - Identification of entities for <u>potential</u> coverage
      - Municipalities
      - Counties
      - Other small MS4's
    - Evaluation against designation criteria
      - Discharge to sensitive waters
      - High growth / growth potential
      - Significant contributor of pollutants
      - Effectiveness of applicable existing programs

Petitioning

- Rule defines submittal requirements
- Specifies review and public involvement in process

Post-Construction Program

- Applies to new development and redevelopment
- Requires ordinance(s)
- Rule establishes program elements
  - 1 Year 24 Hour Storm Control
  - 85% Average Annual TSS Removal

- Operation & Maintenance of BMPs
- Control / Oversight Programs
- Specific Requirements - SA, Tr and NSW

Program Administration

- Public Input / Notice
- Application / Implementation Schedules
- State Implementation Procedures Schedules

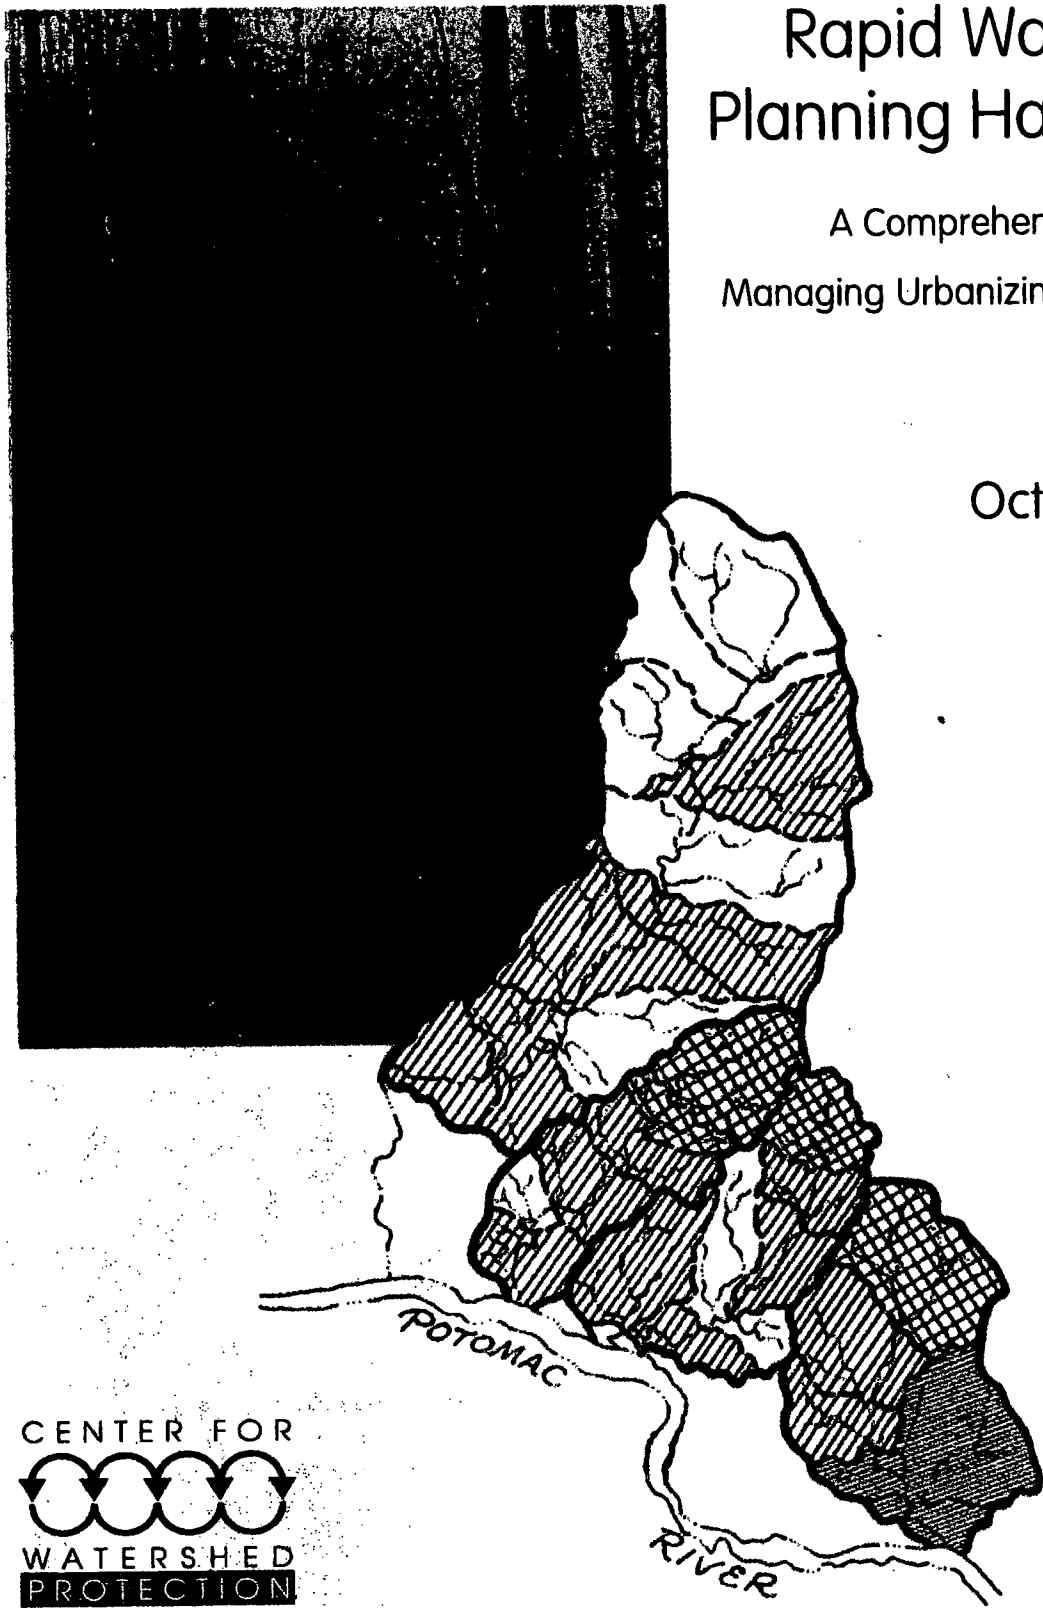
Rapid Watershed Planning Handbook

A Comprehensive Guide for Managing Urbanizing Watersheds

October 1998

(Reprinted 1999)



CENTER FOR WATERSHED PROTECTION

Ellicott City, Maryland

CHAPTER 1
BASIC CONCEPTS OF WATERSHED PROTECTION

1.1 Introduction

This chapter introduces some of the basic watershed concepts that are at the heart of the rapid watershed planning approach. It is helpful to fully understand these concepts before embarking on a local watershed plan.

> ***Concept No. 1.*** **There are many different watershed management units.** Watershed and subwatershed units are most practical for local plans. Each watershed is composed of many individual subwatersheds that can have their own unique water resource objectives. A watershed plan is a comprehensive framework for applying management tools within each subwatershed in a manner that also achieves the water resources goals for the watershed as a whole.

In developing a watershed plan, it is useful to consider how watersheds are configured. The term **management unit** is used to describe watersheds and their smaller segments. The two management units that will be focused upon in this handbook are the **watershed** and the **subwatershed**. A **watershed** can be defined as the land area that contributes runoff to a particular point along a waterway. A typical watershed can cover tens to hundreds of square miles and several jurisdictions.

Watersheds are broken down into smaller geographic units called **subwatersheds**. Subwatersheds typically have a drainage area of 2 to 15 square miles with boundaries that include the land area draining to a point at or below the confluence of two second order streams and almost always within the limits of a third order stream. While management unit size will vary among geographic regions and also as a function of slope, soils and degree of urbanization, this general definition provides a consistent and uniform basis for defining individual subwatershed boundaries within a larger watershed.

The terms "watershed" and "subwatershed" are *not* inter-changeable. Readers will observe that throughout this handbook, the term **watershed** is used when referring to broader management issues across an entire watershed, while the term **subwatershed** is used to refer assessment level studies and specific projects within the smaller subwatershed units.

There are other important management units to consider when developing a watershed plan. The largest watershed management unit is the basin. A **basin** drains to a major receiving water such as a large river, estuary or lake. Basin drainage areas typically exceed several thousand square miles and often include major portions of a single state or even a group of states. Within each basin are a group of **subbasins** that extend over several hundred square miles. Subbasins are a mosaic of many diverse land uses, including forest, agriculture, range, and urban areas. Subbasins are composed of a group of watersheds, which, in turn, are composed of a group of subwatersheds. Within subwatersheds are **catchments**, which are the smallest units in a watershed. A **catchment** is defined as the area that drains an individual development site to its first intersection with a stream. Table 1.1 describes the various management units and provides a comparison of impervious cover influences and possible management measures. Figure 1.1 illustrates how watershed management units nest together within the drainage system.

Table 1.1 Description of the Various Watershed Management Units

Watershed Management Unit	*Typical Area (square miles)*	*Influence of Impervious Cover*	*Sample Management Measures*
Catchment	0.05 to 0.50	very strong	BMP and site design
Subwatershed	1 to 10	strong	stream classification and management
Watershed	10 to 100	moderate	watershed-based zoning
Subbasin	100 to 1,000	weak	basin planning
Basin	1,000 to 10,000	very weak	basin planning

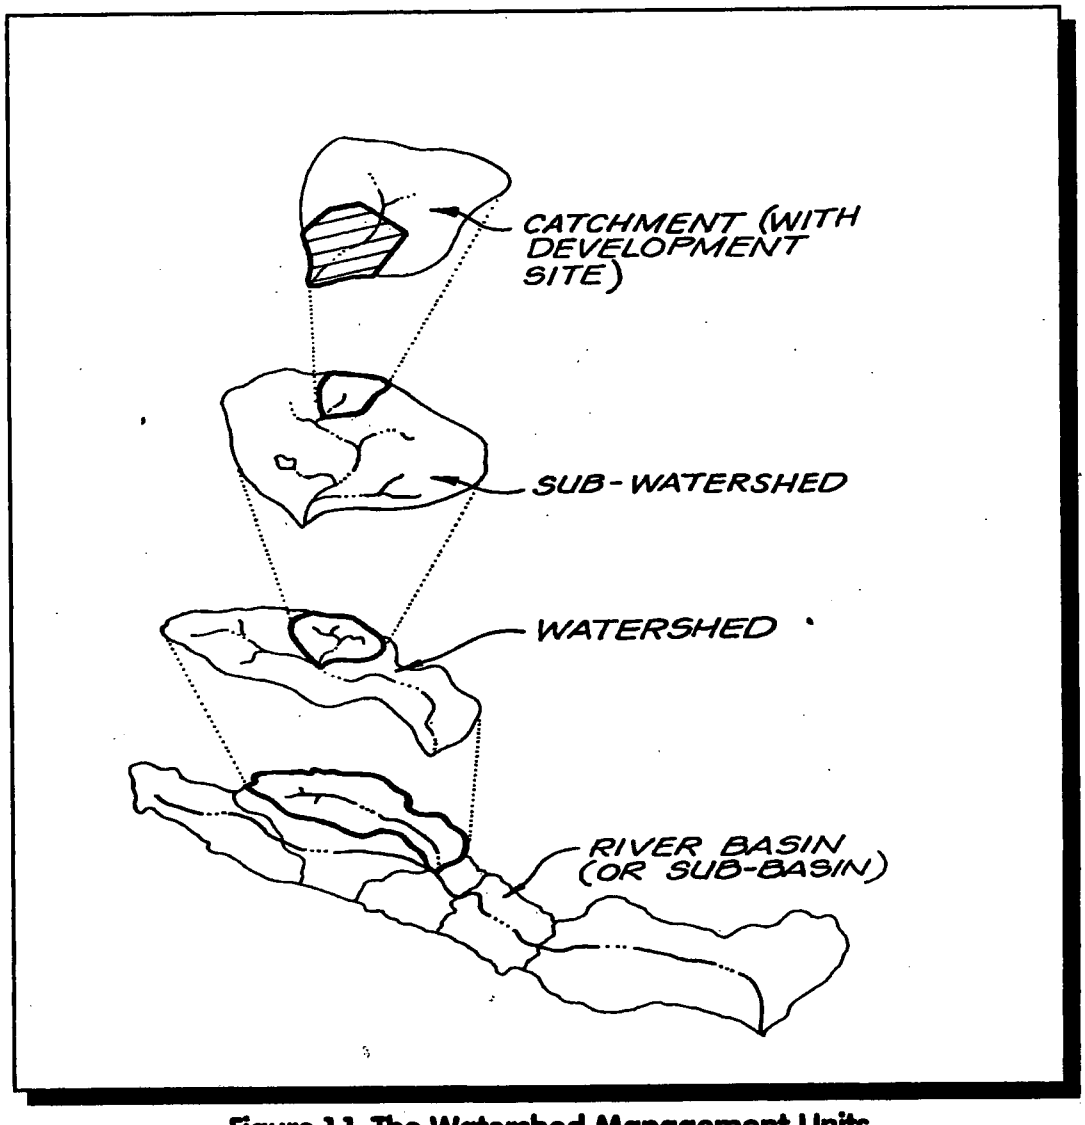


Figure 1.1 The Watershed Management Units
(Adapted from Clements, et al., 1996)

A local watershed may have dozens of individual subwatersheds within its boundaries. A watershed plan tracks the planning and management within individual subwatersheds. Figure 1.2 illustrates this concept of multiple subwatersheds within a larger watershed.

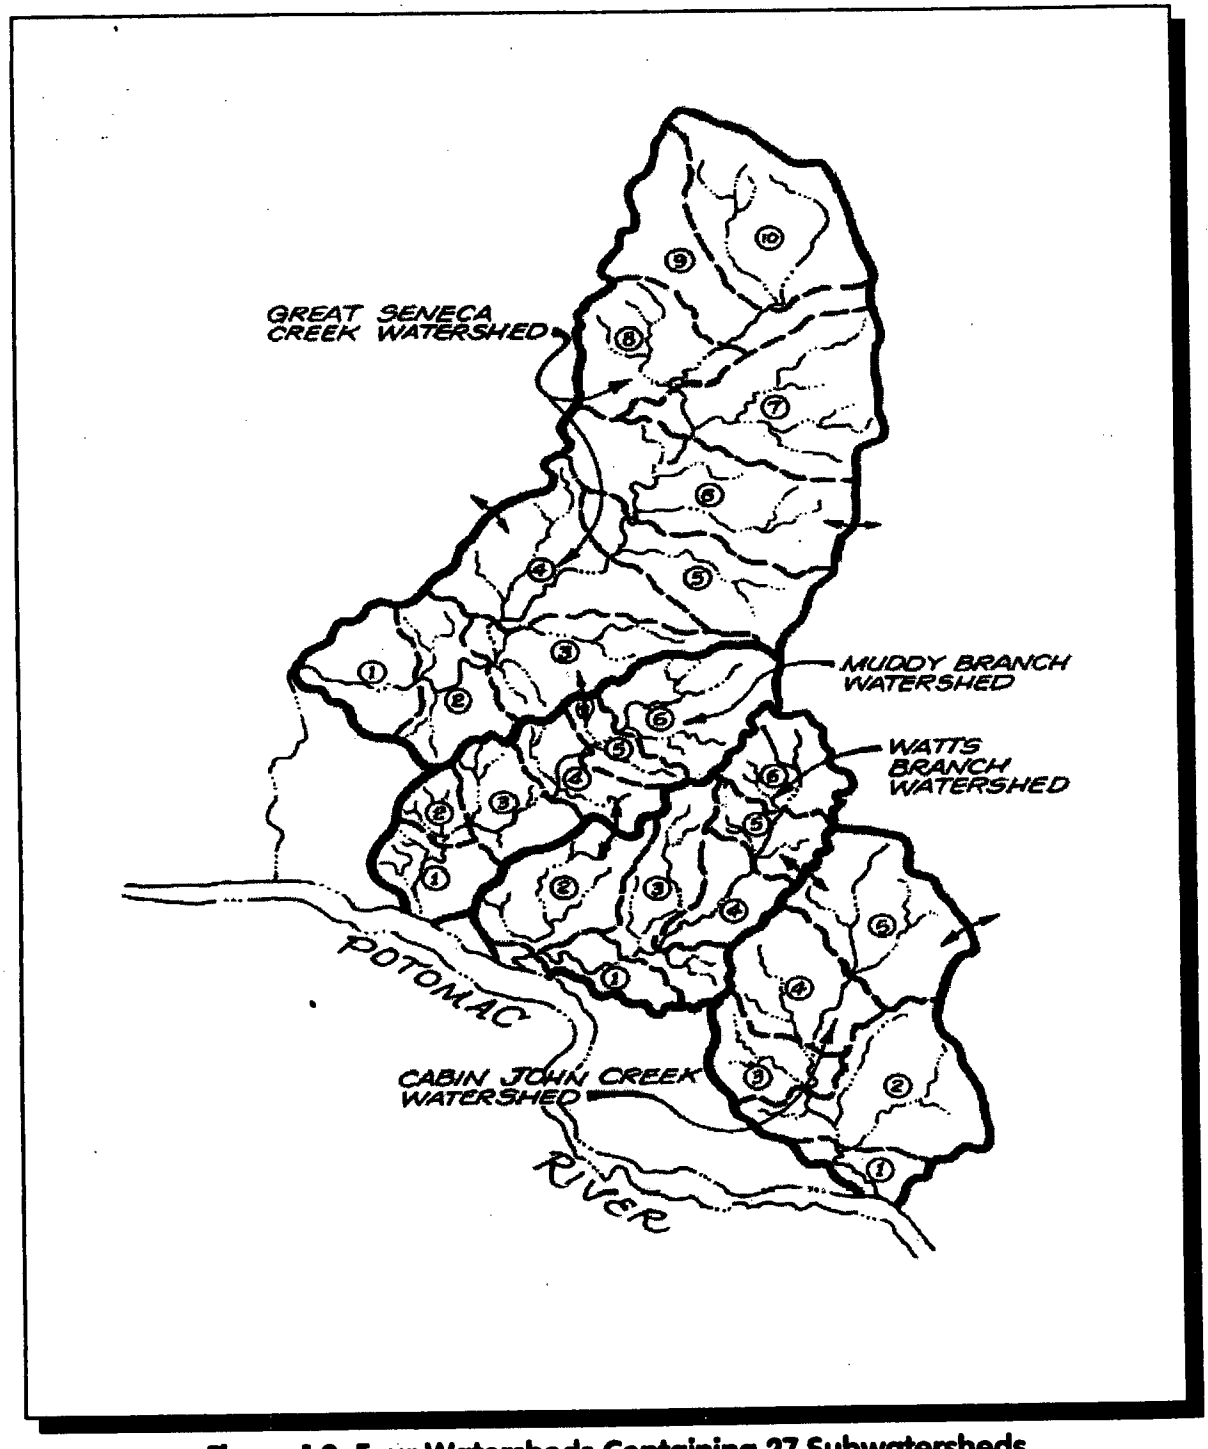

Figure 1.2 Four Watersheds Containing 27 Subwatersheds
(Modified from MCDEP Countywide Stream Protection Strategy, 1998)

This handbook focuses on the subwatershed as the primary planning unit for several reasons:

- The influence of impervious cover on hydrology, water quality, and biodiversity is most evident at the subwatershed level where the influences of individual development projects are easily recognizable.
- Subwatersheds are small enough to be within just a few political jurisdictions where it is easier to establish a clear regulatory authority and incorporate the smaller number of stakeholders into the management process.
- Subwatersheds are limited so that few confounding pollutant sources (e.g., agricultural runoff, point sources, etc.) are present that confuse management decisions.
- A map of a subwatershed can usually fit on a standard 24" by 36" sheet with sufficient detail to provide useful management information.
- Locally, managers may prefer the subwatershed as a planning unit because it is small enough to perform monitoring, mapping, and other watershed assessment tasks in a rapid time frame. A subwatershed plan can generally be completed within a year's time and still allow ample time for goal development, agency coordination, and stakeholder involvement. This shorter time span enables planners to generate many subwatershed plans in a consistent and coordinated cycle.

***Concept No. 2.* Each subwatershed contains a network of small streams channels that are known as headwater streams.** While each headwater stream is short and narrow, they collectively represent a majority of the drainage network of any watershed management unit. In addition, headwater streams are exceptionally vulnerable to watershed development. Consequently, it makes sense to focus on headwater streams in any watershed plan.

Stream classification is important in watershed management. It is also important to understand the spatial connections between the stream and its watershed. A network of streams drain each watershed. Streams can be classified according to their order in that network. A stream that has no tributaries or branches is defined as a first-order stream. When two first-order streams combine, a second-order stream is created, and so on. **Headwater streams** are defined as first- and second-order streams. Figure 1.3 illustrates the stream order concept.

Headwater streams are the smallest streams but they are crucial in watershed management because they dominate the landscape through their shear number and cumulative length. Figure 1.4 illustrates the significance of a headwater stream network in a local landscape.

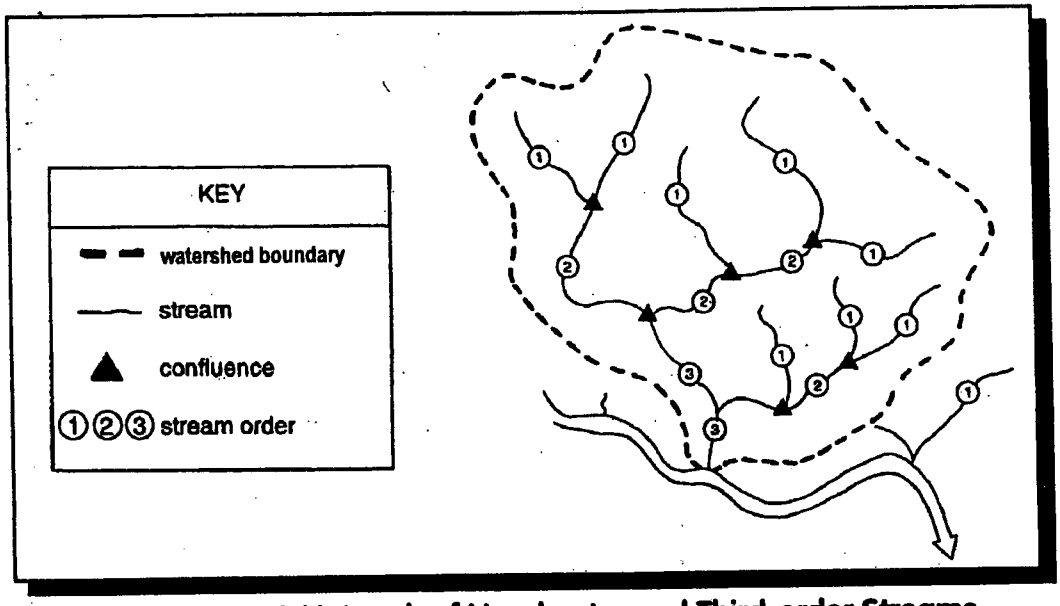

Figure 1.3 A Network of Headwater and Third-order Streams
(Source: Schueler, 1995b)

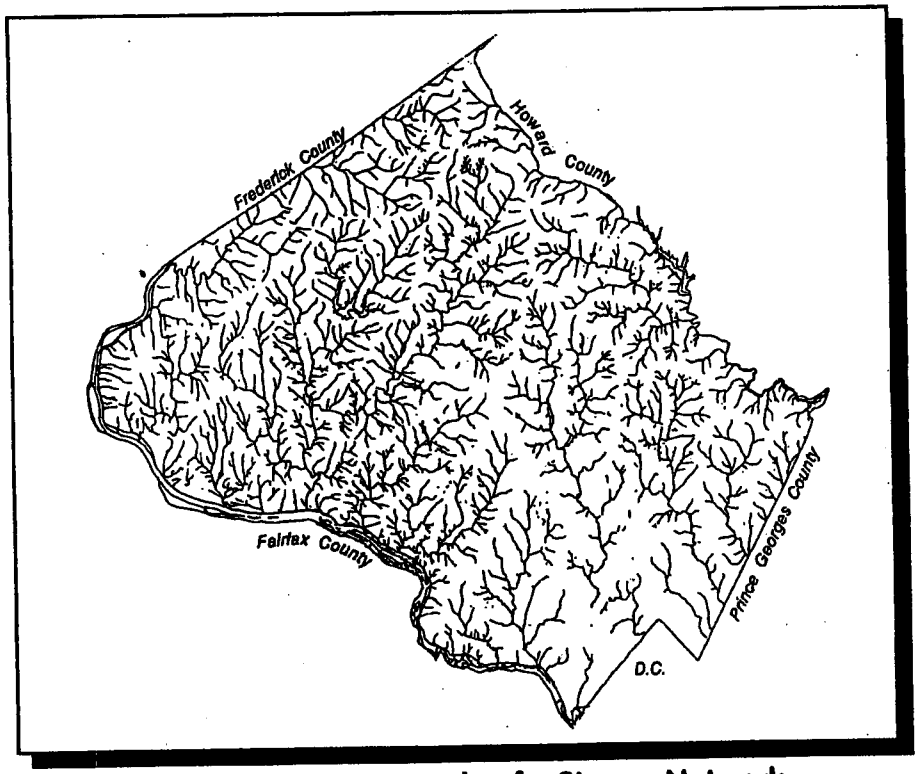

Figure 1.4 An Example of a Stream Network
(Source: Montgomery County DEP)

Headwater streams are typically short in length and drain relatively small areas, but are important because they comprise roughly 75% of the total stream and river mileage in the United States. Table 1.2 illustrates the proportion of smaller streams to larger streams in the United States.

What happens in the local landscape is directly translated to headwater streams and major receiving waters are affected in turn. As urbanization increases, streams handle increasing amounts of runoff which degrades headwater streams as well as major tributaries.

Focusing on the headwater stream level is important in watershed management for several reasons:

- streams are exceptionally vulnerable to watershed changes
- streams are on the same scale as development
- the public intuitively understands streams and strongly supports their protection
- streams are the "narrowest door" for water resource protection
- streams are good indicators of watershed quality

Table 1.2 Proportion of National Stream and River Mileage in Headwater Streams
(Leopold, Wolman, Miller, 1964)

Stream Order*	Number of Streams	Total Length of Stream (miles)	Mean Drainage Area (square miles)**
1	1,570,000	1,570,000	1.0
2	350,000	810,000	4.7
3	80,000	420,000	23
4	18,000	220,000	109
5	4,200	116,000	518
6	950	61,000	2,460
7	200	30,000	11,700
8	41	14,000	55,600
9	8	6,200	264,000
10	1	1,800	1,250,000
Total	2,023,400	3,250,000	N/A

* stream order based on Strahler (1957) method, analyzing maps at a scale of 1:24,000
** cumulative drainage area, including tributaries

The watersheds and subwatersheds that drain to these streams are "readily identifiable landscape units that integrate terrestrial, aquatic, geologic, and atmospheric processes" (Clements et al., 1996). They are the most appropriate geographic unit to protect water resources.

Concept No. 3. Recent research has shown that the amount of **impervious cover in a subwatershed can be used to project the current and future quality of many headwater streams.** There are also strong lines of evidence that suggest that impervious cover is linked to the quality of other subwatershed resources such as lakes, reservoirs, estuaries and aquifers.

The influence of impervious cover on stream quality

The conversion of farmland, forests, wetlands, and meadows to rooftops, roads, and lawns creates a layer of impervious surface in the urban landscape. Impervious cover is a very useful indicator with which to measure the impacts of land development on aquatic systems. The process of urbanization has a profound influence on the hydrology, morphology, water quality, and ecology of surface waters (Horner, et al, 1996). Recent research has shown that streams in urban watersheds possess a fundamentally different character than streams in forested, rural, or even agricultural watersheds. The amount of impervious cover in the watershed can be used as an indicator to predict how severe these differences can be. In many regions of the country, as little as ten percent watershed impervious cover has been linked to stream degradation, with the degradation becoming more severe as impervious cover increases (Schueler, 1994).

Impervious cover directly influences urban streams by dramatically increasing surface runoff during storm events. Depending on the degree of impervious cover, the annual volume of stormwater runoff can increase by two to 16 times its predevelopment rate, with proportional reductions in groundwater recharge (Schueler, 1994). Figure 1.5 illustrates the influence of impervious cover on the hydrologic cycle and the amount of infiltration which occurs. In natural settings, very little annual rainfall is converted to runoff and about half is infiltrated into the underlying soils and the water table. This water is filtered by the soils, supplies deep water aquifers, and helps support adjacent surface waters with clean water during dry periods. In urbanized areas, less and less annual rainfall is infiltrated and more and more volume is converted to runoff. Not only is this runoff volume greater, it also occurs more frequently and at higher magnitudes. As a result, less water is available to streams and waterways during dry periods and more flow occurs during storms.

Other key changes in urban streams due to increases in impervious cover levels are detailed below:

Bankfull and sub-bankfull floods increase in magnitude and frequency. The peak discharge associated with the bankfull flow (i.e., the 1.5 to 2 year return storm) increases sharply in magnitude in urban streams. In addition, channels experience more bankfull and sub-bankfull flood events each year, and are exposed to critical erosive velocities for longer intervals (Hollis, 1975; Booth, et al, 1996; and MacRae, 1996).

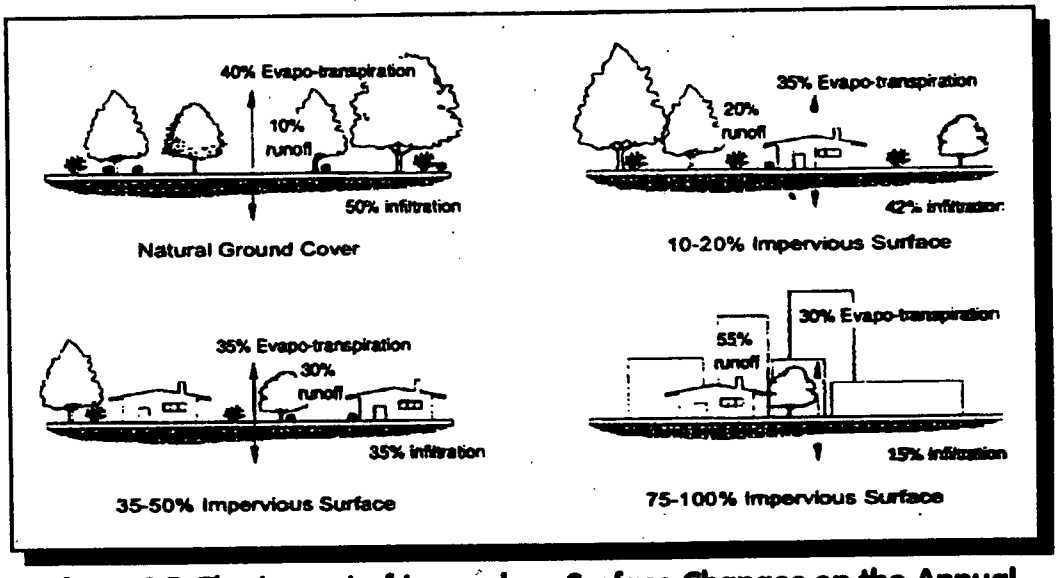

Figure 1.5 The Impact of Impervious Surface Changes on the Annual Water Balance (Source: PGDER, No Date)

Dimensions of the stream channel are no longer in equilibrium with its hydrologic regime. The hydrologic regime that had defined the geometry of the pre-development stream channel irreversibly changes and the channel faces higher flow rates on a more frequent basis. The higher flow events of the urban stream are capable of performing more "effective work" in moving sediment than they had done before (Wolman, 1954).

Channels enlarge. The customary response by an urban stream is to increase its cross-sectional area to accommodate the higher flows. This is done by stream bed down-cutting, stream bank widening, or a combination of both. Urban stream channels often enlarge their cross-sectional area by a factor of 2 to 5, depending on the degree of impervious cover and the age of

development in the upland watershed (Arnold, et al, 1982; Gregory ,et al, 1992;and MacRae, 1996).

Stream channels are highly modified by human activity. Urban stream channels are extensively modified in an effort to protect adjacent property from streambank erosion or flooding. Headwater streams are frequently enclosed within storm drains, while others are channelized, lined, and or "armored" by heavy stone. Another modification that is unique to urban streams is the installation of sanitary sewers underneath or parallel to the stream channel. According to May, et al (1997), 20 to 30% of natural stream channels are modified in typical urban watersheds.

Upstream channel erosion contributes greater sediment load to the stream. The prodigious rate of channel erosion in urban streams, coupled with sediment erosion from active construction sites, increases sediment discharge to urban streams. Researchers have documented that channel erosion constitutes as much as 75% of the total sediment budget of urban streams (Crawford and Lenat, 1989 and Trimble, 1997). Urban streams also tend to have a higher sediment discharge than non-urban streams during the active channel enlargement stage.

Dry weather flow in the stream declines. Since impervious cover prevents rainfall from infiltrating into the soil, less flow is available to recharge groundwater. Consequently, during extended periods without rainfall, baseflow levels are often reduced in urban streams (Simmons and Reynolds, 1982).

Wetted perimeter of the stream during low flow declines. The wetted perimeter of a stream is the fraction of the total cross-sectional area of the channel that is covered by flowing water during dry-weather periods, and is an important indicator of habitat degradation in urban streams. Given that urban streams develop a larger channel cross-section while their baseflow rates decline, it follows that the wetted perimeter becomes smaller. Thus, for many urban streams, this results in a very shallow low flow channel that "wanders" across a very wide stream bed, often changing its lateral position in response to storms.

Instream habitat structure degrades. Urban streams are routinely scored as having poor instream habitat quality, regardless of the specific metric or method employed. Habitat degradation is often exemplified by a loss of pool and riffle structure, embedding of stream bed sediments, shallow depths of flow, eroding and unstable banks, and frequent stream bed turnover.

Large woody debris is reduced (LWD). Large woody debris is an important structural component of many low order streams systems, creating complex habitat structure and generally making

the stream more retentive. In urban streams, the quantity of LWD found in stream channel declines sharply, due to the loss of riparian forest cover, storm washout, and channel maintenance practices (Booth, et al, 1996; May, et al, 1997).

Stream crossings and potential fish barriers increase. Many forms of urban development are linear in nature (e.g., roads, sewers, and pipelines) and cross stream channels. The number of stream crossings increases directly in proportion to impervious cover (May, et al 1997), and many crossings can become partial or total barriers to upstream fish migration, particularly if the stream bed erodes below the fixed elevation of a culvert or a pipeline.

Riparian forests become fragmented, narrower and less diverse. The important role that riparian forests play in stream ecology is often diminished in urban watersheds, as tree cover is often partially or totally removed along the stream as a consequence of development (May, et al 1997). Even when stream buffers are reserved, encroachment often reduces their effective width, and native species are supplanted by exotic trees, vines and ground covers.

Water quality declines. The water quality of urban streams during storm events is consistently poor. Urban stormwater runoff contains moderate to high concentrations of sediment, carbon, nutrients, trace metals, hydrocarbons, chlorides and bacteria (Schueler, 1987). While considerable debate exists as to whether stormwater pollutant concentrations are actually toxic to aquatic organisms, researchers agree that pollutants deposited in the stream bed exert an undesirable impact on the stream community.

Summer stream temperatures increase. The impervious surfaces, ponds, and poor riparian cover found in urban watersheds can increase mean summer stream temperatures by 2 to 10 degrees Fahrenheit (Galli, 1991). Since temperature plays a central role in the rate and timing of biotic and abiotic reactions in streams, even moderate increases can have an adverse impact on streams. In some regions, summer stream warming can irreversibly shift a cold-water stream to a cool-water or even warm-water stream, with deleterious effects on salmonoids and other temperature sensitive organisms.

Reduced aquatic diversity. Urban streams are typified by fair to poor fish and macro invertebrate diversity, even at relatively low levels of watershed impervious cover or population density (see Table 1.3). The ability to restore pre-development fish assemblages or aquatic diversity is constrained by a host of factors: irreversible changes in carbon supply, temperature, hydrology, lack of instream habitat structure, and barriers that limit natural recolonization.

A typical relationship between impervious cover and the presence of sensitive aquatic insects from the Delaware Piedmont region is illustrated in Figure 1.6. As the level of impervious cover in the watershed increases, the amount of sensitive species declines. Beyond watershed imperviousness levels of 10 to 15%, about 90% of the sensitive organisms are lost from the stream (Maxted and Shaver, 1996).

In recent years, many studies have begun to quantify the relationship between development and the health of the receiving waters. Some key findings of this research are summarized in Table 1.3. In general, the studies point to a decrease in stream quality with increasing urbanization. Other measures may also have predictable relationships to stream quality, such as the quantity and quality of riparian cover, or the amount of compacted urban turf (Schueler, 1995a).

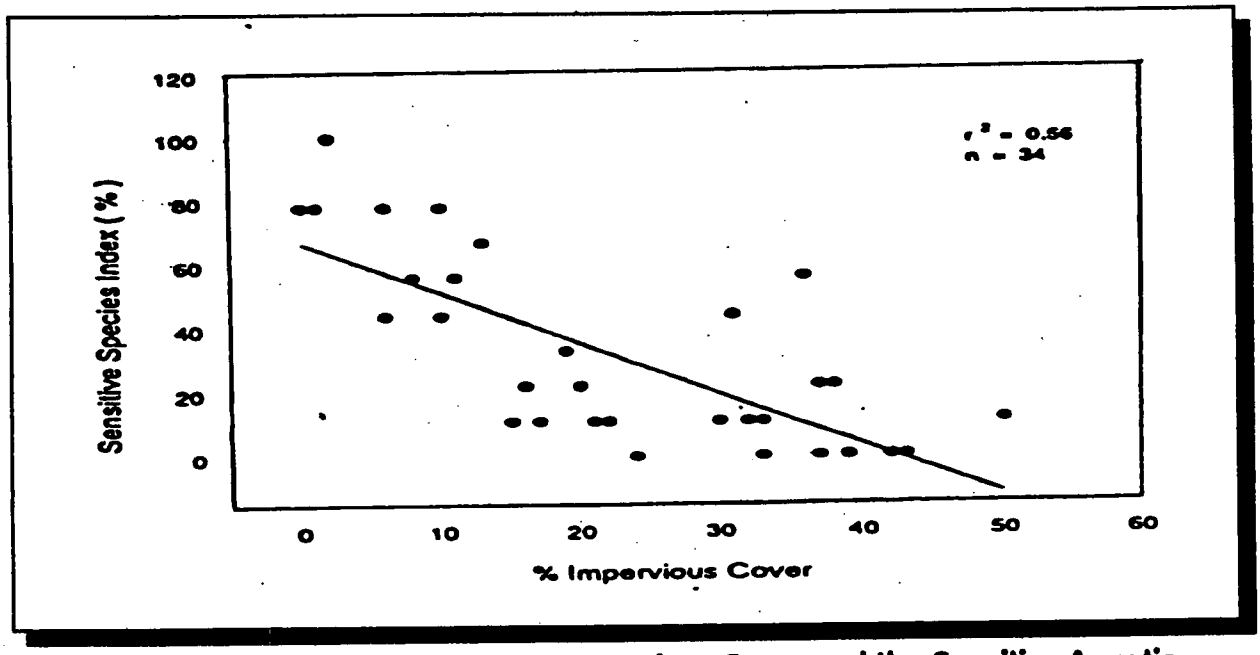

Figure 1.6 Relationship Between Impervious Cover and the Sensitive Aquatic Insect Index in Delaware's Northern Piedmont Streams.
(Source: Adapted from Maxted and Shaver, 1996)

Table 1.3 Review of Key Findings of Recent Research Examining the Relationship of Urbanization on Aquatic Systems

Watershed Indicator	*Key Finding*	*Reference*	*Year*	*Location*
Aquatic insects	Negative relationship between number of insect species and urbanization in 21 streams.	Benke, et al.	1981	Atlanta
Aquatic habitat	There is a decrease in the quantity of large woody debris (LWD) found in urban streams at around 10% impervious cover.	Booth, et al.	1996	Washington
Fish, habitat & channel stability	Channel stability and fish habitat quality declined rapidly after 10% impervious area.	Booth	1991	Seattle
Fish, habitat	As watershed population density increased, there was a negative impact on urban fish and habitat	Couch, et al.	1997	Atlanta
Aquatic insects and fish	A comparison of three stream types found urban streams had lowest diversity and richness	Crawford & Lenat	1989	North Carolina
Stream temperature	Stream temperature increased directly with subwatershed impervious cover.	Galli	1991	Maryland
Aquatic insects	A significant decline in various indicators of wetland aquatic macroinvertebrate community health was observed as impervious cover increased to levels of 8-9%.	Hicks & Larson	1997	Connecticut
Insects, fish, habitat water quality, riparian zone	Steepest decline of biological functioning after 6% imperviousness. There was a steady decline, with approx 50% of initial biotic integrity at 45% impervious area.	Horner, et al.	1996	Puget Sound Washington
Aquatic insects and fish	Unable to show improvements at 8 sites downstream of BMPs as compared to reference conditions.	Jones, et al.	1996	Northern Virginia
Aquatic insects	Urban streams had sharply lower insect diversity with human population above 4/acre. (About 10%)	Jones & Clark	1987	Northern Virginia
Aquatic insects & fish	Macroinvertebrate and fish diversity decline significantly beyond 10-12% impervious area.	Klein	1979	Maryland
Aquatic insects	Drop in insect taxa from 13 to 4 noted in urban streams.	Garie and McIntosh	1986	New Jersey

Table 1.3 Review of Key Findings of Recent Research Examining the Relationship of Urbanization on Aquatic Systems

Watershed Indicator	*Key Finding*	*Reference*	*Year*	*Location*
Fish spawning	Resident and anadromous fish eggs & larvae declined in 16 streams with > 10% impervious area.	Limburg & Schmidt	1990	New York
Fish	Shift from less tolerant coho salmon to more tolerant cutthroat trout pop.-between 10-15% impervious area at 9 sites.	Luchetti & Fuersteburg	1993	Seattle
Stream channel stability	Urban stream channels often enlarge their cross-sectional area by a factor of 2 to 5. Enlargement begins at relatively low levels of impervious cover.	MacRae	1996	British Columbia
Aquatic insects & stream habitat	No significant difference in biological and physical metrics for 8 BMP sites versus 31 sites without BMPs (with varying impervious area).	Maxted and Shaver	1996	Delaware
Insects, fish, habitat, water quality, riparian zone	Physical and biological stream indicators declined most rapidly during the initial phase of the urbanization process as the percentage of total impervious area exceeded the 5-10% range.	May, et al.	1997	Washington
Aquatic insects and fish	There was significant decline in the diversity of aquatic insects and fish at 10% impervious cover.	MWCOG	1992	Washington, DC
Aquatic insects	As watershed development levels increased, the macroinvertebrate community diversity decreased.	Richards, et al.	1993	Minnesota
Aquatic insects	Biotic integrity decreases with increasing urbanization in study involving 209 sites, with a sharp decline at 10% I. Riparian condition helps mitigate effects.	Steedmen	1988	Ontario
Wetland plants, amphibians	Mean annual water fluctuation inversely correlated to plant & amphibian density in urban wetlands. Declines noted beyond 10% impervious area.	Taylor	1993	Seattle
Wetland water quality	There is a significant increase in water level fluctuation, conductivity, fecal coliform bacteria, and total phosphorus in urban wetlands as impervious cover exceeds 3.5%.	Taylor, et al.	1995	Washington
Sediment loads	About 2/3 of sediment delivered into urban streams comes from channel erosion.	Trimble	1997	California

Table 1.3 Review of Key Findings of Recent Research Examining the Relationship of Urbanization on Aquatic Systems

Watershed Indicator	*Key Finding*	*Reference*	*Year*	*Location*
Water quality-pollutant conc.	Annual P, N, COD, & metal loads increased in direct proportion with increasing impervious area.	US EPA	1983	National
Fish	As watershed development increased to about 10%, fish communities simplified to more habitat and trophic generalists.	Weaver	1991	Virginia
Aquatic insects & fish	All 40 urban sites sampled had fair to very poor index of biotic integrity (IBI) scores, compared to undeveloped reference sites.	Yoder	1991	Ohio

The influence of impervious cover on other aquatic systems

The impact of impervious cover on the quality of lakes, water supply reservoirs, aquifers, or coastal areas has not been as well investigated as it has for urban streams. Although research is scarce, there is some evidence that impervious cover does have a similar impact on these aquatic systems. The impacts to these systems are manifested in different ways and may occur at different levels of impervious cover than are often seen for urban streams.

Even small increases in impervious cover change stream morphology and degradation of aquatic habitat. By contrast, aquatic systems such as lakes, water supply reservoirs, aquifers, and coastal areas tend to be impacted more by a decline in water quality due to non-point source pollutants. Research has shown that stormwater pollutant loads increase when the percentage of impervious cover in a watershed increases.

Urban Lakes

For urban lakes, the major water quality impacts are caused by higher stormwater pollutant loads. Elevations in total phosphorus and chlorophyll *a* are often associated with the impervious cover generated in developing areas. These factors can negatively affect the quality of the lake for activities such as fishing, swimming, or other water contact recreation. Sediment inputs may also be heightened with additional development in the watershed, which can often affect water clarity. In addition, the natural level of the lake may also be affected by the increased stormwater runoff which occurs with changes in impervious cover levels in the watershed.

Table 2: Review of Key Findings of Urban Stream Studies Examining the Relationship of Urbanization to Stream Quality

Ref.	Year	Location	Biological Parameter	Key Finding
Booth	1991	Seattle	Fish habitat/ channel stability	Channel stability and fish habitat quality declined rapidly after 10% imperv.
Galli	1994	Maryland	Brown trout	Abundance and recruitment of brown trout declines sharply at 10-15% imperv.
Benke *et al.*	1981	Atlanta	Aquatic insects	Negative relationship between number of insect species and urbanization in 21 streams
Jones and Clark	1987	Northern Virginia	Aquatic insects	Urban streams had sharply lower diversity of aquatic insects when human population density exceeded 4 persons/acre. (estimated 15-25% imperv. cover)
Limburg and Schimdt	1990	New York	Fish spawning	Resident and anadromous fish eggs and larvae declined sharply in 16 tributary streams greater than 10% imperv.
Shaver *et al.*	1994	Delaware	Aquatic insects	Insect diversity at 19 stream sites dropped sharply at 8 to 15% imperv.
Shaver *et al.*	1994	Delaware	Habitat quality	Strong relationship between insect diversity and habitat quality; majority of 53 urban streams had poor habitat
Schueler and Galli	1992	Maryland	Fish	Fish diversity declined sharply with increasing imperv., loss in diversity began at 10-12% imperv.
Schueler and Galli	1992	Maryland	Aquatic insects	Insect diversity metrics in 24 subwatersheds shifted from good to poor over 15% imperv.
Black and Veatch	1994	Maryland	Fish/insects	Fish, insect and habitat scores were all ranked as poor in 5 subwatersheds that were greater than 30% imperv.
Klein	1979	Maryland	Aquatic insects/fish	Macroinvertebrate and fish diversity declines rapidly after 10% imperv.
Luchetti and Fuersteburg	1993	Seattle	Fish	Marked shift from less tolerant coho salmon to more tolerant cutthroat trout populations noted at 10-15% imperv. at 9 sites
Steedman	1988	Ontario	Aquatic insects	Strong negative relationship between biotic integrity and increasing urban land use/ riparian condition at 209 stream sites. Degradation begins at about 10% imperv.
Pedersen and Perkins	1986	Seattle	Aquatic insects	Macroinvertebrate community shifted to chironomid, oligochaetes and amphipod species tolerant of unstable conditions.
Steward	1983	Seattle	Salmon	Marked reduction in coho salmon populations noted at 10-15% imperv. at 9 sites
Taylor	1993	Seattle	Wetland plants/ amphibians	Mean annual water fluctuation was inversely correlated to plant and amphibian density in urban wetlands. Sharp declines noted over 10% imperv.
Garie and McIntosh	1986	NewJersey	Aquatic insects	Drop in insect taxa from 13 to 4 noted in urban streams
Yoder	1991	Ohio	Aquatic insects/ fish	100% of 40 urban sites sampled had fair to very poor index of biotic integrity scores

Department of Environment and Natural Resources
Division of Water Resources
STATUS REPORT TO THE GENERAL ASSEMBLY
ON
WATER SUPPLY PLANNING
JANUARY 1, 2002 THROUGH SEPTEMBER 30, 2002

Drought

Water supply planning efforts over the months covered by this report have been dominated by the ongoing drought. Portions of the Piedmont and Mountains have experienced drought conditions for the fourth consecutive year. Streamflows and ground water levels in these areas have been setting new low flow records this year. As of September 30, 2002, 230 water systems were under some level of water use restrictions. Seven of these systems were under emergency restrictions. An extended period of normal precipitation will be needed to return ground water levels to pre-drought conditions. Until then, we will continue experiencing low streamflows during periods without rain.

The Division of Water Resources chairs the North Carolina Drought Monitoring Council. The Drought Monitoring Council has been meeting regularly since November 2001. At its December 6, 2001 meeting, the Drought Monitoring Council activated its Water Source Task Force to closely monitor water supply conditions. Since then the Water Source Task Force has met monthly and has consistently recommended that all water systems in the state closely monitor their water supplies, develop water shortage response plans and act early to minimize the impacts of the current drought.

The Piedmont region has been the most severely impacted by the drought. This region contains the Broad, Catawba and Yadkin river basins, as well as the headwaters of the Roanoke, Neuse and Cape Fear river basins. Most of these rivers are regulated by dams that provide water storage and varying degrees of ability to manage river flows. The Division of Water Resources initiated steps to modify normal operating procedures on several of the regulated rivers to minimize impacts of the drought. Drought response efforts have been underway in the Roanoke River Basin since last year. Releases from the hydropower projects on this river are being managed to protect water quality and control the migration of the salt water upstream from the estuary. Water systems in North Carolina and Virginia have instituted varying levels of water conservation measures.

By mid-summer, forecasts indicated that if water quality releases from Jordan Lake and Falls Lake were continued at normal levels, the water allocated for these releases would be exhausted, severely affecting water quality and downstream users. After consultation with the Division of Water Quality, the Wildlife Resources Commission, and water users, the Division of Water Resources and the U.S Army Corps of Engineers began reducing water releases from Jordan Lake (in the Cape Fear River Basin) in July and from Falls Lake (in the Neuse River Basin) in August. Water quality monitoring was increased and regular meetings with affected parties have been held to closely monitor for potential impacts. The reduced releases have not caused significant water quality problems and downstream water users have been able to get adequate amounts of water to meet their current needs. This effort has extended the usefully life of the storage dedicated to downstream releases without significantly affecting water quality and water availability downstream.

Dams on the Catawba and Yadkin rivers are operated for electric power generation under licenses issued by the Federal Energy Regulatory Commission (FERC). Duke Power manages a series of lakes on the Catawba River. Duke Power's staff has been managing these lakes for the last several years to make the most of the limited water available during the drought. Water systems using the Duke Power lakes have been buffered from the effects of the drought by the adaptations made to lake operations. However, declining lake levels have increased the need for everyone that depends on these lakes to reduce their withdrawals to protect water supplies.

In the Yadkin River Basin there are four lakes managed by Alcoa Power Generating Inc. and two lakes managed by Carolina Power & Light. The licenses for these facilities lacked the flexibility needed to alter releases in response to the worsening drought conditions. In early July, the Division of Water Resources initiated efforts to allow reductions in releases from the regulated lakes to protect lake levels, public water supplies and water quality. DWR is working closely with the power companies, other North Carolina and South Carolina resource management agencies, and the Federal Energy Regulatory Commission to manage the lakes during the current drought. Releases from the dams in this basin are now being managed to provide enough water to protect water quality downstream in South Carolina as well as to improve lake levels, to protect lake water quality and aquatic habitat and to protect public water supply intakes.

On July 12, 2002, Governor Easley requested that the federal government designate 54 counties as disaster areas due to the effects of the drought on agricultural operations. He also asked all North Carolinians to begin or increase water conservation measures and called for communities in the most severely impacted areas of the state to impose mandatory water restrictions. Affected water users were requested to reduce usage by 20 percent. The Division of Water Resources established a web site where communities could voluntarily report their water usage and reductions and continues to provide assistance with water conservation programs to local water systems.

On August 15, 2002, Governor Easley's Executive Order No. 26 ordered that "all state government agencies discontinue non-essential water use until further notice". The order also established a Water System Protection Team to provide assistance to state agencies and drought-stricken communities. The Division of Pollution Prevention and Environmental Assistance is providing assistance to local governments and industrial water users to comply with the governor's requests. The Division of Water Resources and the Division of Environmental Health's Public Water Supply Section have been working closely with drought-stricken communities and the Water System Protection Team. A weekly assessment of drought affected water systems is provided to the co-chairs of the Water System Protection Team. Water systems considered to be in the worst condition were invited to meet with agency representatives to explore options and identify difficulties the systems face in their efforts to address water shortages. The most often received request has been for financial assistance.

The Division of Water Resources is working closely with the Water System Protection Team, local water systems and other water users in the ongoing struggle to manage water resources during what appears likely to be our most severe drought of record. Efforts are underway to help water system administrators identify alternative sources of water and support applications for funding to have solutions in place to minimize anticipated drought impacts next summer.

On September 30th Governor Easley announced that more than $20 million will be made available through the departments of Commerce and Environment and Natural Resources and the North Carolina Rural Center to help communities ensure safe adequate water supplies. Communities with the most critical needs will be targeted and priority will be given to

communities that are developing interconnections with other systems or supplemental water sources to improve system reliability.

Water Supply Planning Program

Water supply planning in North Carolina is generally undertaken at the local level, with local communities having the primary responsibility for maintaining adequate water supplies. However, to help assure and assess the availability of water and to protect the state's water resources, the General Assembly has established several planning and regulatory programs administered by the Division of Water Resources (DWR). These programs require a variety of activities including: assessments of the availability of water through a network of monitoring wells and stream gages, preparation of Local Water Supply Plans by local government water systems, development of a statewide North Carolina Water Supply Plan, registration of large water withdrawals, certification of interbasin transfers of surface water, and permitting of water withdrawals in designated capacity use areas. This status report provides an update on these water supply programs, along with other DWR water supply planning activities.

Local Water Supply Plans

The General Assembly established a water supply planning program under General Statute 143-355(l) and (m) in order "to assure the availability of adequate supplies of good quality water to protect the public health and to support desirable economic growth". The statute requires units of local government that provide or plan to provide public water service to prepare a Local Water Supply Plan (LWSP). LWSPs describe current and future water needs and provide an assessment of the system's ability to meet those supply needs. LWSPs have to be adopted by the water system's local governing board and have to be updated at least every five years. The Division of Water Resources (DWR) is responsible for reviewing the local plans for consistency with the law and using the information in the plans to develop the North Carolina Water Supply Plan (NCWSP) mandated in G.S. 143-355(m). The NCWSP presents a summary of water use statewide and identifies areas of concern where water availability or conflicts between uses may limit the ability to meet water demand.

The first set of LWSPs were developed by over 500 local governments based on their 1992 water supplies and demands, with projections through 2020. Beginning in 1998 these plans were updated based on 1997 supply and demand conditions. Data from Local Water Supply Plans, available on the Division's web site, provide a valuable source of information for all local and regional water supply planning. Local Water Supply Plans have provided essential information as communities and state agencies have struggled to deal with the drought induced water shortages this year.

As of August 31, 2002, The following water systems have not submitted a 1997 LWSP: Green Level, Speed, Bunn, Gibsonville, Raeford, Mooresville, Taylortown, Saratoga, Ossipee Sanitary District, Chowan County, Lincoln County, Perquimans County, Whitley Heights Sanitary District, and North Brunswick Water & Sewer.

Local government water systems are currently compiling information on 2002 water supply and demand in preparation for updating their local plans in 2003. The Division of Water Resources has developed a web-based data submission program that will allow online submission of 2003 Local Water Supply Plans. Online submission will reduce printing and postage costs for local governments and speed the review process. Division of Water Resources' staff, with the help of the North Carolina Rural Water Association, will be conducting a series of workshops in early 2003 to assist water system administrators with their local plan updates.

North Carolina Water Supply Plan (NCWSP)

The 2001 NCWSP is available on the Division of Water Resources web site at www.ncwater.org. It is based on information from the 1997 LWSPs and 1999 water withdrawal registrations submitted pursuant to General Statute 143-215.22H.

In 1997, Local Water Supply Plan systems provided 867 million gallons of water per day to 68 percent (5,067,094) of North Carolinians, with the remainder of the state's population served by non-local government water systems and domestic wells. By 2020, these LWSP systems expect to need 1,415 million gallons per day to meet the water demands of 8 million people, a 63 percent increase in water to meet a 58 percent increase in population.

To help avoid water shortages and supply problems DWR recommends that water systems establish plans for managing water demand and developing additional water supplies by the time their average daily demand equals 80 percent of their estimated available supply. The 1997 LWSPs showed that 106 water systems were over this planning threshold with 80 systems regularly using over 90 percent of their estimated available supply. Implementing water conservation programs that reduce water losses and improve water use efficiency can help minimize operating costs and extend the useful life of existing water supplies and treatment facilities. Many of these water systems will face major investments to develop new supplies and expand their treatment facilities to meet future water demands, in addition to the costs of operating and maintaining existing operations.

The NCWSP presents several recommendations that are important to maintaining adequate water supplies for the citizens of North Carolina. In the 15 counties identified as the Central Coastal Plain water users should reduce the over-pumping of the Black Creek and Upper Cape Fear aquifers and develop sustainable water sources. The Division of Water Resources and other appropriate agencies should identify and provide assistance to water systems that are at greater risk of water supply shortages (those with demands greater than 80 percent of their supply). All public water systems should develop Water Shortage Response Plans to minimize impacts of droughts and other water shortage emergencies. State and local governments should work together to seek regional solutions to water supply problem. All interested parties should work together to encourage coordination of state programs and policies to encourage innovative solutions to water supply problems while protecting the environment and public health.

Central Coastal Plain Capacity Use Area

Establishment of the Central Coastal Plain Capacity Use Area directly addresses one of the recommendations of the NCWSP. The Black Creek and Upper Cape Fear aquifers have provided high-quality, low-cost water to residents of eastern North Carolina's Central Coastal Plain for generations. Declines in water levels and water pressure in the aquifers are causing migration of saltwater inland and threaten the long-term viability of these aquifers. To protect these aquifers for current and future residents of the area, withdrawals from these aquifers have to be reduced.

In November 1998, after years of study, the Division of Water Resources recommended that the Environmental Management Commission (EMC) designate 15 counties in eastern North Carolina as the Central Coastal Plain Capacity Use Area (CCPCUA) under authority granted to it by the Water Use Act of 1967. Over the next several years the Division of Water Resources worked closely with local governments and other large water users in the region to develop a set

of rules that provide a schedule for reductions of withdrawals from the aquifers of concern. The Central Coastal Plain Capacity Use Area rules became effective on August 1, 2002. The rules and supporting documentation are available on the Division of Water Resources web site at www.ncwater.org.

Under these rules, anyone withdrawing more than 100,000 gallons of ground water per day in the designated counties must apply for a water use permit from the Division of Water Resources. To provide a better picture of overall water use in the region, the rules also require that anyone withdrawing more than 10,000 gallons per day of surface water or ground water must register their water use on an annual basis. Water withdrawals from the Black Creek and Upper Cape Fear aquifers will be reduced in three stages over a 16-year period. In defined critical areas reductions will be as much as 75 percent below current withdrawals. In addition, applicants for a water use permit must adopt a set of minimum water conservation measures to improve water use efficiency.

The North Carolina Rural Economic Development Center provided funds for a private consulting firm to identify and evaluate alternative water supplies for systems in the 15 Central Coastal Plain Capacity Use Area counties. The results of this study were presented to local officials and concerned citizens in the spring of 2002. Many local governments in the 15-county region are already actively planning to manage water demands and develop new, sustainable water sources to meet their future needs.

The Division of Water Resources is partnering with the Department of Agriculture and Consumer Services for registration and reporting of agricultural water use.

The successful implementation of these rules will significantly reduce withdrawals from the affected aquifers and insure that they will remain reliable sources of water for residents of eastern North Carolina for generations to come.

Allocation of Water Supply Storage in B. Everett Jordan Lake

The third round of allocations of water supply storage in B. Everett Jordan Lake was approved by the EMC on July 11, 2002. Water supply storage in Jordan Lake is allocated by the EMC to units of local government based on rules outlined in NCAC T15A:02G.0500. Applications were received from 11 local governments in May 2001.

To evaluate the long-term effects of allocations of water supply storage in Jordan Lake, DWR staff developed the Cape Fear River Basin Water Supply Plan. A draft of the plan was reviewed by water users in the basin in December 2001. After further public review, the plan was completed in March 2002.The plan provides an assessment of water supply needs and availability through 2050 for water systems using water from the Cape Fear River Basin above Lock and Dam # 1 in Bladen County. The plan uses data from Local Water Supply Plans and applications for allocations from Jordan Lake combined with the newly developed Cape Fear River Hydrologic Model. This computer model is designed to characterize water quantity effects of major withdrawals and discharges on the Cape Fear River and its major tributaries. The plan considers the water supply and wastewater discharge needs of 94 systems that withdraw water from or discharge water to the Haw, Deep or Cape Fear river basins. The effects of these demands are compared to the conditions in the basins in 1998, the base year for the model. The model uses a 69-year (1930-1998) record of precipitation, streamflow and water usage. Using the information contained in the allocation applications and projections based on Local Water Supply Plan data the model indicates that the current level of water supply allocations from Jordan Lake will not hinder any community's ability to meet its 2050 water needs. Allocations were based on applicants needs in 2030 and their existing water supply sources. The current

allocations leave 37 percent of the water supply storage available to meet future needs and do not require any additional interbasin transfer certificates.

Interbasin Transfer Certifications

General Statute 145-215.22I regulates large transfers (over 2 mgd) of surface water between designated river basins. In March 2002, the Environmental Management Commission approved, with conditions, an increase in the allowable interbasin transfer for Charlotte Mecklenburg Utilities from 16.1 to 33 million gallons per day. Water is withdrawn from the Catawba River Basin and transferred to the Rocky River Basin.

The conditions require: continued work on watershed management to protect water quality and control runoff during construction; prohibit increased distribution lines to move water into the Goose Creek watershed until impacts on the endangered Carolina Heelsplitter are evaluated; require periodic reporting on compliance with conditions; and drought management planning. In addition there is a provision to re-open the process if environmental impacts turn out to be significantly different from the projected impacts that form the basis of the Finding of Facts.

Requests for additional interbasin transfer certifications associated with the Catawba River and neighboring basins are expected from Gastonia, Kannapolis, Mooresville, Concord and Union County.

The environmental studies are underway to support an application by the City of Roxboro for approval to transfer 8.5 million gallons per day of water from the Roanoke River Basin to the Neuse River and Tar River basins. If approved this transfer will supplement the City's water supply and will provide cooling water to an 1100 MW electric generation facility proposed by Dominion Power.

In addition, environmental evaluations are underway by the Kerr Lake Regional Water Authority to support an application to increase their grandfathered interbasin transfer capacity of 10 million gallons per day to 18. Water is withdrawn from the Roanoke River Basin and transferred to the Tar River and Fishing Creek basins.

As the population and water systems in North Carolina continue to grow, more systems will exceed their grandfathered interbasin transfer amounts (their transfer capacity as of July 1, 1993), and will face the lengthy process required to obtain an IBT certificate. The 1997 LWSPs document system reliance on interbasin transfers to aid water system managers in understanding the extent to which this law may affect them.

Hydropower Facility Relicensing

As noted in previous status reports, the licenses issued by the Federal Energy Regulatory Commission (FERC) for all of the non-federal major hydroelectric projects in the state will expire between 2001 and 2008. Nearly a dozen projects involving over 30 impoundments along the Yadkin-PeeDee, Catawba, Roanoke, Little Tennessee, and other mountain rivers will need to be relicensed. The relicensing process is an intensive, multi-year process that attempts to balance the many benefits of these projects such as power generation, water supply, recreation, water quality, aquatic habitat, and others. Relicensing provides a process that can address concerns of state agencies and local communities about how the lakes are managed. Licenses are typically issued for 30 to 50 years.

Relicensing is nearing completion for Dominion Generation's Lake Gaston and Roanoke Rapids projects on the Roanoke River. Relicensing is also underway for the numerous Duke Power - Nantahala Area and Alcoa Power Generating Inc.'s Tapoco Division's projects in western North Carolina. Work is beginning on relicensing of Duke Power's facilities in the

Catawba River Basin. Duke Power's lakes on the Catawba River are used by many water systems as sources for their public water supplies. Also work is beginning on facilities in the Yadkin-Pee Dee River Basin operated by Alcoa Power Generating, Inc. and Carolina Power and Light. Several water systems depend on these lakes for public water supplies.

Growth, Development and water supply

Severe drought conditions this year have provided a preview of conditions that may be faced in the future as our growing population increases demand on limited water resources. The significant reductions in available supply provided a short duration simulation of how conditions could be when a larger customer base requires a higher percent of available water to cover water system withdrawals.

Much of the growth over the last few decades occurred along the Piedmont Urban Crescent, the Interstate 40 and Interstate 85 corridors between Raleigh and Charlotte. A recent tread is for new growth to spread out from these urban centers into the surrounding countryside and neighboring small towns. The metropolitan centers have developed extensive and reliable water supplies and distribution systems to meet community needs. The movement of people out from the urban centers is putting increased stress on the water systems in these smaller communities. With the prime reservoir sites having been developed in previous decades, many supporting our urban centers, there are few easily developed water supply sources available for these smaller dispersed community water systems to expand their supplies. As our population continues to grow many communities will face significant challenges, especially with finances and limited local resources, as they struggle to meet growing demands for water.

The Division of Water Resources is working toward developing long-range water demand projections and availability analysis for the river basins in the state. Community water systems could do much to minimize the impacts of water shortages on their systems by improving the efficiency with which water is used and developing water shortage response plans. Local Water Supply Plan data show that unaccounted-for water is a serious problem for many systems, some being unable to account for almost half of the finished water they produce.

Local water policies that allow unrestricted use of drinking water for irrigation commonly face their highest demands when their available supplies are the lowest and experience inflated demands for drinking water that speed the obsolescence of existing treatment facilities and supplies. By adopting policies that encourage efficient use of water local governments could extend the useful life of their existing infrastructure and accommodate more growth with existing supplies.

The impacts of water shortages can be mitigated by preparing ahead for when and how to respond. A Water Shortage Response Plan establishes a priority ranking of types of water use and a protocol for when to begin and end reductions in water use. Developing a plan outside of an emergency situation and with customer input gives customers and local officials guidance to recognize when a shortage is developing and a community-developed plan for how to respond, making it more difficult to be caught unaware of a developing crisis. The Division will be placing increased emphasis on unaccounted-for water and water shortage response planning when reviewing 2002 Local Water Supply Plans.

REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION ON THE NORTH CAROLINA UNDERGROUND STORAGE TANK PROGRAM INCLUDING THE PAY-FOR-PERFORMANCE INITIATIVE

A: The Universe of Underground Storage Tanks

1. In North Carolina, there are 12,147 UST facilities which have 34,030 tanks.

2. These facilities are owned by 5,406 owners.

3. Of these 34,030 tanks, 31,309 are regulated and 2,721 are commercial heating oil tanks.

4. There are also an estimated 250,000 home heating oil tanks in the state. These are unregulated tanks.

B: The UST Program's Corrective Action Progress

1. Since the programs inception, we have recorded 17,335 incidents of leaking tank systems.

2. We have closed 8,412 of these incidents.

3. Presently, we are dealing with 8,923 active incidents: 2,595 are High-Risk; 1,219 are Intermediate-Risk; 2,066 are Low-Risk; 2,416 are Unconfirmed-Risk; and 627 are Default Low-Risk.

4. Each month, we add about 78 new releases. Right now, the majority of these new releases (about 65%) are home heating oil tanks.

5. Default Low-Risk sites are a special category of Unconfirmed-Risk sites. We began evaluating these sites in June 2000. At that time, there were 2,840 such sites. Now, there are only 637 left to evaluate, which should be completed within the next 12 months.

6. In addition, there have been 5,705 "clean closures" of tank systems. These were closures where there was no release of petroleum.

7. We have 38 incident managers in the seven regional offices. Together with the seven regional supervisors, we have 43.5 FTE working on UST release incidents. Since the bulk of the work is being done on High-Risk, Intermediate-Risk and Unconfirmed-Risk sites, each incident manager works on about 158 sites.

C: The UST Program's Compliance Progress

1. We have 13 inspectors to assure compliance of the 12,147 UST facilities, or an average of 934 facilities per inspector.

2. Typically, each inspector can inspect one facility per day, including the inspection, follow-up meetings with the facility, data entry, reports, and enforcement. That means, at present, we can inspect each facility once every four years. Right now, our compliance rate is 68%. Our goals are to increase our inspections to at least once every two years and to increase the compliance rate to 90%.

3. We are taking several steps to increase both the inspection rate and the compliance rate. We have adjusted the 13 regional areas to even out the inspector workload, and we have home-based the inspectors to reduce their travel time to facilities. We are focusing on faster up-front training for new inspectors and follow-up training to ensure consistency. We are working with facility owners, equipment contractors, and consultants to educate them about the requirements to prevent tank system releases. We are assisting some tank owners in the organization of their certifications and records so that inspection time is shortened.

D: The Commercial Fund

1. Since the inception of the Commercial Trust Fund in 1988, we have received about $335 million and disbursed about $332 million. 93% of that money has gone toward cleanup of releases from USTs. 7% of the money has been used for administrative expenses.

2. As of 3 January 2003, the balance of the Commercial Fund is $2,292,972. Claims pending against the Commercial Fund total $17,536,192.

3. In June 2002, in order to stabilize the Commercial Fund, we instituted a procedure to pay out of the Fund each month only an amount equal to the Fund receipts for the month. Claims against the Fund are paid in the order in which they are received. Right now, the time between a claim being approved and being paid is approximately 4 ½ months.

4. On average, 154 claims are made against the Commercial Fund each month. The amount of claims vary widely, but usually fall between $500,000 and $3,000,000.

E: The Non-Commercial Fund

1. Since the inception of the Non-Commercial Trust Fund in 1988, we have received about $69 million and disbursed about $66 million. Again, 93% of that money has gone toward cleanup of releases from USTs. 7% of the money has been used for administrative expenses.

2. As of 3 January 2003, the balance of the Non-Commercial Fund is $2,966,433. Claims pending against the Non-Commercial Fund total $4,849,326.

3. On average, 79 claims are made against the Non-Commercial Fund each month. The amount of the claims is usually in the $100,000 to $500,000 range.

4. If the present trend of claims continues against the Non-Commercial Fund, we expect to institute the same stabilizing procedure this spring. Right now, the time between claim approval and claim payment in the Non-Commercial Fund is short, but it is widening rapidly.

F: Program Improvements to Increase Fund Viability

1. Where possible, adjust remediation policies to lower remediation costs. We have already done this by limiting some analytical procedures and limiting some Low-Risk site excavations. We are considering modifying the over-excavation policy and eliminating some site assessment steps.

2. Introduce legislation to add a co-pay requirement and eliminate the deductible requirement for tank owners. This will keep tank owners fiscally involved in the entire remediation process, not just up to a deductible amount, and lower costs by having tank owners watch costs carefully.

3. Introduce legislation to phase in secondary containment for all regulated tank systems. If we can catch releases before they reach the soil or ground water, we can eliminate a large portion of the remediation costs.

4. Continue trying to institute Pay-For-Performance.

   On October 15, 2001, House Bill 1063 was enacted, which gave the UST Program the authority to allow performanced-based cleanups of UST sites. Sites selected for the pilot program will be posted for competitive bidding in the North Carolina Interactive Purchasing System. A performance-based contract will be awarded to the qualified environmental services firm that submits the lowest, technically qualified bid for an acceptable remedial proposal for the advertised site. A series of milestones (generally percentage reductions in contaminant levels in the soil and the ground water) must be achieved before payments are made from the Commercial or the Non-Commercial Funds.

On November 2, 2001, the Division of Waste Management met with representative of the Professional Engineers of North Carolina, the Consulting Engineers Council of North Carolina, the North Carolina Board for the Licensing of Geologists, and the North Carolina Petroleum Marketer's Association to develop a temporary rule. A follow-up meeting on November 9, 2001 resulted in further refinement of the rule and the discussions of the contract and bidding procedures proposed for use with the rule.

The temporary rule was presented to the Groundwater Committee of the Environmental Management Commission (EMC) on December 12, 2001, who voted for a full EMC review in February 2002. On February 14, 2002, the EMC approved the publication of the temporary rule in the North Carolina Register. The temporary rule was published for public comment between March 15 and April 15, 2002 in Volume 16, Issue 18, page 2,019 of the NC Register. No comments were received. The EMC adopted the temporary rule on May 14, 2002.

The permanent rule was published for public notice in August 2002 and went to public hearing on 18 November 2002. No comments were received. On December 12, 2002, the EMC approved the permanent rule, and on December 20, 2002, the rule package was presented to the Rules Review Commission (RRC). Comments were received from the RRC during the week of January 6. One minor change was made and the package was resubmitted to the RRC this week. If approved by the RRC, the permanent rule will be effective when approved by the General Assembly, probably in August 2003.

We have been unable to implement any PFP remediations of regulated USTs since the law only allows us to use 50% of any funds from the Commercial Fund that are unobligated at the beginning of a quarter. Since we have $17.5 million in claims and $2.3 million in the Commercial Fund, we do not have unobligated money at the beginning of any quarter.

We are continuing to pursue implementation of PFP using the Non-Commercial Fund. The use of PFP is voluntary on the part of the tank owner. We have sent out approximately 100 letters to unregulated tank (home heating oil) owners who were planning remediations explaining the benefits of this program (having the Division do all the contracting, saving money in the Fund). So far, we have had no responses.

Appendix C - LUSTs closed out 7/1/88-6/30/02

EXECUTIVE SUMMARY

The Department of Environment and Natural Resources is required to prepare a semi-annual report on the status of leaking petroleum underground storage tanks.

From July 1 2001 through June 30, 2002, the Underground Storage Tank Program received reports of 1,045 releases or discharges to the environment. During the same time period, 732 sites were closed. A total of 8,585 sites currently exist in North Carolina. Of that number, approximately 84 percent are commercial and 16 percent are non-commercial.

Expedited claim reviews began in July 1, 2001. The increase in claims processed nearly doubled the amount expended from the Commercial Trust Fund in the first six months. This increase continued through June 30, 2002 although revenues remained steady. The precipitous drop in funds available for reimbursement caused the section to begin reimbursing only when funds are available for that purpose. Please see the Recommendations section for suggestions to stabilize the revenue stream.

Pay-for-performance cleanups were adopted by temporary rule on May 14, 2002. This process differs from the standard in that site contracts are awarded by competitive bid and payments are made only when milestones specific, measurable reductions in contaminant levels are met. PFP programs in Florida have reduced costs 66 percent and lowered them by 50 percent in South Carolina. The section looks forward to implementing this new process.

Program Summary

The Division of Waste Management's UST Section in DENR administers North Carolina's underground storage tank program. The UST Section enforces UST regulations and manages funds used to perform cleanups of petroleum UST discharges or releases. The program was initiated in 1988 in response to growing reports of USTs leaking petroleum into soil and drinking water supplies. Funding for the program has been provided by the Commercial and Noncommercial Trust Funds, the Groundwater Protection Loan Fund, the Federal UST Regulatory Grant and the Federal Leaking UST Fund.

This is the summary of the statistics described in this report for the period July 1, 2001 through June 30, 2002.

Commercial Fund Revenues	$27,124,210
Commercial Fund Total Expenditures	$39,269,690
Noncommercial Fund Revenues	$ 6,620,808
Noncommercial Fund Total Expenditures	$10,096,076
Petroleum UST Incidents - Reported	1,045
Petroleum UST Incidents - Closed Out	732

This is the summary of the statistics for the entire history of the UST program (7/1/88 -6/30/02).

Commercial Fund Revenues	$319,795,285
Commercial Fund Total Expenditures	$315,915,347
Noncommercial Fund Revenues	$ 65,685,246
Noncommercial Fund Total Expenditures	$ 59,709,964
Petroleum UST Incidents - Reported	16,550
Petroleum UST Incidents - Closed Out	7,965

As of June 30, 2002, the status of the Commercial and Noncommercial Funds was:

Commercial Fund Balance	$3,958,556
Commercial Fund Claims Pending	$6,606,996
Noncommercial Fund Balance	$5,977,277
Noncommercial Fund Claims Pending	$2,004,723

The initiation of expedited claim reviews beginning May 24, 2001 has contributed to an increase in payments from the Commercial Fund. A significant backlog of pending claims was processed and, as a result, reimbursement costs nearly doubled during the six month period between July 1, 2001 and December 31, 2001. Payment increases continued during the following six-month period from January 1, 2002 through June 30, 2002, while revenues remained steady. An evaluation of the claims paid during the twelve month period from July 1, 2001 through June 30, 2002 indicate a significant increase in payments for costs associated with comprehensive site assessments and corrective action plans. This is partly due to re-examining low or undetermined risk sites and an increase of enforcement efforts. Beginning on June 17, 2002, reimbursements from the Commercial Fund have only been made as funds are available. The ability to cover all obligations by the Commercial Fund will continue to be closely monitored during FY 2002 - 2003 and recommendations will be made to address the shortfall.

The Noncommercial Fund still appears to be able to meet all obligations based on the current rate of claims submitted. However, the Noncommercial Fund balance is decreasing. North Carolina General Statute 119-18(b) states that if the amount of revenue in the Noncommercial Fund at the end of the month is at least $5 million, one half of the motor fuel inspection tax must be credited to the Commercial Fund and one half must be credited to the Noncommercial Fund. If the amount of revenue in the Noncommercial Fund at the end of the month is less than this threshold amount, all of the inspection tax will be credited to the Noncommercial Fund. The ability to cover all obligations by the Noncommercial Fund will be closely monitored during the financial year of 2002 - 2003.

FUNDING FOR THE UNDERGROUND STORAGE TANK PROGRAM

Program funding is provided by revenues from the Commercial and Noncommercial Trust Funds and the Groundwater Protection Loan Fund. The Federal UST Regulatory Grant and the Federal Leaking UST Fund are provided by the Environmental Protection Agency. Of the 99 staff positions assigned to the UST program, state revenue funds 68 positions and 31 are supported by federal grants.

Commercial and Noncommercial Trust Funds

The Leaking Petroleum Underground Storage Tank Cleanup Act of 1988* established two separate funds: the Commercial Trust Fund and the Noncommercial Trust Fund. Both may be used to reimburse eligible UST owners, operators and landowners for reasonable and necessary costs incurred as a result of environmental cleanup and third party liability claims. Additionally, both funds enable UST Section staff to:

- record and track UST release incidents;
- register and permit commercial USTs, manage a database and receive annual UST operating fee payments;
- identify responsible parties;
- provide technical assistance to tank owners and operators;
- inspect USTs to ensure compliance with UST regulations;
- monitor site cleanups;
- review site assessments and corrective action plans;
- evaluate innovative assessment and cleanup technologies;
- review reimbursement claim procedures;
- manage contracts for cleanups designated as "State Lead";
- inspect and monitor land applications of contaminated soil; and
- identify and evaluate abandoned petroleum USTs.

The UST Section has the authority to contract for the cleanup of petroleum UST incidents if the owner or operator cannot be identified or located, if the owner or operator is financially unable to perform cleanup, or if the owner or operator refuses to perform the required cleanup. In the latter case, the section is authorized by general statute to recover costs incurred during assessment and cleanup activities.

Sources of funding for the Commercial Trust Fund include:

- a motor fuel and kerosene inspection tax,
- an excise tax (0.297 cents per gallon) on motor fuel and kerosene sales,
- annual payment of UST operating fees,
- costs recovered from UST owners and operators for State Lead sites,
- loan collection and interest for the Groundwater Protection Loan Fund, and
- interest earned on the account.

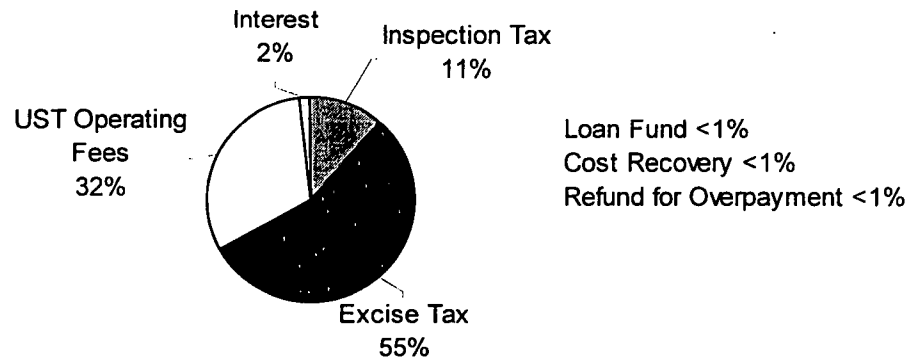
* General Statute 143-215.94A et.seq.

Owners and operators are required to pay annual operating fees to receive operating permits and to be eligible for the Commercial Fund. Annual fees for commercial USTs began at a rate of $30 for tanks with a capacity equal to or less than 3,500 gallons (small tanks) and $60 for tanks with a capacity in excess of 3,500 gallons (large tanks). Tank fees increased annually from 1989 to 1993. From 1993 to 1997, fees were $150 for small tanks and $225 for large tanks. Beginning January 1, 1997, annual fees were increased to $200 for commercial USTs with a capacity equal to or less than 3,500 gallons and $300 for commercial USTs with capacity in excess of 3,500 gallons. Revenues received for the Commercial Fund for the twelve-month period from July 1, 2001 to June 30, 2002 were approximately $21.1 million (Table 1). The relative contributions to the Commercial Fund from each of the funding sources are illustrated in Figure 1.

Table 1 - Commercial Trust Fund Revenues
7/1/01 - 6/30/02

Motor Fuel & Kerosene Inspection Tax	$ 3,082,427
Motor Fuel & Kerosene Excise Tax	$ 14,850,470
UST Operating Fees	$ 8,525,252
State Lead Cost Recovery	$ 38,189
Interest	$ 529,022
Loan Fund Collection and Interest	$ 98,847
Total Commercial Revenues	**$ 27,124,207**

Figure 1 - Commercial Fund Revenue Sources



Funding for the Noncommercial Trust Fund is provided by a motor fuel and kerosene inspection tax and excise taxes (0.047 cents per gallon) on kerosene and motor fuel sales.* Owners and operators of noncommercial USTs are not required to pay annual operating fees. Revenues received for the Noncommercial Fund for FY 2001-02 were approximately $6.6 million (see Table 2, page 3).

* House Bill # 681 of 1993

Table 2 - Noncommercial Trust Fund Revenues
7/1/01 - 6/30/02

Motor Fuel & Kerosene Inspection Tax	$ 3,082,427
Motor Fuel & Kerosene Excise Tax	$ 2,346,259
Interest	$ 407,739
Inter-Agency Transfer (Circle K)	$ 784,382
Total Noncommercial Revenues	**$ 6,620,808**

North Carolina General Statute 119-18(b) states that if the amount of revenue in the Noncommercial Fund at the end of the month is at least $5 million, one half of the motor fuel inspection tax must be credited to the Commercial Fund and one half must be credited to the Noncommercial Fund. If the amount of revenue in the Noncommercial Fund at the end of the month is less than this threshold amount, all of the inspection tax will be credited to the Noncommercial Fund.

Groundwater Protection Loan Fund

The Groundwater Protection Loan Fund Program was created in 1991.** It provided financial assistance to owners of commercial USTs for replacing or upgrading their tanks to meet the performance standards required for all USTs by December 22, 1998. Administrative rules implementing the program were adopted by DENR and became effective December 1, 1992. Revenues for the fund were generated through a 0.0025 cent (one quarter of one cent) per gallon motor fuel excise tax received from January 1, 1992 through December 31, 1994.

Federal UST Regulatory Grant Program

This program promotes compliance with UST regulations. It provides the state's UST Section with $186,675 per year to fund three positions in the DWM central office. The positions provide technical assistance to the owners and operators of USTs, develop materials, conduct educational activities, train regional staff and conduct UST inspections.

Federal Leaking UST Fund

The Federal Leaking UST Trust Fund is used to clean up petroleum contamination from leaking USTs, provide potable water to affected third-parties, perform emergency activities, relocate residents affected by leaking USTs and conduct enforcement activities. This fund is limited to USTs regulated by federal agencies, primarily commercial tanks used for storing motor fuels. Tanks used for heating oil and those used for farm or residential uses (1,100 gallons capacity or less) are not covered by this fund.

Individuals (i.e., owners/operators) do not have access to the fund. Only the federal government and states with cooperative agreements with the EPA can draw on the fund. It may be used in situations when: (1) the responsible party cannot be identified; (2) the responsible party is financially unable to pay for the cleanup; or (3) the responsible party is unwilling and refuses to undertake assessment and/or cleanup actions.

**Session Laws 1991, c. 538, s. 25 - G.S. 143-215.94P

Since the state's UST program began in 1988, the Federal Leaking UST Fund has made 17 awards totaling $34,699,569 to the state's UST Section. As of June 30, 2002, the state spent $33,368,411 from these awards. Of this amount, $15,574,330 was spent for cleanup-related activities and $3,202,354 for enforcement actions. Administrative, operating, travel and equipment costs totaled $14,502,540.

The program is obligated to seek recovery of all costs incurred during state lead cleanups. As of June 30, 2002, the UST Section had recovered $1,518,496 in federal cleanup money through cost recovery actions. Of this amount, $729,532 came from the North Carolina Commercial Fund for sites determined eligible for Commercial Fund coverage after cleanup activities had begun. Cost recovery funds in the amount of $1,382,228 were returned to the Federal Trust Fund to be used for additional corrective action expenditures.

The EPA approved $2,033,793 for North Carolina from the Leaking UST Fund for FY 2001-2002.

PETROLEUM UST INCIDENTS

Discharges or releases from petroleum USTs are reported to DENR regional offices where they are added to an incident management database. Table 3 (see page 5) lists the number of incidents reported and closed out in each region during the twelve-month period from July 1, 2001 through June 30, 2002. It also shows the number of incidents reported and closed out since the UST program began in 1988.

Beginning January 2, 1998, the UST Section implemented risk-based corrective action rules for petroleum UST incidents. Discharges or releases under these rules receive a risk classification of "high," "intermediate," or "low" based on the potential threat to human health and the environment. Of the total number of UST incidents closed since 1988, 56 percent were closed following implementation of Risk-Based Corrective Action. The total number of open incidents has generally increased since 1988; however, recent data indicates the trend may be leveling off (see Figure 2, page 5).

Table 3 - Petroleum UST Incidents by Region

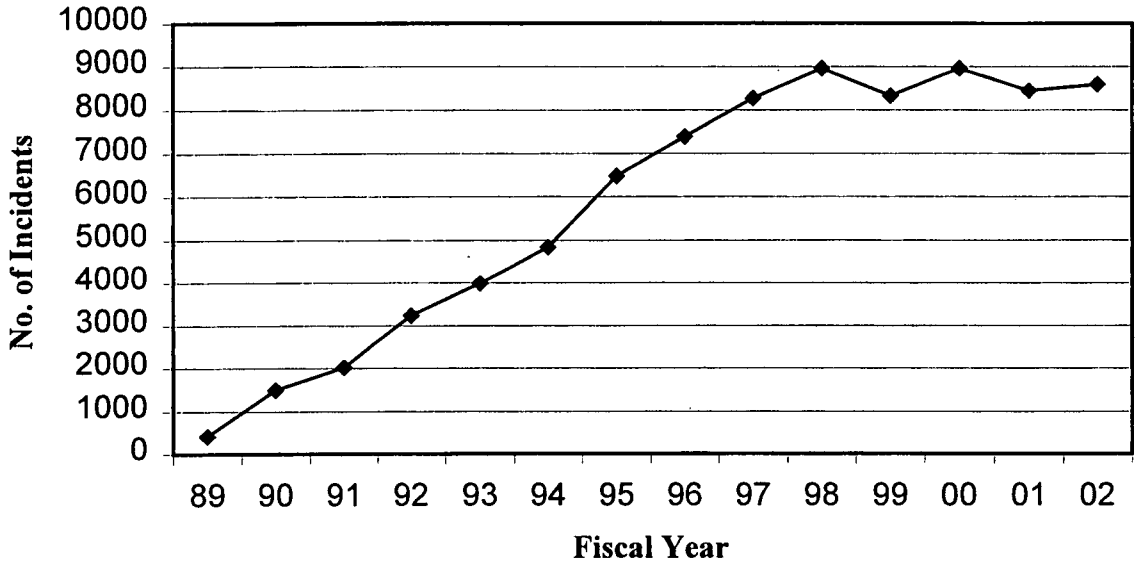
REGION	7/1/01 - 6/30/02		7/1/88 - 6/30/02	
	Reported	Closed	Reported	Closed
Asheville	82	27	1570	998
Fayetteville	43	37	978	472
Mooresville	163	155	3,357	1,641
Raleigh	249	165	3,467	1,472
Washington	174	133	2,113	986
Wilmington	101	65	1,278	463
Winston-Salem	233	150	3,787	1,933
TOTAL	**1,045**	**732**	**16,550**	**7,965**

Total reported releases affecting groundwater that have been closed out	1,431
Total reported releases closed out since implementation of RBCA*	4,466
Total remaining open sites	8,585
Estimated open commercial sites**	7,211
Estimated open noncommercial sites**	1,374

* Risk-based corrective action implemented 1/2/98.

** Based on an average of past data (85%) and the current twelve month period (76%), approximately 84 percent of the reported releases are from commercial sites, while the other 16 percent are from noncommercial sites.

Figure 2 - Open UST Incidents



RECEIPTS AND DISBURSEMENTS: COMMERCIAL AND NONCOMMERCIAL TRUST FUNDS AND GROUNDWATER PROTECTION LOAN FUND

Commercial and Noncommercial Funds

UST owners, operators and landowners may submit reimbursement claims for reasonable and necessary costs incurred during environmental assessment and cleanup activities. Claims may be submitted if the eligibility requirements for the trust funds are met. Deductibles that must be met before receiving reimbursement from the Commercial Fund range from $20,000 to $75,000. Noncommercial Fund deductibles are $0 for UST owners and operators, and $5,000 for landowners. Table 4 lists the receipts and disbursements by fiscal year for both funds for the period July 1, 1988 to June 30, 2002.

Table 4 - Receipts & Disbursements for Cleanups
7/1/88 - 6/30/02

FISCAL YEAR	RECEIPTS		DISBURSEMENTS[1]	
	Commercial	Noncommercial	Commercial	Noncommercial
FY 88-89	$ 2,337,685	$ 0	$ 14,768	$ 0
FY 89-90	5,773,632	2,905,035	79,080	0
FY 90-91	7,330,573	2,934,347	1,616,760	564,206
FY 91-92	13,484,008	3,018,344	4,409,229	2,143,155
FY 92-93	18,032,784	7,693,288	9,651,948	4,069,497
FY 93-94	24,438,966	3,404,086	22,904,802	2,012,312
FY 94-95	56,037,135[2]	5,194,725	37,405,510	2,900,368
FY 95-96	28,178,768	5,215,550	44,060,639	5,029,109
FY 96-97	28,564,034	5,587,781	44,163,273	5,924,799

FY 99-00	27,178,623	5,636,563	22,820,069[3]	5,028,505
FY 00-01	27,240,303	5,811,666	24,566,132[4]	7,890,618[5]
FY 01-02	27,124,210	6,620,808[6]	36,872,426	9,182,320
TOTAL	**$319,795,285**	**$ 65,685,246**	**$294,936,180**	**$ 51,390,085**

[1] Does not include administrative costs.
[2] Commercial receipts for FY 94-95 included $31,288,889 that was transferred from the Groundwater Protection Loan Fund.
[3] Adjustment due to a transfer from the Commercial Fund to the Federal Trust Fund of $288,117 as a cleanup expenditure rather than as an administrative cost.
[4] $33,866 transferred to Federal Trust Fund as a cleanup expenditure.
[5] $2 million transferred out of Noncommercial Fund to the state's General Fund.
[6] Includes transfer of $784,382 from Circle K Settlement Fund.

The administrative budget for the state-funded portion of the UST program is derived from the Commercial and Noncommercial Funds. Table 5 lists past administrative expenditures since the beginning of the UST program.

Table 5 - Administrative Expenditures

Fiscal Year	Commercial	Noncommercial
FY 89-90	$ 201,255	$ 201,254
FY 90-91	547,595	547,595
FY 91-92	517,221	517,221
FY 92-93	601,687	601,686
FY 93-94	694,424	694,423
FY 94-95	666,270	666,270
FY 95-96	2,322,632	783,684
FY 96-97	2,623,339	801,143
FY 97-98	2,530,036	667,724
FY 98-99	2,567,668	620,574
FY 99-00	2,579,540*	570,738
FY 00-01	2,730,236	733,811
FY 01-02	2,397,264	913,755
TOTAL	**$ 20,979,167**	**$8,319,878**

Incorporating the administrative costs into receipts and cleanup disbursements yields these Commercial and Noncommercial Fund balances:

Commercial Fund Balance (as of June 30, 2002)	**$ 3,958,556**
Noncommercial Fund Balance (as of June 30, 2002)	**$ 5,977,277**

Groundwater Protection Loan Fund

After the Groundwater Protection Loan Fund was created, 11 North Carolina banks agreed to administer the loan program. As of June 30, 1995, four loans totaling $1,228,350 had been closed. After this date, remaining funds of $31,288,889 were deposited into the Commercial Trust Fund. Loan repayments are also deposited into the Commercial Fund. During the twelve-month period ending June 30, 2002, $67,903 was repaid. Total receipts for the Loan Fund since its inception in January 1992 are $32,994,840.

* Adjustment due to a transfer from the Commercial Fund to the Federal Trust Fund of $288,117 as a cleanup expenditure rather than as an administrative cost.

CLAIMS AGAINST THE CLEANUP FUNDS

Claims against both the Commercial and Noncommercial Funds are processed on a "first-come, first-served" basis. The status of all claims requesting reimbursement from both funds that were received as of June 30, 2002 is presented in Table 6. These claims only include costs claimed to date, and do not represent the total costs for cleanups.

UST Section staff have supervised contract cleanups at 277 commercial and noncommercial sites (Table 6, 213 commercial and 64 noncommercial). Currently, DENR has four contracts with environmental engineering/geology firms that perform a range of assessment and cleanup actions. The term of these contracts is 18 months with an option to renew for an additional 18 months. Two contracts expire in August 2002 and two contracts expire in November 2002.

Table 6 - Claims Against the Cleanup Funds
7/1/88 - 6/30/02

	Commercial Fund		Noncommercial Fund	
	Number	Cost	Number	Cost
Claims Paid	18,265	$288,334,564	5,617	$ 47,927,270
Incidents Denied Totally [1]	33	$ 4,573,040	4	$ 59,845
Claims Denied Partially [2]	11,134	$ 57,301,779	2,860	$ 7,273,497
Total Deductibles Paid	-------	$ 58,585,814	-------	$ 255,515
Claims Pending	571	$ 6,606,996	205	$ 2,004,723

[2] Excessive or undocumented costs
[3] State Lead actions undertaken or completed

COMMERCIAL AND NONCOMMERCIAL FUND BALANCES AND PROJECTED NEEDS

Commercial Fund

As of June 30, 2002, the Commercial Fund balance was $3,958,556 with pending claims of $6,606,996 (see Figure 3, Page 9). Since January 1, 2001, the difference between the fund balance and the pending amount has decreased (see Figure 4, Page 9). During the six-month period from July 1, 2001 to December 2001 expedited reviews were initiated in an effort to reduce claim review time. While the claim review time has been reduced, the result has been an increase of nearly double the claim reimbursement payments during the six-month period of July 1, 2001 to December 31, 2001. Expedited reviews have continued during the period January 1, 2002 through June 30, 2002. Review of the claims paid beginning on July 1, 2001 indicate that a significant increase of payments are being made for comprehensive site assessments and corrective action plans. The increase in CSAs and CAPs appears to be related to required work

for sites that were formerly under suspension and have been re-evaluated (low and undetermined risk sites). Claim amounts continue to increase while revenues remain steady.

Figure 3 - Commercial Fund Balance and Claims Pending

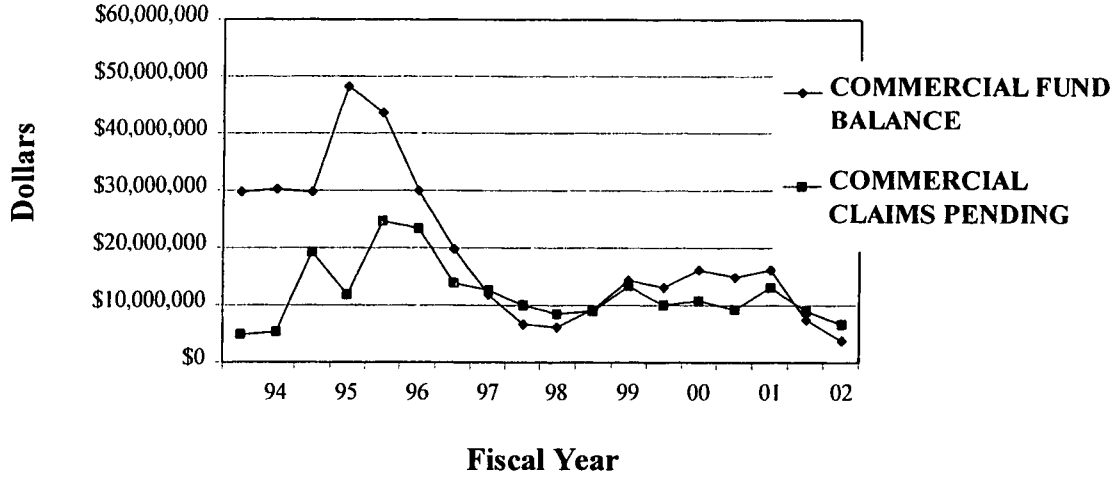

Figure 4 - Commercial Fund Balance Minus Claims Pending

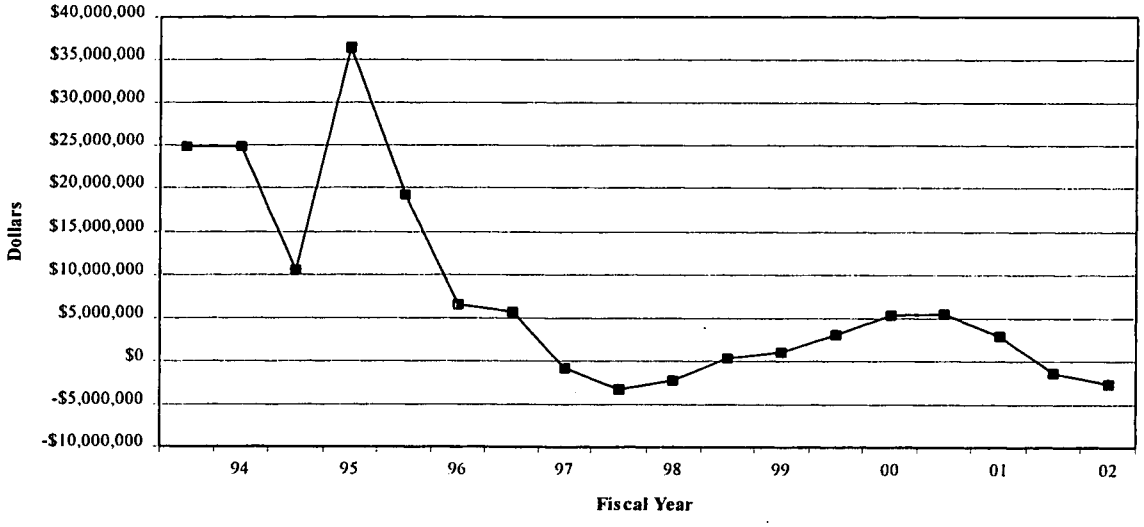

Commercial Fund revenues should remain relatively steady while claim costs and contracted cleanups will likely increase due to the continuation of expedited reviews.

Table 7 - Total Commercial Fund Revenues and Expenditures
7/1/01 – 6/30/02

Total Commercial Revenues (see Table 1, page 2)	**$27,124,207**
Total Claims and Contracted Cleanups	$36,872,426
Administrative Costs	$ 2,397,264
Total Commercial Expenditures	**$39,269,690**

Another factor, which may effect an increase of demands to the Commercial Fund in the future, is pay-for-performance based cleanups. On October 1, 2001, the General Assembly ratified House Bill 1063, which allows responsible parties to participate in the pay-for-performance program on a voluntary basis. Pay-for-performance is a reimbursement method that requires cleanup goals to be met before payments can be made to environmental consultants. This reimbursement method requires the Trust Fund to obligate the contracted cleanup costs. Pay-for-performance obligations may initially place a higher demand on the Trust Fund, but should greatly decrease the costs of cleanups and thus result in a lesser burden to the Trust Fund.

Another factor that may effect future demands on the Commercial Fund is third-party claims. There is currently one pending third-party claim under review which has the potential to place a burden of many hundred thousands of dollars on the Commercial Fund. Other third party claims may be planned that have not been submitted for review.

After UST operating fees were raised on January 1, 1997, revenue from this funding source declined through the end of FY 1998-99 (see Table 8). This decrease was likely due to the reduction in the number of registered USTs that occurred as a result of the federal 1998 upgrade regulations. The number of registered USTs continued to decrease during the period from July 1, 2001 to June 30, 2002. However, UST operating fees have remained stable.

Table 8 - Commercial UST Population and Operating Fee Revenue

Fiscal Year	No. of Commercial USTs Billed	Operating Fee Revenue
FY 1996-97	37,776	$ 10,839,975
FY 1997-98	36,563	$ 10,008,917
FY 1998-99	34,428	$ 8,697,468
FY 1999-00	33,558	$ 8,844,093
FY 2000-01	33,776	$ 8,464,019
FY 2001-02	32,839	$ 8,553,715

At present, approximately 7,200 commercial incidents have yet to be closed out. With minor work performed in accordance with the RBCA rules, many of these sites may receive "no further action" letters. However, some will require additional assessment and corrective action that will subsequently result in additional demands on the Commercial Fund.

Data tracking improvements are being made to the UST incident management database. These changes will enable the UST Section to better predict the number of incident closures and project Commercial Fund expenditures.

UST systems pose a substantial threat to human health and the environment. Over 1,200 leaks are reported each year. Maintaining the quality of North Carolina's drinking water depends on preventing releases to the environment. Direct education and technical assistance for tank owners and operators is critical. Only education and assistance ensure responsible handling of petroleum products, including methyl tertiary-butyl ether, and early detection in the event of a leak.

North Carolina currently has about 31,620 active regulated USTs at 9,900 facilities. Of that number, we estimate 40 to 50 percent are located within 500 feet of both domestic and public drinking water supplies. Our inspection data show that over 30 percent of tank owners and operators do not comply with UST regulations. These regulations cover proper operation and maintenance, with an emphasis on leak detection. If we are to preserve the quality of North Carolina's drinking water, improving compliance must be a future priority.

Noncommercial Fund

As of June 30, 2002, the Noncommercial Fund balance was $5,977,277. The total for pending claims stood at $2,004,723. Based on past data, the present financial condition of this fund appears sound (see Figure 5), but will be carefully monitored for anticipated increased demands.

Figure 5 - Noncommercial Fund Balance and Claims Pending

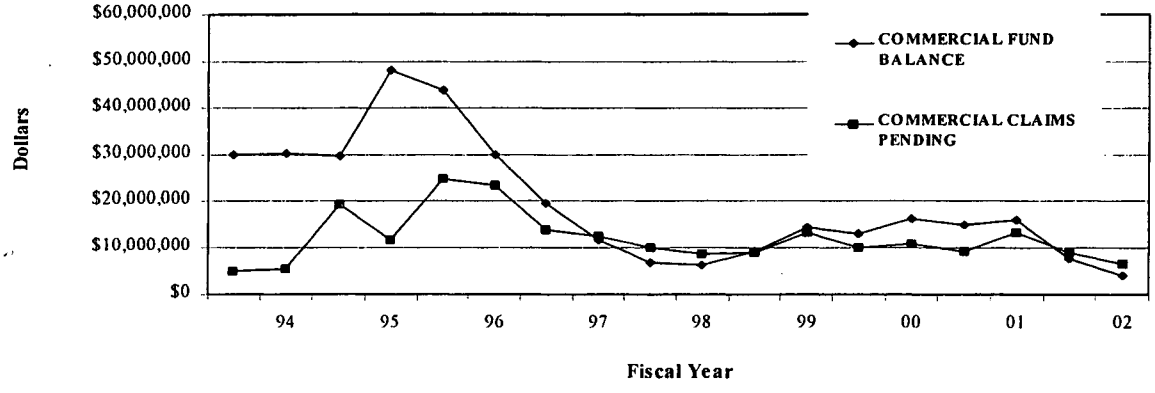

Figure 6 - Noncommercial Fund Balance Minus Claims Pending

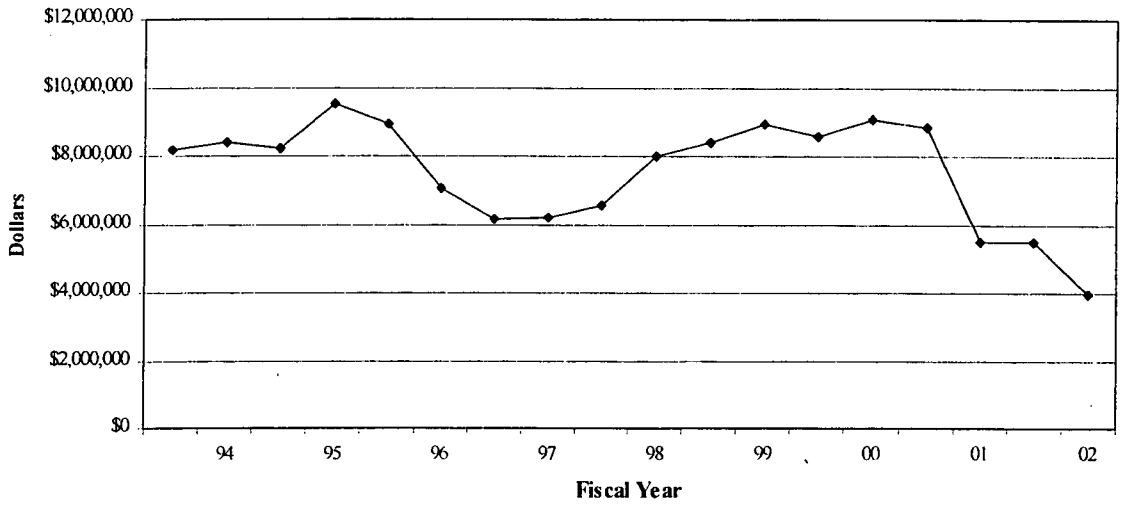

Table 9 - Total Noncommercial Fund Revenues and Expenditures
7/1/01-6/30/02

Total Noncommercial Revenues (see Table 2, page 3)	**$6,620,808**
Total Claims and Contracted Cleanups	$ 9,182,321
Administrative Costs	$ 913,755
Total Noncommercial Expenditures	**$10,096,076**

Table 10 shows the estimated cost to complete cleanups for noncommercial incidents reported from July 1, 2001 to June 30, 2002. It should be noted, however, that cleanups can easily extend over several years and costs may vary greatly.

Table 10 - Estimate of Cleanup Costs for Noncommercial Incidents
Reported 7/1/01 - 6/30/02

Region	Incidents*	Total Estimated Cleanup Cost**
Asheville	30	$ 1,875,000
Fayetteville	16	$ 1,000,000
Mooresville	60	$ 3,750,000
Raleigh	92	$ 5,750,000
Washington	64	$ 4,000,000
Wilmington	37	$ 2,312,500
Winston-Salem	86	$ 5,375,000
Total	**385**	**$24,062,500**

* Calculations of the last 12-month period indicate that approximately 37 percent of reported releases are from noncommercial sites.

** An average cost of $62,500 is used as an estimate of total cleanup costs for noncommercial sites.

PAY-FOR-PERFORMANCE

On October 15, 2001, House Bill 1063 was enacted by the North Carolina General Assembly. This bill gives the Division of Waste Management's Underground Storage Tank program the authority to allow performance-based cleanups of sites where petroleum has been discharged or released from underground storage tanks. Sites selected for the pilot program will be posted for competitive bidding in the North Carolina Interactive Purchasing System. A performance-based contract will be awarded to the qualified environmental services firm that submits the lowest, technically qualified bid for an acceptable remedial proposal for the advertised site. A series of milestones (generally percentage reductions in contaminant levels in the soil and groundwater) must be achieved before payments are made to the cleanup firm from the Commercial or Non-Commercial Fund.

On November 2, 2001, the Division of Waste Management convened a stakeholders workgroup consisting of representatives of the Professional Engineers of North Carolina, the Consulting Engineers Council of North Carolina, the North Carolina Board for the Licensing of Geologists and the North Carolina Petroleum Marketer's Association to develop a temporary rule. A follow-up meeting on November 9, 2001 resulted in the further refinement of the rule and the discussions of the contract and bidding procedures proposed for use with the rule.

The proposed temporary rule was presented to the Groundwater Committee of the Environmental Management Commission on December 12, 2001. It received a favorable vote to proceed to full commission review in February 2002. On February 14, 2002, the EMC voted to approve the publication of the temporary rule in the North Carolina Register. The temporary rule was published for public comment between March 15 and April 15, 2002 in Volume 16, Issue 18, page 2,019 of the NC Register. No comments were received. The Commission adopted the temporary rule on May 14, 2002.

RECOMMENDATIONS

Based on the results of this report, the UST Section makes the following recommendations for the Commercial and Noncommercial Trust Funds:

- Responsible parties of UST releases should continue to be encouraged to consider pay-for-performance cleanups at their sites. Pay-for-performance is a reimbursement method that requires cleanup goals to be met before payments can be made to environmental consultants. PFP programs in other states have dramatically reduced the costs for cleanups. Costs are down 66 percent in Florida and 50 percent in South Carolina. PFP also accelerates the rate of cleanups. The Department of Environment and Natural Resources will monitor the obligated costs for pay-for-performance contracts and the potential cleanup cost savings of the PFP program.

- Additional revenue should be made available for continued expedited payment of Commercial Fund claims.

- Establish a statute of limitations for filing claims. Because fund deductible amounts vary, we propose grouping all years with like deductibles (Example: releases detected 6/88-12/91 and 1/92-12/93) and assigning a common claim submittal deadline. The UST Section can inform its customers of the new deadline, and then provide one year for all claims to be prepared and filed. By learning more about outstanding claims, the UST Section can increase its ability to predict fund expenditures.

- The $5 million Noncommercial Fund floor which triggers revenue diversion from the Commercial Fund should be reduced to $2.5 million to more accurately reflect a typical month's demand. The remaining amount above the floor should be transferred to the Commercial Fund to assist with meeting this Fund's outstanding obligations.

1.0 Introduction

The North Carolina Parks and Recreation Trust Fund (PARTF) was established by the North Carolina General Assembly on July 16, 1994. The General Assembly gave an initial appropriation of $1 million to PARTF to fund improvements in state parks, to fund grants for local governments and to increase public access to the state's beaches. In 1995, the General Assembly dedicated funds from the excise stamp tax to the trust fund starting in FY 1996-97. The Parks and Recreation Authority, an eleven-member board, was also created to allocate funds from PARTF to projects in state parks and to grants for local governments.

The excise tax is the primary funding source for PARTF. The tax is levied on each "deed, instrument, or writing by which interest in real property is conveyed to another person." The tax is levied at the rate of one dollar on each $500 of the interest or property conveyed. Each county remits one-half of the proceeds, less the county's allowance for administrative expenses, to the state. Effective July 1996, the General Assembly (G.S. 105-228.30) stipulated that part of the state's share would be allocated to PARTF. Of the funds remitted, the Department of Revenue credits 75% to the Parks and Recreation Trust Fund and 25% to the Natural Heritage Trust Fund.

Pursuant to G.S. 113-44.15, the money from the Parks and Recreation Trust Fund are to be allocated as follows:

(1) Sixty-five percent (65%) for the State Parks System for capital projects, repairs and renovations of parks facilities, and land acquisition.

(2) Thirty percent (30%) to provide grants to local governments on a dollar-for-dollar basis to create or improve parks and recreational projects.

(3) Five percent (5%) for the Coastal and Estuarine Water Beach Access Program.

(4) No more than three percent (3%) may be used by the Department of Environment and Natural Resources (DENR) for the operating expenses associated with managing capital improvements projects, acquiring land, and administering the local grants program.

2.0 North Carolina Parks and Recreation Authority

The North Carolina Parks and Recreation Authority, an 11-member board that oversees the Parks and Recreation Trust Fund, was created by the General Assembly with the Authority's powers and duties becoming effective July 1, 1996. The Governor appoints three members, including the chairperson. The General Assembly appoints four members upon the recommendation of the President Pro Tempore of the Senate. The General Assembly appoints four members upon the recommendation of the Speaker of the House.

The Authority is charged with six powers and duties: to receive public and private donations and funds for deposit into the trust fund; to allocate funds for land acquisition; to allocate funds for capital projects; to solicit financial and material support; to develop effective support for parks and recreation; and to advise the Secretary of DENR on any matter he may refer to the body.

Members are appointed for three-year terms and may serve no more than two consecutive three-year terms. After serving two consecutive three-year terms, a member is not eligible for appointment to the Authority for at least one year after the expiration of the member's last term.

The 2001-2002 Parks and Recreation Authority members were:

Jonathan B. Howes, Chairman
Chapel Hill

Roy Alexander
Charlotte

Leslie Anderson
Asheville

Wendell Begley
Black Mountain

Harriet Farrior
Wallace

Eddie Holbrook
Cherryville

Walt Israel
Belmont

Ron Kincaid
Mount Gilead

Russell Robinson III
Greensboro

Kenneth Sadler
Lewisville

Todd Tilley
Hertford

The Parks and Recreation Authority held four meetings during fiscal year 2001-2002.

3.0 Parks and Recreation Trust Fund Revenue Summary

Table 3-1 shows the revenues received into the Parks and Recreation Trust Fund and the allocation of revenues by program for fiscal year 2001-2002.

Table 3-1
Parks and Recreation Trust Fund (PARTF)
Distribution of Revenues for Fiscal Year 2001-2002

Item	Subtotal	Amount	Percent
Public Beach and Coastal Waterfront Access Program		$1,073,746	5.00%
Local Governments Matching Grants Program		$6,312,011	29.39%
State Parks System		$13,676,026	63.68%
Capital Improvement & Renovation Projects	$9,573,218		
Land Acquisition	$4,102,808		
Administrative Expenses		$413,135	1.92%
Contract with N.C.S.U. Recreation Resources Service	$144,955		
Division of Parks & Recreation staff and Authority members	$268,180		
2001-2002 PARTF Revenues		**$21,474,918**	**100.00%**

Note: In fiscal year 2001-2002, $5 million was transferred from the Parks and Recreation Trust Fund to the General Fund to address the shortfall in the state's budget.

4.0 Local Government Matching Grants Program

4.1 Program Description

The Parks and Recreation Trust Fund (PARTF) program provides dollar-for-dollar grants to local governments. All counties, incorporated municipalities and public authorities (as defined in N.C.G.S. 159-7) are eligible for funding. Two or more local governments may apply jointly. Recipients can acquire land to use for public recreation or to protect the natural or scenic resources of the property. Recipients can also use a grant to build or renovate recreational and support facilities. All facilities must serve the general public.

In September, the Division of Parks and Recreation (DPR) mails a description of the PARTF program and a schedule to local governmental officials and parks and recreation directors. A local government can request a maximum grant amount of $250,000 in PARTF assistance with its grant application. The approved value of land that is donated to a local governmental unit or public authority may be applied to the 50% matching requirement.

The DPR provides assistance to local governments in several ways. In October, the PARTF staff conducts a workshop where local governments can learn about the program and how to complete an application. The workshop is presented simultaneously at University of North Carolina video conference sites. The DPR has a contract with Recreation Resources Service (RRS) at North Carolina State University. The staff of RRS can provide technical assistance to local governments who request help in planning projects and preparing grant applications. RRS has six consultants in regional offices across the state.

The Parks and Recreation Authority selects which applicants will receive a grant. The factors considered by the Authority as it selects recipients include, but are not limited to, the criteria contained in the PARTF scoring system, the population of the applicant, the geographic distribution of projects across the state, the presence or absence of other funding sources and compliance with prior grant agreements.

Applications are due January 31. The Parks and Recreation Authority meets in May to select recipients from PARTF revenues received for the first three-quarters of the fiscal year. The Authority meets in early July to select grant recipients from PARTF revenues received during the fourth quarter of the fiscal year.

4.2 Description of Applications and Grants

Sixty-one local governments submitted applications for consideration in fiscal year 2001-2002. The Parks and Recreation Authority reviewed all of the applications and awarded 37 grants for a total of $6,566,777. This amount is greater than the $6,312,011 in PARTF revenues that was available to award for fiscal year 2001-2002. The difference includes $317,634 returned by previous grantees who were unable to compete all or a portion of their projects.

Pursuant to G.S. 113-44.15, up to three percent in PARTF funds may be used by the Department of Environment and Natural Resources (DENR) for the operating expenses associated with managing capital improvements projects, acquiring land, and administering the local grants program. The current balance in the PART grants program for local governments is $62,810. This amount includes the unspent administrative funds.

Table 4-1 on the following page is a list of the projects approved for fiscal year 2001-2002. The table is organized alphabetically by county.

4.3 Geographic Distribution of Grants

The Parks and Recreation Authority considers the geographic distribution of funds across the state as one of the factors used in selecting grant recipients. After seven funding cycles, the Authority has awarded $40 million in PARTF grants to 263 projects in 93 counties across North Carolina.

Figure 4-1 (page 7) is a map showing the distribution of PARTF grants by county across North Carolina from 1995-2002.

Table 4-1 North Carolina Parks and Recreation Trust Fund Grant Recipients for Fiscal Year 2001-2002			
Sponsor	**County**	**Project**	**Amount**
Alexander	Alexander	Dusty Ridge Park	$50,000
Anson	Anson	Little Park Renovation and Development	$200,000
Archdale	Randolph	Creekside Park Expansion	$143,193
Asheville	Buncombe	Azalea Road Park Phase I	$249,165
Banner Elk	Avery	Charles B. VonCanon Fort Play Structure	$32,227
Bertie	Bertie	Bertie County Park	$250,000
Buncombe	Buncombe	Buncombe County Recreation Park	$250,000
Carolina Beach	New Hanover	Lake Park	$152,114
Cherokee	Cherokee	Cherokee County Pool and Wellness Center	$250,000
Concord	Cabarrus	Three Mile Branch Park	$230,856
Currituck	Currituck	Point Harbor Park	$250,000
Dare	Dare	Soccer / Football Complex	$80,885
Durham	Durham	Downtown Trail/Central Park	$200,695
Elon	Alamance	Elon Park	$250,000
Greenville	Pitt	River Park Nature Center	$250,000
Grifton	Pitt	Creekside Trail Park	$37,731
Guilford	Guilford	Northeast Park	$250,000
Laurel Park	Henderson	Little Laurel Green	$33,788
Liberty	Randolph	Freedom Park Improvements	$10,800
Lincolnton	Lincoln	Highland Drive Park	$250,000
Marion	McDowell	Cross Mill Community Park	$50,542
Mecklenburg	Mecklenburg	Rockwell Neighborhood Park	$170,331
Mount Gilead	Montgomery	Property Acquisition	$39,383
Nashville	Nash	J.W. Glover Park	$242,130
Oakboro	Stanly	Oakboro District Park	$250,000
Princeville	Edgecombe	Riverside Heritage Park	$165,750
Rocky Mount	Edgecombe	Stith Talbert Park Renovation	$250,000
Rolesville	Wake	Rolesville Town Park	$231,369
Rowan	Rowan	Nature Center Renovation	$250,000
Smithfield	Johnston	Smithfield Community Park -Phase IV	$250,000
Surf City	Pender	Surf City Community Park	$250,000
Surry	Surry	Fisher River Park Phase III	$83,160
Wade	Cumberland	Wade Park	$89,562
Watauga	Watauga	Watauga County Park	$250,000
Whitakers	Nash	Whitakers Town Park	$73,096
Wilmington	New Hanover	17th Street Park	$250,000
Wilson	Wilson	Toisnot Park Soccer Complex	$250,000
		Total	$6,566,777

5.0 State Parks Program

5.1 Land Acquisition

For fiscal year 2001-2002, the Parks and Recreation Authority approved land acquisition projects for the state parks system for a total of $4,102,808 (Table 5-1).

Table 5-1
North Carolina Parks and Recreation Trust Fund
Land Acquisition Projects Approved in Fiscal Year 2001-2002

Park	Acres	Description	Amount
Dismal Swamp State Natural Area	15	Funds to buy an easement to build a road that will give the Division an access to this state natural area and will allow for park management and the construction of facilities.	$25,000
Eno River State Park	825	PARTF money used to match a grant from the federal Land and Water Conservation Fund for the Eno Wilderness project. Project has extensive river frontage, significant natural communities and intact upland hardwood forests. This will be the largest single acquisition at the park.	$1,207,808
Eno River State Park	161	River corridor protection upstream of the Cabelands section of the park. Additional funds from the Natural Heritage Trust Fund and LWCF. Project contains extensive river frontage and significant natural communities.	$500,000
Lake Norman State Park	75	Land to improve boundary management on the north side of the park and to protect water quality of Norwood Creek, the main stream into the park's lake.	$450,000
Lumber River State Park	80	River corridor tracts across from the Pea Ridge Access of the park. Landowners wanted to sell to the state for the park.	$200,000
Merchants Millpond State Park	200	Entrance protection across from the picnic area and property on the north side of the park.	$300,000
Mountains to Sea Trail	1,117	First tract in the Neuse River bottomland section of the river for Mountains to Sea State Park. This area contains significant natural communities and extensive bottomland hardwood forests.	$500,000
South Mountains State Park	150	Funds for tracts in the Henry Fork and Jacob Fork watersheds. These acquisitions will protect the water quality in both rivers.	$300,000
South Mountains State Park	310	Additional funds for tracts in the Jacobs Fork water shed to protect water quality and provide critical trail connections on the east side of the park.	$620,000
Total	**2,933**		$4,102,808

5.2 Construction and Renovation

During fiscal year 2001-2002, the Parks and Recreation Authority approved state park construction and renovation projects totaling $10,854,201 (Table 5-2). The PARTF receipts in fiscal year 2001-2002 were $9,573,218. The Authority was able to allocate an additional $1,280,983. This amount was available from projects that were completed under budget during fiscal years 1996-1999.

Table 5-2
North Carolina Parks and Recreation Trust Fund
State Parks Capital Improvement Projects Approved in Fiscal Year 2001-2002

Park	Project	Amount
Cliffs of the Neuse	Lake Area Safety and Improvements	$186,974
Cliffs of the Neuse	Picnic Area Toilet Building	$336,099
Dismal Swamp	Design fees for swing barge across the canal	$75,000
Falls Lake	Telephone/Utilities Improvements	$501,670
Hammocks Beach	Replace Bathhouse	$1,539,320
Jockey's Ridge	Sand Removal	$573,763
Jordan/Falls Lake	Replace Playground Equipment Replacement	$900,605
Jordan Lake	Crosswinds Group Area	$1,511,235
Lake James	Hidden Cove Development	$541,489
Medoc Mountain	Footbridge Across Fishing Creek	$334,236
Morrow Mountain	Renovation of Lodge for Community	$354,580
Mount Mitchell	Tower and Access Trail	$623,967
Pilot Mountain	Grassy Creek Section-Design Only	$800,000
South Mountain	Visitor Center - Design Only	$243,000
Weymouth Woods	Renovate Visitor Center Building Renovations	$664,002
William B. Umstead	Replace Toilet Facilities	$287,712
Park System	Major Maintenance Fund	$800,000
Park System	Small Trails Funds	$200,000
Park System	Emergency Funds	$150,000
Park System	Statewide Exhibits Repair Funds	$50,000
Park System	Construction Reserve	$180,549
	Total	$10,854,201

6.0 Public Beach and Coastal Waterfront Access Program

The Public Beach and Coastal Waterfront Access Program was established by the General Assembly in 1981. Beginning in fiscal year 1996-97, the program began receiving 5% of the revenues from the Parks and Recreation Trust Fund. The public beach and coastal waterfront access program's enabling legislation (GS 113A-134.1) states that "Public purposes would be served by providing increased access to ocean beaches, public parking facilities, or other related public uses." The program provides matching grants to local governments for low-cost capital projects designed to improve pedestrian access to the state's beaches and waterways.

The program, administered by the Division of Coastal Management (DCM), offers matching grant funds to local governments throughout the 20 coastal counties. Since 1981, over 280 public access sites have been constructed at a cost of $11.6 million ($11.2 million state/federal and $5.2 million local funds). Local governments are responsible for construction, operation and long-term maintenance of the facilities. While most of the early projects were located along the oceanfront, more and more projects are now designed to improve access to estuarine shorelines, coastal rivers, and urban waterfronts.

The Division of Coastal Management sends requests for proposals to local governments in the 20 coastal counties in March of each year. The division uses criteria developed by the Coastal Resources Commission to select grant recipients. Local governments are required to match at least 25% of the project costs. Recipients are selected in July and contracts are awarded in August or October. Grant recipients have one year to complete their projects.

Communities can apply for five different types of water access sites: local, neighborhood, regional, multi-regional and urban waterfront redevelopment projects.

"Local access sites" include public access points which offer minimal or no facilities. They are primarily used by pedestrians who reside within a few hundred yards of the site. Generally, these accessways are a minimum of ten feet in width and provide only a dune crossover or pier, if needed, litter receptacles and public access signs. Vehicle parking is generally not available at these access sites. However, bicycle racks may be provided.

"Neighborhood access sites" are public access areas offering parking, usually for five to twenty-five vehicles, a dune crossover or pier, litter receptacles and public access signs. Such accessways are typically 40 to 60 feet in width and are primarily used by individuals within the immediate subdivision or vicinity of the site. Restroom facilities may be installed.

"Regional access sites" serve the public from throughout an island or community including day visitors. These sites normally provide parking for 25 to 80 vehicles, restrooms, a dune crossover, pier, foot showers, litter receptacles and public access signs. Where possible one-half acre of open space in addition to all required setback areas should be provided for buffering, day use, nature study or similar purposes.

"Multi-regional access sites" are generally larger than regional accessways but smaller than state parks. Multi-regional accessways provide parking for a minimum of 80 and a maximum of 200 cars, restrooms with indoor showers and changing rooms, and concession stands. Where possible two acres of open space in addition to all required setback areas should be provided for buffering, day use, nature study or similar purposes.

"Urban waterfront redevelopment projects" improve public access to utilized urban waterfronts. Such projects include the establishment or rehabilitation of boardwalk areas, shoreline stabilization measures such as the installation or rehabilitation of bulkheads, and the placement or removal of pilings for the purpose of public safety and/or increased access and use of the urban waterfront.

The Division of Coastal Management received $1,080,375 in PARTF revenues from the last quarter of 1999-00, the first three quarters of 2001-02 and reserve ($327,715) from canceled projects. The Division distributed $1,285,481 to local governments (Table 7-1). The remaining $122,609 will be reserved for grant awards in 2002-2003.

The Division of Coastal Management (DCM) received 27 pre-applications from 23 local governments requesting $2,636,310. DCM received 18 final applications from 15 local governments requesting $1,285,481. These eighteen local governments received public beach and coastal water front access grants funded by PARTF in 2001-2002 (Table 7-2).

6.0 Public Beach and Coastal Waterfront Access Program

Table 6-1 Division of Coastal Management's Distribution of PARTF Revenues For Fiscal Year 2001-2002	
Item	Amount
PARTF revenues received in first three quarters of fiscal year 2001-2002	$798,611
Reserve from fiscal year 1999-2001 (4th quarter revenues)	$609,479
Total available for fiscal year 2001-2002 grants	$1,408,090
Grants awarded for fiscal year 2001-2002	$1,285,481
Reserve for grants to be awarded in fiscal year 2002-03*	$122,609

*DCM's annual funding cycle is based on PARTF revenues for the first three quarters of fiscal year 2001-2002 and any reserve from the previous fiscal year including the fourth quarter revenues. The balance of $122,609 will be added to upcoming PARTF revenues and used to fund projects in the fiscal year 2002-03 grants cycle.

Table 6-2 Public Beach and Coastal Waterfront Access Grant Program
PARTF Grants Awarded for Fiscal Year 2001-2002

Local Government	Project Description	Grant Request	Cash Match	In-Kind Match	Total Cost
Kill Devil Hills	Construction of a new estuarine access site at West Arch Street including a 20'x20' observation platform.	$48,750	$15,440	$810	$65,500
Elizabeth City	Construction of a bulkhead for a new waterfront park on the Pasquotank River.	$225,000	$75,000	$0	$300,000
Washington County	Acquisition of a 61-acre parcel on Albemarle Sound near the mouth of the Roanoke River for future construction of a waterfront park.	$150,000	$25,000	$25,000	$200,000
Windsor	Construction of restroom facilities at the existing Roanoke/Cashie River Center.	$45,000	$7,500	$7,500	$60,000
Plymouth	Construction of a new bulkhead and boardwalk access along the Roanoke River between Washington and Adams Streets.	$90,000	$15,000	$15,000	$120,000
Swansboro	Construction of an elevated walkway to connect to an existing public pier on the White Oak River along NC Hwy 24..	$59,175	$14,500	$5,000	$78,900
Pine Knoll Shores	Phase II improvements to an existing access facility at the Iron Steamer including restroom and stormwater control.	$29,175	$9,725	$0	$38,900
Pine Knoll Shores	Purchase of an existing improved beach access site at the AmeriSuites/Royal Pavillion.	$26,250	$8,750	$0	$35,000
Morehead City	Construction of a launch area, limited docking facilities and composting restroom on Sugarloaf Island.	$115,000	$38,334	$0	$153,334
Jacksonville	Construction of a new boardwalk, dock and parking lot for an estuarine access on Wilson Bay.	$200,000	$118,765	$11,4150	

Table 6-2 Public Beach and Coastal Waterfront Access Grant Program
PARTF Grants Awarded for Fiscal Year 2001-2002

Local Government	Project Description	Grant Request	Cash Match	In-Kind Match	Total Cost
Emerald Isle	Construction of a new ocean access at Seagull Road with an ADA compliant walkway.	$14,325	$4,775	$0	$19,100
Emerald Isle	Construction of a new ocean access at Less Street with an ADA compliant walkway.	$10,987	$3,663	$0	$14,650
Surf City	Phase II construction of a parking lot, restrooms, concessions and shelters, boardwalks, shoreline stabilization and fishing piers at the Surf City Soundside Park.	$90,000	$135,000	$10,000	$235,600
Kure Beach	Upgrade three existing accessways by increasing parking and improving stormwater drainage at Avenues E, F, H and Hwy 421.	$39,967	$10,922	$2,400	$53,289
Ocean Isle	Improvements to an existing ocean access site at Charlotte St..	$13,612	$4,538	$0	$18,150
Southport	Construction of a new estuarine access on Kingsley St with a walkway, boardwalk and fishing pier.	$100,000	$16,500	$16,500	$133,000
Wrightsville Beach	Improvements to two existing ocean accessways at 2498 & 2698 N. Lumina Avenue.	$28,240	$8,760	$0	$37,000

DRAFT

NORTH CAROLINA

NATURAL HERITAGE TRUST FUND

AWARD REPORT

Calendar Year 2002

A Report to the Governor and General Assembly

William G. Ross, Secretary
Department of Environment
and Natural Resources

Dewey W. Wells, Chairman
Board of Trustees
NC Natural Heritage Trust Fund

DRAFT

NORTH CAROLINA
NATURAL HERITAGE TRUST FUND
AWARD REPORT
Calendar Year 2002

Origins and Mission

The North Carolina Natural Heritage Trust Fund was established by the 1987 General Assembly (G.S. 113-77, effective July 1, 1987) as a supplemental funding source for state agencies to acquire lands and to pay for the inventory of natural areas by the North Carolina Natural Heritage Program. A twelve-member board of trustees administers the Trust Fund.

Funding Sources

Since 1987, and as of December 31, 2002, the Natural Heritage Trust Fund has received $98 million including an initial appropriation of $275,000. The Trust Fund acquired a continuing source of funding in 1989 when a part of the receipts from the sale of personalized license plates was designated as income. The General Assembly in 1991 increased the state's deed stamp tax to $2 per $1000 value and set aside 15% of the state's share of this additional money as income for the Trust Fund. The 1995 General Assembly increased the Trust Fund's portion of the deed stamp tax from 15% to 25% effective July, 1996. Moneys not expended remain in the interest-accumulating Natural Heritage Trust Fund account and do not revert to the General Fund. In the calendar year January 1,2002 - December 31,2002, a total of $12,689,018 was received from all funding sources.

Board of Trustees

The North Carolina Natural Heritage Trust Fund is delegated the authority to grant funds to eligible state agencies pursuant to applications which meet statutory criteria and board guidelines. The governing authority for the Trust Fund is a 12 member Board of Trustees. This number was increased from nine members during the 2001 legislative session. Four members are appointed by the Governor who also designates the chairman. Eight members are appointed by the General Assembly with four recommended by the President Pro-Tempore of the Senate and four recommended by the Speaker of the House. Appointments are made effective January 1 and are for staggered six year terms. Persons appointed are to be knowledgeable in the acquisition and management of natural areas. The 2002 trustees are as follows:

Governor Appointees	Senate Appointees	House Appointees
Charles E. Clement Watauga County	J. Robert Gordon Scotland County	Alan D. Briggs Wake County
Lawrence G. Diedrick Nash County	George Richards Wake County	William Joslin Wake County
Thomas D. "Bud" Hunter Henderson County	Jim Sponenburg Caldwell County	Henry L. Kitchen Richmond County
R. Michael Leonard Forsyth County	Dewey W. Wells, Chairman Avery County	Thomas W. Reese Catawba County

Projects and Agencies

Grants are awarded for the purposes of acquiring lands that represent the state's ecological diversity to ensure their preservation and conservation for recreational, scientific, educational, cultural, and aesthetic purposes; for additions to the system of parks, state trails, aesthetic forests, wild and scenic rivers, fish and wildlife management areas; to develop a balanced State program of historic properties; and for other beneficial use and enjoyment of the public. Funds are also allocated to the Natural Heritage Program for natural area inventories and conservation and protection planning of natural areas. State agencies authorized to apply for grant awards are the Department of Environment and Natural Resources, the Wildlife Resources Commission, the Department of Cultural Resources, and the Department of Agriculture and Consumer Services. Priority consideration is given to protection of land having outstanding natural or cultural heritage values. Land with outstanding natural heritage values is land that is identified by the N.C. Natural Heritage Program as having state or national significance. Land with outstanding cultural heritage values is land that is identified, inventoried or evaluated by the Department of Cultural Resources.

During calendar year 2002, the Natural Heritage Trust Fund awarded 20 grants totaling $9,688,240 which contributed to the protection of 23,266 acres. An additional $3 million was reverted to the general fund due to the State Budget Emergency. The amount requested was $24,520,903, showing that the need far exceeds the received amount of $12,689,018.

Calendar Year 2002
NHTF Awarded Grant Totals by Agency

Agency	Acres	Grant Total
Department of Environment and Natural Resources - *Division of Forest Resources*	876	$529,460
Department of Environment and Natural Resources - Division of Parks and Recreation - *Natural Heritage Program*	N/A	$118,000

2002 Annual Report
NC Million Acre Initiative

Presented to the Environmental Review Commission
North Carolina General Assembly

January 16, 2003

By the North Carolina Department of Natural Resources
Office of Conservation and Community Affair

The Latest Numbers

At the end of the third full year of the NC Million Acre Initiative (January 1, 1999 - December 31, 2001), private and public land protection partners across the state have permanently protected an additional **175,515** "Million Acre" acres. Adding **63,444** of those acres during the 2001 calendar year. This past year's activities represent a substantial increase in the rate of land protection in NC, and a clear sign of the effectiveness of the Million Acre Initiative.

However, while our rate of land protection is increasing each year, we have not yet reached an annual rate that will allow us to meet the goal of permanently protecting an additional million acres by December 31, 2009 (G.S. 113A-240 and 241). The primary barrier is the availability of public and private funding for new protection projects. If we intend to meet the Million Acre Goal by the end of 2009, more money for land protection must be found.

The table at the end of this report, describes in detail the number of acres protected by sector (State government, Local Government, etc), by program, and by time period. Footnotes at the bottom of the page note special circumstances in some of the calculations. The end result is a conservative presentation of the totals. It is likely that the numbers presented here could be adjusted upward between 10,000 to 30,000 acres. To avoid frustration and embarrassment in the future, only official reports of new acquisitions (from our surveys, interviews, and questionnaires) make it into the final total. Estimations for non-respondents are not included.

The Program

In addition to successfully increasing the rate at which we are protecting land in North Carolina, the Million Acre Initiative continues to work towards making information about land protection tools and techniques more broadly available. The Million Acre website was completely updated in the Spring of 2002, with many new and updated links to land protection information from across North Carolina and across the nation. This web site, in conjunction with regular public presentations at local, regional, and statewide conferences, annual meetings, and workshops is slowly, but steadily increasing awareness among North Carolinians about the desperate condition

of our land resources. As tens of thousands of acres a year are permanently altered from their existing natural condition for new development, increased awareness about the importance of setting aside our critical and unique lands is essential.

Work also continued with several public and private partners to further develop a centralized, up-to-date, accessible clearinghouse for Geographic Information System data on protected lands. Towards the end of the year, the NC Clean Water Management Trust Fund approved a grant to the Center for Geographic Information and Analysis to continue their work of cataloging all protected properties, developing a system to continuously update those lists, and make the data layers available via the internet.

Looking Ahead

Calendar year 2002 looks to be another great year for new land protection projects. Final reports regarding how many acres were protected from January 2002 – December 2002 will not be available until the Spring of 2003, but estimates suggest that approximately 80,000 acres have been protected – due in large part to one extraordinarily large protection project completed by The Nature Conservancy. In addition, hundreds of surveys, filled out across the State during a series of meetings in the Fall of 2002, make it clear that more technical assistance to local governments, non-profits, and community groups is still needed. This includes education and awareness building for local elected officials and the general population.

The upcoming year offers us an opportunity to initiate new regional-scale projects for identifying networks of important resources, and an opportunity to finalize similar projects that are already underway. By fostering the completion of regional open space plans for every part of the State, it will be possible to see how individual greenspaces and working landscapes across North Carolina fit together into a network of essential green infrastructure. Understanding the interrelationships among those areas will help us target our protection efforts so that we maximize the cost effectiveness and the natural protection value of our investment.

Acres Under Permanent Protection

(note: a blank cell means no data was collected. 0 means no land was protected)

MEMORANDUM

To: The Honorable Fountain Odom, Co-Chairmen
The Honorable Pryor Gibson, Co-Chairmen
Members of the Environmental Review Commission

From: Bill Holman, Executive Director

Re: Clean Water Management Trust Fund's Annual Report

Introduction

I am writing on behalf of the Board of Trustees and staff of the Clean Water Management Trust Fund to thank the members of the General Assembly of North Carolina for your strong support for investments in clean water and to make our annual report to the General Assembly and the public.

Thanks to the General Assembly North Carolina continued to make substantial progress in protecting and restoring water quality in 2002, despite one of the worst fiscal crises in years. As we face another challenging budget year ahead, the future of our state's environmental and economic health depends on your continued support and interest.

Background

The General Assembly for many years has advocated non-regulatory, incentive-based programs to complement North Carolina's environmental regulatory and educational programs and to ensure both a strong economy and healthy environment.

The 1996 General Assembly created the Clean Water Management Trust Fund (CWMTF) (GS 113-145) "to clean up pollution in the state's surface waters and to protect and conserve those waters that are not yet polluted." The CWMTF "shall be used to help finance projects that specifically address water pollution problems and focus on upgrading surface waters, eliminating pollution, and protecting and conserving unpolluted surface waters, including urban drinking water supplies" and "to build a network of riparian buffers and greenways for environmental, educational, and recreational benefit."

TEL (919) 733.6375 | FAX (919) 733.6374 | wwwcwmtf.net
530 NORTH WILMINGTON STREET, RALEIGH, NC 27604
1651 MAIL SERVICE CENTER, RALEIGH, NC 27699-1651

The CWMTF is an independent agency housed for administrative purposes in the Department of Environment and Natural Resources (DENR.) An eighteen-member board of trustees establishes criteria, allocates funds and approves grants, makes rules, and hires the executive director. Six members are appointed by the Governor; six, by the General Assembly upon the recommendation of the President Pro Tempore of the Senate; and six, by the General Assembly upon the recommendation of the Speaker of the House. An advisory council composed of the Commissioner of Agriculture, Chair of the Wildlife Resources Commission, Secretary of DENR, and Secretary of Commerce or their designees advises the board of trustees.

Local governments or other political subdivision of the state, state agencies, and nonprofit conservation organizations, such as land trusts, may apply for grants. Deadlines for applications are June 1 and December 1 of each year.

The board of trustees typically meets ten times per year - six times across the state and four times in Raleigh. In 2002, the board met in Blowing Rock, Lumberton, Charlotte, Elkin, Tyrrell County, Ashe County, Troy, and Raleigh. In 2003, the board plans to meet in Greenville, Gastonia, Fayetteville, Cullowhee, Rockingham County, Jacksonville, and Raleigh.

Moneys from CWMTF may be used to acquire land or easements for riparian buffers and watersheds; to restore wetlands, buffers and watershed lands; to repair failing wastewater treatment systems; to improve stormwater controls and management practices; for planning, and for administration and staff. The board works through three principal committees: acquisitions; infrastructure/wastewater, and restoration/stormwater/planning.

CWMTF applications forms for grants, grant evaluation guidelines, enabling legislation, lists of the board of trustees, staff directory, and news releases and other reports and documents are available at www.cwmtf.net.

The executive director, deputy director, senior scientist, administrative officer, public information officer, and administrative assistant are based in the central office in Raleigh. Currently, four field representatives cover the coast, piedmont and mountain regions of the state. A part-time water quality advisor is home based.

Progress

Last year, much attention was focused on North Carolina's water resources because of the extreme drought, which caused widespread agricultural damage and forced communities all across the state to take mandatory conservation measures. During this time, the importance of maintaining **quantity** of our water resources took center stage.

The drought may have focused attention on the amount of our water resources, but it also served as a reminder that North Carolina's water **quality** is still one of the state's top environmental issues.

In its North Carolina 20/20 report, the state's Progress Board laid out a series of performance targets to improve environmental quality by the year 2020. Those targets included increasing the percentage of water bodies fully supporting their uses, ensuring that 100 percent of all North Carolinians have access to clean and safe drinking water, protecting and permanently preserving one million acres by 2010, and improving water quality to ensure the continued viability of the state's fisheries.

In almost all the areas cited by the North Carolina 20/20 report, CWMTF grants are playing a role in reaching those performance targets. Here are some examples:

- The CWMTF and its partners have helped protect 2,422 miles of riparian buffers and preserve 203,966 acres of land, thereby ensuring streams, rivers and lakes can continue or will be able to support their uses. In total, CWMTF has funded 61 stream and riparian buffer restoration projects totaling over $158.8 million.
- The CWMTF has funded 61 wetlands restoration projects totaling over $42 million to help maintain and preserve these important ecosystems.
- The CWMTF has assisted 74 local governments with wastewater improvements, investing over $65 million to reduce discharges and more effectively treat wastewater so that fewer nutrients and other pollutants enter our rivers.
- CWMTF grants have funded 24 stormwater management projects totaling $25.3 million to reduce pollution from urban runoff and decrease flooding. .
- CWMTF grants have been used for watershed planning projects, and to purchase land surrounding water supply watershed lakes to make sure some of the state's largest population centers are guaranteed clean drinking water.
- CWMTF acquisition grants have been used to protect waters in areas closed to shellfishing, or to protect important nurseries for key fisheries.

All of these efforts and the target measures to which they correlate are just as important to North Carolina's economic well-being as they are to the health and safety of her citizens and the environment. They enhance both the recreational and commercial fishing industries, reinforce North Carolina's travel and tourism industry, and help maintain North Carolina's high quality of life.

As the Progress Board states in its report, "...states can and do have strong economies and simultaneously protect the environment. In fact, the states with the strongest environmental records also claim the distinction of having the best job opportunities and climate for long term economic development."

Thanks to appropriations from the General Assembly CWMTF approved 89 water quality grants totaling over $64.9 million in calendar year 2002.

As of December 1, 2002, 840 applicants had requested over $933 million for water quality projects. Since 1997 the board of trustees has approved 372 grants for a total of $300.4 million. CWMTF grants have leveraged at least $499 million in private and other public funds.

The CWMTF continues to be an important tool in helping local governments protect their water resources. Since 1996, $142.9 million - nearly half of the $300.4 million in

CWMTF grants issued – have been awarded to local governments. These grants have funded:

- Improvements to Wastewater Treatment Facilities
- Stormwater management
- Removal of septic tanks/straightpiping
- Wetlands and Stream Restoration
- Greenway and open space acquisition

These projects are increasingly important to cities and counties as they experience increased growth and development, and as they face severe water usage issues in light of the 2002 drought.

2002 Examples

In May, the state completed the second and final phase of the $4.2 million purchase of **Bird Island** in Brunswick County. With the help of a $2.75 million CWMTF grant the Division of Coastal Management has added Bird Island to its Coastal Reserve system. The acquisition protects 1.2 miles of ocean beach and 1.5 miles of shoreline and extensive marshes for a total of nearly 1,300 acres.

The CWMTF awarded a $444,000 grant to the Southern Appalachian Highlands Conservancy to help purchase an important conservation easement at the **headwaters of the Catawba River** in McDowell County. The easement on 180.5 acres will extend the protection already provided by the U.S. Forest Service to the source of the river by an additional mile. As part of the project, a conservation easement will be donated on the 137-acre uplands portion of the property for a total of 317.5 protected acres.

Last year, the City of **Goldsboro's innovative constructed wetlands** project to reduce pollution in the Neuse River was completed. The $3.2 million venture was funded in part with a $1.6 million grant from CWMTF. This project is only one of several being taken by the city to curb pollution in the Neuse. Goldsboro has reduced discharges of nitrogen.

Two early CWMTF grants are coming to fruition in the Little Tennessee watershed. The **Macon County Greenway Project** received a $3.8 million CWMTF grant for restoration of wetlands and buffers along the river in Franklin in 1997.

Macon County government partnered with the Macon County Soil and Water Conservation District to restore riparian and wetland habitat in the six-mile portion of the river that flows through the town of Franklin.

In conjunction with the restoration, the county has developed a greenway along this section of the Little Tennessee, enhancing its environmental, recreational and economic value to the community.

Last year, the CWMTF helped fund the purchase of the 2,168-acre **North River Farms in Carteret County for wetlands restoration**. The property is adjacent to the North River, Core Sound, and the upper reaches of Jarretts Bay, and was drained and converted to cropland over the last several decades. Three creeks originate on the land. Many of these surrounding wasters are now too polluted for shellfish harvest because of high bacteria counts contained in runoff from drained land.

Conservation Reserve Enhancement Program (CREP)

CWMTF's $40 million investment in the Conservation Reserve Enhancement Program (CREP) will leverage $221 million in US Department of Agriculture and $10 million in other funds over the next six years. The Division of Soil and Water Conservation requested $4.5 million in June 2002 from CWMTF to continue CREP. CWMTF approved expansion of CREP into the Pasquotank, Roanoke, White Oak, and lower Cape Fear Rivers last year. The Chowan, Tar-Pamlico, Neuse, and upper Cape Fear Rivers were already covered.

CWMTF is working with DENR's Division of Soil and Water Conservation, local soil and water conservation districts, the US Natural Resources Conservation Service, and others to leverage federal Farm Bill conservation programs.

Recent Legislative Action

The 2002 General Assembly demonstrated that protecting and restoring water quality remains a high priority of the State and appropriated $66.5 million ($70 million minus a 5% budget cut) to CWMTF in fiscal year 2002-2003. The Office of State Budget and Management is withholding about 4% of that appropriation to CWMTF. The 2002 appropriation enabled the board of CWMTF to provide funds for all the projects that CWMTF approved in 2001 but were delayed by 2002 budget cuts and to fund about one-third of the applications that CWMTF received and reviewed in 2002.

The 2002 General Assembly also continued its strong support for CWMTF partners, the Parks and Recreation Trust and Natural Heritage Trust Fund.

CWMTF appreciates the efforts of the 2002 General Assembly to simplify and clarify CWMTF's reporting requirements and to clarify and strengthen the law regarding conservation easements.

The CWMTF board of trustees supported legislation in the 2002 session of the General Assembly to restructure the terms of board members in an effort to promote continuity in the decision-making process. Under the existing law the terms of two-thirds of the board expired on December 31, 2002. The proposed change was among provisions in the appointments bill passed by the General Assembly but ultimately vetoed by the Governor. The board will continue to push for the change in the 2003 legislative session.

Finally, on October 31, Governor Easley signed SB 1161, Amend Present Use Value, by Senator Fletcher Hartsell and others. SB 1161 clarified that rollback taxes are not owed when a conservation easement is either donated or purchased on farm or forestland and clarified that property encumbered by a conservation easement remains eligible for present use taxation. CWMTF supported SB 1161 and commends the General Assembly for its passage. SB 1161 is another incentive for conservation on private lands.

The Year Ahead

The CWMTF board and staff are reviewing 70 projects requesting $105.2 million this spring. Specific grant requests submitted in the December 2002 cycle include:

- $2.3 million from the North Carolina Division of Parks and Recreation for purchase of 815 acres along the Eno River near Durham.
- $13.3 million from the North Carolina Wildlife Resources Commission for purchase of the 4,458-acre Needmore tract on the Little Tennessee River in Swain and Macon counties.
- $2.4 million from the City of Fayetteville for stormwater management on Little Cross Creek.
- $450,000 from the Buncombe County Soil and Water Conservation District for stream restoration along Newfound Creek in the French Broad River Basin.
- Two separate requests from Mecklenburg County for continued stormwater improvements and stream restoration along Little Sugar Creek totaling $1.8 million.
- $400,000 from the town of La Grange for improvement to the town's wastewater treatment plant which will reduce discharges into the Neuse River.
- $500,000 to the city of Charlotte for additional land acquisition to protect Mountain Island Lake. Mountain Island Lake provides drinking water for Charlotte, Gastonia, and many other towns.

2003 Legislation

State law requires an appropriation of $100 million to CWMTF in 2003-2004 and future years. CWMTF will work with the General Assembly this year to secure appropriations to continue North Carolina's progress in protecting and restoring water quality.

CWMTF supports the work of the Conservation Income Tax Program, Natural Heritage Trust Fund, Parks and Recreation Trust Fund, and Farmland Preservation Trust Fund.

The 2002 General Assembly considered HB 1761 and SB 1464, Certificates of Participation for Natural Heritage and Parks, sponsored by Representative Pryor Gibson, Senator Fountain Odom, and others. CWMTF is interested in certificates of participation financing for natural heritage, parks, and other purposes.

CWMTF is available to assist the Governor and General Assembly in their efforts to mitigate hazards in floodplains to help reduce rising property insurance costs and to prevent encroachment on Fort Bragg, Camp Lejuene, and other military bases. Governor Mike Easley is hosting a National Governors Association conference on encroachment on military bases on January 21, 2003 in Kinston.

CWMTF recommends that the General Assembly reenact legislation to improve the staggering of terms of CWMTF trustees.

CWMTF is available to assist the General Assembly in the development of an incentive-based air quality program such as the proposed Clean Air Trust Fund.

Please contact me if you need more information.

DRAFT

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
January 28, 2003

The Environmental Review Commission (ERC) met on Tuesday, 28 January 2003 at 9:30 a.m. in Room 643 of the Legislative Office Building.

Representative Pryor Gibson presided over the 28 January 2003 meeting. The following members were present: Senators Albertson, Clodfelter, Forrester, Horton, Kinnaird and Odom and Representatives Gibson, Hackney, Hill, McComas and Weiss. Mr. George Givens, Commission Counsel, Jeffrey Hudson, Assistant Commission Counsel, Susan Iddings, Assistant Commission Counsel, Tim Dodge, Research Assistant, Kevin Howell, Research Intern, and Mary Watson, Commission Clerk were also present.

On 24 January 2003, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice was included in the attachments to these minutes as **Exhibit A**. A copy of the visitor registration and the agenda for the meeting are included in the attachments as **Exhibits B and C**.

Representative Gibson called the meeting to order.

George Givens, Commission Counsel, was asked to explain the agenda.

Mr. Givens asked visitors to sign the visitor registration sign-in sheet and asked members to sign and send forward their reimbursement forms.

Mr. Givens announced that a several documents provided by DENR had been placed on each member's desk for read only. First, a Truth in Penalties Framework, the 2002 Annual Fish Kill Report, Funds Transfers Authorized for State Fiscal Years 2001-2002 and 2002-2003, and a report on Environmental Regulatory Compliance Activity in Calendar Year 2000. Copies of these read-only reports are listed as **Exhibit D**.

Mr. Givens announced that next meeting of the ERC will occur after the 2003 long session although it is possible we could meet during the session.

Mr. Givens said that the meeting of the Underground Storage Tank Working Group would resume at 10:00 a.m. on Monday, 3 February 2003 in Room 605.

Mr. Gene Upchurch, Director of Public Affairs, Progress Energy gave an update on Progress Energy's plan to comply with the requirements of the Clean Smokestacks legislation. A copy of Mr. Upchurch's comments is listed as **Exhibit E**.

Senator Kinnaird asked Mr. Upchurch if there was ongoing research as to the best way to clean up the pollution and to deal with the waste.

Mr. Upchurch said that the engineering had already been done for the first five units using the best available technology. He added that there was a by-product called gypsum that comes from the dry-scrubbers. This is try to be marketed and sold to companies who can use it in wallboard and what cannot be sold will be stored on-site.

Senator Kinnaird asked where the research would come from and was there any incentive for research.

Mr. Upchurch said that he was not aware of any research but that they were using the best engineering firms in the state that used the latest technology.

Next, Mr. George T. Everett, Vice President for Environmental Affairs, Duke Power, gave an update on NC Clean Air Initiative. A handout summarizing what Duke Power has done to implement the Clean Air bill from last session is included as **Exhibit F**.

Mr. Everett covered the information in Exhibit F and then called for questions.

Senator Albertson asked Mr. Everett how many hydros and how many CT's there were.

Mr. Everett said that the hydros were divided into several groups. There are several units in the western part of North Carolina on the Nanthala system and they have CT's located in Lincoln County and some located at coal-fired plants.

Representative Gibson asked Mr. Everett to define CT.

Mr. Everett said that CT stands for Combustion Turbine that runs off of natural gas or oil.

Mr. Everett added that in addition to the hydros in the western part of the state, there are a group of them along the Catawba-Wateree river system that they will begin relicensing this year.

Senator Albertson asked Mr. Everett how many total hydros there are.

Mr. Everett said that on the Catawba Wateree, there are 13 and a total of 30 in their system.

Representative Hackney asked Mr. Everett if any effort was being made to geographically arrange the phase-in so that the benefits come into all regions or is it done on some other basis.

Mr. Everett said there are a couple of considerations. They have talked to the agency about the ozone issue and where they would best help them in meeting the ambient ozone standard and their best estimate was that the system would benefit most if they could put NOx controls all along the I-85 corridor.

Mr. Everett said that in order to meet the NOx target, the SCR's would have to go lower. These were done at the biggest, newest units because of the cost. The combination of this technology, along with the SNCR's would answer the eight-hour ozone issue.

Mr. Everett said that their strategy was to lower initially the NOx emissions at all of the units.

Representative Gibson asked Mr. Everett if they have the flexibility and the model to do the construction schedule so that if there is someway to lower the removal of a ton of pollutant that they will have the flexibility to address that.

Mr. Everett said that the schedule, as it is laid out in Exhibit F is the best information at this point. They may move a unit, change a schedule or use a different technology; however, in order to meet the target date, they cannot delay in searching for new technology.

Representative Gibson asked if there would be a measurement by which the energy groups would be involved in developing so that they could get the most for their dollar.

Mr. Everett said there are many people interested in how the money is being spent. The technology they are currently using is the best in the marketplace now.

Representative Hackney said that he believed the EPA Office of Air is taking the position that the new source review rules do not preempt state initiatives and asked if that was Duke Energy's position as well.

Mr. Everett said that it appears that whatever happens with the new source review requirements, this would install a lot of progress at these new units.

Representative Hackney asked Mr. Everett which units it would impact.

Mr. Everett said it would not affect the newest units.

Senator Forrester asked Mr. Everett if there was a cleaner coal that would cause less pollution even though it may be more expensive.

Mr. Everett said that the sulfur content of the coal is a big issue. North Carolina has very stringent requirements of sulfur content in the coal and has been paying a premium for coal for a long time.

Mr. Everett said that nitrogen is also a contaminant in the coal and cannot be changed by buying cleaner coal. So, the best thing to do is burn the coal efficiently.

Senator Kinnaird asked if Duke Energy was taking into consideration any of the measures of alternative energy that will overall reduce pollutants.

Mr. Everett said there were many considerations around this issue. As the units get older, they have put scrubber on 12 of their units. There are 27 coal units at seven coal plants. Over a period of time, these units will be phased out and new technology will have to be found to replace these units.

Mr. Keith Overcash, Director, Division of Air Quality, DENR, gave a progress report of the Clean Smokestacks Act. A copy of his comments is listed as **Exhibit G**.

Senator Kinnaird asked Mr. Overcash if utility companies have to submit permit request as well as compliance plans.

Mr. Overcash said that the bill does not provide information on when permit applications have to be submitted, but they are aware that they must have a permit before they begin construction.

Representative Gibson asked Mr. Overcash if any other states were doing as much as North Carolina on compliance.

Mr. Overcash said that they had not seen any other states working at the level that North Carolina is.

Senator Forrester asked Mr. Overcash how mercury emissions affected people.

Mr. Overcash said that they mercury emissions were a byproduct of coal-burning. The legislation states that technologies have to be explored on mercury removal and how much concurrent removal they could get from equipment that is already in place.

Mr. Carl G. Pigford, Administrator, Motor Vehicle Emission Inspection and Maintenance Program, Division of Motor Vehicles, Department of Transportation, gave a report on the progress in implementing the motor vehicle inspection and maintenance program. A copy of this report is listed as **Exhibit H**.

Mr. Donnie Redmond, Division of Air Quality, added some examples of why these readiness rejections are occurring. There are a few makes and model years that are having a problem with it. For examples 1996 and 1998 Volvos, 1996 and 1997 Mitsubishis have been troublesome. On many of these models there were outstanding recalls on them.

Representative Gibson asked Mr. Redmond what percentage overall are being rejected.

Mr. Redmond said about three percent are being rejected.

Representative Gibson asked what percentage of that three percent is targeted to a manufacturer glitch and was not foreseen.

Mr. Redmond said that they did not foresee the amount of recalls that were not done and the amount of retraining that would need to be done for the service technicians to know how to handle these situations.

Representative Gibson asked Mr. Redmond what timeframe he was predicting that the three percent would go to one percent.

Mr. Redmond said that the number could be reduced within a year.

Senator Forrester asked Mr. Redmond what the rationale was on requiring new cars to be inspected. What percentage of the three percent are brand new cars that are found not in compliance with the emissions standards.

Mr. Redmond said that brand new cars are exempt from the OBD test but have to have the safety inspection.

Senator Forrester asked why new car owners had to pay for safety inspection.

Representative Gibson said that they had the debate last year and no one could not come up with a explanation.

Senator Albertson added that he had research done on the necessity of the safety inspection on any car, and it was found to be of little or no value.

Mr. Givens asked Mr. Redmond what percentage of vehicles had failed because they are violating air quality standards.

Mr. Redmond said the failure rate was four percent for 1996 and new cars.

Mr. Givens asked Mr. Redmond what percentage of vehicles had failed because they are violating air quality standards.

Mr. Redmond said that four percent are failing because they are dirty and the other three percent are readiness issues.

Mr. Pigford added that DMV and Air Quality are in the process of putting together a widespread public outreach campaign to reach the inspection industry and the general public about the OBD testing and the issues that are occurring.

Senator Forrester asked who is monitoring trucks and buses to make sure they are not over polluting the air and asked what could be done about that.

Mr. Redmond said that ozone has been a concern and EPA has established standards for particulates. There are also requirements on rebuilt engines in these trucks and buses that will prevent emissions of particulates.

Representative Hackney said that the EPA regulations would be in place soon.

Senator Kinnaird asked if trucks are required to have state inspections.

Mr. Redmond said that all gasoline vehicles, trucks and autos require inspection.

Mr. Givens pointed out that our law was amended to allow the EMC to adopt rules on diesel and are awaiting the federal litigation outcome.

Mr. Brock M. Nicholson, Chief, Planning Section, Division of Air Quality, DENR gave a report on the Process of Designations of Non-Attainment for Ozone and Fine Particle Air Quality Standards. A copy of this report is listed as **Exhibit H**.

Representative Gibson asked Mr. Nicholson if the report on attainment will be ready by April.

Mr. Nicholson said that the Association of the State Environmental Officials requested an October 15 date and hopefully will be allowed more time for the attainment.

Mr. Givens asked if there was monitoring done in every county.

Mr. Nicholson said that they do not monitor in every county because of the expense. However, they follow the federal guidelines on citing and covering monitors based on population, area and wind direction. Ozone is monitored in 33 counties.

Mr. Givens asked if Davidson County was monitored and surrounding counties were not.

Mr. Nicholson said this was correct. He emphasized that the map showing the counties and monitoring data status does not reflect what the state's recommendations would be on areas to be designated. A good example of this is Gaston County because it has never been monitored.

Mr. Paul S. Crissman, Environmental Programs Manager, Solid Waste Section, Division of Waste Management, DENR, gave a report on the White Goods Management Account Balance. A copy of his report is listed as **Exhibit I.**

Mr. Crissman said that there has been an increased demand for white goods, which accounts for the low balance in the fund.

Mr. Crissman said that with regard to the scrap tire program, scrap tire costs are going down in terms of management cost and the number of tires being managed is increasing slightly.

Mr. Crissman said that there are tons of solid wastes being produced by our state. In the past year, the solid waste being produced is higher than previous years. In times of economic recession, waste usually decreases; however, this year it did not.

Mr. Crissman added that the top 25 waste producing counties all have a population of over 100,000 people. Fourteen of those counties increased in waste and 11 of them decreased. Statewide, 58 counties increased and 42 decreased. Orange County reached the 40 percent goal of waste reduction.

Representative Hackney asked Mr. Crissman if Orange County was the only county that had achieved the 40 percent waste reduction goal.

Mr. Crissman said that it was the only large county that had.

Mr. Crissman thanked Senator Odom for his interest in solid waste over the past years and said that he would be missed.

Senator Kinnaird added that it would be interested to see if the pay as you throw program in Carrboro would have an effect on the waste reduction.

Mr. Crissman said that the City of Wilmington has a pay as you throw program.

Representative Weiss asked Mr. Crissman if there are plans to urge other large counties to do what Orange County is doing.

Mr. Scott B. Mouw, Chief, Community and Business Assistance Section, Division of Pollution, Prevention and Environmental Assistance, DENR, answered Representative Weiss' question.

Mr. Mouw said that Orange County had put in place a number of aggressive policies on cardboard and construction and demolition disposal.

Representative Gibson asked Mr. Mouw if Orange County has a lumber and gypsum wallboard recycling facility.

Mr. Mouw answered in the affirmative.

Mr. Givens asked Mr. Crissman to give an explanation of the distribution formula for the proceeds from taxes.

Mr. Crissman said that he distribution of the scrap tire tax proceeds is 67 percent to county governments and the balance to the State. Other portions are used to clean up nuisance tire sites and to support tire recycling.

Mr. Givens added that when North Carolina entered the modern era of solid waste management, with the passage of SB 115 in 1989, almost all landfills were publicly owned and operated. With the requirement of liners, everyone thought that landfilling would go down and we would go to other methods of managing solid waste. What has happened is that we have private companies in the landfill business that can dispose of waste cheaply so that other methods of waste management are not economically viable.

Mr. Crissman said that this was a correct observation. Solid waste never got as expensive as it was first predicted.

Senator Horton asked Mr. Crissman if plastic cups used by the General Assembly are biodegradable.

Mr. Givens said that they are not accepted by any landfills in our area.

Senator Horton said that we should be setting a better example.

Senator Odom added that we do a lot of things that are not good examples of public policy. He also said that he does not think we will make real progress in the solid waste stream until the cost becomes so exorbitant that people will have to pay per pound for what they throw away.

Senator Kinnaird said that we should look at a bottle bill. She also said we over package.

Senator Clodfelter asked Mr. Mouw how much of the recycling is packaging materials.

Mr. Mouw said that it is probably around 15 to 20 percent.

Mr. Mouw gave a slide presentation on the State's progress in supporting recycling markets. A copy of his slide presentation is presented as **Exhibit J**.

Mr. Mouw said there is still a need to improve access to recycling markets in the western part of the state.

Senator Odom asked Mr. Mouw what a new market is for food waste.

Mr. Mouw said there are two commercial composters in the triangle area who are now going out and collecting food waste from restaurants and cafeterias and putting it into their compost mix.

Senator Odom asked if they are mixing the food with yard waste.

Mr. Mouw said they are using wood waste, yard waste and other organic materials, which they are able to sell.

Mr. Mouw said the General Assembly put on some very strict mandates on state agencies to help the recycling markets by buying recycled products. This has been a success.

Mr. Mouw discussed electronic recycling. This is a complex waste stream that produces a number of concerns. He said there are approximately around 1.4 million units of televisions discarded each year. There is a CRT that contains lead that may contaminate the soil.

Mr. Mouw said that electronics have good usable materials in them but they are difficult to process. All communities that have collected electronics have not found any market restrictions as yet.

Mr. Mouw said that Mecklenburg County, Wake and Lee counties have a permanent collection program for electronic materials.

Mr. Mouw said that any electronic waste generated by a household in North Carolina can be legally disposed of in a landfill.

Mr. Mouw said that the state of California and Massachusetts have banned CRT's from disposal and Virginia has introduced a bill to ban them.

Mr. Mouw said that there is dialog going between the states and industry called the National Electronic Stewardship Initiative that produce a national, voluntary program.

Mr. Mouw added that a bill was introduced last year to put an advanced recycling fee on CRT's in North Carolina. These fees would go to set up local recycling programs. As a result of the complexity of this issue, the bill went to a study committee.

Senator Odom added that he hoped the ERC would in the future pass legislation that would ban electronic goods going in the landfills.

Mr. Givens added that with regard to the development of legislation on this topic, he said that the meetings on this topic were stopped because of the length of the session and hopes to bring it back up in the next interim.

Representative Weiss added that she and Representative Hackney had made previous recommendations on this legislation and asked if they could introduce it again this session.

Mr. Givens said that his recommendation would be for the ERC to introduce this legislation in the short session.

Lisa D. Martin, Director of Regulatory Affairs, North Carolina Home Builders Association, Edmund P. Regan, Deputy Director, North Carolina Association of County Commissioners, Kimberly S. Hibbard, Associate

General Counsel, North Carolina League of Municipalities and Trip Van Noppen, Carolinas Office Director, Southern Environmental Law center gave their comments on the development and implementation of rules and programs to control storm water runoff.

Ms. Martin said they were responding to the report presented at the last ERC meeting regarding the implementation of the federal Phase II and PDES programs.

Ms. Martin said that since 1999, neither the deadlines nor the requirements in the federal rule have changed substantially. The federal rule was adopted in North Carolina in February 2000 and the temporary rule went into effect in February 2002.

Ms. Martin said that most of the environmental groups, municipalities, the counties and other interest groups decided that a temporary rule was not necessary.

Ms. Martin said that one rule added after the public comment period that the Home Builders Association has a problem with is the expedited post construction implementation. These are the requirements that most affect the development and homebuilding industry. They are also the requirements that will cost the cities and counties the most to implement. They are the most complicated and the most onerous of the post construction measures.

Ms. Martin said that the federal rule requires that the implementation of all six minimum measures under the NPDES program be completed within five years. For most of the cities and counties in North Carolina, that will be in 2008.

Ms. Martin said that after the close of the public hearing period, the EMC decided to expedite the post construction requirements to 2005.

Ms. Martin said that the second disagreement the HBA has with the state is that the federal rule does not prescribe set built upon area requirements or density requirements. What the federal rule does do is acknowledges land use decisions must be made locally depending on the circumstances that are in that jurisdiction.

Ms. Martin said that the EMC does not have the authority to prescribe density built upon area requirements outside of water supply watersheds. DENR testified that the only reason that they had to add this measure was because the municipalities and counties would have no idea what was required of them if they did not.

Ms. Martin said that if the state had completed the model ordinance, the cities and counties would have had an idea of what the state expected in terms of their permit without picking a one-size fits all rule.

Ms. Martin said there were concerns regarding the cost of this program. No federal money and limited state money is available to help local

governments. DENR offered to assist with the education minimum measure but would charge the local governments for that assistance.

Ms. Martin said that the application process itself is also cumbersome. Local governments would have to hire additional staff to complete the applications.

Ms. Martin said that housing costs would increase for first time homebuyers.

Mr. Regan handed out copies of letters written to DENR, and the United States Environmental Protection Agency, regarding the position of the North Carolina Association of County Commissioners on the Phase II storm water rules. A copy of these letters is listed as **Exhibit K**.

Mr. Regan said that county governments have had questions regarding the applicability of the federal Phase II stormwater requirements to North Carolina counties since the EPA issued final rules in December 1999.

Mr. Regan said that some of the problems they have encountered are with how the rules will apply in North Carolina.

Mr. Regan said that the federal requirements apply to the owners and operators of Municipal Separate Storm Sewer Systems (MS4s). Generally, North Carolina counties do not own and operate MS4s, which are generally around operating road systems.

Mr. Regan also said that the federal rules included a listing of all local government units in each state that would be automatically subject to the requirements if these jurisdictions owned and operated MS4s. The listing included 25 urban counties in North Carolina and has been expanded to include eight additional counties.

Mr. Regan said that it was apparent that two of our counties, Cumberland and Mecklenburg were in the storm sewer business.

Mr. Regan said that at the request of their member counties, following some hearings in the summer of 2000, they wrote to DENR (see Exhibit L) asking how the federal rules would be applied to the urban counties on the EPA list. In the conclusion of that letter, they asked DENR to take two actions. First, to seek a definitive ruling from EPA as to how these rules would apply in a situation where the county governments listed did not operate MS4s. The second thing they asked was for the Department to convene representatives of the 25 metropolitan counties to determine what role these jurisdictions might play in stormwater management.

Mr. Regan said that under state law, the Department could develop rules that address the county role in stormwater management.

Mr. Regan pointed out that this was not the first inquiry that had been made to the Department. Forsyth County wrote a letter shortly after the federal rules were issued and raised the same questions.

Mr. Regan said that a formal response was never received; however, the Department began the process of developing rules.

Mr. Regan said it would be much more efficient if the Department had approached stormwater management issues on two separate tracks. Clearly the federal rules had to be implemented in North Carolina and a system had to be in place by March 2003, applying to those units that owned municipal storm sewer systems.

Mr. Regan said it also would have been more efficient for the counties if the Department had begun development of a stormwater program based on state law to address an appropriate role for county governments and land use management subdivision regulation.

Mr. Regan pointed out that the other two letters in Exhibit L come from the Attorney General's office, issued at the request of DENR, as to how the counties might be required to participate if they were deemed a MS4. Tanglewood Park in Forsyth County might fall into this category.

Mr. Regan said that DENR did attempt, in the temporary rules, to identify several ways in which counties could voluntarily participate in certain aspects of the program most notably in pre-construction regulation and in post-construction monitoring of stormwater issues.

Mr. Regan said that since the summer hearings, the Department has recognized the need to address an appropriate county role through separate rulemaking. In February, it is expected that the Department may take a two-track approach sending the rules that implement the federal requirements for the federal rulemaking and a separate set of rules applying to county governments to permanent rulemaking.

Mr. Regan concluded by saying that they needed more time and more input from the county governments affected to develop a meaningful set of regulations.

Ms. Kimberly S. Hibbard, Associate General Counsel, North Carolina League of Municipalities, presented her comments on the draft stormwater rules on behalf of the League of Municipalities. A copy of Ms. Hibbard's comments is listed as **Exhibit L**.

Senator Kinnaird asked Ms. Hibbard if there were incorporated towns with only 51 people in them.

Ms. Hibbard said there was one, Spencer Mountain.

Senator Kinnaird asked Ms. Hibbard if there was an exemption for a town as small as Spencer Mountain.

Ms. Hibbard said that her reading of the draft permanent rules indicates that essentially there is no exemption based on the size of a town.

Mr. Trip Van Noppen, Carolinas Office Director, Southern Environmental Law Center, offered his comments on the Phase II stormwater rules. A copy of Mr. Van Noppen's comments is listed as **Exhibit M**.

Mr. Van Noppen addressed the importance of managing stormwater, the reason we are doing Phase II, and commented on the specific rules and issues that are pending in the EMC.

Senator Odom asked Mr. Van Noppen if he had a problem with the adopted rules and asked he thought they should be more expansive.

Mr. Van Noppen said that this was correct.

Representative Gibson asked Mr. Givens to explain the difference between the temporary rule and the permanent rule.

Mr. Givens said that in 1996, the General Assembly amended the administrative procedure act to revise the process by which temporary and permanent rules are adopted. At that time, the concept of legislative disapproval of administrative rules was added to the statutes. The statues now provide for legislative disapproval of permanent rules but do not provide for legislative review of temporary rules.

Mr. Givens added that since 1996, the staff and the General Assembly have been grappling with this concept of legislative review of rules and with the constitutional issues related to separation of powers. While the statues does not provide for a formal mechanism for legislative disapproval of a temporary rule, most of the APA is statutory in nature and any member could introduce a bill that had the potential to affect a temporary rule, even though the APA does not provide for that.

Mr. Givens gave an example of the 1998 legislation on buffers where the status of the rule at that time was a temporary rule and a bill was introduced to address the temporary rule to provide further instructions and guides to the EMC on the adoption of the permanent rule.

Mr. Givens said that as things now stand, we have a temporary stormwater rule in effect and potential legislative review of the permanent rule in the 2004 Session.

Senator Clodfelter corrected Mr. Regan regarding his comment that Mecklenburg County operates a MS4 as defined in the regulations. They do, however, operate a stormwater management system, but not an MS4.

Senator Clodfelter added that Mecklenburg maintains all of the stream, creek and ditches in the county, but this is not a structured system and viewed it as a countywide stormwater system. So, when the compliance issue came

up, the question was how to integrate it with the MS4 that the cities in the county did operate.

Senator Clodfelter said if we look back at the legislation that resulted from this, we might come up with some good suggestions that could provide some good models to show how an integrated, countywide operation in which the roles of the particular parties are all well defined.

Senator Odom added that it appears there are legitimate concerns with regard to the process and the goal that the Department has set is commendable.

Senator Odom further added that this sounds like a good subject for a working group to see what can be done to work out some of the problems.

Dr. Charles M. "Mike" Williams, Director, Animal and Poultry Waste Management Center, North Carolina State University, gave a report on issues related to the evaluation of alternative animal waste management technologies to determine whether those technologies are environmentally superior and economically feasible. A copy of Dr. Williams' report and slide presentation is listed as **Exhibit N**.

Senator Albertson asked Dr. Williams to explain why two of the systems located outside of the United States.

Dr. Williams said that the technology providers are located in those locations. The system in Germany has been delayed because of cash flow problems.

Senator Albertson asked if the two operating technologies units are gasification units.

Dr. Williams said the two that have completed data are actually the inground ambient digester system on the Barem Farm with the greenhouse and the constructed wetlands system in Onslow County.

Senator Albertson asked if we are going to find a better system than the one we already have.

Dr. Williams said he is optimistic that of these eighteen, there will be some systems that will meet the environmental performance standards. However, he is concerned about the cost.

Representative Hill asked Dr. Williams if there a problem finding a market for the solids and how are they trying to solve this problem.

Dr. Williams said they are looking at technologies that have options other than just compost or fertilizer. That is why there are technologies that can take the solids and gasify those to an end product such as ethanol or methanol.

Dr. Williams said that another end product that is receiving a lot of attention nationally is bio diesel. Any of these systems that generate methane or solids would be a candidate for bio diesel.

Senator Clodfelter asked Dr. Williams if the schedule is an aggressive one or is it subject to slippage.

Dr. Williams said the schedule is subject to slippage and he continues to have surprises in this initiative. However, he has taken the information from the people involved in the process after a two-year learning curve and he feels they are realistic projections.

Mr. Givens asked Dr. Williams if he would be able to make a valid economic feasibility determination based on the 2004 group.

Dr. Williams answered in the affirmative.

Mr. Givens reminded members that the moratorium that has been in effect since March 1997 is scheduled to expire on September 1, 2003.

Representative Hill asked Dr. Williams if anything had been done to help the odor problem in the lagoon system, as it now exists.

Dr. Williams said that there has been improved management that is impacting the odor on farms.

Senator Albertson asked if this same technology be used for municipal waste and poultry waste.

Dr. Williams said there is no question that it could be. In fact, any of these technologies that are targeting a solid waste stream could be used for municipalities. The gasification approach, the larvae, the anaerobic digestion would all be candidates.

Senator Albertson commented that the benefits from these technologies could be very beneficial to us.

Dr. Williams concluded by saying that one of the technology suppliers of the anaerobic digester are also looking to process municipal type waste and have an arrangement with Ft. Bragg.

Senator Albertson asked Dr. Williams if possible a source of use with energy is feasible.

Dr. Williams said that this type of incentive would be necessary for broad-scale implementation.

Ms. Robin W. Smith, Assistant Secretary for Policy and Planning, DENR, gave a report on implementation of the two-year action plan for livestock operations. A copy of this plan is listed as **Exhibit O**.

Senator Albertson asked if they are making changes to some of the permits and when the NPDES comes in they will make changes again.

Ms. Smith said they are both going along on the same track. The NPDES general permit is final and now people are being asked to apply under that general permit. The general permit for the non-discharge expired this year and was due to be renewed.

Senator Albertson asked Ms. Smith if there are scientists involved in helping develop protocol for producers for groundwater testing.

Ms. Smith said they largely worked with DENR staff, the Pork Council and representatives from Frontline. The protocol was not a monitoring protocol but one for screening down to identify the farms that were to be evaluated.

Senator Albertson commented that he feels like there should be some scientific expertise in this evaluation.

Senator Albertson asked if the protocol is based on whether someone is not following rules and regulations.

Ms. Smith said they are basing it on the expertise of DENR staff and the other consultants in terms of types of violations that are likely to impact groundwater.

Senator Odom asked Dr. Williams to come forward to answer a question.

Senator Odom asked Dr. Williams what happens if his work is not completed by the time the Smithfield Agreement is terminated by time limitation.

Dr. Williams said there is a five-year research agreement between the University, Smithfield and the Attorney General's Office. The actual Smithfield Agreement is a twenty-five year agreement.

Senator Odom asked where this information comes from and suggested that we get something from the Attorney General's office to indicate where we will be if the research is not concluded by the date that agreement ends.

Senator Odom then asked how long the agreement with Frontline Farmers runs.

Dr. Williams said he did not know the time limitations on that agreement. The Frontline Farmers did not bring cash into the process; however, they are providing farms for making baseline measurements. This scope of work will be completed within the next couple of years.

Mr. Givens said that we have copies of all three agreements on file and will inquire about the terms of the agreement with the Attorney General's office.

Mr. Givens called attention to three items that were distributed to members during the lunch break. The first item is Response to Phase II Stormwater questions. The second item is Basinwide Water Quality Public Workshop Schedule and the third item is the Annual Report of the Conservation Easement Program. These three items are listed as **Exhibit P**.

Ms. Charlotte V. Jesneck, Head, Inactive Hazardous Sites Program, Superfund Section, Division of Waste Management, DENR, gave an annual report on the Inactive Hazardous Waste Sites Program. A copy of this report is listed as **Exhibit Q**.

Ms. Jesneck said there have been some local governments interested in converting some of these old landfills to greenspace. They would like to encourage this but do it in a way where exposure concerns are addressed. She said that building on landfills creates some expensive construction and problems with landfill gases entering into buildings that would be constructed on those properties.

Ms. Jesneck said that the most practical remedy for large, unlined landfills is for a local government or nonprofit group to purchase the property, placing land use restrictions on the property that would limit its use to greenspace or park space and ensuring that a cover is maintained over the waste.

Ms. Jesneck said that it is cost prohibitive in most cases to remove the waste. However, if the waste is not removed the groundwater will not be safe and the property would be unsuitable for restoring to unrestricted use levels.

Ms. Jesneck said that local governments that operated these did so to control indiscriminate dumping. The private individuals do not have funds for remediation.

Ms. Jesneck said that local governments and citizens would benefit from increased greenspace. Since the majority of these are located next to streams and rivers, redeveloping them as greenspace is even more critical. Property damage that occurs from more expensive development in flood prone areas would not be an issue, there would be little or no impervious surfaces installed with parklands that would aggravate flooding problems and the contamination exposure that currently exists would be addressed.

Ms. Jesneck said they are seeking funding from the federal government to continue to locate and determine the use of these old landfills in the remaining counties.

Ms. Jesneck said that there are many sites that are higher priority because of exposure concerns. At may of these sites, there are cases where

there is no financially viable responsible party. They are presently using the remainder of their clean-up funds to address these sites.

Mr. Bruce I. Nicholson, Head, Special Remediation Branch, Superfund Section, Division of Waste Management, DENR gave a report on the effectiveness of the Brownfield's Property Reuse Act in facilitating the remediation and reuse of existing industrial and commercial properties and receipts by expenditures from the Brownfield's Property Reuse Act Implementation Account. A copy of Mr. Nicholson's report is listed as **Exhibit R**.

Senator Clodfelter asked Mr. Nicholson asked what is needed to continue the progress we are making on this program.

Mr. Nicholson said that pursuing the federal funds under the Brownfields Act would allow for more staff.

Senator Clodfelter asked if the State has to match funds.

Mr. Nicholson said there is no state matching funds associated with this Act. What the federal government is looking at is that these funds be supplementary fund and not replacement funds.

Senator Odom asked Mr. Nicholson if there was any information available on the tax value of this program.

Mr. Nicholson said there are no statistics on this but numbers from developers themselves regarding individual projects and how much capital they are receiving or putting into those projects.

Senator Odom suggested that in his next report, he should include the increased property tax values for the local communities.

Mr. Nicholson added that there is also the Brownfield's Property Tax Incentive that could be used to help track this information.

Senator Kinnaird asked if the Penco Project was a contaminated site.

Mr. Nicholson said it was a contaminated site and the previous owner is still conducting a remedial operation on this site.

Senator Kinnaird asked if there are some sites that are too polluted to clean up. Could a parking deck be built on these types of sites.

Mr. Nicholson said this is a typical project they would undertake.

Mr. Nicholson said that under the statute, the one prohibition they have is that the site cannot be on a national priorities list, worst of the worst superfund sites. Other than that, a site would be eligible.

Senator Horton asked Mr. Nicholson if the time between application and completion would be about four months plus two months for public comment.

Mr. Nicholson answered in the affirmative.

Senator Horton asked what has changed between last year and this year with regard to the number of projects being completed.

Mr. Nicholson said the last two years have seen quite a number of Brownfield Agreements coming through. Prior to that, they did not have staffing or funding.

Senator Horton said that he had constituents who have faced discourtesy from personnel in the Brownfield's office and asked Mr. Nicholson to convey this message to proper people.

Mr. Ronald E. Ferrell, Program Manager, North Carolina Wetlands Restoration Program, Division of Water Quality, DENR, gave a report on implementation of the Wetlands Restoration Program and use of the Wetlands Restoration Fund. A copy of this report is listed as **Exhibit S**.

Mr. Ferrell said that all of the reports for the Wetlands Restoration Program can be found on their website.

Mr. Ferrell said that the Wetlands Restoration Program has made significant progress in meeting the statutory mandates established by the General Assembly. The foundation has been laid through careful watershed planning and project selection is yielding desired results for replacing lost wetland and repairing area functions throughout North Carolina.

Senator Odom asked Mr. Ferrell if part of Mecklenburg was in the Yadkin River Basin.

Mr. Ferrell said that Rocky River, in Mecklenburg County, is a tributary of the Yadkin River Basin.

Senator Odom asked Mr. Ferrell about the cost per acre dealing with riparian wetlands. He asked Mr. Ferrell if the cost had come down.

Mr. Ferrell said the reason for the cost coming down is due to non-riparian wetlands. The fee schedule is $12,000 for non-riparian and $24,000 for riparian wetlands.

Senator Odom asked Mr. Ferrell how many times the private mitigation bank companies were asked to respond to the survey.

Mr. Ferrell said they had sent the same survey out every year since 1998 and the response rate from the private banking community had gone down each year. There were only two respondents in 2002.

Representative Gibson announced that the ERC may meet during the 2003 Session.

Mr. Givens said that as of 29 January 2003, the ERC would consist of those members of the Commission who continued to be members of the General Assembly. He said that we would continue to have 11 members until the leadership of each House made changes and appointments.

Mr. Givens said that further notification of ERC meetings would be announced on the floor of the House and Senate.

Members bid farewell to Senator Odom who has served as Co-Chair of the ERC since 1995.

The meeting was adjourned at 3:00 p.m.

RE: **Notice of Meeting**

COMMISSION MEETING:

The Environmental Review Commission will meet at 9:30 a.m. Tuesday 28 January 2003 in Room 643 of the Legislative Office Building in Raleigh.

At this meeting, the Commission will hear reports from State agencies, consider studies for which the Commission is responsible, and attend to other matters.

The agenda for the 28 January meeting of the Commission may include:

1. Report on progress in implementing the "clean smokestacks" legislation (Senate Bill 1078, S.L. 2002-4)
2. Report on progress in implementing the motor vehicle inspection and maintenance program
3. Report on the process by which areas of the State are designated as non-attainment areas with respect to air quality standards for specific pollutants
4. Annual report on the status of solid waste management efforts (G.S. 130A-309.06(c))
5. Comment on the development and implementation of rules and programs to control stormwater runoff
6. Discussion of issues related to the evaluation of alternative animal waste management technologies to determine whether those technologies are environmentally superior and economically feasible
7. Report on implementation of the two-year action plan for livestock operations (S.L. 2002-148, Sec. 2)
8. Annual report on the Inactive Hazardous Waste Sites Program (G.S. 130A-310.10(a))

9. Annual report on the effectiveness of the Brownfields Property Reuse Act in facilitating the remediation and reuse of existing industrial and commercial properties and receipts by and expenditures from the Brownfields Property Reuse Act Implementation Account (G.S. 130A-310.40)

10. Annual report on implementation of the Wetlands Restoration Program and use of the Wetlands Restoration Fund (G.S. 143-214.13)

11. Other matters related to the Commission's powers and duties under G.S. 120-70.43

FUTURE MEETINGS:

The General Assembly will convene for the 2003 Session of the General Assembly at 12:00 noon on Wednesday 29 January 2003.

The Commission may meet at other times while the General Assembly is in session (G.S. 120-70.44). If the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representatives as provided by G.S. 143-318.12(b). The Commission will resume a schedule of regular monthly meetings following adjournment of the 2003 Session of the General Assembly. Mailed notices of Commission meetings will resume at that time.

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties in specific topics as indicated below:

Leaking Underground Storage Tank Working Group
10:00 a.m. Monday 3 February 2003 – 605 Legislative Office

ADDITIONAL INFORMATION:

Persons who have questions about the Commission meeting or other matters related to the Commission may contact the Commission Counsel at (919) 733-2578.

AGENDA
9:30 a.m. Tuesday 28 January 2003
Room 643 – Legislative Office Building

1. Call to order
   Representative Pryor Gibson, Presiding

2. Introductory remarks by Cochairs
   Representative Pryor Gibson
   Senator Fountain Odom

3. Report to the Commission and explanation of agenda items
   George F. Givens, Commission Counsel

4. Report on progress in implementing the "clean smokestacks" legislation (Senate Bill 1078, S.L. 2002-4)
   P. Eugene Upchurch, Director of Public Affairs
   Progress Energy

   George T. Everett, Vice President for Environmental Affairs
   Duke Power

   Keith Overcash, Director
   Division of Air Quality, DENR

5. Report on progress in implementing the motor vehicle inspection and maintenance program
   Carl G. Pigford, Administrator
   Motor Vehicle Emissions Inspection and Maintenance Program
   Division of Motor Vehicles, Department of Transportation

6. Explanation of the process by which areas of the State are designated as non-attainment areas with respect to air quality standards for specific pollutants
   Brock M. Nicholson, Chief
   Planning Section, Division of Air Quality, DENR

7. Annual report on the status of solid waste management efforts (G.S. 130A-309.06(c))
   Paul S. Crissman, Environmental Programs Manager
   Solid Waste Section, Division of Waste Management, DENR

   Scott B. Mouw, Chief
   Community and Business Assistance Section, Division of Pollution Prevention and Environmental Assistance, DENR

8. Comment on the development and implementation of rules and programs to control stormwater runoff (Response to report presented by Coleen Sullins at the 16 January 2003 meeting of the Commission)
   Lisa D. Martin, Director of Regulatory Affairs
   North Carolina Home Builders Association

   Edmund P. Regan, Deputy Director
   North Carolina Association of County Commissioners

   Kimberly S. Hibbard, Associate General Counsel
   North Carolina League of Municipalities

   Trip Van Noppen, Carolinas Office Director
   Southern Environmental Law Center

LUNCH BREAK – Estimated for 12:15 p.m. to 1:00 p.m.

9. Discussion of issues related to the evaluation of alternative animal waste management technologies to determine whether those technologies are environmentally superior and economically feasible
   Charles M. "Mike" Williams, Director
   Animal and Poultry Waste Management Center
   North Carolina State University

10. Report on implementation of the two-year action plan for livestock operations (S.L. 2002-148, Sec. 2)
    Robin W. Smith, Assistant Secretary for Policy and Planning
    DENR

11. Annual report on the Inactive Hazardous Waste Sites Program (G.S. 130A-310.10(a))
    Charlotte V. Jesneck, Head
    Inactive Hazardous Sites Program, Superfund Section
    Division of Waste Management, DENR

12. Annual report on the effectiveness of the Brownfields Property Reuse Act in facilitating the remediation and reuse of existing industrial and commercial properties and receipts by and expenditures from the Brownfields Property Reuse Act Implementation Account (G.S. 130A-310.40)
    Bruce I. Nicholson, Head
    Special Remediation Branch, Superfund Section
    Division of Waste Management, DENR

13. Annual report on implementation of the Wetlands Restoration Program and use of the Wetlands Restoration Fund (G.S. 143-214.13)
    Ronald E. Ferrell, Program Manager
    North Carolina Wetlands Restoration Program
    Division of Water Quality, DENR

14. Commission discussion and announcements

15. Adjourn

FUTURE MEETINGS:

The Commission may meet while the General Assembly is in session (G.S. 120-70.44). If the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representatives as provided by G.S. 143-318.12 (b). The Commission will resume a schedule of regular monthly meetings following adjournment of the 2003 Regular Session of the 2003 General Assembly. Mailed notices of Commission meetings will resume at that time.

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Leaking Petroleum Underground Storage Tank Working Group
10:00 a.m. Monday 3 February 2003 – 605 Legislative Office Building

NC Department of Environment and Natural Resources
Truth In Penalties Framework

What is the goal of Truth in Penalties?

The goal of Truth in Penalties is to encourage responsible environmental behavior through enforcement programs that are strong, effective and fair – so that

- serious violations of environmental laws are met with serious consequences;
- penalties are consistently and vigorously assessed and collected; and
- the public has full confidence in environmental enforcement.

Truth in Penalties Strategy

Target serious violations in all programs

- Assess stiff and deterring penalties for willful violations.
- Assess stiff and deterring penalties for violations posing a serious threat to the environment.
- Increase the severity of enforcement for repeat violations.
- Seek increased penalty authority where necessary.
- Close the gap between the amount of the penalties assessed and the amount collected.

Ensure public access to the enforcement decision-making process in all programs

- Clarify and disclose to the public the criteria used by each program in the Department to establish and modify penalties.
- Provide to the public a complete description of the appeal process.

Make penalty information available to the public in a clear, usable form

- Using year 2000 as a baseline, regularly report to the public on penalties assessed, penalties collected, compliance rates by program and trends in enforcement.
- Develop an integrated computer system to share information between programs and to make penalty information across program lines more readily available to the public.

North Carolina Division of Water Quality
Annual Report of Fish Kill Events
2002

Water Quality Section
Environmental Science Branch
Raleigh, NC
December 2002

Introduction

The investigation of fish kill activity across the state currently involves protocols established by the North Carolina Division of Water Quality (DWQ) in 1996. The protocols were developed with assistance from Regional Office staff, North Carolina Wildlife Resources Commission biologists, and Division of Marine Fisheries personnel as a means to improve the tracking and reporting of fish kill events in North Carolina. Fish kill and fish health investigations are recorded on a standardized form and sent to the Division's Environmental Sciences Branch (ESB) where the data are reviewed and compiled. Data from fish kill investigation forms and supplemental information sent to the ESB are entered into a central database where the data can be managed and retrieved for use in reports to concerned parties. The procedure also requires the notification of appropriate state officials and scientists associated with the investigation of such events. In addition, reported kill information is updated weekly on the ESB website at: www.esb.enr.state.nc.us/Fishkill/fishkillmain.htm.

This document is a summary of fish kill events reported to the DWQ from January to mid December, 2002. The report is mandated under Section 4 of Chapter 633 of the 1995 North Carolina General Assembly Session Laws.

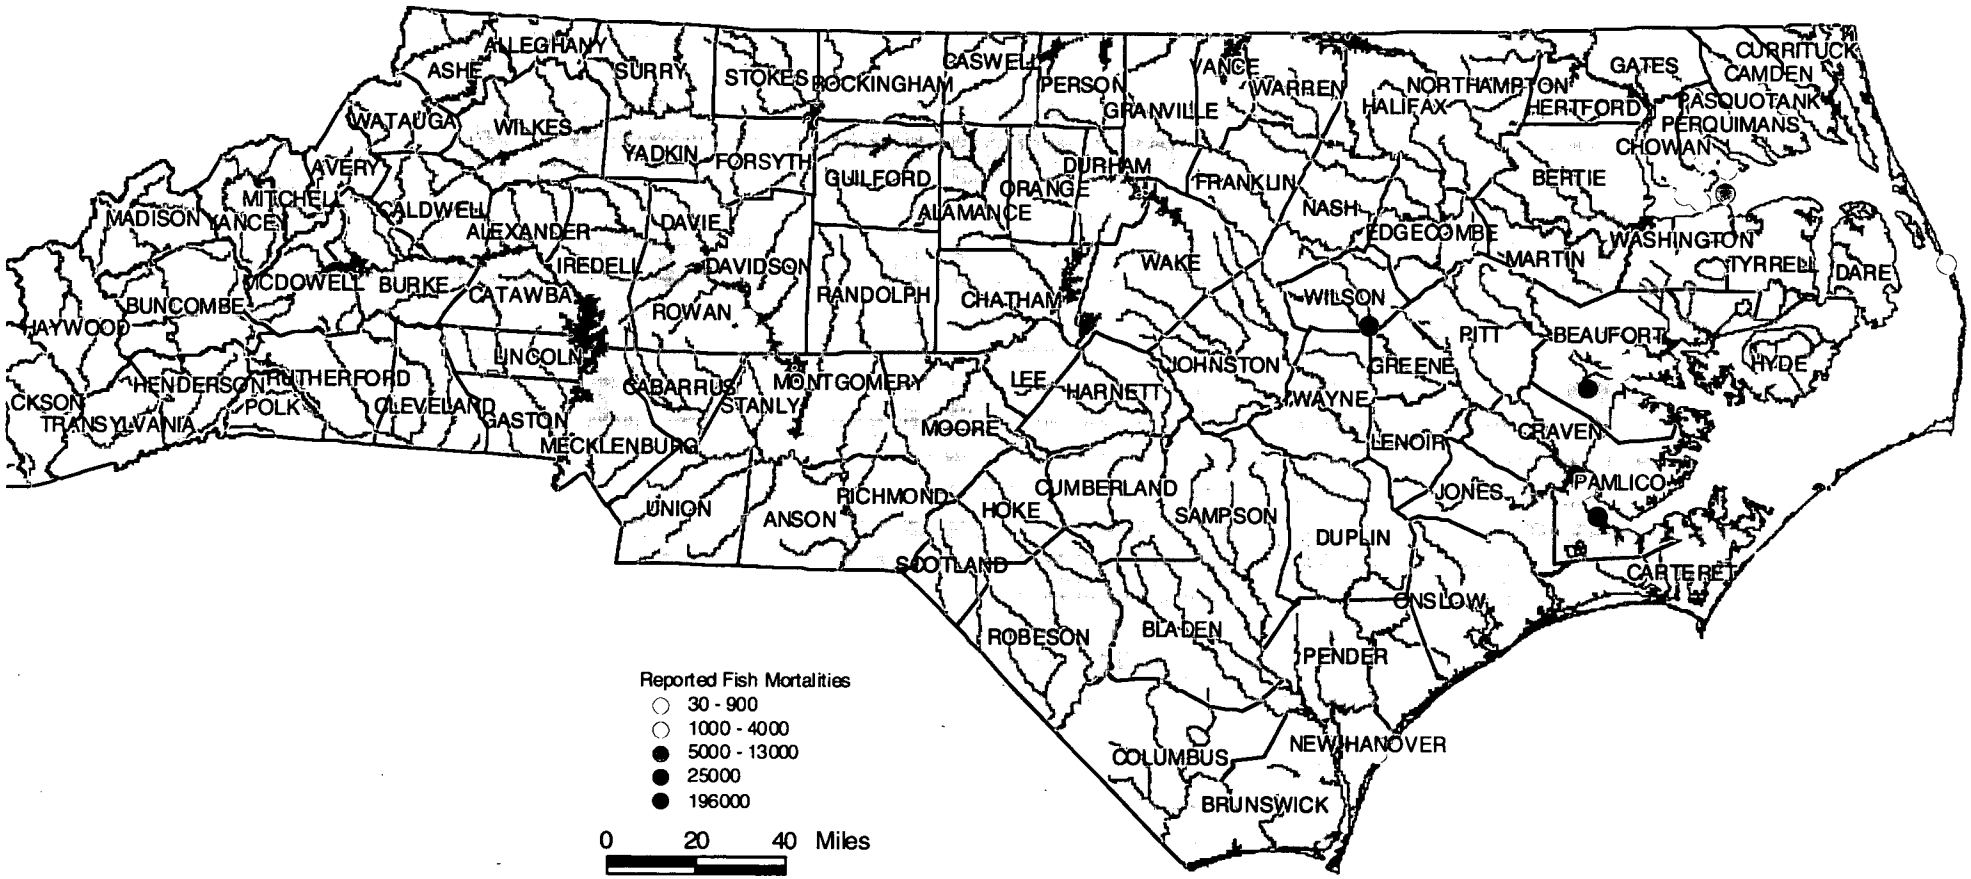
2002 Fish Kill Summary

Field investigators reported 46 fish kill events from January to December, 2002. Kill events were reported from the coast to as far west as Mitchell County in 9 of the state's 17 major river basins. The ESB tracks fish kill events when at least 25 fish are affected and when the event is confirmed by investigators.

The total fish mortality for all 2002 reports was 269,635. This figure represents a sharp drop from the 2001 figure and is the lowest total since systematic fish kill reporting began in 1996. Mortality totals for individual events ranged from 30 to 196,000 with a median mortality of 350. Two-thirds of the fish kill activity for 2002 was reported from freshwater locations leaving about one-third of reports from estuarine waters. No reports were received from the Atlantic Ocean.

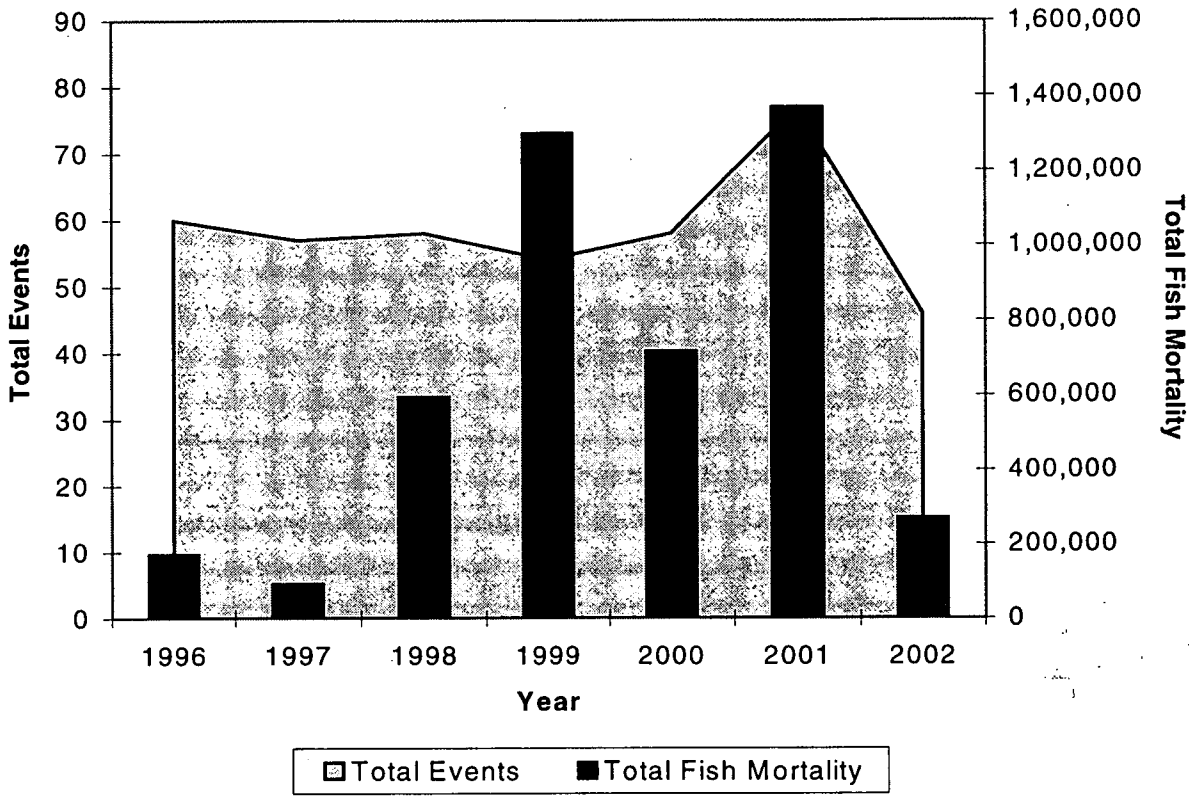
Total Kill Events for 2001	46
Total Mortality for 2001	269,635 (229,796 Freshwater, 39839 Estuarine)
Report Mortality Range	30 to 196,000
Report Median Mortality	350
Basins with Activity	9 (of 17)
Freshwater Kills	30
Estuarine Kills	16

Figure 1 : Fish Kill Events Reported to NCDWQ - 2002



million (2001). The total for 2002 represents a sharp drop from yearly totals reported for the previous four years (Figure 2).

Figure 2: Reported annual fish kill events and mortality, 1996 to 2002



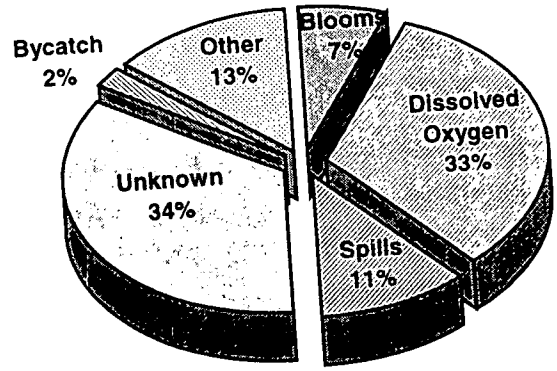
Suspected Causes of 2002 Events

Specific causes of fish kill events may or may not be obvious to investigators depending on a host of factors. Many causes may quickly be defined, but others remain unconfirmed or unclear due to an investigation occurring after the fact. Kill events often result from many environmental conditions, and sorting out the major reason(s) why fish are dieing is frequently a difficult and often subjective task. The NCDWQ reviews and tracks suspected causes of fish kills reported by field investigators. Suspected cause reports aid in evaluating potential water quality trends and problems, and assist scientists and decision-makers with formulating future courses of action. Suspected cause reports should not be viewed as a definitive label for a particular event.

Reported causes of 2002 kill events are summarized into six categories –dissolve oxygen (DO) induced events, algal bloom related events, spills, bycatch, and other (miscellaneous) causes. Those events where no specific causes could be determined were assigned as "unknown" (Figure 3).

Dissolved Oxygen Depletion: Poor dissolved oxygen (DO) was cited as a factor in 33 percent of the kill events during 2002. Unlike the trend in previous years, the majority of DO related kills were reported in fresh waters. Freshwater DO events were reported in conjuction with low flows and high water temperatures brought about by the state's ongoing drought conditions, most notably in July and August. Although several DO related events occurred in estuarine waters, the intense kill activity historically associated with DO problems in the lower Neuse and Pamlico Rivers was reduced in 2002.

Figure 3: Suspected causes for fish kills - 2002



Harmful Algal Blooms: Nutrient enrichment of waterbodies throughout North Carolina has resulted in eutrophication and algal blooms, common factors in fish kill events. Algal blooms cause dissolved oxygen (DO) and pH fluctuations as well as DO depletion through diurnal cycles and algal decomposition. These elements often precede fish kills events. Certain types of algae also release toxins during the course of a bloom that are detrimental to aquatic life. Blooms were suspected in 7 percent of the fish kill events for the year. A dense bloom of the blue-green alga *Oscillatoria geminata* occurred in High Rock Lake near Buddle Creek in October. The bloom depleted DO levels and was a factor in the death of 1,000 common carp and striped bass. Water samples from two estuarine fish kills contained dense blooms of dinoflagellates, ciliates, some euglenoids and cryptomonads (see Appendix B).

During 2002, the ESB staff routinely examined water samples associated with estuarine fish kills for the presence of *Pfiesteria* and *Pfiesteria*-like organisms. ESB examinations were performed using light and epifluorescent microscopy. Suspect samples warranting further confirmation for toxic *Pfiesteria* species were also forwarded to UNC-Greensboro and the NCSU Center for Applied Aquatic Ecology for further tests. These tests included fish bioassays, scanning electron microscopy, and an RNA probe that can discern the presence of actual *Pfiesteria* cells.

Pfiesteria-like cells examined by ESB staff during 2002 appeared as nontoxic obligate autotrophs and not forms historically associated with fish health events. At the time of this report, all confirmatory tests results have been reported as negative and all involved laboratories have reported that toxic *Pfiesteria* was not a causal factor in any of the 2002 events.

Spills: Toxic spills either deplete DO levels in receiving streams or induce kills outright through physical or chemical toxicity. Spills were reported as a cause in 11 percent of the kill events during 2002 (Table 2).

Table 2: Spill-induced fish kills during 2002.

Date	Waterbody	County	Mortality	Comments
1/10	Hitchcock Creek	Richmond	70	Kill caused by uncured concrete coming in contact with water below Lake McKinney spillway.
4/18	Cane Creek	Mitchell	1062	Kill event was caused by a petroleum spill into Cane Creek on 4/16/02.
4/19	Pete Dye Lake	New Hanover	200	Investigators suspected prior application of copper based algacide as cause for kill.
5/12	Village Creek	Chowan	500	Kill caused by discharge water from a fire at the Chowan Veneer facility.
7/30	Peter's Creek	Forsyth	1000	Kill caused by a fire at P&B distributors on Chatham Street in Winston Salem on 7/30/02. Chemicals from the fire migrated to Peter's Creek.

Bycatch: Discarded fish from nearby fishing operations was reported as a cause in only one kill event during 2002. A kill of 1,000 menhaden was reported on Albemarle Sound by Division of Marine Fisheries investigators in late October. Investigators suspected the fish were discarded eel pot bait.

Other: Miscellaneous causes were reported for 13 percent of the fish kills during 2002. Fish were reported killed by extremes in temperature in several reports both during the winter and summer. A bacterial infection of catfish in Catawba County and trauma in associated with a dam spillway affecting threadfin shad on the Pee Dee River were among other miscellaneous events.

Unknown Causes: Causes for kill events are listed as unknown when investigators fail to report specific reasons for an event. Investigations may not provide definitive causes when they are conducted too long after an event and no clear factors are determined, or when causes are suspected but not confirmed. Investigators failed to cite specific causes for an event in 34 percent of the year's reports. Reports with unknown causes were received from both estuarine and fresh waters. Investigators reported dead or decomposed fish even though water quality measurements and water samples failed to suggest a problem.

Drought Effects: North Carolina entered a fourth consecutive year of drought conditions in 2002. The entire state was affected with the center of the state experiencing the most severe conditions, and the far western and eastern sections generally experiencing moderate drought. During June and July, 80 percent of the monitored streams across the state were at less than 10 percent of normal flow for that time of year (www.ncwater.org). Some areas across the state reported rainfall levels from 40 to 60 inches below normal since the drought began.

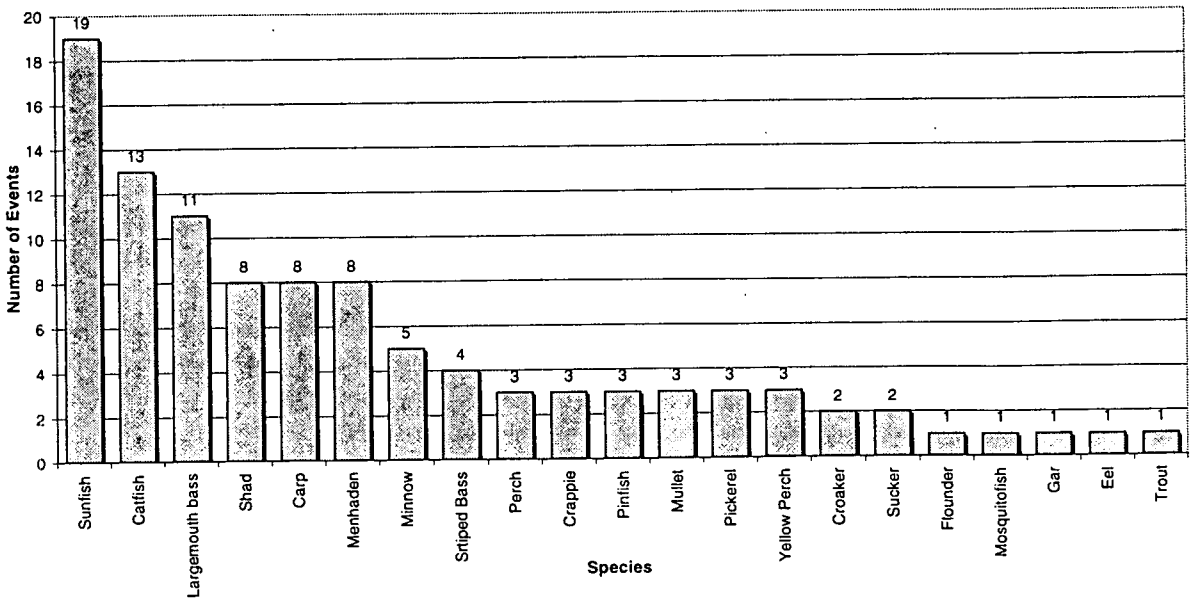
Drought conditions were evident in many fish kill reports submitted by investigators during 2002. Reports from the eastern sections of the state often mentioned low dissolved oxygen levels associated with low river flows and subsequent stagnation. Eastern investigations also revealed areas with extremely high salinities due to the lack of freshwater inflow. High salinities were blamed for the stress and mortality of freshwater fishes in a number of waterways around the Neuse and Pamlico estuaries. Investigators from the Piedmont often reported fish kills occurring simply from a lack of water. Numerous investigations as well as a number of anecdotal reports from citizens described extremely low river flows and lake levels that trapped fish in small pockets without adequate oxygen to sustain the schools.

The year's most high profile events occurred on High Rock Lake (Davidson and Rowan Counties) during a period from July to October. Record low stream-flows into High Rock Lake reduced water levels over 20 feet below full pool by September. The low water levels were a factor in the death of at least 5,000 fish most of which were common carp (see Appendix B). Reports from citizens during this time period suggested that many more fish may have perished on High Rock Lake, but were not observed by investigators due to access difficulties, scavenging, and limited manpower.

Fish Species

Fish kill reports in 2002 involved 21 different species of fish across the state (Figure 4). Freshwater species most commonly identified during investigations included sunfishes, catfishes, and largemouth bass. Estuarine species most commonly reported included menhaden. Menhaden, which have historically been involved in a majority of yearly kill events, were cited in only eight kills during 2002. Menhaden reports decreased as a result of reduced kill activity in the state's estuaries.

Figure 4: Fish species observed during 2002 fish kill events



Other animals were observed at about 15 percent of the year's kill events. These included blue crab, Rangia clams, scallops, Asian clams, crayfish, turtles, and ducks. A large kill of rangia clams was reported on the Yeopim River (Perquimans County) from unknown causes in August. Investigators also reported a significant kill of asian clams as a result of drought effects on the South Yadkin River (Davie County).

NCSU College of Veterinary Medicine Pathology Results

During 2002, Dr. Mac Law along with NCSU College of Veterinary Medicine staff and veterinary students, assisted DWQ investigators by performing gross and microscopic evaluations of fish found dead and fish found stressed and/or diseased in association with fish kill events. Dr. Mac Law is an American College of Veterinary Pathology (ACVP) board-certified veterinary pathologist at the North Carolina State University College of Veterinary Medicine.

The year was relatively quiet for fish kill activity in the state's estuaries, so Dr. Law's staff was asked to evaluate only a small number (less than 20) of Atlantic menhaden from only three kill events. Most of these fish had no remarkable gross or microscopic lesions, and the cause of the kills was not associated with a particular disease syndrome (i.e., some kills were attributed to low dissolved oxygen, which leaves no observable lesions behind). The few lesioned fish associated with fish kills had chronic symptoms and fungal infections consistent with ulcerative mycosis described by Noga, et al (1993). At present Dr. Law's staff has been unable to establish a solid link between the presence of lesioned menhaden or the presence of potentially harmful algal species (such as toxic *Pfiesteria*) with fish kill events that they have helped investigate.

The NCSU laboratory also helped DWQ investigate a large kill of common carp in High Rock Lake, NC. Since carp were the only species affected, a viral agent was suspected and fish samples were submitted for virus isolation. No viruses were found in any of the samples. Lesions were, however, consistent with a bacterial infection that caused severe gill pathology.

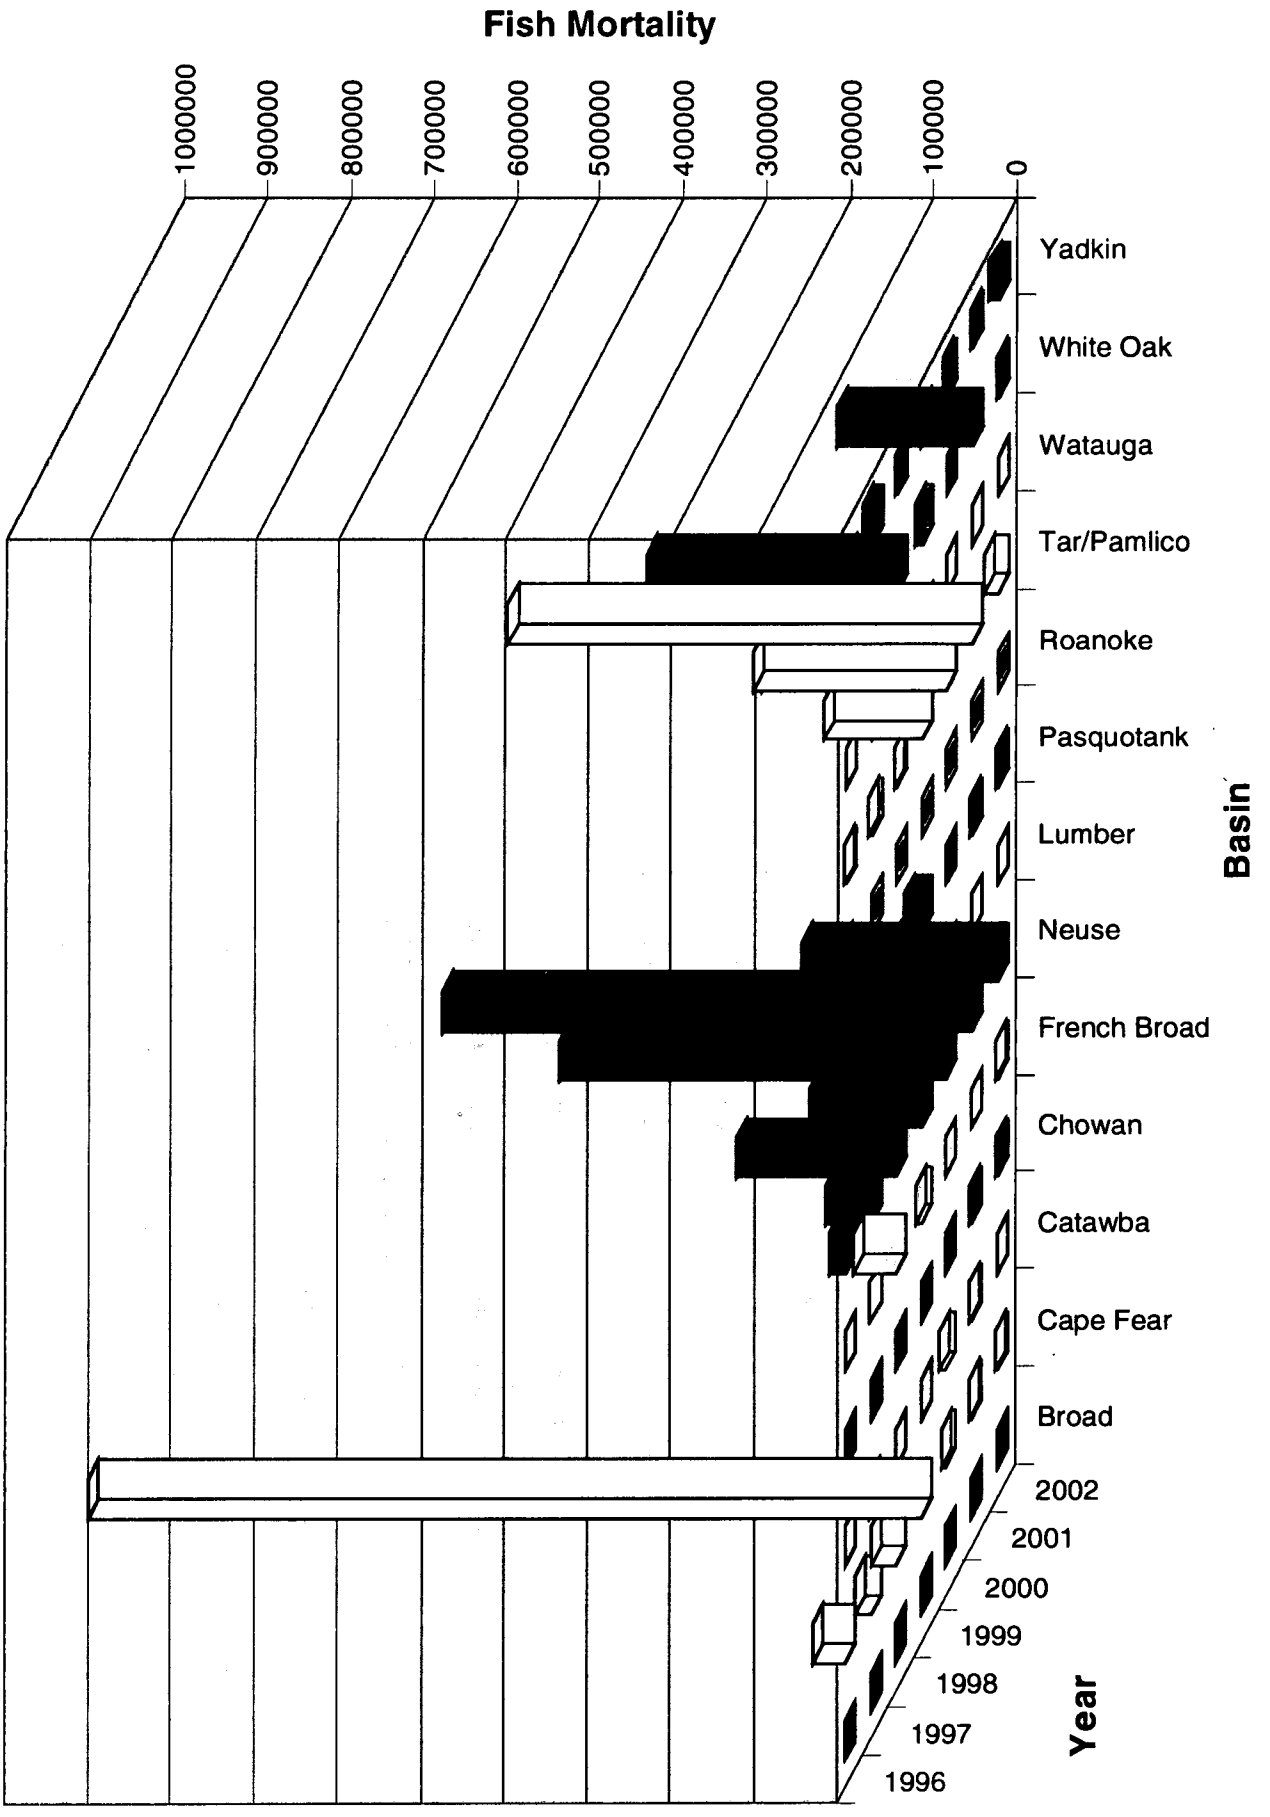
2002 Summary

The number of fish kills reported across North Carolina during 2002 declined from previous yearly figures to 46. This is the lowest number of reports since the DWQ began systematically tracking fish kill activity in 1996. Reported fish mortalities were also low, totaling about 270,000 fish.

As North Carolina entered a fourth year of drought conditions in 2002, environmental conditions conducive to fish kills appeared to worsen. Severe conditions were experienced throughout the midsection of the state where most flows in monitored streams dropped below 10 percent of normal. These conditions further resulted in stream stagnation, depleted dissolved oxygen levels, and high salinities (coastal areas). The effects of the drought were common in reports from investigators throughout the season. Reports to ESB showed the worse kill activity shifted away from coastal estuaries where the most activity was reported in prior years, to inland streams and reservoirs where water levels were critically low. About 85 percent of the 2002 fish mortality was reported from freshwaters.

Although the drought played a role in many kill events during 2002, the drought effects surprisingly did not increase the total number of events or total fish mortality for 2002 over prior yearly figures. Investigators pointed to several conditions brought on by the drought that may have acted to suppress fish kills in 2002. Drought conditions drastically reduced freshwater flows into estuaries and coastal systems. Areas that typically experience water column stratification at the saltwater and freshwater interface were more saline in 2002 and thus less stratified. Water quality problems associated with stratification, such as hypoxia, were reported on a much smaller scale in coastal areas. Less freshwater input into reservoirs and estuaries also meant less input of the nutrients responsible for algal blooms often associated with fish kills. ESB staff received 31% fewer reports of algal blooms statewide when compared to 2001. It was anticipated that freshwater fish species in coastal areas would suffer from saltwater intrusion into creeks and rivers as a result of the drought. Investigators reported eight kill events where saltwater stress may have played a role, far fewer than the number expected. Some investigators concluded that freshwater species were able to move far enough upstream to avoid salty conditions, or they were more tolerant of those conditions than expected.

Appendix A : Fish mortality by basin, 1996 - 2002



Appendix B: Fish kills reported to DWQ

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
1/3/2002	030501	WL02002	Pasture Branch	near Molly's Landing	Onslow	Mullet	540	Water quality measurements were normal at time of investigation. Investigators suspected extreme cold mayy have induced kill.
1/3/2002	030502	WL02001	New River	US 17 in Jacksonville	Onslow	White perch	30	Water quality readings were normal at time of investigation. Marine patrol indicated fish looked fine with no sores or injuries. Investigators suspected cold temperatures induced kill.
1/10/2002	030716	FA02001	Hitchcock Creek	Lake McKinney	Richmond	Bluegill, Largemouth bass, Chain pickerel, Pirate perch, Catfish	70	Kill caused by uncured concrete coming in contact with water below Lake McKinney spillway. No fines or penalties assessed by NCWRC.
1/24/2002	030307	WA02001	Bay Lake		Beaufort	shad, sunfish, perch, catfish, gar	500	Cause of fish kill is unknown, fish found at event were severely decomposed and water conditions were within resonable expectations. The weather on the day the kill was reported was 70+ F and winds 20+ WSW, and there were multiple rainfall events within the last two weeks. Past several days were rainy with aprox. 1.5" rain. Fish had been reported dead one or two here and there within the last week or so, wind had pushed all of dead fish together in corner of canal and drawn the attention of residents. Salt was high and DO was low in some canals. Canals closest to outlet were fresher with normal DO those farthest from canal outlet were salter and had lower DO near the bottom.
1/25/2002	030407	WA02002	Private Pond	near Farmville	Pitt	shad, sunfish, perch	3800	Community fishing pond next to Farmville Waste Water Treatment Plant. Past several days were rainy with aprox. 1.5" rain. Most of fish were several days dead with a few that had died with in a day (still had color to scales). Area around pond was mostly swamp, readings at the time of investigation were with in normal range. Overflow from swamp could have caused pond to turn over.
4/4/2002	030623	WL02003	Floyd Lake		Onslow	sunfish	200	Lake level extremly low - pond had become 2 water bodies. Kill occurred in the larger, deeper pond. Two stations were sampled in the larger pond, one station in the smaller pond. A cold front came in overnight (after the kill) and it was overcast.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
4/12/2002	030307	WA02003	Canal	Middle Street Aurora	Beaufort	sunfish, largemouth bass, mosquito fish	50	Fish seen floating along the surface being pushed out toward main body of Pamlico river. Neighbor along the canal reported seeing dead fish on 4/11/02. Parameters were within normal ranges for south side of Middle St. with the exception of high DO % Sat., bloom suspected. Parameters on the north side of Middle St. had a low DO. Other canals were obseved in the area and a few dead fish were also found in them, again parameters for these canals were with in normal ranges. Water samples contained a dense algal bloom of dinoflagellates, ciliates, and some euglenoids and cryptomonads.
4/14/2002	030413	WA02004	Alligator Creek	NC 55 near Stonewall	Pamlico	Menhaden	3060	Fish kill took place in Pamlico Co. on Alligator Cr. The kill spanned for a quarter mile downstream from HWY55 bridge south of the town of Stonewall. Only menhaden were observed in the kill, none with lesions. The fish appeared to be around 24hrs old. The creek is very shallow and narrow and there were thunderstorms moving through the area for a couple of days. There was an algal bloom present and samples were taken.
4/18/2002	040306	AS02001	Cane Creek	at Bakersville	Mitchell	Trout, Northern hogsucker, sunfish, stoneroller, bluehead chub,	1062	Kill event was caused by a petroleum spill into Cane Creek on 4/16/02. Most fish appeared to have died quickly from an acute event and did not show signs of disease. Many carcasses contained residues of petroleum. NCWRC requested a reimbursment from the responsible party of $1825.
4/19/2002	030617	WL02004	Pete Dye Lake		New Hanover	Carp, Bass, Sunfish, Eel	200	Investigators suspected prior application of copper based algaecide as cause for kill. 5 gallons of Cutrine Plus applied 3 days prior to event. Lake is also shallow and in the vicinity of golf course with no buffers. The lake has experienced fish kill events at numerous times in the past.
4/24/2002	030622	WL02005	Nash Johnson Lake		Duplin	Sunfish, Bass	1000	Water at time of investigation described as green with floating filamentous mats. Water samples analyzed by ESB didi not show evidence of bloom event.
5/9/2002	030307	WA02005	Pamlico River	Hawkins Beach	Beaufort	Menhaden	250	95 percent of affected fish had lesions. Increasing water temperatures and sudden changes in water conditions due to wind shifts may have caused a marked change in DO or salinity. Lesioned fish may not have been able to adjust to these changes, having difficulty in osmoregulating and moving to areas where oxygen, salinity, and temperatures would not have been at such stressful levels.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
5/12/2002	030104	WA02006	Village Creek	Edenton	Chowan	Shad, bluegill, Largemouth bass, White Catfish	500	Discharge water from a fire at the Chowan Veneer facility on Thursday, May 9, was observed running into the headwaters of Village Creek. Firefighters placed hay at the entry and exit outlets on a small impoundment on Village Creek to contain the runoff. No chemicals were known to be in the plant during the time of the fire, with the exception of wood dye (makeup unknown). The cause of the fire was traced to a faulty conveyor belt; the origin of the fire was not under suspicion.
5/22/2002	030710	FA02002	Pee Dee River	Below Tillery Dam	Montgomery	Treadfin Shad	3000	CP&L biologists investigated the kill. They suspect that shad were schooling near the dam and high wind and wave action forced them over the dam and into the tailrace. Mortalities appeared to be a result of falling over the dam and hitting the dam apron. Dam operators had noticed large schools of shad in the forebay area preceeding kill.
6/1/2002	030618	FA02003	Black Lake	behind Clubhouse	Bladen	Yellow perch	300	Hot weather days prior. No causes suggested by investigators.
6/5/2002	030409	WA02007	Weyerhaeuser Pond		Pitt	Sunfish, Carp, Largemouth bass	200	A fire occurred at the Weyerhaeuser saw mill on Saturday, June 1, 2002 around 5:00. After the fire, many aeriation pumps were turned off. The pond where the fish were dead is the last in a series before it discharges into Little Swift Creek. This pond is the last to receive flow and aeriation. The intense heat combined with shallow water is believed to be the reason for the low dissolved oxygen.
6/17/2002	030410	WA02008	Slocum Creek	Near Cherry Point	Craven	Channel catfish	62	Approximately 62 Channel catfish were found severely decomposed in the upper reaches of navigable waters of Slocum Cr. Dissolved oxygen levels were found to be less than 1 mg/L from 1 meter down to the bottom in the area of the fishkill. Heavy rains two days prior most likely caused a flushing type event, which pushed stagnant water from upstream areas containing very little if any dissolved oxygen into the area of the fishkill. Persistant drought conditions have caused many creeks along the neuse River estuary to become highly saline which could also stress freshwater fish species. Salinity levels at the site of the fishkill were higher than expected, and were found throughout most of the water column. In the area of the fishkill thousands of healthy Atlantic Menhaden were observed swimming in the uppermost layer of the water column. No other species were found dead in this fishkill, although several other were observed in the area after the event.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
7/2/2002	030153	WA02023	Albemarle Sound	Hwy 32, Mackeys side	Tyrrell	Menhaden	1000	Mr. Winslow called PRRT and reported that DMF had responded to a fish kill. Approximately 1000 menhaden 8-9" in length washed along shore. The fish had no signs of lesions and were decaying. DO levels 8 mg/L, salinity 4.1 ppt and water temp. 28.5-30.3°C. DMF officials believe the kill to be a release of eel pot bait.
7/3/2002	030410	WA02009	Neuse River	near Fairfield Harbor	Craven	Atlantic menhaden	400	A small kill comprised of Atlantic Menhaden with all fish showing lesions. This kill is most likely a result of high temperatures stressing lesioned fish. Many healthy schools were sampled in the area of the kill and those fish that were sampled showed less than 1% lesions. No algae bloom activity was found at the kill area and most fish were found in a small very shallow bay.
7/4/2002	030410	WA02010	Neuse River	Bridgeton	Craven	Atlantic menhaden, Striped Bass	6500	Approximately 6500 dead Atlantic Menhaden were found along a stretch of the Neuse River at Bridgeton. Fish appeared to be around 12 hours old, and had died in the area offshore of Bridgeton and were blown onto the shoreline, and into grass beds along the eastern shoreline of the Neuse River. Conditions in the area of the fishkill were stratified for several days prior to this event and, several smaller similar kills had also occured just downstream along the same shoreline. Hot conditions and a persistant salt wedge caused severe stratification in the Neuse River from Johnson Pt. to upstream of New Bern. These conditions most likely caused the death of lesioned fish swimming in that area due to added stress of high water temperatures, and low oxygen conditions.
7/7/2002	030502	WL02006	Little Northeast Creek	Jacksonville	Onslow	Largemouth bass, Pickerel, Sunfish, Atlantic menhaden	150	A fish kill was investigated by NRRT on 7/7/02 at 14:30. Upon investigation approximately 150 mixed species of fish were found in Little Northeast Creek , a trib. of the New River. The fish apeared to be about 48hrs old with no obvious signs of sores or lesions. There had been severe thunder storms in the area two days before the kill was reported. The salinity in the creek was high and the DO was very low.
7/8/2002	030407	RA02001	Private Pond	near Stantonsburg	Wilson	Largemouth Bass, Sunfish, Minnows	196000	Ben Smith, Stantonsburg Wastewater Plant ORC, reported seeing fish mortality at about 8 PM July 6, and by 10 AM July 7, all activity had ceased. He measured DO on Sunday AM at about 0.5 mg/l. Strongly suspect hot pond water had relatively low DO, then rainstorm went to the bottom and caused the pond to "turn over". Investigator certain fish died from lack of oxygen. Impacted all sizes and all species over a short period of time.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
7/9/2002	030155	WA02011	Pamlico Sound	near Oregon Inlet	Dare	Flounder, Houndfish, Pinfish, Mullet, Toadfish	54	Commercial gill netting for flounder and mullet occuring in area prior to kill. Fish looked dead for quite some time. Investigators unable to definitely conclude that fish were net discards.
7/11/2002	030307	WA02012	Back Creek	near Hwy 92 Bridge	Beaufort	Croaker, Pinfish	33	Juvenile croakers 3- 5 in. in length were found over a 200m stretch of Back Creek, a tributary of Bath Creek. The fish appeared to have been dead for 12 - 24 hrs. Low DO levels and recent heavy storms may have contributed to the kill.
7/19/2002	030704	MO02001	High Rock Lake	Second Creek arm near Bringle Ferry	Rowan	Shad, Crappie, Catfish	2000	Water had receeded due to drought trapping fish in a shallow, isolated pool near the Bringle Ferry Rd. bridge. Fish most likely succumbed due to low dissolved oxygen levels.
7/29/2002	030704	MO02002	High Rock Lake	Crane Creek Arm	Rowan	Carp, Crappie, Catfish	1000	Water had receeded trapping fish in a shallow, isolated pool near the Goodman Lake Rd Bridge. Fish most likely succumbed due to low dissolved oxygen levels.
7/30/2002	030410	WA02013	Neuse River	between Stately and Carolina Pines	Craven	Croaker, Silver perch, Pinfish, Menhaden	25330	It is likely that these fish did not die in the area where they were counted. Northwest winds were blowing them into the Stately Pines/Carolina Pines area. Just upriver at CM# 11 and Flanner's Beach the water column was very stratified with very little if any DO in the lower layers. Water temperatures were over 32° C (90° F) throughout the area where dead fish were found. Nearly all of the fish found were juvenile, and were most likely killed by stress related to extremely high water temperatures/low DO.
7/30/2002	030704	WS02001	Peters Creek	Winston Salem	Forsyth	Sunfish, Suckers, Minnow Sp.	1000	Kill caused by a fire at P&B distributors on Chatham Street in Winston Salem on 7-30-02. Chemicals from the fire migrated to Peter's Creek
8/1/2002	030104	WA02014	Albemarle Sound	near Sandy Point	Beaufort	striped bass	150	NC DMF personnel discovered 150 dead striped bass in the Albemarle Sound from the Hwy 32 bridge west to the Chowan River bridge, a distance of approximately 7.6 mi. Although gill nets were present in the area, no apparent net marks were found on the fish. Dissolved Oxygen levels were within normal ranges, however high water temperatures throughout the kill zone may have been a contributing factor in the kill.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
8/3/2002	030152	WA02019	Yeopim River	near Bethel	Perquimans	none	2000	Approximately 1,000 dead clams in vicinity of boat ramp at Bethal Fishing Center on the Yeopim River. Most clams on shore were without shell. Several more clams floating in shell in water around boat ramp.
8/7/2002	030307	WA02015	Blounts Creek	below Hwy 33 Bridge	Beaufort	Catfish	50	Water was green in color . Several phyto samples were sent to ESB for analysis. Stress from high salinity and low Do were suspected as factors in the death of the fish. The phyto samples were dominated by a benign Peridinium dinoflagellate, and euglenoids were common.
8/8/2002	030152	WA02016	Canal off Albemarle Sound	near Holiday Island	Perquimans	Menhaden	300	300 menhaden observed floating on surface of water. Grayish film on water with thick mats of green algae and spots of duckweed. Homeowner reported that there has been no water movement since December. Fish are believed to have swam into area where the number of fish quickly reduced the amount of oxygen in the water to anoxic levels, thus killing the menhaden. No other fish species were present. There were also reports of approximately 75 canadian geese utilizing the area frequently, but no signs of fecal matter that could have affected the water.
8/9/2002	030401	RA02002	Private pond	Creedmore	Granville	Sunfish, Catfish, Carp, Largemouth bass	300	Rain and low pond levels prior to kill. Fish samples showed no signs of disease or lesions.
8/14/2002	030619	FA02004	Rice's Run	near Beaman Crossroads	Sampson	Warmouth	100	Fish apparently died from the lack of dissolved oxygen. The kill is a pool located beside SR 1335 on Rice's run which is a small trib. to Great Coharrie. DO was 0.33 mg/L. The pool had no flow associated with it. Weather conditions were hot, humid and dry.
8/21/2002	030706	WS02002	South Yadkin River	near Cooleemee	Davie	Clam Kill	1000	Investigators believe kill was caused by manipulation of pool area behind the run of the river water supply dam at Cooleemee. Two weeks prior to the event the dam gates were closed to raise pool levels above the dam . Except for seepage, no water was allowed to flow downstream from the dam during this time. Clams were reported killed from a lack of water flow.
8/22/2002	030153	WA02020	Albemarle Sound	Hwy 32 Bridge	Washington	Striped bass, White catfish	120	Most striped bass showed no signs of disease or lesions. Most fish seen on shore and decomposed. Water temperature was high and was suspected as a cause.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
8/23/2002	030307	WA02017	Blounts Creek	near Cotton Patch Landing	Beaufort	Catfish	13024	Extremely elevated salinity levels and low dissolved oxygen levels were the cause of the kill. Salinity readings of 12 ppt in a creek with an average reading of 3 ppt or below created stressful conditions too difficult for the fish to overcome. Some fish are still in distress, prolonging the kill.
8/23/2002	030307	WA02018	Chocowinity Creek	Hwy 33 Bridge	Beaufort	Catfish	500	Combination of high salinities and low DO stressed fish. At time of investigation there were approx. 3000 fish gasping for air upstream of bridge. Expected these fish to perish in next few days. Fish very visible from Hwy 33 bridge.
8/26/2002	030307	WA02021	South Creek	near Idalia	Beaufort	Carp, Catfish, Sunfish, Largemouth bass	850	Investigators responded to a call from a concerned citizen regarding dead carp in South Creek. The kill was several days old and the majority of fish were in advanced stages of decay. Low DO's and high salinity levels appeared to be the cause of the kill.
9/12/2002	030616	FA02005	White Lake		Bladen	Yellow perch	300	Water quality parameters within normal range at time of investigation.
9/16/2002	030616	FA02006	White Lake		Bladen	Largemouth bass, Yellow perch	200	Fish reported dead near marina on the downwind side of the lake.
9/27/2002	030704	WS02003	High Rock Lake	Abbotts Creek arm	Davidson	Carp, Sunfish, Crappie, Shad	1000	Investigators reported strong wastewater and sulfur smell in area. Water color reported as very dark.
10/2/2002	030617	WI02007	Rice Creek, Town Creek	At confluence	Brunswick	Striped mullet, Largemouth bass, Pickerel, Sunfish, Shad	50	Low dissolved oxygen levels reported throughout the sample area. Aquatic weed (Elodea?) very prevalent throughout the creeks.

Date	Subbasin	Kill Number	Waterbody	Location	County	Fish Species	Mortality	Comments
10/3/2002	030704	WS02004	High Rock Lake	Abbotts Creek Arm	Davidson	Carp, Striped bass	1000	Investigators reported ph and DO levels indicative of an algal bloom. Fish kill attributed to low DO levels. Water reported dark and turbid in some areas. Green surface film also observed in Abbotts Creek. Results of ESB analysis indicated that High Rock Lake (near Buddle Creek) experienced a extremely dense algal bloom (> 140,000 units/ml). The bloom was dominated by filamentous blue greens, primarily (36%) Oscillatoria geminata. O. geminata is a common bloom former and found in many waters throughout the state. The alga is known to discolor water and cause taste and odor problems.
10/15/2002	030153	WA02022	Thirty Foot Canal	between Phelps Lake and	Washington	Sunfish, Shad, Carp, Largemouth bass	200	none
10/31/2002	030835	MO02003	Ut to Clark Creek	near Newton	Catawba	Catfish	200	Most fish removed and buried before investigators arrived. Carp and sunfish were abundant in the pond and not affected. the Surface water samples contained filamentous bluegreen microalga Anabaena, a common species in North Carolina. Investigators suspected a bacterial infection of the catfish caused by environmental stress.

DENR Funds Transfers Authorized for State Fiscal Years 2001-2002 and 2002-2003

Budget Code	Fund Code	DENR Division	Transfer Amount
Funds transfers authorized by S.L. 2001-424 (SFY 2001-2002)			
24300	2106	DEH – Sleep Products	$46,437
24300	2331	DAQ – Air Permits	$77,889
24300	2735	DLR – Sedimentation Fees	$148,562
24300	2620	DLR – Land Env. Controls	$111,261
24300	2740	DLR – Dam Safety Account	$18,522
64305	6372	DWM – Inactive Haz. Sites Cleanup	$499,263
64305	6373	DWM – Emergency Response Fund	$49,771

APPENDIX F – ENFORCEMENT PRINCIPLES 37

INTRODUCTION

After taking office in January, Governor Mike Easley directed the Department of Environment and Natural Resource to strengthen North Carolina's environmental enforcement programs. As a first step in that process, Secretary Bill Ross initiated a department-wide review of the complex array of regulatory programs within DENR that promote compliance with environmental laws.

This report of environmental regulatory activities provides a basis from which to analyze DENR's enforcement activities across 14 regulatory programs during the last calendar year, from January through December 2000. With this information, the department will implement strategies to accomplish the Governor's goal of assuring that enforcement is strong, effective and fair.

The 15 programs reviewed in this report are:

- Air Quality
- Coastal Management
- Dam Safety
- Erosion & Sedimentation Control
- Groundwater (including Well Certification and Oil Pollution & Hazardous Substance Control)
- Hazardous Waste
- Mining
- National Pollutant Discharge Elimination System (NPDES)
- Non-Point Source Discharge
- On-Site Wastewater
- Public Water Supply
- Radiation Protection (including x-ray machines and tanning booths)
- Solid Waste
- Shellfish Sanitation
- Underground Storage Tanks

It is generally believed that an active inspection and enforcement presence ensures compliant behavior among those regulated by correcting current violations and by deterring future violations. This report is DENR's first attempt to evaluate departmental measures and provide analysis of compliance tools, most notably enforcement. Future reports will assess compliance assistance, education, and performance incentives. Limited experience indicates that these are valuable tools and deserve broader use.

Environmental regulatory agencies, including DENR, primarily focus on compliance with environmental laws. This focus creates an indirect relationship with the desired outcome of environmental protection and makes measuring results a challenge. Environmental protection is more accurately a measure of acceptable environmental impact determined through the process of making laws. DENR can easily compute activity measures that show adherence to the law, but less readily interpret environmental outcomes that occur either because of or in spite of environmental laws. Still, it is our responsibility to quantify the relationship between effectiveness of laws and the realized environmental benefits. This report begins the effort to link the two.

Why is compliance with laws and environmental protection not the same thing? Laws are subject to a process of negotiation to meet the needs of diverse interests in a society that measures progress in terms of economic development. While the environment can thrive without us, we cannot thrive without the environment. Sometimes we balance the benefits of economic development with the need for environmental protection as a means of compromise. More and more, we are finding ways that economic development and environmental protection can achieve mutually compatible outcomes.

Currently, there is limited dialogue among DENR enforcement practitioners about the job we do in maintaining compliance with environmental standards. This report aims to begin a continuing conversation in DENR's divisions about the value of our work and the results of our efforts. Although this report does not answer all the questions, it begins an internal process of asking quite a few of those questions.

Differences between the regulatory programs make comparative analysis complicated and can lead to faulty conclusions. Some programs regulate transient and temporary operations that need significant near-term oversite while other programs regulate stationary facilities that remain in place for years. Some programs regulate activities that occur at a limited number of industrial sites while other programs regulate activities occurring at any given homeowner's site. There are few similarities in the way these programs are managed or in their expected results.

BACKGROUND

Nearly four years ago, the Department of Environment and Natural Resources (DENR) began looking at how we ensure compliance with North Carolina environmental regulations. In the Division of Water Quality (DWQ), a new enforcement policy took effect July 1, 1998, resulting in a measurable improvement in compliance rates. As fines increased in the NPDES program, the compliance rate rose from a threshold barrier of 80% in 1998 to 88.4% in 2000 [*see Figure 4, page 12*].

Early in 1999, DENR decided to build on the success in DWQ to strengthen enforcement in DENR's other regulatory agencies. Senior management initiated a department-wide enforcement assessment designed to better understand DENR's strengths and weaknesses and identify opportunities for improvement.

The enforcement assessment was completed and released to the public on February 22, 2000 and called for DENR to create a set of departmental enforcement principles, develop meaningful performance measures, and improve public access to enforcement information.

On February 23, 2000, DENR chartered a team to develop a framework from which enforcement programs could implement the major recommendations. The team brought together DENR staff from various program perspectives within the department, all experienced practitioners in enforcement and compliance assistance. The team became known as the STEP Team, an acronym for Stewardship Through Enforcement Principles.

The STEP Team produced an implementation plan that provides a schedule to act on the major recommendations of the February 2000 assessment. The implementation plan also develops several stewardship strategies that will be implemented over the next several years.

Since the beginning of 2001, departmental enforcement received continuing support from the new administration. Bill Ross was named as secretary of DENR, and enforcement is strong among his priorities. In April of 2001, Secretary Ross directed staff to prepare this compliance report and establish calendar year 2000 as a baseline year to begin annual reporting.

HOW THIS REPORT IS ORGANIZED

This report presents key DENR activities for a strong enforcement program based on four departmental goals: fairness, focus, visibility, and timeliness. These goals are discussed in the following pages and expanded upon in the form of guiding principles. Goals and principles are denoted by headings followed by numerical measures and discussion text.

Certain discussion points are supplemented with background explanations found in text boxes. These supplemental boxes are provided to give readers a common orientation to the information presented in this report.

ENFORCEMENT GOALS: A STRONG ENFORCEMENT PROGRAM THAT IS FAIR, FOCUSED, VISIBLE, AND TIMELY

On March 31, 2000, DENR released a set of twelve guiding principles developed to ensure a strong enforcement program. These principles form the basis for performance measurement in this report and are based on the premise that when enforcement is necessary, it should be fair, focused, visible, and timely [*see Appendix F*]. These four goals are the cornerstones of DENR's enforcement program.

Fairness is the application of consistent decision-making criteria in determining appropriate penalties for all violations. Focus means to plan our enforcement activities for effectiveness and spend our resources where problems are likely to be found. Visibility ensures community awareness and maintains accountability of those responsible. Timeliness is a necessary goal to ensure that enforcement actions are meaningful and occur in close proximity to the violation.

Enforcement has traditionally been the most widely used and trusted tool to promote compliance. Enforcement is a process designed to deal selectively with sectors operating outside of the law and return them to compliance. Because non-compliant sectors represent the most obvious environmental threat, enforcement has been the tool of choice receiving priority in the allocation of limited resources.

Still, enforcement operates at the exact opposite end of the compliance spectrum from where communities want to be. The desired state is a conscientious community where everyone considers first his or her own accountability. Consider the prospect of a self-regulating community where citizens, business and government work together to take responsibility for environmental outcomes. DENR leadership recognizes the value of other compliance tools, in addition to enforcement, and is using them as appropriate to create desired results.

DENR's twelve principles establish a baseline of expected behavior and consequences of deviation from that behavior.

What are Compliance Tools?

DENR uses various methods to ensure adherence to environmental laws and regulations. Depending on the awareness and willingness of the regulated entity, one tool may prove more effective than another.

Enforcement is a critical tool applied to those who violate environmental standards. Enforcement can escalate from a simple warning to a civil penalty or a court injunction and even to criminal prosecution. If a simple warning will correct the situation, compliance is achieved with minimal resources spent. If stronger legal remedy is required, the process becomes long and costly for all involved.

Education is offered in most programs to provide those regulated with a clear understanding of the requirements they face. DENR divisions offer workshops and training conferences to help everyone achieve a threshold understanding of conditions for compliance. Some programs advertise in the media and launch awareness campaigns to help increase understanding. Other types of education include videos, brochures, and videoconferences.

Technical Assistance is a tool available to those who would seek and benefit from guidance. Technical staffs are made available to answer questions, interpret regulations and give advice. Other types of technical assistance include fact sheets, manuals, videos, and checklists.

Performance Incentives can be positive, such as awards and recognition, or negative, such as publicly noticing violators. Both types of incentives can achieve the desired result of compliance.

GOAL: Enforcement should be fair.

Each of the fourteen environmental regulatory enforcement programs included in this report uses standardized penalty assessment criteria based on degree of harm and deviation from regulatory requirements. The programs use matrix analyses, penalty trees, or some combination of the two to guide decision-making. Penalty assessment criteria for programs are found in either general statute or administrative code [*see side bar – What factors are considered in determining the penalty amount? on page 18*].

Some DENR enforcement programs consider the *actual* degree of harm, and others have the latitude by statute or regulation to consider the *potential* degree of harm. Fair processes should result in consistent decision making, yet provide flexibility to address issues that may be unique in certain programs. An important attribute of being fair is to keep faith with those who have demonstrated compliance by firmly dealing with those who are non-compliant.

In one program, On-Site Wastewater, the maximum allowable penalties are so limited by regulation that the program categorically uses the maximum allowable penalty for all assessments. For example, large system violators can not be assessed more than $300 even if they have multiple violations.

Programs that use a matrix analysis:
- Hazardous Waste
- NPDES
- Public Water Supply
- Solid Waste
- Underground Storage Tank

Programs that use a penalty tree:
- Air Quality
- Non-Point Source Discharge

Programs that use a matrix/tree in combination:
- Coastal Management.
- Groundwater Protection
- Radiation Protection

Programs that use a hybrid matrix:
- Erosion & Sedimentation Control
- Dam Safety
- Mining

Programs that apply maximum penalties in all cases:
- On-Site Wastewater

What is a penalty matrix?

Some programs calculate a penalty based on the relationship between the degree of harm caused or threatened by a violator and the extent that a violation deviates from the rules. The relationship is characterized as major, moderate or minor cells. At the intersection of the selected cell, a penalty range is isolated to guide the agency.

For example, a violation determined to be major for degree of harm and moderate in their deviation from the rules would be assessed from 60 – 80 percent of the maximum penalty. Factors that contribute to the gravity of the violation are offset by considerations for remission (e.g. good faith efforts to correct the violation).

Degree of Harm ☐ Potential ☐ Actual	Degree of Deviation from Requirement		
	MAJOR	MODERATE	MINOR
MAJOR	80 – 100%	60 – 80%	44 – 60%
MODERATE	32 – 44%	20 – 32%	12 – 20%
MINOR	6 – 12%	2 – 6%	1 – 2%
Degree of Harm Factors:		Degree of Deviation Factors:	
☐ Duration of Violation ☐ Area of Impact (size) ☐ Proximity to receptors ☐ Sector impacts (air, land, water) ☐ Health Impacts		☐ Administrative / Record Keeping ☐ Indirect sector impact ☐ Direct sector impact ☐ Undermines statute / regulation	

FIGURE 1. Generic Penalty Matrix Worksheet

What is a penalty tree?

Some programs use a penalty tree to guide their decision-making. When the violation is identified, a table indicates the base penalty amount which can then be increased or decreased based on aggravating or mitigating factors [*see side bar – What factors are considered in determining the penalty amount? on page 18*].

2.0 NON-PERMITTED ACTIVITY		
Class	Violation	Amount
2.1	operating without a permit	$4,000
2.2	failure to submit reports	$500

FIGURE 2. Generic Penalty Tree

GOAL: Enforcement should be focused.

DENR compliance programs plan their inspection activities annually, ideally focusing on sectors that are likely to have compliance difficulty. DENR's awareness of these sectors may come from community complaints, from data that reveal a pattern of repeat violations, or from other sources. In all cases, DENR inspectors are assigned to monitor compliance, but inspection rates are not the same from one program to the next. Some programs need higher frequency of inspection because of the amount of damage that can be done in a very limited amount of time. Other programs can supplement physical inspections with automated monitoring data. Because different inspection strategies are used depending on program needs and resource availability, it is not helpful to compare inspection rates across different programs.

The Erosion and Sedimentation Control Program regulates over 7000 active land disturbing activities at any given time. Temporary control structures, used to prevent offsite sedimentation at construction sites, require proper installation and regular maintenance to remain effective. Changing weather conditions and human error can virtually eliminate their usefulness in a very short period of time.

Three studies[1] during the past eleven years have concluded that land disturbing activities need more frequent inspections than current levels to determine compliance with the Sedimentation Pollution Control Act of 1973. The most recent study, by Dr. Seth R. Reice and Richard N. Andrews, found a direct correlation between downstream water quality and frequency of sedimentation compliance inspection. A Sedimentation Control Commission study in 1997 recommended to the Governor that land disturbing activities be inspected at least once a month. This increased level of oversite would require a total of 133 technical positions. The Land Quality Section currently has 34 positions. At the current staffing level, Land Quality staff inspect sites on the average about once every 4 to 4.5 months.

Many programs with lower inspection frequencies rely on monitoring data that are routinely submitted without an inspection. It is not the goal of these programs to inspect every site every year. For example, the Division of Air Quality inspection rate (61 percent) exceeds EPA's most recent guidance on compliance monitoring, which recommends one inspection every five years at smaller sources and one inspection every two or three years at major sources. Unlike the Erosion and Sedimentation Control Program, Air Quality sites are usually fixed long-term facilities.

Effectiveness of Regulatory Incentives for Sediment Pollution Prevention: Evaluation Through Policy Analysis and Biomonitoring prepared by Seth R. Reice and Richard N. Andrews, UNC-Chapel Hill, December 15, 2000.

What do we mean by "Sectors"?

Sectors are identifiable groups with common business practices who are likely to be subject to the same environmental requirements. Some readily distinguished sectors include universities, electroplating operations, dairy farms, textile industry and dry cleaners.

Sectors may be targeted for compliance purposes, including site visits, inspections, training and technical assistance that is tailored to meet their specific needs.

GOAL: Enforcement should be visible.

Regulated entities are accountable to their communities, especially when they have violated environmental requirements. Community awareness ensures that violators can demonstrate their future intent to be good stewards of the environment. Additionally, negative publicity is a potent deterrent. Any enforcement action carries the potential to reach other regulated entities and impress upon them the value of maintaining compliance.

Future activities in DENR will build on our current philosophy of access to information. More enforcement information will be made available on the Internet. DENR's information systems will be enhanced and integrated to allow easier access to our programs.

DENR makes enforcement activity public at www.enr.state.nc.us/novs/index.htm. Information is updated monthly.

Who does enforcement in DENR?

Division of Air Quality – Regulates air pollution including open burning, Title V permitting and state .0300 permits
Division of Coastal Management – Regulates development within areas of environmental concern within the 20 coastal counties
Division of Environmental Health – Regulates public water supplies, On-Site wastewater systems, shellfish sanitation and restaurant sanitation grades
Division of Land Resources – Regulates mining, erosion and sedimentation control, and dam safety
Division of Radiation Protection – Monitors radiation sources from power plants and medical facilities
Division of Waste Management – Regulates solid waste disposal, hazardous waste management, underground storage tanks and superfund cleanups
Division of Water Quality – Regulates water pollution including surface water quality, ground water quality, well-driller certifications, wetlands, storm water and municipal water treatment

See Appendix C for detailed descriptions.

GOAL: Enforcement should be timely.

Currently, DENR divisions are assessing – and in some cases have changed – their enforcement processes to remove steps in the process that can cause delay. Historically, compliance actions generated in the field have gone through the organizational hierarchy, ultimately to the division director, prior to being decided.

Some programs have delegated the authority to levels in the organization closer to the point of origination. This saves time and allows for decision-makers in closer proximity to the situation to determine the compliance remedy.

The DENR administration is addressing issues of timeliness and has developed, with the STEP Team, a strategy to implement delegated decision making. The strategy would include:

- Targeted training for regional decision-makers;
- Standard decision matrices;
- A departmental tracking system;
- Conditional delegation.

PRINCIPLE: Compliance is the first step toward the ultimate goal of stewardship.

Measure:	Division Compliance Rates
Result:	Values vary. See text below.

Until more sophisticated data gathering is institutionalized, this measure has limited reliability. Compliance rate is based on inspections and only provides information about a percentage of those regulated. Inspections may have occurred randomly or they may have been targeted. Multiple inspections may have occurred at one site or several. In other words, any two inspections may represent single visits to two sites, or duplicate visits to one site. Still the information has value in revealing the level of compliance that can be expected at sites that we select for inspection, even though inference cannot be made regarding those facilities that were not inspected. Despite our concern about reliability, we decided to present the data that is available until a better measure is developed.

Lower compliance rates are not necessarily a concern. For example, the compliance rate in the Division of Air Quality (DAQ) is 64 percent. This relatively lower rate is an expected outcome because DAQ inspections are targeted instead of random. Regional air personnel use inspection-targeting software that helps them locate places where they can expect to find violations.

Another reason for lower compliance rates in the Division of Air Quality is that the Title V program is newly established and the experience level of the regulated community is low. Air program inspectors are conducting thorough inspections and finding a high rate of violations at the facilities that have recently received their Title V permits.

In some cases, higher compliance rates are expected. For example, the Shellfish Sanitation Section reports a compliance rate of 100 percent. Since they inspect seafood dealers, the consequences of low compliance rates are a more immediate threat to public health. The section does not issue notices of violation (NOV's) but rather denies certification for violators. In other words, violators are shut down. The certification process is similar to the restaurant inspection and certification program. Only certified facilities are allowed to open.

In Public Water Supply, the compliance rate is reported two ways, both different from our departmental definition (see Appendix B). When based on exceedences of maximum contaminant levels, the compliance rate is 99 percent. When based on failure to perform all required tests, the compliance rate is 82 percent.

Measure:	Return to Compliance Rate
Result:	92 percent
[based on select measure – Hazardous Waste Section]	

In the hazardous waste regulatory system, 92 percent of the regulated facilities returned to compliance within time frames specified by the regulatory division. Only 1 of 13 facilities that were given deadlines to remedy compliance problems was not able to achieve compliance. In the absence of data from other programs in this baseline year, it is difficult to make inferences. In future reports, this information will be requested from all programs.

PRINCIPLE: Enforcement will be an effective deterrent against future violations.

Measure:	Civil Penalty Timelines
Result:	See Figure 3 below.

The average time across all programs from awareness of a violation to issuance of an NOV was 16 days. The average time from NOV issuance to penalty assessment ranges from 35 days in some programs to 423 days in others – the department mean is 144 days. In many instances, before a penalty is assessed, a follow-up inspection takes place. Each program gives the facility a certain amount of time (usually 30 – 60 days) to return to compliance. If the facility is not in compliance at the follow-up inspection, then a penalty may be assessed.

Resolution of contested civil penalty assessments is time consuming. The department mean from penalty assessment to penalty resolved through settlement or final action is 111 days, excluding facilities that choose not to contest their cases. Facilities that would have resolved the enforcement action beyond the calendar year cut off date are excluded as well.

The average time for facilities to pay their penalties in full once their cases were resolved was 20 days, ranging from 10 to 56 days. Cases that did not pay their penalty by December 31, 2000 are excluded from the data below.

How much does it cost to develop an enforcement case?

A true figure for this cost is not readily known. By law, civil penalty collections are distributed to public schools through the State School Technology Fund [NCGS Chapter 115C – 457.3]. DENR may keep the "cost of collection," up to 10 percent of the amount collected [NCGS Chapter 115C-457.2]. DENR cannot categorically attach a 10 percent cost recovery fee to the penalty, but must show cost accounting. At a 10 percent recovery rate, tracking costs can exceed the potential collection.

Timeliness of Penalty Collections in Calendar Year 2000
(of penalties assessed in calendar year 2000)

PROGRAMS	Average Number of Days from Violation Awareness to when NOV is Issued (for Cases where further Department Action was later taken)	Average Number of Days from when NOV is Issued until Penalty is Assessed Excluding Facilities that chose not to Contest their Cases	Average Number of Days from when Penalty is Assessed to when Penalty is Resolved through Settlement or Final Action as of 12/31/2000	Average Number of Days from when Penalty is Resolved through Settlement or Final Action to When Penalty is Paid in Full as of 12/31/2000

FIGURE 3. n/a – not applicable, which is different than "not available". In cases where data is not available, either the data is not collected or programs are delegated to local government and records are not easily compiled. Programs that were unable to supply this data are currently reformatting their databases so this information will be available in future years.

[2] In the Hazardous Waste Program, it took 2,212 days to negotiate a consent agreement for one particular case. If this case were excluded, the average time to assess a penalty in that program would be 156 days.

PRINCIPLE: Enforcement will be an effective deterrent against future violations.

Measure:	Compliance Rate Related to Enforcement
Result:	See Figure 4.
[based on select measure – NPDES Program]	

In July of 1998, DWQ implemented an enforcement initiative. The goal of the initiative was to increase compliance by increasing enforcement activities. The initiative appears successful at achieving higher compliance rates over time.

It is unclear why the compliance rate actually began rising before enforcement cases were increased. To determine a causal relationship between the enforcement initiative and increased compliance rates over time, statistical analysis should be completed in future years.

NPDES Program: Number of Enforcement Cases vs. Compliance Rate of NPDES Dischargers

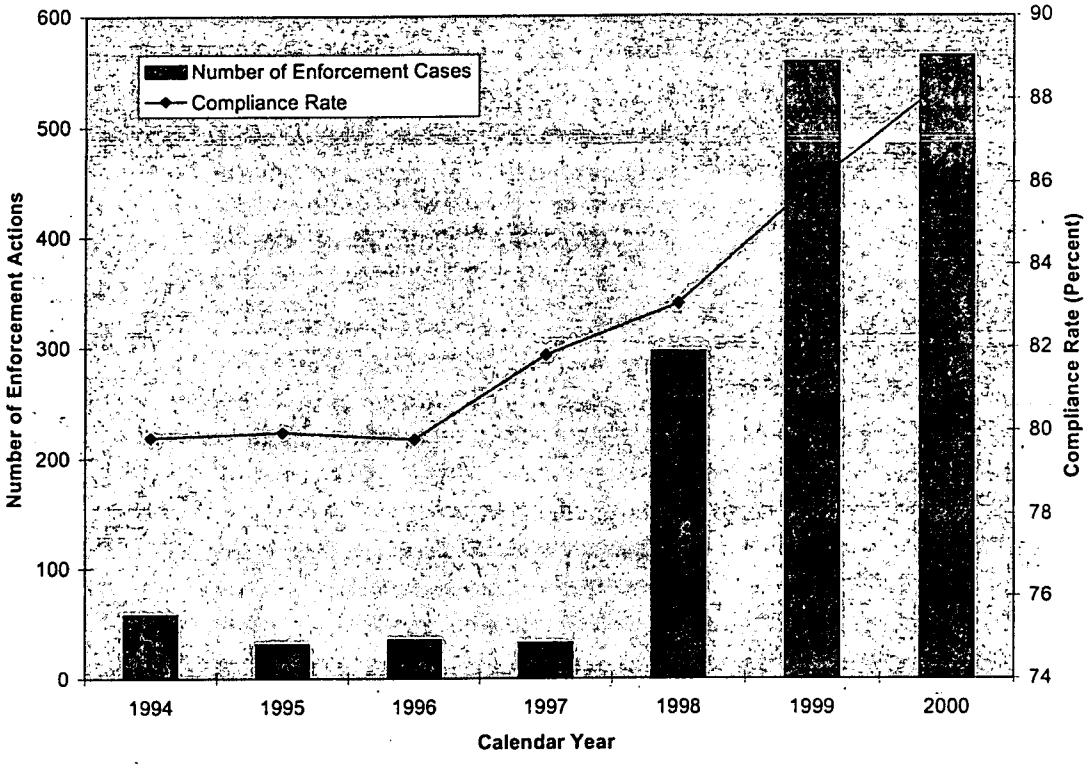

FIGURE 4. NOTE: This compliance rate calculation only includes discharge monitoring reports (DMRs). Other compliance rate calculations in this report include both DMRs and site visits.

PRINCIPLE: Enforcement will be an effective deterrent against future violations.

Measure:	Compliance Rate Related to Enforcement and Inspections
Result:	See Figures 5 & 6.
[based on select measure – Non-Point Source Discharge]	

This measure reflects DWQ's enforcement initiative. A combination of events may have led to decreases in surface water discharges. In 1999, inspection resources were increased to provide a dedicated inspector for each region. Enforcement activities increased as well. Mass mailings took place in May 1998, June 1999, and October 1999 to owners and operators notifying them of the new enforcement policy (made effective July 1, 1998) and new legislation regarding their systems.

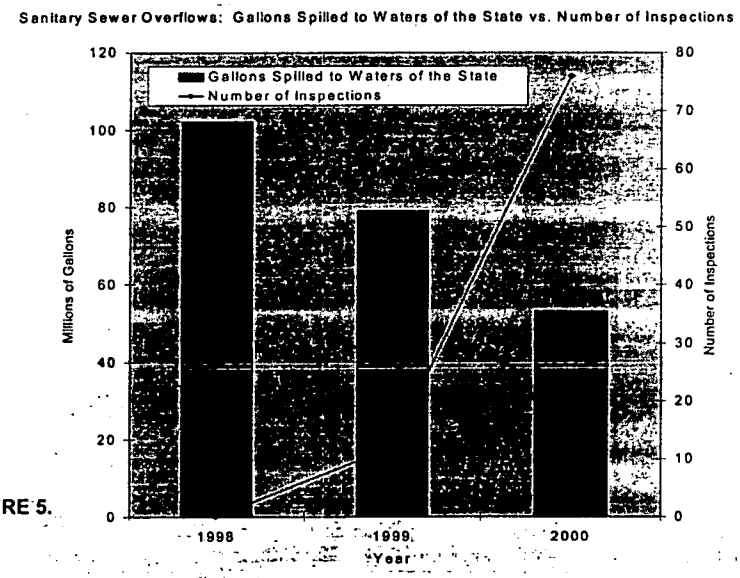

FIGURE 5.

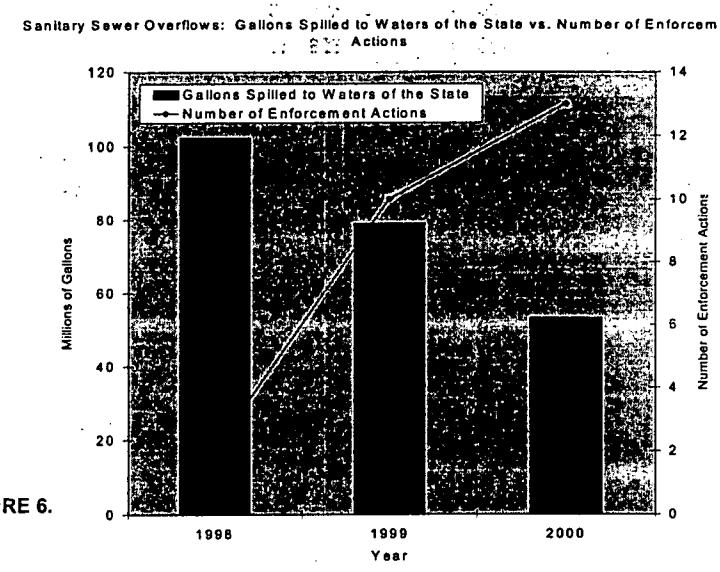

FIGURE 6.

PRINCIPLE: Enforcement will be an effective deterrent against future violations.

Measure:	Civil Penalty Dollar Amounts	
Result:	Total amount	$6,138,837
	Highest amount	$198,194
	Average amount	$3,054

Sediment, NPDES, and Air Quality programs assessed the highest penalty amounts in the department - each from about 1 – 1.5 million dollars for calendar year 2000. The department total is $6,138,837. Average individual penalty assessments vary from around $350 for Coastal Management to $58,153 in the Hazardous Waste Program. The department average is $3,054.

The highest penalty assessed in 2000 was in the Air Quality Program – $198,194. This occurred at a site with over 200 violations and a poor compliance history. Air Quality's average penalty assessment was $2,784. [*see side bar – What are the maximum daily civil penalties in DENR? on page 17*]

As a matter of principle and as a matter of fact, DENR's interest in penalties is not to generate revenue, but rather to change the behavior of regulated persons who violate environmental laws. The proceeds from penalties do not benefit DENR, but are distributed to public schools through the State School Technology Fund. [*see sidebar – How much does it cost to develop an enforcement case? on page 11*]

CIVIL PENALTY ASSESSMENTS IN CALENDAR YEAR 2000				
PROGRAMS	Number of Penalties	Total Dollar Amount	Average Dollar Amount	Highest Dollar Amount
Sedimentation	94	$1,002,955	$10,670	$121,440
Mining	8	$83,940	$10,493	$55,800
Dams	0	n/a	n/a	n/a
Coastal Management	83	$29,550	$356	$1,000
Groundwater	65	$135,125	$2,079	$21,200
NPDES	660	$1,526,740	$2,313	$78,167
Non-Discharge	106	$628,450	$5,929	$55,750
Solid Waste	5	$41,995	$8,399	$13,625
Hazardous Waste	13	$755,983	$58,153	$147,998
UST	90	$561,184	$6,235	$28,278
Public Water Supply	435	$201,380	$463	$5,040
On-site Wastewater	16	$8,800	$550	$7,200
X-Ray	1	$750	$750	$750
Tanning	35	$51,050	$1,459	$3,050
Radioactive Materials	0	n/a	n/a	n/a
Shellfish Sanitation	0	n/a	n/a	n/a
Air Quality	399	$1,110,935	$2,784	$198,194
DEPARTMENT	2010	$6,138,837	$3,054	$198,194

FIGURE 7.

PRINCIPLE: Enforcement will be an effective deterrent against future violations.

Measure:	Penalty Collection Information
Result:	See Figure 8.

The penalty amount established through settlement, agreement or final action is $1,766,990. Differences between penalty assessments and resolved penalty amounts vary between programs. Some programs assess penalties frequently using lower dollar amounts while other programs use penalties sparingly but assess high penalties when needed. More cases are contested when penalty assessments are high, resulting is lower resolved penalty amounts.

The penalty assessment and resolved penalty dollar figures do not include investigative costs or costs incurred by facilities for fixing their environmental harm. This increases the facilities' cost of noncompliance when all dollar amounts are included.

How are penalties reduced from originally assessed amounts?

State law provides for review and possible reduction of civil penalty assessments through administrative processes including requests for penalty remission and formal appeals. Processes may vary from program to program, but a right to appeal exists under every program.

When an agency assesses a penalty and the violator chooses to appeal instead of pay the fine, the penalty will go through several different steps to reach a final resolution. Independent commissions, DENR's secretary, the Office of Administrative Hearings (OAH) and the courts can all play a role in determining the final amount of a penalty that is contested.

OAH conducts a hearing and issues a recommended decision. Depending on the program, the case then goes to the DENR secretary, the state health director or an independent citizen commission for final decision. If none of these avenues produce a result accepted by the violator, the case can then go to the courts for resolution.

Sometimes violators choose not to contest the factual circumstances that led to the penalty, but will pursue settlement of the case — either directly with the state agency or through the Attorney General's Office — to avoid lengthy administrative hearings or court action. Reductions in penalties may be established through penalty remission procedures established by independent commissions or through an even less formal negotiation process.

Penalty Collection Information for Calendar Year 2000

PROGRAMS	Total Number of Penalties Assessed	Total Dollar Amount of Penalties Originally Assessed	Total Dollar Amount of Penalties Established through Settlement or Final Action as of 12/31/2000	Percent of Cases Where Penalty Amount has not yet been Established Through Settlement or Final Action as of 12/31/2000	Total Dollar Amount of Penalties Collected as of 12/31/2000

FIGURE 8.

PRINCIPLE: Enforcement will be an effective deterrent against future violations.

Measure:	Uncollected Penalty Totals from 1996 – 1999
Result:	$3,368,277

It is not possible to accurately determine penalty collections in the year the penalty is assessed. In contested cases, the legal process extends the time it takes to arrive at a penalty amount. Collection may occur weeks or months later. Many programs use payment plans for facilities that cannot afford to pay their penalty in full at once and collection occurs over several years.

It is possible, however, to review uncollected penalties over time and develop an understanding of trends in penalty collections. The data in figure 9 suggest that most penalties are paid within five years of the time they were first assessed. Almost all of the uncollected penalties are from 1998 and 1999 ($1,398,019 and $1,547,963 respectively).

In some cases, these penalties may no longer be collectable. For example, a violator may have filed bankruptcy. The department makes effort to collect on delinquent cases. Efforts include using liens or seizing property. Future reports will delineate the percentage of collectable penalties and separate non-collection based on business default.

These numbers represent a "snapshot" in year 2000 of penalties assessed in the previous four years. The amounts in each column are representative of that year alone as of December 31, 2000. The amounts are not accumulated from one year to the next. For example, in year 2000, there were no uncollected penalties in the Erosion and Sedimentation program from the year 1996.

The data does not always show a gradient trend of successively reduced amounts in earlier years. For example, the Public Water Supply Section has a large uncollected amount in 1998 but a significantly lower amount in 1999.

Uncollected Penalty Totals From Years 1996 – 1999 as of December 31, 2000

PROGRAMS	1996	1997	1998	1999	TOTAL
Sedimentation	$0	$58,800	$185,365	$583,225	$827,390
Mining	$0	$0	$63,250	$20,460	$83,710
Dams	$0	$0	$0	$0	$0
Coastal Management	$3,300	$5,800	$8,300	$2,475	$19,875
Groundwater	$3,863	$20,148	$166,861	$77,740	$268,612
NPDES	$23,909	$21,915	$148,967	$179,933	$374,723
Non Discharge	$0	$0	$32,605	$134,283	$166,889
Solid Waste	$15,600	$129,250	$22,125	$0	$166,975
Hazardous Waste	$0	$0	$1,235	$201,245	$202,480
UST	$0	$0	$19,603	$116,070	$135,674
Public Water Supply	$0	$71,800	$733,580	$187,945	$993,325
On-site Wastewater	$0	$0	$0	$0	$0
X-Ray	$0	$0	$0	$0	$0
Tanning	$1,250	$0	$0	$1,500	$2,750
Radioactive Materials	$0	$0	$0	$0	$0
Shellfish Sanitation	n/a	n/a	n/a	n/a	n/a
Air Quality	$59,794	$12,767	$28,753	$43,086	$144,400
Department	$107,115	$315,180	$1,398,019	$1,547,963	$3,368,277

FIGURE 9.

PRINCIPLE: Enforcement actions will increase in severity for regulated entities with poor compliance histories.

Measure:	Percent Repeat Violations
Result:	0.4 percent

Across all programs, less than one percent of sites – 1,397 – were found to have been in violation more than once during a five-year period from 1996-2000. This measure is based on those violations requiring more significant enforcement actions (e.g. penalty assessments, administrative orders, injunctions etc.) and excludes NOVs.

This measure is reliable to the extent enforcement programs focus inspections to re-inspect violators within a five year period. The department will test the validity of this measure in future years by ensuring follow-up inspections at sites that have violations.

In practice, compliance history is routinely considered as part of penalty assessment. Typically, the enforcement officer will bring the information to the division director or delegated authority and discuss previous violations when determining the amount of penalty [*see sidebar – What factors are considered in determining the penalty amount? on page 18*].

Compliance history is not currently tracked in a database for easy retrieval, but rather is found through file review. DENR does not yet have an integrated information management system to allow one program to investigate violations that may have occurred in other programs. Even to do so manually can be problematic since programs do not use identical facility identifications.

Developing common facility identification is the first step to realizing an integrated information system. This is being addressed now in the department through the work of the FITS (Facility Identification Template for States) Team.

What are the maximum daily civil penalties in DENR?

- **Air Quality** – $10,000 per day per violation [NCGS 143-215.114A (a)]
- **Coastal Management** – $250 per day (minor development), $2500 per day (major development) [NCGS 113A-126(d)]
- **Erosion and Sediment Control** – $5,000 per day [NCGS 113A-64(a)(1)]
- **Dam Safety** – $500 per day for each day of willful violation [NCGS 143-215.36.(b)(1) and(2)]
- **Hazardous Waste** – $25,000 per day 15A NCAC 13B Section .0702
- **Mining** – $500 per day; Mining without a permit $5,000 per day [NCGS 74-64(a)(1)a and b]
- **Non-Point Discharge** – $25,000 per day [NCGS 143-215.6A and 143B-282.1(b)]
- **NPDES** – $10,000 per violation per day; $25,000 if assessed in the past three years [NCGS 143-215.6A(a) and (b1)] NOTE: Repeat offenses will be considered for violations occurring within 5 years beginning October 1, 2002.
- **Solid Waste** – $5,000 per day; $25,000 per day for medical waste disposed on water first violation, $50,000 per day for subsequent violations [NCGS 130A-22(a)]; $50 per violation per tire improperly disposed [NC GS 130A-309.62]; $50 per violation for improper disposal of lead-acid batteries [NC GS 130A-309.70(c)]; $100 for improper disposal of white goods or failure to remove refrigerants [NC GS 130A-309.84]
- **Oil Pollution/Hazardous Substance Control** – $5,000 per day
- **On-Site Wastewater** – $50 per day (</= 480 gallon systems); $300 per day (>480 gallon systems) [NCGS 130A-22(c)]
- **Public Water Supply** – $25,000 per day [NCGS 130A-22(b)]
- **Radiation Protection** – $10,000 per day; Each day of continuing violation is a separate violation. [NCGS 104E-24(b)]
- **Underground Storage Tanks** – $10,000 per day per violation [NCGS 143-215.6A]
- **Well Construction** – $100 per day per violation [NCGS 87-94]

PRINCIPLE: Enforcement decisions will be defensible, documented, and proportional to the degree of potential harm.

Measure:	Percent of Civil Penalty Cases Contested
Result:	32 percent

Of the 2,010 civil penalty assessments in the department in year 2000, 32 percent were contested. Nearly all of the programs fall between 5 percent and 40 percent. A higher percentage of penalties are appealed in programs where higher penalties are assessed (e.g. Hazardous Waste). This number does not include instances where violators ignore compliance orders.

Percent of Penalty Assessment Cases Contested In Calendar Year 2000

PROGRAMS	Total Number of Penalties Assessed	Percent of Penalty Assessment Cases Contested
Sedimentation	94	76%
Mining	8	13%
Dams	0	n/a
Coastal Management	83	8%
Groundwater	65	2%
NPDES	660	39%
Non-Discharge	106	
Solid Waste	5	40%
Hazardous Waste	13	69%
UST	90	22%
Public Water Supply	435	34%
On-Site Wastewater	16	0%
X-Ray	1	100%
Tanning	35	6%
Radioactive Materials	0	n/a
Shellfish Sanitation	n/a	n/a
Air Quality	399	20%
Department	2,010	32%

FIGURE 10. n/a – not applicable which is different from "not available". In the case of Shellfish Sanitation, the data is not applicable because the program does not issue NOVs or penalty assessments for violations, but rather withholds certification effectively causing the violator to close.

What factors are considered in determining the penalty amount?

Most programs are bound by statute or regulation to consider the following factors in determining the amount of a penalty:

- Degree and extent of harm;
- Duration and gravity of the violation;
- Effect on media (air, water, land);
- Effect on public health;
- Cost of rectifying the damage;
- Any money saved by noncompliance;
- Cause (i.e. whether the violation resulted from negligent, reckless, willful, or intentional act or omission);
- Compliance history (prior record) of the violator.

Where is the Penalty Assessment Computation Criteria found?

- **Air Quality** – NCGS 143-215.114A(c), 143B-282.1(b) and 15A NCAC 02J .06
- **Dams** – NCGS 143-215.36(b)(3) and 15A NCAC 02K .0102
- **Coastal Management** – NCGS 113A-126(d)(4) and 15A NCAC 07J .0409(f)(3)
- **Erosion and Sediment Control** – NCGS 113A-64(a)(3) and 15A NCAC 04C. 0105
- **Hazardous Waste** – NCGS 130A-22(f) and 15A NCAC 13B Section .0702
- **Mining** – NCGS 74-64(a)(1)(c) and 15A NCAC 05D .0102
- **Non-Point Discharge** – NCGS 143-215.6A and 143B-282.1(b)
- **NPDES** – NCGS 143-215.6A and 143B-282.1(b)
- **Solid Waste** – NCGS 130A-22(f) and 15A NCAC 13B Section .0702
- **Oil Pollution/Hazardous Substance Control** – NCGS 143-215.91, recodified as NCGS 143-215.88A and B which references 143-215.6 recodified as 143-215.6A through 143-215.6C and 143B-282.1
- **On-site Wastewater** – NCGS 130A-22(b1), 15A NCAC 18A
- **Public Water Supply** – NCGS 130A-22(f) and 15A NCAC 18C .1906
- **Radiation Protection** – NCGS 104E-24(b)
- **Underground Storage Tanks** – NCGS 143-215.6A(c), which references 143B – 282.1(b)
- **Well Construction** – NCGS 87-94 references NCGS 143B-282.1(b) and NCGS 143-215.6A

NCGS – North Carolina General Statute
NCAC – North Carolina Administrative Code

Observations and Next Steps

This report is intended to establish a baseline of information that can be used to evaluate and improve DENR's performance in maintaining compliance with environmental laws and regulations. In issuing this report, the Department takes an important first step in developing a more comprehensive analysis of program activity and effectiveness.

Initial conclusions are difficult to reach because data systems within DENR do not support the collection of information that answers key questions. For example, it is important to understand the rate at which regulated parties are complying with environmental laws enforced by DENR programs. But determining compliance rates accurately requires a certain method of data collection that is not currently used in the Department. To answer questions surrounding compliance rates with greater certainty, DENR needs to gather data differently. Compliance contacts from the enforcement programs will meet with the department's STEP Team to develop an improved compliance rate measure and initiate better data collection practices.

Data were also not readily available to determine the timeliness of penalty collections in year 2000. Compliance programs will begin tracking cases through decision points in the enforcement process more closely to gain a better understanding of the steps involved in moving from the identification of a violation to ultimate penalty resolution.

As this report notes, the amount of penalties originally assessed is higher than the amount that Department actually ends up collecting from the violator. Several factors contribute to that outcome. One factor is fairness: those found in violation of environmental requirements are afforded a system of appeals and second review that can bring to light circumstances that merit a reduction in the penalty amount. Additionally, statutes provide for a process of penalty mitigation even where the violation is admitted and the penalty is not subject to judicial review. While DENR has some delegated authority in this area, ultimate decisions on mitigation lie with commissions.

Another factor in collections is allocation of resources. DENR staff – or Department of Justice attorneys – sometimes conclude that the resources required to litigate a case are too high to merit pursuing, so they settle for a smaller penalty in order to commit enforcement resources elsewhere. At other times, penalties prove to be uncollectible because violators have left the state's jurisdiction or gone bankrupt.

Risks associated with litigation can increase as facts and arguments come to light. Depending on the certainty of the case, sometimes settlement is a wise choice.

DENR is now analyzing the effect that each of these factors plays. The Department is also committed to helping the public and the regulated community gain a better understanding of the penalties process by making the enforcement process more transparent.

Following the Governor's direction, DENR is developing a "truth in penalties" program. Taking the data presented in this report, Department management will review the penalty processes program by program, and identify areas where action is needed to strengthen each program.

The Department will do all in its power to ensure that its enforcement actions lead to a final penalty that is proportional to the violation. Willful and egregious misconduct will be dealt with in a tough, coordinated fashion that takes full advantage of civil penalties and other authority available. The Department will also identify programs in which its regulatory authority is not sufficient to enforce the law adequately and to protect public health and the environment, so that a plan for enhancing this authority – whether through rulemaking or legislative change – can be developed and implemented.

Conclusion

This report is the department's first attempt to put in place a large-scale system of measurement for activities and outcomes related to our compliance programs. Many of the measures in this report are being generated for the first time and reveal gaps in our data systems that yield incomplete answers. Some measures are currently limited in scope and will be improved in future reports.

The department recognizes the need to continue developing measures that allow any interested person to evaluate the effectiveness of our enforcement programs. Not only do we need to assess the quality of our enforcement programs, but we should be able to link enforcement activities to trends in environmental quality. Ultimately, what matters is that healthy citizens live in a healthy environment.

The department has begun strengthening environmental information systems to facilitate better internal decision-making and to inform our constituents of enforcement and compliance related activities. Existing data systems are not yet integrated and only minimally support DENR's information needs for program planning, decision-making and communication. An integrated information management system will allow DENR to answer questions that are important to manage our enforcement programs.

The STEP Team's implementation plan is due to be released later in 2001 and will act on specific strategies designed to foster a stewardship culture within all North Carolina communities. These "stewardship strategies" will balance enforcement with other compliance tools and engage the community to take responsibility for environmental outcomes. Our intent is to share the responsibility of environmental protection rightfully with those in the communities who ultimately live with the consequences of environmental impact.

Currently, enforcement is a necessary tool to achieve the desired outcome of regulatory compliance. Moving into the 21st century, environmental stewardship will receive more attention as the department focuses on other compliance assistance tools for enhanced environmental protection. Business, government and community leaders need to share accountability as all parties value the health of citizens and their environment, and understand that a healthy economy cannot exist without a healthy environment.

Readers are invited to send suggestions, comments and questions that will help improve this report in future years. You may direct your comments to:

Appendix A – Enforcement Profiles by Program

Air Quality	
Number of Regulated Sites	3,622
Number of Inspectors [Full-Time Equivalents (FTEs)]	12
Number of Inspections per year	2,206
Compliance Rate Among Inspected Sites [1]	64 %
Percent Repeat Violators [2]	–

[1] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[2] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Coastal Management	
Number of Regulated Sites [3]	4,206
Number of Inspectors (FTEs)	6
Number of Inspections per year	8,412
Compliance Rate Among Inspected Sites [4]	96 %
Percent Repeat Violators [5]	0.25%

[3] At any one time during the year

[4] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[5] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Dam Safety	
Number of Regulated Sites	4,305
Number of Inspectors (FTEs)	11
Number of Inspections per year	1,764
Compliance Rate Among Inspected Sites [6]	96 %
Percent Repeat Violators [7]	–

[6] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[7] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Erosion & Sedimentation Control	
Number of Regulated Sites [8]	7000
Number of Inspectors (FTEs)	34
Number of Inspections per year	15,445
Compliance Rate Among Inspected Sites [9]	95 %
Percent Repeat Violators [10]	0.1%

[8] At any one time during the year

[9] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[10] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Groundwater	
Number of Regulated Sites	19,100
Number of Inspectors (FTEs)	24
Number of Inspections per year	2,947
Compliance Rate Among Inspected Sites [11]	98 %
Percent Repeat Violators [12]	0.1%

[11] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[12] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Hazardous Waste	
Number of Regulated Sites	6,605
Number of Inspectors (FTEs)	10
Number of Inspections per year	997
Compliance Rate Among Inspected Sites [13]	83%
Percent Repeat Violators [14]	0.02%

[13] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[14] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Mining	
Number of Regulated Sites	898
Number of Inspectors (FTEs)	3
Number of Inspections per year	779
Compliance Rate Among Inspected Sites [15]	91%
Percent Repeat Violators [16]	0.1%

[15] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[16] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

NPDES	
Number of Regulated Sites	18,000
Number of Inspectors (FTEs)	28
Number of Inspections per year	1,203
Compliance Rate Among Inspected Sites [17]	93%
Percent Repeat Violators [18]	0.4%

[17] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[18] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Non-Point Source Discharge	
Number of Regulated Sites	3,473
Number of Inspectors (FTEs)	22
Number of Inspections per year	3,409
Compliance Rate Among Inspected Sites [19]	85%
Percent Repeat Violators [20]	0.4%

[19] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[20] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

On-Site Wastewater	
Number of Regulated Sites [21]	1,502,970
Number of Inspectors (FTEs)	632
Number of Inspections per year	not available
Compliance Rate Among Inspected Sites [22]	not available
Percent Repeat Violators [23]	not available

[21] On-Site Wastewater program is delegated to local government agencies. Number of regulated sites and number of inspectors reflects local government resources. All other data is based on state program activities alone.

[22] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[23] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Public Water Supply	
Number of Regulated Sites	7,695
Number of Inspectors (FTEs)	35
Number of Inspections per year	10,054
Compliance Rate Among Inspected Sites [24]	82%
Percent Repeat Violators [25]	1.5%

[24] Compliance rate based on population served with water improperly tested rather than violations based on inspections.

[25] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Radioactive Materials	
Number of Regulated Sites	679
Number of Inspectors (FTEs)	1.8
Number of Inspections per year	395
Compliance Rate Among Inspected Sites [26]	not available
Percent Repeat Violators [27]	0%

[28] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[27] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Shellfish Sanitation	
Number of Regulated Sites	149
Number of Inspectors (FTEs)	2
Number of Inspections per year	1,023
Compliance Rate Among Inspected Sites [28]	100%
Percent Repeat Violators [29]	0%

[28] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[29] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Solid Waste	
Number of Regulated Sites	685
Number of Inspectors (FTEs)	6.6
Number of Inspections per year	790
Compliance Rate Among Inspected Sites [30]	98%
Percent Repeat Violators [31]	0.1%

[30] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[31] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Tanning Booths	
Number of Regulated Sites	2,871
Number of Inspectors (FTEs)	3
Number of Inspections per year	1,142
Compliance Rate Among Inspected Sites [32]	68.4%
Percent Repeat Violators [33]	0%

[32] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[33] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Underground Storage Tanks	
Number of Regulated Sites	10,797
Number of Inspectors (FTEs)	13
Number of Inspections per year	2,122
Compliance Rate Among Inspected Sites [34]	76.1%
Percent Repeat Violators [35]	0.6%

[34] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[35] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

X-Ray Machines	
Number of Regulated Sites	6,017
Number of Inspectors (FTEs)	7
Number of Inspections per year	1,544
Compliance Rate Among Inspected Sites [36]	78.8%
Percent Repeat Violators [37]	0%

[38] Pending sophisticated data collection, this measure is unreliable to infer compliance rates at uninspected sites.

[37] NOVs are excluded from this measure to isolate more serious violations (e.g. penalty orders and injunctions).

Appendix B – Definitions of the Measures for this Report

Page 10. Compliance Rate

1. Percent – *[(1 - (in calendar year 2000, total number of enforcement actions ÷ total number of inspections)) × 100]. Enforcement actions include notices of violations (NOVs), civil penalties, injunctions, or special orders of consent (SOCs).*

Page 10. Return to Compliance Rate

1. Percent – *what percent of facilities were found to be in compliance at their follow-up compliance inspection (i.e. returned to compliance by their specified deadline)*

Page 11 – Figure 3. Timeliness of Penalty Collections in Calendar Year 2000 (of penalties assessed in calendar year 2000)

1. Time from Inspection to Issuance of NOV - *average number of days from when a violation was detected to when an NOV was issued*
2. Time from NOV Issuance to Penalty Assessment - *average number of days from when an NOV was issued to when a penalty was assessed (or in instances where the issuance of the NOV was skipped, the average number of days from when violation was detected to when penalty was issued).*
3. Time from Penalty Assessment to Penalty Established through settlement or final action - *average number of days from when a penalty was assessed to when the penalty was established (for penalties established as of 12/31/00). This number only includes facilities that chose to contest their case.*
4. Time from Penalty being established through settlement or final action to Penalty Paid in Full - *average number of days from when a penalty was established to when the penalty was paid in full (for penalties paid in full as of 12/31/00)*

Page 14 – Figure 7. Penalties Assessments in Calendar Year 2000

1. Number – *number of penalties assessed*
2. Total – *total dollar amount assessed*
3. Average – *average dollar amount assessed (Total/Number)*
4. Highest – *highest dollar amount assessed*

Page 15 – Figure 8. Penalty Collection Information for Calendar Year 2000

1. Total Established Through Settlement, Agreement or Final Action – *total dollar amount established as of 12/31/00 (i.e. the total dollar amount you expect to receive in penalty collections). This includes the total dollar amount that is finally agreed upon through negotiations (i.e. settlement amount) or through the appeals process (of all the facilities that decide to appeal) plus the total dollar amount assessed (of the facilities that choose not to appeal and time has expired for them to contest their penalty). This excludes cases that were appealed in calendar year 2000, but a settlement amount was not decided as of 12/31/00. This excludes cases where the facility still had time to contest their case as of 12/31/00 and has not yet appealed or paid their penalty in full as of 12/31/00.*
2. Percent of Cases Where the Penalty Amount has not yet been Established– *Cases still outstanding as of 12/31/00 [cases that were appealed in calendar year 2000, but a settlement amount was not decided as of 12/31/00 and cases where the facility still had time to contest their case as of 12/31/00 and has not yet appealed or paid their penalty in full as of 12/31/00].*
3. Total Collected – *the total dollar amount collected (through 12/31/00) for penalties assessed in 2000*

Page 16 – Figure 9. Penalty Collections Pending in Years 1996-1999 (as of 12/31/00)

1. Collections Pending (1996) – *penalties assessed in 1996 that have not been collected as of 12/31/00*
2. Collections Pending (1997) – *penalties assessed in 1997 that have not been collected as of 12/31/00*
3. Collections Pending (1998) – *penalties assessed in 1998 that have not been collected as of 12/31/00*
4. Collections Pending (1999) – *penalties assessed in 1999 that have not been collected as of 12/31/00*

Page 17. Repeat Violations

1. Number – *number of regulated entities with two or more enforcement actions over the last five calendar years (2000, 1999, 1998, 1997, and 1996). Enforcement actions include civil penalties, injunctions, or SOCs. NOVs are excluded from this measure.*
2. Percent – *[(number of regulated entities with two or more enforcement actions over the last five calendar years + 5) + total number of inspections in calendar year 2000]. Enforcement Actions include civil penalties, injunctions, or SOCs. NOVs are excluded from this measure.*

Page 18 – Figure 10. Percent of Civil Penalty Cases Contested in Calendar Year 2000

1. Percent – *of all civil penalties assessed in calendar year 2000, what percent were contested (as of 12/31/00)*

Appendix C – Program Descriptions

PROGRAM (DIVISION)	PROGRAM DESCRIPTION	EXAMPLES OF REGULATED ENTITIES
Division of Air Quality	The Division of Air Quality regulates the quality of air in North Carolina through technical assistance and enforcement of state and federal air pollution standards. The division issues permits, establishes ambient air quality standards, monitors the air quality of the state and implements a vehicle inspection/maintenance program in conjunction with the Division of Motor Vehicles (DOT).	• Industries with air emissions • Animal operations with liquid waste management systems
Division of Coastal Management	The Division of Coastal Management carries out the state's Coastal Area Management Act, the Dredge and Fill Law, and the federal Coastal Zone Management Act of 1972 (CZMA) in the 20 coastal counties, using rules and policies of the NC Coastal Resources Commission (CRC). Areas of environmental concern (AECs) are the foundation of the CRC's permitting program for coastal development. An AEC is an area of natural importance: it may be easily destroyed by erosion or flooding; or it may have environmental, social, economic, or aesthetic values that make it valuable to our state.	• Those proposing any development (construction, excavation, filling) in the coastal area and within an AEC
Non-point Source Discharge Unit (Division of Water Quality)	The Nonpoint Source Discharge Branch regulates a wide range of facilities that handle wastewater or biosolids but are not designed to discharge pollutants directly into a waterbody. The solids generated by any wastewater treatment facilities are regulated. The branch also oversees the Neuse and Tar Pamlico river basin buffer rules, wetlands development, and stream course modification. Oil and hazardous substances control, as they cannot be discharged, are regulated by the unit under the provisions of Article 21A.	• Animal farms • Municipal wastewater treatment plants that apply waste to land • Sewers • Industrial wastewater spray facilities • Developers that modify a stream course or move a wetland • Facilities that spill oil or hazardous materials in or near water
Groundwater Section (Division of Water Quality)	The Groundwater Section is the lead state agency for groundwater protection. Responsibilities include ground water pollution prevention, ground water quality classification and standards, review of permits for wastes that may enter the ground water, developing and implementing ground water clean-up requirements, promoting resource restoration, well construction rules, underground injection control, and ground water quality monitoring.	• Well contractors • Industrial and municipal wastewater treatment plants producing residuals needing disposal on land • Wastewater spray irrigation systems • Above-ground petroleum storage tank systems. • Parties causing groundwater pollution
NPDES Unit (Division of Water Quality)	The National Pollutant Discharge Elimination System (NPDES) is the federally-established program for controlling point-source discharges of pollution. The Clean Water Act of 1972 initiated strict control of wastewater discharges giving enforcement responsibility to the Environmental Protection Agency (EPA). The EPA delegated permitting authority to the State of North Carolina in 1975. The NPDES Unit is responsible for administering the program for the state.	• Municipal wastewater treatment plants • Industrial wastewater treatment plants • Subdivision wastewater treatment plants • Mobile home park wastewater treatment plants. • Animal farms

PROGRAM (DIVISION)	PROGRAM DESCRIPTION	EXAMPLES OF REGULATED ENTITIES
On-Site Wastewater Section (Division of Environmental Health)	The On-Site Wastewater Section regulates all wastewater collection, treatment, and disposal systems that do not discharge to surface waters. The department has delegated the permitting (>50k permits/year) and enforcement of the laws and rules to authorized environmental health specialists in local health departments	• Privies • Incinerating and composting toilets • Septic tank systems • Wastewater treatment plants and industrial process wastewater systems discharging to the subsurface • Modified, alternative, and innovative wastewater collection, treatment and disposal systems designed for subsurface disposal
Solid Waste Section (Division of Waste Management)	The Solid Waste Section regulates safe management of solid waste in North Carolina through guidance, technical assistance, regulations, permitting, environmental monitoring, compliance evaluation, and enforcement. Waste types handled at these facilities include municipal solid waste, industrial waste, construction and demolition waste, land-clearing waste, scrap tires, and medical waste.	• Landfills • Transfer stations • Incinerators • Treatment and processing facilities • Compost facilities • Land application sites for a variety of non-hazardous solid waste types
Underground Storage Tank Section (Division of Waste Management)	The Underground Storage Tank (UST) Section issues permits, collects annual fees and handles requests for information for regulated and/or commercial Underground Storage Tanks. The UST Section ensures compliance with all relevant state and federal laws, policies, rules and regulations by assisting owners and operators in complying with the operation standards (standards for leak detection, spill and overfill detection, etc.) and inventory record-keeping. In addition, the UST Section is charged with overseeing the permanent closure activities of UST systems.	• Gas stations • Any facility that uses USTs
X-Ray (Division of Radiation Protection)	The X-Ray Inspection Program inspects X-Ray machines and facilities to meet the regulations adopted by the Radiation Protection Commission to protect the public and workers against over-exposure to radiation. The program provides technical assistance to encourage x-ray exposure as low as reasonably achievable.	• Dental x-ray machines • Hospital x-ray machines • Industrial x-ray machines
Tanning (Division of Radiation Protection)	The Tanning Inspection Program inspects tanning machines and facilities to ensure compliance with the regulations adopted by the Radiation Protection Commission to protect the public. The program provides technical assistance to registrants and operators to encourage responsible operation of tanning facilities.	• Beauty shops • Spas • Video stores • Home-based commercial tanning facilities.
Radioactive Materials (Division of Radiation Protection)	The Radioactive Materials Program regulates the receipt, possession, use, transfer, and disposal of radioactive material and particle accelerators. The program inspects specific licensees periodically and general licensees as required. The program reviews and certifies new sealed radioactive sources manufactured in North Carolina.	• Nuclear medicine facilities • Civil engineering firms • Industrial radiographers • Research facilities
Dam Safety (Division of Land Resources)	The Dam Safety Program ensures the safety of the public from dam failures, the maintenance of water reservoirs and the maintenance of downstream minimum stream flows from dams. The Dam Safety Program performs inspections, reviews permit applications, and	• Owners of dams

PROGRAM (DIVISION)	PROGRAM DESCRIPTION	EXAMPLES OF REGULATED ENTITIES
	enforces the Dam Safety Law of 1967 to bring dams that pose a threat to human life or property into compliance with the requirements of the law. There are more than 5,000 dams on the state's inventory of dams, approximately 1,000 of which would cause probable loss of human life and/or extensive property damage in the event of dam failure. The program processes approximately 200 applications each year for the construction, repair modification, and removal of dams. The regional offices are responsible for inspection of dams and the initiation of enforcement for violations of the law.	
Erosion and Sedimentation Control (Division of Land Resources	The Erosion and Sedimentation Control Program prevents offsite sedimentation pollution from land disturbance activities. The program began in 1974 following the 1973 passage of the Sedimentation Pollution Control Act by the North Carolina General Assembly. The act is a performance-oriented legislation that establishes four mandatory standards. The regional offices are responsible for the review and approval of erosion control plans, inspection of land-disturbing activities and the initiation of enforcement for violations of the Act. The Land Quality Section received approximately 3,600 new erosion and sediment control plans in FY 2000, and has approximately 7,000 active projects.	• Builders of homes, subdivisions, commercial property, etc.
Public Water Supply Section (Division of Environmental Health)	The Public Water Supply Section promotes public health by ensuring that safe, potable water is available in adequate quantities to the residents and visitors of North Carolina served by public water systems by ensuring that such systems are properly located, constructed, and maintained. The section implements and enforces the provisions of the federal Safe Drinking Water Act in the state through a primacy agreement with the US Environmental Protection Agency.	• Public water systems with at least 15 service connections or that serve 25 or more individuals for 60 or more days per year
Hazardous Waste Section (Division of Waste Management)	The Hazardous Waste Section ensures the safe management of hazardous waste in North Carolina. The section applies the adopted federal rules that incorporate the Resource Conservation and Recovery Act (RCRA) requirements and additional state rules. In addition, the section oversees the RCRA Used Oil regulations.	• Small and large quantity generators • Hazardous waste transporters • Treatment / storage / disposal facilities • Facilities that are in various states of closure and post-closure • Used oil facilities
Shellfish Sanitation Section (Division of Environmental Health)	The Shellfish Sanitation Section protects the consuming public from shellfish and crustacea that could cause illness. Rules and regulations following national guidelines have been implemented to ensure the safety of harvesting waters and the proper sanitation of establishments that process shellfish and crustacea for sale to the general public.	• Shellfish and crustacea harvesters that sell to the public
Mining Program (Division of Land Resources)	The purpose of the Mining Program, as authorized by The Mining Act of 1971, is to ensure that mining operations protect the environment and public safety during mining and reclaim the mined land after mining. The Mining Program regulates approximately 900 mines. The Land Quality Central Office processes approximately 325 applications for new mines, renewals, and transfers and releases each year, and initiates and coordinates enforcement. The regional offices are responsible for inspection of the mine sites.	• Mining operations

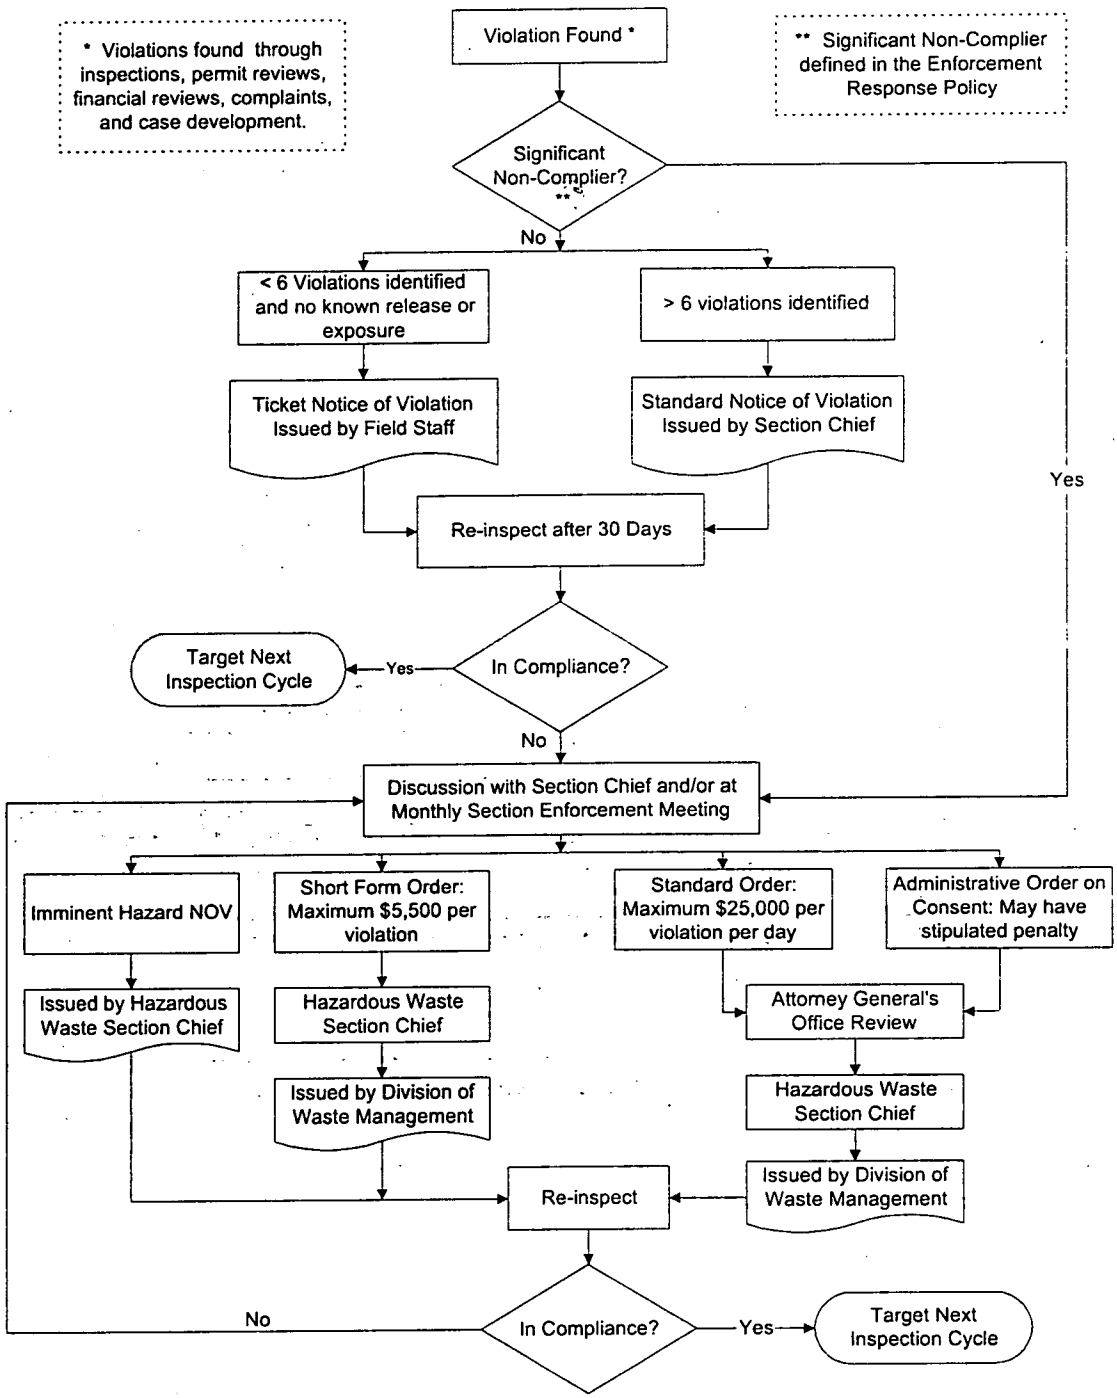
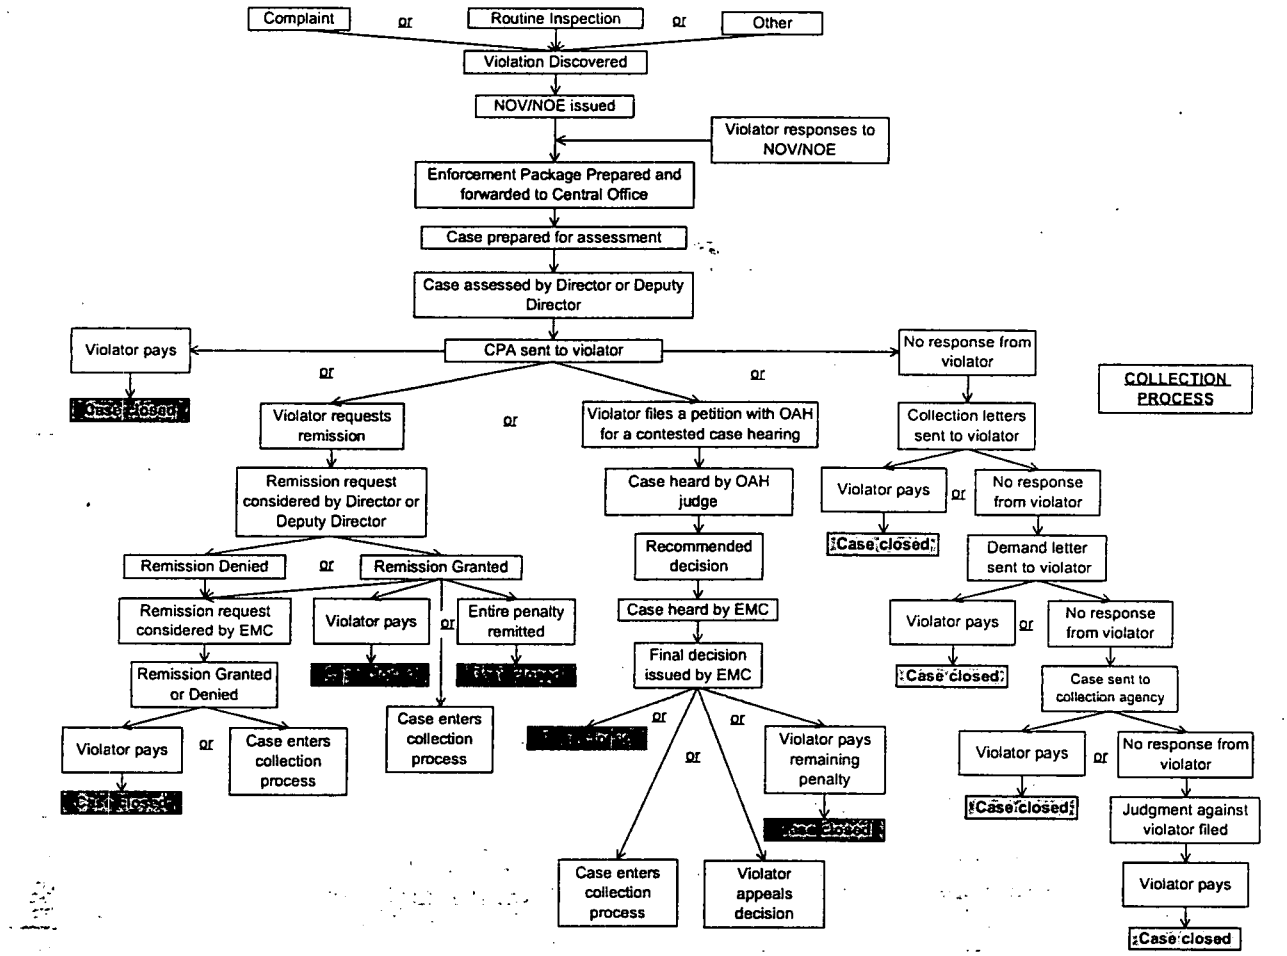
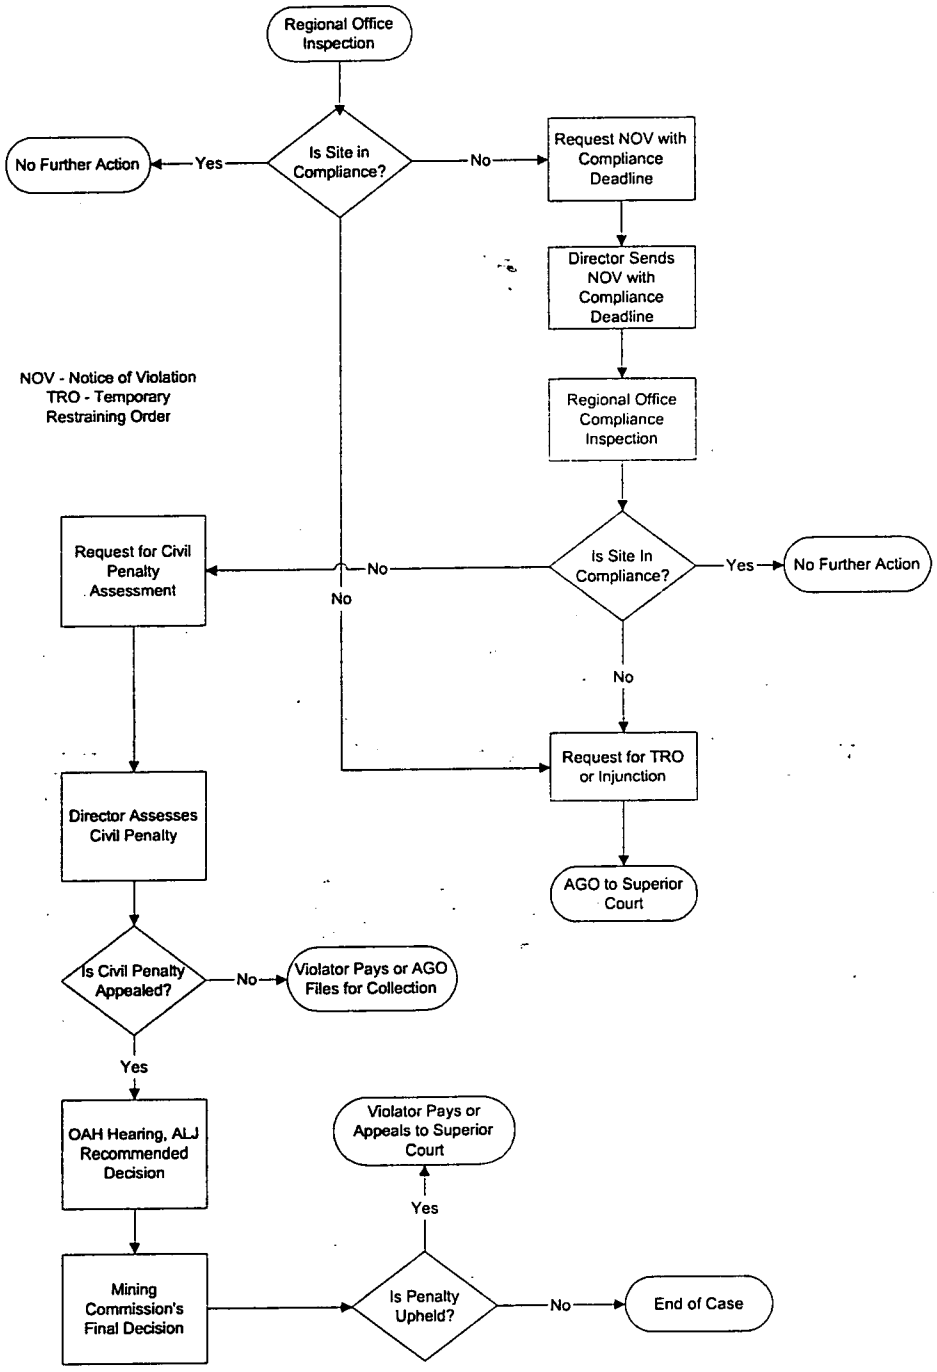
HAZARDOUS WASTE SECTION ENFORCEMENT PROCESS



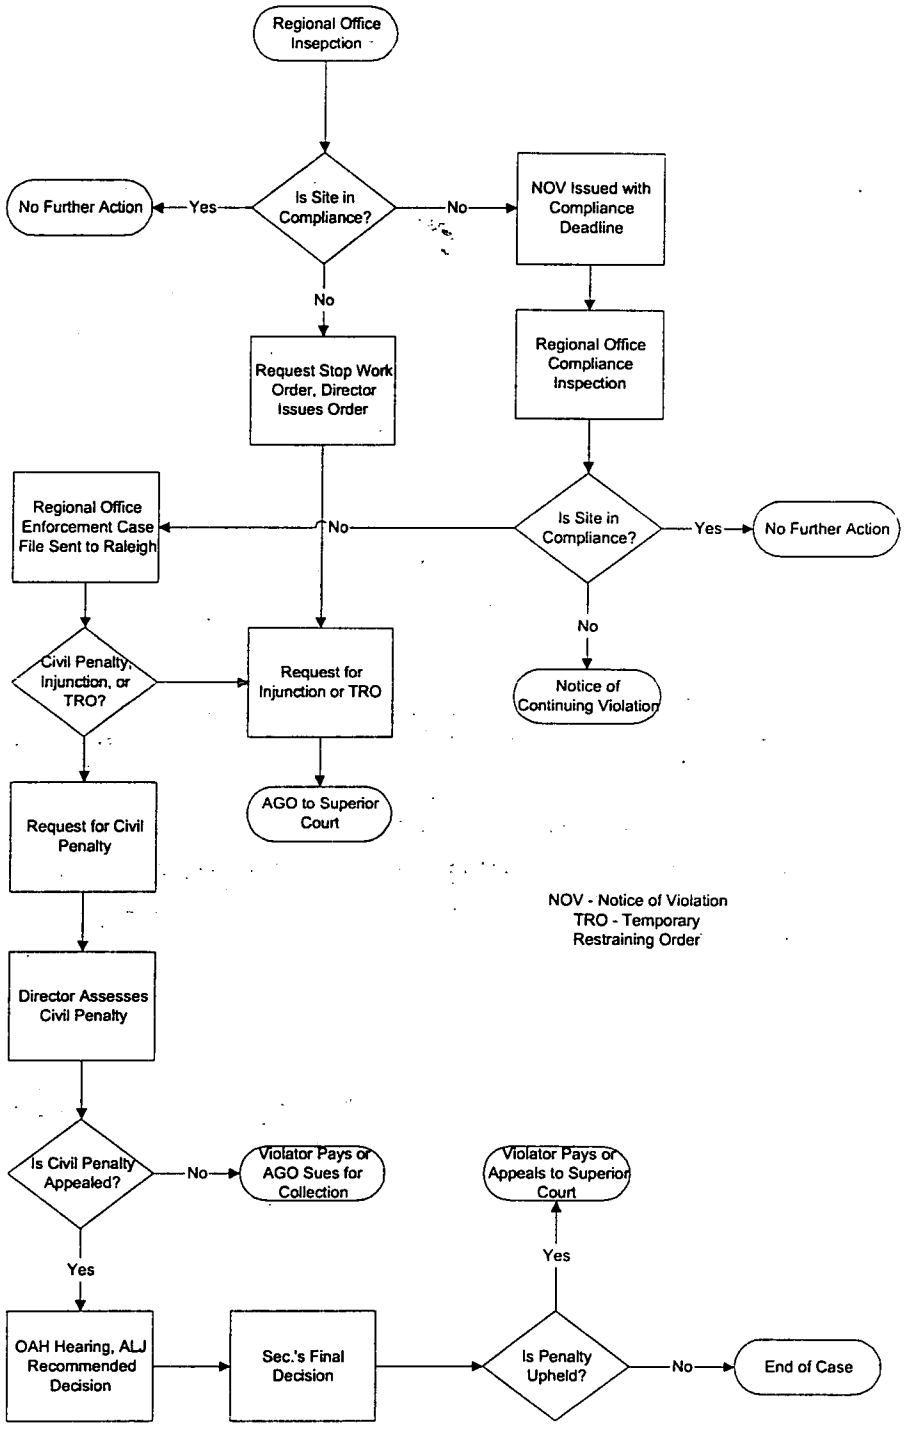
Division of Air Quality Enforcement Process



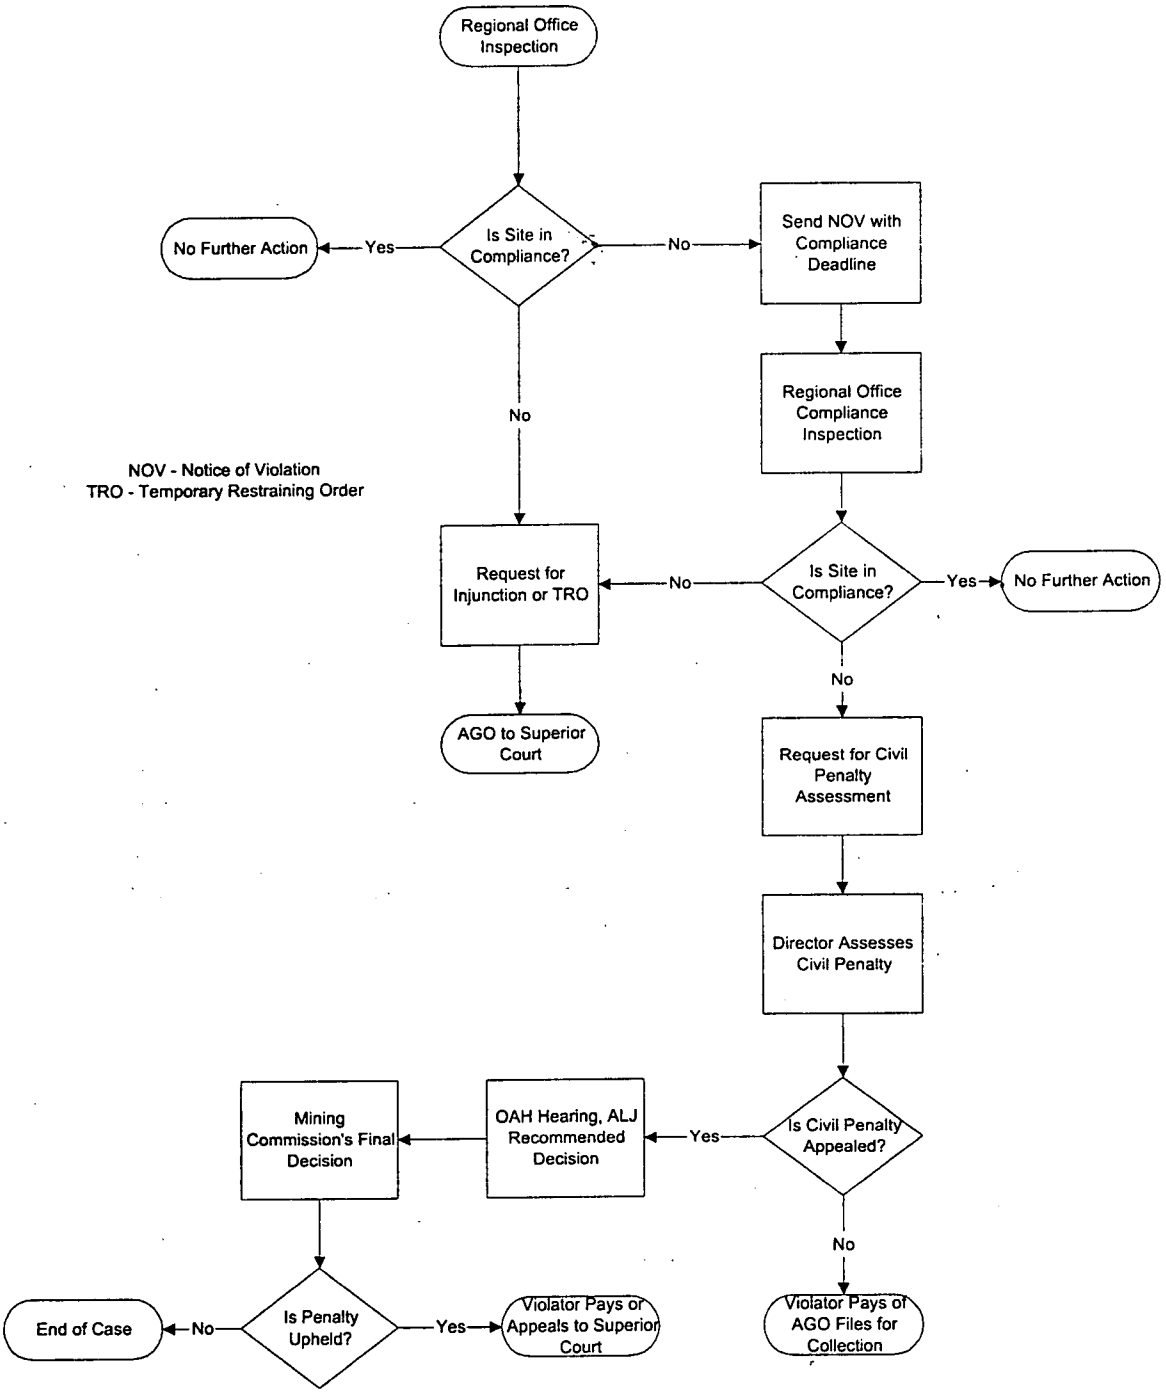
Mining Enforcement Process – Permit Violations



Sedimentation and Pollution Control Act Enforcement



Mining Enforcement – Mining Without a Permit



PRINCIPLES OF ENFORCEMENT
March 31, 2000

In an ideal world, regulation is replaced by stewardship; an inherent respect for the environment. In this concept of stewardship, everyone takes responsibility for their actions and the use of resources for the benefit of the community. In the real world, stewardship is sometimes compromised by conflicting capabilities, priorities, values, and perspectives. This creates the need for regulation and enforcement.

The challenge for regulators is to balance the use of compliance tools with the recognition of stewardship efforts. Regulated entities must be made aware of the conditions for compliance, made to feel the consequences of non-compliance, and provided an opportunity to demonstrate behavior beyond compliance. When enforcement is necessary, it should be fair, focused, visible, and timely.

The following principles are embraced to meet this challenge:

1. Compliance is the first step toward the ultimate goal of stewardship.
2. Enforcement will be balanced with education, technical assistance, and incentives to achieve compliance and encourage stewardship.
3. Enforcement will be an effective deterrent against future violations.
4. Enforcement actions will increase in severity for regulated entities with poor compliance histories.
5. The cost of non-compliance should be greater than the cost of compliance.
6. Resources will be used proportional to the potential impact on human health and the environment and in keeping with statutory responsibilities.
7. DENR will support the development and use of alternative tools to traditional enforcement that achieve compliance and encourage going beyond compliance.
8. DENR will trust, empower, and support its employees to make enforcement decisions and use enforcement discretion where appropriate.
9. DENR will ensure that its employees are well trained and informed to make enforcement decisions which are measurably consistent.
10. Enforcement policies, procedures, pertinent data, and other critical information will be accessible to any interested party.
11. Enforcement decisions will be defensible, documented, and proportional to the degree of potential harm.
12. DENR will foster partnerships internally and externally to realize shared responsibilities in environmental stewardship.

Good morning, Mr. Chairman and members of the committee.

I'm Gene Upchurch with Progress Energy, and I'm pleased to give you this update on our plan to comply with the requirements of the Clean Smokestacks legislation passed last year.

Right now, we're on schedule and on budget to comply with the General Assembly's requirement that we reduce by 70 percent the emissions of NOx and S02 from our 18 coal-fired units at seven power plants in North Carolina in the next 10 years.

Most of our work will focus on S02 reductions since we have been installing NOx reduction equipment at our plants since 1995 to comply with the Clean Air Act and the NOx SIP call rule adopted by the EMC.

To comply with Senate Bill 1078, our two units in Asheville will be among the first to be scrubbed, with construction beginning later this year and scrubber technology in operation in 2005 for unit 1 and 2006 for unit 2. One of our four Roxboro units will be scrubbed by 2005 and we will have a total of five units scrubbed by the end of 2007.

By the time we are in full compliance with SB 1078 at the end of 2013, will plan to scrub 11 of our units. However, our plan may be adjusted over the years as we work to meet the targets established in the legislation.

We will use flue-gas desulfurization technology and will use both wet scrubbers and dry scrubbers depending on the plant location. As you know, these scrubbers produce unique waste and by-product streams, and we'll need to address issues relating to wastewater permitting and disposal for each site.

We've been very pleased so far with the cooperation of regulators, who understand that this is an aggressive compliance schedule and are working with us to ensure we have the necessary permits in a timely manner.

Thank you, Mr. Chairman. I'll be glad to answer questions.

NC CAI Duke Power Projected Cost

- NOx $81 Million
  - Year around operation of Low NOx Burners & Selective Catalytic Reduction (SCR)
  - 24 additional Selective Noncatalytic Reduction (SNCR) systems
  - Additional Low NOx Burners
- SO2 $1.4 Billion
  - Wet Scrubber at 12 Units
- Total $1.5 Billion

NC CAI Technologies (NOx)

Technology	Cost $/kw	Reduction
LNBs	10 $/kw	25 %
Advanced LNBs	25 $/kw	60 %
SNCRw/ AdvLNBs	40 $/kw	72 %
SCRw/ AdvLNBs	250 $/kw	83 %

Current Activities & Upcoming Milestones

- NC CAI
  - NOx efforts
    - Spring 2002 - Cliffside Unit 5 SCR operational
    - November 2002 - Competitively bid and awarded the first permanent SNCR system at Allen
    - June 2003 – Belews Creek Unit 1 SCR operational
    - July 2003 – Allen Unit 1 SNCR operational date for long term trial
    - March 2004 – Belews Creek Unit 2 SCR completion date

Current Activities & Upcoming Milestones

- NC CAI
  - SO2 efforts
    - November 2002 - Competitively bid and awarded Alstom/Shaw-Stone/ Webster the Duke system scrubber optimization study. Will provide engineering, procurement and construction for scrubber additions.
    - Early 2003 – Begin permit preparation for air water and by-product disposal
    - June 2003 – Compete system optimization study
    - December 2003 – Award EPC contract for first scrubber unit(s)
    - 2006 – First scrubber unit operational

PROGRESS REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION OF THE CLEAN SMOKESTACKS ACT

January 28, 2003

B. Keith Overcash, P.E.
Director, Division of Air Quality

IMPLEMENTATION OF CLEAN SMOKESTACKS ACT

Efforts to Date:

- Governor Easley signed legislation into law on June 20, 2002.
- Utility companies submitted compliance plans and initial cost estimates in June '02.
- Governor Easley sent letters to all other governors in July '02 advising of clean smokestacks law.
- Attorney General Roy Cooper sent letters to the Attorneys General of upwind states in August '02 in reference to the clean smokestacks law.
- Secretary Bill Ross sent a letter to TVA in Sept. '02 requesting information about that utility's efforts to reduce NO_x and SO_2 emissions from its plants.
- DAQ Director Keith Overcash sent letters in Oct. '02 to air directors in 28 states and 18 local air programs requesting information about efforts underway in those jurisdictions to reduce NO_x and SO_2 emissions.
- Presentations were made about the legislation at two national state environmental organizations meeting in Fall of '02.

What's Up Next:

- Permits must be issued for the new control equipment to be installed by utilities. No permit applications have been received by DAQ to date.
- Utility companies must submit a progress report to the Environmental Management Commission and DENR by April 1 '03.
- DENR and State Utilities Commission must make a report on the implementation of the act to the ERC and Joint Legislative Utility Review Commission by June 1 '03.
- DAQ will make the first annual report to the EMC and the ERC in Sept. '03 on its interim findings relative to future requirements to control mercury and carbon dioxide emissions from coal-fired generating units. The final report with recommendations is due in September '05.

Status Report on On-Board Diagnostic Implementation and Inspection Maintenance Expansion

Environmental Review Commission
January 23, 2003

Presenter: Carl G. Pigford
Emissions & I/M Program Administrator
Division of Motor Vehicles

Summary of Phase 1 Implementation

- **Notifications to Stations** - Information regarding penalty and fee changes were mailed to over 7,000 safety and emissions stations in all 100 counties in December 2001.

- **Contract Negotiations** - The contract with MCI was amended in May 2002, which included development of a new vehicle information database and the testing for collection and storing of on-board diagnostic data. Specifications were developed for a new telecommunications system.

- **Software Development & Enhancements**
  - **MCI WorldCom** - New software enhancements were made to enable the network to perform all the essential functions required to accommodate the on-board diagnostic testing procedures, program administration and enforcement.
  - **DOT/Information Technology** - A gateway interface was developed to transmit and share data from the state database to the vehicle information database for on-board diagnostic testing.
  - **Analyzer Vendors** - Development of new specifications for on-board diagnostic testing equipment for North Carolina Analyzer Systems began in August 2001 and was finalized in late February 2002. The testing and certification process by our partners at the Division of Air Quality began in April 2002.

- **North Carolina Analyzer System Testing & Certification** - This was a team effort between the Division of Motor Vehicles, Division of Air Quality and the various vendors. Six (6) different vendors submitted equipment for testing and certification. This resulted in eight (8) different types of equipment that was certified and tested by the Division of Air Quality for purchase by the stations.

- **DMV Inspection Maintenance Training** - In May 2002, the Center for Automotive Science and Technology at Weber State University in Utah provided training locally for all Division of Motor Vehicles' Inspection Maintenance personnel.

- **Mechanic & Technician Training** - The first phase of training involved "train the trainer," in which State Instructors trained the Community College Instructors. In a partnership with the Community Colleges and Continuing Education Departments, over 4,000 on-board diagnostic technicians were trained at Community Colleges in the nine (9) existing emissions counties and certified in the operation of on-board diagnostic training by DMV Inspectors.

- **Public Awareness Outreach**
  - **Station Education Campaign** - Town meetings were conducted in Raleigh, Greensboro, and Charlotte to educate stations owners and operators about on-board diagnostic implementation, requirements, and equipment.
  - **Registration Renewal Inserts** - Inserts concerning the new on-board diagnostic testing were placed on the license plate renewal notices sent to our customers in the existing nine (9) emissions counties.

- **Public Service Announcements** - Announcements about the new on-board diagnostic testing were made in English and Spanish on radio stations in the nine (9) existing emissions counties.
- **Website Enhancements** - On-board diagnostic system information has been added to the DMV Website providing the locations of stations and the type of inspections a station is licensed to perform.

➢ **Current Status of Phase 1 Implementation** - The on-board diagnostic implementation in the nine (9) existing emissions counties is 100% complete.
- **1,212 licensed safety/exhaust/on-board diagnostic stations**
- **Over 4,000 licensed and certified technicians**
- **257 additional licensed safety/exhaust stations**

Preparations for Phase 2 Implementation

➢ **Overview** - Effective July 1, 2003, the expansion of the inspection maintenance program will involve the phase-in of six (6) additional counties (Catawba, Cumberland, Davidson, Iredell, Johnston and Rowan)

➢ **Notifications to Stations** - Information will be sent to approximately 780 safety inspection stations notifying them of the upcoming on-board diagnostic implementation.

➢ **Personnel for Expansion** - Personnel will be hired, trained and placed in the new counties to facilitate a successful transition into the emissions program.

➢ **Mechanic & Technician Training** - Approximately 2,300 technicians will go through the on-board diagnostic training and certification process at the Community Colleges offering the training.

➢ **North Carolina Analyzer System Testing & Certification** - Continuous testing of software and hardware will be made as it is submitted for approval.

➢ **Public Awareness Outreach** - An on-going public outreach program is planned to include all of the instruments used in Phase 1 and any other resources available.

Designations of Non-Attainment for Ozone and Fine Particle Air Quality Standards

Report on the Process of Designations to the Environmental Review Commission

January 23, 2003

Brock M. Nicholson, P.E.
Chief, Air Quality Planning
NC DENR

What are Designations?

- *Federal Action under the Clean Air Act*
- *In Code of Federal Regulations, CFR*
- *Based on Measured Air Quality Levels; Non-Attainment - Areas Exceeding Federal Ambient Air Quality Standards*

What Air Pollutants are Involved?

- *Ground Level Ozone, 8 - Hour Average*
- *Fine Particle, $PM_{2.5}$*

What is the Process?

- New Air Quality Standard "Triggers" Requirement
  - July 1997
  - Legal Challenges
  - Consent Agreement
- State Analysis
- Public Input
- Governor's Recommendation
- EPA Administrator's Action by Rule Making

What is the Timing for Designation?

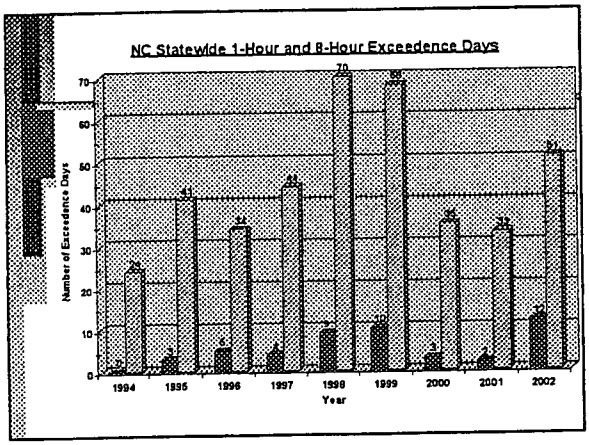
- Ozone
  - Final action by Administrator - April 15, 2004
  - Recommendation by Governor - April 15, 2003
- Fine Particles
  - Final Action by Administrator - December 31, 2004
  - Recommendation by Governor - September 30, 2003

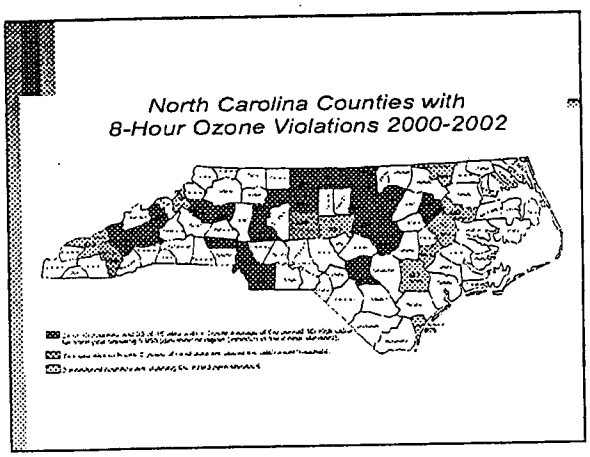
What are the Consequences of Designation of Non-Attainment?

- Starts "Clock" when State Implementation Plan (SIP) Revision is Due - Three years from Designation
  - Early Action Compact (EAC) Areas for Ozone are Due Earlier - December 31, 3004
- Transportation Conformity Starts One Year After Designation - April 2005 for Ozone; December 2005 for PM
- General Conformity Effective Upon Designation
- Non-Attainment New Source Review (NSR) Effective Upon Designation
  - Lowest Achievable Emission Rate (LAER) Controls Required
  - Offsets of New Emissions

What Areas of North Carolina will be Affected?

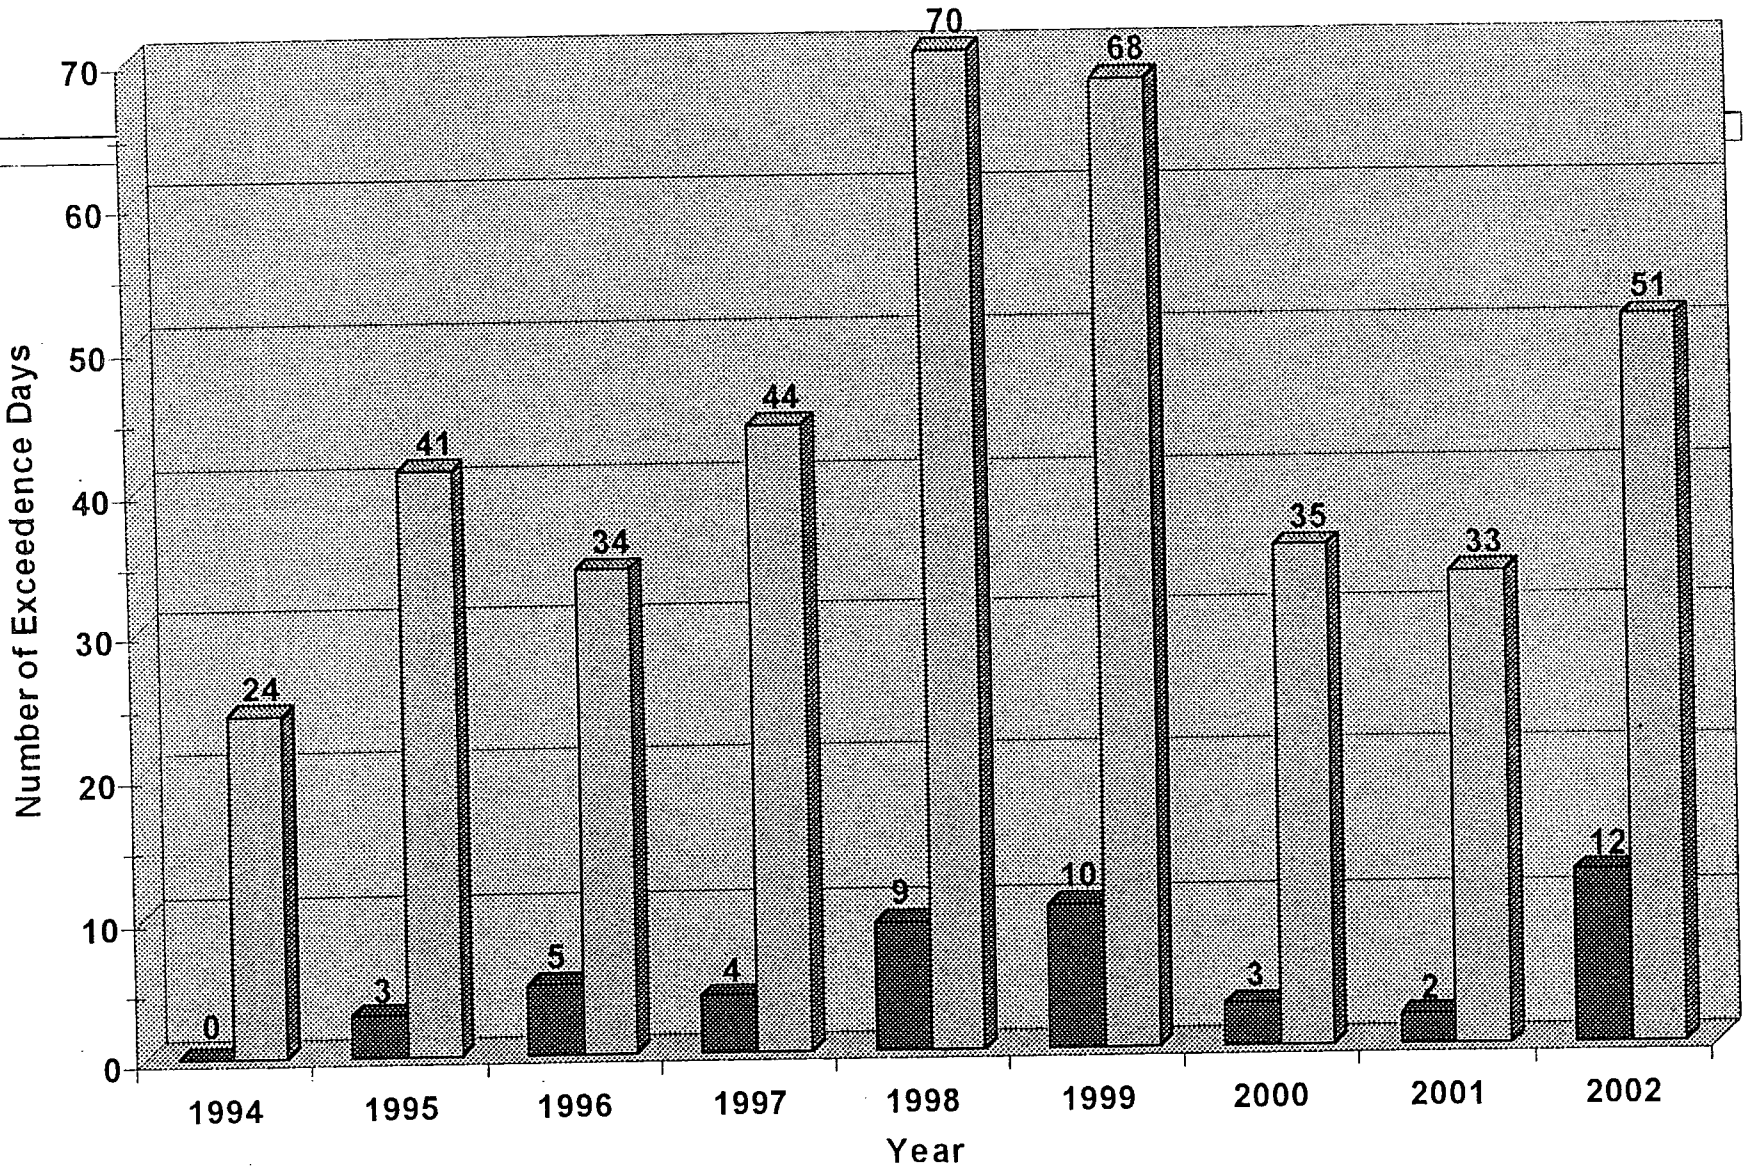
- **Ozone - See Following Graphics and Attached Map**
- **Fine Particles - See Attached Map**





Page 3a

NC Statewide 1-Hour and 8-Hour Exceedence Days



Issues

- *Timing for Governors Recommendations*
- *Implementation Requirements from EPA are Late*
- *Metropolitan Statistical Area (MSA) Adjustments from Last Census Not Determined Yet*
- *EPA Presumption for Boundaries*

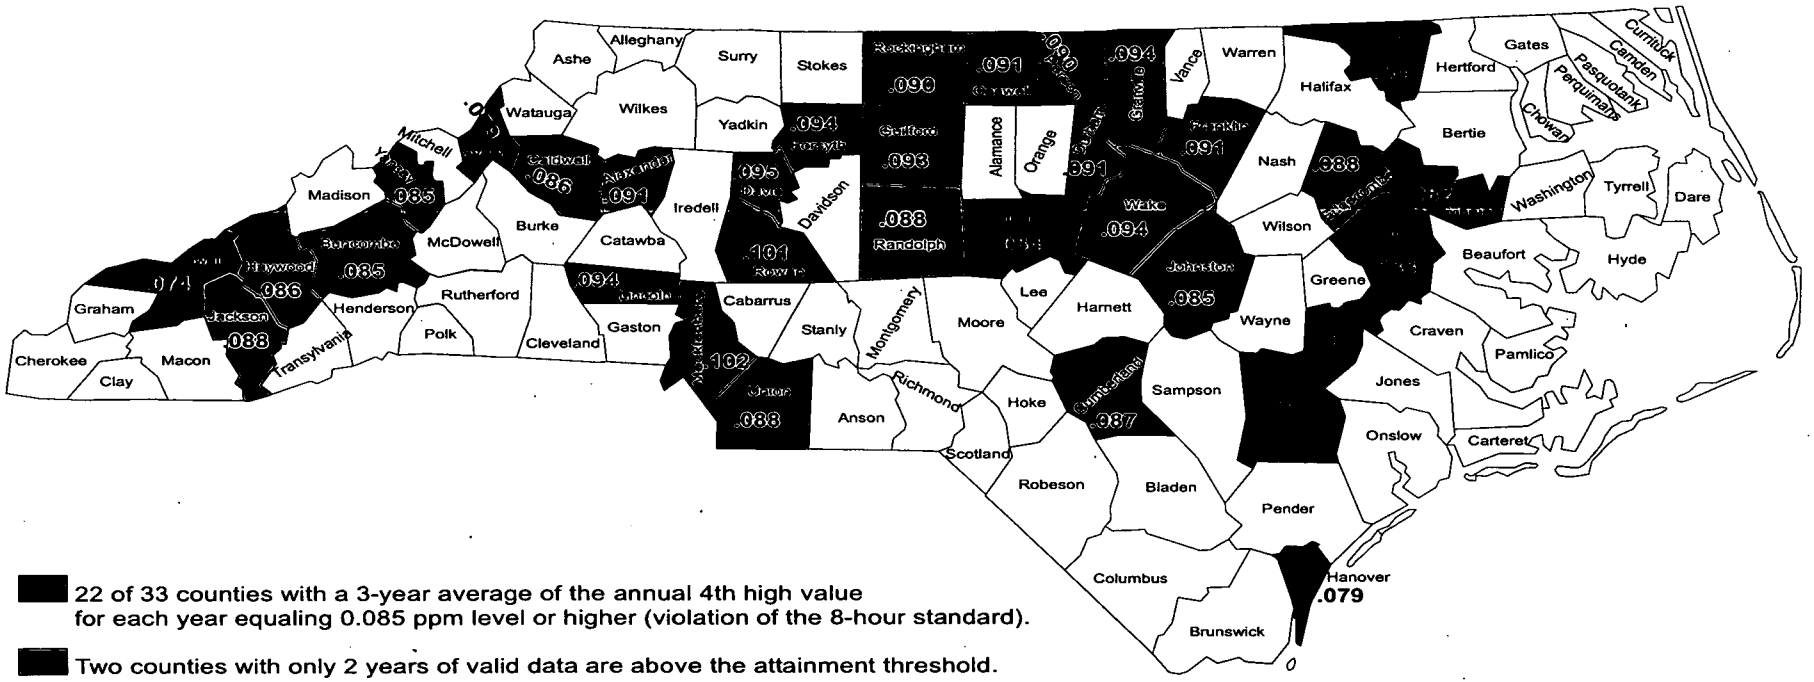
DRAFT

North Carolina Counties with 8-Hour Ozone Violations 2000-2002



- 22 of 33 counties with a 3-year average of the annual 4th high value for each year equaling 0.085 ppm level or higher (violation of the 8-hour standard).
- Two counties with only 2 years of valid data are above the attainment threshold.
- 9 monitored counties are attaining the 0.085 ppm standard.

NOTE:

- Additional counties may be involved in emission reduction strategies.
- Nonattainment designations may not follow county boundaries.
- Final data validation is not yet complete.

State Progress in Supporting Recycling Markets

- DOT a major user of recycled materials, including over 1 million tires, 70,000 recycled plastic offset blocks, and 67,000 cubic meters of fly ash in 2003.
- DOA continues to add many environmental products to state term contracts, including items like biodesiel fuel and recycled carpet.
- Recycled paper constitutes over 70 percent of all paper purchases by state agencies; 21 agencies bought only recycled paper.
- State agencies also bought over $6 million worth of non-paper recycled products in FY 02.

Recycling Markets

- Markets stable, with price fluctuations over time.
- Big factors: health of economy and virgin material prices.
- Many end markets express need for more materials.
- Markets emerging for "new" materials – e.g. food waste.
- Need more processing capacity in some areas of the state.

Mr. Bradley Bennett
Department of Environment and Natural Resources
Division of Water Quality
512 N. Salisbury St.
Raleigh, NC 27604-1148

Dear Bradley:

A number of counties have raised an issue regarding the responsibilities of the counties that were listed by EPA in the Phase II Stormwater rules. It appears that EPA listed twenty-four North Carolina counties because these units contain urbanized areas that potentially would be subject to the requirements of the Phase II regulations. The assumption is that these counties would be automatically subject to all of the Phase II requirements and would be required to implement the six stormwater program components. The EPA regulations are intended to apply automatically in local government jurisdictions that include defined urbanized areas and where the local government units own or operate municipal storm sewer systems (MS4s).

The issue raised by our member counties is this: county government in North Carolina should not be automatically required to implement all components of the Phase II program since our county governments do not own or operate storm sewer systems. Furthermore, North Carolina counties do not own or operate road or street systems with their extensive stormwater drainage systems.

This issue was raised earlier by Forsyth County. We have attached a copy of a letter dated December 16, 1999 written by Mr. Ragland, Forsyth County Water Quality Program Manager to you. Mr. Ragland made the point that the EPA regulations contemplated that units of local governments which own or operate MS4s in designated urbanized areas would be automatically required to implement the full-fledged stormwater management program. However, Forsyth County did not own or operate such systems nor did the county have any control or jurisdiction over the most extensive stormwater control systems within the county, namely, the drainage systems owned and operated by the State Department of Transportation.

Again, we contend that the EPA regulations do not automatically require any county in North Carolina to implement the Phase II program. We fully understand that the EPA regulations

authorize the states to designate additional units of local governments to be covered by the Phase II requirements. There may be a number of situations where requiring some level of participation by county governments in urbanizing areas would be both beneficial in carrying out state and Federal policy on stormwater management and appropriate in terms of county local authority and responsibility.

Let us suggest that your division pursue the following course of action.

1.) Seek a definitive ruling from the U.S. Environmental Protection Agency regarding the automatic applicability of the Phase II requirements to North Carolina counties containing urbanized areas.
2.) Initiate a dialogue with representatives of our metropolitan counties to determine what roles can reasonably be assumed by county governments to implement the Phase II requirements.

We would be happy to assist in setting up a meeting with the appropriate counties. We look forward to your response.

Sincerely,

Ed Regan, Deputy Director

REGION 4
ATLANTA FEDERAL CENTER
61 FORSYTH STREET
ATLANTA, GEORGIA 30303-8960

APR 9 2002

Honorable David Price
House of Representatives
Washington, DC 20515

Dear Congressman Price:

Thank you for your inquiry of March 15, 2002, on behalf of the North Carolina Association of County Commissioners, regarding its request for clarification of the applicability of the Phase II storm water regulations to county governments within the State of North Carolina. On December 9, 1999, the United States Environmental Protection Agency (EPA) promulgated the National Pollutant Discharge Elimination System (NPDES) Phase II Storm Water regulations. In short, the regulations set out to address operators of small municipal separate storm sewer systems (MS4s), industrial facilities that discharge storm water associated with industrial activity, and construction activity disturbing one to five acres.

The Association has expressed three major concerns with regard to the potential impact of the Phase II rule on the counties in North Carolina. In the first issue of concern, the Association asks, "What is the responsibility of the counties containing urbanized areas that were named on the initial list if the county governments do not own or operate the separate storm sewer systems or road/street systems?" The intent of the rule is to clearly address the owner/operator of the MS4 system, and hold that party responsible for applying for the permit. However, the State of North Carolina presents a unique situation where unincorporated counties neither own nor operate the road systems in their jurisdictional area. These systems represent a large portion of the MS4s that have direct discharges to waters of the U.S. in unincorporated county areas. Therefore, even though a county may be listed in Appendix 6, if that county does not own or operate the MS4, it does not have to submit an application or develop a storm water management plan, in accordance with NPDES regulations. If another entity does own or operate an MS4 within the county (e.g., town, department of transportation, regional utility district), that other entity will need to submit an application and develop the program. Please note that the federal NPDES regulations require delegated states to establish authorities for administering the federal requirements, including the development and implementation of their own designation and petition criteria which may expand storm water permit coverage by state law rather than by federal law.

The second concern expressed by the Association concerns the responsibilities of the counties with regard to the rule if they own public facilities such as parks, office parks, courthouses, landfills, and water supply systems. In 40 Code of Federal Regulations (C.F.R.) §122.26(a)(16)(iii) of the Phase II rule, EPA clarifies that the definition of a small MS4 does not include individual buildings, such as post offices, courthouses or urban buildings. These buildings may have a municipal separate storm sewer, but not have a "system" of conveyances. The State

will have to employ some discretion in deciding as to the nature of the building (or complex of buildings) and its storm water conveyance system.

Finally, the Association wants clarification regarding facilities requiring discharge permits. Specifically, would the six minimum measures apply only to the specific facilities or across the entire jurisdiction of the local governments that own/operate these facilities? As noted above, these facilities may not be required to obtain NPDES permit coverage according to the federal Phase I or Phase II storm water regulations. However, the State may use the authority under the Clean Water Act, Section 402(p)(2)(E), to designate an individual storm water discharge as a source of significant pollutants or one that contributes to a violation of a water quality standard within waters of the U.S. Under State designation authority, the State would determine the extent of the six minimum measures application.

The specific situations in North Carolina are unique and complex. The EPA Region 4 staff will continue to work with the North Carolina permitting staff in addressing these issues in the most effective manner possible. If EPA Region 4 can be of further assistance, please contact me or the Office of Congressional and Intergovernmental Relations at (404)562-8327.

Sincerely,

for J. I. Palmer, Jr.
Regional Administrator

Re: **Advisory Opinion:** Application of the NPDES Storm Water Phase II Program to Local Governments; N.C. Gen. Stat. § 214.7; N.C. Admin. Code tit. 15A, r. 2H.0126; 33 U.S.C. § 1342(p); 40 C.F.R. §§ 122.26, 122.32, 123.35

Dear Coleen and Bradley:

You requested written advice on two questions concerning the State implementation of the federal National Pollutant Discharge Elimination System ("NPDES") Storm Water Phase II Program as it relates to local governments. The questions arose from a request by the North Carolina Association of County Commissioners to review the federal rule and determine whether State implementation would require a county to obtain a permit, notwithstanding the county does not own or directly operate the largest storm water conveyance system in its jurisdiction, i.e., the State road system and its associated drainageways.[1] In particular, you asked (1) whether a county may be required to obtain a NPDES Storm Water Phase II permit for the storm water conveyances within its jurisdiction notwithstanding that it does not own or operate roads and associated drainageways; and (2) if a county is required to obtain a permit, what permitting avenues would be available.

In regard to the first Issue our answer is "yes;" we conclude that there are four scenarios under which a county may be required by DENR to obtain a Phase II permit, notwithstanding that it does not own or operate roads and associated drainageways. The four scenarios arise when: (a) the county owns or operates a municipal separate storm sewer system ("MS4")[2] in an urbanized

---

[1] Letter from Ed Regan, Deputy Director of the North Carolina Association of County Commissioners to Bradley Bennett of the North Carolina Department of Environment and Natural Resources' Division of Water Quality dated September 27, 2000.

[2] Under either phase, "municipal separate storm sewer" means a conveyance or system of conveyances including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains owned by a public body designed or used for collecting or conveying storm water which is not a

area which discharges directly to receiving waters; (b) the county owns or operates a storm water conveyance in an urbanized area which is interconnected with a permitted MS4, but retains the authority to implement a measure of the program; (c) the State designates a county's MS4 as needing a permit, regardless of location; or (d) a third party successfully petitions the State to require county permitting. In response to the second Issue, if required to obtain a Phase II permit, a county may obtain a general permit, an individual permit or arrange to be co-permittees with existing or new permittees.

Issue 1. The NPDES storm water permitting program has two phases, Phase I for large and medium MS4s[3] and Phase II for smaller MS4s[4]. Phase II permits require implementation of a storm water management program which is composed of six minimum measures. The minimum measures consist of (1) public education; (2) public notice; (3) illicit discharge detection and elimination; (4) construction controls; (5) post-construction controls; and (6) pollution prevention. In certain instances, only the county may be able to implement one or more of these six minimum measures. One such example of municipal control over a minimum measure is the requirement of post-construction controls, i.e., requiring maintenance of installed best management practices after construction is complete. To this end, a county may exercise control over its jurisdiction through the land use authorities granted to it by statute. Counties have broad authority to regulate and restrict the size of buildings; the percentage of lots occupied, the size of open spaces; the density of population; the location and use of buildings, structures, and land for trade, industry, residence or other purposes; and provide density credits or severable development rights for dedicated rights-of-way. N.C. Gen. Stat. § 153A-340. Counties may adopt zoning regulations designed to facilitate the adequate provision of water, sewerage and other public requirements. N.C. Gen. Stat. § 153A-341. Counties also regulate subdivisions by ordinance. N.C. Gen. Stat. § 153A-330 *et seq.*

North Carolina is one of the few states in which roads and adjoining drainageways are owned and operated by the state's department of transportation[5] rather than by counties. Apparently for this reason, the Association of County Commissioners has questioned whether a county may be required to obtain a Phase II permit when a county does not own or operate the majority of storm water conveyances, namely road drainageways, in its municipal jurisdiction, despite their ability to implement the minimum measures contemplated under Phase II.

---

combined sewer or publicly owned treatment works. 40 C.F.R. § 122.26(b)(8).

[3] Phase I covered discharges from MS4s serving populations of 100,000 or more. 33 U.S.C. § 1342(p)(2).

[4] Phase II covers discharges from MS4s serving populations of less than 100,000.

[5] North Carolina currently regulates NC DOT storm water under a statewide NPDES Stormwater Phase I permit (NPDES Permit No. NCS000250).

However, it is our opinion that North Carolina counties may be required by DENR to obtain a permit under at least four scenarios, notwithstanding that they do not own or operate the majority of MS4s in their jurisdiction.

First, a county may be required by DENR to obtain a permit for any discrete system which it owns or operates in an urbanized area.[6] Road drainageways are not the only MS4s in a county. Counties own or operate jail facilities, hospital complexes, municipal buildings, maintenance facilities and parks which contain catch basins, ditches, storm drains and other features of storm drainage which discharge directly to waters of the State without passing through another storm system such as NC DOT's road system. These MS4 point sources must obtain Phase II permits to discharge storm water directly to waters of the State.

Second, a county may be required by DENR to obtain a permit when its storm water devices are interconnected in an urbanized area with a permitted MS4 and the county retains authority to implement one or more of Phase II's six minimum measures. Under Phase I, the permitting agency could include storm water conveyances that did not themselves constitute a large or medium MS4 under the permit for a large or medium MS4 due to the interrelationship between the discharges of the smaller system and the MS4, including the physical interconnections between the storm sewers and other factors. 40 C.F.R. §§ 122.26(b)(4) and (7). DENR issued a statewide NPDES Phase I permit to the NC DOT for its roadways, but did not require counties to be permitted at that time. Without the county as a co-permittee, NC DOT's Phase I permit fails to provide program coverage outside of the right-of-way although those areas contain storm water conveyances that drain to the right-of-way.

Third, a county may be required by DENR to obtain a permit when the State permitting authority designates it for coverage, even if it falls outside of an urbanized area. 40 C.F.R. §§ 122.32(a)(2) and 123.35(b). The rule's preamble discusses this extended coverage by indicating that "Permitting authorities may also decide to designate all MS4s within a county or township, if they believe it necessary to protect water quality." 64 Fed. Reg. 68751. As the NPDES permitting authority, DENR is required to develop a process, as well as criteria, to designate small MS4s outside of the urbanized area which have the potential to result in exceedances of water quality standards or other significant water quality impacts. 40 C.F.R. § 123.35(b). Other significant water quality impact criteria may consist of discharge to sensitive waters, high growth or growth potential, high population density, contiguity to an urbanized area, significant contributor of pollutants to waters, and ineffective protection of water quality by other programs. 40 C.F.R. § 123.35(b)(1)(ii). DENR may also designate any small MS4 that contributes substantially to the pollutant loadings of a physically interconnected MS4 that is regulated by the NPDES storm water program. 40 C.F.R. § 123.35(b)(4). Therefore, even if a county lies outside

[6] The Bureau of Census determines urbanized areas based upon the latest decennial census data. Appendix 6 of the Phase II rule lists 25 counties which are partially or fully located within an urbanized area.

an urbanized area or is only physically interconnected with another regulated MS4, it may be required to obtain a Phase II permit through the State's own designation process.

Fourth, a county may be required by DENR to obtain a permit when it is subject to a successful third party petition. Even if DENR itself does not designate a county as needing a Phase II permit, third parties may petition the permitting agency to do so. 40 C.F.R. §§ 122.26(f)(4) and 122.32(b). Under the petition process, ***any operator*** of a permitted MS4 may petition DENR to require a separate NPDES permit for a discharge entering the operator's MS4. 40 C.F.R. § 122.26(f)(1)(emphasis added). Moreover, ***any person*** may petition DENR to require a county to obtain an NPDES permit for a storm water discharge which contributes to a violation of a water quality standard or is a significant contributor of pollutants to receiving waters. 40 C.F.R. §§ 122.26(f)(2) (emphasis added).

The Phase II rule generally focuses on discharges from MS4s which, by definition, requires the county to own or operate the MS4.[7] However, the language of the rule addressing the Phase II petition process addresses "any discharge into [an MS4]."[8] This change in language creates some ambiguity as to the scope of coverage. In particular, it might be argued by the petitioning operator of a permitted MS4 that he must only show that the discharge reaches its system, not that the discharge comes from another MS4. The petition process also addresses "[any] discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States."[9] In this instance, it might be contended that the third party must show that the discharge negatively affects water quality, without a requirement that the third party must show that the discharge emanates from an MS4.

It may be contended that the general intent of the statute would support such a construction. The structure of the CWA and its history indicate that all point sources should be permitted. *See Natural Resources Defense Council (NRDC) v. Train, 396 F. Supp. 1393 (D.D.C. 1975), affirmed, NRDC v. Costle*, 568 F.2d 1369 (D.C. Cir. 1977). With the adoption of the Water Quality Act of 1987, Congress amended the CWA and added section 402(p), which established the priorities, deadlines and permit requirements for storm water point sources, including MS4s. 33 U.S.C. § 1342(p).

The Phase II rule implements the Clean Water Act goal by seeking to provide comprehensive coverage of storm water control and to eliminate gaps in storm water coverage.

---

[7] *See* 40 C.F.R. §§ 122.26(b)(4), (7), (8), and (16).

[8] *See* 40 C.F.R. §§ 122.26(f)(1).

[9] *See* 40 C.F.R. § 122.26(f)(2). *Also see* 33 U.S.C. § 1342(p)(2)(E).

As the rule's preamble states, "'Donut holes' are gaps in program coverage where a small unregulated MS4 is located next to or within a regulated larger MS4 that is subject to an NPDES permit under the Phase I NPDES storm water program. The existence of such 'donut holes' creates an equity problem because similar discharges may remain unregulated even though they cause or contribute to the same adverse water quality impacts. Using NPDES permits to regulate the unregulated discharges in these areas is intended to facilitate the development of a seamless regulatory program for the mitigation and control of contaminated storm water discharges in an urbanized area." 64 Fed. Reg. 68739. The rule's preamble dedicates an entire subsection, Section II.H., to describing the municipal role in Phase II. 64 Fed. Reg. 68748 through 68771. The rule's appendix goes on to identify twenty-five North Carolina counties as being fully or partially located within an urbanized area. 64 Fed. Reg. 68822. It appears that EPA anticipated that North Carolina counties would be covered by the Phase II program and did not anticipate that whole areas would be left out simply because NC DOT rather than local government maintained the road system. Thus, the petition process may extend county coverage to county storm water discharges regardless of whether the discharge emanates from a conveyance that is owned and operated by the county and otherwise meets the definition of a small MS4.

Issue 2. If a county is required to obtain a NPDES permit under Phase II, it has several permitting options. It may request a general permit for all systems and components within the county boundaries. The Phase II program encourages the use of general permits on a system-wide or jurisdiction-wide basis. Under Phase I, NC DOT received a system-wide permit for its road system. Under Phase II, a county could receive a jurisdiction-wide permit for the systems within the county. In this regards, an NPDES general permit can cover a category of dischargers within a defined geographic area which may be defined broadly to include political boundaries, e.g., an entire county. 64 Fed. Reg. 68739. For the storm water systems which interconnect with NC DOT road systems, a county could join NC DOT as a co-permittee in its Phase I permit which would have to be modified to include the Phase II minimum measures. The Phase II rule allows a newly regulated MS4 to join as a "limited" co-permittee with a regulated MS4 by referencing a common storm water management program. 64 Fed. Reg. 68739. A "limited" co-permittee is only responsible for the measures not covered by the already-existing permit. Alternatively, a county could obtain its own Phase II permit for the systems that interconnect with NC DOT. Finally, a county may obtain or require individual permits for each system within its geographical area.

We trust this analysis proves helpful. If you have any questions or wish to discuss this matter further, please do not hesitate to contact us. With best wishes, we are

Very truly yours,

Comments to Environmental Review Commission
on Stormwater Rules
January 28, 2003

Thank you Mr. Chairman and members of the Commission. My name is Kim Hibbard and I'm here to comment on the draft stormwater rules on behalf of the League of Municipalities.

Timing. We agree with many of the points made by previous speakers today. From the beginning, League policy has supported focusing the state's resources on implementation of the federal Phase II criteria before attempting to develop a more expansive program. We asked that priority be placed on complying with Phase II because the federal deadline for municipal applications is March of 2003. We had hoped that permanent rules would be in place well in advance, but here on the eve of that deadline there are still no permanent rules. As you can imagine, municipalities are frustrated by the process and the continued lack of certainty as to what will be expected of them.

Cost. A major issue for municipalities will be the fiscal impact of these regulations. You will note on the list of Phase II municipalities that there are 123 towns automatically designated and 22 more listed as "possible designees." In addition, the draft permanent rules specify that any municipality located in a regulated county may be designated, so many more towns are likely to join this list. If you've had a chance to review the list of designees, you've probably noticed that most of these are not big cities. Many of them are 2,000 or 3,000 or 4,000 in population; fourteen of them are under 1,000. Consider how Belville, population 287, or Spencer Mountain, population 51, will have the financial resources to implement a stormwater program. These are not towns that own or operate MS4's, nor do they have the staff or the expertise to administer a new program.

References were made at your last meeting to federal analysis of the potential costs of Phase II compliance. Those federal figures give a broad range as to the possible per capita costs, but they are not specific to the requirements contemplated under North Carolina's draft permanent rules. At best they are a starting point for discussion. Needless to say, it is imperative that fiscal information addressing the impact of the specific state regulations be forthcoming. We have seen no sign of a fiscal note.

As was pointed out at your last meeting, the General Assembly assisted municipalities in the 2000 Session by amending the stormwater statutes to clarify that local governments can charge a fee for stormwater programs. We believe that Phase II municipalities will have to rely heavily on that fee option.

Coverage & Authority. The draft permanent rules require municipalities to implement all six of the minimum measures within their city limits but also in the extraterritorial jurisdiction. The League generally supports addressing stormwater in unincorporated areas, since that is where much of the growth is occurring. However, we have several concerns regarding the ETJ coverage, as there may be some gaps in municipal statutory authority to implement all of the measures contemplated by the rules. ETJ authority

currently exists only with respect to certain land-use activities—planning, zoning, subdivision control, and building permits. Municipalities do not have broad police powers outside of city limits.

This does not pose a problem as to those aspects of a stormwater program that are closely tied to land use. But questions have been raised, for example, as to what authority a town official has to enter private property in the ETJ for the purpose of detecting illicit stormwater discharges. (Attorneys for Phase II municipalities have contacted us with this concern.) It is also not abundantly clear that municipalities can charge a stormwater fee in the ETJ to finance the program. We know they can't charge a property tax in the ETJ, so fee-based financing will be necessary. The statutes have some ambiguous language that may need tweaking on this point.

Also, the draft permanent rules require the stormwater program to regulate on-site wastewater systems (septic tanks). Authority for that is vested in county health services, and we question what authority municipalities would have. The draft permanent rules further specify that in nutrient sensitive waters, the stormwater program must include a nutrient application management program. Again, we are unsure where the statutory authority lies for municipalities to regulate the use of fertilizer. I bring these to your attention simply to give you an idea of some of the items that might require legislation to clarify.

Post-Construction. Briefly, we have concerns about the details of several items under the post-construction component of the proposed rules. In the low-density option, the draft permanent rules have been left blank with regard to the limitation on Built-Upon Area. This should be a local land-use decision, and we would not support a one-size-fits-all approach. Under the high-density option, the rules would require removal of 85% of Total Suspended Solids. Our discussions with biological and agricultural engineers at NCSU indicate that this is not a realistic target and that 85% removal can only be achieved under optimum circumstances. Finally, the draft permanent rules would shorten the deadline for compliance with post-construction measures to one year, while retaining the federal five-year compliance time for the other measures. We believe one year is inadequate and question the wisdom of seeking to implement the most costly and complex aspect of the program before implementing the public education and participation components.

Thank you for allowing us this time to respond. I will be happy to answer any questions.

Comments of Southern Environmental Law Center (SELC)

Trip Van Noppen, SELC
January 28, 2003

I. North Carolina will benefit as a result of implementation of Phase II stormwater rules

- Contaminated surface runoff is the number one cause of impaired surface water quality in North Carolina according to the US Environmental Protection Agency.

- The North Carolina Division of Water Quality has determined that more than 2,000 stream miles have impaired water quality and that surface runoff from cities, construction sites, and other land uses accounts for nearly two-thirds of that pollution.

- About 80 percent of the water pollution in estuaries comes from polluted runoff.

- DENR Secretary Bill Ross has determined that nonpoint source runoff is a major concern and has directed most agencies within DENR to conduct efforts to educate the public about the connection between polluted runoff and impaired streams.

- Another devastating impact of poor storm water controls is that some neighborhoods flood during heavy rains because existing stormwater controls are not effective.

- Prevention is the least cost method to handle stormwater. Builders throughout the country are designing developments that make a strong profit and prevent the degradation of streams. The Phase II rules are designed to lead North Carolina is this direction.

- The cost of retrofits to remediate flooding and to restore impaired waters is extremely high. A study conducted for the City of Wilmington determined the cost of remediating flooding after developments had been built on Page's Creek watershed was $7,500 per acre.

- The Town of Washington spent over $4 million to redirect stormwater from the downtown area away from the Pamilco River and onto a stormwater wetland. The Town of Emerald Isle is also spending about $5 million to pump out Coast Guard Road on to wetland, which floods due to overdevelopment during heavy rains.

- Protected uses of waters, such as shellfishing and recreational swimming, are being lost in violation of the federal Clean Water Act. Due to stormwater runoff, most shellfish beds from Cedar Island to the South Carolina line are closed regularly as a result of fecal coliform bacteria contamination after 1.5 or 2 inches of rain. Recreational swimming is also curtailed whenever stormwater is pumped into the ocean.

II. The Phase II program is both federally required and consistent with state law.

- Federal law requires implementation, in two phases, of a comprehensive program for addressing stormwater discharges through mandatory National Pollution Elimination Discharge System (NPDES) permits.

- Phase II of that program addresses, among other things, stormwater pollution from smaller municipal separate storm sewer systems (MS4s). Federal rules require states choosing to implement the program to develop a permitting program that meets federal criteria. If the states do not implement the program, the federal government does.

- A variety of groups (including the National Association of Home Builders) challenged these "Phase II" rules. On January 14, 2003, a federal appellate court upheld the rules in almost all respects. The court did agree with conservation groups that certain aspects of the rule were not protective enough.

- In addition to the federal stormwater requirements, in the late 1980s, the General Assembly directed the EMC to "develop and adopt a statewide plan with regard to establishing and enforcing stormwater rules for the purpose of protecting the surface waters of the State. . . . [and to] implement stormwater runoff rules and programs for point and nonpoint sources on a phased-in statewide basis." N.C. Gen. Stat. § 143-214.7(a)-(b).

- The General Assembly directed the EMC first to consider standards for classified shellfish waters, water supply watersheds, outstanding resource waters ("ORWs"), and high quality waters ("HQWs"). After developing standards for those specific waters, the EMC was to consider standards and best management practices to control runoff to "[a]ll other waters of the State to the extent that the [EMC] finds control of stormwater is needed to meet the purposes of Article 21 [the State law providing for the protection of air and water resources]." N.C. Gen. Stat. § 143-214.7(b).

III. We recommend strengthening North Carolina's Phase II rules to protect state waters.

- The rules should include science-based best management practices that will protect water quality. For example, especially where urban runoff is draining to shellfishing waters, science does not support the conclusion that development with less than 24 percent built upon area addresses water quality problems related to urban runoff. Scientific studies suggest that the allowable amount of built upon area (impervious surface) should be 10 percent or lower.

- The rules should ensure seemless coverage so that potential gaps in coverage are eliminated. Moreover, counties and municipalities should have similar criteria for stormwater management programs.

- The final rules should be written so that they can be carried out effectively taking into account staff constraints within the Division of Water Quality.

DEVELOPMENT OF ENVIRONMENTALLY SUPERIOR TECHNOLOGIES: NC Agreements project – *a progress report*

Report prepared by: C.M. (Mike) Williams January 2003

Background: The Attorney General of North Carolina entered into Agreements in July and September, 2000 with Smithfield Foods and its subsidiaries (Smithfield Foods), and Premium Standard Farms (PSF), respectively, to develop "Environmentally Superior Technologies" (EST) for implementation onto farms located in North Carolina that are owned by these companies.[1] In March 2002, the Attorney General also entered into an Agreement with Frontline Farmers in which its membership agreed to work cooperatively with the Attorney General and North Carolina State University (NCSU) to develop and implement EST.[2] The Smithfield Foods Agreement provides $15 million and the NC Attorney General allocated $2.3 million from the PSF Agreement for a total of $17.3 million for the EST identification and development initiative.

Environmentally Superior Technologies: The Agreements define EST as "any technology, or combination of technologies that (1) is permittable by the appropriate governmental authority; (2) is determined to be technically, operationally, and economically feasible for an identified category or categories of farms as described in the Agreements and (3) meets the following performance standards: 1. Eliminate the discharge of animal waste to surface waters and groundwater through direct discharge, seepage, or runoff; 2. Substantially eliminate atmospheric emissions of ammonia; 3. Substantially eliminate the emission of odor that is detectable beyond the boundaries of the parcel or tract of land on which the swine farm is located; 4. Substantially eliminate the release of disease-transmitting vectors and airborne pathogens; and 5. Substantially eliminate nutrient and heavy metal contamination of soil and groundwater."

Candidate EST: Selection of EST candidates to undergo performance verification and economic analysis involved a request for proposals that was issued nationwide to research institutions and industry. Selections were based on terms and conditions of the Agreements and competitive review (outside *ad hoc* review) as well as review by an Advisory Panel appointed per the Agreements and comprised of individuals that represent government, environmental and community interests, the companies (Smithfield, PSF and Frontline Farmers) and individuals with expertise in animal waste management, environmental science and public health, economics and business management. Collectively, this process yielded the following EST candidates:

1. In-ground ambient temperature anaerobic digester / energy recovery / greenhouse vegetable production system,
2. High temperature thermophilic anaerobic digester (TAnD) energy recovery system,
3. Solids separation / constructed wetlands system,
4. Sequencing batch reactor (SBR) system,
5. Upflow biofiltration system,
6. Solids separation / nitrification-denitrification / soluble phosphorus removal /solids processing system,
7. Belt manure removal and gasification system to thermally convert dry manure to a combustible gas stream for liquid fuel recovery,
8. Ultrasonic plasma resonator system,

---

[2] See Agreement between Attorney General of North Carolina and Frontline Farmers (North Carolina Department of Justice, on file with Ryke Longest, 2002).

9. Manure solids conversion to insect biomass (black soldier fly larvae) for value-added processing into animal feed protein meal and oil system,
10. Solids separation / reciprocating water technology system,
11. Micro-turbine co-generation system for energy recovery,
12. Belt system for manure removal,
13. High-rate second generation totally enclosed Bion system for manure slurry treatment and biosolids recovery,
14. Combined in-ground ambient digester with permeable cover / aerobic blanket - BioKinetic aeration process for nitrification-denitrification / in-ground mesophilic anaerobic digester system (this project represents 3 farm sites),
15. Dewatering / drying / desalinization system,
16. Solids separation / gasification for energy and ash recovery centralized system (this project represents 3 farm sites),
17. High solids high temperature anaerobic digester system, and
18. Solids separation / mesophilic anaerobic digestion / membrane filtration – reverse osmosis system.

EST determination: Performance verification and economic feasibility analysis for candidate EST located on commercial farm sites involves a 15-step systematic process: 1) EST candidate selection through a pre-proposal and subsequent full proposal competitive review process, 2) selection of appropriate commercial farm or university research site for the technology study, 3) execution of farm owner agreement, 4) execution of technology design agreement, 5) development of technology design documents, 6) submittal, review and approval of design documents by NC Department of Environment and Natural Resources (NCDENR) for permitting purposes, 7) execution of technology construction agreement, 8) on-site construction, 9) execution of agreements for technology operation and post-evaluation decommission (if necessary), 10) construction closure approval, 11) establishment of functional operation of technology (e.g. steady state waste treatment conditions), 12) procurement of environmental performance data and economic feasibility data by third party research teams, 13) analysis of data and results reporting to the Advisory Panel, Designee, and public, 14) input and review process by the advisory panels, and 15) EST technology determinations per terms and conditions of Agreements.

Progress to date: Currently candidate EST nos. (as referenced above) 1, 3, 5, 6, 7, 9, 10, 12, and 17 are in various stages of operation and performance verification. Nos. 2, 4, 11, 13, 14, 16, and 18 are in various stages of design and/or permitting and/or construction. Candidate EST no. 8 (a portable unit process technology) is under fabrication in Germany and will be shipped to North Carolina as soon as possible; EST no. 15 (also a portable unit process) is under development out-of-state and a decision is pending regarding the location of the performance evaluation.

The 15-step process described above is grouped into 3 categories – 1) "on site" construction, 2) "on campus" technology development and objective environmental/economic performance verification, and 3) Advisory Panel review and technology determination reporting by the Designee named in the Agreements. A full service civil, agricultural, and environmental consulting engineering firm was retained in Year 1 of this initiative to provide project technical management assistance for the construction and permitting processes associated with all "on site" activities (items 2-10 in the 15-step process). Also during Year 1, request for proposals were issued for the "on campus" activities. Responses were subjected to outside *ad hoc* review and Advisory Panel review. Subsequently, successful project teams were identified and awarded grants/contracts for this scope of work. These teams are comprised of faculty and staff from NCSU and also include faculty from the University of North Carolina – Chapel Hill (UNC-CH), Duke University, University of Georgia (UGA), and professionals from Research Triangle Institute (RTI), United States Department of Agriculture (USDA), United States Environmental Protection Agency (USEPA), United States Air Force Combat Climatology Center, MCNC, and NCDENR.

Work in progress detail is provided on the college's waste management program web site.[3]

NC STATE UNIVERSITY

Development of Environmentally Superior Technologies

Progress Report – NC Attorney General

Agreements with Smithfield Foods, Premium Standard Farms, and Frontline Farmers

C.M. (Mike) Williams
Animal and Poultry Waste Management Center
North Carolina State University

NC STATE UNIVERSITY

Environmentally Superior Technologies

- "permittable by the appropriate governmental authority
- determined to be technically, operationally, and economically feasible for identified categories of farms
- meets the following performance standards..."

NC STATE UNIVERSITY

Performance Standards

- "Eliminate the discharge of animal waste to surface waters and groundwater through direct discharge, seepage, or runoff;
- Substantially eliminate atmospheric emissions of ammonia;
- Substantially eliminate the emission of odor that is detectable beyond the boundaries of the parcel of land on which the swine farm is located;
- Substantially eliminate the release of disease-transmitting vectors and airborne pathogens;
- Substantially eliminate nutrient and heavy metal contamination of soil and groundwater"

NC STATE UNIVERSITY

Economic Feasibility Determination

- Projected 10 year annualized cost of the technology (including capital, operation and maintenance) per 1000 # steady state live weight for each category of farm system
- Compared to lagoon and spray-field system
- Projected revenues, including income from byproducts
- Available cost-share monies or other financial assistance from federal, state or other public sources
- Impact that the adoption of the technology may have on the competitiveness of the NC pork industry
- ID/quantification (if possible) of emissions to environmental media from each category of farm system implementing the technology as compared to lagoon and spray-field system
- Estimate of the economic benefits to NC households arising from the changes in emissions to environmental media resulting from implementation of the technology

NC STATE UNIVERSITY

Concise Overview of Activities / Progress to Date

- Advisory panels appointed (meet app quarterly)
- 18 candidate technologies identified
- Performance verification teams identified for environmental variables (nitrogen and odor emissions & pathogen) analysis and economic analysis - work in progress
- 9 candidate EST in various stages of construction / operation / performance verification
- 7 candidate EST in various stages of design / permitting
- 2 candidate EST under development out of state

NC STATE UNIVERSITY

Advisory Panel Membership

- Delilah B. Blanks; North Carolina Association. of County Commissioners
- Alan Briggs; Save Our State
- Don Butler; Murphy-Brown, LLC
- Kim Colson; NCDENR
- Bob Epting; EPTING & HACKNEY
- Bundy Lane; Frontline Farmers, Inc.
- George Lucier; National Institute of Environmental Health Sciences
- Randy Mapes; AgProVision, LLC
- Fred Pfaender; UNC-CH, Dept. of Environmental Science and Engineering
- Karen Priest; Alliance for a Responsible Swine Industry
- Dennis Rondinelli; UNC-CH, Kenan-Flagler Business School
- Joe Rudek; NC Environmental Defense
- Paul Sherman; NCDENR
- Shihwu Sung; ISU, Dept. of Civil and Construction Engineering
- John Sweeten; Texas A&M Univ.,Texas Agri. Experiment Station
- Dave Townsend; Premium Standard Farms, Inc.

RE: Update on Two-Year Livestock Plan

DATE: January 22, 2003

Set out below is a brief status report on the action items in the Two-Year Livestock Plan developed by the Department of Environment and Natural Resources in 2001. The plan is built on the Attorney General's agreements with Smithfield Foods, Premium Standards Farms and the Frontline Farmers organization to fund and test innovative animal waste management technologies.

I. **Attorney General / Producer Agreements**:

The Smithfield Agreement and similar agreements with Premium Standard Farms and the Frontline Farmers organization (representing independent and contract growers) created a process for identifying new animal waste management technology that would be environmentally superior to the lagoon and sprayfield system now in common use.

The Smithfield Technology Panel has chosen eighteen technologies for review. DENR has permitted eight of these alternative animal waste treatment systems and four others are currently in the permitting process.

II. Economic Initiatives:

- Legislative Study – In the last legislative session, DENR proposed a legislative study of potential funding sources to assist contract and independent farmers in adopting new and innovative technologies. The study, discussed as part of a broader legislative proposal on regulation of animal operations, did not move forward. DENR continues to see a need for development of economic incentives and potential funding sources for implementation of new technology. Some of these same issues are addressed in the Soil

and Water Conservation Commission's State Nutrient Plan which was submitted to the General Assembly last session.

- State Nutrient Plan – The State Plan for Managing Animal Manures and Animal-Derived Nutrient Produced in North Carolina, prepared by the North Carolina Soil and Water Commission, was released in September 2001. The plan considers value-added alternatives for using animal waste.

III. Federal Initiatives

- **NPDES Permits** –In response to an EPA mandate to issue NPDES permits (discharge permits required under the federal Clean Water Act) to swine, poultry and cattle facilities exceeding certain thresholds in of numbers of animals, DENR worked closely with stakeholders to develop a proposed general NPDES permit for animal operations. The NPDES general permit was finalized on July 19, 2002. The State will now issue two types of water quality permits for animal operations. Facilities with 2500 or more swine weighing 55 pounds or more each, 700 or more mature dairy cows, 1000 or more confined beef cattle or 30,000 or more chickens served by a liquid waste management system must have an NPDES permit. Facilities that fall below those thresholds will receive a State non-discharge permit. By April 30, 2003 (when coverage under the current non-discharge permit expires) all animal operations must be covered under either an NPDES permit or a state non-discharge permit (according to the size of the facility). DENR staff held thirteen (13) information sessions across the state to acquaint producers with the new NPDES permit. In December, DENR sent a notice for NPDES permit applications to 1000 producers; producers have 60 days to submit applications for coverage under the NPDES permit.

  DENR is in the process of reissuing the non-discharge general permit for animal operations. Public meetings on the proposed non-discharge general permit will be held in Kenansville on February 3, in Williamston on February 4, and in Statesville on February 6, 2003.

- **Federal NPDES Rules.** The Environmental Protection Agency (EPA) released new federal rules for large animal operations (referred to in the federal rules as "concentrated animal feeding operations" or "CAFOs") in December. Major changes include an expansion of the rules to apply to dry-litter poultry operations of specific sizes (55,000 or more turkeys; 82,000 or more laying hens; and 125,000 or more hens that are not layers) and a requirement that animal operations assess and manage phosphorus loss.

- **Phosphorus** – The federal Natural Resource Conservation Service (NRCS) has developed a phosphorus standard, but the recommended approach for evaluating phosphorus loss is still under discussion. Once the Phosphorus Loss Assessment Tool (PLAT) has been completed and approved by the Soil and Water Commission, DENR will need to begin incorporating use of the phosphorus assessment into the permitting of animal operations. Legislation may be needed to make current state statutes governing preparation of animal waste management plans consistent with the new federal requirement that animal operations address phosphorus.

- **Dry-Litter Poultry Operations** – The Division of Soil and Water is working with the poultry industry to determine compliance with the requirements of SB 1217 and planning for regulatory changes required under the new EPA rules applicable to poultry operations.

IV. State Initiatives

- **Groundwater / Drinking water protection** – DENR is addressing groundwater issues in two ways:

  1. The Department is developing a groundwater database to consolidate all information on groundwater contamination so that the Department can better identify sources of groundwater contamination. The Department still expects that effort to be completed by late summer 2003.

  2. Using a protocol developed with input from producers, the Division of Water Quality has reviewed enforcement records to identify farms with a high potential for groundwater contamination and evaluated those farms to determine whether groundwater monitoring should be required. To date, DENR has required eighteen farms to institute groundwater monitoring.

- **Management of Existing Facilities**

  Environmental Management Systems. The Division of Pollution Prevention and Environmental Assistance (DPPEA), with the assistance of the N.C. Cooperative Extension Service and the Division of Soil and Water Conservation, has worked with seven independent and contract farms to design and implement an EMS for swine operations. The project will be competed this spring. All seven farms are actively implementing an EMS; two farms plan to pursue ISO 14001 certification. Out of this experience, DPPEA will develop guides to assist other producers in implementing an EMS, including a web-based tool that will enable farmers to identify farm activities that have a significant impact on the environment. A workshop will be held in late summer 2003 to train other producers on the use of the tools to develop an effective EMS.

  Recently, DPPEA has obtained a $150,000 grant to test the effectiveness of an EMS in achieving, maintaining and exceeding compliance on hog farms. Information gained from this project will lead to development of additional compliance assistance tools.

  As required by the new NPDES permit for Smithfield's Tar Heel Plant, DPPEA is working with Smithfield to develop a model EMS program that can be adopted by contract growers. Drawing on the expertise of Smithfield, DPPEA, hog farmers and other experts, the target date for completion of the model program implementation is the fall of 2003.

January 28, 2003 ERC Meeting
EXHIBIT Q

Response to Phase II Stormwater Questions

- How can a Phase II City Be Removed?
  - The NPDES rules do include waiver options for systems served by less than 10,000 people. The requirements for waiver differ somewhat depending on size (less than 1,000 and less than 10,000. In general, the waivers require that the systems can show that they are not contributing substantially to pollutant loading. The system may have to show that other approved programs are in place to address pollutants of concern.

- What Are The Minimum Federal Mandates?
  - NPDES permits and comprehensive stormwater programs are required for all owners and operators of storm sewer systems in census designated urbanized areas.
  - The federal regulations also require that entities outside of the urbanized areas be reviewed for potential designation into the program. At a minimum, these reviews must take place for entities with a population over 10,000.
  - The federal regulations also establish minimum control measures for stormwater management programs, including: public education and outreach, public participation/involvement, illicit discharge detection and elimination, construction site runoff control, post-construction stormwater control and pollution prevention/ good housekeeping.

- What are the Post-Construction Stormwater Control Requirements?
  - Apply to all new development and redevelopment disturbing one acre or more of land.
  - Stormwater controls must be designed to have an 85% annual average removal of Total Suspended Solids (TSS)
  - Measures must be designed to control and treat the difference in stormwater runoff volume (pre verses post construction) for the 1 year 24 hour storm.
  - Owners of structural stormwater measures must provide adequate long-term operation and maintenance of the measures.
  - Built-upon area must be 30 foot landward of surface waters
  - For projects draining to sensitive waters, measures selected must be those appropriate for the pollutant of concern - fecal coliform for shellfishing waters, temperature for trout waters and nitrogen and phosphorous for nutrient sensitive waters.

CONSERVATION EASEMENT PROGRAM
ANNUAL REPORT
January 23, 2003

Pursuant to NC G.S. 113A-235(c), the Department of Environment and Natural Resources reports to the Environmental Review Commission each year on the implementation of Article 16, the Conservation Easement Program. This Article, 113A-230 through 113A-235, also includes enabling legislation for a program for conservation tax credit promotion/education, and enabling legislation for a conservation grant fund. The following reports on these programs.

Conservation Easement Program 113A-230. Having been established in 1997, this program is administered as part of the NC Conservation Tax Credit Program (NCCTC). The Conservation Easement (CE) program is intended to use promotion and education to increase the use of conservation easements as a tool to accomplish conservation goals, such as the Million Acre Initiative. A graph (Attachment A) of NCCTC Program Statistics shows the increasing use of conservation easements through this program, due primarily to the growing acceptance of CEs within the farming and forestry communities. Also an inventory (Attachment B) of the conservation easements held by the Department shows use of this conservation tool by programs such as State Parks, Wetlands Restoration, Conservation Reserve Enhancement, Coastal Reserves, Forest Legacy, and Clean Water.

To accomplish optimum use of conservation easements and their related economic advantages, the program needs to provide more than superficial information and guidance. While a more substantial and in-depth outreach program could greatly increase the use of conservation easements, it will also require more attention to the complexities of conservation easement drafting and stewardship. By combining the CE Program with the NCCTC Program, the Department has maintained a limited CE Program in the absence of staff or line item operating budget.

Conservation Tax Credit Program 113A-231. The State's Conservation Tax Credit was established in 1983 and this Department's role was passive, to respond to donor's applications for certification of their gifts of interests in real property for conservation purposes. In 1997 the Department received the authorization to begin a non-regulatory program of education/promotion to increase the use of conservation tax credits. Last year NCCTC/CE presentations were made at three workshops organized by other groups for landowners and land related professionals, and the NCCTC display and brochures were sent to three other workshops or conferences.

Graphs (Attachments C,D,E,F) of the NCCTC Program Statistics show the acreage and value of donations over the duration of the program. Cumulatively, more than 98,800 acres valued in excess of $252 million has been donated.

Over the duration of Conservation Tax Credit use, it has leveraged the donation of $72.8 million of excess value that was above the amount that could be used to create the maximum credit allowed (Attachments G, H, I, J).

Further, when used in conjunction with bargain sales, the conservation Tax Credit (Attachments K, L) can yield substantial savings for conservation trust funds, local governments, and nonprofit organizations purchasing land. For example, in 1998 & 1999 alone, the gift portion of bargain sales to the State that qualified for the Conservation Tax Credit allowed the acquisition of conservation lands by the state at a price $23 million below appraised market value. Over the duration of the program, all recipients have saved more than 44.2 million through bargain sales including the tax credit.

The increasing benefits from the Conservation Tax Credit Program have been derived mostly from increases in the maximum tax credit allowed. A more substantial and in depth outreach program could greatly increase donations of real property for conservation purpose from the use of conservation tax credits. To date the Department has provided minimum support for this function, but the Conservation Tax Credit Program has operated in a limited fashion in the absence of permanent, full time staff or line item operating budget.

Conservation Grant Fund 113A-232. Established in 1997, it was intended to stimulate the use of conservation easements, to improve the capacity of private nonprofit land trusts and agencies to successfully accomplish conservation projects, to better equip real estate related professionals to pursue opportunities for conservation, to increase private landowner participation in land and water conservation, and to provide an opportunity to leverage private or other public monies for the stewardship of conservation easements. To date the Department has not received an appropriation to actualize the Conservation Grant Fund.

Results from 2002 Legislative Session.

(1) **Awkward Text**. Article 16 was amended in 1999 to include the Conservation Reserve Enhancement Program (CREP). The result was somewhat awkward and was clarified through a technical amendment in 2002.
(2) **Clarify Donation in Perpetuity**. Donations of interests in real property for conservation purposes that qualify for the N.C. Conservation Tax Credit must be made in perpetuity. Nevertheless, the enabling legislation at G.S. 105-130.34 and 105-151.12 was not explicit on that point. Having the perpetuity expectation prominently within the text of these statutes assures the understanding of potential donors and their professional representatives, as well as benefits administration of the program. This clarification was made through a technical amendment in 2002.

Recommendations for Substantive Legislation. Generally speaking, activities under Article 16 are being carried out as well as can be expected, given the limited resource commitment to these programs. The principal constraint on the promotional and educational opportunities envisioned by Article 16 is the absence of staff and operating budgets. Nevertheless, there are items that may be considered for substantive legislation to improve existing programs.

(1) Index Credit Cap. Since its establishment in 1983, the maximum credit allowed (credit cap) for the NCCTC has been raised three times (1989, 1997, and 1999). Further requests for increases are inevitable as increasing property values decrease the incentive provided by the NCCTC. These dynamics can be addressed by indexing the credit cap. The incentive to donate would then be stabilized relative to land value, and repetitive legislated increases would be avoided. For discussion purposes, an increase equal to 75% of the CPI (Consumer Price Index) can be calculated from the last year of credit cap increase, with the cap increasing incrementally in the year following a cumulative increase of $25,000 for individuals and $50,000 for corporations. If enacted, it would be several years before an indexed increase would occur.

(2) **NCCTC Refundability**. The NCCTC was created as an incentive for landowners to donate interests in real property for conservation purposes. While the concept has been very successful and has been emulated in other states, there is still a category of landowner that finds little incentive in the program. "Land-rich and cash-poor" landowners receive disproportionately low response from their conservation donation for a tax credit. Several states with more recent conservation tax credit programs have addressed this issue by authorizing "transferability" for their tax credits, but this involves a considerable administrative workload. The issue could be addressed more simply through "refundability". For discussion purposes, a 50% refund of any remaining credit amount might be considered after the second year of carry forward (third year including the year of donation). In this way, land-rich and cash-poor landowners would have more incentive to donate interests in real property for conservation purposes. If enacted, it would be four years before any refunds were paid.

(3) **Charitable Purpose Flexibility.** To be eligible for a NCCTC, the donated land must yield one or more of the required public conservation purpose. Nevertheless, minor parts of donated tracts may not contribute to the conservation purpose and may not be allowed to be converted to another purpose without conflict with the tax credit statutes. While it would be inappropriate to allow wholesale or unsupervised conversion of conservation properties to other uses, there may be justification to consider allowing small parts that do not contribution to conservation purposes to be converted to another charitable purposes under a specific process of checks and balances administered by the NCCTC Program.

Report to the North Carolina General Assembly on the Inactive Hazardous Sites Program

October 2002

Superfund Section
Division of Waste Management
North Carolina Department of Environment and Natural Resources

http://wastenot.enr.state.nc.us/

EXECUTIVE SUMMARY

The Inactive Hazardous Sites Program was created by the North Carolina General Assembly to identify, control and correct properties contaminated with hazardous substances.

To date, 1,081 chemical spill and disposal sites and 755 old, unlined dumps or landfills have been catalogued. In most cases, the locations of the landfills are still being determined. The Inactive Hazardous Sites Branch is currently supervising a contract to locate these landfills, collect information on property use, and determine the potential for exposure. Of the 148 landfills inspected under this contract thus far, 109 (or 74 percent) have either a residence, school, church, day care or drinking water source on or within 1,000 feet of the landfill. Based on observations at sites investigated by the US EPA and the North Carolina Division of Waste Management, most of North Carolina's unlined landfills can be expected to have groundwater contamination.

The branch has a five person staff. To increase efficiency without additional appropriations, the General Assembly authorized the use of branch-approved private environmental consulting firms to certify lower priority voluntary party cleanup actions. Called Registered Environmental Consultant's or RECs, these private overseers are working on 31 sites. At present, 59 firms have received REC status.

Figure ES-1, on page iii, shows both the number of sites catalogued by the program and the number where all work is now complete. Figure ES-2, on page iv, shows how the number of sites that can be addressed at one time by the program has grown.

Sites Identified	
Chemical spills and disposal	1,081
Old unlined dumps and landfills	755
Total	**1,836**
Sites With All Work Complete	
Since last status report in 10/01	8
Previous site completions (three sites reactivated due to newly reported releases; one site determined to be a duplicate.)	400
Total	**404**
Ongoing Cleanup Actions	
Ongoing REC-Supervised Site Cleanup Actions	31
Ongoing Priority Cleanup Actions Supervised by State Staff	64
Total	**95**

The Inactive Hazardous Sites Response Act requires annual reporting to the General Assembly. All of the reporting requirements specified under N.C.G.S. 130A-310.10 are met in this report. The status report on the Brownfields program, as required by N.C.G.S. 130A-310.40, will be provided separately.

Figure ES-1 Inactive Hazardous Sites Inventory

Number of Catalogued Sites and Sites With All Work Complete

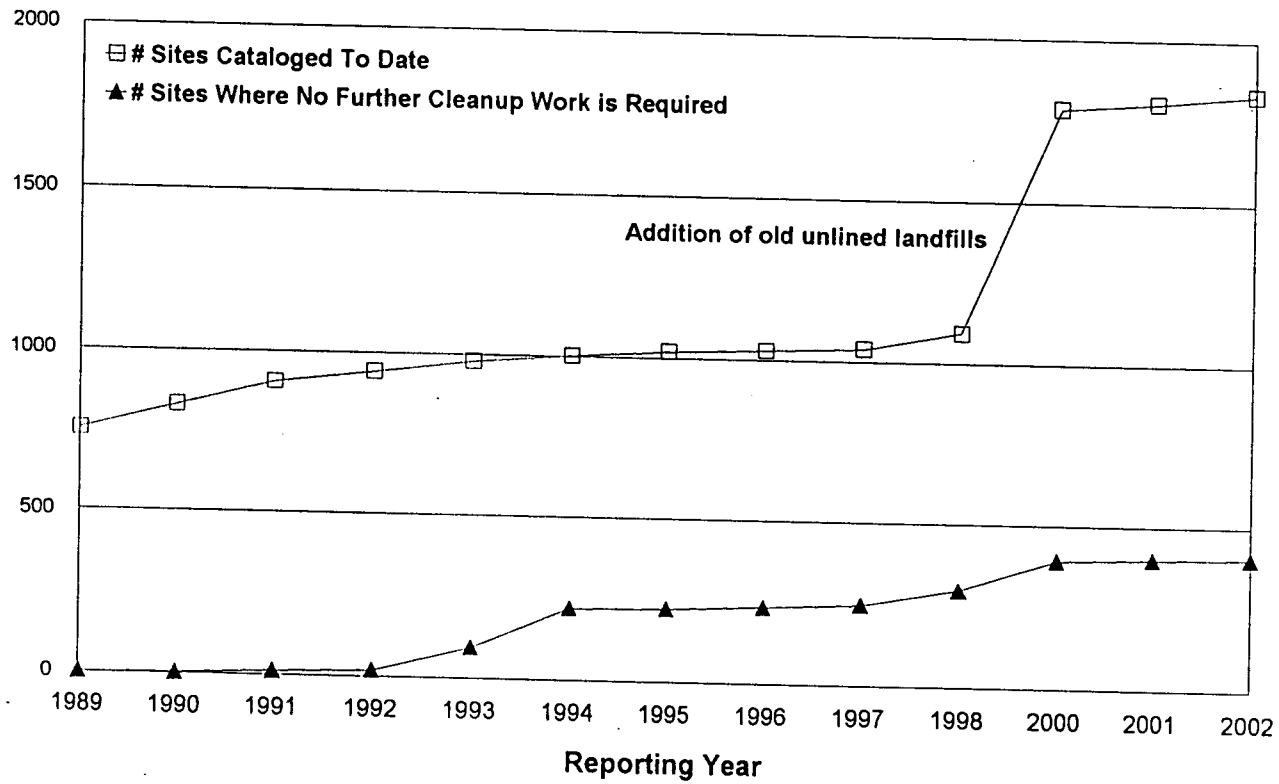

Figure ES-2 Inactive Hazardous Sites Program

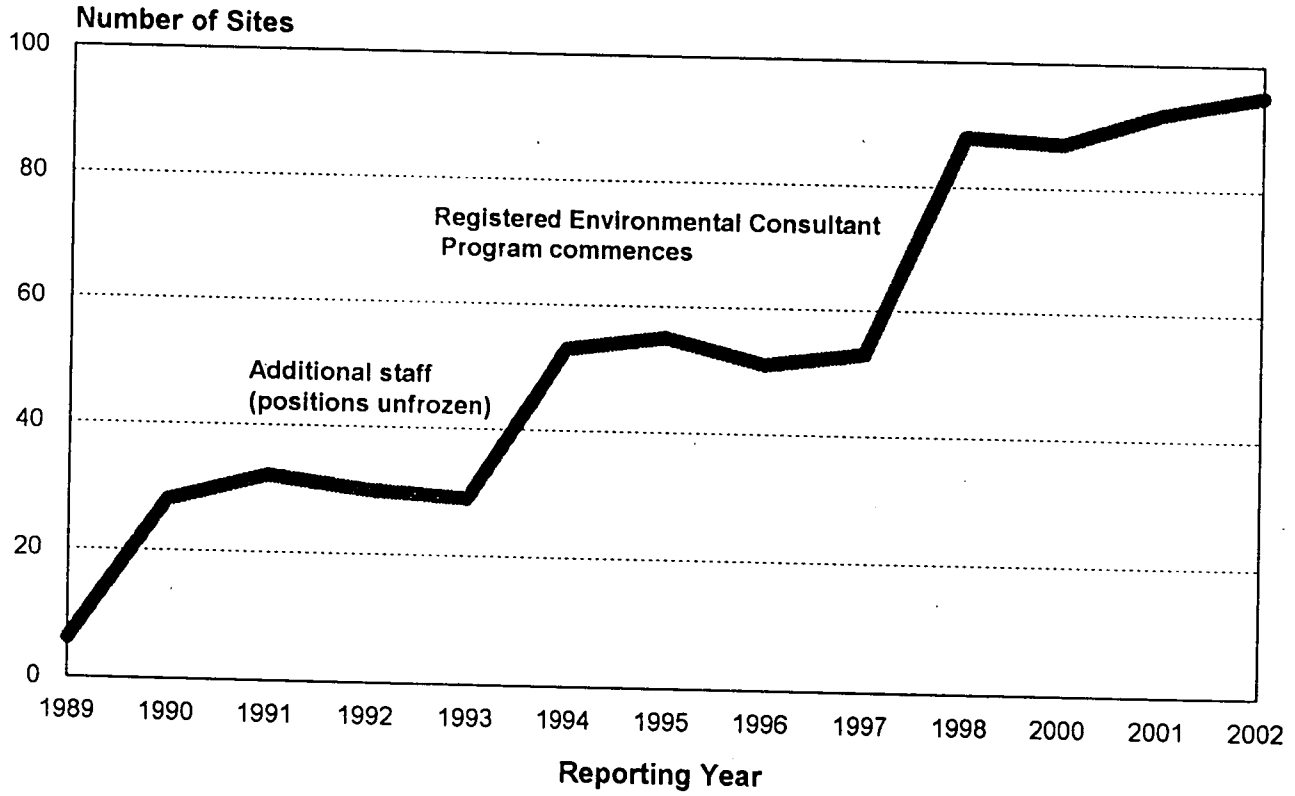
Ongoing Assesment/Cleanup Actions Supervised



Program has five state positions and one privately funded REC position.

I. THE INACTIVE HAZARDOUS WASTE SITES PRIORITY LIST

The Inactive Hazardous Sites Branch is within the North Carolina's Department of Environment and Natural Resources' Division of Waste Management. It implements the Inactive Hazardous Sites Response Act of 1987. This act requires the branch to maintain a catalog of inactive hazardous substance or waste disposal sites. Table 1, on the following page, provides a list of sites added to that inventory since the last program report in October 2001. Table 2, also on the following page, provides a list of sites assigned "No Further Action" status. The entire inventory can be found in Appendix II. Figure 1, on Page 3, shows how the inventory is distributed by category. Appendix I provides a description of each inventory category.

N.C.G.S. 130A-310.2 requires that sites catalogued in the Inactive Hazardous Sites Inventory be prioritized based on their threat to public health and the environment. After discovery, sites are first cataloged in the "Evaluations Pending" category of the Inactive Hazardous Sites Inventory until their rank is determined. Site rankings are determined using the rules found in 15A NCAC 13C .0200. Once ranked, sites are transferred to the Inactive Hazardous Waste Sites Priority List. This list is provided in Table 3, found on Page 4.

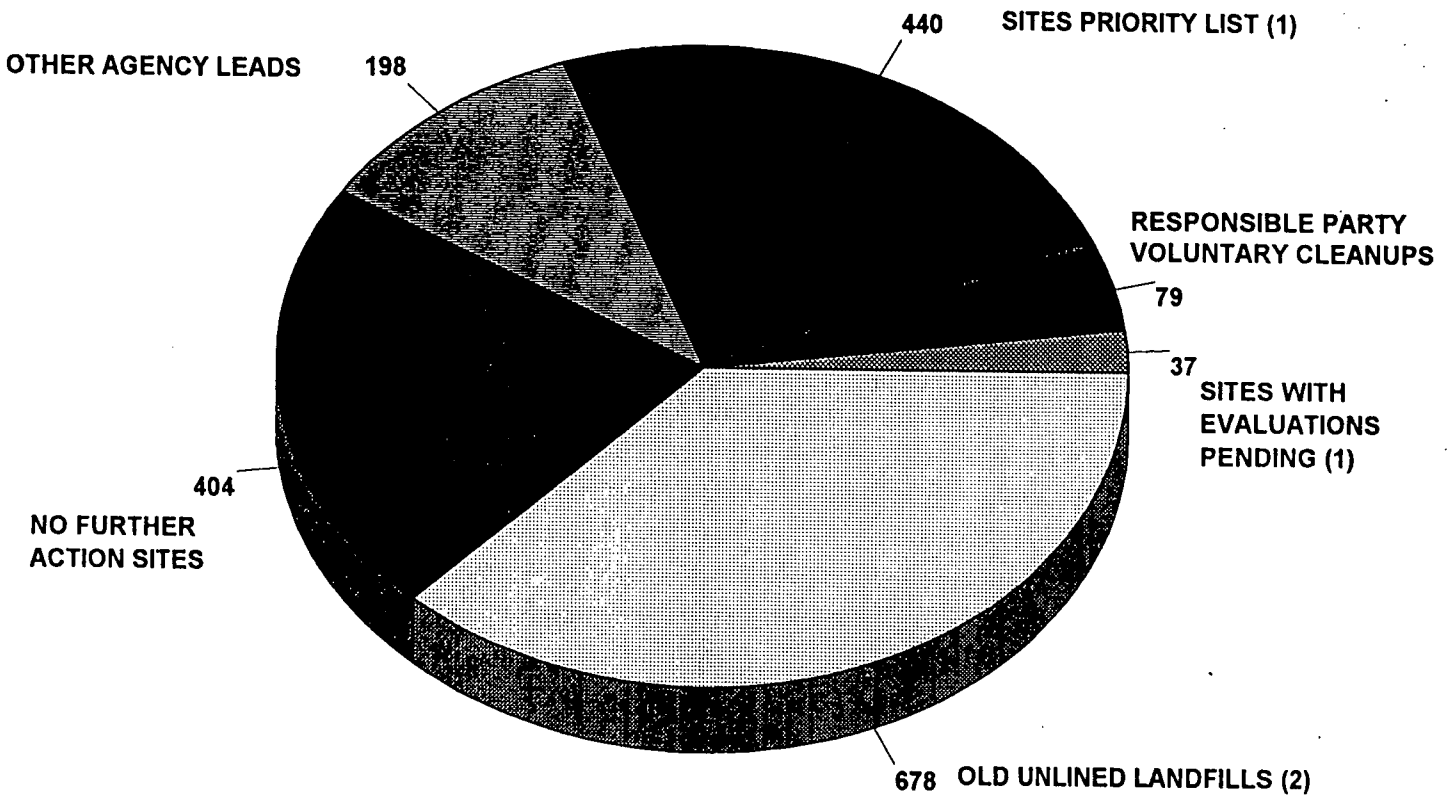
OCTOBER 2002 INVENTORY CATEGORICAL DISTRIBUTION
(1,836 Sites)



(1) Sixteen sites in either the "evaluations pending" or "sites priority list" categories are also undergoing assessment and/or cleanup with program supervision (but not under an agreement).

(2) Inventory has 755 landfills. Of tht number, 77 were already included in the Inventory before the addition of the larger catalog of old unlined landfills. As a result they fall into other categories.

II. SITES THAT MAY OR ARE KNOWN TO REQUIRE USE OF THE INACTIVE HAZARDOUS SITES CLEANUP FUND

Purpose of the Fund

The Inactive Hazardous Sites Cleanup Fund is used to: (1) address imminent hazard sites; (2) pay for assessment and cleanup when responsible parties do not comply with orders to clean up sites; (3) pay for assessment and cleanup of sites without financially-viable responsible parties (orphan sites); and (4) pay for state-contracted survey and legal assistance necessary to prepare notices of Inactive Hazardous Substance or Waste Disposal Sites where owners do not comply with orders to conduct such work. The state must attempt to recover its expenditures from responsible parties in the first, second and fourth cases.

The branch's Sites Priority List helps determine priorities for cleanup. Responsible parties for top priority sites are encouraged to voluntarily clean up their sites. When a responsible party does not comply with a request and subsequent order to clean up a site, the state must perform the cleanup using the Inactive Hazardous Sites Cleanup Fund. The demand for state funds to conduct site cleanups, also known as "remedial actions," depends on two factors. First, how often responsible parties refuse to comply with orders to conduct remedial action. Second, how often sites are without financially-viable responsible parties. To date, the program has been successful in encouraging voluntary actions by responsible parties. Funds are mainly needed for orphan cases.

The statute requires that the program report the list of sites known to require funds and the list of sites suspected to require funds for cleanup. Determining if responsible parties exist (and thus, if funds are needed) is often a complex and lengthy process. This information can become dated as owners and operators of the facilities change over time. Therefore, to operate as efficiently as possible with limited staff resources, responsible party research is not done until a site is next in priority for action. For this reason, the total number of orphan sites on the SPL requiring state funds is not presently known.

Orphan Chemical Sites

As of this writing, we have identified 37 orphaned chemical waste sites. Of these, 22 have attributes that make them a high priority. These attributes include current use as a residence or some other use with high exposure potential, and the existence of drinking water wells on or close to the disposal site. We are initiating a contract to sample and conduct some waste removal at these sites. Due to a transfer of $2.5 million (specified in the budget bill) from the Inactive Hazardous Sites Cleanup Fund to address the PCB landfill in Warren County, we do not have sufficient funds to complete sampling and waste removal work at all of these priority orphan sites. In addition, several of these sites will likely require additional funds to conduct a complete cleanup of contamination.

In addition to these orphan sites, the branch will require funds to control the large threat to public health and the environment posed by the Texfi, Inc. site in Fayetteville, Cumberland County. Groundwater contaminated with hazardous substances has migrated from Texfi to the adjoining City of Fayetteville's Hoffer Water Plant property. The contaminated groundwater is in contact with the City's primary finished drinking water holding tank. This tank sits, in part, below the groundwater table. The tank's construction and the nature of its water flow make it possible for contaminated groundwater to enter the tank. Thus far, the drinking water has not been affected. The branch used cleanup funds to construct a barrier wall to prevent additional flow of contaminated water toward the tank. Extraction wells have been installed to remove some of the contaminated water that had already passed on to the water plant property. The City's drinking water intakes on the Cape Fear River, 450 feet downstream from the Texfi property, and a city park adjoining the Texfi property, are also threatened. Texfi, Inc. is in the final stages of bankruptcy liquidation. None of the state's claims for funds expended thus far and for funds needed to clean up the site have been paid by the bankruptcy trustee.

There is a risk the barrier wall will fail overtime. Thus it is important to remove the source of the groundwater contamination on the Texfi property. The sources are solvents in the subsurface and contaminated soils. No monies are available to conduct this work.

Unlined Landfills

Due to the frequency of old unlined landfills having hazardous substance contamination, the branch has also begun the task of determining the location and current use of these sites. To date, we have completed field surveys of the old landfills in 22 counties. Of the 148 landfills inspected, 109 are considered priorities. This is due to either a drinking water source, a residence, a school, a church, or a daycare on the property or within 1,000 feet of the landfill.

We can estimate the number of old, unlined landfills that pose the greatest hazard by using the following equation:

$$\frac{\text{No. of landfills w/exposure concerns (109)}}{\text{Total no. of landfills surveyed thus far (148)}} \times \text{Total no. of landfills in inventory (755)} = \text{556 landfills w/exposure concerns}$$

Almost without exception, these landfills were operated either by private individuals with limited financial ability or by counties and municipalities which operated in the public interest and did not make a profit. Thus, these sites may be considered to have no responsible parties available to pay for any corrective measures required.

Cleanup Funds Needed

There are a total of 792 orphan chemical sites and orphan landfills identified to

date. Thus far, 131 of these are considered high priorities due to exposure concerns. An estimate of cleanup funds required to address these sites can be determined by multiplying the number of orphan sites and the average cost estimate for remedial action per site of $601,533 reported in a survey of state cleanup programs. (See "State and Territory Cleanup Accomplishments for the Period 1993-1997," prepared by the Association of State and Territorial Solid Waste Management Officials, December 1, 1998, pg. ES-9.) A total $65,567,097 would be required to address just the priority orphan landfills. A total of $1.5 million is needed to fullfill our pending contract to conduct the sampling and waste removal work at the orphan chemical sites. Additional monies will be needed to address the non-priority sites and to conduct complete cleanup of the orphan chemical sites.

Texfi, Inc., being the final stages of bankruptcy, and the Fayetteville facility having no other responsible parties, means that cleanup of this orphan site will become a responsibility for the state. The federal government has already indicated the site is not a candidate for a National Priorities List cleanup under Superfund. The drinking water for the entire population of the City of Fayetteville is threatened. Immediate attention is needed for this site. A cleanup cost for the Texfi site was determined by averaging cleanup costs at six similarly-contaminated sites. An estimated $4.6 million is needed.

As of August 31, 2002, the balance of the Inactive Hazardous Sites Cleanup Fund totaled $3,312,473. This total is presently being reduced by a transfer of $2.5 million from the cleanup fund to address the PCB landfill. Of the remainder, $244,163 is obligated in a contract to operate the extraction wells and monitor the City of Fayetteville's drinking water. This contract will end on June 11, 2003. This leaves only $568,310 of the $1.5 million needed to sample and conduct waste removal at the orphan chemical sites. The contract for this work is presently being finalized. No money remains to conduct the Texfi contaminant source cleanup or to address the orphan priority unlined landfills.

III. NATIONAL PRIORITIES LIST SITES REQUIRING A STATE COST SHARE

National Priorities List sites are those hazardous substance or waste disposal sites that are priorities for cleanup under the federal Comprehensive Environmental Response, Compensation and Liability Act, more commonly known as Superfund. North Carolina has 27 NPL sites. One additional site is currently proposed for the NPL.

The NPL includes sites with and without financially-viable responsible parties. Cleanup costs are financed either by responsible parties or by a federal trust fund with a state cost share. When the federal trust fund is used, CERCLA requires North Carolina to pay 10 percent of the cleanup cost plus 100 percent of the cost to operate and maintain the remediation system.

Table 4, found on Page 28, provides a list of the North Carolina NPL sites, their locations, investigation/cleanup status, estimated costs, and projected start dates for cleanup. Part I, found on Page 28, includes those sites where the Federal Trust Fund/North Carolina cost share is required. A summary of North Carolina's cost share obligations is provided at the end of this part. Part II, found on Page 30 includes the status of responsible party funded cleanups.

TABLE 4. NORTH CAROLINA NATIONAL PRIORITIES LIST SITES

PART I - SITES WHERE FEDERAL TRUST FUND/NORTH CAROLINA COST SHARE IS REQUIRED

NPL Site	*City/County*	*Operable Unit*	*Cleanup Status*	*Estimated Cost*	*Projected Cleanup Start Date*
ABC One Hour Cleaners	Jacksonville, Onslow	OU1-Groundwater	Remedial Action	$3,760,000	In Progress

NPL Sites	City/County	Operable Unit	Cleanup Status	Estimated Cost	Projected Cleanup Start Date
Reasor Chemical	Castle Hayne, New Hanover	Entire Site Soil Groundwater	RD/RA[1]	$2,000,000	2004
Ward Transformer[2]	Raleigh, Wake				

SUMMARY OF NORTH CAROLINA COST SHARE REQUIREMENTS
As of 31 May 2002

Estimated cost of pending Federal Trust Fund/NC Cost Share Cleanups:	**$94,943,764**
North Carolina's 10% cost share portion of pending Federal Trust Fund cleanups:	**$9,494,376**
Total NC Cost Share Fund income including appropriations, interest and other income:	**$11,435,480**
Disbursed amount of the Fund for cost share payments for NPL sites:	**$3,356,149**
Encumbered amount of the Fund for cost share payments for NPL sites:	**$4,539,939**
Other disbursed and encumbered amounts of the Fund:	**$1,496,966**
Current available Fund amount:	**$2,042,426**
State proceeds from bankruptcy settlement for FCX sites:	**$198,000[3]**

1 - Different portions of the site are in different work phases from Remedial Investigation/Feasibility Study to Remedial Design/Remedial Action
2 - Proposed for the NPL.
3 - A bankruptcy settlement contributed $2 million toward the total cost of the two FCX sites. North Carolina received $2,444.50 of this money for past state expenses. Approximately $198,000 remains in a separate trust fund that can be applied to the state's cost share for the FCX sites.

PART II - NORTH CAROLINA NATIONAL PRIORITIES LIST SITES - RESPONSIBLE PARTY FUNDED CLEANUPS

NPL Site	*City/County*	*Operable Unit*	*Cleanup Status*	*Estimated Cost*	*Projected Cleanup Start Date*
Aberdeen Pesticides	Aberdeen, Moore	OU1 & OU4 - Soils - All sites.	Complete	$30,000,000	Complete
		OU3 - Ground Water for FC, TS, F6.	Remedial Action	$5,520,464	In Progress
		OU5 - Ground Water for Rt 211 & McIver.	Remedial Action	$3,290,000	In Progress
Bypass 601/Martin Scrap	Concord, Cabarrus	OU1 - Soil and Sediment at the MSR	Const. Complete	$10,942,836	O & M[1]
		OU2 - Soil and Sediment Offsite	Complete	$1,319,887	Complete
		OU3 - Ground Water	Const. Complete		O & M[1]
Charlie Macon Lagoon and Drum	Cordova, Richmond	Entire Site			
		Soil	Complete	$1,254,000	Complete
		Ground Water	Const. Complete	$6,900,000	O & M[1]
Celanese Corporation	Shelby, Cleveland	OU1 - Ground Water	Const. Complete	$2,000,000	O & M[1]

		Soil	Complete	$1,100,000	Complete
		Ground Water	Remedial Action	$1,157,500	In Progress
General Electric/Shepard Farm	East Flat Rock, Henderson	Entire Site			
		Soil	Const. Complete	$2,348,496	O & M[1]
		Ground Water	Const. Complete	$4,578,440	O & M[1]
		Surface Water and Sediment	Complete	$6,000,000	Complete
Jadco-Hughes	Belmont, Gaston	Entire Site		$5,000,000	
		Soil & Sediment	Remedial Acton		In Progress
		Ground Water	Remedial Action		In Progress
JFD Electronics/Channel Master	Oxford, Granville	Entire Site			
		Soil	Complete	$2,582,385	Complete
		Groundwater	Const. Complete	$5,181,000	O & M[1]
Koppers Company, Inc.	Morrisville, Wake	Entire Site			
		Soil	Complete	$4,750,000	Complete
		Ground Water	Const. Complete	$4,031,000	O & M[1]
		Surface Water	Complete	$1,995,500	Complete

PART II - NORTH CAROLINA NATIONAL PRIORITIES LIST SITES - RESPONSIBLE PARTY FUNDED CLEANUPS

NPL Site	*City/County*	*Operable Unit*	*Cleanup Status*	*Estimated Cost*	*Projected Cleanup Start Date*
Martin Marietta/Sodyeco	Charlotte, Mecklenburg	Entire Site			
		Soil	Remedial Action	$2,072,000	In Progress
		Ground Water	Remedial Action	$4,090,000	In Progress
National Starch and Chemical	Salisbury, Rowan	OU1-Groundwater in western part of site	Const. Complete	$3,036,000	O & M[1]
		OU2-Trench area soils & Surface Water	Const. Complete	$151,000	O & M[1]
		OU3-Groundwater in Area 2 & wastewater treatment area and surface water/sediments in Northeast tributary	Const. Complete	$8,159,000	O & M[1]
		OU4-Soils in Area 2 & wastewater treatment lagoon area	Const. Complete	$5,281,000	O & M[1]
New Hanover County Airport	Wilmington, New Hanover	Groundwater	Remedial Action	$350,000	In Progress
NCSU	Raleigh, Wake	Entire Site			
		Soil	Complete	$931,000	Complete
		Groundwater	Remedial Design	$2,100,000	2004
USMC Camp LeJeune	Jacksonville, Onslow	Multiple Units	RI/FS - RD/RA[2]	Not Determined	In Progress
USMC Cherry Point	Cherry Point, Craven	Multiple Units	RI/FS - RD/RA[2]	Not Determined	In Progress

1- O & M - Operation and Maintenance
2 - Different portions of the site are in different work phases from Remedial Investigation/Feasibility Study to Remedial Design/Remedial Action

IV. RESPONSIBLE PARTY VOLUNTARY SITE REMEDIAL ACTION

When the Inactive Hazardous Sites Branch solicits the cooperation of responsible parties in taking action at a priority site, most parties agree to voluntarily conduct a cleanup with branch approval. In addition to these voluntary actions, responsible parties and owners often come forward on their own to initiate an approved assessment and/or remedial action. Due to the number of volunteers and very limited staff resources, the branch was authorized by the General Assembly to privatize its oversight role at lower priority voluntary site remedial actions. Sites with more severe public health threats or concerns are still reviewed by state staff.

The privatized portion of the voluntary cleanup program is called the Registered Environmental Consultant, or REC Program. Under this program, a responsible party hires an REC to both conduct, and to certify the regulatory compliance of, the site assessment and clean up. In order for a firm to qualify as an REC, it must demonstrate it meets certain regulatory qualifications criteria. The REC certification replaces state oversight. The state audits a portion of the REC projects to ensure the integrity of the program. The state sanctions RECs where necessary. A state staff auditor is funded through fees collected from the voluntary participants.

A current list of sites which have parties conducting assessments and cleanups in accordance with consent agreements with the state is provided in Table 5, on the following page. Table 6, found on Page 35, is a list of additional ongoing Branch-directed priority actions not under consent agreements.

V. IMMINENT HAZARD SITES

The NC Department of Environment and Natural Resources and the US EPA are committed to addressing imminent hazard sites when identified. Table 7 provides a list of sites where imminent hazards have been discovered, or where abatement activities have continued, since the last legislative report in October 2001. Their location, a site description, status and funding source are also provided.

TABLE 7. SUMMARY OF IMMINENT HAZARD SITES

Site	City/County	Site Description	Status	Funding Source
American Elements CON	Farmville/ Pitt	Numerous drums and a tank containing acids present at facility refusing to take action to stabilize the waste.	The USEPA stabilized and removed the acids. Removal complete. The USEPA plans to do further sampling.	USEPA
Balfour Road Battery NEW	Granite Quarry/ Rowan	Lead contaminated soils discovered on property 100 ft upslope from a private well.	State supervised cleanup by owner of contaminated property. All work complete in 9/02.	Owner
Holmes Scrap Yard CON	East Spencer/ Rowan	Abandoned source of radium 226 found at scrap yard.	USEPA is arranging for removal and proper disposal.	USEPA
Holtra Chem/ Honeywell NEW	Riegelwood, Columbus	Tanks, lagoons, ponds, soils, materials and a building contaminated with mercury.	USEPA is in the process of determining the extent of contamination prior to removal.	PRPs
Texfi Industries CON	Fayetteville/ Cumberland	Chlorinated solvent groundwater contaminant plume has migrated from a former textile mill to the City of Fayetteville's water plant property. The City's finished drinking water holding tank sits in contact with contaminated groundwater. Groundwater could permeate this tank. The City's drinking water intakes on the Cape Fear River are 450 feet downstream from the Texfi property line.	The State constructed a barrier wall to prevent further contaminant migration to the holding tank area and installed extraction wells to remove contamination presently near the tank. The State continues to monitor groundwater and the drinking water tank. USEPA is evaluating removing source material at plant. The State is attempting to get bankruptcy court to fund source removal.	State
VC Chemical CON	Wadesboro/ Anson	Former fertilizer manufacturing operation. Very high levels of metals in soils. Property is near a residential area.	USEPA is supervising a site cleanup being conducted by Exxon/Mobil. Work continues.	Exxon/ Mobil

CON - Continued action from previous reporting period
NEW - Initiated since last report
PRP - Potentially responsible party

TABLE 7. SUMMARY OF IMMINENT HAZARD SITES (CONT.)

Site	City/County	Site Description	Status	Funding Source
Woody's Salvage Yard CON	Vander/ Cumberland	Site used as a salvage yard. Tanks, gas cylinders, drums and other wastes from a salvage yard were found on site. Asbestos present in an on-site building.	USEPA has removed all hazardous waste sources.	USEPA

CON - Continued action from previous reporting period
NEW - Initiated since last report
PRP - Potentially responsible party

VI. SUMMARY OF THE INACTIVE HAZARDOUS SITES CLEANUP FUND AND NATIONAL PRIORITIES LIST COST SHARE FUND

Inactive Hazardous Sites Cleanup Fund
As of August 31, 2002

Deposits (8/01-8/02)	
Interest	$146,359
Cost recovery of previous expenditures	$37,564
Total Deposits	**$183,923**
Withdrawals (8/01-8/02)	
Emergency action (Texfi Industries-Fayetteville)	$145,392
Reversion to General Fund	$499,263
PCB Landfill Transfer (pending)	$2,500,000
Total Withdrawals	**$3,144,655**
Current Balance	**$812,474**
Obligations	
Remainder of Texfi emergency abatement contract	$244,163
Orphan priority site sampling/removal contract	$568,311
Total Current Obligations	**$812,474**
Effective Balance	**$0**
Orphan Cleanup Cost Requirements (*see Chapter II for more details*)	
Additional funds needed for orphan site sampling/removal contract	$931,689
Texfi contaminant source removal	$4,600,000
Priority unlined landfill remediation	$65,567,097
Total Priority Orphan Cleanup Cost Requirements	**$71,098,786**

National Priorities List Cost Share Fund
As of May 31, 2002

NC Cost Share Fund Income	
Appropriation, interest and other income	$11,435,480
Note: An additional $198,000 set aside for remediation of the two FCX sites in NC came from the final FCX bankruptcy settlement. These funds are not included in the fund income.	
Total Fund Income	**$11,435,480**
NC Cost Share Fund Expenditures	
Disbursed funds for NPL site cost share obligations	$3,356,149
Encumbered funds for NPL site cost share obligations	$4,539,939
Funds disbursed or encumbered for other than cost share obligations	$1,496,966
Total Fund Disbursements and Encumbrances	**$9,393,054**
NC Cost Share Fund Remaining Amount Available	**$2,042,426**
NC Cost Share Fund Estimated Obligations	
The estimated total cost of pending fund-lead NPL site cleanups in North Carolina is $94,943,764. Therefore, North Carolina's 10% share obligation of the total cost of fund-lead NPL cleanup is	$9,494,376
The estimated additional North Carolina obligation for a new fund-lead NPL site to be added within the next 12 months is	$1,000,000
The estimated North Carolina obligation for operation and maintenance expenses for existing fund-lead NPL sites is	$20,000,000
Total Estimated Current Obligations	**$30,494,376**

Note: There is currently enough money in the Fund to meet the State's present cost share obligation. However, virtually no funds remain to pay for the State's operation and maintenance obligations which will begin in the next few years. Aside from interest, the Fund has no continuing source of income.

APPENDIX I

INACTIVE HAZARDOUS SITES INVENTORY
Description of Categories

The Department of Environment and Natural Resources is required by North Carolina General Statute 130A-310.1(a) to maintain an inventory of inactive hazardous substance or waste disposal sites. The Inactive Hazardous Sites Inventory accounts for all of the sites in the EPA's Comprehensive Environmental Response, Compensation and Liability Act inventory of potential contaminated sites called CERCLIS. The intent is to address those sites determined not to be federal priorities. Many sites in the CERCLIS inventory, and therefore also the Inactive Hazardous Sites Inventory, are regulated by other state and federal laws. Thus, they are not priorities for the Inactive Hazardous Sites Branch. The Inactive Hazardous Sites Inventory is organized in the categories described below. To avoid duplication of work, sites being addressed by other agencies are tracked in separate categories. Ten of the inventory sites appear in multiple other agency lead categories (4 through 10).

1. **Sites Priority List**
   The SPL includes sites with confirmed contamination or known disposal of hazardous substances that have been ranked using the Prioritization System rules (15A NCAC Subchapter 13C .0200).

2. **Responsible Party Voluntary Remedial Action Sites**
   In accordance with North Carolina General Statute 130A-310.9(b), voluntary cleanups or "remedial actions" conducted by responsible parties under agreements with the state must be listed in a separate category.

3. **Sites with Evaluations Pending**
   This category includes those sites that require evaluation before site priority can be determined. Each site with evidence of contamination will be ranked and transferred to the SPL. Those sites where no further action is required will also be transferred to that category.

4. **National Priorities List**
   The NPL consists of sites the federal government has determined to be the most serious, uncontrolled hazardous waste disposal sites in the nation. Either federal and state dollars or responsible parties will fund these cleanups. This list only includes North Carolina NPL sites.

5. **Non-NPL Federal Superfund Cleanups**
NPL-caliber sites where the USEPA has entered into agreements with responsible parties to conduct remedial action are supervised by the USEPA. This list includes only the USEPA Non-NPL remedial action sites located in North Carolina.

6. **Inventory Sites Managed as TSD Facilities by the Hazardous Waste Section***
Facilities that have, or are in the process of applying for, a Resource Conservation and Recovery Act permit to treat, store or dispose of hazardous waste are tracked in this category. These sites are exempt pursuant to G.S. 130A-310(3).

7. **Non-TSD Inventory Sites Under the Jurisdiction of the Hazardous Waste Section ***
The inventory includes some sites that are currently undergoing Resource Conservation and Recovery Act corrective action under the direction of the North Carolina Hazardous Waste Section, but do not hold RCRA permits.

8. **Inventory Sites Under the Jurisdiction of the Solid Waste Section***
Permitted solid waste landfills being monitored and controlled by the North Carolina Solid Waste Section are tracked in this category.

9. **Inventory Sites Under the Jurisdiction of the Division of Water Quality ***
Sites in this category include those where the North Carolina Division of Water Quality has been specified as the lead agency to oversee assessment and/or cleanup.

10. **Inventory Sites Under the Jurisdiction of the Division of Radiation Protection ***
Sites conducting assessment and cleanup under the direction of the North Carolina Division of Radiation Protection are tracked in this category.

11. **Old Unlined Landfills**
This is a list of all the old unlined landfills catalogued by the branch. Seventy-seven of the 755 landfills are also listed in other categories.

* Note: Additional sites, not included in the Inactive Hazardous Sites Inventory, may be managed by these regulatory agencies.

Brownfields Property Reuse Act
Annual Report to the General Assembly
January 2003

Executive Summary

This report to the General Assembly, required by the Brownfields Property Reuse Act (BPRA) of 1997 (G.S. 130-310.30 *et seq.*), describes the Brownfields Program's growth during 2002. It also examines the effectiveness of the BPRA in encouraging and facilitating the safe reuse of abandoned, idled or underutilized properties where environmental liability has hindered redevelopment.

DENR reports that the Brownfields Program continued to build on its past success with expanded cost effectiveness and leveraging capability. The program completed a record 10 brownfields agreements during 2002, which brought the total number of completed agreements to 26. These 26 projects represent more than $400 million in committed private investment in brownfields redevelopment across the state. Demand for services is increasing. In 2002, the program received a record 21 Letters of Intent from prospective developers seeking entry into the program. DENR's efforts to address the program's expanding inventory and the increasing demand are briefly described below.

1) In May, DENR filled the position funded by a cooperative agreement between Charlotte and DENR. The agreement set a national precedent by establishing the first state brownfields program position funded directly by a municipality. The brownfields staff member works in a city-supplied office and works exclusively to advance Charlotte's brownfields projects. The city is a proven center of brownfields redevelopment activity with nine agreements completed and many more pending.
2) In October, the U.S. EPA's Region 4 recognized the program's progress and demonstrated success by approving DENR's request for increased funding to hire another staff member. The additional $170,000 continues funding for the existing federally funded staff position and allowed the program to fill its third brownfields staff position, a hydrogeologist, to work on projects across the state.
3) In December 2002, DENR submitted a grant proposal entitled "Brownfields Assessment Outreach for Rural North Carolina Communities" to take advantage of federal funds made available to local and state governments by the U. S. EPA under the new federal brownfield statute. If awarded, the grant has a potential value as high as $700,000.

Background

Brownfield properties are abandoned, idled or underutilized properties whose redevelopment is hindered by actual or perceived environmental contamination. The BPRA creates a mechanism that modifies the environmental liability barrier for prospective developers who did not cause or contribute to the contamination. The legal vehicle to do this is termed a brownfields agreement. Under the BPRA, DENR may provide prospective developers a brownfields agreement that limits their cleanup liability to those specific actions DENR deems necessary to make the property safe for reuse. As a result, these projects can obtain financing for redevelopment without the cloud of uncertainty associated with cleanup liability. Under the BPRA, DENR gained the authority to enter into brownfields agreements with prospective developers as of October 1, 1997.

The BPRA provides guidelines for a new public policy that allows DENR to treat prospective developers of brownfield properties differently from the polluters of these properties. Rather than requiring cleanup of the site to current standards, DENR requires the developer to make the site safe for reuse by first examining the health or environmental risk on a site and then determining what, if anything, the prospective developer must do to ensure safe redevelopment. These actions can range from land-use restrictions to cleanup, or a mixture of both. Typically, prospective developers achieve economic viability for the brownfields project by not having to clean up groundwater to state 2L standards where the prospective developer can show that the groundwater does not threaten wells, surface water or other receptors. However, DENR reserves the right to enforce against any parties responsible for the contamination by requiring cleanup to current 2L groundwater standards. A brownfields agreement defines the actions that the prospective developer must perform. In return, the prospective developer receives liability protection once those activities are completed.

The steps involved in creating a brownfields agreement are shown below:

Summary of the Brownfield Process

Step 1 - DENR determines if the prospective developer and the property proposed for reuse are eligible under the BPRA statute.

Step 2 - DENR reviews existing site data to determine the risk posed by contamination at the site. If the data are insufficient to evaluate such risk, DENR advises the prospective developer on further site assessment to gather the necessary data.

Step 3 - DENR determines what actions are necessary to make the site safe for reuse and includes these actions in a brownfields agreement.

Step 4 - The brownfields agreement is published with a 60-day public comment period.

Step 5 - The brownfields agreement is finalized after any public comments are considered and incorporated. Once the agreement is final, the prospective developer uses the brownfields agreement, and the liability protection it provides, to obtain financing for the project. Liability protection is contingent on completion of safe-making steps.

The overall result is a win-win scenario for both the environment and economic development. Risk reductions and cleanups are achieved at sites that could have posed a risk to the public or

the environment and prospective developers are able to redevelop abandoned properties that otherwise had little hope for redevelopment or productive reuse. The ancillary public benefits of job creation, improved quality of life in the surrounding neighborhoods, expansion of the local tax base and general fund revenue are other positive impacts.

The program also supports smart growth, sustainability, and the One North Carolina agenda since every project that reuses property in urban centers reduces suburban sprawl and preserves green space. Were it not for the availability of brownfields agreements, many of the redevelopment dollars spent on these projects would otherwise have been spent on projects that contribute to suburban sprawl or promote commercial development in greenspace areas. In a very real sense, for each brownfield redeveloped, a greenspace is saved.

Program Status

A record number of Letters of Intent were submitted during 2002, despite economic conditions that were less favorable for development than in previous years. This clearly indicates an increase in demand for Brownfields Program service. Demand is expected to increase as a result of the program's improved capacity to educate the development community about the brownfield property tax incentive. The award of federal assessment and cleanup grant funding to some of the North Carolina municipalities will further increase demand. The brownfields staff added in 2002 are critically needed to meet current and anticipated demands and provide the resources needed to continue the program's momentum.

A summary description of all brownfields projects in the program's pipeline at the end of 2002 is provided in the Appendix. The table is divided into three sections: active eligible projects, projects pending eligibility and projects with finalized brownfields agreements.

Active eligible projects are those that meet the statutory eligibility criteria and are in some stage of data gathering, analysis, or negotiation of a brownfields agreement. While most are awaiting the submittal of additional site data requested by the program, a few projects are delayed due to past staffing limits.

Projects pending eligibility are those that have not yet been determined to be eligible for the Program under the statutory requirements. For those few projects, the Program is waiting for requested clarification or additional information from the prospective developer regarding specific eligibility requirements.

Projects with finalized brownfields agreements have either completed the public notice phase of the brownfields process and have a signed agreement or the agreement is waiting to be executed.

Brownfield Project Demographics

Brownfield sites in heavily industrial regions of the country tend to be almost exclusively in urban areas. However, North Carolina's tradition of rural manufacturing creates a significant number of rural brownfields opportunities.

This fact is reflected in the program's inventory of projects. Four of the 10 agreements completed during 2002, and about one-third of the program's 26 completed agreements, are for projects in rural settings. Additionally, half of the program's 40 eligible and pending projects are rurally located.

The staff hired last year will greatly expand the outreach needed to make rural communities more aware of the state's Brownfields Program. As a result, the public benefits of brownfields reuse so familiar to urban centers will be increasingly realized in rural regions of the state. DENR recognizes the importance of rural brownfields to their surrounding communities. The most recent EPA brownfields grant application targets an expansion of its rural efforts for the safe and productive redevelopment of brownfields.

Significant Events Affecting Brownfields

In January 2002, long-awaited brownfields related reforms of the federal Superfund Program became reality when President Bush signed into law the Small Business Liability Relief and Brownfields Revitalization Act (SBLRBRA). This statute makes changes to the Comprehensive Environmental Response, Compensation and Liability Act's liability framework. The reforms provide liability relief to small business and removes prospective purchasers of brownfields properties from federal liability as long as they did not cause the contamination at the site. It is interesting to note that the federal act's disparate treatment between causative and non-causative parties is similar to the public policy found in North Carolina's BPRA.

The SBLRBRA also provides for direct funding for state and local brownfields programs, an element of equal or greater importance than the liability reform. The fact that this funding was generally not possible under CERCLA was one of the driving forces for reform. The law authorizes a total of up to $250 million annually through 2006 for this effort. For a summary of the SBLRBRA provisions that affect brownfields redevelopment, please see Table 2.

In a significant event for the state and Charlotte, the U.S. EPA held its national conference, "Brownfields 2002: Investing in the Future," in the city. The conference was the largest to date and drew over 3,400 brownfields professionals to Charlotte from November 13th through November 15th. DENR's Secretary Ross was an active participant. He spoke five times over three days, co-hosted the national awards show, and signed the state's 24th and most highly valued brownfields project to date in a well attended public ceremony.

Table 1. Summary of the Major Provisions of the Small Business Liability Relief and Brownfields Revitalization Act.

Liability Provisions

1. Provides liability relief for future buyers of brownfields property who are not responsible for contamination, allow site access for cleanup, and exercise appropriate care with respect to the contamination. These buyers are subject to windfall liens placed on the property for the value of the property, or for the total amount of government resources expended for cleanup, whichever is less.
2. Clarifies liability relief provided to both innocent landowners (who had no reason to know the property was contaminated) and contiguous property owners and the showings each must make to obtain that relief.
3. Protects sites cleaned up under a state response program (in North Carolina, the State Inactive Hazardous Sites Program) from being subject to Federal Enforcement or CERCLA.
4. Specifies the circumstances under which the federal government reserves rights to reopen a site or bring its own enforcement action. This includes sites where it is determined that a cleanup conducted by the state is no longer protective, at sites whenever requested by a state, or when the site contamination crosses state lines or onto federal property.

Funding Provisions

1. The Act authorizes $50 million annually from 2002 through 2006 in direct federal grants to support state and Indian tribe response programs. (This provision is a marked departure from CERCLA, which did not permit federal funding of state voluntary cleanup or brownfields programs.) These funds may be used flexibly by states and tribes to broadly enhance the capability of these programs as well as to provide specific brownfield incentives: for example, capitalizing a revolving loan fund.
2. The Act authorizes $200 million annually in additional funds in years 2002 through 2006 for grants to states, tribes, and local or municipal governments. Funds are used to assess and cleanup brownfields properties or to provide technical assistance for such efforts. $50 million of this amount (or 25 percent of the ultimate budgeted amount if less than $200 million) is set aside for brownfield sites with petroleum contamination. (This provision is interesting in that the funding provided would be for sites that may be outside CERCLA liability, since petroleum contamination is exempt from CERCLA.)

Funding Opportunities in Flux

To date, DENR has relied exclusively on limited federal funds provided by targeted brownfields cooperative agreements to operate the Brownfields Program. DENR broke new ground with its funding agreement with Charlotte. With Charlotte funding a staff person to work on brownfield agreements in the city, the program was expanded without additional overhead. Funding uncertainties inherent to relying on grants continue to exist, but the developing federal infrastructure appears more likely to provide significant future funds. DENR has taken the following active steps to take full advantage of the opportunity to garner federal funds to support brownfields redevelopment in the state.

1. In December, DENR submitted a SBLRBRA Subtitle A Grant proposal, "Brownfields Assessment Outreach for Rural North Carolina Communities," on behalf of 10 small North Carolina communities. The objective is to stimulate brownfields redevelopment in the state's rural areas by providing funding for environmental assessment to communities with identified brownfields redevelopment opportunities that lack the infrastructure to apply for and administer these funds themselves. In selecting the 13 initial sites for this proposal, DENR, in partnership with the N.C. Department of Commerce, solicited input from brownfields stakeholders in rural communities across the state. If the EPA chooses the grant proposal, up to $700,000 will be provided for environmental assessment at these 13 sites and, possibly, additional rural brownfields properties.

2. DENR plans to apply for a SBLRBRA Subtitle C Cooperative Agreement in 2003. The objective is to operate a significantly expanded brownfields program capable of meeting the increasing demand. At the request of EPA Region 4, and in advance of the formal proposal, DENR recently submitted a preliminary funding request summary that outlines the scope of the envisioned program. Most significantly, the request includes funding for brownfields staff in most, if not all, of DENR's seven regional offices. Improved customer service and reduced processing times are the expected outcomes. If granted, the cooperative agreement's value could equal or exceed $1 million.

All federal funding opportunities are still uncertain because Congress has not yet budgeted the money into the program as authorized under the act. Once this step is accomplished, the EPA will seek formal funding applications from states. It is anticipated that these funds will not be provided until October 2003, the start of the next federal fiscal year. At present, the program has two federally funded staff members and one funded through the agreement with Charlotte.

Improving Effectiveness

In its five-year existence, the Brownfields Program has provided a high "bang for the buck" on the federal and city funds on which it has operated. The 26 completed brownfields agreements represent over $400 million in committed private investment in brownfields projects. To date, the program has spent approximately $200,000 in public funds ($170,000 from federal cooperative funding, and $30,000 from Charlotte). The extent to which these funds have been successfully leveraged proves that the BPRA is effective. However, increasing the volume of projects moved through the brownfields process will significantly improve current levels of effectiveness.

Adding program staff in 2002 significantly reduced the queue of projects pending and moved others more quickly through the pipeline. In addition to effectiveness, the program made gains in efficiency as well. Implementing internal technical protocols and a project tracking system reduced process time, as did streamlining various administrative elements. Improvements to and maintenance of the program's Web site made additional and more timely information available to brownfields stakeholders. The result was less time spent personally conveying this information and more time spent processing Brownfields Program applications. The net result was a record number of completed agreements in 2002.

For 2003 and beyond, any large volume increase in program output will come from staff resources derived from federal funds under the SBLRBRA. This opportunity to provide a higher volume of brownfields redevelopment, and their commensurate public benefits, will be DENR's focus for the future.

Fund Status

As of the end of calendar year 2002, the Brownfields Property Reuse Act Implementation Account has a balance of $23,958.81. 2002 expenditures measured $4,622.57, the majority of which was spent on program informational brochures and DENR's participation in the Brownfields 2002 conference EPA hosted in North Carolina this year.

Further Information

For additional information on the Brownfields Program and how it works, please visit our Web site at **www.ncbrownfields.org.**

Appendix - Status Summary of Brownfield Projects as of January 1, 2003

ACTIVE ELIGIBLE PROJECTS (33)

8th STREET LANDFILL
West 8th Street
Kannapolis, Rowan Co.
PD: City of Kannapolis

Former landfill operated by Cannon Mills for the disposal of residential, commercial and industrial waste from the early 1900s through 1972. Landfill contents may include hazardous and regulated compounds. Prospective Developer intends to redevelop the site for public recreational and dedicated open space uses.

ABC ENGRAVERS
724 North I-85
Charlotte, Mecklenburg Co.
PD: Holden Business Park, LLC

Former engraving and plating facility with known chromium and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site as an office complex.

AIRPORT EXXON
3305 North Liberty St.
Winston-Salem, Forsyth Co.
PD: Mrs. Becky Flowers

Former automobile engine repair and maintenance facility with known soil and likely groundwater contamination involving petroleum and degreasing solvent constituents. Intended redevelopment is a gas station/convenience store to serve Smith-Reynolds Airport users and employees.

ALAMAC AMERICAN
1885 Alamac Road
Lumberton, Robeson Co.
PD: Alamac American Knits, LLC

150 acre site containing a textile manufacturing facility. Known chlorinated solvent contamination from previous site operations exists in groundwater at the site. PD intends to take over existing water quality monitoring plan prepared under NC Division of Water Quality and to redevelop the property in textile manufacturing.

AUSTIN FOODS
315 East Chatham Street
Cary, Wake Co.
PD: Cary Ice Company

Six acre site containing former food processing and warehousing facilities. Known pesticide and herbicide contamination from previous site operations exists in site soil and groundwater. PD intends to redevelop the property as an ice manufacturing and distribution facility.

BROWN'S SOLVENT CO.
2935 Griffith Street
Charlotte, Mecklenburg Co.
PD: Kathryn C. Bell Estate

Former paint and solvent formulation facility with known solvent-impacted soil and groundwater. PD intends to initially renovate and reuse the existing structure for office/warehouse use. The long-term plan is to raze the building and redevelop the site as a mixed office/retail complex in keeping with other redevelopment taking place in Charlotte's South End.

BURLINGTON – JAMESTOWN
6008 High Point Road
Jamestown, Guilford Co.
PD: Alberdingk Boley, Inc.

22-acre site containing an abandoned chemical formulation facility operated to support Burlington Industries textile manufacturing operations. Known chlorinated and petroleum hydrocarbon contamination in soil and groundwater is being addressed under a DENR consent order. PD intends to redevelop the property as polyurethane and polyacrylate emulsions manufacturing facility.

BURLINGTON MILLS
476 South Main St.
Mooresville, Iredell Co.
PD: Cherokee Investment Partners

Abandoned textile-manufacturing facility with known petroleum hydrocarbon contamination in soil and groundwater and chlorinated solvent contamination in groundwater. PD intends to redevelop the site as an auto racing industry complex with office, flex, shop and R&D space.

CAMEL CITY CLEANERS
501 East Third St.
Winston-Salem, Forsyth Co.
PD: Brownfields Redevelopment International, LLC

Former dry cleaning facility with chlorinated solvent-impacted soil and groundwater from dry cleaning operations and semi-volatile impacted groundwater from a nearby manufactured gas plant facility. Intended reuse is for commercial/light industrial flex space.

CAROLINA LOG BUILDINGS
Howard Gap Rd at US Hwy. 25
Fletcher, Henderson Co.
PD: Town of Fletcher

Former wood treating facility with known pentachlorophenol contamination in soil and groundwater. PD intends to redevelop the 30-acre site as the new heart of the Town of Fletcher to include various office and retail uses.

CAROLINA METALS
Howard Gap Rd at US Hwy. 25
Fletcher, Henderson Co.
PD: Town of Fletcher

Former metal fabrication facility with metals contamination in soil, and metals and chlorinated solvent-impacted groundwater. PD intends to redevelop the 4.2-acre site as a residential apartment complex.

CHATHAM MANUFACTURING
NC Hwy. 268
Elkin, Surry Co.
PD: Town of Elkin

30 acre site containing solid waste disposal area used by former textile manufacturing facility. Volatile and semi-volatile organic compound contamination exists in groundwater at the site. PD intends to redevelop the property for park and recreational uses in keeping with the current use of adjoining property as baseball fields.

CHEROKEE OIL
925 Summit Avenue
Charlotte, Mecklenburg Co.
PD: M & J Equities, LLC

Approximately two acre site was formerly a non-permitted hazardous waste storage facility and the site of an EPA removal action. Known arsenic, oil and grease, and solvent contamination in soil and groundwater. PD intends to redevelop the property as a nightclub and parking facility.

CLAWSON RADIATOR
So. Tryon St. & W. Park Ave.
Charlotte, Mecklenburg Co.
PD: Mr. Gains Brown

Former automobile radiator repair facility with metals contamination in soil and groundwater. PD intends to redevelop the site as studio and office space for professionals in the graphic and industrial design industry.

CMI WWTP
NC Hwy. 268
Elkin, Surry Co.
PD: Town of Elkin

Eleven acre site in the Yadkin River flood plain that was once home of an industrial waste water treatment plant with excess permitted capacity. Known VOC and SVOC contamination in soil and groundwater. PD intends to consolidate the town's sanitary and current industrial waste into this facility that allows for current and future waste treatment requirements.

DYNATECH INDUSTRIES
2213 Toomey Ave.
Charlotte, Mecklenburg Co.
PD: R. G. Automation, Inc.

Former plating facility with metals-impacted soil and groundwater. EPA conducted soil removal activities at the site and has classified it as no further remedial action planned. PD intends to redevelop the property for use as mixed office/retail complex.

EAST GANNON PROPERTY
SE corner East Gannon and Arendell Avenues
Zebulon, Wake Co.

P.D. Berkshire-Hudson Capital XI, LLC

This property consists of four parcels of land totaling 1.75 acres with four existing structures (former restaurant, current auto sales, auto service garage and hair salon). Site to be redeveloped into a stand-alone Eckerd Drug Store with surrounding complementary retail tenants. Soil and groundwater are contaminated with petroleum constituents from above ground storage tanks used by previous gas station.

EAST PARK – JOAL REALTY
Elizabeth Ave. parcels
Charlotte, Mecklenburg Co.
PD: East Park, LLC

Portion of 24 acre site encompassing a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed-use development with an emphasis on the needs of pedestrians in an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the central business district and the historic residential neighborhoods of Elizabeth and Myers Park.

EAST PARK – KOSSOVE
East Fourth St. parcels
Charlotte, Mecklenburg Co.
PD: East Park, LLC

Portion of 24 acre site encompassing a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the needs of pedestrians in an urban setting. Also part of the City of Charlotte's East Park re-development zone.

FISHBURNE EQUIPMENT
Airport Road
Arden, Buncombe Co.
PD: R. & P. Van Praag

Former metal fabrication and tobacco press manufacturing facility with suspected VOC contamination in soil and groundwater, based on detection of these compounds on adjoining, downgradient property, the former Buncombe County landfill. PD intends to redevelop the site for light manufacturing/assembly, warehousing and public storage uses.

FLEMINGTON LANDFILL
NC Hwy. 421
Wilmington, New Hanover Co.
PD: Cape Fear SoccerPlex, LLC

Site of a closed (1979), privately operated domestic and industrial solid waste landfill with VOC-impacted soil and groundwater. Intended reuse is for a soccer complex. This is the first former landfill property proposed for redevelopment under the N.C. brownfields statute. The project's feasibility and technical challenges are being carefully evaluated as a model for future like projects.

GLEN RAVEN MILLS
114 Raven Circle
Kings Mountain, Cleveland Co.
PD: Consortium for Progress

Former textile manufacturing facility with solvent contamination in groundwater. PD intends to redevelop the property as a residential/retirement center for senior citizens. Responsible party will continue assessment and/or cleanup activities under state Voluntary Cleanup Program.

GREY HOSIERY MILL
Fourth & Laurel Streets
Hendersonville, Henderson Co.
PD: Old Mill Arts Committee

Former hosiery manufacturing facility located in downtown Hendersonville with low concentrations of chlorinated solvents in site groundwater. PD intends to renovate the building and redevelop the property as a performing arts center.

GUILFORD MILLS
West Wendover Ave.
Greensboro, Guilford Co.
PD: Wendover Crossing, LLC

55 acre site containing former textile manufacturing facility with known VOC contamination in soil and groundwater. PD intends to redevelop the property in mixed retail uses. Public benefits include the creation of an estimated 500 jobs and substantial tax role increases.

HOME INNOVATIONS SITE
Hwy 52 S & Ratliff Gin Road
Morven, Anson Co.
PD: Dan River Inc.

Former textile manufacturing facility with petroleum hydrocarbon and VOC contamination in soil and groundwater. PD intends to redevelop the site as a modern textile manufacturing operation that will not use the contaminating VOC compounds. Project has significant job creation potential.

MALLARD CREEK Mallard Creek Road Charlotte, Mecklenburg Co. PD: Colonial Properties Trust	21 acre site adjacent to former auto service station and chainsaw service center operations. Petroleum hydrocarbon and chlorinated solvent contamination in groundwater has migrated onto the subject property. PD intends to redevelop the property as an apartment complex.
QUALITY METAL PRODUCTS 1111 Oates Road Gastonia, Gaston Co. PD: Porter's Fabrications	This 11 acre site contains an abandoned facility of 48,000 square feet formerly used as for metal fabrication. Parts cleaning activities resulted in solvent impacts to site soil and groundwater. PD intends to refurbish the facility for metal fabrication utilizing high-tech, non-contaminating methods.
REDMAN HOMES Redman Crossing Road Mebane, Orange Co. PD: Barber & Ross Company	Former mobile home manufacturing facility with metals and solvent contamination in soil and groundwater. PD has performed drum removal and soil remediation activities. PD intends to redevelop the site as a manufacturing facility to produce windows and doors.
SANFORD WWTP US Hwy 1 and Spring Lane Sanford, Lee Co. PD: S. Wornom & G. Perkins	Former municipal waste water treatment plant site with petroleum impacted sewer sludge and metals impacts in soil and low concentrations of VOCs and SVOCs in groundwater. PD intends to redevelop the property for commercial use, including restaurant, retail space and a multi-screen movie theater.
SHELBY DYEING & FINISHING 1000 West Grover Street Shelby, Cleveland Co. PD: GMAC Commercial Credit, LLC	Former textile dyeing and finishing facility with solvent and metals contamination in soil and groundwater. Through its sale of the property to Environmental Fibers, PD intends to facilitate the redevelopment of the site as a cotton recycling facility. This will bring the two site buildings back into productive use and create jobs and tax base improvements to the community.
SHELBY WILLIAMS 401 Meacham Road Statesville, Iredell Co. PD: Lou Jay Associates, LLC	The 28-acre site contains an idled furniture manufacturing facility with metals contamination in soil and groundwater from former plating operations. Applicant-PD intends to up-fit the facility for the production of high-end cabinetry and add an estimated 650 jobs in the next three years.
SOUTHERN MANUFACTURING 1000 Seaboard Street Charlotte, Mecklenburg Co. PD: Fiber Mills, LLC	This nine-acre site located in inner Charlotte was a former asbestos tile manufacturing facility. Asbestos operations were discontinued in 1986 and the facility was closed in 1999. The site has known asbestos contamination in soils. Intended reuse of the site includes an outdoor amphitheater, a technical business park, or a mixed-use development with industrial, commercial and residential components.
WESTOVER SHOPPING CENTER 1506 West Boulevard Charlotte, Mecklenburg Co. PD: City of Charlotte	Dilapidated shopping center seized in a drug raid by the U.S. Dept. of Justice that has been approved for transfer to the city of Charlotte. Site had VOC and chlorinated solvent contamination in soil and groundwater. The city intends to transfer the property to a not-for-profit development corporation to redevelop the site as commercial retail shopping facility.

PROJECTS PENDING ELIGIBILITY (7)

CENTRAL PARK LANDFILL
NE of intersection of Salem Street and South Main Street
Winston-Salem, Forsyth Co.
PD: Salem Recreational Fields

Former municipal landfill operated by Winston-Salem with low levels of SVOC and VOC contamination in soil and groundwater, respectively, and significant methane generation. Currently an underutilized city park, the PD plans to construct two soccer and one baseball fields for Salem College/Academy on this seven-acre site. Salem College, who will be able to build over their current athletic fields on its landlocked campus, will allow public access to the soccer fields when not in use by the college.

EAST PARK – BOYER
1607 & 1611 E. Fourth St.
Charlotte, Mecklenburg Co.
PD: James & Cecil Boyer

A portion of the 24-acre East Park Development with chlorinated solvent contamination. PD intends to redevelop the site as a pedestrian urban infill mixed-use development. The site is part of the City of Charlotte's East Park re-development zone.

LEARY BROTHERS STORAGE
Virginia & Broad Streets
Edenton, Chowan Co.
PD: Charles M. Reeves III

Approximate six-acre site containing former flower distribution and pesticide storage facility. Known arsenic contamination exists in site soil and groundwater. PD intends to redevelop the property in commercial retail uses.

MOSER-HALL
Indian Trail, Union Co.
PD: Moser-Hall, LLC

Property with petroleum hydrocarbon contamination in groundwater which has migrated onto the property. The source of the contamination was a release from a leaking underground storage tank system located on an adjoining parcel. PD intends to redevelop the site in commercial/retail use.

NATIONAL TEXTILES
Jamestown Road
Morgantown, Burke Co.
PD: National Textiles

Former textile manufacturing facility with chlorinated solvent contamination in soil and groundwater. The Applicant -PD intends to sell the site to an identified potential buyer for conversion and reuse as a furniture manufacturing facility.

RADIATOR SPECIALTY
1900 Wilkinson Blvd.
Charlotte, Mecklenburg Co.
PD: Suttle Avenue, LLC

Idled automotive chemicals, hardware and plumbing supplies manufacturing facility with volatile, semi-volatile and metals contamination in soil and groundwater. PD intends to redevelop the property into a major mixed-use office, retail, commercial, and multi-family residential development.

SPANCO, Inc.
1604 Boone Trail Road
Sanford, Lee Co.
PD: Pier Real Estate, Ltd.

Former hosiery manufacturing facility on approximately 10 acres with chlorinated solvent contamination in soil and groundwater. Applicant-PD intends to redevelop the property for use as a fasteners manufacturing and distribution facility.

FINALIZED BROWNFIELDS AGREEMENTS EITHER IN FORCE OR PENDING SIGNATURE (26)

ALAMAC KNIT FABRIC
Hamilton, Martin Co.

Former textile manufacturing facility with known soil and groundwater contamination involving chlorinated solvents. Site is undergoing active remediation under N.C. DWQ corrective action plan. Intended reuse as a school locker manufacturing facility that will employ some 350 workers.

ANCHOR MILL
Huntersville, Mecklenburg Co.

Abandoned textile manufacturing facility with metals contamination in soil, and groundwater contaminated with lead, chlorinated solvents and petroleum hydrocarbons. PD intends to redevelop the 32-acre site as a mixed-use transit village that reuses the old mill building and adds new office, retail and residential components.

BALDOR ELECTRIC
Charlotte, Mecklenburg Co.

Former electric motor and component manufacturing and assembly facility with solvent impacted soil and groundwater. PD intends to redevelop the property for use as industrial condominiums.

BURKHART CAROLINA
Henderson, Vance Co.

Former pickle processing and packing facility with chloride impacted soil and groundwater and minor solvent contamination in groundwater. PD intends to redevelop the property for commercial retail use. Simultaneously, the responsible party will implement groundwater remediation at the site under separate action. The PD's development will provide an impervious cap on the site, further assisting remedial efforts.

CAMDEN SQUARE
Charlotte, Mecklenburg Co.

Abandoned knitting and printing operations rebuilt into the "Design Center of the Carolinas". Project supported by the Wilmore Community as a vital redevelopment in an economically depressed area. Land use restrictions for chlorinated solvents in groundwater.

CAMDEN SQUARE ADDITION
Charlotte, Mecklenburg Co.

This project added 4.5 acres by amendment to the first brownfields agreement completed in North Carolina. Camden Square is located in Charlotte's South End redevelopment corridor. Contamination includes VOC and SVOC impacted soil and groundwater. Intended reuse is for mixed office and retail.

CAROLINA PRODUCTION FINISHING
Asheville, Buncombe Co.

Former textile finishing facility with metals contamination in both soil and groundwater. PD intends to redevelop the site for warehousing and as a sewing operation. PD is in the process of reviewing DENR's draft brownfields agreement for this site.

C.K. LAND DEVELOPMENT
Charlotte, Mecklenburg Co.

A large mixed use development on a former industrial services firm adjacent to a manufactured gas plant. Ground floor retail and studio with office and residential units above. Project is in vicinity of Camden Square and provides redevelopment to economically depressed area. Capping and land use restrictions regarding polyaromatic hydrocarbons in soil and chlorinated solvents in soil and groundwater.

CUMBERLAND SHOPPING CENTER Greensboro, Guilford Co.	Site of former shopping center and dry cleaner with chlorinated solvent impacted soil and groundwater. PD is a not-for-profit community development corporation. The PD has performed soil remediation activities and intends to redevelop the site with affordable residential housing.
ERWIN SQUARE Durham, Durham Co.	This approximately six-acre property is a portion of a former Burlington Industries site, other portions of which have already been redeveloped. There is known chlorinated solvent contamination in groundwater. These impacts are being addressed under an approved DWQ CAP. PD intends to redevelop the site in high density residential use.
FOOD LION Winston-Salem, Forsyth Co.	A new, large supermarket placed on the site of an abandoned grocery store in urban Winston-Salem. Project had strong community support as a quality of life issue because the community had no supermarket. Land use restrictions for chlorinated solvent contamination in groundwater. Brownfield assessment determined the source to be nearby drycleaner.
HAMILTON PROPERTY Charlotte, Mecklenburg Co.	Dilapidated property bought for the expansion of Cost Effective Maintenance Inc., a small business in the South End area of Charlotte. Expansion into this property allowed CEM to stay in Charlotte instead of move to suburbs. Land use restrictions for chlorinated solvent contamination in groundwater.
HILLSBOROUGH VENTURES Raleigh, Wake Co.	Project involves redeveloping an area of parking lots and dilapidated, underused retail structures. Land use restrictions are in place for the petroleum hydrocarbon and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the property as mixed residential (private student dormitory for N.C. State University) and retail complex.
HILLSBOROUGH VENTURES ADDITION Raleigh, Wake Co.	Prospective developer added acreage to the footprint of original Hillsborough Ventures project, which involves redeveloping an area of parking lots and dilapidated, underused retail structures adjacent to N.C. State University for mixed residential (private student dormitory) and retail uses.
LEWITH TEXTILE Charlotte, Mecklenburg Co.	Project involves the redevelopment of over 50 acres of abandoned and underused commercial and industrial property, including the former Lewith Textile facility. Contaminants include petroleum hydrocarbon and chlorinated solvents in soil and groundwater. PD intends to redevelop the site as an industrial park for light manufacturing and warehousing/distribution.
LUCENT TECHNOLOGIES Greensboro, Guilford Co.	Former cotton mill and manufacturing facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site in mixed commercial retail/office and residential.
OXFORD PRINTING Oxford, Granville Co.	Former textile printing and finishing facility with VOC contamination in groundwater. PD has conducted remediation of floor drain contents. PD intends to redevelop the site for industrial/distribution use.

PILOT MILLS
Raleigh, Wake Co.

Abandoned, condemned turn-of-the-century textile mill in downtown Raleigh with chlorinated solvent contamination in groundwater and metals contamination in soil. The site has been redeveloped into office space and a charter school. The restored Mill is listed on the National Register of Historic Places.

SINGER COMPANY
Chocowinity, Beaufort Co.

Abandoned rural manufacturing facility with lead and phthalate contamination in soil and groundwater. The brownfields agreement provides for partial site remediation. PD intends to redevelop the site with mixed retail and light industrial uses.

SMITH METAL & IRON
Charlotte, Mecklenburg Co.

Former site of a scrap metal yard and a waste cell created for the temporary disposal of impacted soil removed during the construction of the adjoining Carolina Panther's practice field. The waste in the cell has been removed, but minor chlorinated solvent impacts remain in site groundwater. PD intends to redevelop the site as part of the campus of Johnson and Wales University, a school of culinary arts with an anticipated 2,500 students.

SMITH PROPERTY
Shelby, Cleveland Co.

Project involves the redevelopment of an area occupied by seven underused and dilapidated residential homes with petroleum hydrocarbon and chlorinated solvent contamination in groundwater. PD has the support of local residents to reuse the site as a parking lot serving the Cleveland County Offices.

STATE FARM ROAD
Boone, Watauga Co.

Former residential property with low levels of chlorinated solvent contamination in groundwater and a surface water spring. Contamination resulted from a release at a nearby textile facility. PD intends to redevelop the site as a medical office complex.

TARTAN MARINE
Hamlet, Richmond Co.

Former boat manufacturing facility with lead contamination in soil. Additional site sampling conducted by the PD indicated that previous soil removal actions left no lead contamination above the risk-based cleanup standard. PD intends to redevelop the site as a chair and table base manufacturing facility.

TERRELL MACHINE
Charlotte, Mecklenburg Co.

Site of former textile manufacturing and gearbox machining operations located in Charlotte's South End district. It is being redeveloped with ground floor retail and office/residential above. Remedial actions to eliminate hot spot contamination included soil removal and groundwater pump and treat. Land use restrictions are in place to address remaining chlorinated solvent contamination in groundwater.

VANIER GRAPHICS
Eden, Rockingham Co.

Former printing facility with petroleum and chlorinated hydrocarbon contamination in the soil and solvent contamination in the groundwater. PD intends to redevelop the site as a furniture assembly and upholstering facility.

WEST MOREHEAD
Charlotte, Mecklenburg Co.

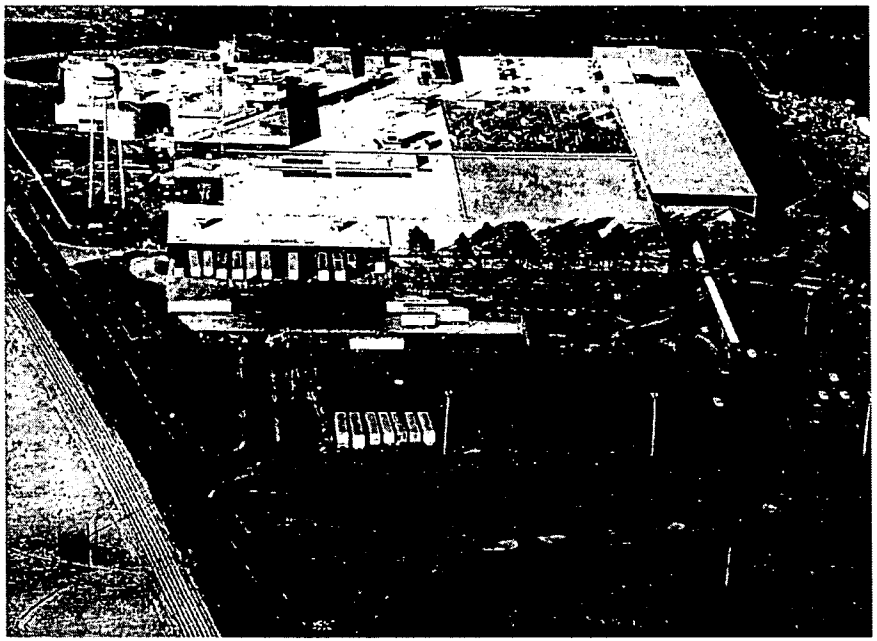
Former automobile repair and maintenance facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site, to include both facility renovation and new construction for use as commercial office/retail.

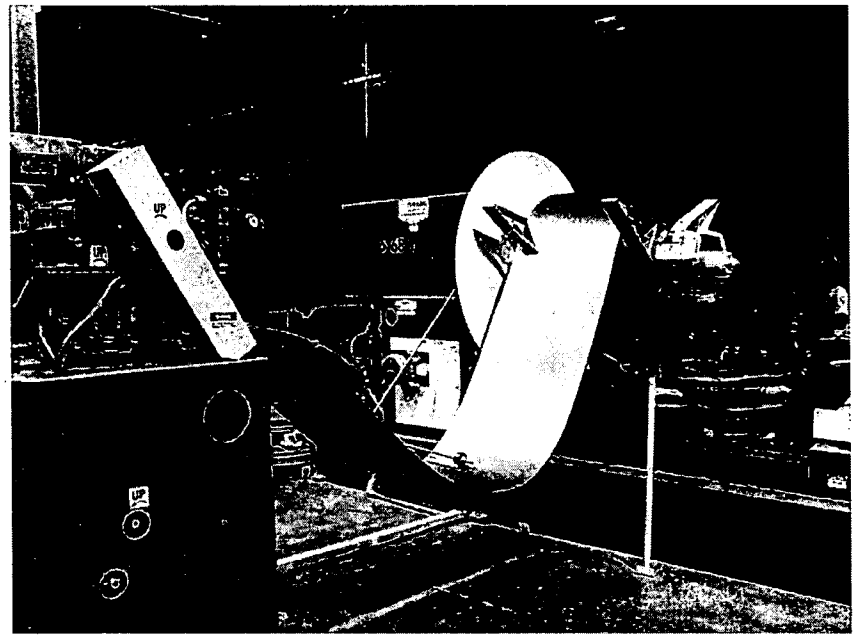
NC Brownfields Program Status

- 66 Projects in Program's Inventory
  - 40 under consideration for an agreement
  - 26 with completed Brownfields Agreement
  - Projects in 26 counties across NC
  - More than a third are rural sites (28 of 66)
  - About a third are former textile facilities

- 2002 Actions
  - 21 Site Applications
  - 10 Completed Agreements

Penco Products, Hamilton, NC





"The NC Brownfields Program enabled the redevelopment of an otherwise abandoned site, allowing us to hire 300 people. Had it not been for this program, Penco would be elsewhere."

Bob Heffernan, Penco Products, August 2002

N.C. Wetlands Restoration Program
NCDENR

Section 1: Program Accomplishments

Planning Initiatives

Watershed Restoration Plans

The Wetlands Restoration Program conducts a comprehensive review and revision of each Watershed Restoration Plan every 5 years in accordance with the schedule used by the Division of Water Quality for the review and revision of the Basinwide Water Quality Management Plans. Basin planning activities occurred in nine river basins during FY01-02 (Table 1.1). Four (4) plans were completed during the fiscal year (Savannah, White Oak, Watauga and Little Tennessee). All completed plans are available through the WRP web site: http://h2o.enr.state.nc.us/wrp/index.htm. Additional information on the process of watershed plan development and the targeting of local watersheds can be found in previous annual reports and in Appendix B of this report.

TABLE 1.1. UPDATE ON WATERSHED RESTORATION PLAN DEVELOPMENT

River Basin	DWQ Workshop(s) and location	Solicit Resource Professional Input [Draft Targeted Local Watersheds Selected]	Date Comments Due	Date for Plan Completion [on WRP website within a month]
Savannah	10/16/00 Sapphire	12/6/00 Pisgah	8/10/01	12/01
White Oak	10/23/00 & 10/24/01 Morehead City and Jacksonville	6/21/01 Morehead City	8/13/01	1/02
Watauga	11/16/00 Boone	9/20/01 Boone	10/31/01	2/02
Little Tennessee	3/12/01 & 3/13/01 Sylva, Franklin, Robbinsville	10/4/01 Bryson City	12/14/01	4/02
Chowan	3/22/01 & 3/27/01 Ahoskie, Edenton	Spring 2002 [via mail]	6/07/02	7/02
Pasquotank	3/26/01 & 3/27/01 Manteo and Elizabeth City	8/22/01 Camden	1/31/02	7/02
Neuse	6/4/01, 6/5/01, 6/11/01, & 6/14/01 Raleigh, Durham, Goldsboro, New Bern	6/02	4/12/02	10/02
Broad	10/29/01 & 10/30/01 Forest City, Shelby	5/02	6/15/02	12/02
Yadkin-Pee Dee	4/22/02, 4/23/02, 4/24/02 & 4/30/02 Elkin, Winston-Salem, Uwharrie & Fairview	will solicit input via mail, Fall 2002	11/02	3/03

Local Watershed Plans

The Wetlands Restoration Program continues the development and implementation of Local Watershed Plans throughout North Carolina. The primary purpose of the Local Watershed Plans is to identify the causes of water quality and habitat degradation and to develop strategies to address these problems that are consistent with the objectives of the local communities. This process ensures that compensatory mitigation projects are designed and located to replace those functions within each watershed that provide the maximum benefits in restoring and protecting our natural resources. Please refer to the 2000 Annual Report for a detailed explanation of the Local Watershed Planning process. During FY 01-02, work continued on three plans that were initiated in FY 00-01and eight additional plans were initiated. A summary of the location and status of each Local Watershed Plan is provided in Appendix Table B-2.

Implementation of Restoration Projects

At the end of FY 01-02, sixty-three projects were at or beyond the initial design phase. The phases of project implementation are described in Section 5 of the 2001 Annual Report. Twenty projects have been completed resulting in the restoration, enhancement or preservation of 206.7 acres of wetlands, 58,632 linear feet of streams, and 153.2 acres of riparian buffer. The remaining projects are currently in the design phase and will be constructed during FY02-03. Collectively these 63 projects will result in the restoration, enhancement, and preservation of 627.2 acres of wetland, 192,662 linear feet of streams, and 316.5 acres of riparian buffer (Table 1.2). These projects are located throughout North Carolina in 11 different river basins and 30 counties. Seventy-three percent of these projects are located within Targeted Local Watersheds that have been identified by the Wetlands Restoration Program planning process as watersheds in need of restoration activities

The WRP continues to work with landowners, federal, state and local government agencies, non-profit conservation groups, and others to identify and implement restoration projects. Nineteen additional projects were identified during FY 01-02 and when complete will result in the restoration, enhancement, and/or preservation of 184 acres of wetlands, 63,000 linear feet of streams, and 116 acres of riparian buffer. Negotiations with landowners and/or property acquisition are underway for these projects with anticipated construction dates late in FY02-03 or early FY03-04 (Table 1.3).

In order to provide an opportunity for private mitigation providers to provide fully restored sites to the WRP a Request for Proposals to restore 150 acres of riparian buffer in the Neuse River basin was issued in May 2002. Six additional Requests for Proposals for wetland and stream restoration will be issued in early FY 02-03. Collectively these Requests for Proposals will fund the restoration of up to 575 acres of wetlands, 19,000 linear feet of streams, and 190 acres of riparian buffer.

TABLE 1.2. RESTORATION SITES BY RIVER BASIN

Project Name	Project ID	Compensatory Mitigation	Basin	Cataloging Units	County	Wetland (ac.) R/C	Wetland (ac.) Enh	Wetland (ac.) Pres	Stream (linear feet)	Buffer (acres)	Project Status

Section 2: Compensatory Mitigation Requirements

One of the functions of the Wetlands Restoration Program is to provide a compensatory mitigation option that is available to permit applicants throughout North Carolina (NCGS 143-214.9). The option to pay a fee to the Wetlands Restoration Program to satisfy compensatory mitigation requirements of Section 404 permits and 401 Water Quality Certifications has been available since November 1998. The Wetlands Restoration Program also accepts payments for riparian buffer mitigation requirements in the Neuse, Tar-Pamlico and Catawba River basins, and nitrogen offset payments in the Neuse River Basin. This section summarizes the payments that have been accepted and the progress that has been made in implementing projects to meet these obligations. Please refer to Appendix A of this report and the 1999 Annual Report for additional information concerning the Memorandum of Agreement between the U.S. Army Corps of Engineers and the Wetlands Restoration Program.

Section 404/401 Water Quality Certification Mitigation Requirements

The compensatory mitigation requirements for 65 projects permitted by Section 404 or 401 certifications were accepted during FY01-02. The mitigation requirements of these permits/certifications total 42,861 linear feet of streams and 46.99 acres of wetlands (Table 2.1). Since 1998, the compensatory mitigation requirements of 273 Section 404 permits and 401 Water Quality Certifications have been accepted. The cumulative mitigation requirements accepted by the Wetlands Restoration Program total 220,238 linear feet of streams and 252.34 acres of wetlands in 13 river basins.

TABLE 2.1 COMPENSATORY MITIGATION REQUIREMENTS ACCEPTED BY NCWRP BY RIVER BASIN

River Basin	Mitigation requirements accepted FY2001-2002		Cumulative mitigation requirements accepted since NCWRP inception	
	Stream mitigaton (feet)	Wetlands Mitigation (acres)	Stream mitigation (feet)	Wetlands Mitigation (acres)

Totals	**42,861**	**46.99**	**220,238**	**252.35**

Riparian Buffer Mitigation

The buffer mitigation requirements of 23 Certificates of Authorization were accepted during FY01-02. These payments require the restoration of 33.68 acres of buffer in the Neuse River basin. Since 1999, the buffer mitigation requirements of 42 projects have been accepted. Ninety-nine percent of these payments are for impacts within the Neuse River Basin, the remainder of the payments are for impacts within the Tar-Pamlico River basin. No payments have been received for buffer impacts in the Catawba River basin. Cumulative riparian buffer mitigation requirements in the Neuse and Tar-Pamlico River basins are shown in Table 2.2.

TABLE 2.2 RIPARIAN BUFFER COMPENSATORY MITIGATION REQUIREMENTS ACCEPTED BY NCWRP

River Basin	Mitigation requirements accepted FY2001-2002 (acres)	Cumulative mitigation requirements accepted since NCWRP inception (acres)
Catawba	0	0
Neuse	33.70	75.06
Tar-Pamlico	0.00	0.08

Nitrogen Offset Payments in the Neuse River Basin

As required by the Neuse River Basin, Nutrient Sensitive Waters Management Strategy: Basinwide Stormwater Requirements (15A NCAC 2B .0235) certain local governments within the Neuse River basin must implement strategies to ensure that development activities within the jurisdiction of these local governments do not result in an increase in the amount of nitrogen loading to the Neuse River basin. One option available to help in achieving this goal is the payment of a nitrogen-offset fee to the Wetlands Restoration Fund (15A NCAC 2B .0240).

A total of 166 nitrogen-offset payments were received during FY01-02 (Appendix D, Table D-2). These payments require the implementation of projects that will provide 87,986 pounds of nitrogen reduction over 30 years within the Neuse River basin. Cumulatively payments have been received since FY00-01 that will fund the implementation of projects that will provide 88,740 pounds of nitrogen reduction over 30 years. The WRP is working with the local governments that are affected by the Neuse River Basin, Nutrient Sensitive Waters Management Strategy: Basinwide Stormwater Requirements (15A NCAC 2B .0235) to identify and implement projects that will achieve the required nitrogen reduction.

Progress in Meeting Compensatory Mitigation Requirements For FY 01-02

The NCWRP has accepted eighty-seven 401 Water Quality Certifications and forty-three Section 404 permits which were due to have implemented projects by the close of FY 01-02. Ninety-one percent of the 401 Water Quality Certifications and ninety percent of the 404 permits have projects assigned.

Wetland Mitigation Requirements

Fifteen wetland restoration and enhancement projects have been initiated that will restore 168 acres of wetlands. These projects will meet the compensatory mitigation requirements of 83% of the permits that

are due to be implemented by the WRP through the end of FY 01-02 (Table 1.2). The total acreage of wetland restoration implemented by the WRP on a statewide basis exceeds the acreage of wetland compensatory mitigation requirements due by the end of FY01-02. However, additional projects that will restore 16 acres of wetlands are needed in the Cape Fear, Catawba, Roanoke, and Yadkin River basins to meet the specific permit requirements of four Section 404 permits and three 401 Water Quality Certifications.

Stream Mitigation Requirements

Fifty-three projects have been implemented that will restore 192,662 linear feet of streams (Table 1.2). These projects will meet the compensatory mitigation requirements of 93% of the permits assumed by the WRP through the end of FY 01-02 (Table 1.2). The total linear feet of stream restoration implemented by the WRP on a statewide basis exceeds the linear feet of stream compensatory mitigation requirements due by the end of FY01-02. However, additional projects that will restore 3250 linear feet of streams are needed in the French Broad, Broad, Cape Fear and Tar-Pamlico River basins to meet the specific permit requirements of one Section 404 permit and six 401 Water Quality Certifications.

Riparian Buffer Mitigation Requirements

Two projects (Beamon's Run and Smith /Austin Creeks) have been implemented that will restore 28 acres of riparian buffer in the Neuse river basin. These projects will meet the riparian buffer mitigation requirements of 5 Certificates of Authorization issued by the Division of Water Quality. The Request for Proposals for 150 acres of riparian buffer restoration issued in May 2002 will address the remaining riparian buffer mitigation requirements in the Neuse River basin. Projects to meet the riparian buffer mitigation requirements in the Tar Pamlico River basin will be identified in FY 02-03.

Section 3: Trust Funds

Wetlands Trust Fund

The Wetlands Trust Fund was established by the General Assembly as a repository for funds to restore, create, enhance, and preserve wetlands and riparian areas throughout North Carolina. Three accounts have been established within the Wetlands Trust Fund: Account 2980 – Wetland Restoration; Account 2981 – Compensatory Mitigation; and Account 2982 – Riparian Buffer. Account 2980 is the repository for appropriations received from the General Assembly. This account is used to implement restoration projects to compensate for cumulative losses of wetlands and riparian areas associated with projects that are below the threshold that triggers the compensatory mitigation requirement. Account 2981 is the repository for payments made to the Wetlands Restoration Program to satisfy the compensatory mitigation requirements of Section 404 permits and 401 Water Quality Certifications, and nitrogen offset payments. Payments to this account and the interest earned on these funds are used to implement projects designed to meet the compensatory mitigation requirements of projects accepted by the Wetlands Restoration Program and to implement projects to reduce nitrogen loading within the Neuse River Basin. Account 2982 is the repository for payments to satisfy the buffer mitigation requirements for permitted impacts to riparian buffers in the Neuse, Tar-Pamlico, and Catawba River basins. Payments to this account and the interest earned on these funds are used to implement riparian buffer restoration projects within these river basins.

During FY 01-02, the NCWRP received 233 payments for compensatory mitigation associated with Section 404/401 permits, permitted riparian buffer impacts, and nitrogen offset payments. The majority of the payments (207 or 89%) were received from the private sector, 9 payments (4%) were received from the Department of Transportation and 17 payments (7%), were received from other state, federal and local government agencies.

Of the total dollar amount of payments received 62% were for stream restoration and 11% for wetland restoration associated with Section 404/401 permits. Riparian buffer payments comprised 16% with the remaining 11% for nitrogen offset payments. Refer to Appendix D for a complete listing of payments.

Income/Expenditures

Account 2980 – Wetlands Restoration Fund

The beginning balance of Account 2980 in FY01-02 was $10,576,756. A total of $388,814 was deposited into this account during the fiscal year. Income received during the fiscal year was derived from the interest earned on the funds within this account. Total expenditures for FY01-02 were $7,703,653. These funds were expended for activities associated with the restoration, enhancement, or preservation of wetland, streams, and riparian buffers; the transfer of interest to funds 2981 and 2982; and the reversion of $4,400,000 to the General Fund due to the budget emergency. Of the remaining balance $3,257,072 is encumbered for activities associated with the restoration and enhancement of wetlands, streams and riparian areas. At the end of FY01-02 the unencumbered balance of Account 2981 was $4,845. Please refer to Table 3.1 for additional details concerning this account.

Account 2981 – Compensatory Mitigation Fund

The beginning balance of Account 2981 in FY01-02 was $32,509,756. A total of $12,530,549 was deposited into this account during the fiscal year. Income received during the fiscal year was derived from payments to satisfy the compensatory mitigation requirements of Section 404 permits and 401 Water Quality Certifications, nitrogen offset payments as required by 15A NCAC 2B .0242, and the interest earned on the funds within this account. Total expenditures for FY01-02 were $2,444,310. These funds were expended for activities associated with the restoration, enhancement, or preservation of wetland, streams, and riparian buffers. Of the remaining balance $6,902,756 is encumbered. At the end of FY01-02 the unencumbered balance of Account 2981 was $35,693,239 (Table 3.2).

The unencumbered balance is reserved for the implementation of projects to meet the compensatory mitigation requirements of Section 404 permits and 401 Water Quality Certifications accepted by the Wetlands Restoration Program, watershed assessments, and nitrogen reduction projects. These projects will restore and enhance approximately 185,000 linear feet of streams, 220 acres of wetlands, and 425 acres of riparian buffers. Approximately 3,000 pounds of nitrogen per year will be removed through the implementation of nitrogen reduction projects in the Neuse River basin. The projected cost of these projects is $30,100,000 with $25,800,000 allocated for stream projects, $3,300,000 for wetland projects, $1,000,000 for nitrogen reduction projects, and of the remaining unencumbered funds, $4,700,000 is reserved for the development of Local Watershed Plans as required by the Memorandum of Agreement with the Department of Transportation. Please refer to Section 2 and Appendix D for additional information concerning compensatory mitigation requirements assumed by the Wetlands Restoration Program. Information concerning the Memorandum of Agreement with the Department of Transportation can be found in Appendix B.

Account 2982– Riparian Buffer Fund

The beginning balance of Account 2982 in FY01-02 was $1,792,669. A total of $1,516,721 was deposited into this account during the fiscal year. Income received during this fiscal year was derived from payments for the compensatory mitigation requirements associated with permitted impacts to buffers, and the interest earned on the funds within the account. No funds were expended from this account during FY 01-02. At the end of FY01-02 the unencumbered balance of Account 2982 was $3,309,390. These funds are reserved for contracts that will be issued to private mitigation providers for 150 acres of buffer restoration resulting from the Request for Proposals that was issued in May 2002. Contracts will be awarded by November 2002. Please refer to Table 3.3 for additional details concerning this account.

Summary

During FY 01 – 02, the pace of expenditures increased significantly with total expenditures from Accounts 2980 and 2981 doubling during this time period (Figure 3.1). This increase is associated with expenditures on the design and implementation of restoration projects identified and the initiation of a more comprehensive watershed planning process. Although the planning process has resulted in some delay in the implementation of projects, the benefits associated with the implementation of high quality projects identified through the watershed planning process will provide long-term benefits. In addition to expenditures, as of 6/30/02 more than $10 million remained encumbered in 46 active contracts in the Wetlands Trust Fund accounts (Table 3.4). Of this total, $7,740,675 in 32 new contractual agreements were encumbered during FY01-02. These contracts will provide local watershed planning, site identification, design, construction, construction management and monitoring of the restored sites. The pace of expenditures will continue to increase as the planning process matures and the WRP increases the efficiency of its implementation processes.

Section 4. Analysis of Restoration Costs

The Wetlands Restoration Program evaluates the cost of restoration projects on an annual basis and compares this cost to the Schedule of Fees and the cost of restoration projects implemented by the private mitigation banking industry. Please refer to Section 5 of the 2001 Annual Report for information on the methods used in this analysis.

Stream Restoration Projects

The construction of thirteen stream restoration projects had been completed by the end of FY 01-02. Five of these projects are located in urban areas and eight projects are located in rural areas. These projects restored 55,951 linear feet of stream at an overall average cost per linear foot of $128.50. As shown on Tables 4.1 and 4.2 there is a significant difference in the costs of urban and rural projects. The average per linear foot cost of urban projects is $164.50. The average per linear foot cost of rural projects is $111.78.

TABLE 4.1. STREAM RESTORATION COSTS FOR URBAN PROJECTS

Urban Project	Hominy Swamp	Price Park	Smith/Austin	Kentwood Park	Chavis Park
Site identification	$2,450	$1,690	$4,750	$1,800	$2,250
Site acquisition	$2,500	$62,526	$300,368	$12,711	$0
Project assessment-design	$123,903	$86,380	$240,717	$93,559	$72,461
Construction management	$12,600	$21,666	$136,323	$38,334	$30,329
Site restoration	$322,618	$154,789	$446,602	$94,862	$281,703

Project status	Monitoring	Monitoring	Monitoring	Monitoring	Monitoring
* Projected Cost for five-year period					

The increased costs of urban projects are due to a number of factors. In most urban stream settings there are numerous constraints that must be addressed during the design and construction of projects. Examples of these constraints include roads, sewer lines, water lines power lines, fiber optic cables, and gas lines. These constraints must be avoided or relocated during a stream restoration project. In addition these constraints also influence the design and maintenance of the restoration project which further increases project cost. Other common constraints in urban situations include numerous road crossings, protecting city park equipment, and ensuring the compatibility of the project with surrounding buildings and structures.

Another factor that significantly increases the cost of restoration in urban areas is that stream reaches suitable and available for restoration tend to be shorter than those in rural areas because of a higher density of land ownership and smaller parcel size. Shorter restoration projects decrease the "economies of scale" for urban projects since the initial mobilization of equipment is one of the larger costs in constructing stream restoration projects. The one-time cost of construction staging and delivering equipment becomes more economical as project length increases.

TABLE 4.2. STREAM RESTORATION COSTS FOR RURAL PROJECTS

Rural Project	Payne Dairy	Stone Mountain	Brush Creek	County Line Creek	Lyle Creek	Brown Branch	Beaver Creek	Bear Swamp
Site identification	$3,700	$5,200	$2,200	$1,750	$1,150	$3,500	$2,200	$750
Site acquisition	$86,965	$0	$864	$30,414	$35,166	$0	$2,300	$6,902
Project assessment-design	$178,357	$242.781	$109,690	$97,663	$72,522	$104,164	$90,858	$44,300

* Projected Cost for five-year period

Wetland Restoration Projects

Five wetland restoration projects had been constructed by the end of FY 01-02. Three of these projects involved the restoration of coastal wetlands and two projects involved the restoration/enhancement of riparian wetlands. All of these projects were located in the coastal plain physiographic region of the state and resulted in the restoration and enhancement of 108.5 acres of wetlands.

Riparian Wetlands

The construction of two riparian wetland restoration projects had been completed by the end of FY 01-02 resulting in the restoration and enhancement of 104.4 acres of wetlands (Table 4.3). The Jumping Run Creek project is located in an urban setting and had an average cost per acre of $25,085. The Howell Woods project is located in a rural area and involves the restoration/enhancement of 100 acres of riparian wetlands in the floodplain of the Neuse River. Wetland hydrology and vegetation has been restored on 20 acres at an average cost per acre of $20,109. The Howell Woods project will also result in the enhancement of 80 acres of wetlands and the preservation of 39 acres of forested buffer. The differences in the per acre costs of these two projects demonstrates the savings associated with economies of scale. Due to the fixed mobilization costs that are similar regardless of project size, large projects will generally provide a lower per acre cost than small projects.

TABLE 4.3. COSTS OF RIPARIAN WETLAND RESTORATION

Project	Jumping Run Creek	Howell Woods
Site identification	$4,050	$5,695
Site acquisition	$0.00	$36,800
Project design	$16,125	$66,916
Construction management	$12,500	$48,734

Coastal Wetlands

The construction of three coastal wetland restoration projects had been completed by the end of FY 01-02 resulting in the restoration of and enhancement of 4.11 acres of wetlands at an average cost of $101,148 per acre. Please refer to Section 5 of the 2001 Annual Report for additional information on these projects.

Non-riparian wetlands

The Wetlands Restoration Program had not completed any non-riparian wetland restoration projects at the end of FY 01-02 therefore no cost analysis of non-riparian wetland restoration is reported.

Cost Analysis of Private Mitigation Bank Restoration Projects

The enabling legislation for the Wetlands Restoration Program requires an annual cost comparison on a per acre basis between the restoration costs of the Wetlands Restoration Program and private mitigation banks. To obtain the data necessary to accomplish this task, a survey requesting restoration cost information is sent to the sponsor of each approved bank each year (Table 4.4). The only response received this fiscal year was from EcoBank. EcoBank reported a per acre cost of $8,675 for non-riparian wetlands. During FY 99 – 00, responses were received from two sponsors, Triangle Group and EcoBank, representing four separate mitigation banks. The average per acre cost for non-riparian wetlands for these four banks was $9,665 (page 41, NCWRP 2000 Annual Report).

As noted above, the Wetlands Restoration Program has not completed any non-riparian wetland restoration projects, therefore no actual cost data to compare with the private mitigation banking industry is available. The private mitigation industry has not provided any information concerning the costs of restoring other types of wetlands or streams therefore cost comparisons with the Wetlands Restoration Program projects are not possible at this time.

TABLE 4.4. APPROVED MITIGATION BANKS IN NORTH CAROLINA

Mitigation Bank Name[1]	County	River Basin	Cataloging Unit	Restoration Type	Sponsor
Scuppernong River Corridor Mitigation Bank	Tyrrell	Pasquotank	03010205	Non-Riparian	Green Vest, LLC

[2]The Fisher River Mitigation Bank was not contacted for this survey.

Comparison of Restoration Costs with Schedule of Fees

The Wetlands Restoration Program conducts an annual comparison of actual restoration costs incurred by the Wetlands Restoration Program and costs reported by the private mitigation banking industry with the Schedule of Fees found at 15A NCAC 2R .0402. The purpose of this annual review is to ensure that the Schedule of Fees reflects the actual cost of restoration activities.

Based on the results of the analysis of restoration costs conducted last fiscal year, rulemaking was initiated during FY 01-02 to increase the fee for stream restoration to $200 per linear foot. A public hearing on the proposed increase was held in July 2002. If approved, the increase will be effective in 2003

Based on the comparison of actual costs for riparian wetlands, non-riparian wetlands and coastal wetlands with the Schedule of Fees, no adjustment to the Schedule of Fees for these categories is recommended at this time.

Section 5. Statewide Wetland and Stream Losses and Gains

Introduction

The Department of Environment and Natural Resources is one of the agencies responsible for protecting and restoring the functions and values of wetlands and streams across the state. The N.C. Wildlife Resources Commission, U.S. Environmental Protection Agency, U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, National Marine Fisheries Association, local governments, and countless non-profit organizations are all working to maintain and add to North Carolina's remaining inventory of wetlands and streams. Despite the efforts of these groups, there is still an annual net loss of streams in North Carolina, and a net loss of wetlands in some river basins.

The Division of Water Quality and Division of Land Resources within the Department of Environment and Natural Resources regulate construction activities near streams and wetlands. The intent of these regulatory programs is to minimize the impact of construction projects to these resources and to ensure that unavoidable impacts are addressed through mitigation projects. DENR also funds restoration projects through the North Carolina Wetland Restoration Program, the 319 Program, Clean Water Management Trust Fund, and Division of Water Resources Grant Program that can help to offset stream and wetland impacts.

This section presents a summary of information gathered by the NCWRP concerning statewide wetland and stream losses and gains that occurred in the state during FY 2001-2002. This information represents the activities of not only the Division of Water Quality, but also other agencies and programs working to protect and restore wetlands and streams across the state. Wetland, stream and buffer losses and gains are tracked through the Wetland/401Unit of the Division of Water Quality, and are presented under the heading Regulatory Losses and Gains. Information about other programs is presented under the heading Non-Regulatory Gains.

Regulatory Losses and Gains

The information presented in this section is based on the 401 Water Quality Certification database maintained by the Wetland/401 Unit of the Division of Water Quality. This database tracks wetland and stream losses that are authorized through the issuance of a 401 Water Quality Certification. The issuance of a 401 Water Quality Certification by the Division of Water Quality is required before the Corps of Engineers can issue a Section 404 Permit authorizing the fill or alteration of wetlands and/or streams. Although in the majority of cases the impacts authorized by the 401 Water Quality Certification are consistent with the impacts authorized by the Section 404 Permit, it should be noted that the amount of impact authorized by the Section 404 Permit may be less than that authorized by the 401 Water Quality Certification and, in some cases, a Section 404 Permit may never be issued. In addition, the authorized impacts may not occur during this fiscal year and in some cases may never occur. The Division of Water Quality is increasing its efforts to monitor and track the impacts that actually occur during each fiscal year. Questions about information presented in this report regarding regulatory wetlands losses and gains should be directed to Mr. John Dorney with the Division of Water Quality's Wetland/401 Unit at (919) 733-9646.

In addition to the wetland and stream impacts that are tracked in the database, an unknown amount of permanent wetland and stream losses occurs that can be attributed to two causes. First, projects that affect less than one-third of an acre of wetlands or less than 150 linear feet of stream are not required to receive written confirmation from the Division of Water Quality and, therefore, might not be reported. Second, at this time, the magnitude of unauthorized impacts to wetlands and streams is still being assessed. The Division of Water Quality is working to resolve this issue.

Permitted Wetlands Impacts

During FY 2001-2002, the Division of Water Quality issued Water Quality Certifications authorizing 235.82 acres of wetland impact. Table 5-1 summarizes the permitted wetland impacts that occurred

throughout the state by river basin. The majority of these impacts occur in river basins that flow through the coastal plain.

Permitted Stream Impacts

During the FY 2001-2002, Water Quality Certifications were issued authorizing 158,178 linear feet of permanent stream impact. These impacts are summarized by river basin in Table 5-1. The majority of these impacts occur in the piedmont and mountain regions of the state and in urban areas. The state of North Carolina does not require mitigation for impacts to intermittent streams, but impacts to these streams are reported in the table. The reported loss of 78,167 linear feet of stream is partially attributable to intermittent streams.

Permitted Riparian Buffer Impacts in the Neuse and Tar-Pamlico River Basins

The Riparian Buffer Rules are currently in effect for both the Neuse and Tar-Pamlico river basins. These rules apply to 50-foot wide riparian buffers directly adjacent to surface waters including intermittent and perennial streams, lakes, ponds, and estuaries. Activities within riparian buffers are categorized as exempt, allowable, allowable with mitigation, or prohibited. The Wetland/401 Unit of the Division of Water Quality regulates activities in riparian buffers and maintains the database of riparian buffer losses that are permitted through the issuance of an Authorization Certificate.

During FY01-02, 32.29 acres of buffer impact in the Neuse River Basin and 3.53 acres in the Tar Pamlico River Basin were authorized. There was .48 acre of riparian buffer impact in the Catawba River Basin during the FY 2001-2002.

Compensatory Mitigation

The purpose of compensatory mitigation is to replace wetland and stream functions that are lost through permitted impacts to stream and wetlands. Eighty-one of the 401 Water Quality Certifications issued during FY01-02 required wetland or stream mitigation. Of those, 69 percent were satisfied through payment to the NCWRP. Compensatory mitigation requirements for 7 percent were satisfied through payment to private mitigation banks. The applicants conducted the remaining 23 percent of the required compensatory mitigation on site.

Wetlands

During FY 2001-2002, a total of 230.38 acres of wetland restoration and creation was required as compensatory mitigation through the issuance of 401 Water Quality Certifications (Table 5-1). The statewide compensatory mitigation requirements for wetlands were 5.44 acres less than the authorized impacts. Twenty two percent (53.16 acres) of this total amount of wetland impact is attributed to projects that impact less than one acre of wetland and, therefore, those impacts do not require compensatory mitigation as a condition of the 401 Water Quality Certification.

Streams

The compensatory mitigation requirements of the 401 Water Quality Certifications issued during FY 2001-2002 totaled 158,178 linear feet of stream (Table 5-1). The authorized stream impacts exceeded the compensatory mitigation requirements for stream restoration in every river basin. The authorized impacts statewide exceed the compensatory mitigation requirements by 78,167 feet. This substantial difference between permitted stream impacts and compensatory mitigation requirements is attributable to two factors. First, stream impacts must exceed the minimum threshold of 150 linear feet before compensatory mitigation is required. Second, mitigation is only required for impacts to perennial streams. No mitigation was required for the loss of intermittent streams.

Non-Regulatory Gains

In addition to restoration projects associated with compensatory mitigation requirements, there are numerous state, federal and local government agencies as well as non-profit organizations that are involved in restoration activities. In order to determine the magnitude of these efforts and to provide a mechanism to share information on restoration efforts, the NCWRP conducted a survey to collect information concerning the amount of wetlands and streams that have been restored, created, enhanced, and preserved during the FY 2001-2002 (Appendix C, Appendix Table C-1). Based on the results of this survey, 0.5 acres of wetland restoration/creation and 33,600 linear feet of stream restoration were completed during the FY 2001-2002. A listing of these projects, as well as the organizations that received the survey, are shown in (Appendix C, Appendix Table C-1). The full text of the survey is presented at the end of Appendix C.

The NCWRP is committed to tracking stream and wetland restoration efforts that are conducted outside of regulatory requirements. The data for wetland and stream restoration presented in this section should be evaluated with the following caveats:

The distinction between restoration and enhancement is difficult to discern. Projects that are categorized by survey respondents as restoration projects may actually be enhancement projects.

The NCWRP makes every effort to notify appropriate organizations about the restoration project survey. It is likely, however, that some restoration projects completed during FY01-02 are not recorded in the NCWRP database. The NCWRP is continuing to improve methods of data collection to increase the accuracy of the information provided in this section.

Net Gains / Losses of Wetlands and Streams Including Regulatory and Non-Regulatory Gains in Wetlands and Streams

As depicted in Tables 5-2and 5-3 when regulatory losses, compensatory mitigation requirements, and non-mitigation projects are combined, there is a net gain of 0.56 acres of wetlands and a net loss of 44,567 linear feet of streams for the state during FY01-02. There was a net loss of wetlands in some river basins. Additional wetland, riparian and buffer preservation efforts were reported (Appendix C, Table C-1). Preservation of 18,521 acres of wetlands was reported in the Cape Fear, Catawba, Lumber, Pasquotank, Tar-Pamlico, Watauga, and White Oak River Basins. Riparian buffer preservation totaling 9,639 acres was reported in the Cape Fear, Catawba, French Broad, Little Tennessee, Lumber, Neuse, Tar-Pamlico, Watauga, White Oak, and Yadkin River Basins.

Compensating for Non-Mitigated Wetlands Losses and Gains

An important role of the NCWRP is to provide compensation for permitted impacts to wetlands and streams that fall below the regulatory threshold requiring compensatory mitigation by the 401 Water Quality Certification. As discussed previously, the Division of Water Quality does not require compensatory mitigation for impacts to wetlands that are less than one acre or for impacts to streams that are less than 150 feet. On an annual basis, the cumulative effects of these impacts result in a substantial loss of wetland and riparian resources. During FY 2001-2002, an estimated total of 53.16 acres of wetlands were lost due to permitted impacts less than one acre in size. These impacts are summarized by river basin in Table 5-1.

Through the Wetlands Trust Fund, the NCWRP has resources to fund projects that offset these wetland losses. The NCWRP uses appropriated funds, interest earned by the Wetlands Trust Fund and grant awards to work in areas where non-mitigated impacts are significant.

TABLE 5.1. STATEWIDE WETLAND, STREAM AND RIPARIAN BUFFER LOSSES AND GAINS.

The North Carolina Wetlands Restoration Program
2002 Annual Report to the
U.S. Army Corps of Engineers
Wilmington District

As required by paragraph VI of the Memorandum of Understanding (MOU) between the U.S. Army Corps of Engineers, Wilmington District (Corps of Engineers) and the Department of Environment and Natural Resources, Wetlands Restoration Program (NCWRP) a report documenting the activities of the NCWRP related to the MOU has been prepared and is submitted to the Corps of Engineers for review.

Please note that the majority of the information concerning the activities of the NCWRP is documented in the main body and appendices of this report that has been prepared for the Environmental Review Commission of the North Carolina General Assembly as required by the enabling legislation for the NCWRP. The 2002 Annual Report, including this appendix, documents all activities of the NCWRP during FY2001-02 (July 1, 2000 through June 30, 2001). This appendix will address the specific reporting requirements found in Paragraphs V and VI of the MOU.

Memorandum of Understanding: Reporting Requirements

As specified in paragraphs V and VI of the MOU, the following information is presented in this report: the administrative costs associated with the MOU; a summary of monitoring results of projects that have been implemented; an accounting of the amount of restoration, creation, enhancement or preservation that has been conducted in each river basin by Catalog Unit; an accounting of the acres of mitigation required by Section 404 permits in each river basin by Catalog Unit; documentation concerning the implementation of projects in accordance with the time frame specified in the MOU; and an accounting of the funds that have been paid into the Wetlands Restoration Fund to satisfy the compensatory mitigation requirements of Section 404 permits.

Administrative Costs Associated with Implementation of the MOU

The salaries, travel and other operating expenses of five positions are funded through the Compensatory Mitigation Fund (Account 2981). The cost of these positions during FY01-02 was $255,351, which is equivalent to 2.61% of the payments to Account 2981. Administrative costs are incorporated within the fee structure, and will not reduce the funding available for compensatory mitigation projects.

Summary of Monitoring Results of Projects

As required by Paragraph IV F of the MOU, monitoring reports and as-built plans for each project will be submitted to the Corps of Engineers upon completion of each project. In addition, the appropriate Corps of Engineers Regulatory Field Office is notified during the planning and design phase of each project to provide an opportunity for input during the design phase of the project.

The NCWRP has completed 15 projects and is monitoring these projects in accordance with the MOU (Table A-1). The monitoring reports contain hydrological, fluvial geomorphological, and vegetative monitoring data as appropriate for each project as well as project specific data that is necessary to ensure success of the restoration project. The first monitoring report for each project is submitted to NCWRP during the fall after the first full growing season after the initial planting of vegetation. Monitoring continues for at least five full growing seasons after planting, or until after all success criteria have been met.

Three projects (YD-101-WL-S-SM, Stone Mountain; CT-101-AX-S-PD, Payne Dairy; and WO-001-ON-W-SC1, Sturgeon City) completed the first year of monitoring during FY01-02. The results of these monitoring reports are summarized below. Three additional projects will complete their first year of monitoring during FY02-03 (NU-203-WS-H-HSC, Hominy Swamp; CF-0020GU-S-PP, Price Park; and

NW-001-AG-S-BC, Brush Creek). The full monitoring reports for all projects are submitted to the USACE by January 1st of each year and are available for review at the NCWRP office.

Monitoring of Stream Restoration Projects

The monitoring of stream restoration projects involves the measurement of fluvial geomorphological and vegetative parameters. Fluvial geomorphological parameters include the measurement of channel dimension (cross-sections), pattern (sinuosity), and profile (channel slope). In addition, channel substrate is measured by performing pebble counts at identified pool and riffle cross-sections. Vegetative monitoring focuses on the growth, survival, and diversity of vegetation within the riparian buffer of stream restoration projects.

Stream Restoration Success Criteria

The success criteria for stream restoration projects are based on the stability of the fluvial geomorpholocical parameters. Channel stability is primarily based on the measurement of dimension and slope. A determination is made that the success criteria has been met when there is no significant difference between the measurements for dimension and slope in the restored channel and the range for these parameters for the specific stream type identified as the reference type for the project. A significant change is defined as a value that falls outside the specified range in the morphological table for the reference stream type.

Vegetative monitoring focuses on the survival and growth and diversity of planted species in the riparian area (25-50 feet on both sides of the stream). The vegetative success criterion is met by documenting the survival and growth of at least 320 trees per acre of the species selected for each site. In addition, the species composition of the riparian buffer must meet the species diversity criteria established for each project based on site-specific conditions.

Monitoring of Wetland Restoration Projects

The monitoring of wetland restoration/enhancement projects involves the measurement of the hydrological and vegetative parameters. Hydrologic monitoring includes the measurement of groundwater hydrology, i.e. the depth from the surface to the groundwater table throughout the year. Vegetative monitoring focuses on the growth, survival, and diversity of vegetation within the riparian buffer of stream restoration projects.

Wetland Restoration/Enhancement Success Criteria

The hydrological success criterion documents that the restored site meets the hydrological criteria for each site based on site-specific conditions associated with landscape position and soil types. At a minimum, monitoring must document that the groundwater table is within 12 inches of the ground surface from 5-12% of the growing season. In addition, the NCWRP monitors a reference wetland that is similar in type and landscape position and compares this data to data from the restored site. Success is achieved when the hydroperiod of the restored site is within +/- 10% of the hydroperiod of the reference site.

Vegetative monitoring focuses on the survival and growth and diversity of planted species within the restored/enhanced wetland. The vegetative success criterion is met by documenting the survival and growth of at least 320 trees per acre of the species selected for each site. In addition, the species composition of the restored/enhanced wetland must meet the species diversity criteria established for each project based on site-specific conditions.

Summary of Results from Individual Projects

YD-101-WL-S-SM - Stone Mountain

A stream restoration project consisting of 7,000 linear feet of restoration and 2,590 of enhancement was performed on the East Prong of the Roaring River in Stone Mountain State Park in 2000. The primary objectives of this project were to improve water quality and habitat by returning the river channel to a stable pattern, dimension and profile.

Success Criteria:

Fluvial Geomorphology:
Stream cross-sections (dimension) and slope (profile) show no significant change from the as-built plan therefore the success criteria for fluvial geomorphology has been met for this reporting period.

Vegetation:
All monitoring plots show a survival of at least 320 stems per acre. The diversity of species within each plot is within the range established for this project

Comments/Recommendations/Remedial Actions:

A large log cross vane was repaired in reach 2 during the past year.
To ensure adequate diversity and continued survivability of a minimum of 320 stems per acre, additional planting (live stakes and bare root seedlings) will be performed during winter 2002-03.
The deer browse continues to be a problem at the Stone Mountain site. Deer repellent was sprayed on many of the seedlings last winter; however, deer browse was still considerable. Tree shelters may be utilized if this continues to be a problem.

CT-101-AX-S-PD - Payne Dairy

A stream restoration project was performed on a 7,000 linear foot reach of Jumping Run Creek in Alexander County. Priority I restoration was performed on 5,180 linear feet of stream channel. The remainder of the project consisted of 470 linear feet of Enhancement I and 1,350 linear feet of Enhancement II. The entire 7,000 linear foot reach was fenced to remove cattle from the stream on an active dairy farm. The primary objective of this project was to improve water quality and habitat through the restoration of a stable channel and restoring the vegetation in the adjacent riparian buffer.

Success Criteria:

Fluvial Geomorphology:
Stream cross-sections (dimension) and slope (profile) show no significant change from the as-built plan therefore the success criteria for fluvial geomorphology has been met for this reporting period.

Vegetation:
The survival of the bare-rooted seedlings in the riparian buffer was significantly less than 320 stems per acre therefore the success criteria was not met. The survival of willow stakes within the stream channel exceeded the requirement of 320 stems per acre.

Comments/Recommendations/Remedial Actions:

No further repairs to structures and/or banks are required at this time.
The head-cut in Area 1 will be monitored with repairs made as necessary.
Minor bank failure (<10 feet) was observed in one location along the 5,755 linear feet of restoration. This area will be monitor with remedial actions taken as necessary.
Two rock cross vanes had some minor flow through at low flow but were still serving as grade control. Over time, the small holes between the header rocks of the second structure should be filled in by bedload. This area will be monitored and additional actions will be taken if necessary.
The riparian buffer areas were replanted in the spring of 2002.

WO-001-ON-W-SC1 - Sturgeon City

Three acres of brackish coastal marsh and tidal creek were restored at the site of an abandoned wastewater treatment plant on Wilson Bay, Jacksonville, NC. This project involved the removal of fill and debris that had been used to fill the marsh. The area was graded to the elevation of adjacent marshes and planted with giant cordgrass (Spartina cynosuroides) and other species. The goal of the project was to stabilize the shoreline with native vegetation and to improve water quality and habitat through the restoration of the marsh. This project is one of a number of actions that have been taken to improve the water quality of Wilson Bay and demonstrates how compensatory mitigation projects can be incorporated into watershed scale projects.

Success Criteria:

Hydrology:
The hydrology of the reference site was not properly monitored therefore no assessment of compliance with success criteria can be made at this time. However, the automatic groundwater monitoring gauges indicate that diurnal tidal fluctuations occur at the restored site and that the tidal creek is functioning as designed.

Vegetation:
All monitoring plots show good survival of planted species. The stem counts indicate that the success criterion of 25% cover after year 1 has been met.

Comments/Recommendations/Remedial Actions:

The deficiencies in the monitoring report will be addressed.
The invasive grasses observed in some plots will continued to be monitored with actions taken as necessary to ensure that these grasses do not impede the growth of desired species.

Accounting of the Amount of Restoration, Creation, Enhancement or Preservation Conducted in Each River Basin by Catalog Unit

The NCWRP currently has 60 projects that meet the definition of "instituted" and will be used to meet the compensatory mitigation requirements of Section 404 permits (Table 1-2). Collectively these 60 projects will restore, enhance, and preserve approximately 376.9 acres of wetlands, 192,662 linear feet of stream channel, and 297.1 acres of riparian buffer. As defined in the MOU, "instituted" means that a site has been identified, the property has been acquired, and a contractor has been assigned to design the project. An additional 19 projects that will result in the restoration of 184 acres of wetlands and 63,000 linear feet of streams have been identified and will be instituted during FY02-03 or FY03-04 (Table 1-3).

Accounting of the Compensatory Mitigation Required by Section 404 Permits Assumed by NCWRP in Each River Basin by Catalog Unit

During FY01-02 the NCWRP assumed the compensatory mitigation requirements of 68 Section 404 permits related to 36 impacts. The compensatory mitigation requirements of these permits require the restoration of 39,820 linear feet of stream channel and 41.04 acres of wetlands (Table A-2). Payments to fund mitigation projects associated with these impacts totaled $5,849,085 (Table A-3).

Since the effective date of the MOU (November 4, 1998) the NCWRP has assumed the compensatory mitigation requirements of 108 Section 404 permits. The cumulative compensatory requirements of these permits require the restoration of 164,051 linear feet of stream channel and 194.06 acres of wetlands. The impacts accepted are distributed among 11 river basins and 22 catalog units (Table A-4).

Documentation Concerning the Implementation of Projects in Accordance with the Time Frame Specified in the MOU

As stipulated in paragraph IV of the MOU, the NCWRP has a specified amount of time from the date a payment for compensatory mitigation is received to implement projects that satisfy the compensatory mitigation requirement. The long-term goal of the NCWRP is to identify and implement projects that are incorporated into watershed restoration strategies in advance of permitted impacts. Although significant progress has been made in achieving this goal, the current emphasis of the NCWRP is compliance with the timeframes established by the MOU. This section will examine the progress NCWRP has made in meeting the compensatory mitigation requirements of Section 404 permits from the initiation of the MOU through the end of FY01-02.

In accordance with the schedule established by the MOU, there were 73 Section 404 permits with compensatory mitigation requirements due by the end of FY 01-02 (Table A-5). The mitigation requirements of 92% of these permits have been met by projects that met the definition of instituted by the end of FY01-02. The mitigation for 84% of the permits was provided within the timeframe established in the MOU. The mitigation requirements of 95% of the permits will have been met when the projects listed on Table 1.3 are instituted in FY02-03.

Statewide the NCWRP has assumed the responsibility of Section 404 permits with compensatory mitigation requirements totaling 67.55 acres of wetlands and 52,955 linear feet of stream. The NCWRP has instituted projects that will result in the restoration, enhancement or preservation of 376.9 acres of wetlands and 192,662 linear feet of stream channel.

Although the total amount of restoration instituted by the NCWRP exceeds the total amount of required mitigation on a statewide basis there are mitigation obligations that have not been met. Specifically, at the end of FY01-02, there were 6 permits for which the mitigation requirements were not met within the specified timeframe. A number of actions have been initiated to address the outstanding mitigation requirements. These activities include the allocation of additional staff resources to the watersheds of concern, the development of Local Watershed Plans in these watersheds to assist in the identification of appropriate projects, and the issuance of Requests for Proposals for wetland and stream restoration. It is anticipated that the outstanding mitigation requirements as of June 30, 2002 will be met by June 30, 2003.

Accounting of the Funds Paid into the Wetlands Restoration Fund to Satisfy the Compensatory Mitigation Requirements of Section 404 permits

As required by the MOU, the NCWRP has established a separate account, 2981 - Compensatory Mitigation within the DENR Wetlands Trust Fund as a repository for all payments made to the NCWRP for the purpose of satisfying Section 404 compensatory mitigation requirements. As reflected in Section 3 of the 2001 Annual Report, Compensatory Mitigation Account 2981 is a repository for payments that satisfy both Section 404 permit and 401 Water Quality Certification compensatory mitigation requirements. During FY01-02, payments to Account 2981 to satisfy the compensatory mitigation requirements of Section 404 permits totaled $9,197,500. These payments fulfill the compensatory mitigation requirements of 44 permits (Table A-7). Since the effective date of the MOU, November 4, 1998, 86 payments totaling $24,140,218.31 have been made to Account 2981 for the purpose of satisfying the compensatory mitigation requirements of Section 404 permits.

Please refer to Section 3 for an explanation of the use of the funds deposited into Account 2981 during FY 01-02.

Additional Actions Taken To Implement the Memorandum of Understanding

Establishment of the Advisory Team

The Memorandum of Understanding between DENR and the U.S. Army Corps of Engineers (see Appendix B, 1998 Annual Report) requires the NCWRP to convene an Advisory Team to review the progress of the NCWRP in meeting compensatory mitigation requirements of Section 404 permits. The appropriate state and federal agencies have been invited to appoint a representative to serve on the Advisory Team. It is anticipated that the first meeting of the Advisory Team will be held during January 2002.

Development of Reporting Formats for Site-Specific Restoration Plans and Monitoring Reports

The NCWRP has submitted recommendations to the Corps of Engineers for review and comment on the format for site-specific restoration plans and monitoring reports. These formats will be finalized during FY 02-03.

Quarterly Progress Reports

The NCWRP acknowledges the need to provide information to the Corps and other interested parties concerning the progress it has made in meeting assumed compensatory mitigation requirements of Section 404 projects. Although the Annual Report meets the reporting requirements of the Memorandum of Understanding the NCWRP will began providing quarterly reports to the Corps in January 2002. These reports will be posted on the NCWRP web page for review by interested parties.

*Description of mitigation required. Warm, cool, or cold stream restoration is sometimes specified on the Section 404 permit.

Non-riparian or riparian restoration is specified for all permits that require wetland mitigation.

[1] As defined in COE/DENR MOU

[2] Acres of wetlands

[3] Linear feet of stream

[4] Mitigation is in the adjacent cataloging unit 03030001

APPENDIX B. 2001-2002 DEPARTMENT OF TRANSPORTATION ANNUAL REPORT

Department of Environment and Natural Resources and Department of Transportation Memorandum of Understanding

On July 7, 1999, the Department of Environment and Natural Resources and the Department of Transportation signed a Memorandum of Understanding designed to help address future Department of Transportation compensatory mitigation needs while protecting and improving water quality and habitat through the restoration of wetlands and streams and other activities that restore the biological, chemical and physical integrity of the waters of the state (refer to Memorandum of Understanding copy within Appendix B of the 2000 Annual Report). The agreement calls for the Department of Transportation to pay the Department of Environment and Natural Resources Wetlands Trust Fund $2.5 million annually for a period of seven years, through 2006. These resources are allocated strictly for the development of Local Watershed Plans within cataloging units where the Department of Transportation is anticipating compensatory mitigation needs. Refer to Table B-1 for a summary of receipts and expenditures related to this MOU.

TABLE B-1. RECEIPTS AND EXPENDITURES RELATED TO THE MOU WITH NCDOT

Local Watershed Plan	FY00-01	FY01-02
Catawba		57,705
Lower Yadkin		79,191

Subtotal	**28,271**	**803,642**
Administrative	167,163	255,351
	295,434	1,058,993
Total Receipts		**7,500,000**
Total Expenditures		**1,354,427**

NCWRP Progress in Development of Local Watershed Plans

Significant progress has been made with Local Watershed Planning initiatives this past fiscal year. From July 1, 2001 through June 30, 2002 the NCWRP continued efforts in three areas where Local Watershed Plans were initiated in FY 2000 and began eight additional plans. Other accomplishments during FY01-02 included the development of an agreement between DOT and the NCWRP regarding the catalog units for which each is responsible and when those responsibilities are effective. This agreement is included as an attachment at the end of this appendix. A summary of the status of each Local Watershed Plan is provided in Table B-2.

The implementation of Local Watershed Plans across North Carolina in order to meet projected NCDOT mitigation needs has generated a number of important benefits at local, state and national levels. Highlights of these benefits include:

- At the ***local*** level, communities and local governments are working with the NCWRP to help identify watershed needs and feasible solutions to address them. Data generated during the

planning process is being used to attract grant funds to implement solutions that cannot be implemented with mitigation funds. These efforts enhance and complement restoration projects implemented by the NCWRP to meet NCDOT mitigation needs. Additionally, the planning process is promoting education and awareness of water quality and habitat issues at a local scale which is generating community buy-in for project implementation as well a community involvement in watershed solutions.

- At the ***state*** level, Local Watershed Planning has laid the groundwork for the development of an innovative new program, the Ecosystem Enhancement Program, that will provide all of NCDOT's mitigation needs across the state beginning in January of 2005. The development of the Ecosystem Enhancement Program is benefiting directly from the experiences gained through Local Watershed Planning.

- ***Nationally***, the experiences generated through the Local Watershed Planning process are adding to a growing database of watershed planning and management examples. Each effort advances the science toward the development of the best approaches to characterizing watershed conditions and developing effective and locally supported solutions. Approaches being applied are inclusive of data analysis, model application and stakeholder involvement.

Status of Other Provisions Outlined in the Memorandum of Understanding

Beyond the development and implementation of Local Watershed Plans, other provisions of the Memorandum of Understanding include: development of a North Carolina Watershed Restoration Policy Committee, Department of Transportation involvement in Local Watershed Plan implementation, and a Department of Transportation commitment to minimize impacts to certain types of wetland, stream andriparian habitats. The policy committee has not been established due to the implications of the development of the Ecosystem Enhancement Program. However, an advisory committee established in accordance with the NCWRP's MOU with the Corps of Engineers is being used to hear recommendations resulting from LWP efforts as they are completed. The NCWRP continues to involve DOT in LWP activities as evidenced in the agreement presented at the end of this report.

Another component of the MOU is a commitment by the NCDOT to increase the avoidance and minimization of impacts to high quality resources. As part of the Permit Process Improvement Initiative involving NCDENR, NCDOT, USACOE and other regulatory agencies, the High Quality Resources Identification Team has been initiated. This team will identify the types and locations of High Quality Resources throughout North Carolina. In unison with the Local Watershed Planning approach, this commitment works to ensure that proactive planning to protect critical areas occurs in advance of road development impacts.

In accordance with the MOU, the NCWRP continues to provide mitigation for NCDOT projects within 11 watersheds. During FY 01-02, nine projects were permitted with the NCWRP assuming the mitigation requirements (Table B-3). The NCWRP will assume responsibility for one additional watershed during FY 02-03, Cape Fear 03030007.

TABLE B-2. SUMMARY OF CURRENT LOCAL WATERSHED PLANNING INITIATIVES

River Basin	8-Digit CU	14-Digit HU	Local Watershed Name	Comments/Status	Contact / Plan Lead
Lower Cape Fear	03030007	03030007140010	Northeast Cape Fear	Due for completion in fall of 2002.	Bonnie Duncan Bonnie.Duncan@ncmail.net (919) 733-5315

White Oak	03030001	NCWRP will continue to accept all NCDOT mitigation responsibilities
Cape Fear	03030007	NCWRP is engaged in Local Watershed Planning and will assume all of NCDOT's mitigation needs on 1/1/03
Pasquotank	03010205	NCWRP is engaged in Local Watershed Planning and will assume all of NCDOT's mitigation needs on 1/1/04
Yadkin	03040105	NCWRP is engaged in Local Watershed Planning and will assume all of NCDOT's mitigation needs on 1/1/04
Broad (Catawba)	03050105	NCWRP will engage in Local Watershed Planning in 2002 and will assume all of NCDOT's mitigation needs on 1/1/05

* Note: River Basins and Cataloging Units are based on "Hydrologic Unit Map – 1974, State of North Carolina," published by the US Department of Interior Geological Survey.

Conditions

Mitigation for Transportation Improvement Projects (TIP) with a let date earlier than the NCWRP assumption date will not be accepted unless specifically agreed upon on a case-by-case basis. The TIP (26th Edition; 2002-2008) will be used as a "let date" baseline for planning purposes. This condition

applies only to the following Regional Watersheds: lower Cape Fear (03030007), lower Yadkin (03040105), Pasquotank (03010205), and the Broad (Catawba 03050105) watersheds.

The NCWRP is committed to providing for NCDOT's mitigation needs in the above listed Cataloging Units as projected in the impact numbers received by the NCWRP in January, 2002. These summary figures will be considered a baseline for NCWRP planning purposes. Annual updates of NCDOT's impacts will be provided to the NCWRP each January. Any subsequent annual increases over in the baseline figures within a given Cataloging Unit for a given year greater than 15% will be considered for NCWRP assumption on a case-by-case basis taking into account NCDOT justification.

By March of each year, the NCWRP will inform the NCDOT of the 14-digit hydrologic units that will be the focus of a LWP. Within a month of this notification, the NCDOT will provide the NCWRP the following information for each identified LWP area:

The results of any previous site searches conducted after 1998

EAs/EISs for the LWP area for projects scheduled to be let within 2 years after the completion of the LWP Specific information regarding permitted impacts to convey the types (as well as extent) of impacts that the LWP will need to address, these types include columns showing impacts by catalog unit for non-riparian, riparian, and coastal wetlands in addition to SAVs, and cold, cool, and warm stream impacts. For river basins with buffer rules, a column should also be included which lists buffer impacts.

The location and type of any existing mitigation projects or properties that NCDOT has implemented or purchased in the watershed (including remaining credits and any project problems)

The location of the chosen road alignment of future, unconstructed projects (in MicroStation format) The NCDOT agrees to pay for the total cost of restoration projects even when they are in excess of the NCWRP's established fee schedule.

The NCDOT agrees to advance funds to the NCWRP for projects identified prior to the time that payment must be made for permit issuance.

The NCWRP agrees to work with NCDOT to make up mitigation deficits caused by failed restoration sites in the above listed cataloguing units. In those areas, the NCDOT will notify the NCWRP of potential failures as soon as they become evident or may initiate measures to locate a mitigation site(s) prior waiting for a deficit to occur for which NCWRP cannot meet, provided that NCDOT coordinates with NCWRP to prevent duplication or overlap of efforts of the two organizations. Upon successful implementation of any replacement mitigation (whether used or not), NCDOT will "donate" any excess mitigation to the NCWRP program for later use for other NCDOT transportation projects.

The NCDOT agrees to have PD&EA staff make an informational presentation to each of the stakeholder groups at a Local Watershed Plan meeting and to coordinate with other groups within NCDOT to provide presentations on other issues of interest (sedimentation, erosion control, or stormwater issues) to the stakeholders.

APPENDIX C. WETLANDS AND STREAM RESTORATION SURVEY AND RESULTS

The Wetlands Restoration Program surveys organizations that restore, enhance and protect wetlands and riparian area. The survey and tabulated results are shown in the following section.

North Carolina Wetland, Stream and Riparian Restoration, Creation, Enhancement and Preservation Survey for Fiscal Year 2001-2002

PROGRAM INFORMATION: ***If your organization has more than one program conducting wetland or stream restoration, please fill out separate surveys for each program or make note of which projects are associated with different programs.***

Program Title / Agency:_____
Program Representative and Contact Information:
Name
Address_____
Phone:_ Fax:_____
E-Mail:_____

PROJECT INFORMATION: Please provide as much of the requested information as possible for each wetland/stream project.

Only include NON-COMPENSATORY MITIGATION projects initiated or completed between July 1, 2001 – June 30, 2002.

- List information for each project individually. You will need to make copies of the survey if you initiated or completed more than one project during the last fiscal year.
    - Provide details on projects completed before fiscal year 2001 - 2002 by noting the appropriate fiscal year for each project on your survey.

1. **Project Name / Number:**_____
   (assigned by your program or organization)

Purpose of the Project: general information about your project's purpose (i.e. to improve water quality, to reopen closed shellfish waters, improve fisheries and wildlife habitat, etc.).

Project Completion Date or Target Date of Completion: (Month/Year) Include the percentage of your project that was completed by June 30, 2002, if you provided a targeted project completion date.
Completion or Targeted Completion Date: _____
% of Project Completed as of June 30, 2002: _____

Project Funding Source(s) / Partners Involved: List any programs or granting entities that are funding your project and any other partners involved with your project.

Location Reference(s): The River basin, subbasin, county, 14-digit hydrologic unit – or whatever geographical unit your program uses for referencing projects.

River Basin:

____Broad ____Little Tennessee____Savannah
____Cape Fear ____Lumber ____Tar-Pamlico
____Catawba ____Neuse ____Watauga
____Chowan ____New ____White Oak
____Hiwassee ____Roanoke ____Pasquotank
____French Broad ____Yadkin-Pee Dee

Subbasin (if known):

Subbasin Number: _____
USGS 14-Digit Hydrologic Unit: _____
County:_____ Nearest Town:_____

Type of legal instrument used to protect restored/protected project properties: If you are using conservation easements, please indicate the term length (i.e. 10, 15, 30 years or perpetuity).

____Conservation Easement (number of years_____or permanent).
____Purchase Fee-Simple
____Contract (number of years_____)

2. **Project Activities:** *Review the definitions below, and then complete the table by placing a check next to the activities that apply to this project. Specify the number of acres / feet where appropriate.*

Wetland Restoration: Re-establish wetland hydrology and vegetation in an area where it previously existed.

Wetland Enhancement: Increase one or more of the functions of an existing wetland by manipulating vegetation or hydrology.

Wetland Creation: Establishing wetland hydrology, vegetation and soils in an area where wetlands did not exist in the recent past.

Stream Restoration: The process of converting an unstable, altered or degraded stream corridor, including adjacent riparian zone and floodprone areas to its natural or referenced, stable conditions considering recent and future watershed conditions. This process also includes restoring the geomorphic dimension, pattern, and profile as well as biological and chemical integrity, including transport of water and sediment produced by the stream's watershed in order to achieve dynamic equilibrium.

Stream Enhancement: Protecting and/or enhancing stream stability and functions by establishing vegetated buffers; increasing buffer width, and/or stabilizing streambanks using bioengineering techniques.

Wetlands and Stream Segment Preservation: Protecting wetlands and stream segments by purchasing, donating or conveying a conservation easement to an appropriate government or non-profit agency to manage.

Nonwetland Riparian Buffer Restoration: Establishing a vegetated buffer (minimum 25 ft. width) and maximizing sheet flow through buffer by receiving concentrated flow areas.
Nonwetland Riparian Buffer Enhancement: Increasing width of existing vegetated buffer and maximizing sheet flow through buffer by reducing concentrated flow amounts.
Nonwetland Riparian Buffer Preservation: Preserving existing forested buffers (minimum 25 ft. width).

Wetland

	Please Check	Specify Acres
_____Restoration		_____Acres

DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES
WETLANDS RESTORATION PROGRAM
2002 ANNUAL REPORT
TO THE
ENVIRONMENTAL REVIEW COMMISSION
JANUARY 28, 2003

Activities to Improve the Ecological Effectiveness of Restoration Projects

During the past several years there have been numerous studies conducted to determine if the compensatory mitigation required for permitted impacts to wetlands and streams was achieving the goal of replacing the lost functions due to permitted impacts. In general these studies have documented that the "no net loss" goal is not being met. One of the primary reasons for failure to achieve the "no net loss" goal is that the location of many mitigation projects is not conducive to replacing the desired functions. Most of these studies have recommended that watershed planning be used to identify the most appropriate locations for mitigation projects.

For example, as stated in the recommendations of the report published by the National Research Council in 2001, "Compensating for Wetland Losses Under the Clean Water Act"

> "Site selection for wetland conservation and mitigation should be conducted on a watershed scale in order to maintain diversity, connectivity, and appropriate proportions of upland and wetland systems ... Regional watershed evaluation should greatly enhance the protection of wetlands and/or the creation of wetland corridors that mimic natural distributions of wetlands in the landscape."

In addition the 2000 "Federal Guidance on the Use of In-Lieu-Fee Arrangements for Compensatory Mitigation" states:

"Local watershed planning efforts, as a general matter, identify wetland and other aquatic resources that have been degraded and usually have established a prioritization list of restoration needs. In-lieu fee mitigation projects should be planned and developed to address the specific resource needs of a particular watershed."

The Wetlands Restoration Program has adopted watershed planning as a central component of its efforts to improve the ecological effectiveness of restoration projects. Basinwide Watershed Restoration Plans are developed at the river basin scale and identify watersheds where restoration projects provide the maximum benefit based on a number of factors. Local Watershed Plans are developed on a smaller scale and involve the local community in making decisions on the specific types and locations of restoration projects. These efforts ensure that projects implemented by the Wetlands Restoration Program provide the maximum water quality and habitat benefits. These plans also provide a mechanism to coordinate the efforts of others, such as Clean Water Management Fund projects, so that mitigation projects compliment other efforts that are underway in each watershed.

During FY01-02 the Wetlands Restoration Program conducted the following planning activities. Please refer to Section 1, page 1-1 of the 2002 Annual Report and the 2001 Annual Report for additional information on planning activities.

- Basinwide Watershed Restoration Plans
  - The review and revision of plans in 9 river basins was initiated.
  - The revision of 4 plans was completed.

- Local Watershed Plans
  - Eleven Local Watershed Plans are under development.
  - Eight plans were initiated during FY01-02.

Providing Compensatory Mitigation Option for all Permit Applicants

One of the purposes for the establishment of the Wetlands Restoration Program was to provide a compensatory mitigation option that is available throughout North Carolina. The 1998 Memorandum of Understanding between the WRP and the U.S. Army Corps of Engineers, Wilmington District established the guidelines that provides Section 404 permit applicants with the option of paying a fee to the Wetlands Restoration Program to satisfy compensatory mitigation requirements. This option is also available for permitted impacts to riparian buffers in the Neuse, Tar-Pamlico and Catawba River basins.

- During FY 01-02, the mitigation requirements of 88 permits (65 Section 404/401 permits, 23 riparian buffer) were satisfied through payment to the Wetlands Restoration Funds.

- Since 1998, the mitigation requirements of 315 permits (273 Section 404/401 permits, 42 riparian buffer) were satisfied through payment to the Wetlands Restoration Funds. Of these permits,
    - 64% were issued to the private sector;
    - 26% were issued to NCDOT; and
    - 10% were issued to other local, state and federal government agencies.

- An analysis of the funds received for assuming the mitigation requirements of these permits reveals that:
    - 76.5% were from the NC Department of Transportation;
    - 18.5% were from the private sector; and
    - 5% were from other local, state and federal government agencies.

Progress in Meeting Compensatory Mitigation Requirements

Since 1998, the Wetlands Restoration Program has assumed mitigation requirements that require the restoration of approximately 228,000 linear feet of stream channel; 265 acres of wetlands; and 164 acres of riparian buffer. On a statewide basis, the Wetlands Restoration Program has constructed, instituted, or identified projects that exceed the amount of mitigation assumed (Table 1). At the end of FY01-02, the mitigation requirements of over 90% of permits with mitigation due had been met. Please refer to Section 2 and Appendix A of the 2002 Annual Report for additional information concerning progress in meeting compensatory mitigation requirements.

Status of Wetland Trust Funds

Outlined below is the status of each of the Wetland Trust Funds as of December 31, 2002. Please refer to Section 3 of the 2002 Annual Report for additional information concerning these funds.

Account 2980 – Wetlands Restoration Fund

The balance of Account 2980 as of 12/31/02 was $2,488,069. Of this amount, $2,397,696 was encumbered leaving an unencumbered balance of $90,373 (Table 2). Since July 1, 2001, a total of $497,652 in revenue has been deposited into Account 2981. Expenditures during this period totaled $8,586,339, including a reversion of $4,400,000 to the General Fund to assist with the budget emergency.

Account 2981 – Compensatory Mitigation Fund

The balance of Account 2981 as of 12/31/02 was $44,139,592. Of this amount, $8,750,504 was encumbered leaving an unencumbered balance of $35,389,088 (Table 2). Since July 1, 2001, a total of $19,044,590 in revenue has been deposited into Account 2981. Expenditures during this period totaled $7,414,754. Of the unencumbered balance, $18,000,000 is reserved for the construction of projects currently in design, and $16,000,000 is reserved for the design and construction of identified projects that are required to meet the compensatory mitigation requirements of Section 404 permits and 401 Water Quality Certifications. The remaining balance is reserved to implement nitrogen reduction projects in the

Neuse River basin in accordance with 15A NCAC 2B .0240. It must be noted that the majority of the funds deposited into Account 2981 are voluntary payments from permit applicants to satisfy the compensatory mitigation requirements of federal permits. Failure to utilize these funds for the restoration, enhancement, and preservation of wetlands, streams, and riparian areas will result in environmental degradation and will jeopardize the agreement with the U.S. Army Corps of Engineers that authorizes the in-lieu-fee mitigation program.

Account 2982 – Riparian Buffer Fund

The balance of Account 2982 as of 12/31/02 was $7,286,035. Of this amount, $3,285,547 was encumbered leaving an unencumbered balance of $4,000,488 (Table 2). Since July 1, 2001, a total of $5,493,366 in revenue has been deposited into Account 2982. The remaining unencumbered balance is reserved for the design and implementation of buffer restoration projects in the Neuse, Tar-Pamlico, and Catawba River basins.

Progress in Meeting 2002 Implementation Goals

During 2002 the Wetlands Restoration Program increased the pace of implementation of restoration projects. This increased activity reflects the maturity of the planning process and actions that were taken to address concerns with the pace of implementation of restoration projects. Provided below is information concerning Wetland Restoration Program restoration, enhancement and preservation projects and documentation concerning program activities associated with implementation during 2002.

Project Status

As of December 31, 2002 the Wetlands Restoration Program has 68 projects that have completed the site identification and property acquisition phases. All of these projects will be completed or under construction within 14 months. Collectively these projects will restore, enhance or preserve 806 acres of wetlands, 194,562 linear feet of streams, and 300 acres of riparian buffer (Table 3). The status of each of these projects is summarized in Table 4. An additional 18 projects that will restore approximately 184 acres, 58,500 linear feet of streams, and 135 acres of riparian buffer are in the property acquisition phase (Table 5).

Progress in meeting 2002 goals

Goal 1: 9 projects in construction by June 30, 2002

- All 9 projects in construction by June 30, 2002

Goal 2: 13 projects in construction by December 31, 2002

- 4 projects are in construction
- 1 project will be in construction by February 28, 2003
- 5 projects to bid by February 28, 2003 and under construction by April 30, 2003
- 2 projects delayed due to combining 4 projects in Greensboro to save on design and construction costs, 2 of the 4 projects will be in construction in April with work beginning on the other 2 projects when construction complete on first 2 projects. Construction will be completed by June 2003.
- 1 project delayed due to presence of an endangered species. The endangered species issue has been resolved; construction bids will be solicited in February 2003 with construction scheduled for April 2003.

Goal 3: 21 projects at the "construction bid" phase by December 31, 2002.

- 7 projects to bid by February 28, 2003, construction scheduled for April/May 2003.
- 7 projects to bid by April 30, 2003, construction scheduled for May/June 2003.

Goal 3: 21 projects at the "construction bid" phase by December 31, 2002 (continued)

- 2 projects to bid by June 30, 2003, construction scheduled for July/August 2003.
- 2 projects delayed until Fall 2003 at the request of the property owners. These projects are located on golf courses and the construction has been delayed so that play is not interrupted during the spring and summer.
- 3 wetland projects have been delayed due to additional monitoring necessary for the design of these projects. These projects will be under construction within 14 months.

Pace of Implementation of Projects

As shown in Tables 6 and 7 there was a significant increase during 2002 in all phases of project implementation. For example, the number of design contracts executed increased 68% and the number of projects in construction increased 110%. This increase in activity is further documented by the increase in expenditures and contract encumbrances. The total expenditures/encumbrances doubled during 2002 (Table 8). The amount of design contracts increased sixfold and the amount of construction contracts increased fivefold during 2002 (Tables 9 and 10).

Utilization of Private Mitigation Providers

One of the recommendations of the Environmental Review Commission last year was for the Wetlands Restoration Program to provide opportunities for private mitigation providers to supply full delivery restoration projects. During 2002, seven Requests for Proposals were issued for the restoration of 150 acres of riparian buffer, 575 acres of wetlands, and 19,000 linear feet of streams. In response to these requests, eight different firms submitted proposals. Contracts have been issued to four firms for 151 acres of riparian buffer restoration. Recommendations to issue contracts to 3 firms for 42 acres of wetland restoration and 10,000 linear feet of stream restoration have been submitted (Table 11). The total value of these contracts is $7,660,347. The proposals for 455 acres of wetland restoration in the Pasquotank River basin are due February 28, 2003.

Summary

As documented by the information presented in this report to the Environmental Review Commission, the Wetlands Restoration Program has made significant progress in meeting the statutory mandates established by the General Assembly. The foundation that has been laid through careful watershed planning and project selection is yielding the desired results of replacing lost wetland are riparian area functions throughout North Carolina.

Table 1. NCWRP Mitigation through 12/31/02

Type	Total Mitigation	Total Mitigation	NCWRP Mitigation Projects			
	Accepted 12/31/02[1]	Due 12/31/02[2]	Constructed	Instituted[4]	Identified[5,7]	Total
Streams (linear feet)	228,702	203,351	47,556	140,680	72,650	260,886
Total Wetlands (acres)	264.30	235.26	57.87	229.70	48.80	336.37
Riparian Wetlands (acres)	187.39	168.26	57.87	154.70	18.80	231.37
Non-riparian Wetlands (acres)	76.91	67.00	0.00	75.00	30.00	105.00
Buffer (acres)	164.61	N/A	28.00	151.00[6]	0.00	179.01

[1]Total payment in amount specified in 404/401 permit received and deposited in Account 2981.

[2]In accordance with 1998 MOU, all mitigation requirements assumed by 11/8/2001, were due by 11/8/2002. All mitigation requirements now due within 12 months of receipt of payment.

[3]This number reflects the amount of restoration projects implemented to meet compensatory mitigation requirements. The NCWRP has implemented additional projects

to address the cumulative and historical loss of wetland and riparian area functions.

[4]Instituted, as defined in 1998 MOU, means that a site has been acquired and has designer assigned; will be constructed within 2 years.

[5]Identified means that the site is in acquisition phase, construction will occur within 2 years.

[6]Includes Buffer RFP contracts.

ENVIRONMENTAL REVIEW COMMISSION

MINUTES

DRAFT

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
February 6, 2004

The Environmental Review Commission (ERC) met on Friday 6 February 2004 at 9:30 a.m. in Room 643 of the Legislative Office Building.

Senator Charles Albertson presided over the 6 February 2004 meeting. The following members were present: Senators Albertson, Clodfelter, Dorsett, Horton, Kinnaird and Swindell and Representatives Fox, Gibson, Hackney, LaRoque, Weiss and Williams. Mr. George Givens, Commission Counsel, Jeffrey Hudson, Assistant Commission Counsel, Susan Iddings, Assistant Commission Counsel, Jennifer McGinnis, Assistant Commission Counsel, Tim Dodge, Research Assistant, and Mary Watson, Commission Clerk were also present.

On 29 January 2004, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. A copy of the visitor registration and the agenda for the meeting are included in the attachments as **Exhibits B and C**.

Senator Albertson called the meeting to order and asked members to introduce themselves and tell which district they represent.

George Givens, Commission Counsel, was asked to introduce the staff members for the Commission, give a brief history of the ERC, and to explain the agenda.

Mr. Givens said that the Environmental Review Commission began in 1986 as a special provision in the budget bill that directed there be a study as to whether there should be the consolidation of environmental regulatory agencies and whether there should be a State Environmental Protection Agency. As it was, the original provision did not provide a name, so they operated the first year under the name Consolidation of Environmental Regulatory Agency Study Committee and the next year it was changed to Commission. Along the way, it occurred to a number of folks that if they were going to be looking at executive branch consolidation of functions, there ought to be a legislative entity that had overall responsibility for oversight and study of environmental, natural resources and public health issues. So, in 1988, the original Commission, with its members intact, was renamed the Environmental Review Commission. At that time, there were relatively few statutory oversight commissions to serve as a model for ERC.

Mr. Givens said that it had been his honor to be counsel to the ERC since its inception in 1986, along with Representative Hackney the original House co-chair of the Commission.

Mr. Givens said that he had distributed to each member, copies of current membership of the Commission, authorizing legislation and a summary of enactments in 2003 that may be of interest. Mr. Givens also explained a copy of reports that are required to be made to the Environmental Review Commission. These handouts are listed as **Exhibit D**.

Mr. Givens said that in addition to formal meetings of the Commission, there is a planning process that includes a public meeting that is available to anyone who wants to attend to give ideas and suggestions that should be considered in the development of the agenda. These meetings are held in advance of each Commission meeting.

Mr. Givens added that under the auspices of the ERC and individual members of substantive committees, he convenes working groups on various topics from time to time in an effort to resolve outstanding issues. There are two substantive committees active at the moment, one of Underground Storage Tanks and one on the Chronic Rainfall Issue, with others to follow.

Mr. Givens then explained the agenda. He said that today's item on stormwater runoff is moving into a new and more expansive geographic area with an option of Phase II regulations which are quite controversial. They are in the process of development, right now. The Environmental Management Commission (EMC) and the Department of Environment and Natural Resources (DENR) hope and anticipated that these rules would be before the legislature in the 2004 Session for legislative review. If that occurs, then he fully anticipates that a bill would be introduced to disapprove the rules.

Mr. Givens said he thought it was important to note what the issues are that you may be confronted with in the short session. Various people have asked him to convene a 605 working group, including one of the co-chairs, ever since April of last year and he had not thought it was timely to do so while the rules were still in flux.

Mr. Givens said that his thought was that once those rules are in the form likely to be presented to the legislature, if we get to that point, he would go ahead and begin the negotiation process in anticipation of a bill being filed and in anticipation of the likelihood that it would be difficult to conclude successful negotiations in the time available if he waits until the time that the short session actually convenes.

Mr. Givens said that where we are in the process, and it is very timely that we meet today on this matter, the EMC has adopted proposed rules, which have gone to the Rules Review Commission (RRC). The RRC met last month and took action, which has been the subject of some controversy and confusion. Their counsel will appear today to explain where they are in the process. Just yesterday he issued his formal letter explaining what the RRC has done and he will be here to talk about that.

Mr. Givens said that in the sequence of events, between now and the February 24, 2004 meeting, the EMC will meet and will have received a decision from the RRC and will perhaps determine what they are going to do.

And, in our meeting of the ERC later in February, Dr. Moreau, Chairman of the EMC, will be here to give a quarterly report. In particular to stormwater, Dr. Moreau will be advancing that discussion by telling us what the EMC proposes to do.

Mr. Givens said that this is not the only time we will have a discussion on stormwater but this gets the discussion going with a comprehensive overview at a critical point in time.

Mr. Givens added that the ERC receives many reports and, in exercise of our oversight function, we hear some of those reports and some are distributed as read-only reports. A packet of all the reports, which are determined it best be reviewed at your leisure, are handed out to you and listed as **Exhibit E**.

Mr. Givens asked members to let him know if they feel that any of these reports should be presented orally.

Mr. Givens said that the next business meeting of the ERC is scheduled for Tuesday and Wednesday, 24 and 25 February 2004. He said that time had been set aside to make up for lost meeting time and to possibly have some out of town meetings. Some of the co-chairs have indicated that they would like to meet out of town, that this would be a matter of discussion, and he would welcome any input that members would care to give.

Mr. Givens said that the planning meeting for the end of February meeting will be held next Tuesday, February 10, 2004, at which time a determination will be made as to whether that meeting should be a one-day or a two-day meeting.

Mr. Givens said there is a list of potential agenda items that has been handed out to members and is listed as **Exhibit F**.

Mr. Givens said that the planning meeting for today's meeting was held at 2:00 p.m. on Tuesday, 13 January 2004.

Mr. Givens asked visitors to sign the visitor registration sign-in sheet and asked members to sign and send forward their reimbursement forms.

Mr. Givens said that with respect to stormwater, no decision is needed by the Commission today; however, this Commission will need to be informed if there are recommendations to be made to the 2004 Session. In the event that there is no rule over here for approval or disapproval, the question then becomes whether the legislature ought to statutorily enact something with regard to stormwater. One of the issues that have arisen in the debate about the stormwater rules is the adequacy of statutory authority. This is easily corrected by the legislature.

Senator Kinnaird asked Mr. Givens if part of the explanation would be on the relationship and requirements of the federal government on us for stormwater management so that we can conform to that.

Mr. Givens said that Ms. Smith and Dr. Moreau would both speak to her question.

Mr. Givens added that the legislature has another entity called the Administrative Oversight Commission (AOC) on which Representative Gibson serves. The AOC will be meeting later this month and will be looking at this issue, focusing on the procedural and rulemaking aspects and we will focus on the substantive aspects, although he expected there to be some overlap in the process.

Senator Kinnaird expressed concern that if this road is so bumpy and curved, the end result is still that we start at the federal government and end up at the federal government, no matter how many groups are looking at this issue.

Mr. Givens said that we certainly have to meet the requirements under the Clean Water Act and through the regulations adopted by the Environmental Protection Agency (EPA). The issues are, how we go about that and what we do to protect the environment as it relates to stormwater to meet those requirements and to meet the other needs of the State.

Mr. Givens said that we have a good panel of presenters today and he anticipates that we should be able to conclude today's meeting without a lunch break and adjourn in the early afternoon.

Robin W. Smith, Assistant Secretary for Policy and Planning, DENR, gave a report of procedural and substantive issues involved in the development, adoption and implementation of the Phase II stormwater rules and programs to control stormwater runoff.

Ms. Smith explained that she had handed out to each member copies of a memorandum, PowerPoint slides and chronology of the development of Phase II stormwater program. These handouts are listed as **Exhibit G**.

Ms. Smith said she would try to hit the basics of what were the main concerns and what there may be confusion about.

Ms. Smith started with the question that Senator Kinnaird raised which is what do the federal rules require.

Ms. Smith said that one of the most important things to understand about the Phase II stormwater program is that it is a federal program, not a state program. It is a program that requires that the owners and operators of municipal storm sewer systems obtain a federal, national pollution discharge elimination system (NPDES) permit under the Federal Clean Water Act.

Ms. Smith said that Congress directed the Environmental Protection Agency (EPA) in the late 1980s to develop a stormwater program under the authority of EPA to address discharges of pollutants to waters of the United States. In 1990, EPA adopted the first set of federal stormwater rules. Those

rules were directed to the large municipalities and required those municipalities to obtain NPDES stormwater permits. Those rules became known as the Phase I rules. So, they looked first at the largest municipalities in North Carolina in cities such as Charlotte and Raleigh that have Phase I NPDES permits and have had those permits for a number of years. The State Department of Transportation has a Phase I stormwater permit for the entire State road system. It was treated as a large system for purposes of Phase I stormwater.

Ms. Smith added that in 1999, again in direct response to this congressional directive to develop stormwater regulations, EPA adopted what have become Phase II stormwater rules. Those rules were designed to reach the next tier of owners and operators of storm sewer systems; the small and medium sized municipalities and other public entities smaller than the large cities and large entities that had to obtain Phase I permits and extended that stormwater permitting requirement to that next tier or municipal storm sewer systems.

Ms. Smith said that the basic requirement in the federal rules is that municipal separate storm sewer systems must have the NPDES permit. This includes any system owned or operated by a city, a county, or any other federal or state agency. So, it is not just cities and counties, it could be a community college, a university system or any public entity.

Ms. Smith said that the federal rules set out what the basic requirements are to obtain that NPDES permit. She added that there has probably been a little bit of a misconception that she has heard from a number of folks that, if the state were not doing state rules on Phase II stormwater, this requirement would go away. This is not the case. If there were no state rulemaking, these small and medium municipalities and other public entities in North Carolina would still have to get a NPDES stormwater permit under the Clean Water Act. And, in order to get that permit, they would have to develop a stormwater management program.

Ms. Smith said that these permits are a little bit different from the other Clean Water Act permits that tend to be directed toward specific discharges. These permits really require that the public entities develop a stormwater program to address stormwater pollution within their jurisdiction. The federal rule set out six minimum measures that those local or community entities programs need to include. That list starts at the midpoint of page one of Exhibit H.

Ms. Smith said that these measures include: public education and outreach, public involvement and development of the program, detection of illegal discharges to the municipal storm sewer system, control of stormwater runoff from active construction sites (what EPA calls post construction stormwater management). What that really means is stormwater design criteria for new development.

Ms. Smith said that EPA was looking toward future development in urbanizing areas and requiring these permitted storm sewer systems to start

exercising some design controls on those new developments to manage their projected inputs of stormwater into that system.

Ms. Smith said that the final minimum measure is pollution prevention, good housekeeping measures for actual municipal operations. For example, if you have a school bus garage, you need to have good housekeeping measures in place to make sure that oil from your buses aren't getting into the storm drains.

Ms. Smith said that these six minimum measures are all set out in the federal rules so that every entity that requires a Phase II permit has to develop a program that includes all six of those measures.

Ms. Smith said that one of the things that the EMC has struggled with in developing the Phase II program, is that when it came to the point of talking about once the local governments submit their Phase II permit applications, how do you determine whether they have an adequate program or not and whether or not you issue them a permit.

Ms. Smith said that the federal standards for approving these programs are very broad. Basically those standards are that the local government has to show that their program, which incorporates those six minimum measures, is going to be sufficient to control stormwater pollution to the maximum extent practical and protect water quality standards.

Ms. Smith explained the State's role in all of this. She said the State's role in NPDES permitting is that DENR has been delegated the authority to issue NPDES permits in the State of North Carolina. If the Department were not issuing these permits, the federal EPA would issue the permits directly. EPA has actually run NPDES programs in some states for a period of time. They actually ran the Florida NPDES program for a number of years.

Ms. Smith said that DENR has a delegation from EPA to issue these federal permits in North Carolina. As part of that authority the EMC, in beginning to develop these rules, started looking at the need to provide some additional guidance to local governments on what would be approvable so that when they came in and submitted their permit application, they would know what would be approvable under the program.

Ms. Smith said there are some other issues that the EMC felt needed to be flushed out in the federal rules. Before we get there, let's talk about to whom the rules apply. As mentioned before, it is small and medium storm sewer systems. Ms. Smith made reference to one of the attachments in Exhibit G that lists all of the cities and counties in North Carolina that have been identified under the federal rules as requiring a Phase II stormwater permit.

Ms. Smith said that the way the federal rules went about designating these local governments, when the federal rules were actually published in 1999, the rules themselves included a specific list of cities and counties for every state in the nation. That list was developed based on a determination of

which cities and counties in that state met the definition of an urbanized area under the census. The federal rules are written in a way that they will also pick up cities and counties that, as a result of growth and future census determinations, become urbanized areas. So, when the federal rules were published in 1999, there was a list published with those rules. But, the rules themselves were written in a way that they would capture additional local governments as they grew and fell into the EPA definition of an urbanized area.

Ms. Smith said that in fact, in North Carolina as in many states, we have had another batch of cities in particular that as a result of the 2000 Census are now considered urbanized areas under the federal rules and automatically fall under the Phase II stormwater program. The list in Exhibit G includes both the communities that were originally listed in the federal rules, based on the 1990 Census, and the additional cities that fall under the federal rules by virtue of the 2000 Census.

Ms. Smith said that within those areas, the basic Phase II requirement is that any owner or operator of a storm sewer system has to have this permit. So, the permits aren't necessarily issued to a county or a community college automatically. They only require a permit if they own or operate a storm sewer system.

Ms. Smith said that the federal rules also require the state to look at designating additional local governments as needing Phase II permits, based on a finding that those jurisdictions are going to be significant contributors of stormwater pollution. The State has not done that yet but is required to look at additional state designations. One of the things that the EMC did in their rules was set up a process for making those additional designations. But, to date, the only communities that are directly affected by the Phase II program are the ones that have been federally identified.

Ms. Smith said that the state rules are trying to accomplish a number of things. They are trying to establish the criteria for the state designations. Basically, what the EPA said was that states have to look at additional areas and assess whether these additional areas that they have not identified at the federal level are in fact going to be significant contributors to stormwater pollution.

Ms. Smith said that the federal rules actually had a deadline of December 2002, by which the state was to have done that. But, it allowed states to establish a different timeline and a different process for doing those designations. That is one of the things that the EMC has used the state rules to do. The rules adopted by the EMC set up a process by which, in North Carolina, we would look at those additional state designations on a river basin basis as our river basin management plans came up for regular review. So, instead of needing to do all of our state designations by December 2002, we set up a phased process that would link those designations or at least the study of whether designations were needed with our river basin planning process.

Ms. Smith said that the rules also set out what the basic criteria would be for making those state designations. Federal rules really don't provide any guidance on that. One of the things that the EMC heard from local governments was that they liked more certainty than the federal rules applied on a number of issues and this was one of them. So, one of the things that the state rules do is try to describe what the process will be and what standards will be applied in making those state designations.

Ms. Smith said the other thing the state is required to do under the federal rules is to consider petitions for additional designations. So, any person can petition the state to have an additional local government brought into the Phase II stormwater program. So, another issue in development of the state rules has been to set up a process for considering those petitions. The EMC included in its state rules a set of criteria describing what kind of information a petition would need to include and how the EMC would make decisions on petitions received from third parties for additional designations.

Ms. Smith added that the EMC rules also attempted to provide a little bit more certainty on what it means to have an approvable, post-construction runoff control program. That is one of the six minimum measures that the EPA requires, the federal standards for approval are very broad, as mentioned before.

Ms. Smith said that another thing they heard consistently from local governments throughout this process was that they wanted more certainty and more direction on what an approvable program might look like, largely because there are a number of relatively small communities captured in the federal list of communities that don't have very large planning and engineering staffs. So, one of the things the EMC responded to was a desire that the states lay out more clearly what a basic approvable program would look like.

Ms. Smith said that the rules also; however, include the option for local governments, particularly those who have better-developed planning staffs, allowing them to come in and propose something that looks different from these minimum requirements, as long as they provide the same level of stormwater protection. So, the rules were trying to do two things: one was to provide a little bit more of a template for smaller local governments who wanted to be able to follow a recipe for developing their stormwater management program but it also provided the out that said if you want to do something different, you can do that as long it provides the same level of protection.

Ms. Smith said that one problem they immediately ran into that turned out to be fairly unique to North Carolina was the problem of counties. Ms. Smith pointed out on the list of designated local governments that EPA developed that there are both cities and counties. EPA was making the assumption that counties own and operate municipal storm sewer systems. In most states, the counties maintain the road system in the unincorporated areas of the county. In North Carolina, and in perhaps two other states, that is not the case.

Ms. Smith said the road system and the drainage that is associated with the road system in those unincorporated areas actually is the primary storm sewer system out in the counties. In most of the United States, because those roads are county roads, that would, under the Phase II program, lead to a county permitted stormwater program.

Ms. Smith said that in North Carolina, that is not the case because counties do not own and operate the major storm sewer system in the unincorporated areas because North Carolina Department of Transportation (NCDOT) does.

Ms. Smith said that as she had mentioned earlier, NCDOT has a Phase I permit for the state road system. So, immediately the issue came up as to how does the Phase II program work in North Carolina with respect to counties. After going back and forth a number of times, seeking an advisory opinion from the Attorney General's office and consulting with EPA, the conclusion was that in North Carolina, because counties don't own and operate that road drainage system, the counties for the most part don't need a county-wide Phase II stormwater permit. In fact, the only Phase II NPDES stormwater permit they need is one for any actual county facility that has its own storm sewer system.

Ms. Smith said that if you have a county, multi-building facility, number of acres has a network of drainage ditches, then the counties would need to get a Phase II permit for that storm sewer system. But, obviously that system is not going to cover the entire unincorporated area of the county. So, that left North Carolina in a somewhat unique position of not having the counties as the permittee in those unincorporated areas under Phase II.

Ms. Smith said that the EMC worked through that in a couple of different ways. Obviously, the counties had strong feelings about not being required to get an NPDES permit if they didn't have to have one, the cities had very strong feelings about not having stormwater controls in the urbanized areas in the counties immediately adjacent to a city because of the inequities that might create for development to avoid the city boundaries and move to the county, and the EMC had concerns about that because stormwater pollution doesn't stop being stormwater pollution when it gets to the boundary of the extra territorial jurisdiction (ETJ) of the city. The issue is there; and in fact, the EPA was largely attempting to reach, with Phase II stormwater, the new development that would be going into areas that are urbanized. In these unincorporated areas of the counties, that is where much of the new development is going. It is very difficult to have an effective stormwater management program in these urbanizing counties without covering the unincorporated area. But, the fact is, under the federal rules, the counties were not required to get the NPDES permit.

Ms. Smith said that the EMC first wrote the state rules to do two things. They had a set of rules that addressed the cities and other entities that clearly operate storm sewer systems, and those permits issued to those entities would be federal Phase II stormwater permits under the Clean Water Act. Then, the EMC adopted a parallel rule under state stormwater authority that

would have required the counties to develop a stormwater management program in the unincorporated areas only in the designated counties listed for Phase II coverage.

Ms. Smith said that the requirements for the counties were exactly parallel to those of the cities. In subsequent developments though review by the Rules Review Commission (RRC) and additional comments by the counties; ultimately what the EMC did in December was to revise those rules one more time. The part of the rules that address the cities remained unchanged. The state stormwater rule that was written to fill the gap in the unincorporated areas of the counties was revised one more time so that instead of requiring the counties to develop a stormwater program in those unincorporated areas, the last version of the rules provided that the state would do that. Again, the criteria didn't change; it was an exactly parallel program to the program required of the counties. The design criteria for new development didn't change. The only thing that changed in that last revision of the rules was instead of the counties approving new development and reviewing new development for compliance with those stormwater management standards, the state would have been doing it directly.

Ms. Smith said that one additional reason for concern about those unincorporated areas was that DOT is the owner of that storm sewer system and under their NPDES permit, DOT is responsible for the output from their storm sewer discharges. And, of course, DOT is different from any of those other systems in that it is owns and operates a fairly discreet drainage system and obviously their mission is to maintain that state highway and road system. But, they are also receiving stormwater from any number of private developments. Ultimately, much drainage from private development goes into the DOT road drainage system and ultimately, DOT is responsible for the stormwater impacts of the discharges from the DOT system. This puts DOT in the position of managing a system that is receiving a lot of input over which they have relatively little control.

Ms. Smith said that another concern, other than having an effective program that would cover both the cities and the unincorporated areas, was that DOT is holding a permit that makes them responsible for the discharges from that road drainage system. And, it appeared to be necessary to get some handle on the new inputs to that system and DOT wasn't really in a good position to do that, directly.

Ms. Smith added that the EMC first looked at the counties to do that and ultimately decided that the state would do it through the Division of Water Quality in those areas. But, one goal was to make sure that the new development was required to address stormwater since, in many cases, the drainage from those new developments would be going into a state storm sewer system.

Ms. Smith said that this was what the final version of the rules look like. Ms. Smith noted that copies of the memo handed out to members was missing page 4 and promised to provide copies of the missing page. A

complete copy of the memo was handed to the Committee Clerk after the meeting.

Ms. Smith next covered impacts on private development. She said one thing that is really confusing about Phase II is private developments aren't required to get Phase II stormwater permits but public entities are. And, EPA's general scheme was that anticipation of these Phase II stormwater permits would go to the public entity, that owned and operated the storm sewer system, and because the federal rules said in order to get that permit, the public entity had to, in essence, regulate new development and require new development to incorporate new stormwater management into their design. It would be the local governments that would be addressing the private development activity. So, it was a two-step process instead of a one-step process. But, it creates a requirement that these storm sewer systems address design for new development and stormwater controls.

Ms. Smith said that nothing in the Phase II program and nothing in the State rules affects existing development. There is no requirement under the federal program that existing development be retrofitted to address stormwater management. There is nothing in the State rules implementing Phase II or in the State stormwater rule that was developed to address the unincorporated areas of the counties. Neither set of rules requires retrofitting of existing development for stormwater. It is all focused on development that will happen in the future after these stormwater management programs are in place. And, it is intended to be prospective in setting up design criteria for new development to meet.

Ms. Smith noted that members had a summary of what the State rule that goes into some details as to what those minimum standards are for approval of these local programs. Most of those minimum criteria are fleshing out what the requirements would be for post-construction runoff controls. So, the State rules go into the kind of additional detail that the local governments said they needed in describing what, at minimum, need to be done with these post-construction runoff controls.

Ms. Smith added that the rules identify a level of development, below which no stormwater controls are required. It is a threshold. There has been some misunderstanding of the rules. It is easily to look at the rules and think that what these rules set out is a density cap—they do not. They say the threshold above which a new development would need to incorporate stormwater management into its design. There is no ultimate cap on the density of new development. It is just a threshold below which no structural stormwater controls are required and above which structural stormwater controls are required.

Ms. Smith said there are also other minimum stormwater measures that are described that are tailored specifically to more sensitive water bodies like trout waters and shellfish waters that have a very stringent water quality standard for bacteria in order to protect public health. So, there are some variations within these rules intended to provide a specific level of protection for those waters. The same thing for trout waters: in that case often the issue

is sedimentation. So, the general approach is the same. It is using thresholds at which stormwater controls are necessary.

Ms. Smith repeated something she said earlier. There is something also in the rules that allows local governments the flexibility to develop programs that look different from these minimum standards as long as they provide the same level of protection.

Ms. Smith explained the chronology of the development of these rules shown in the handout listed as Exhibit G. As shown in the chronology, there have been two stakeholder groups, innumerable workshops and public hearings, both before the rules were drafted and again after the rules were drafted. These rules have probably had the most significant degree of public participation as any set of rules she has ever seen come out of the EMC and probably most other state agencies. So, it has been a long process and in many ways a very difficult process because it presented some legal issues that was unique to North Carolina that had to be sorted through. She said that the EMC had tried very hard, throughout; to develop a program that they believed would be fair and equitable in the way it treated the cities and the counties in the urbanizing areas that would lead to an effective stormwater program and would respect the need for these local governments to have some additional guidance on how to develop an approvable program.

Ms. Smith went on to say that on NPDES permits of all types, one of the things that raises the stakes on a program like this, is that for federal NPDES permits, under the Clean Water Act, there are a couple of additional factors to be dealt with. One is, there is the opportunity for direct federal enforcement requirements and there is authority for third party citizens suits to enforce the requirements. So, another reason for the EMC and the Department to spend a lot of time to work with governments to develop a rule that would give them some more certainty about approval of their program is that if you don't have some level of certainty, if you are using simply the very broad standards in the Clean Water Act for approval of these programs, you have a much greater risk of third party challenges to those permits.

Ms. Smith said that one of the things that the EMC was trying to do was to provide something of a shield that would show they had gone through a rulemaking process and determined if they had a program that meets these basic standards you have met those federal requirements that you protect water quality and that you manage stormwater to the maximum extent practical. If that goes away and you step back to those very broad federal standards, aside from the uncertainty that the local governments face in terms of how to put their program together, there is the additional uncertainty of will they be challenged when it is all over with, through that citizen suit provision.

Senator Albertson asked Ms. Smith if there would be any federal dollars to accompany these rules and, if not, who pays and what is the estimated cost.

Ms. Smith said that federal dollars is an excellent question and is something the states have been pushing for, ever since the Phase II federal

rules were adopted. So, far there has not been a good response to that in the federal budget. One response recently from the EPA was that there is a certain amount of funding that they have been providing for a number of years under their Section 319 grants. Generally, these grants have been used for more traditional water quality point source oriented projects. One of the things EPA has said recently is that those Section 319 grant monies can be used for non-point source stormwater controls.

Ms. Smith added that she was not aware of any proposal that the federal administration has made to provide additional monies for Phase II stormwater implementation.

Senator Albertson asked Ms. Smith if she had any idea of what this might cost.

Ms. Smith said there was a federal fiscal note prepared for the federal rules and then there was a State fiscal note that basically used the federal note to a large degree for the State rules. She said she did not recall exactly what the fiscal note says.

Ms. Smith called on Coleen Sullins from the Division of Water Quality (DWQ) to answer Senator Albertson's question.

Ms. Sullins said that she did not remember the specifics of that fiscal note but she would be happy to provide a copy to the members.

Senator Albertson asked Ms. Smith about the coordination of permitting. He said it sounded like this permitting process could be all over the place.

Ms. Smith said they were trying to avoid that. One of the goals of the rulemaking process was to be pretty clear about what the standards would be and who would be subject to the permitting requirements. This does fall within NPDES permitting which is a pretty well established program within DENR.

Ms. Smith added that one of the challenges would be that it is a new and much expanded stormwater program that did not come with additional federal resources to implement it. But, they are prepared to do the best they can with the resources available.

Senator Kinnaird asked Ms. Smith what NPDES stands for.

Ms. Smith said it was the National Pollutant Discharge Elimination System.

Ms. Smith added that the NPDES permits were originally designed to address point source discharges—pipes coming out of municipal treatment plants or industrial discharges. The relatively recent development on the federal level has been to take that NPDES point source discharge program and start applying it to stormwater discharges.

Senator Kinnaird asked if all stormwater systems would collect at one point and then be cleaned up as municipal waste is. And, has anybody anticipated how new developments in unincorporated areas will tie into the new city municipal systems.

Ms. Smith said that this is the reason why the EMC felt it necessary to address what would otherwise have been a gap in North Carolina's Phase II program by creating a separate state stormwater rule that would require the same level of post construction runoff controls in the unincorporated areas of the county that would be required in the municipality. So, the idea was that you didn't want to have that disconnect. If you have an urbanizing county, you don't want to have stormwater controls inside the city limits and none outside the city limits where inevitably most of that new development would be going on. This is one of the reasons for having the complimentary rules in North Carolina's case. One was an NPDES rule and the other was a State stormwater rule that would address those unincorporated areas so that as new development went on in both the city and the county they would be occurring under very similar sets of development standards.

Senator Kinnaird followed up by asking if the State would be a third entity that is floating out there and isn't actually operating yet for stormwater controls.

Ms. Smith said that what the EMC had proposed was that using its authority to regulate stormwater, statewide, that it would create a state program to be implemented by the Division of Water Quality in those unincorporated areas of the designated Phase II counties. So, the answer is yes, it would be the State's responsibility.

Senator Clodfelter asked Ms. Smith if we still have anybody in the designated cities and counties who use combined systems and what is the status of combined systems.

Ms. Smith called on Ms. Sullins to respond to Sen. Clodfelter's question.

Ms. Sullins said that there are not any combined storm sewer wastewater systems in the State of North Carolina.

Senator Clodfelter asked what defines a municipal storm sewer system. The only experience he has to draw on in this question is that at home he doesn't know what is done elsewhere and he expects it is different from county to county and that is probably one of the issues we need to be sensitive to. "But, Mecklenburg County doesn't maintain any roads or streets, but he defies anyone to say they don't operate a municipal storm sewer system because they channelize stream and creeks, they armor creek banks, they clean and maintain culverts and police the natural system of drainage in the county, both in the incorporated and unincorporated areas. And, if that is not part or the storm sewer system, I think we are wacko if we don't think it is. The county maintains that, maintains it regularly, has a huge budget for it,

office for it, they call it stormwater services and has nothing to do with streets and roads. Is that under the regulations, a storm sewer system?"

Ms. Smith answered Sen. Clodfelter by saying that potentially it could be. The federal definition of a storm sewer system is very broad and would really capture any system of conveyance of stormwater, which could include ditches and culverts and does include that. She said that one of things they have recognized in looking at the county issue is that to some extent you may find yourself trying to make a county-by-county determination. Mecklenburg has long intended, and has applied, for a countywide Phase II stormwater permit because they want to address this on a countywide basis.

Senator Clodfelter said that he feels this is a critical point and the thing that concerns him about a statewide rule for unincorporated areas is that is does not recognize that urbanization occurs in different ways in different counties in a different context. "And, some counties, his being one, may be very important for the county to be the permit holder in order to provide a better management and integration of activity and development in permitting at the local level." In other counties, they may not do that or want to do that. So, he has a concern about a statewide rule that applies to all unincorporated areas.

Ms. Smith said that they are really focused on the urbanized county. It is not a statewide program in the sense that it applies to all 100 counties. The program developed by the EMC only applies to the counties that were designated under Phase II and, one of the things that is going on right now is that there are some counties, including Mecklenburg, that applied for a Phase II, NPDES program. Part of what Mecklenburg was doing was linking together a number of different small municipal and then county systems, and then asking for a permit to cover that entire network, which is clearly allowed under the federal Phase II program. What the EMC rules are trying to address was where it is not as clear where you have a countywide municipal storm sewer system as being owned and operated by the county, you still need somebody addressing the post-construction runoff issue so that you get stormwater designs in place for new development.

Senator Clodfelter asked Ms. Smith if the last proposed version from EMC would not pre-empt the existing county stormwater programs nor prevent a county that wanted to have a Phase II permit locally from getting one.

Ms. Smith said that is correct.

Senator Horton asked Ms. Smith if DOT has its own NPDES permit and asked her to explain their stormwater system. Is DOT's stormwater system merely ditches on either side of the road?

Ms. Smith said that to a large extent it is.

Senator Horton said that as he understands it, most of the ditches on either side of the road simply discharge right into a watercourse. So, how can they get a permit when they don't have any pollution control whatsoever?

Ms. Smith said that she could not address the details of what was in the Phase I permit for DOT but essentially there were some specific requirements placed on those large municipal and in this case DOT's system. A lot of these requirements have to do with mapping their system, identifying illegal discharges. Under neither Phase II nor I requires the kind of end of pipe treatment that Senator Kinnaird was asking about. Phase II actually tries to avoid getting to that issue by putting into place post-construction runoff controls.

Ms. Sullins was called on to address Senator Horton's questions. She said that both the Phase I and Phase II rules really does have to do with post-construction activities. The Phase I rules and the rules under which DOT was initially permitted was required to do things like best management practices to minimize the amount of pollutants that would get into their storm drainage systems. So, that might be something they would be doing associated with their maintenance activities on the roads, fertilizing of the stream sides, checking their systems to make sure that there is not any illicit discharges coming into them where somebody might have connected wastewater directly from a house to their ditch and some of those sorts of things. It is more of a planning and management type of approach to things. Those are the types of things that DOT's initial permit was issued under.

Ms. Sullins said that DENR is required to address the post-construction aspect with DOT as well. It is one of the things, as they design new roads and is designing new construction activities; they are addressing stormwater controls associated with the road system itself.

Senator Horton said that all we are doing seems to be diagramming or noting where the ditches are and nothing is being done to control the runoff. As you know, one of biggest source of sedimentation pollution is the public transportation and ditches alongside the roads. He said he gathered that they are permitted but are not forbidden in any way to continue to discharge into the surface waters. If that is so, then we have a problem there that we are not addressing at all.

Ms. Smith added to Ms. Sullins response that the Phase I and Phase II programs separately address construction stormwater impacts. One of the things we get with Phase II is an enhanced look at putting stormwater controls on active constructions sites whether it is a DOT site or a subdivision site. Those sites, if they are more than an acre, will now require a federal Phase II NPDES permit, individually, to manage stormwater during the construction phase.

Ms. Smith said she didn't talk about this much because most of the focus on the Phase II program has been on post-construction runoff requirements but it also includes an enhanced construction runoff control.

Senator Albertson asked Ms. Smith if this means they are going to have to do more than they are presently doing to control runoff.

Ms. Sullins said that they are going to be putting in more controls associated with their stormwater runoff and a higher degree of controls. She said that Bradley Bennett said that DOT, as part of their Phase I permit, has also agreed to go in and put in some BMP measures to address pollutants associated with the more sensitive waters. They are going back in and retrofitting their system to put in some of those management measures, starting first with the most sensitive waters.

Representative Gibson asked Ms. Smith to put the monetary piece of Phase II into a form so that it is easier to understand.

Ms. Smith said they would take a look at that. One thing that makes this difficult is that there is a fair amount of flexibility from local government to local government and how they do this and some of them have existing programs already in place to meet the requirements of Phase II.

Representative Gibson asked Ms. Smith that in her estimation would there be any more additions to the list of counties.

Ms. Smith said there would be no automatic federal additions to the list before the next Census. So, the only thing that could happen before the next Census would be if there were state designations made and the federal rules do direct them to look at whether additional state designations should be made. But, this is a whole separate process.

Representative Gibson asked Ms. Smith if there was a possibility on a state regulation or third party designee reducing the number from 146. While we might be able to include more folks based on what we do regulatory wise, in your estimation, is there no way to change the gross number that we are looking at now in Phase II?

Ms. Smith said that is correct, because it is based on what the federal definition of what an urbanized area is. Unless they change that urbanized area definition and raise the threshold for that definition, that basic list would not change. Ms. Smith said she believed there is a process under the federal rules for us to opt out a community. If they find out, based on its peculiar circumstances that it just doesn't have the potential for contributing stormwater pollution; there is an option to take individual storm sewer systems out of that permitting requirement. This is pretty much a case-by-case determination.

Senator Clodfelter explained that he had asked the Sergeant at Arms to distribute to members a memo that discusses the Attorney General's opinion under what circumstances in North Carolina a county might be deemed to operating a municipal stormwater system even though it doesn't operate roads and streets. A copy of this memo is listed as **Exhibit H**.

Representative Williams asked Ms. Smith if there is a place they could go to look at what the federal definition of urbanized counties is.

Ms. Smith said that the definition is in the federal rules and that DENR could provide that on their website link or provide it to him directly.

Mr. Joseph DeLuca, Staff Director, Rules Review Commission (RRC), gave a report on the review of the Phase II stormwater rules by the Rules Review Commission. A copy of a letter from the RRC to the EMC stating that the rules were being returned to the EMC for failure to adopt the rules in accordance with Part 2 of Article 2A, Chapter 150B, is listed as **Exhibit I**.

Mr. DeLuca said the RRC had been working on the stormwater runoff rules for a number of months. He said he would briefly explain what has been going on and what the position is of the Commission and take any questions and amplify on that to whatever extent is necessary.

Mr. DeLuca said that these rules originally came over to the RRC in the fall of 2003 after their final adoption by the EMC. Through a series of requests and revisions they were revised and finally reviewed for much more substantive issue at the meeting in January 2004. This was the first time the Commission took a good hard substantive look at the set of rules.

Mr. DeLuca said that to understand the Commission's action, you would need to understand a peculiar difficulty with this particular set of rules and the review process. As you may or may not be aware, the law, the Administrative Procedure Act (APA), was changed last year and there was a process that would apply to new permanent rules that were adopted after October 1, 2003. If the rules were adopted after the legislation was put into effect by the Governor's signature, then there was a period of time that the rules in the old rulemaking process could make their way through the system and go through the system without making them start all over again on every rulemaking. And, this rule and set of rules is the last one and the only one in a sense that got caught in the middle. The EMC adopted their final draft of these rules prior to October 1, 2003, so the rules from at least one point of view would be under the old rulemaking system.

Mr. DeLuca said that if the rules are under the old rulemaking system, then obviously the APA, as it was before the changes, applies to this set of rulemaking. And, there is less flexibility for the agency under the old rulemaking system. What happened was that the RRC, as you can see from the letter in front of you, returned the rules to the agency for failure to comply with the APA as it existed prior to those changes. Mr. DeLuca said that under that old law, this ends the rulemaking on these rules and that essentially would be the position of the RRC.

Senator Horton asked Mr. DeLuca to explain what the difference is between the old rules and the new rules.

Mr. DeLuca said that under the old set of rules, there were different notice requirements depending on whether the rules had a substantive fiscal impact of affected state and local governments or municipalities. There were different lengths of time that the rules had to be noticed in the register. Under the new system it is all just a 60-day notice. Under the old system, rules had

to wait for legislative review. Any rules approved by the RRC, the month before the legislature would reconvene, would go to legislative review and unless a bill was filed to keep them from becoming effective, would be effective on the 31st legislative day of that next session. That applied to all rules. The rules would wait to become effective until essentially that 31st legislative day. As soon as the legislature reconvened, you would start a new time period where you would be collecting rules that were approved by the RRC after that date for the next legislative session. So, you could have a rulemaking that could easily take, if it was in the wrong cycle, a year and a half to become effective. The change last year, the main things about it, was it changed so that most rules that are non-controversial could become effective the month after RRC approved the rules. They could still be disapproved by the legislature. None of that was taken away, but they could become effective, essentially a month after they were approved by the RRC.

Mr. DeLuca said that if they were controversial rules and people wanted the legislature to continue to look at those and the Commission approved them, there was a procedure then subjecting them to a legislative delay for the effective date of the permanent rule.

Mr. DeLuca explained that rulemaking goes through two or three adoptions. The first one is when an agency decides to make a rule and now, under the new process, drafts a version of that rule. This is called a notice of text and is published in the register. This requires EMC action to get it that far. Then it goes through the notice period and the comment period.

Mr. DeLuca said that the RRC, at its January meeting, ended up voting 4 to 1 to return the rules to the EMC for failure to comply with the APA. Under the old law, that essentially ends the rulemaking. Under the new APA, that could be an objection that the Commission could then attempt to satisfy.

Representative Hackney said that he was looking at the letter dated February 5, 2004 and asked Mr. DeLuca if this was an example of the way you respond to agencies.

Mr. DeLuca said that it was the way he responded to agencies.

Representative Hackney said that he was appalled that there was absolutely no detail in it, but that he had cited without any explanation that there was lack of statutory authority with going forward as to making findings as to why that might be true or as to what the law is on what they based their findings on.

Representative Hackney then said that he felt that the RRC needed to make findings and conclusion and support what you do other than with a cursory, perfunctory letter like this.

Mr. DeLuca said that this is what the action of the RRC was. The objection in the letter is really more of an alternative, from his point of view. The action of the RRC is in the first paragraph to return the rules to the agency for failure to comply with the APA. That is what the Commission did.

Representative Hackney said he understands that. But, as any court would or any agency would go forward to explain what they found and why it was wrong and in terms of appellate procedure would be returned for findings because nobody knows what you did and why.

Mr. DeLuca said that as they have been told many times, and the position of the RRC, is that they are not a judicial agency, but an executive agency.

Representative Hackney asked Mr. DeLuca if the RRC did not indeed have an obligation to the legislature, which passes the authority for these things and to the agency which in good faith promulgates rules, to explain their decisions.

Mr. DeLuca said that he believed anybody who was at the meeting would have a good sense of what the problems were that his Commission was facing with it. The tapes are available for people to listen to. He said he was sure that each of the Commissioners had their own reasons for taking the position that they did and they did not each explain their reason for doing it. The letter describes the action that the RRC took and that is the best he can do with it.

Senator Clodfelter said he was going to preface what he was about to say with a comment that his remarks have nothing to do with the substance of the EMC rule, which he does not understand or know enough about yet.

Senator Clodfelter asked Mr. DeLuca if the rule adopted by the EMC was adopted before October 1, 2003 or after.

Mr. DeLuca said the rule was adopted before October 1, 2003.

Senator Clodfelter said that the statutory language says that if it was adopted before October 1, 2003, the old APA applies. So, the RRC's conclusion is flat wrong under the statute.

Senator Clodfelter asked Mr. DeLuca what the effect of the rule right now given that the RRC has sent it back to the EMC based upon a flat contradiction to the General Assembly statute. The rule was adopted before October 1, 2003. The statute says that if it was adopted before October 1, 2003 the old rules apply. So, the RRC's action is void but where does it leave the rule?

Mr. DeLuca answered Senator Clodfelter by saying that with all due respect he thought under the APA, as it was in existence at that point, there was a provision for the RRC to return a rule to the agency for failure to comply with the APA.

Senator Clodfelter said that they were faulting the agency for not complying with the new rule.

Mr. DeLuca said the RRC's position was that they did not comply with the old APA.

Senator Clodfelter asked Mr. DeLuca to point out where in the letter it says that because you are citing to the new statute.

Mr. DeLuca responded by saying that at the end of the fourth line in the letter, "and it is returnable under the N.C. Gen. Stat. 150B-21.9(a) (2001)."

Senator Clodfelter asked him to read on.

Mr. DeLuca read "or objectionable under the new statute".

Senator Clodfelter said that Representative Hackney's question is pertinent, and asked Mr. DeLuca what did they decide? Which one of those did they decide?

Mr. DeLuca said they decided that it is returned to the agency under the old APA or if it is not under the old Act, then it should be returned under the new Act, since the non-responsive rulemaking was concluded after October 1, 2003.

Senator Clodfelter asked Mr. DeLuca what was the defect in compliance under the old APA?

Mr. DeLuca said that he was limited to what the RRC has said.

Senator Clodfelter asked again, how are we supposed to know if you don't state it in the letter?

Mr. DeLuca said it is a failure to comply with the APA and that is what the Commission's decision was.

Senator Clodfelter asked Mr. DeLuca in what respect did they fail to comply?

Mr. DeLuca told Senator Clodfelter that he could not give him a better answer.

Mr. Givens added that Mr. DeLuca makes reference to what people would know had they been at the meeting. "Well, of course, it should not matter whether you have been at the meeting or not. The record should speak for itself. But, in Mr. DeLuca's defense and what he is not able to say, I will say for him. That his Commission failed to follow his advice and now he is in the unhappy position of being the messenger thereof."

Senator Albertson said that if that is the case, then he hoped they would get the message over there.

Senator Clodfelter said that his fundamental question still stands: What in the world is the status of this rule right now given this piece of paper?

Representative Hackney said that surely Mr. DeLuca must have an opinion on that even though he wasn't willing to put it in his letter.

Senator Albertson asked Mr. DeLuca if he could respond to that.

Mr. DeLuca said that his opinion was that the rulemaking was concluded.

Representative Hackney asked Mr. DeLuca what that means.

Mr. DeLuca said that it was finished and if they want these rules they have to start a new rulemaking.

Representative Hackney asked if it would take five more years.

Mr. DeLuca said it did not have to be that long. Under the law it could be six to eight months.

Representative Hackney said that after all these years, the RRC can vote 4 to 1, give no reasons and just cause the whole thing to start all over without telling the agency what the defect was.

Mr. DeLuca said that the defect was that they failed to comply with the APA.

Representative Hackney asked in what respect did they fail to comply?

Mr. DeLuca said that in looking through the APA they failed to comply with it.

Representative Hackney asked in what respect did they fail to comply?

Mr. DeLuca said that was the only thing that he can tell him.

Mr. Givens said he was inclined to think that the options for the EMC, which is the next entity to react to this, and they meet later this month, are to either start all over again, if this rulemaking is indeed concluded, or appeal to the courts, or appeal to the legislature for some way out of this morass which is what he eluded to earlier and is why we have this matter before the Commission. Because one way or the other, we will have a rule here in 2004 which the legislature will be reviewing under the APA or we have an issue here without a rule which the legislature could address in one-way or another.

Senator Clodfelter said he would like to make one more comment because he was rather agitated. There is a concept in the law, and it applies whether you call the RRC an executive agency or a judicial agency, a decision that is rendered without reasons is arbitrary and capricious and is void and he has not seen anything like this in a long time.

Senator Kinnaird asked Mr. DeLuca if the ERC members could get a summary or a few of the sentences from the transcript from the meeting so that they could get a sense of what this is all about or in the alternative could the Chair come and speak with the ERC.

Mr. DeLuca said he would be happy to have the Chair of the RRC come and talk with the ERC. He said he believed that there is a prepared transcript because they had a number of requests for copies of the tapes. It may well be that there are already transcripts available.

Senator Kinnaird asked Mr. DeLuca if this was a public meeting? And, if it was, then transcripts have to be available to the public.

Mr. DeLuca said that as a taped meeting, they do not make a transcript because they don't have those kinds of resources, but they could make tapes of the meeting available so that someone else can make a transcript.

Senator Albertson called an end to this discussion He said he believes everyone knows exactly where we are in these discussions and what has to be done and we will precede to fix it.

Representative Gibson said that the Administrative Procedures Oversight Commission (APOC) was aware of this problem, was looking at it and would try to help resolve the gray area between the old rules and the new rules, so we probably ought to be monitoring what the APOC does and bring that into our deliberations.

Representative Weiss said that she respected that we had taken up a lot of time on this issue but she did want to ask Ms. Smith about this. Isn't there a right of third party action for enforcement?

Ms. Smith said that for those communities that are under the federal Phase II NPDES program, there is third party enforcement and there is federal enforcement. There are issues that were addressed in the state rules that are not addressed in the federal rules. For example, we gave a longer time for the municipalities that came under this rule as a result of the 2000 Census, to apply for their permit. The federal rules would have required them to apply in March of 2003; our rules gave them an additional 18 months to submit their permit application. If the state rules go away, you fall back to the federal rules. So, we have a few glitches where the state had the opportunity to create some processes and timelines that were and to the extent they are no longer available to us. As a result of the RRC's action, it creates some legal uncertainty for some of these communities and for the State as to how we go forward with this permitting program.

Ms. Lisa D. Martin, Director of Regulatory Affairs, North Carolina Home Builders Association (NCHBA), made comments on the Phase II stormwater rules.

Ms. Martin said that the NCHBA have been very involved with this issue since its inception and the one consensus they all have is that they hope this will come to some conclusion.

Ms. Martin said that what happened in the last six months is not a conclusion—it simply wasn't finished. She said she would highlight what the NCHBA's substantive issues are and what some of the remedies are that they have suggested over this long period of time that have not been taken up by the State.

Ms. Martin said that the NCHBA does not and has never challenged the fact that the State of North Carolina needs to adopt an NPDES program. They do know they have to adopt the minimum requirements and are aware that the state has adopted the minimum federal requirements.

Ms. Martin said that in February of 2000, the State adopted the minimum federal NPDES stormwater requirements. There is a baseline program on the books in North Carolina. Admittedly, that adoption did not include certain parts of the program such as the petitioning aspect; it did not include the State designation aspect. But, for the most part, the minimum federal requirements have been adopted by reference, going on four years now.

Ms. Martin said that the NCHBA does support state, statewide stormwater education, the enforcement of existing water quality laws, local land use implementation and implementation of the NPDES Phase II program based on science not on speculation.

Ms. Martin said that what the NCHBA does not support, and have not supported since day one, is a one-size fit all approach for a state as diverse as North Carolina.

Ms. Martin said that one of the remarks Ms. Smith made regarding rulemaking was that one of the reasons was to incorporate a model approvable program that local governments could use. The NCHBA believes that adopting a model ordinance could have done this. A model program can go in a model ordinance. A model ordinance would give the agency flexibility to get very specific about guidance into what types of BMPs work and other items that could be used by local government based on the sophistication and the ability that they have to enforce that. The NCHBA has all along supported the creation of a model ordinance. The State EMC has promised a model ordinance and believes there is one in existence with the League of Municipalities, which can be viewed in rough form on their website.

Ms. Martin said that over the past four years, there has never been a movement by the EMC to create or implement a model ordinance. So, an attempt was made to put this model approval program into regulations. It now becomes regulatory.

Ms. Martin said that the NCHBA has three specific topics of issues they have with the stormwater rules. They are flexibility, authority and ambiguity. One of the highlights of this program was flexibility. In fact the EPA said that the Phase II permitting approach provides flexibility for regulated operators to determine the most appropriate stormwater controls in their jurisdiction. North Carolina has not done that. They chose one built upon area that applies everywhere in the state with the exception of areas that drain into shell fishing waters and they don't have any consideration in that of land use and soil characteristics. One example is the difference in land use between industrial and commercial facilities versus residential. You may have a residential subdivision that has 28 or 30 percent built upon area. A lot of the stormwater falling on that is carried into the stormwater system, but a lot of it is not. That stormwater falls on the roof, goes through a roof drain and into the yard where it is absorbed and put back into the groundwater or into the water table.

Ms. Martin said the NCHBA had suggested that one way the State could incorporate flexibility and recognize these differences and put more enforcement on the industrial and commercial areas would be to look at directly connected impervious surface. They provided the state with a study done by a national consulting firm that said there are a number of states that have very advanced stormwater programs like Maryland and Massachusetts that use this directly connected impervious surface. It is a way you can really look at what is going into your storm sewer system; give a little more flexibility for residential developments in areas where you can design it. If you can design the impervious surface such that the water is filtered naturally, then you don't have to count it. They suggested that they provide evidence and it was ignored.

Ms. Martin said they also have a problem with the authority that the state is using to implement this. The restrictions that the State has in these rules include requirements for buffers, density restrictions and prohibitions on new discharges in coastal waters. These restrictions greatly exceed the EMC's authority and directly usurp the authority of land use decisions that are made by the counties and the cities and allowed by statute.

Ms. Martin said that in the past, when the General Assembly has wanted the EMC to regulate density or built upon area or provide buffers; they have expressly provided that authority. An example is the Water Supply Watershed Protection Act. That wasn't done for this.

Ms. Martin said that another example of exceeding their authority was in the regulations for local governments to coordinate with the local health departments. Coordination is not a bad thing, but the way the rules are written and the fact that they are in rules imply that they are now going to be impinging on the authority of the Commission for Health Services in requiring counties to coordinate on-site wastewater permits. So, it is another example of the EMC overstepping their authority.

Ms. Martin said that in the final version of the EMC's rules adopted in December, the EMC requires all private projects disturbing more than one acre or more within an urbanizing county to go to the state and get a permit.

The Department claimed that was a logical extension of what they were attempting to do when they required the counties to do it.

Ms. Martin said that NCHBA disagrees with that. First of all, there is no requirement that says the trigger for this is a sedimentation erosion control permit. It simply says that all projects that disturb this amount of land have to get a sedimentation erosion control permit and have to provide post construction and they have to do public education and they have to do elicit discharges and they have to do good house keeping. All private projects would have to do all six minimum measures, not that those wouldn't have been done if they were required, but they would have been done through an entity that had the ability to write ordinances and enforce this. If you look at how something like this would be enforced in a subdivision, the homeowners associations would be responsible. She said that she couldn't imagine that type of thing being successful over time. Maybe in the initial phases when it is built, but over time, these homeowners associations are not going to be able to provide annual operation and maintenance and public education and do all these things they are required to do. So, the fact that this second version of these rules reached out and grabbed these projects instead of trying to get the public entities that were forcing land use in those areas was wrong and exceeded the authority of the EMC.

Ms. Martin said that the EMC's rules also provided for exceptions to the rules. And the federal government mentions this and says they provide some exceptions in the federal rules and that the state-permitting agency should do this. The problem was that when the EMC created their exceptions, they did so based on factors that were not pertinent to water quality. Such as, you would not get an exception if you bought the property after a specific date. That has nothing to do with water quality. And, frankly, in land use, if the project would have been eligible for a variance or exception 100 years ago, it should be eligible for one 100 years from now. These requirements are supposed to be based on the land, not on who owns it. So, this is the kind of place where the state overstepped its bounds in creating this type of exception.

Ms. Martin said that ambiguity is strewn throughout these rules. The words practicality, practically accomplished, lack of a practical alternative are given no definition. What the NCHBA doesn't know is what sort of standard practicality is. Is it a technical standard or practical from an economic standard, or a combination of both? If it is a test of an economic or financial practicality, who is responsible for that? None of this was specified in any version of the rules.

Ms. Martin said that what the NCHBA wants to know is what constitutes a hardship, how is it determined? This is arbitrary and not written in the rules.

Ms. Martin said another term they see a lot is reasonable. They see that in terms of a reasonable return, a reasonable use and are a fuzzy term. But as it stands in the rule, it allows DENR the absolute and arbitrary authority to determine what constitutes reasonable economic return and reasonable use.

Ms. Martin concluded by saying that what is most disturbing in these rules is the concept of substantial justice. When you use the terms hardship and reasonable use test, they provide that these exceptions have to maintain some sort of substantial justice. The question of the NCHBA is what does that mean and what bearing does this have on water quality?

Ms. Martin said it was obvious that the EMC's rules have parts of them that are beyond the authority of the EMC. There are many terms that, even if they are quoted from the federal rules, are still ambiguous and need to be clarified.

Ms. Martin said that NCHBA had submitted meaningful comments, participated in every round of the rulemaking, provided scientific evidence, commissioned a study to be done by national experts that didn't go out and necessarily look at North Carolina but simply compared what other states are doing. We don't have to emulate those programs but it gives a really good basis to show what sort of things are being done in these states that we look to for guidance. They are still willing to work with this and are trying to understand what position they are in now. They still have issues that are not resolved.

Mr. Richard Zechini, Director of Regulatory Affairs, North Carolina Association of Realtors (NCAR), gave his comments on the stormwater rules.

Mr. Zechini said that the realtors in the state do not oppose the concept of stormwater management. They have long been as an association components of protecting the environment and believe that only if they do together protect the environment will the state continue to prosper. They do, however, have concerns with the rules and the process by which they were adopted.

Mr. Zechini said that he would be speaking to substantive issues regarding this subject. NCAR is concerned that the EMC went beyond their statutory authority in adopting these rules. For example, they don't have the authority to require local governments adopt specific ordinance or programs. They also believe that the EMC erred in including typical land use regulatory measures in these rules. These types of measures are reserved exclusively to local governments and NCAR thinks the EMC has usurped their authority in including those provisions in the stormwater rules.

Mr. Zechini said that they are also concerned that the rules are very ambiguous and unclear. They are important, yet undefined terms throughout the rules. In addition there are vague and nebulous phrases riddled in the rules as well. They are concerned that as far as folks trying to comply with these rules, it is going to be very difficult and has the potential to result in subjective, arbitrary and inequitable enforcement if that should be the case.

Mr. Zechini said that the NCAR does not object to the concept or idea of stormwater management regulation nor do they expect that every provision of every rule adopted by an agency be exactly to their liking. They do have

certain expectations about rulemaking and the substance of the rules. They expect that the process be fair, that everybody have notice and an opportunity for comment and that the rules be adopted pursuant to the authority that the legislature vests in the agency. They expect that these rules not be arbitrary, capricious or ambiguous and be reasonable in nature.

Representative Hackney asked Mr. Zechini why NCAR is stating a position on whether we have stormwater management or not.

Mr. Zechini said that although he knows they are required by law to participate in stormwater management, he wanted to make it clear that NCAR was supportive of stormwater management.

Representative Hackney asked Mr. Zechini what it was that NCAR thinks we should do, back out of stormwater entirely and let everyone apply to Region 4 in Atlanta for permits?

Mr. Zechini said that was not the case. As Ms. Martin said, the EMC has adopted rules that are a base upon which we can build as a state and NCAR looks forward to working with the ERC and EMC and other interested parties in determining as a state where we go beyond that. One size does not fit all in a state as diverse as North Carolina. He believes we all need to get together and work from here.

Representative Hackney said it was his understanding that we had been getting together for several years now and everybody has had ample opportunity for public input and asked Mr. Zechini if he agreed with this.

Mr. Zechini said he did not feel they had succeeded in getting together and coming together with something that is clear and reasonable to the regulating community.

Senator Clodfelter asked for a question for the future and was not directed at anyone in particular. If there is a problem with ambiguities or lack of specificity he wants to be sure that we are not injecting new ambiguities in the regulations above what the feds have already done. He wants a more specific comment on that issue next time we talk about it. How are the EMC proposals more ambiguous than the default rules that the feds have promulgated?

Senator Horton asked Mr. Zechini if NCAR has a position on the threshold of 24 percent built upon area.

Mr. Zechini said that NCAR had not taken a specific position on this provision in the rules; however, he said that it is of grave concern to them and they think the concept of including density provisions is beyond the statutory authority of the EMC.

Senator Horton asked why this is of grave concern to NCAR.

Mr. Zechini said it should be of grave concern to everybody if the EMC is acting outside of authority. As a practical matter, anytime you have different layers of requirements it becomes problematic from a compliance standpoint for folks who are going out and develop property. The more layers we have out there the more type of land use regulatory measures are included in state rules beyond those that are already included at the local level and becomes problematic.

Senator Kinnaird commented that there is lots of help out there.

Mr. Zechini said that one of the concerns that NCAR has with any type of regulatory requirement is that it ultimately increases the cost of home ownership and they are very careful when they consider any new regulatory measure that will increase the cost of housing to folks. NCAR is a strong proponent of affordable housing.

Mr. Craig A. Bromby, Attorney-at-Law with Hunton & Williams, LLP, Representing the Business Alliance for a Sound Economy (BASE), gave his comments on the stormwater rules.

Mr. Bromby said that the Business for a Sound Economy is concerned because they believe that in the areas where their members are, on the coast, that the rules that were proposed by the EMC did not take into account considerations unique to the coast. The impervious surface requirements they believe are unrealistic for coastal development. They also point out that the coastal areas covered by Coastal Resources Commission (CRC) and its regulations to which they already have to comply, has taken into account a lot of the factors that the stormwater rules would be addressing in addition to the county regulations.

Mr. Bromby said there are recognitions within the CRC process that can accommodate those unique needs of the coastal area but those mechanisms have not been incorporated and are not preserved in the stormwater rules and indeed the rules propose the most stringent of any number of overlapping requirements. That is why he is representing BASE today.

Mr. Bromby said there was an unfortunate use of terminology when talking about the difference in the state and federal program and the use of the term delegate is imprecise.

Mr. Bromby said that the state agency is not the delegate of EPA for the purpose of stormwater permitting or any other type of point source permitting. The state DENR has an approved program under the Clean Water Act, which means that they issue their permits under state law and their state law program has to be demonstrated to EPA to be the equivalent of the federal program. If that program is approved then state law based permits are issued reviewed by EPA and EPA still retains the authority to come in and object to permits or take federal enforcement directly. But, it is the extent of state law that determines whether or not their regulations are valid. The fact that state law may not totally accommodate what the federal program wants

does not create authority in the state to do something more than existing state law provides for them.

Mr. Bomby said that also counties are not covered by Phase II programs by virtue of their status, they are covered by Phase II programs only because they happen to have some sort of a stormwater discharge that fits within these definitions. And, in fact, as was pointed out repeatedly, all of these systems are already covered under a permit issued to DOT. So, these are all permitted systems, there is not an unpermitted system out there presently except perhaps in some of the cities. But the counties are already permitted in a point source permit. NPDES permits apply only to point sources. If a stormwater conveyance does not terminate in a point source, it is not subject to the permitting requirements.

Mr. Bromby said that the state rule we are talking about is 15 NCA 2h0126. This rule has been on the books since 1986. In 1992, the EMC adopted, by reference, the federal stormwater rule, 40cfr122.21.26 providing that any amendments to that rule would also be incorporated by reference in the state rule. So, we presently have in North Carolina the federal program adopted by reference. It was a temporary rule adopted in November of 2002 that went beyond that to adopt, by reference, other federal rules that had subsequently been adopted and it also incorporated a program much like a program that was in the rules before the RRC.

Mr. Bromby said that because of the adoption by reference of the federal rules, the EMC presently has the authority today to require permits for point source dischargers of Municipal Separate Storm Sewer System (MS4s). The temporary rule imposed a system of permitting much like the rules that went before the RRC and were returned. That temporary rule now is probably dead because the rule was returned and according to the APA that was in force at the time. When a rule is returned, the temporary rule expires if that rule was based on that permanent rule or was returned. So, what we have defaulted to at this point is the EMC has the program adopted by reference that does not have everything in it or what the rules subsequently provided. But what that means is not that they cannot issue permits or accomplish what they want to in those permits, but that they have to issue them on a case-by-case basis.

Mr. Bromby said that Phase I and Phase II permits are both NPDES permits. They are terms to distinguish the development of the rule at the federal level. Developments within an urbanizing county, if they are greater than an acre, are going to be required under another provision within the federal rule, which has been adopted by reference by the state, to get permits of their own.

Mr. Bromby said that with respect to the RRC process, he disagrees that there is no reasoning in this letter to the EMC from the RRC. In fact, the last sentence says the creation of a permanent obligation for entities, which are not owners, or operators of MS4s and not governmental bodies is not responsive to the objection but that it was new rulemaking designed to accomplish a comparable substantive results. What he is saying there, in his

opinion, is that what the RRC decided (and he had provided Mr. Givens with a transcript his firm had prepared from the tapes of the meeting) is the change in the rule is a wholesale rewrite. It purported to regulate an entirely new class of persons. It was not a response to the objection that was lack of statutory authority. It was a recognition that the statutory authority didn't exist but they wanted to achieve a comparable substantive result. So, what they did was making a wholesale change in the rule and went right through the counties, in this particular case, to entities within those urbanizing counties and said now you will have a permitting obligation from the state. That was not a change in the rule in response to the objection. That was a new rule designed to achieve a comparable substantive result to what the prior rule to what had been objected to on the basis of statutory authority would otherwise have provided for them. So, what the RRC said was that this is not a change and therefore you are not allowed to do this. This is new rulemaking, you didn't go to public notice with this, you didn't comply with part two under the 2001 APA and that rule has to be returned. What the RRC said was, however, on the strength on the rule itself, we also find it to be objectionable on this basis that it does not have statutory authority and there are ambiguities in it. So, It had to be returned but they made finding nevertheless that if it did not have to be returned, it would nevertheless have been objectionable. In addition to that change where they went through the counties to subject an entirely new class of people to a permit obligation, there was also a change to the 85 percent removal design standard. In the rule, as it was presented in October, it was 85 percent as a design standard. In the rule, as it was presented in January, it was an 85 percent performance standard. That change was responsive to no objection made by the State but by the RRC; therefore, the RRC found that this was a change in the rule that was not permissible under the EPA and returned for failure to comply with Phase II.

Representative Hackney said that with all due respect we couldn't read this letter and know what Mr. Bromby just said to us and are we not as citizens or even as ordinary country lawyers entitled to have a document before us which tells us what the RRC did without having to have an interested party come and tell us what it did. Aren't we entitled to something on paper that tells us all of this?

Mr. Bromby said that he thinks believes that the ERC is entitled to that but the RRC process is not an adversary process so in his remarks was he neither invited to or was it appropriate for him to have written an order for them. His firm prepared a transcript and he believed everything he has said could be found in that transcript.

Senator Kinnaird said this is sort of like the Nixon tapes that showed up at the hearing before Congress. She asked Mr. Bromby who owns those transcripts and how much would he charge to let the ERC get a summary of them?

Mr. Bromby said that he had provided a transcript that was prepared by his firm to Mr. Givens. He said they were sent to a transcription service and the tapes don't identify speakers. He believes that this transcript tells what occurred at the meeting.

Mr. Bromby said that with respect to Representative Hackney, he believed that the reasoning that it is a new rule for the fact of the permit obligation was passed through to those other entities is, in fact, in this letter. The 85 percent is not. He cannot explain that.

Representative Hackney asked Mr. Bromby if he was referring to the last sentence?

Mr. Bromby replied in the affirmative.

Representative Hackney said that you couldn't read the last sentence and tell where it came from and what facts support it or what the defects are other than in a very exclusory manner.

Mr. Bromby said that he was not the author and it was not his process to work. He was, however, at the meeting and provided testimony and this is his interpretation of what happened and offers it primarily because what he had heard previously was quite fair for the process.

Senator Horton asked Mr. Bromby if he could tell us how these are unfair to the coastal areas as a practical matter.

Mr. Bromby said the development pressure in the coastal area, the impervious surface requirements therefore put an additional burden on developers and builders and on property owners just to get some value out of their real estate that is going to be marketable. The problem for the coastal developers are that a lot of the issues that the stormwater rule is trying to address have already been addressed in the CRC requirements in the county regulations in all sorts of other regulatory programs. These have been debated over the years and have been negotiated in the General Assembly and have gotten these coastal resources program and county programs where they think they can work with them. Now, we come in with the stormwater rule that applies one standard across the state and it explicitly provides that the most stringent of the overlapping requirements applies even to the coast.

Senator Horton asked Mr. Bromby if what he is trying to say is that sand absorbs water a whole lot quicker than clay?

Mr. Bromby said this was correct.

Senator Clodfelter asked Mr. Bromby if the proposed rule from the EMC is inconsistent with any existing regulations?

Mr. Bromby said he believed the proposed rule does not provide for some of the flexibility or some of the other means to achieve the same goal that you would find in CRC rules or in the county ordinances.

Senator Clodfelter said that if we were to have rules to go into effect, is there anyway to reconcile those differences or inconsistencies?

Mr. Bromby said this is a problem and the most stringent of the overlapping rules applies and that is where the problem occurs.

Ms. Kimberly S. Hibbard, Associate General Counsel, North Carolina League of Municipalities (NCLM), commented on the stormwater rules on behalf of NCLM, representing 531 cities, towns and villages throughout the State of North Carolina.

Ms. Hibbard said that 123 of NCLM's members were designated under the federal Phase II rule. Sixty of those applied in October 2003 and the other 63 were to apply, under the State's temporary rule, by May 2004; however, given the action by the RRC, it appears that the temporary rule has been killed and that the State deadline no longer exists and we are placed back under the federal rule. So, it appears that we have already missed the federal deadline, which is March of 2003 for those designated municipalities to have applied.

Ms. Hibbard asked members to note on their list of designated unit that some very small municipalities were automatically designated because they are located within urbanizing areas as defined by EPA and that definition is based on population and density of the particular area. As has been emphasized today, Phase II is a federal program and it applies the six minimum requirements to entities that own or operate municipal separate storm sewer system, the MS4's.

Ms. Hibbard added that the vast majority of municipalities in North Carolina, even the very small ones, have responsibility for maintaining some amount of public streets and streets are by definition under that federal law considered to be MS4's or municipal separate storm sewer systems. But even a very tiny town like Spencer Mountain, which is on your list, population 50 or 51 is covered and designated on that list because it maintains a third of a mile of road and because it is located within a larger area that is considered urbanized under those definitions. Therefore, municipalities are subject to the federal mandate whether we like it not or whether it makes sense to us or not, we are subject to it. So, I want to tell you that this is the current state of affairs from the municipal standpoint. We are between a rock and a hard place here. We are in an unenviable position of trying to comply with the federal mandate when the requirements have not been finalized at the state level.

Ms. Hibbard went on to say that with the objections of the RRC, it appears unlikely that the uncertainty that we are facing as to state requirements can be resolved through the administrative rulemaking process. So, essentially we are in a Catch 22. Municipalities have to make investments and expend resources to comply with Phase II in spite of that uncertainty. If we don't move ahead now, we are in violation of federal rules and we may be vulnerable to federal enforcement action as well as to third party lawsuits. But, because of the lack of finality, the requirements are kind of a moving target. The designated towns know they need to comply but they don't know exactly how to comply and if what they do expend their money on to create a program will be enough to comply with those requirements. So, frustration is an understatement for the municipalities at this point.

Ms. Hibbard said that for NCLM, as a practical matter, the bottom line is that they need to get on with it. Phase II for us, for those federally designated municipalities, is not optional. They need to know what is required, they needed to know it yesterday or at least by March of 2003, so we are suggesting that it may be time now to formulate a legislative solution to this problem and we are asking for your help in protecting these municipalities and their investments, we are glad to assist in anyway that we can with that. League policy does support implementation of the Phase II regulations and the application of similar requirements to development in urbanized areas, generally. We ask for a flexible program that will allow us a cost effective means of compliance that will address everyone in an equitable way. At best, even the most costly efforts of municipalities will not be enough to correct stormwater problems if the rules only apply to development that takes place in municipalities. In order to protect water quality, control stormwater, those controls need to be applied to all development in urbanizing areas, not just that which takes place within municipalities.

Ms. Hibbard said that although opponents have at times argued that we should rely only on the bare bones of the federal rules and what is in that program, in order to implement the state program, that would have a couple of major consequences for municipalities. First of all, those federal rules are very broad and ambiguous and they don't really provide much in the way of specific direction to the regulated parties. They depend on the state to flesh out the details of those programs. That includes things like design standards that our municipalities would need to know in order to develop a program that complies. Secondly, relying on the federal rules alone would in effect prevent the application of stormwater regulations to development that does take place in urbanized areas outside municipalities. And, we do have serious concerns about that from an effectiveness and equity standpoint. Such an approach might place the regulatory burden disproportionately on municipalities and put us at a competitive disadvantage for purposes of economic development. Therefore, we have generally supported the state rules as a means of creating a more equitable, more effective program and providing adequate guidance to the regulated parties. To that end we have worked extensively with DENR and with the EMC throughout this process. Particularly in the last version of the rules, we felt that we had made significant progress towards crafting some more reasonable and more feasible standards that would allow a great deal of the flexibility that we had requested.

Ms. Hibbard said that the EMC did take into consideration a number of our concerns and revised those rules to address them, so we appreciate DENR and the EMC for their willingness to work with us on some of those issues. But, as you know sometimes, in spite of our best efforts, there are issues that the rulemaking process is unable to resolve. So, we believe that the guidance of the General Assembly is needed now to allow municipalities to comply with those federal requirements. I might also add that there may be another reason that legislation would be needed in this general area of stormwater. Only the General Assembly has the ability to address issues of municipal statutory authority and, as I believe I have mentioned to this group in the past, there are some gaps in municipal authority, currently, to implement all of the measure that would be required under federal Phase II

within particularly areas of extraterritorial jurisdictions. So, we do ask that you do take these comments into consideration and help us, if you possibly can, to address these issues in a timely manner.

Senator Clodfelter asked Ms. Hibbard: as a result of the recent action with respect to the Rule, if that action is valid, are you saying that some of your members are now automatically in violation of the federal rule by default because they did not get their permits in time?

Ms. Hibbard said that this would be her interpretation. That federal deadline for applications was March of 2003. The State, through the temporary rule, was able to develop other timelines.

Senator Clodfelter asked Ms. Hibbard if you have to default back to the federal rule you don't get the benefit of those timelines now?

Ms. Hibbard said that this was her understanding.

Senator Clodfelter ask Ms. Hibbard if NCLM had any comfort from EPA that they would not get tagged while we are trying to get this mess worked out here? Have you had any informal discussions with EPA about this?

Ms. Hibbard said they had not had any indication one way or the other about that.

Senator Clodfelter said that he had an idea and that he would like to hear more comment on it when we covered this topic next time. He said he remembered when he went through this process back in Mecklenburg County, one of the real concerns, and they had to get enabling legislation so the county and city could set up a stormwater management system, that they wanted only one system in Mecklenburg County. They didn't want to have to worry about the water flowing across the city limits of Matthews and Pineville and Charlotte and under different systems, so the enabling legislation given by the General Assembly really required a coordinated system.

Senator Clodfelter said that he understood under the federal rules you had to have only one permit holder per system. But, would it make sense, at the state level, if we do any supplementation of the federal regulations, if there are multiple permit holders within a county, they should at least have programs that are consistent, coordinated and match. Would that make sense as a policy? Otherwise, you could have a hodgepodge of stormwater programs within a single county.

Ms. Hibbard said it certainly makes sense to her that NCLM should look at and address that.

Senator Clodfelter asked Ms. Hibbard and Mr. Meyer and DENR to talk more about this in detail because it is an important issue.

Representative Gibson asked Ms. Hibbard if it was fair to say that the Phase I folks that are getting a little wiggly because of the process mess that we have, and don't we have a pretty good idea of where they are headed? The wiggle that they are having and the uncertainty and concern that you have expressed here, aren't your folks headed in the right way? Is the concern is that something might change? Is that fair to say?

Ms. Hibbard said that Representative Gibson had hit it on the head. NCLM is trying to proceed in good faith, understanding that for most of those listed are under the federal law and will have to do something. Their concern is that trying to go forward doing consulting, engineering and studies and making those expenditures to try to get those applications done and get those programs in place, if they don't know exactly what those regulations are and what the guidance is, they may be wasting effort and money and have to do something different down the line.

Representative Gibson asked Ms. Hibbard if she had heard anything that she sees that would cause NCLM any problems from the LGA perspective? He said he is confident that if we need a legislative solution between ERC and APO and the fact that there are influential lobbyists, we should be able to get a legislative solution. He added that we ought to be able to get EPA and whoever would send the lightening bolts down to you because we haven't done something correctly will understand this. That entire aside, do you feel pretty comfortable that we will be able to get this done—even the barriers we have heard about today and the consternation that some of the members have expressed, do you feel that we can get this resolved? Do you think we have enough time to get this resolved in a timely fashion?

Ms. Hibbard said that she thinks we have already made significant progress, just in their discussions with DENR and EMC in addressing municipal issues. She said they have no reason to believe they could not try to come to some type of agreement with the other stakeholders about a reasonable approach.

Representative Gibson asked if the other folks in the southeast are having any problems like we are? Are their people at the table having the same concerns about flexibility, one size fits all, about timeline implications? Our uniqueness in this particular day is that we have changed our APA and that is what has caused all of our wrinkles and we are going to fix that. But I'm more interested in the amount of money in this economy, especially those of us who are losing traditional economies. If you look down the list at these 130 or 140 municipalities, some of those are the hardest hit municipalities in our whole world. And, what are other states doing, what are the feds saying about the impact, financially, and the planning implications? You can't expect Valdese to have the same thing as Charlotte has.

Ms. Hibbard said that she could not answer that but hoped that Representative Hackney had some information about other states.

Representative Hackney said that this is not one of the issues that he hears a lot about at the national level because he thinks everyone believes the program is in place and is being implemented.

Mr. Givens said that this is something we can look at but he would observe that at least as far as the relationship between the cities and the counties, we are somewhat unique because of our transportation structure, and don't have much to model by.

Mr. Paul A. Meyer, Assistant General Counsel, North Carolina Association of County Commissioners spoke to the issue. He said that the counties are in a position now of wanting a handful of things. The most recent iteration of the rules that are apparently dead, did in fact address many of the concerns that we had concerning county authority and a variety of other things.

Mr. Meyer said they would be interested in looking at the implementation of the federal rules as they currently are plus what was in the most recent iteration of rules that died. In concept, that is what they think would be the fix to this problem.

Mr. Meyer said that, secondly, in order to address the questions about flexibility for differing counties across the state with differing circumstances, we would want to maintain the existing authority that are currently in the statutes, providing for a voluntary system of participation by county governments in the unincorporated areas.

Mr. Meyer mentioned that Senator Clodfelter was asking for more specificity and said he could draw his attention G.S. 143-214.7 where it lays out pretty clearly the desire or concept of a model ordinance developed by the state that is then put before counties for their adoption on a voluntary basis of a similar type ordinance.

Mr. Meyer said that in addition they would be looking for a state stormwater education program, so that the counties that in fact were to adopt and implement a voluntary program could rely on that state program to move their programs forward.

Mr. Meyer said there was a lot of question about counties and whether they in fact should be in this program or not. There has been an Attorney General's opinion, passed out by Senator Clodfelter. During the confusion about whether counties in North Carolina were in fact part of this program or not, the Association of County Commissioners asked EPA if counties in North Carolina were part of the Phase II stormwater program and they received a letter from them that said no, that in fact counties in North Carolina are not covered under Phase II stormwater regulations. So, he has a copy of that letter and did not bring it today but if folks are interested in seeing it, he would be glad to provide it.

Mr. Meyer said that in light of everything that is going on in the confusion, there are still a number of counties who are acting in a voluntary way already. Anecdotally, they have six to eight counties who either do own or operate and have applied for a permit with DENR, some folks who have applied for a permit voluntarily and two counties that are operating programs voluntarily and have for a number of years. Despite this consternation, we do have some folks who are actively pursuing these environmental goals.

Mr. Meyer said that he wanted to touch briefly on one other thing and that is one piece on the history of the rules that they are concerned about. There are a number of counties in which urbanizing areas just barely breach the county line, four square miles of a county can be an urbanizing area, yet under the current rulemaking process, they would expect the entire county to implement these types of rules. They have some concerns about this. There is a significant difference between Mecklenburg County and Stokes, Haywood, Alexander, Davie, Nash, Edgecombe and Hoke with respect to resources in terms of development of land use controls. As we move forward to develop the final result of this issue, they hope to take that into concern.

Representative Hackney asked Mr. Meyer if his concept of participation was the municipalities should all, to the extent designated, be covered but the urbanizing areas within counties which are not within a municipality should be covered only at the choice of the county itself.

Mr. Meyer said that first of all the municipalities have to participate because of the federal regulations and the fact that they are owners and operators of these conveyance systems. Under the most recent iteration of the rules, DENR would serve as the permitting entity for the development itself, but if a county wanted to go ahead and take the program voluntarily or delegate the program, they could do that. In fact, the most recent round of the rules laid that out. It said that if a county wants to voluntarily or in a delegated fashion act on behalf of the state for the development in the unincorporated areas, they could.

Representative Hackney asked Mr. Meyer if he meant that the stormwater controls would be voluntary whether the county or the state did it?

Mr. Meyer said that was correct.

Representative Gibson made the observation that if there is a silver lining to this swirl that we have had today it is that we have had inequities between the counties and we had problems with the cities and through whatever process, bad or good, these guys have gotten really close and they should be complimented on something as technical and the fact they have had 95 percent of this worked out is a good sign.

Senator Clodfelter seconded Representative Gibson's comments and said that this is a rather different presentation than the one he remembered hearing two years ago and commended him on the advances they had made. He said that when he hears all of these folks talking about local flexibility and accommodation of difference, which he thinks is critical, you guys are the only

ones who can provide that. And this is the only way to avoid the default position of a one size fits all from the state and he's really glad to see that they recognize that even though they may have a position that is legally a little different. They recognize it is very important to their citizens that they soften that legal position and provide what folks like the development community and the municipalities really need.

Mr. Trip Van Noppen, Carolinas Office Director, Southern Environmental Law Center (ELC), spoke on the issue. He said that like all of the others who have spoken, he had been working on this issue with all of these interested parties for all of these years and he was here on behalf of a number of environmental groups, not just the SELC who have been involved in this.

Mr. Van Noppen said that he was called on to be more blunt than Mr. DeLuca was able to be about the train wreck that has happened here and he had a different characterization that he thinks members need to hear about where we are as to what has happened.

Mr. Van Noppen said that first of all the Phase II program has been described as something brand new when in fact that we have been managing stormwater in our cities for many years, we have been managing stormwater in our 20 coastal counties for many years, we have stormwater programs in our watershed and we have stormwater programs now for the entire Neuse basin and the entire Tar Pamlico Basin. This is not new; we are talking about spreading stormwater management requirements to a broader part of the State. But, we know how to do it, it is being managed at the state and local levels and a lot of work has gone into solving the problems among most of the parties.

Mr. Van Noppen said that what you haven't had described to you, yet, is at the RRC last month, all of the parties that have spoken here, other than the homebuilders and the realtors, were prepared to postpone consideration of those rules for one month and work out these remaining differences and have an agreed upon set of rules at the RRC. That request was made by the agency at the RRC and was opposed by nobody but the NCHBA, it was not adopted at the RRC and instead you had the outcome that has been mentioned here. In other words, this was not a commission acting on its own, it was acting at the behest of one of the many interests involved in this dispute.

Mr. Van Noppen said that the RRC's action was very explicit to send the whole package back. I defy to find anybody to find any reference from the mouth of any commissioner to some 85 percent standard or any other detail about the rules other than send it back and make them start over. That was the very explicit command and outcome of this thing.

Mr. Van Nappen went on to say that we have a train wreck. Because as has been said, permits are not being issued and won't be issued for some time and local governments who have to get this have no guidance on what to go on. And that's not the job of the legislature. It has been mentioned that

this should have a legislative solution when in fact writing technical rules for stormwater management is not the job of the legislature. The legislature has passed a statute quite some time ago in the 1980's that said we should have a statewide stormwater management system.

Mr. Van Noppen said that five years ago, the Department tried to start this process by knitting together these fragmented stormwater systems all over the state that have different requirements for different people in different parts of the state that often times have overlapping requirements. They tried to bring the parties together and have a statewide system. That was torpedoed—no this should not be a statewide stormwater system, we should only do what Phase II requires was the demand of some participants in the statewide stakeholder process. So, instead and unfortunately, we set about the process of writing these Phase II rules. And, at first, it was let's have a program that will be administered by local governments. That was the original set of rules that were adopted, because, in fact, response to this objection was that we shouldn't have a statewide program. So, okay, we will have the counties and cities implemented. That went to the RRC with objection. Counties shouldn't do it, so they come back to write a program that say to let the state do it. State writes a program that they will do it and permit the developers just like they already do on the coast and just like what they were told to do when they objected to our locally government run program. "No, objection, there is no authority for that either."

Mr. Van Noppen added that this is a never ending set of obstacles that has been presented and he thinks that a gauntlet was thrown down that it was not a let's get together and work it out. Environmental groups have, in essence, held their fire. They have not been bringing these citizen suits to date that the municipalities and the developers say they are worried about. In other parts of the country, local governments have been sued for their failure to get these permits. Developers have been sued for their failure to get these permits. And, it appears that there is no other alternative to make progress in North Carolina than to get the message across that stormwater management is important, it can't be obstructed, we have to have this happen by cooperation with state and local governments, it has to happen with developers doing the stormwater management that the law requires and not trying to use procedural devices to torpedo five years of work of getting a responsible program in place. So, he just wanted to be candid with members that this is just isn't a situation where we are all going to work it out because that has not been the way this has been carried out. It has become a serious problem and is the worst water quality problem that we have in the state and we are not able to make progress on it while we are in this train wreck.

Mr. Van Noppen said that he had not addressed the substance of the rules, there are many issues that have been brought up about the substance of the rules, he knows that is not what we are trying to do here today, but rather to get a picture of where do we stand. He regrets to say that this is where we stand.

Senator Kinnaird asked Mr. Van Noppen if we took what the EMC has cranked out within the past five years and the RRC turned down, and you say that it is not a legislative solution, is it possible to take what the EMC did and the legislature says that this is what we are passing?

Mr. Van Noppen said that he didn't mean that the legislature couldn't solve the problem; it is typically not the business of the legislature to take a general policy need such as stormwater management and try to decide if 12 percent impervious surface or 15 percent impervious surface is the right answer. That is what you have created the EMC to do but certainly the legislature could adopt these rules as statutes and we could go forward.

Senator Kinnaird said that this was not the best solution because rules are things that can be changed more easily. But, this is an emergency and wanted to know if this was a possibility.

Mr. Van Noppen said that it was a possibility.

Representative Hackney asked Mr. Van Noppen if he thinks this is unlikely to be worked out.

Mr. Van Noppen said that he had seen no indication so far, despite all of the parties having almost no differences among themselves. Also, Mr. DeLuca didn't say that at the RRC, the staff recommendation, Mr. DeLuca's recommendation was there were not any remaining big problems with these rules. So, even at the level of the RRC's staff, we didn't get there and that is his concern.

Senator Clodfelter said that he was intrigued by Ms. Martin's concept of directly connected impervious surfaces because it sounded like a concept that encourages incentives and design to manage impervious surface without any discharges of the site at all. He asked Mr. Van Noppen to come back next time and talk about this concept in substance.

Senator Clodfelter also reinforced with Mr. Van Noppen the issue of ambiguities in the state regulations and asked for his analysis when he comes back with the comparative ambiguity of the federal regulations that we would be operating under by default.

Mr. Van Noppen said that he looked forward to that part of the discussion because a large part of the purpose of this five-year effort was to give more specificity to the North Carolina program than a very general set of federal rules does.

Representative Gibson asked Mr. Van Noppen if he believes that this process is not going to be completed and is there some way that the parties in opposition to process will come to an agreement?

Mr. Van Noppen said that is what makes sense to him but he is not able to say that he has optimism based on what he has seen so far.

Representative Gibson said it appears that there is no other alternative, other than a lawsuit, and what would that do to expedite it. In an effort to get this resolved, whether it is legislative or adopting EMC rules, don't you think that a lawsuit would make this even worse? Wouldn't it create an EPA issue? Don't you think we should get everyone in a room and lock the door and come up with a solution in a 30-day period?

Mr. Van Noppen said that the fundamental premise of the state and Federal Clean Water law is that you can't discharge pollutants from a point source including a stormwater ditch without a permit. So everyone out there now, whether they are in a Phase II community or not, is violating that basic principle of our water quality laws. So far, it hasn't seemed to matter that much to the developers that they are in violation, but it matters a great deal to the local governments. I don't know if that's because they don't realize they are in violation. Certainly being found liable would bring home that message that it does matter to get rules in place and permits issued because otherwise they are vulnerable.

Senator Kinnaird asked Mr. Van Noppen if a sustainable zero runoff, which is very expensive, would raise the cost of housing.

Mr. Van Noppen said that there is a lot of work done on this and a lot of experimentation going on. Whether it costs more or not depends on how you do it and where you are. People at the coast are doing a lot of very low impact, low impervious surface development that doesn't necessarily cost more. If you take a piece of land and cluster the development well and protect other areas, you may be able to put as many units on it at the same cost as if you spread them all out and increased the amount of impervious road surface that you have. You get benefits to the stormwater system basically by having a lot of buffer and you also get economic benefits from that. In other words, this may increase the benefits to the developer to have some of these buffers and conservation lands because people will pay more for that kind of development.

Senator Albertson said that it appears to him that the whole process needs some coordination and streamlining. This is one of the most frustrating processes he has ever heard tell of and how anybody works through it he doesn't know.

Mr. Givens announced that the next actor in this will be the EMC when it meets later this month and, as he see it, they will either need to start all over again at whatever cost and time, to initiate litigation, or to seek a legislative solution. He said it appears to him, as Senator Clodfelter and others have suggested, if the EMC chose to treat the return of the rule by the RRC as invalid, the only way it would have to enforce that would be through litigation. One effect of that might be that if the EMC took the position that the rule was valid, then the municipalities would at least get the protection it might be afforded from citizen suits. This is certainly a matter for the EMC to consider.

Mr. Givens said that it appears unlikely that we will have a rule and that the legislature could address the issue more quickly than the courts, so there

may need to be a 605 meeting regarding this. So, on Friday, 5 March 2004, a meeting will be held to see what they can do. What will happen in the meantime, in addition to the EMC meeting, is that the ERC will meet and Dr. Moreau will be here at our next meeting to address the ERC on the quarterly reports of the EMC and will address this issue.

Mr. Givens said that perhaps we should hear from the Attorney General's office regarding question of statutory authority. That would at least help move the ball forward in the 605 process. He said he would echo what Senator Clodfelter said with regard to the questions of ambiguity. If folks would identify their specific issues, this would help the process in a subsequent presentation before the full Commission or more likely in 605.

Senator Albertson asked members to note the memo regarding future meetings.

The meeting was adjourned at 1:00 p.m.

Senator Charles Albertson	Mary R. Watson

29 January 2004

TO: Interested Parties – Environmental Review Commission

FROM: George F. Givens, Commission Counsel
Mary R. Watson, Commission Clerk

RE: **Notice of Meeting; Additional Information**

COMMISSION MEETING:

The 27 January 2004 **Environmental Review Commission meeting**, which was cancelled due to inclement weather, **has been rescheduled for 9:30 a.m. Friday 6 February 2004 in Room 643 of the Legislative Office Building in Raleigh**. The agenda will consist of issues related to stormwater management.

SCHEDULE OF FUTURE MEETINGS:

Below is a schedule of meetings of the Commission for February through May 2004. Please note the following:

1. This schedule provides for two-day meetings in February, March, and April. In some months it may be desirable to have a two-day meeting to accommodate the workload. This also allows for the possibility of one or more out of town meetings that could include field trips. Thus this schedule is tentative and subject to adjustment. For planning purposes, however, please reserve these dates.

2. Meetings normally begin at 9:30 a.m., include a lunch break, and run until mid-afternoon. Please plan on meeting from 9:30 a.m. until 3:30 p.m.

3. To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel holds informal planning meetings for staff and interested parties. Commission members are not expected to attend these meetings.

4. The 2004 Regular Session is scheduled to begin at 12:00 noon on Monday 10 May. The Commission normally meets shortly after the beginning of the session to complete work on legislative proposals prior to the commission/committee bill request deadline, which in 2004 is 4:00 p.m. Wednesday 12 May. The Tuesday 11 May meeting date is tentatively scheduled for this purpose.

Commission Meeting	Staff Planning Meeting
9:30 a.m. Tuesday and Wednesday 24 and 25 February	10:00 a.m. Tuesday 10 February
9:30 a.m. Thursday and Friday 25 and 26 March	10:00 a.m. Friday 12 March
9:30 a.m. Thursday and Friday 22 and 23 April	10:00 a.m. Tuesday 13 April
9:30 a.m. Wednesday 5 May	
2:30 p.m. Tuesday 11 May	

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Chronic Rainfall Working Group
2:00 p.m. Monday 9 February 2004 – 605 Legislative Office Building

Leaking Petroleum Underground Storage Tank Working Group
10:00 a.m. Friday 27 February 2004 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, please feel free to contact the Commission Counsel at (919) 733-2578.

AGENDA
9:30 a.m. Friday 6 February 2004
Room 643 – Legislative Office Building

1. Call to order; Introduction of Commission members
   Senator Charles W. Albertson, Presiding

2. Introductory remarks by Cochairs
   Senator Charles W. Albertson
   Senator Daniel G. Clodfelter
   Representative Pryor A. Gibson
   Representative Daniel F. McComas

3. Introduction of Commission staff; History, statutory authority, and powers and duties of the Commission (G.S. 120-70.41 *et seq.*); Report to the Commission and explanation of agenda items
   George F. Givens, Commission Counsel

4. Discussion of procedural and substantive issues involved in the development, adoption, and implementation of the Phase II stormwater rules and programs to control stormwater runoff
   Annual report on the stormwater management program (G.S. 143-214.7(e)); Explanation of the development and substantive provisions of the Phase II stormwater rules
   Robin W. Smith, Assistant Secretary for Policy and Planning
   DENR

   Report on the review of the Phase II stormwater rules by the Rules Review Commission
   Joseph DeLuca, Staff Director
   Rules Review Commission

   Comment on the Phase II stormwater rules by interested parties
   Lisa D. Martin, Director of Regulatory Affairs
   North Carolina Home Builders Association

   Richard A. Zechini, Director of Regulatory Affairs
   North Carolina Association of Realtors

Craig A. Bromby, Attorney-at-Law
Hunton & Williams, LLP,
Representing the Business Alliance for a Sound Economy

Kimberly S. Hibbard, Associate General Counsel

Paul A. Meyer, Assistant General Counsel
North Carolina Association of County Commissioners

Trip Van Noppen, Carolinas Office Director
Southern Environmental Law Center

5. Commission discussion and announcements

6. Adjourn

SCHEDULE OF FUTURE MEETINGS:
Below is a schedule of meetings of the Commission for February through May 2004. This schedule provides for two-day meetings in February, March, and April. Two days have been reserved in these months because it may be necessary or desirable to have a two-day meeting to accommodate the workload. This also allows for the possibility of one or more out of town meetings that could include field trips on one of the two days. Thus this schedule is tentative and subject to adjustment.

To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel holds informal planning meetings for staff and interested parties. The schedule of these public Commission Staff Planning Meetings is also set out below.

9:30 a.m. Tuesday 24 February and 9:30 a.m. Wednesday 25 February 2004
Location: 643 Legislative Office Building
Staff Planning Meeting: 10:00 a.m. Tuesday 10 February 2004 – 605 Legislative Office Building

Thursday 25 March and Friday 26 March 2004
Location: To be determined
Staff Planning Meeting: 10:00 a.m. Friday 12 March 2004 – 605 Legislative Office Building

Thursday 22 April and Friday 23 April 2004
Location: To be determined
Staff Planning Meeting: 10:00 a.m. Tuesday 13 April 2004 – 605 Legislative Office Building (This meeting will also serve as the public Commission Staff Planning Meeting for the Commission meetings scheduled for 5 May 2004 and 11 May 2004.)

Wednesday 5 May 2004
Location: 643 Legislative Office Building

Tuesday 11 May 2004
Location: 643 Legislative Office Building

OTHER MEETINGS:
The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Chronic Rainfall Working Group
2:00 p.m. Monday 9 February 2004 – 605 Legislative Office Building

Leaking Petroleum Underground Storage Tank Working Group
10:00 a.m. Friday 27 February 2004 – 605 Legislative Office Building

February 6, 2004 ERC Meeting

Re: 2003 Environmental Legislation

We are pleased to present you with this overview of the Environmental Review Commission and a review of environmental actions taken by the General Assembly in the 2003 Regular Session. The review includes the following documents:

1. Membership of the Environmental Review Commission
2. Authorizing Legislation
3. 2003 Summaries: Environment and Natural Resources Legislation
4. Summary of Funding for Environmental Initiatives, 2003 Session
5. Table of Reports to the Environmental Review Commission Required or Authorized by North Carolina Law
6. Table of Reports by the Environmental Review Commission Required or Authorized by North Carolina Law

North Carolina General Statutes
ARTICLE 12D.

Environmental Review Commission.

§ 120-70.41. Commission established.

The Environmental Review Commission is hereby established.

§ 120-70.42. Membership; cochairs; vacancies; quorum.

(a) The Environmental Review Commission shall consist of six Senators appointed by the President Pro Tempore of the Senate, six Representatives appointed by the Speaker of the House of Representatives, who shall serve at the pleasure of their appointing officer, the Chair or a Cochair of the Senate Committee on Agriculture, Environment, and Natural Resources or the equivalent committee, the Chair or a Cochair of the House of Representatives Committee on Environment and Natural Resources or the equivalent committee, the Chair or a Cochair of the Senate Committee on Appropriations – Natural and Economic Resources or the equivalent committee, and the Chair or a Cochair of the House of Representatives Committee on Appropriations – Natural and Economic Resources or the equivalent committee.

(b) The President Pro Tempore of the Senate shall designate one Senator to serve as cochair and the Speaker of the House of Representatives shall designate one Representative to serve as cochair.

(c) Except as otherwise provided in this subsection, a member of the Commission shall continue to serve for so long as the member remains a member of the General Assembly and no successor has been appointed. A member of the Commission who does not seek reelection or is not reelected to the General Assembly may complete a term of service on the Commission until the day on which a new General Assembly convenes. A member of the Commission who resigns or is removed from service in the General Assembly shall be deemed to have resigned or been removed from service on the Commission. Any vacancy that occurs on the Environmental Review Commission shall be filled in the same manner as the original appointment.

(d) A quorum of the Environmental Review Commission shall consist of nine members.

§ 120-70.43. Powers and duties.

(a) The Environmental Review Commission shall have the following powers and duties:

(1) To evaluate actions of all boards, commissions, departments, and other agencies of the State and local governments as such actions relate to the environment or protection of the environment, including but not limited to an evaluation of:

a. Benefits of each program relative to costs;

b. Achievement of program goals;

c. Use of measures by which the success or failure of a program can be measured; and
d. Conformity with legislative intent;

(2) To study on a continuing basis the organization of State government as it relates to the environment or to the protection of public health and the environment, including but not limited to:
a. Improvements in administrative structure, practices, and procedures;
b. Increased integration and coordination of programs and functions;
c. Increased efficiency in budgeting and use of resources;
d. Efficient administration of licensing, permitting, and grant programs;
e. Prompt, effective response to environmental emergencies;
f. Opportunities for effective citizen participation; and
g. Broadening of career opportunities for professional staff;

(3) To make any recommendations it deems appropriate regarding the reorganization and consolidation of environmental regulatory agencies and the recodification of statutes relating to the environment, including but not limited to:
a. Ways in which agencies may operate more efficiently and economically;
b. Ways in which agencies can provide better services to the State and to the people; and
c. Instances in which functions of agencies are duplicative, overlapping, incomplete in scope or coverage, fail to accomplish legislative objectives, or for any other reason should be redefined or redistributed;

(4) To review and evaluate changes in federal law and regulations, relevant court decisions, and changes in technology affecting the environment or protection of the environment;

(5) To review existing and proposed State law and rules affecting the environment or protection of the environment and to determine whether any modification of law or rules is in the public interest;

(6) To make reports and recommendations, including draft legislation, to the General Assembly from time to time as to any matter relating to the powers and duties set out in this section; and

(7) To undertake such additional studies as it deems appropriate or as may from time to time be requested by the President Pro Tempore of the Senate, the Speaker of the House of Representatives, either house of the General Assembly, the Legislative Research Commission, the Joint Legislative Commission on Governmental Operations, the Joint Legislative Utility Review Committee, or the Joint Select Committee on

Low-Level Radioactive Waste and to make such reports and recommendations to the General Assembly regarding such studies as it deems appropriate; provided that the Environmental Review Commission shall not undertake any study which the General Assembly has assigned to another legislative commission or committee.

(b) The Environmental Review Commission may continue the study of environmental agency consolidation and reorganization. The study of environmental agency consolidation shall include, but is not limited to:

(1) Monitoring the implementation of Session Laws 1989, c. 727;

(2) Evaluation of the organization, programs, and operation of the Department of Environment and Natural Resources;

(3) Evaluation of the organization, functions, powers, and duties of the components of the Department of Environment and Natural Resources, including boards, commissions, councils, and regional offices; and

(4) Recodification of the General Statutes relating to the environment and environmental agencies.

(c) In addition to its general powers and duties, the Environmental Review Commission shall have the following powers and duties with respect to hazardous waste management:

(1) To study the current and projected need for hazardous waste treatment, storage, and disposal capacity in the State in light of anticipated generation of hazardous waste and alternatives for hazardous waste treatment and disposal;

(2) To evaluate the potential for the development of additional hazardous waste treatment, storage, and disposal capacity by the private sector;

(3) To study the necessity for and scope of hazardous waste treatment, storage, and disposal facilities which are sited, owned, or operated by the State;

(4) To review progress in securing a volunteer county to host a hazardous waste treatment facility;

(5) To study incentives and compensation for the community which hosts, either voluntarily or involuntarily, a hazardous waste treatment facility, including any additional incentives and compensation which may be needed, whether there should be differential compensation for a volunteer county, options for use of funds by local governments, distribution of compensation among local governments, and methods of providing flexibility in the development of an incentives and compensation package for a particular local community;

(6) To review progress in developing interstate agreements for the treatment, storage, and disposal of hazardous waste;

(7) To assist in the development of cooperative, comprehensive regional approach to hazardous waste treatment and disposal;

(8),(9) Repealed by Session Laws 2001-474, s. 12.

(10) To study the capacity assurance requirement under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, Pub. L. No. 96-510, 94 Stat. 2767, 42 U.S.C. 9601 et seq., as amended, and the Superfund Amendments and Reauthorization Act of 1986, Pub. L. No. 99-499, 100 Stat. 1613, as amended as it relates to the continued eligibility of North Carolina for remedial actions under Superfund;

(11) To study alternatives available to the State for dealing with hazardous waste and the ramifications of those alternatives; and

(12) To receive and evaluate reports of every State agency, board, and commission which has any power or duty with respect to hazardous waste management.

§ 120-70.44. Additional powers.

The Environmental Review Commission, while in the discharge of official duties, may exercise all the powers provided for under the provisions of G.S. 120-19, and G.S. 120-19.1 through G.S. 120-19.4. The Environmental Review Commission may meet at any time upon the call of either cochairman, whether or not the General Assembly is in session. The Environmental Review Commission may meet in the Legislative Building or the Legislative Office Building upon the approval of the Legislative Services Commission.

Notwithstanding any rule or resolution to the contrary, proposed legislation to implement any recommendation of the Environmental Review Commission regarding any study the Environmental Review Commission is authorized to undertake or any report authorized or required to be made by or to the Environmental Review Commission may be introduced and considered during any session of the General Assembly.

§ 120-70.45. Compensation and expenses of members.

Members of the Environmental Review Commission shall receive subsistence and travel expenses at the rates set forth in G.S. 120-3.1.

§ 120-70.46. Staffing.

The Legislative Services Officer shall assign as staff to the Environmental Review Commission professional employees of the General Assembly, as approved by the Legislative Services Commission. Clerical staff shall be assigned to the Environmental Review Commission through the offices of the Supervisor of Clerks of the Senate and Supervisor of Clerks of the House of Representatives. The expenses of employment of clerical staff shall be borne by the Environmental Review Commission.

§ 120-70.47. Funding.

From funds available to the General Assembly, the Legislative Services Commission shall allocate monies to fund the work of the Environmental Review Commission.

Enacted Legislation

Air Quality

Air Quality Permits

S.L. 2003-428 (SB 945) clarifies the extent to which a prospective air quality permit applicant for a new facility may engage in construction prior to obtaining the air quality permit and specifies the circumstances under which a person who holds an air quality permit may alter or expand the facility. The act makes the following changes:

Consistency with local government ordinances. – The act requires a person that proposes to construct or expand a facility to ensure that the construction or expansion of the facility is consistent with local zoning or subdivision ordinances prior to operation. The act provides that its provisions do not affect the validity of any lawfully adopted franchise, local zoning, subdivision, or land-use planning ordinance or affect the responsibility of any person to comply with any local ordinance.

Procedures for construction of new air pollution facilities. – The act prohibits the construction or operation of an air contaminant source, equipment, or associated air cleaning device at a site or facility where, at the time of the construction, there is no other air contaminant source, equipment, or associated air cleaning device for which an air permit is required. A person may, however, undertake the following activities prior to obtaining a permit if the person complies with the requirements of the act:

- Clearing and grading.
- Construction of access roads, driveways, and parking lots.
- Construction and installation of underground pipe work, including water, sewer, electric, and telecommunications utilities.
- Construction of ancillary structures, including fences and office buildings, that are not a necessary component of an air contaminant source, equipment, or associated air cleaning device.

Procedures for facilities currently holding a permit. – The act requires a permittee to submit a notice of intent to alter or expand the physical arrangement or operation of an air contaminant source, equipment, or associated air cleaning device in a manner that alters the emission of air contaminants at least 15 days prior to commencing alteration or expansion. The notice of intent must include the following information:

- The name and location of the proposed facility and the name and address of the permit applicant.
- The current permit number.
- The nature of the contaminant sources and equipment associated with the modification.
- An estimate of regulated emissions under the proposed modification.
- The air cleaning devices that will be employed to address each contaminant source.
- The expected construction schedule.
- An acknowledgement by the permittee that the actual air contaminant sources may not be operated in a manner that alters the permitted emissions until a modified permit is obtained.
- An acknowledgement that any construction of an air contaminant source prior to obtaining a modified permit will be performed at the permittee's own risk.
- A certification under oath of the accuracy of the notice of construction or modification.

The act also requires the permittee to give notice by publication, in a newspaper having general circulation in the county or counties where the facility is located, at least 15 days prior to alteration or expansion. The notice by publication must include the first six items listed above.

Review and Determination by the EMC. – Within 15 days of receipt of a complete notice of intent, the act directs the Environmental Management Commission (EMC) to make a determination of whether the following conditions have been met:

- The permittee is and has been in substantial compliance with other permits issued to the permittee.
- The facility will be altered or expanded so that it will be used for either the same or a similar use as the use already permitted.
- The alteration or expansion will not result in a disproportionate increase in the size of the facility already permitted.
- The alteration or expansion will result in the same or substantially similar emissions as that of the facility already permitted.
- The alteration or expansion will not have a significant effect on air quality.
- The EMC is likely to issue the permit modification.

If the EMC determines that all of the forgoing criteria have been met, it must notify the permittee that alteration or expansion may begin. If the EMC determines that one or more of the conditions has not been met, the EMC must notify the permittee that alteration or expansion may not begin.

Order to Cease Construction, Alteration, or Expansion. – The act authorizes the EMC to order a permittee to cease construction, alteration, or expansion if the EMC determines that the permittee will not qualify for a permit or permit modification.

Administrative and Judicial Review of Permit Decisions. – The act prohibits the use of any evidence of prior financial investment, construction, alteration, or expansion undertaken, or economic loss incurred in a contested case or judicial proceeding by a person or permittee who proceeds with construction, alteration, or expansion without first obtaining a permit or permit modification.

State, EMC, and Employees Not Liable. – The act provides that the State, EMC, and their employees are not liable for any loss incurred by a person, permittee, or owner of a facility as a result of the enforcement of the provisions of the act.

Compliance With Other State Laws Not Affected. – The act does not relieve any person of the obligation to comply with any other requirement of State law.

Federal Air Quality Programs Not Affected. – The act does not affect a person's duty to comply with any federal requirement, federal delegation, federally approved requirement in any State Implementation Plan, or federally approved requirement under the Title V permitting program, nor does the act apply if it is inconsistent with any federal requirement.

Fee. – The act provides that an applicant or permittee shall pay a processing fee of $200 at the time of notification.

This act became effective August 19, 2003, and applies to construction of any new facility and alteration or expansion associated with the modification of a permit for an existing facility that commences on or after that date. (GG, TD)

Coastal Development

Erosion Control Structures

S.L. 2003-427 (HB 1028) authorizes the Coastal Resources Commission to adopt rules to establish a general permit for the construction of offshore sills for estuarine shoreline protection and wetland enhancement. The act also codifies the ban on the construction of new permanent erosion control structures in ocean shorelines and prohibits the construction of temporary erosion control structures in ocean shorelines using any material other than sandbags.

The provision establishing the general permit for the construction of offshore sills became effective July 1, 2003. The provision codifying the ban on the construction of permanent erosion control structures became effective August 19, 2003. (GG, TD)

Environmental Health

Consecutive Water System/Manufactured Homes

S.L. 2003-173 (HB 1201) expands the definition of "contiguous premises" so that landlords who rent spaces for manufactured homes or who rent manufactured homes, may meter the water consumption of each tenant and charge for actual water usage at the same cost the landlord pays the supplier of the water, plus an administrative charge set by the Utilities Commission.

This act became effective June 12, 2003. (TD)

Fisheries

Limit Shellfish Lease Area in Core Sound

S.L. 2003-64 (SB 765) limits the area of western Core Sound that may be leased for shellfish cultivation to the area that was subject to shellfish cultivation leases on June 30, 2003.

Core Sound is a body of water located between mainland Carteret County and Core Banks. A moratorium on issuing new shellfish cultivation leases in the western, mainland side of Core Sound was established May 1, 1996. This act allowed the moratorium to expire on July 1, 2003, but limited the area of western Core Sound available for shellfish cultivation leasing to the area that was subject to shellfish cultivation leases on June 30, 2003. On June 30, 2003, 95 acres of western Core Sound were subject to shellfish cultivation leases. Thus, the effect of the act is to limit shellfish cultivation leasing in western Core Sound to these 95 acres.

The act also:

- Expresses the intent of the General Assembly that the limitation on shellfish cultivation leasing in western Core Sound be permanent.
- Provides that shellfish cultivation leases in western Core Sound remain transferable.
- Directs the Division of Marine Fisheries in the Department of Environment and Natural Resources to report to the Joint Legislative Commission on Seafood and Aquaculture on or before January 1, 2004, on the implementation of the limitation on shellfish cultivation leasing in western Core Sound.

The shellfish leasing provisions became effective June 30, 2003. The study provision became effective May 20, 2003. (JH)

Amend Atlantic States Marine Fisheries Commission Appointment

S.L. 2003-92 (SB 979) authorizes the Governor to appoint the legislative member of North Carolina's delegation to the Atlantic States Marine Fisheries Commission (ASMFC) and deletes language that provides for Senate approval of the Governor's appointment of the citizen member of North Carolina's delegation to the ASMFC.

In 1940, Congress authorized the creation of the Atlantic States Marine Fisheries Compact (Compact) and the ASMFC for the better management and utilization of the fisheries of the Atlantic seaboard. The 1940 congressional act authorized the member states of the Compact to appoint three members each to the ASMFC: the executive branch officer responsible for the conservation of marine fisheries resources; a member of the state legislature appointed by the state commission on interstate cooperation or, if there is no commission on interstate cooperation, by the Governor; and a citizen with knowledge of and interest in marine fisheries issues appointed by the Governor. This congressional directive as to how a state is to appoint its members to the ASMFC is controlling and must be followed by a state that chooses to become a member of the Compact.

In 1949, the General Assembly enacted legislation to authorize North Carolina's entrance into the Compact and membership in the ASMFC. This legislation, as amended over time, provided that North Carolina's delegation would consist of the Director of the Division of Marine Fisheries in the Department of Environment and Natural Resources, a member of the General Assembly who is a member of and appointed by the North Carolina Commission on Interstate Cooperation, and a citizen member appointed by the Governor, with the advice and consent of the Senate.

In 1992, the General Assembly enacted legislation to abolish the North Carolina Commission on Interstate Cooperation. This legislation did not include a conforming change to the ASMFC appointment statute. This resulted in a statutory requirement that the legislative member of North Carolina's delegation to the ASMFC be a member of and appointed by a commission that no longer exists.

The act corrects this oversight by providing that the Governor will appoint the legislative member of North Carolina's delegation to the ASMFC. The act also deletes language that provides for the advice and consent of the Senate in the Governor's appointment of the citizen member of North Carolina's delegation to the Commission and makes a number of technical, clarifying, and conforming changes to the ASMFC appointment statutes.

This act became effective May 30, 2003. (JH)

Extend Coastal Habitat Protection Plan Adoption Deadline

S.L. 2003-111 (HB 1134) extends the deadline for the adoption of Coastal Habitat Protection Plans from July 1, 2003, to December 31, 2004.

In 1997, the General Assembly enacted the Fisheries Reform Act of 1997, which overhauled the licensing of marine fishing; required systematic, long-range planning for management of marine fisheries resources; increased penalties for violation of marine fisheries laws; and authorized a number of studies related to marine fisheries. The act also required the Department of Environment and Natural Resources to work with the Marine Fisheries Commission, the Environmental Management Commission, and the Coastal Resources Commission to jointly develop and adopt Coastal Habitat Protection Plans (Plans). The goal of the Plans is the long-term enhancement of marine fisheries through the protection of habitats important to these fisheries, such as wetlands, spawning grounds, nursery areas, shellfish beds, and submerged aquatic vegetation beds. Once the Plans are adopted, the three environmental rulemaking

commissions are required to ensure, to the maximum extent practicable, that their actions are consistent with the Plans.

This act became effective May 31, 2003. (JH)

Amend Fisheries Proclamation Process

S.L. 2003-154 (HB 987) authorizes the Director of the Division of Marine Fisheries to issue proclamations governing quota-managed fisheries that are effective immediately upon issuance.

The Marine Fisheries Commission (MFC) may delegate to the Director of the Division of Marine Fisheries in the Department of Environment and Natural Resources (Fisheries Director) the authority to issue proclamations suspending or implementing rules of the Commission that are affected by variable conditions. This act removes the proclamation provisions from G.S. 113-221 and recodifies them in new G.S. 113-221.1. This act amends the recodified proclamation provisions to provide that a proclamation that governs a quota-based fishery may be made effective immediately upon issuance. This act also:

- Provides that a person who violates a proclamation that is made effective immediately upon issuance may not be charged with a criminal offense for the violation if the violation occurred between the time of issuance and 48 hours after the issuance and the person did not have actual notice of the issuance of the proclamation.
- Expands the authority of the MFC to call an emergency meeting to review proclamation issues to include review of the desirability of directing the Fisheries Director to issue a proclamation to prohibit the taking of certain fisheries resources.
- Makes technical, clarifying, and conforming changes to existing G.S. 113-221 and new G.S. 113-221.1.

This act became effective July 1, 2003. (JH)

Parks and Public Spaces

State Parks added to State Park System

S.L. 2003-106 (HB 1078) and S.L. 2003-108 (HB 1025) authorize the Department of Environment and Natural Resources (DENR) to add Mayo River State Park and Haw River State Park, respectively, to the State Parks System. G.S. 113-44.14(b) provides that DENR may add a State park, State natural area, State recreation area, State trail, State river, or State lake to the State Parks System upon authorization by an act of the General Assembly.

Mayo River State Park will be located in northwestern Rockingham County. The Mayo River is a popular recreational river, with whitewater for canoeing, kayaking, and rafting near the Virginia state line. Mixed hardwoods dominate the rough and hilly scenic corridor. Steep slopes, numerous outcrops, and a mosaic of soil types result in an unusual assemblage of plant communities. At least nine rare species are known to occur along the river, as well as the State's best example of the Piedmont calcareous mafic cliff natural community type. The river valley also has a rich cultural history.

Haw River State Park will be located north of Greensboro along the border between Guilford and Rockingham Counties. The Haw River supports several natural communities within the river floodplain and on the adjacent bluffs and uplands. The river corridor contains a large collection of wetlands, including what may be the largest complex of beaver ponds in the Piedmont. There

are several areas with high quality upland forests, habitat for rare plant and animal species, and significant historic and archaeological resources.

Both parks will be located in a region of the State that is one of four areas identified in the 2000 Systemwide Plan for the North Carolina State Parks System as underserved by the current parks system, based on State park acres per capita. This area was identified as a high priority for the addition of new parks.

The boundaries of the proposed parks have not yet been determined. It is likely that both parks will include linear corridors protecting the water quality and natural resources of the rivers as well as one or more upland nodes at each park that will support State park facilities such as a visitor centers, campgrounds, picnic areas, trails, and river access. DENR is considering several different revenue sources to fund land acquisition for the new parks, including the Natural Heritage Trust Fund, the Clean Water Management Trust Fund, the Ecosystem Enhancement Program, and the Parks and Recreation Trust Fund. Park facilities will be constructed in future years when suitable land has been acquired for the parks.

These acts became effective May 31, 2003. (JM)

State Nature and Historic Preserve Additions and Removals

S.L. 2003-234 (SB 627) dedicates and accepts certain properties as part of the State Nature and Historic Preserve (Preserve), removes certain lands from the Preserve, and deletes Waynesborough State Park from the State Parks System. Section 5 of Article XIV of the Constitution of North Carolina establishes the Preserve, which is intended to insure that lands and waters acquired and preserved for public park, recreation, conservation, and historic preservation purposes continue to be used for these purposes. Upon inclusion in the Preserve, these lands may not be used for other purposes except as authorized by a law enacted by a vote of three-fifths of the members of each house.

The act:

- Dedicates and accepts into the Preserve over 6,700 acres of property added to the North Carolina Park System since the last acceptance of properties in 2001. This property includes Beech Creek Bog, Elk Knob State Natural Area, and Lea Island State Natural Area as new components of the Preserve.
- Removes the following properties from the Preserve:
  - A portion of a parcel at Crowders Mountain State Park is deleted in order to resolve multiple encroachments on the Park and to improve an irregular boundary in a section of the Park.
  - Portions of two parcels at South Mountains State Park that are needed for the realignment of Secondary Road 1904 within the Park.
  - A portion of a parcel at South Mountains State Park that contains the Walker Top Baptist Church is deleted in order to allow transfer of the property to the Trustees of the Church for use for church purposes, with a clause providing that the property shall revert to the State if it ever ceases to be used for church purposes.
  - A portion of a parcel at Eno River State Park that contains a scenic easement is deleted in order to allow for the exchange of easement areas with adjacent landowners. The easement area that the State will receive in exchange is greater than the easement area that is being removed and increases the width of the buffer that the State Park and easement provides to the Eno River.
- Amends the statute that directs the Secretary of State to forward a certified copy of the enacted law to the register of deeds of the counties in which the accepted properties are located, to require that the Secretary of State also forward copies of

the enacted law to the register of deeds of counties in which properties that have been removed from the Preserve are located.

- Deletes Waynesborough State Park from the State Parks System. The Systemwide Plan for the North Carolina State Parks System for 2000 through 2005 issued by the Division of Parks and Recreation of DENR recommended that the Park be removed on the basis that the Park does not contain the biological, archaeological or other resources that make it suitable for continued inclusion in the State Parks System. The Park is located on property that was once a landfill constructed by the City of Goldsboro in 1960. The City of Goldsboro, Wayne County, and the Old Waynesborough Historical Commission have expressed an interest in assuming ownership of the property. The Park closed in August 2002.

This act became effective June 19, 2003. (JM)

Study/Impact of Acquisition of Land for Conservation Purposes on Local Government Ad Valorem Tax Revenues

S.L. 2003-284, Sec. 11.7(HB 397, Sec. 11.7) directs the Property Tax Subcommittee of the Revenue Laws Study Committee to study the positive and negative impacts of the acquisition of land by the State and nonprofit organizations for conservation purposes on local government ad valorem tax revenues. The Subcommittee must report its findings to the Joint Legislative Commission on Governmental Operations, the Revenue Laws Study Committee, and the Fiscal Research Division.

The Subcommittee shall, by January 15, 2004, report its findings to the Joint Legislative Commission on Governmental Operations, the Revenue Law Study Committee and the Fiscal Research Division.

Solid Waste

Franchise Not Required Smokestacks Landfills

S.L. 2003-37 (HB 1205) exempts sanitary landfills that are used only to dispose of waste generated by a coal-fired generating unit that is owned or operated by an investor-owned utility subject to the "Clean Smokestacks Act" (S.L. 2002-4) from the requirement that a franchise be obtained for the operation of those landfills. Generally, an applicant for a new permit, a permit renewal, or a substantial amendment to a permit for a sanitary landfill, is required to obtain a franchise for the operation of the landfill from each local government with jurisdiction over any part of the land on which the landfill is located.

This act became effective May 14, 2003. (JM)

Underground Storage Tanks

Underground Storage Tank Program Amendments

S.L. 2003-352 (HB 897) makes the following changes to the Leaking Petroleum Underground Storage Tank (UST) Cleanup Program:

Cost-effectiveness. – The act provides that the Commercial Leaking Petroleum Underground Storage Tank Cleanup Fund (Commercial Fund) and the Noncommercial Leaking Petroleum

Underground Storage Tank Cleanup Fund (Noncommercial Fund) will not be used to reimburse costs in excess of those required to achieve the most cost-effective cleanup. An owner, operator, or landowner may select a cleanup method other than the cost-effective cleanup method approved by the EMC as long as the EMC determines that the alternative cleanup method will address imminent threats to human health and the environment. The Department of Environment and Natural Resources (DENR) will not, however, pay or reimburse costs in excess of the cost of implementing the approved cost-effective cleanup.

Performance-based cleanups. – The act authorizes DENR to use up to $250,000 of the funds in the Noncommercial Fund and $2,500,000 in the Commercial Fund during each fiscal year for performance-based cleanups of leaking UST sites. The act also provides that before a cleanup contract is awarded, the environmental service firm must secure a surety or performance bond equal to the price of the firm's services under the contract and must demonstrate having secured the bond to the satisfaction of DENR. The performance-based cleanup program is scheduled to expire on October 1, 2006.

Secondary containment. – The act authorizes the EMC to adopt rules to establish standards and requirements for secondary containment for nontank components of petroleum UST systems, including all piping and fittings, pump heads, and dispensers. The rules will apply to any new UST system that is installed on or after the date on which the rules become effective and to the replacement of any nontank component of an UST on or after that date.

Commingled plumes. – Under current law, a discharge or release of petroleum from an UST may be cleaned up to risk-based cleanup standards, but a discharge or release of petroleum from an aboveground storage tank must be cleaned up to State groundwater standards. The act provides that a plume of contamination that results from the commingling of contamination from a leaking UST and a leaking aboveground storage tank may be cleaned up to risk-based standards. The Commercial Fund and Noncommercial Fund may only be used to pay or reimburse the portion of the costs of assessment or remediation that result from the leaking UST.

Preapproval and cleanup schedule. – The act directs DENR to establish the degree of risk to human health and the environment posed by a discharge or release from a leaking commercial UST and to determine a schedule for further assessment and cleanup based on those factors. If any of the costs of assessment or cleanup are eligible to be paid from the Commercial Fund, DENR must also consider the availability of funds in the Commercial Fund. Once DENR has established a cleanup schedule, the costs of any assessment or cleanup activities are not eligible for reimbursement from the Commercial Fund until the actions are authorized by DENR pursuant to the schedule. An owner, operator, or other person may choose to undertake assessment or cleanup before receiving authorization from DENR, but the costs for the assessment or cleanup will only be reimbursed after DENR has paid or reimbursed the costs for all assessments and cleanups authorized by DENR. The preapproval requirements will expire on October 1, 2005.

Testing requirements. – The act authorizes the EMC to adopt rules to modify testing requirements in order to reduce costs associated with the assessment and cleanup of discharges and releases of petroleum from leaking petroleum UST cleanup sites.

Study UST Program. – The act authorizes the Environmental Review Commission (ERC) to study the following issues related to the UST program:

- The adequacy of program funding.
- Options for management of available funds, including prioritization of cleanups and preapproval of cleanups.
- Changes in deductible and co-payment requirements.
- Options to increase program funding.
- The availability and use of private insurance to pay or reimburse the costs of the assessment and cleanup of releases and discharges of petroleum from petroleum USTs and of any liability of owners and operators of those tanks to third parties.

- Issues related to the inclusion of aboveground storage tanks in the program, including registration, fees and other funding issues, cleanup standards, and regulation of these tanks.
- Issues related to the provision of liability protection to a bona fide purchaser of a petroleum-contaminated property who has knowledge of, but did not cause or contribute to, the contamination of the property.

The ERC may report its findings and recommendations, including any proposed legislation, to the 2004 Regular Session of the 2003 General Assembly, or to the 2005 General Assembly.

This act became effective July 27, 2003. The preapproval requirements expire on October 1, 2005. (GG, TD)

Water Quality/Quantity/Groundwater

General Nondischarge Permits/Animal Operations

S.L. 2003-28 (SB 733) directs the Department of Environment and Natural Resources (DENR) to extend the expiration of general permits for animal waste management systems for swine, cattle, and poultry operations and of the certificates of coverage issued under these general permits that were set to expire on April 30, 2003, to October 1, 2004. The act also directs DENR to study the use of general non-discharge permits for animal waste management systems for swine, cattle, and poultry operations, including the impact on land application and potential discharge of nitrogen and phosphorous to surface water and groundwater in the State. DENR will conduct the study in consultation with the Department of Agriculture and Consumer Services; the College of Agriculture and Life Sciences at North Carolina State University; representatives of swine, cattle, and poultry farmers; representatives of environmental protection and natural resources conservation groups; and other interested parties. In the course of the study, DENR will prepare and circulate draft revised general permits for these operations, along with drafts of the forms that farmers would be required to use in connection with these permits, among interested parties for comment. DENR may, consistent with water quality protection goals and strategies, further revise the draft general permits and associated forms on the basis of comment from interested parties. DENR will report its findings and recommendations to the Environmental Review Commission on or before March 1, 2004.

This act became effective April 30, 2003. (JM)

Monitor Coastal Water Quality

S.L. 2003-149 (SB 959) authorizes the Commission for Health Services to adopt rules regarding monitoring of coastal recreation waters in order to implement the federal Beaches Environmental Assessment and Coastal Health Act of 2000. The rules will address definitions, surveys, sampling, action standards, and posting of information on the water quality of coastal recreation waters. The act also provides that a person who removes or destroys a sign posted to convey information on the water quality of coastal recreation waters is guilty of a Class 2 misdemeanor.

This act became effective June 4, 2003, except that the criminal penalty provision becomes effective December 1, 2003, and applies to offenses committed on or after that date. (JM)

Extend Swine Moratoria

S.L. 2003-266 (SB 593) extends the moratoria on the issuance of a permit by the Environmental Management Commission for the construction of a new swine farm or expansion of an existing swine farm from September 1, 2003, until September 1, 2007. These moratoria were first established in 1997 by S.L. 1997-458 and were extended in 1998, 1999, and 2001. The act allows time for the completion of ongoing studies of animal waste management technologies and related research and allows for the implementation of any legislation that may be enacted as a result of the studies.

This act became effective June 26, 2003. (TD)

Cost Share Funds for Limited Resource/New Farmers

S.L. 2003-284, Sec. 11.6 (HB 397, Sec. 11.6) provides that the limitation on the State share of agriculture cost share funding will be increased from 75% to 90% if the assisted farmer is a limited-resource farmer or a beginning farmer. The assisted farmer will be responsible for providing 10% of the funding, which may include in-kind support. Awards of agriculture cost share funding under this allocation formula are limited to $100,000 per year per farmer. A "beginning farmer" is a farmer who has not operated a farm or who has operated a farm for not more than 10 years. A "limited-resource farmer" is a farmer with direct and indirect gross farm sales that do not exceed $100,000.

This section became effective July 1, 2003. (JH)

Local Water Supply Plans

S.L. 2003-387 (HB 1062) requires a community water system that regularly serves 1,000 or more service connections or 3,000 or more individuals to comply with the local water supply planning requirements that apply to local governments. The act requires these community water systems and local governments to include in their local water supply plans a description of how the community water system or local government will respond to water shortage emergencies and continue to meet essential public water supply needs. The act directs the Department of Environment and Natural Resources to establish a Drought Management Advisory Council (Council) in order to enhance coordination among governmental bodies in order to improve the management and mitigation of the harmful effects of drought, and to provide consistent and accurate information to the public about drought conditions. The act authorizes the Council to assist local governments and other water users in taking appropriate drought response actions by issuing drought advisories that designate:

- Specific areas of the State where drought conditions are impending.
- Specific areas of the State as suffering from drought conditions.
- The level of severity of drought conditions.

This act became effective August 7, 2003. The first local water supply plans prepared by community water systems are due on or before January 1, 2004. (JM)

Swift Creek Reclassification

S.L. 2003-433 (HB 566) approves, effective August 1, 2003, portions of two administrative rules, 15A NCAC 2B.0225 (Outstanding Resource Waters) and 15A NCAC 2B.0316 (Tar-Pamlico River Basin), that reclassify a 14-mile stretch of Swift Creek to Outstanding Resource Waters (ORW) and impose an ORW management strategy on all waters and lands that

are located west of Nash County State Road 1003 (Red Oak Road). The act also provides that portions of the rules that impact all waters and lands that are located east of Nash County State Road 1003 (Red Oak Road) shall become effective only as the 2004 Regular Session of the 2003 General Assembly may provide by law. The act also authorizes the Environmental Review Commission to identify and evaluate options to protect water quality and endangered species in the portion of Swift Creek and its watershed in the Tar-Pamlico River Basin that are located east of Nash County State Road 1003 (Red Oak Road) and report its findings to the 2004 Regular Session of the 2003 General Assembly.
This act became effective August 19, 2003. (GG, JM)

Miscellaneous

Protect Certain Reptiles and Amphibians

S.L. 2003-100 (SB 825) authorizes the Wildlife Resources Commission (Commission) to adopt rules limiting, regulating, or prohibiting the taking, possession, transportation, collection, purchase and sale of species of Amphibia and Reptilia that do not meet the criteria for listing as a protected species, but that the Commission has determined require conservation measures to prevent the species from becoming listed. The Commission may not adopt rules to prohibit the taking of species solely to protect persons, property, or habitat. The rules must allow for the possession of 4 or fewer reptiles and 24 or fewer amphibians.

The act also prohibits the commercial taking of all species of turtles or terrapins in the families Emydidae and Trionychidae until the Commission adopts rules to regulate their taking. The turtles covered include the large basking turtles and sliding turtles. Commercial taking is defined as the taking, possession, collection, transportation, purchase or sale of five or more individual turtles from either of the two families. Persons who violate the turtle or terrapin provisions are guilty of a misdemeanor punishable as set forth in G.S. 113-135; however, this does not apply to licensed veterinarians, bona fide zoos operated by the federal government, the State or a local government, or to bona fide scientific, biological, medical, or veterinary education or research.

The provision relating to Amphibia and Reptilia became effective May 31, 2003. The provision relating to turtles or terrapins became effective July 1, 2003, and applies to offenses committed on or after that date. (BR)

Soil and Water Conservation Commission

S.L. 2003-198 (HB 727) amends the statute that specifies the membership of the Soil and Water Conservation Commission to allow members of the Commission to concurrently hold one elective office and one other appointive office or two other appointive offices.

This act became effective June 13, 2003. (JM)

Express Review Pilot Program

S.L. 2003-284, Sec. 11.4A (HB 397, Sec. 11.4A) authorizes the Department of Environment and Natural Resources (DENR) to develop the Express Review Pilot Program (Program). Under the Program, DENR will provide expedited review of certain environmental permits, approvals, and certifications and may charge fees higher than those set by statute for the normal review process. DENR will determine which project applications will receive express review from those submitted by applicants who request to participate in the Program. The Program may apply to

permits, approvals, or certifications under the erosion and sedimentation control program, the coastal management program, and the water quality programs, and will focus on stormwater permits, stream origination certifications, water quality certifications, erosion and sedimentation control permits, and Coastal Area Management Act permits. DENR may establish up to eight positions to administer the Program. No later than May 1, 2004, DENR will report to the General Assembly regarding its findings on the Program and whether the Program should be continued or expanded.

This section became effective July 1, 2003. (JH)

Environmental Permits on Department of Transportation Construction Projects

S.L. 2003-284, Sec. 29.6 (HB 397, Sec. 29.6) provides that any permit required for a Department of Transportation project and issued by the Department of Environment and Natural Resources, or any agency within that Department, remains in effect until the project is completed, subject to exceptions listed in the section.

This section became effective July 1, 2003.

Metropolitan Planning Organizations/Rural Transportation Planning Organizations Transportation Planning Funding

S.L. 2003-284, Sec. 29.14 (HB 397, Sec. 29.14) does the following:

- Authorizes any lead planning agency for a Metropolitan Planning Organization in a nonattainment or maintenance area under the Federal Clean Air Act to apply to the Department of Transportation for funds to avoid a plan conformity lapse; and
- Authorizes any regional transportation planning agency in a nonattainment or maintenance area under the Federal Clean Air Act to apply to the Department of Transportation for funds to support local transportation planning efforts.

This section became effective July 1, 2003.

Department of Environment and Natural Resources Fees

S.L. 2003-284, Secs. 35.1 and 35.1A (HB 397, Secs. 35.1 and 35.1A) provide that the Department of Environment and Natural Resources (DENR) may collect reasonable fees for:

- Vehicle access for off-road driving at the beach at Fort Fisher State Recreation Area.
- The erection, maintenance, and use of a marina at Carolina Beach.
- The use of boats and other watercraft that are purchased and maintained by DENR.

These sections also make a number of technical, clarifying, and conforming changes to G.S. 113-34 and G.S. 113-35, which govern State forests and State parks.

These sections became effective July 1, 2003. (JH)

Amend Environmental Laws

S.L. 2003-340 (SB 824) makes changes to various environmental laws as follows:

- Makes clarifying, conforming, and technical changes and corrections to various environmental statutes.

- Recodifies Article 13A (Clean Water Management Trust Fund) of Chapter 113 (Conservation and Development) of the General Statutes as a new Article 18 of Chapter 113A (Pollution Control and Environment) of the General Statutes.
- Modifies the reporting requirements on implementation of the performance-based cleanup program for underground storage tanks to conform with the annual reporting requirement for the consolidated report on the Leaking Petroleum Underground Storage Tank Cleanup Program, which is due on September 15 of each year.
- Expands what constitutes a permissible base of operations for a pushcart or mobile food unit to include commissaries.
- Increases by two the membership of the Environmental Review Commission.
- Extends by one year the time that temporary rules to protect water quality and riparian buffers in the Catawba River Basin will remain in effect.
- Extends the pilot program for inspection of animal waste management systems by two years and amends the reporting requirement for the pilot program.
- Establishes an exemption to the Moore County moratorium on swine farm and swine waste management system expansion or construction.

This act became effective July 27, 2003. However, the provision that extends the time period that temporary rules protecting water quality and riparian buffers in the Catawba River Basin will remain in effect, became effective retroactively to June 30, 2003. (GG, JM)

Clean Water Management Trust Fund Board Terms

S.L. 2003-422 (SB 831) staggers the terms of members of the Clean Water Management Trust Fund Board of Trustees (Board) to facilitate a regular interval of appointments and expirations. When fully implemented, the staggered four-year cycle will result in the expiration of five terms in each of years one through three and six terms in year four. The act increases the appointments made to the Board by the Governor from six to seven and increases the appointments made upon the recommendation of the President Pro Tempore of the Senate and the Speaker of the House of Representatives from six to seven each. The act also establishes a uniform date for the expiration of terms (July 1) and makes clarifying changes to the statutes regarding vacancies and quorum for the Board to conform to the provisions of similar appointive bodies.

This act became effective July 1, 2003, except that the act is effective retroactively to December 31, 2002 with respect to the term of any person whose term as a member of the Board would otherwise have expired on December 31, 2002. (TD)

Studies

Referrals to Existing Commissions/Committees

General Nondischarge Permits/Animal Operations

S.L. 2003-28, Sec. 2 (SB 733, Sec. 2) directs the Department of Environment and Natural Resources (DENR) to study the use of general non-discharge permits for animal waste management systems for swine, cattle, and poultry operations, including the impact on land application and potential discharge of nitrogen and phosphorous to surface water and groundwater in the State. DENR will conduct the study in consultation with the Department of

Agriculture and Consumer Services; the College of Agriculture and Life Sciences at North Carolina State University; representatives of swine, cattle, and poultry farmers; representatives of environmental protection and natural resources conservation groups; and other interested parties. In the course of the study, DENR will prepare and circulate draft revised general permits for these operations, along with drafts of the forms that farmers would be required to use in connection with these permits, among interested parties for comment. DENR may, consistent with water quality protection goals and strategies, further revise the draft general permits and associated forms on the basis of comment from interested parties. DENR will report its findings and recommendations to the Environmental Review Commission on or before March 1, 2004.

This section became effective April 30, 2003. (JM)

Underground Storage Tank Program Amendments

S.L. 2003-352, Sec. 12 (HB 897, Sec. 12) authorizes the Environmental Review Commission (ERC) to study the following issues related to the Leaking Petroleum Underground Storage Tank (UST) cleanup program:

- The adequacy of program funding.
- Options for management of available funds, including prioritization of cleanups and preapproval of cleanups.
- Changes in deductible and co-payment requirements.
- Options to increase program funding.
- The availability and use of private insurance to pay or reimburse the costs of the assessment and cleanup of releases and discharges of petroleum from petroleum USTs and of any liability of owners and operators of those tanks to third parties.
- Issues related to the inclusion of aboveground storage tanks in the program, including registration, fees and other funding issues, cleanup standards, and regulation of these tanks.
- Issues related to the provision of liability protection to a bona fide purchaser of a petroleum-contaminated property who has knowledge of, but did not cause or contribute to, the contamination of the property.

The ERC may report its findings and recommendations, including any proposed legislation, to the 2004 Regular Session of the 2003 General Assembly, or to the 2005 General Assembly.

This section became effective July 27, 2003. (TD)

Swift Creek Reclassification

S.L. 2003-433, Sec. 3 (HB 566, Sec. 3) authorizes the Environmental Review Commission to identify and evaluate options to protect water quality and endangered species in the portion of Swift Creek and its watershed in the Tar-Pamlico River Basin that are located east of Nash County State Road 1003 (Red Oak Road) and report its findings to the 2004 Regular Session of the 2003 General Assembly.

This section became effective August 19, 2003. (JM)

Pending Legislation

Coastal Recreational Fishing License

HB 831 (Sixth Edition) would establish a program for the licensing of coastal recreational fishing. An annual Coastal Recreational Fishing License (CRFL) would cost $10. An individual could engage in coastal recreational fishing without holding a CRFL if the individual:

- Is under 16 years of age.
- Is 62 years of age or older.
- Holds a Standard Commercial Fishing License or a Retired Standard Commercial Fishing License.
- Holds a Lifetime Resident Comprehensive Fishing License or a Lifetime Sportsman License.
- Is fishing from a public bridge.
- Is fishing from the shore or a shore-based structure.
- Is fishing with hook and line in the county of the individual's residence using natural bait.

Fees collected from the sale of CRFLs would be credited to the General Fund and could be used only for the management, protection, restoration, and enhancement of the marine resources of the State.

HB 831 would authorize the Department of Environment and Natural Resources to use up to $1,100,000 for the 2003-2004 fiscal year and up to $2,000,000 for the 2004-2005 fiscal year of funds appropriated by the 2003 Budget Bill (S.L. 2003-284) to implement the licensing program. HB 831 also provides that no funds appropriated to the Division of Forest Resources or the Division of Soil and Water Conservation may be used to implement the licensing program.

This bill is pending in the Senate Agriculture/Environment/Natural Resources Committee. (JH)

Clean Air Trust Fund

HB 866 (First Edition) and SB 981 (First Edition) would establish the Clean Air Trust Fund (Fund). The purpose of the Fund is to finance projects to protect and restore air quality and to prevent and reduce emissions of various air pollutants. State agencies, local governments, and nonprofit corporations with an environmental purpose are eligible to apply to the Fund for grants and loans. The acts would also establish the Clean Air Trust Fund Board of Trustees, which would develop criteria for awarding grants and loans, and the Clean Air Trust Fund Advisory Council, which would advise the Board of Trustees with regard to criteria, guidelines, and allocations made from the Fund.

The House Bill is pending in the House Environment and Natural Resources Committee. The Senate Bill is pending in the Senate Agriculture/Environment/Natural Resources Committee. (TD)

Improve Environmental Enforcement

HB 868 (Second Edition) and SB 911 (Second Edition) would:

- Add a civil penalty of up to $10,000 for the first day of a violation of the Sedimentation Pollution Control Act of 1973 or ordinance, rule, or order adopted pursuant to the act.
- Increase the maximum amount of the civil penalty that may be assessed for a minor development violation under the Coastal Area Management Act of 1974 (CAMA) from $250 to $1,000. HB 868 would also increase the maximum amount of the civil penalty that may be assessed for a major development violation under CAMA from

$2,500 to $25,000. SB 911 would increase the maximum amount of this penalty from $2,500 to $10,000.

- Authorize the assessment of reasonable costs of any investigation, inspection, or monitoring that results in the imposition of a civil penalty for major and minor development violations under CAMA.
- Provide that the Secretary of Environment and Natural Resources or a local health director may institute an action for injunctive relief against a person who violates an order issued pursuant to Chapter 130A of the General Statutes. This authority would be in addition to existing authority under the Statute to institute actions for injunctive relief for violations of the Chapter, or any rule adopted by the Commission for Health Services or a local board of health.
- Increase the maximum amounts of certain administrative penalties that may be assessed for violations of Article 9 (Solid Waste Management) and Article 11 (Wastewater Systems) of Chapter 130A of the General Statutes.
- Add a penalty for false reporting under the North Carolina Drinking Water Act.
- Repeal a 10% cap on actual costs of collection that may be deducted from civil penalties and civil forfeitures that are collected and payable to the County School Fund.

The House Bill is pending in the Senate Agriculture/Environment/Natural Resources Committee. The Senate Bill is pending in the Senate Finance Committee. (JM)

Establish Electronics Recycling Program

HB 878 (First Edition) and SB 970 (First Edition) would impose a privilege tax on electronic devices that contain cathode ray tubes (i.e., in general, televisions and computer monitors) in order to establish an electronics recycling program and to provide local governments with funds to implement the program. Effective January 1, 2007, the bills would also prohibit the disposal of certain electronic devices in landfills and permitted incinerators.

The House Bill is pending in the House Environment and Natural Resources Committee. The Senate Bill is pending in the Senate Finance Committee. (TD)

Certification of Wastewater Site Evaluators

HB 912 (First Edition) and SB 907 (First Edition) would direct the Water Pollution Control System Operators Certification Commission (Commission) to establish a certification and training program for wastewater system site evaluators. Effective July 1, 2005, the bills would require a certified site evaluator to review and certify all wastewater system permits applications before submission to a local health department, and would require all wastewater system permits applications be reviewed and approved or denied only by a certified site evaluator employed by the local health department. The bills would increase the membership of the Commission from 11 to 13 members, reconfigure the qualifications for each individual commission seat, and provide for a system of staggered three-year terms.

The House Bill is pending in the House Finance Committee. The Senate Bill is pending in the Senate Agriculture/Environment/Natural Resources Committee. (TD)

Sedimentation Act Amendments

HB 953 (First Edition) would:

- Require self-inspection of an area covered by an approved erosion and sedimentation control plan by the person who submitted the plan or the person's agent.
- Raise the fee for the review of an erosion and sedimentation control plan to $150 per acre from a maximum of $50 per acre.
- Allow a local government with an approved erosion and sedimentation control program to regulate land-disturbing activities conducted by that local government.
- Require exposed slopes to be planted or provided with ground cover within 10 working days or 21 calendar days, whichever is shorter, of completion of any phase of grading.
- Authorize a local government to establish a limited erosion and sedimentation control program. Under a limited program, the local government would be responsible for inspecting land-disturbing activities. The Division of Land Resources of the Department of Environment and Natural Resources (DENR) would be responsible for all other program functions (e.g. plan approval and enforcement).
- Require DENR to report annually to the Environmental Review Commission on the implementation of the Sedimentation Pollution Control Act of 1973.

This bill is pending in the House Environment and Natural Resources Committee. (JM)

North Carolina Climate Action Registry

HB 1045 (First Edition) and SB 863 (First Edition) would establish the North Carolina Climate Action Registry (Registry). The primary purpose of the Registry is to promote the voluntary reduction of greenhouse gas emissions in the State. The bill defines greenhouse gases to include carbon dioxide, methane, oxides of nitrogen, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. The bills directs the Department of Environment and Natural Resources to adopt rules to establish monitoring and tracking systems for greenhouse gas emissions in the State, to establish programs to promote participation in the Registry, to encourage companies and organizations to establish greenhouse gas emissions reduction goals, and to adopt a uniform format for reporting emissions baselines and reductions in order to facilitate their recognition in any future regulatory scheme. Participation in the Registry would be voluntary.

The House Bill is pending in the House Environment and Natural Resources Committee. The Senate Bill is pending in the Senate Agriculture/Environment/Natural Resources Committee. (TD)

Certify On-Site Wastewater Contractors

HB 1127 (First Edition) and SB 927 (First Edition) would create the nine-member North Carolina On-Site Wastewater Contractors and Inspectors Certification Board (Board) to establish training and certification requirements for personnel involved in the construction, installation, repair, and inspection of on-site wastewater systems. Effective July 1, 2005, the bills would prohibit the construction, installation, repair, or inspection of an on-site wastewater system in the State by non-certified personnel.

The House Bill is pending in the House Finance Committee. The Senate Bill is pending in the Senate Agriculture/Environment/Natural Resources Committee. (TD)

Closure of Industrial Lagoons

HB 1145 (First Edition) would authorize the Environmental Management Commission to adopt rules governing the maintenance, operation, closure, and post-closure care of industrial lagoons. The bill would require an owner of an industrial lagoon to: (1) establish and maintain evidence of financial responsibility to ensure sufficient availability of funds for facility closure and post-closure

monitoring and corrective measures, (2) close the lagoon within one year of cessation of activities for which the lagoon was permitted, and (3) perform post-closure remediation activities that may be necessary to comply with applicable statutes and rules.

The bill would also require the Department of Environment and Natural Resources to perform closure or postclosure remediation activities for an industrial lagoon, if the lagoon's owner fails to do so. The bill would provide that any person owning the land on which an industrial lagoon is or has been located, or who owned the land while the lagoon was in operation, or who disposed of waste in the lagoon, shall have joint and several liability for closure or remediation costs that exceed the amount of financial responsibility established by the owner. The bill would also establish an annual fee of $1,000 for any treatment works for which a water quality permit is required that includes an industrial lagoon.

This bill is pending in the House Environment and Natural Resources Committee. (JM)

Phase Out Swine Waste Lagoons and Sprayfields

HB 1188 (First Edition) would:

- Delete the provision that establishes moratoria on the construction and expansion of swine farms and on lagoons and animal waste management systems for swine farms.
- Codify and make permanent performance standards for swine farm animal waste management systems (performance standards) established by the General Assembly in 1998.
- Provide that the Environmental Management Commission (EMC) may issue a permit for the construction, operation, or expansion of an animal waste management system only if the EMC determines that the system meets or exceeds the performance standards.
- Provide that an owner or operator of an animal waste management system that employs a lagoon and sprayfield system that is phased out pursuant to the provisions of the bill must close all of the components of the animal waste management system in compliance with all applicable federal and State laws.

This bill is pending in the House Environment and Natural Resources Committee. (JM)

Catawba River Basin Bi-State Advisory Commission

SB 859 (Second Edition) would establish the Catawba River Basin Bi-State Advisory Commission. The Commission would have no regulatory authority. The purposes of the Commission would be to:

- Provide guidance and make recommendations to local, state, and federal legislative and administrative bodies on the use, stewardship, and enhancement of the water and other natural resources within the Basin.
- Provide a forum for discussion of issues affecting the Basin's water quality, water quantity, and natural resources.
- Promote communication, coordination, and education among stakeholders.
- Undertake studies and publish reports related to water quantity, water quality and other natural resources of the Basin.

This bill is pending in the House Environment and Natural Resources Committee. (TD)

Summary of Funding for Environmental Initiatives
2003 Legislative Session

	FY 2003-04	FY 2004-05
Total Funding for Environmental Initiatives	**$500,000**	**$0**
Express Permitting Pilot Program	$500,000	$0

Prepared by Fiscal Research Division, December 2003

Status of Reports to the ERC Required by Law

Organized by topics: air quality, coastal issues, environmental health, fishing, general, hazardous substances, land quality, parks and conservation, solid waste, water quality, water quantity, wetlands

air quality

DAQ	Report To/ Authority	Report Due	Status*
Study issues related to monitoring emissions of mercury and the development and implementation of standards and plans to implement programs to evaluate available control technologies; shall estimate the benefits and costs of alternative strategies to	EMC, ERC S.L. 2002-4, Section 12	Annually (Interim 1 Sep 2003) (Findings 1 Sep 2005)	Sep 03 in
Study issues related to the development and implementation of standards and plans to implement programs to control emissions of carbon dioxide (CO2) from coal-fired generating units and other stationary sources; evaluate available control technologies and	EMC, ERC S.L. 2002-4, Section 13	Annually (Interim 1 Sep 2003) (Findings 1 Sep 2005)	Sep 03 in

MEMORANDUM

To: Members of the Environmental Review Commission
From: Tim Dodge, Research Assistant for Environmental Issues
Re: Reports distribution – February 2004

Attached to this memorandum are copies of the following reports submitted to the Environmental Review Commission since the last report distribution in March 2003 that are not scheduled to be presented orally at the 6 February 2004 Commission meeting.

READ-ONLY REPORTS

Air Quality:

1) *Annual report on the cost of the Title V Program.* Department of Environment and Natural Resources (DENR). 22 December 2003. Statutory Authority: G.S. 143-215.3A(c).

2) *Annual report on progress in increasing the use of alternative-fueled and low emission light duty cars and trucks in privately owned fleets.* DENR. 6 October 2003. Statutory Authority: G.S. 143-215.107C(c).

Coastal Management:

3) *Annual report on progress in developing and implementing coastal habitat protection plans.* Coastal Resources Commission, EMC, and Marine Fisheries Commission. 21 September 2003. Statutory Authority: G.S. 143B-279.8(e).

Hazardous Waste Management:

4) *Biennial report of the North Carolina Hazardous Waste Management Plan.* Division of Waste Management, DENR. 5 October 2003. Statutory Authority: G.S. 130A-294(i).

5) *Annual report on implementation of the resident inspectors program at commercial hazardous waste facilities.* Division of Waste Management, DENR. 5 September 2003. Statutory Authority: G.S. 130A-295.02(m).

Land Resources:

6) *Annual Report on the cost of implementing the Mining Act of 1971.* Division of Land Resources, DENR. 26 August 2003. Statutory Authority: G.S. 74-54.1(c).

Parks and Recreation / Land Conservation:

7) *Annual Report on the North Carolina Aquariums Fund.* Division of North Carolina Aquariums, DENR. 25 September 2003. Statutory Authority: G.S. 143B-289.44(d).

Water Quality:

8) *Semiannual report on the effectiveness of the Pilot Program for Inspection of Animal Waste Management Systems.* Division of Soil and Water Conservation, DENR. 17 October 2003. Statutory Authority: S.L. 2003-340, Sec. 6.2.

9) *Annual report on the Upper Neuse River Basin Association's activities and programs to develop a cooperative, comprehensive, integrated State-local watershed management plan for the upper Neuse River basin to serve as a model watershed management approach for river basins and subbasins in North Carolina.* Upper Neuse River Basin Association. 8 October 2003. Statutory Authority: S.L. 1998-212, Sec. 14.15.

10) *Annual Report on the Wastewater Discharge Elimination Program.* DENR. 15 December 2003. Statutory Authority: S.L. 2001-452, Sec. 2.9.

40 CFR 70.9

NOVEMBER 2003

DIVISION OF AIR QUALITY

DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES

EXECUTIVE SUMMARY

The original Clean Air Act was signed into law in 1963. However, it was the Clean Air Act of 1970, reviewed and amended by Congress in 1975 and 1977 that formed the basis of the federal air pollution control currently in place. Health-based national ambient air quality standards are the strategic basis of the Clean Air Act. The standards were to be met through the application of control technology that would reduce emissions continuously and result in improved air quality. Costs of technological capability were to be subordinated to public health protection requirements. Also, all requirements were to be national, with no facility having a competitive edge by having to meet less stringent controls. The Environmental Protection Agency (EPA) is responsible for carrying out the program.

Prior to the 1990 Clean Air Amendments, EPA set two kinds of National Ambient Air Quality Standards (NAAQS) specifying maximum acceptable levels of pollutants for outdoor air. Primary standards set limits that protect human health; secondary standards protect plants and animals. EPA set primary and secondary standards for six criteria pollutants: carbon monoxide, nitrogen oxides, lead, sulfur, sulfur dioxides, ozone and particulates. Eight substances were listed as hazardous air pollutants: asbestos, beryllium, mercury, vinyl chloride, radionuclides, inorganic arsenic, benzene, and coke oven emissions. National Emissions Standards for Hazardous Pollutants (NESHAPS) were promulgated for sources of seven of these pollutants.

Most air pollution comes from either stationary sources, such as factories, power plants and smelters, or mobile sources such as cars, trucks and airplanes. To limit mobile source pollution, controls were established for automobile emissions. EPA also set standards that applied to new industrial plants and existing ones that were substantially modified. Additionally, state governments were required to draw up State Implementation Plans (SIP's) that set out other measures to achieve acceptable air quality.

Congress mandated the Title V Permit Program, primarily for regulating major air pollution sources, under the Federal Clean Air Act Amendments of 1990. The North Carolina Environmental Management Commission (EMC) established the state Title V Permit Program in 1994 in accordance with state and federal laws and with guidance from the N.C. Clean Air Act Advisory Council. The state Division of Air Quality (DAQ) carries out the program, which received interim approval from the U.S. Environmental Protection Agency (EPA) on December 15, 1995 and final approval in October 2001. To date, the DAQ has issued 354 Title V permits. The division has about 26 additional applications under review and expects to issue all of the remaining initial Title V permits by early 2004.

The Clean Air Act requires that permit fees cover the entire cost of the Title V Program. In North Carolina, the revenue raised from Title V permit fees is close to the estimated cost of the program. This is true even though the total fees collected are only about 78 percent of the minimum fees presumed necessary to run the program under the Federal

Clean Air Act. Many other states charge the minimum presumptive fee, which is $25 per ton in 1990 dollars. The permanent staff size for carrying out North Carolina's Title V program is considered adequate, given the current number of permit applications, the known program requirements, and the DAQ's experience with the program. Contract personnel were, until December 2002, used to assist in the completion of the work on the initial round of permit applications.

The following additional points are provided to clarify/highlight the information provided in this report:

- The issuance of permits is progressing in a satisfactory manner. The prospect of meeting the Divisions goal of completing the first round of permit issuance in the first quarter of 2004 is good.

- The Division has been able to run a fiscally sound program collecting less in fees than was authorized by the oversight committee at the start of the program.

- The break down of staff between the Central Office and the Regional Offices has adequately covered the needs of the Division to date. This distribution will be reviewed after the issuance of the initial Title V Permits has been completed.

INTRODUCTION

This Accountability Report describes the Title V Permit Program in North Carolina as carried out by the Division of Air Quality, Department of Environment and Natural Resources. The report focuses on funding and staffing issues. It does not cover Title V permit programs under the jurisdiction of local air pollution control programs in Buncombe, Forsyth, and Mecklenburg counties.

Congress established the Title V Permit Program under the Federal Clean Air Act (1990 Amendments), primarily as a way to regulate major air pollution sources. Under the Clean Air Act, Title V Permits are required for certain industry groups as designated by the EPA as well as facilities that emit at least:

- 100 tons per year of most regulated pollutants; or
- 10 tons per year of any hazardous air pollutant; or
- 25 tons per year of any combination of hazardous air pollutants.

In North Carolina, the General Assembly enacted laws in 1991 and 1993 authorizing the Title V program. The legislature also established the North Carolina Clean Air Act Advisory Council to develop the programs needed to comply with the Clean Air Act, including the structure of the Title V permit fees. The Clean Air Act Advisory Council issued a final report in August 1992, and the Environmental Management Commission followed the council's recommendations in adopting rules for the state Title V Permit Program in 1994. The EPA gave interim approval to North Carolina's Title V Permit Program on December 15, 1995, with final approval pending certain rules changes, which have been submitted to EPA. Final approval was given in October 2001.

The Clean Air Act as well as the General Assembly, the EPA, the EMC and the Clean Air Act Advisory Council all required or recommended accountability measures for the state Title V program. This Accountability Report includes:

- A discussion of program accomplishments and goals;
- A detailed description of the Title V permit fee structure for calendar year 2003;
- A detailed, line-item budget for state fiscal year 2003;
- An organizational chart for total staff in the Division of Air Quality and Title V related positions; and
- An account of Title V receipts and expenditures from state fiscal year 1992 to 2002;

The Division of Air Quality started receiving Title V permit applications after EPA's interim approval of the program on December 15, 1995. Facilities were given until December 1996 to submit their applications or they would be considered in violation of the permitting rules. Applications received during the aforementioned timeframe were called "Initial Title V Applications" and all other Title V applications received after December 1996 were called "First Time Title V Applications". By January 1998, DAQ had 475 Title V applications under review. Since program approval the DAQ has received a total of 558 Title V applications (488 initial and 70 first time). To date DAQ has issued 354 initial Title V permits and expects to issue 24 of the remaining 26 permits

by December 2003. The issuance of the last two permits has been delayed by the need for public hearings. One hundred and eight of the initial Title V applications have been withdrawn due to reclassification or closure. To date DAQ has issued 45 of the First Time Title V permits and is currently reviewing 47 applications. Four of the First Time Title V applications have been withdrawn. Currently, DAQ has 402 operating facilities classified as Title V facilities.

Questions about this accountability Report or request for copies should be directed to Charles Valrie, Division of Air Quality, Department of Environment and Natural Resources, 1641 Mail Service Center, Raleigh, NC 27699-1641; telephone (919) 715-6281; email: Charles.Valrie@ncmail.net.

ACCOMPLISHMENTS AND GOALS

The Division of Air Quality (DAQ), the Department of Environment and Natural Resources (DENR), and the North Carolina Environmental Management Commission (EMC) have accomplished the following measures in developing and carrying out a Title V Permit Program in North Carolina. Goals are included where applicable.

1. The DAQ has established a Title V Permit Program based on rules adopted by the EMC (15A NCAC 2Q .0500). The program meets the requirements of state law (N.C.G.S. §§143-215.3 and 143-215.108) that authorized the program in North Carolina and set up the North Carolina Clean Air Act Advisory Council. The EPA gave interim approval to the program in 1995, and following the DAQ's revision to the Title V regulations; EPA gave final program approval in October of 2001.

2. In 2002 the DAQ revised the Title V application forms including the development of special forms for the renewal of Title V permits. These revised forms are intended to facilitate the application process, and they have been placed on the Division's website (http://daq.state.nc.us).

3. The DAQ has developed a permit fee schedule that generates an appropriate amount of revenue to carry out the Title V permitting program. The Federal Clean Air Act requires that Title V permit holders pay fees sufficient to cover the cost to administer the permitting program. The DAQ will continue to evaluate the fee structure to ensure that the necessary fees are collected.

4. The DAQ has hired approximately 139 staff members to operate the Title V program since it started in 1992. The total staff size is still smaller than the projected size from the Final Report of the Clean Air Act Advisory Council and has remained constant for several years. There are no plans to increase the number of positions funded by the Title V fees above the current level.

5. DENR has established a Small Business Assistance Program, hired a Small Business Ombudsman, and appointed a Compliance Advisory Panel to conduct citizen overview of small business activity.

6. The DAQ continues to hold meetings, including quarterly Outside Involvement Committee meetings, to provide guidance and allow citizen input into DAQ's permitting and planning procedures.

7. DAQ provided and continues to provide a range of options to qualify facilities as Non-Title V facilities. Many facilities have taken advantage of these options, which is one of the reasons why the number of Title V facilities is much less than initial estimates; that is, 402 Title V facilities now versus the 2000 estimated in the Clean Air Act Advisory Council's Final Report. For example, the DAQ established the synthetic minor program so facilities could avoid the Title V permitting program by taking permitted emission limits and/or operating restrictions. Also, the EMC adopted and EPA approved exclusionary rules to

allow reasonable potential emission calculations in cases where standard methods would produce unreasonably high potential emissions thus subjecting such facilities to Title V. **Goal:** The DAQ will continue to issue appropriate permits to qualified facilities that wish to remain non-Title V facilities.

8. To Date DAQ has received 402 Title V permit applications and issued 354 (380 initial and 22 others). **Goal:** DAQ will issue 24 of the remaining 26 initial permits by the end of December 2003.

9. In 1994 the DAQ conducted its first comprehensive emissions inventory for all facilities in North Carolina. This comprehensive inventory process has been repeated every three years for all sources while Title V facilities are required to submit an inventory annually. This emission information is stored on a computer database that the DAQ uses to calculate fees and for use in regulatory planning. **Goal:** The DAQ has started to develop an electronic on-line inventory system and the system was made available to permittees to use in 2003.

CALENDAR YEAR 2003 PERMIT FEES TABLE

NOTES AND EXPLANATION

The federal Clean Air Act requires that the entire cost of the Title V Permit Program, including both direct and related expenses, be funded by facilities' permit fees and that Title V permit fees be used only for this purpose. The Clean Air Act also set a presumptive minimum for total fees at $25 per ton of air pollutant emissions in 1990 dollars, with a cost-of-living escalator that has raised this minimum to $36.60 in 2002 dollars. The Title V permit fees schedule for North Carolina now yields only 78 percent of the presumptive minimum. However, DAQ considers this amount adequate to run the program as long as all other funding sources for DAQ remain unchanged. The Title V permit fees are required by Federal Statues and DAQ rules to be adjusted each January 1st by an official cost-of-living factor from the U.S. Environmental Protection Agency.

The Clean Air Act Advisory Council (Council) established by the General Assembly recommended in 1992 that the Title V permit fees should total $25 per ton of emission (adjusted annually for cost-of-living from the 1990 base), rather than the $36.45 per ton shown by the workload analysis in the Council's Final Report. The Council recommended this level so North Carolina could remain competitive with neighboring states — most of which were expected to use the $25/ton plus inflation presumptive minimum — and because of the many uncertainties in the program at that time.

The council also considered the fairness of basing fees entirely on the amount of pollutants emitted, rather than on the amount of work required to administer Title V permits for various types of facilities. Because some work is required to issue every Title V permit, regardless of the facility's emissions, the Council recommended that half of the total Title V permit fees come from an applications fee (an annual flat fee for each permit) and the other half of the revenues come from annual per-ton charges.

A major uncertainty during the Council's work was the number of facilities that would be required to hold Title V permits and their emissions levels. This existed because a comprehensive emission inventory had never been required for all facilities. Since the Council concluded its work, the EPA has issued many regulations, policies, clarifications, and changes to the Title V program, and the state has responded accordingly.

The state also has shown flexibility in the Title V program by using size exclusions for some industry groups (such as service stations, grain elevators, dry cleaners and emergency generators) and by allowing facilities to adopt permit limits that reduce their potential emissions below the Title V thresholds (known as synthetic minor sources). As a result, the number of Title V facilities has decreased from an estimated 2,000 in the Clean Air Act Advisory Council's Final Report, to 850 when the Title V permit fees schedule was adopted effective March 8, 1994, to about 402 facilities today. The total amount of emissions has changed little since the Council's Final report.

In Table I, "non-attainment" refers to permits issued under special rules applicable in areas that are in non-attainment with federal standards for criteria air pollutants such as

ozone or carbon monoxide. "PSD" refers to permits issued under federal Prevention of Significant Deterioration rules. "NSR/NAA" refers to permits issued under special rules for New Source Review in Non-attainment Areas.

Another feature of the fee schedule that should be noted is that no permit application fee is charged for a simple renewal of a permit. In addition, no permit application fee is charged when the reason for the change is initiated by the Director of the Division of Air Quality or the Environmental Management Commission, e.g., new control equipment required by a new rule or even the initial Title V permits for existing permitted sources.

CALENDAR YEAR 2003 PROJECTED TITLE V PERMIT FEES 4/3/03

TITLE V PRESUMPTIVE MINIMUM	324711 TONS *	$36.60 =		$11,884,422.60	IN 2003 $

HISTORY
TITLE V FEES/ASSESSMENTS AND EXPENDITURES
EXPLANATION

DENR collected Title V assessments until the Environmental Management Commission adopted rules setting the permit fees schedule in 1994, as specified by the General Assembly in House Bill 551(N.C.G.S. 143-215.3 and 143-215.108). The rule adoption process occurred after the North Carolina Clean Air Act Advisory Council issued its final report in 1992, as specified by the legislature. Assessments were collected in state fiscal years 1992 (starting July 1, 1991) 1993, and 1994. The Title V permit fees set by rule were collected beginning in state fiscal year 1995 (starting July 1, 1994).

In 1997, facilities received a partial refund of Title V fees. This was accomplished by sending the facility a check, valued at 21% of the permit fees paid in 1997. This refund was to reduce the budgeted carry forward as of July 1, 1998.

Air Quality, based on an analysis of variability in fuel tax revenue, decided that it is prudent to have a carry forward of about 35%. The 35% is well within the statutory limitation that allows a state's Title V program to carry forward 100% of the expected cost of the Title V program for the next year. By terms of the Federal Clean Air Act, the entire cost of the Title V program must be paid with Title V permit fees, and Title V permit fees can only be used for this purpose.

ORGANIZATION CHART EXPLANATION

The organization chart shown in this document list all the positions authorized by State Personnel for the Division of Air Quality. Positions that are funded using Title V fees are listed with a funding designation of 2333R. Additionally, positions outside the Division of Air Quality that are funded through the transfer of Title V funds are listed separately.

Environmental Review Commission Counsel

FROM: William G. Ross Jr.

DATE: October 6, 2003

RE: Report on Incentives to Increase the Use of Alternative-fueled Vehicles in North Carolina Pursuant to the Ambient Air Quality Improvement Act

Section 4.5 of Senate Bill 953 (Ambient Air Quality Improvement Act) requires the Department of Transportation (DOT), the Department of Commerce (DOC), and the Department of Environment and Natural Resources (DENR) to jointly develop recommendations for incentives to increase the use of alternative-fueled and low emission light duty trucks and cars in privately owned fleets. The attached report is the third report from DENR to fulfill this requirement.

This report outlines the current efforts underway in North Carolina to fulfill the requirements as stated in Section 4.5 of Senate Bill 953. In March 2000, a joint report from DOT, DOC, and DENR was presented to the Environmental Review Commission detailing possible incentive programs. Since then, two bills have been introduced and considered in the last two legislative sessions. The bills, House Bill 1213 and House Bill 806, are included in this report.

In spring of 1999, the Triangle J Council of Governments coordinated to form a Clean Cities Coalition Program in the Triangle. Since then the Coalition has launched a biofuels program to reduce transportation emissions and stimulate use of domestically produced fuels, partnered with NCDOT to expand biofuel programs, and conducted a workshop to explore alternative fuel options. In addition to the efforts in the Triangle, Centralina formed the Centralina Clean Fuels Coalition (CFCC). Recently, CFCC submitted an application for designation as a member of the Clean Cities Program and created the Sustainable Environment and Quality of Life (SEQL) program to implement and expand regional efforts to protect the quality of life in the bi-state Charlotte region. On a state level, the Mobile Source Emissions Reduction Grant Program (MSERG) recently awarded grants to projects achieving actual reductions from on- and off-road mobile source related emissions.

As technology advances and resources become available, North Carolina will continue to pursue the best course of action to continually work towards improving the air quality, and thus way of life, for its citizens.

Incentives to Increase the Use of Alternative-fueled Vehicles in Privately Owned Fleets in North Carolina 2003 Report

Prepared by

North Carolina Department of Environment and Natural Resources

Section 4.5 of Senate Bill 953 States:

The Department of Transportation, the Department of Commerce, and the Department of Environment and Natural Resources shall jointly develop recommendations for incentives to increase the use of alternative-fueled and low emission light duty cars and trucks in privately owned fleets. The Department of Environment and Natural Resources shall submit these recommendations to the Environmental Review Commission on or before 1 February 2000. The Department of Environment and Natural Resources shall report on progress in increasing the use of alternative-fueled and low emission light duty cars and trucks in privately owned fleets to the Environmental Review Commission on or before 1 October of each year beginning 1 October 2001.

Legislative Background

2001 and 2002 Legislation

On July 21, 1999, Governor James B. Hunt, Jr. signed into law Senate Bill 953, An Act to Enact the Ambient Air Quality Improvement Act of 1999. Section 4.5 of this bill directs the Department of Transportation (DOT), the Department of Commerce (DOC), and the Department of Environment and Natural Resources (DENR) to develop recommendations for incentives that would promote the use of alternative-fueled vehicles (AFVs) in privately owned fleets.

A report jointly prepared by DOT, DOC, and DENR was presented to the ERC on March 16, 2000. Contained in this report were descriptions of a loan program to provide low-interest loans for construction of refueling stations; tax credits to allow private fleet operators to recoup the incremental costs incurred for changing fleets to alternative fuels; tax incentives for the public that provide additional incentives to purchase AFVs; and tax incentives to fuel providers to encourage investments in alternative fuel infrastructure.

House Bill 1213, Alternative Fuel Vehicle Rebate and Infrastructure Grant Program, was introduced by Representative Joe Tolson on April 12, 2001 and was assigned to the committee on Finance. The bill was to provide funds for incremental costs of AFVs and AFV infrastructure, access for AFVs to HOV lanes, and special parking access. The fund to support the bill was based on a $2.00 increase in the annual

motor vehicle registration fees. The NC State Energy Office was to be assigned oversight of the AFV Rebate and Infrastructure Grant Program. The House Finance committee favorably recommended H1213 as amended on August 8, 2001. The bill was then re-referred to the Appropriations committee, and no further action was taken. A copy of this bill is included in the attachments at the end of this report.

2003 Legislation

In March 2003, House Bill 806, co-sponsored by Representatives Joe Tolson and Verla Insko, was referred to the committee on Finance. Entitled "Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program," H806 would establish an alternative fuel and alternative fuel vehicle rebate program to be administered by the NC State Energy Office in the Department of Administration. The program would provide partial rebates to first owners for incremental cost differences for qualified alternative fuel and hybrid vehicles, limited rebates for State taxes paid on incremental costs for alternative motor fuels, and grants for alternative motor fuel infrastructure projects. The program would be funded by adding $1 on all vehicle registration fees for the three years of the program.

H806 incentives were designed to help improve the air quality in North Carolina by reducing ozone forming pollutants, importantly oxides of nitrogen; support economic development of biofuels in our state; and encourage future energy security through diversity of North Carolina's energy supply. The bill was heard in the Finance committee in June and there was general support for promoting alternative fuels, although there was expressed concern with the proposed fee increase to vehicle registration. Two amendments passed, one that reduced the program length from ten to three years, and the second that removed local and state governments from eligibility for grants and rebates. H806 passed the House Finance committee on June 26, 2003, and was sent to the Appropriations committee, where it remained at the end of the session. A copy of H806 can be found in the attachments at the end of this report.

North Carolina Clean Cities

Triangle Clean Cities Coalition

In spring of 1999, the State Department of Commerce's Energy Division asked the Triangle J Council of Governments (TJCOG) to coordinate a Clean Cities program in the Triangle. TJCOG accepted and the two agencies entered into a 15-month, $50,000 contract. In July of 2000 this contract was renewed for a 12-month period for another $50,000. The division's goal was to develop corridors that link major areas of the state with alternative fuel refueling options and to encourage the use of AFVs by federal fleets, state agencies, fuel providers and eventually municipal governments and private companies.

TJCOG has a long history of bringing together public and private groups to address regional issues such as initiatives to help improve air quality. In April 1999, TJCOG staff met in Atlanta with regional and national DOE staff and Clean Cities coordinators from the southeast region and began to develop a plan of action for the Triangle Region. Meetings with local and state government officials and with fuel providers indicated tremendous interest in the alternative fuel market. A 12-member steering committee was formed to establish a stakeholder list. The steering committee met regularly in preparation of the draft plan submittal to the DOE regional office in Atlanta. Comments on the draft plan indicated a need for more niche market activity, as well as a more thorough description of the Triangle Clean Cities Coalition's (TCCC's) objectives. Progress toward development of an approved plan continued through the fall of 2000.

On March 19, 2001, the Triangle Clean Cities Coalition was officially designated as North Carolina's first Clean Cities Coalition and the 80th US Clean Cities Coalition by the US Department of Energy Clean Cities Program. A luncheon was held as part of the *Advancing the Fuel Choice Conference* in Raleigh. The Conference provided a unique opportunity to learn about both alternative fuels and alternative fuel technology.

The Triangle Clean Cities has been successful in advancing alternative fuel incentives to the private sector through several initiatives. Through earnest grant applications and creative program planning TJCOG has been successful in implementing a biofuels grant program; deploying a publicly accessible biodiesel refueling station in Garner, NC; and facilitating future opportunities of biofuel availability in a multi-use service station soon to be located at the RDU airport. To date the request for proposals for the airport station site has not been awarded, but bidders are strongly encouraged to include in their bids alternative fuels such as ethanol, biodiesel, and propane. The BP/Han Dee Hugo station on Benson Road and Route 50 is North Carolina's first commercial biodiesel pump. Since its initial offering of this biofuel at the pump in July 2003, it now boasts that the volume sold has more than doubled. This increase in sales suggests that the public is interested in refueling with B20. More details on Triangle Clean Cities alternative fuel penetration into the private sector may be found in the attached press releases at the end of this report.

Centralina Clean Cities Program (Pending USDOE designation)

The Centralina Clean Fuels Coalition (CCFC) program plan was recently submitted to the US Department of Energy (USDOE) to obtain designation as a member of the Clean Cities Program. The purpose of this coalition's strategy is to increase the community's existing alternative fuel market. The Coalition serves a population of 1.5 million in the nine-county Charlotte metropolitan region. The local existing alternative fuels market currently includes 671 AFVs. The coalition was originally established in May of 1999. The Centralina Council of Governments (CCOG) staffs the CCFC. CCFC is funded partially by the NC State Energy Office and partially by CCOG.

The Centralina Clean Fuels Coalition formed to take advantage of the environmental, public health, energy security, economic benefits and financial incentives that the Clean Cities Program will offer. Alternative fuels will benefit the region by creating commercial opportunities and jobs in the sale, conversion, and maintenance of AFVs and in the installation and service of associated infrastructure. The Centralina Clean Fuels Coalition will provide substantial opportunities for the expansion of the alternative fuel marketplace through the recruitment of stakeholders, coordination of public education and awareness, and assistance to those fleets facing AFV acquisition mandates.

In terms of alternative fuels, biodiesel currently has a strong presence in the region. The North Carolina Department of Transportation has more than 300 vehicles operating on biodiesel, and the City of Monroe will soon begin converting its fleet to this fuel. One hundred thirteen propane vehicles were identified through the survey, and there is strong interest by an active stakeholder to expand that market. There are 96 compressed natural gas (CNG) vehicles in the area and a number of CNG stations. Although none of these stations are currently open to the public, CCFC has been working with the City of Belmont to open their station. There are 520 identified ethanol (E85) vehicles in the region, but only those owned by Duke Energy have access to fueling with ethanol. CCFC has begun discussions with both the Charlotte/Douglas International airport and with Duke Energy about opening their respective stations to the public or to additional fleets. This alone would dramatically increase AFV usage in the region.

CCFC conducted a fleet survey to better understand the Centralina region's current and projected AFV population. The Centralina Clean Fuels Coalition developed a questionnaire in February of 2002. Staff identified key entities and types of fleets within the transportation sector that were most likely to have AFVs. This information was gathered from public and private fleets across the region by way of mailed or faxed written surveys, telephone calls, and one-on-one discussion with approximately 150 fleet managers located throughout the nine-county region. These fleets included local and state governments, school districts, universities, transportation providers, cable television and telephone companies, fuel providers, and distribution companies. Furthermore, all known fleets affected by EPAct were also contacted.

With a population of 1,540,714, the Centralina region is required (Clean Cities criteria) to have a minimum of 500 AFVs. The survey identified 1,121 AFVs, with an additional 232 vehicles proposed to be purchased within the next five years. Compressed natural gas (CNG) accounted for 96 of these vehicles. One hundred and thirteen vehicles ran on propane. Six were electric, and 386 ran on biodiesel. Although the survey identified 520 vehicles able to run on ethanol, only those owned by Duke Power have access to fueling with ethanol. Therefore, the final count of 671 AFVs represented vehicles not mandated under the Energy Policy Act of 1991 (EPACT) and could be credited toward the Clean Cities requirements.

Fueling station numbers were compiled during the 2002 survey and later updated in 2003. Additional fueling stations were located using the DOE *Alternative Fuels Data Center*. A total of 45 fueling stations were identified, with the majority being propane. Seven CNG sites were identified, three electric, and seven biodiesel. Only one ethanol fueling station was identified in the area, which is owned by Duke Energy and is only accessible to Duke Energy's fleet. CCFC has been in discussions with Duke regarding the possibility of opening this station to a limited number of other fleets. The survey data indicates that there is a need to establish state incentives that will help advance the fuels choice for alternative fuels by closing the gap on the incremental costs of AFVs for the private citizen and supporting the infrastructure to fuel these vehicles.

Centralina Clean Fuels Coalition expects to hear whether they will become a newly designated Clean Cities in the near term following final review of the plan by USDOE headquarters. If all goes as expected, CCFC may receive favorable news as early as December 2003 or January 2004.

Sustainable Environment for Quality of Life (SEQL)

Centralina Council of Governments has been awarded a $275,000 grant from the Environmental Protection Agency to implement and expand regional efforts to protect the quality of life in the bi-state metro Charlotte region. The program is called Sustainable Environment for Quality of Life (SEQL). Recognizing that the area currently faces many environmental challenges; SEQL will address these challenges by:

- Allowing local governments the opportunity to work across jurisdictional lines in regional cooperation and collaboration, setting a standard for the nation.

- Providing implementation assistance to local governments on environmental "commitment action items" developed under the Charlotte/Mecklenburg Sustainability Demonstration Project.

- Analyzing multiple air quality issues simultaneously, including ozone, particulate matter, and air toxics, while also addressing transportation, water, land use, energy use, and economic development.

This project supports the region's efforts to develop integrated, long-range plans to ensure economic development and a positive quality of life for its future. During the initial phase of the project, local municipalities agreed to a number of action steps, one of which was to support the Clean Cities effort.

Mobile Source Emissions Reduction Grant Program

Purpose and Background

The purpose of the Mobile Source Emissions Reduction Grants (MSERG) is to achieve actual reductions from on- and off-road mobile source related emissions in North Carolina to assist the State in maintaining the National Air Quality Standards primarily for ozone and carbon monoxide.

In 1993, the North Carolina General Assembly passed clean air legislation, which provided that, beginning on January 1, 1995, a portion of those taxes on the sale of gasoline in North Carolina would be used to fund portions of the State Air Quality Program.

The Department of Environment and Natural Resources formed a Grant Review Committee to help determine how to use the revenues generated from the gasoline tax. The committee represents a broad range of public interests, including environmental, industry, and city, county, and various State government agencies.

Funding for these grants is provided by a tax of 1/64 of a cent per gallon of gasoline sold, which currently generates about $800,000 annually. Grants are awarded by DENR with the assistance of the Grant Review Committee. Each year the Grant Review Committee selects a focus for the upcoming grant year. Although other projects may be submitted and funded, priority is placed on projects addressing the goal for that particular year. The goal for the 2004 grants will be to retrofit existing diesel school buses with newer technologies that will reduce the particulate emissions. In addition to the annual gas tax revenue, the Division of Air Quality has requested a $1,000,000 grant from the US EPA to broaden the school bus retrofit effort.

MSER grants were solicited and approved in 2001; however, due to a budget crisis, contracts for grants were not awarded. Grant funding rounds did not take place in 2002 for the same reason of a budget crisis. In 2003, the Division of Air Quality awarded grant monies for the two top ranked Alternative Fuels projects that previously were approved in 2001 but not funded. Both projects included fueling stations that will be designed and built to provide access for public use.

City of Asheville
Grant Award: $400,000
Project Title: Alternative Fuels Station for Asheville, NC
Summary: Funds will be used to construct a publicly accessible compressed natural gas (CNG) fueling station, train mechanics on the new technology, and purchase CNG vehicles.

Greenville Utilities
Grant Award: $291,000
Project Title: Greenville Area Clean Vehicle Program
Summary: Funds will be used to construct a fast-fill, publicly accessible compressed natural gas (CNG) refueling station and to purchase CNG vehicles.

2004 Model Year Alternative Fuel Vehicles Available or Nearing Completion

Alternative fuel vehicles are widely available for public and fleet purchase. A list of the 2004 model year AFVs is provided as an attachment to this report. For more details on the availability and related information for these vehicles, visit the Alternative Fuel Data Center web site at *http://www.afdc.doe.gov/*.

GENERAL ASSEMBLY OF NORTH CAROLINA
SESSION 2001

HOUSE BILL 1213
Committee Substitute Favorable 8/8/01

Short Title: Rebate and Grant Program for AFVs. (Public)
Sponsors:
Referred to:

April 12, 2001

A BILL TO BE ENTITLED

AN ACT TO ESTABLISH THE ALTERNATIVE FUEL VEHICLE REBATE AND INFRASTRUCTURE GRANT PROGRAM.

The General Assembly of North Carolina enacts:

SECTION 1. Chapter 113B of the General Statutes is amended by adding a new Article to read:

"Article 3.

"Alternative Fuel Vehicle Rebate and Infrastructure Grant Program.

"**§ 113B-30. Definitions.**

The following definitions apply in this Article:

(1) "Alternative fuel" means any of the following:
a. Electricity.
b. Natural gas either as compressed natural gas or liquefied natural gas.
c. Propane.
d. Hydrogen.
e. Ethanol used separately or in mixtures of seventy percent (70%) or more by volume mixed with gasoline.
f. Fuels derived from biological materials, such as biodiesel and methanol additives.

(2) "Alternative Fuel Vehicle" or "AFV" means a vehicle that has been developed for, and is intended to be operated using, one or more alternative fuels.

(3) "Alternative fuel infrastructure project" means fueling stations, fueling tanks, charging stations, and other equipment used to fuel AFVs.

(4) "Bi-fuel (dual-fuel) vehicle" means an AFV capable of running on either an alternative fuel or gasoline.

(5) "Conventional vehicle" means a vehicle running only on gasoline, reformulated gasoline, or diesel fuel.

(6) "Dedicated vehicle" means an AFV that can only be operated using an alternative fuel.

(7) "Flex-fuel vehicle" means an AFV capable of operating on either gasoline or diesel fuel in combination with an alternative fuel in various proportions.

(8) "Hybrid vehicle" means an AFV that is

powered by an electric motor and an engine combusting an alternative fuel, gasoline, or diesel fuel.

(9) "Incremental cost" means the difference in price between an alternative fuel vehicle and a conventional vehicle of the same make and model as provided by the original equipment manufacturer.

(10) "Low-speed vehicle" means a four-wheeled vehicle whose top speed is greater than 20 miles per hour but less than 25 miles per hour.

(11) "Person" means an individual, a business, a corporation, or a unit of municipal government or county government. "Person" does not include any unit of the federal government.

"**§ 113B-31. Administration.**

(a) The State Energy Office in the Department of Administration shall establish and administer policies determined in consultation with other state agencies, including the Departments of Transportation, Correction, Public Instruction, and Environment and Natural Resources, as well as interested organizations and businesses, to comply with environmental and energy regulations of the United States Department of Energy and the Environmental Protection Agency. Up to five percent (5%) of the funds collected in the program may be used by the State Energy Office and the Division of Motor Vehicles for administrative costs of the program.

(b) The State Energy Office shall place an annual cap on the number of vehicles eligible to receive rebates under the program based on the availability of funds. Commitments to vehicle rebates and infrastructure grants must never exceed funds collected and available. The State is not obligated to provide rebates or infrastructure grants beyond the funds available in the program.

(c) During the first two years of the program, annual funding for vehicle rebates shall not exceed forty percent (40%) of the total funds collected.

"**§ 113B-32. Rebate program.**

(a) A person who has purchased an alternative fuel vehicle weighing less than 8,500 pounds gross weight, either from an original equipment manufacturer or that has been retrofitted with a certified kit under the supervision or approval of a certified AFV technician approved by the administering agency, is eligible for the following rebates, subject to a maximum of thirty thousand dollars ($30,000) in total annual rebates:

(1) Eighty percent (80%) of the incremental cost for a dedicated vehicle, up to a maximum of five thousand dollars ($5,000) per vehicle.

(2) Fifty percent (50%) of the incremental cost for a bi-fuel, flex-fuel, or hybrid vehicle, up to a maximum of five thousand dollars ($5,000) per vehicle. Availability of the alternative fuel in the particular area the vehicle will be used must be documented prior to payment of the rebate.

(3) Twenty percent (20%) of the total purchase price of a low-speed vehicle or one thousand dollars ($1,000), whichever is less.

(4) Ten percent (10%) of the total purchase price for all other dedicated alternative fuel vehicles and hybrid vehicles designated as eligible by the administering agency that have no comparable conventional model on which to base incremental cost calculations, up to five thousand dollars ($5,000) per vehicle.

(b) A person who has purchased an alternative fuel vehicle weighing more than 8,500 pounds gross weight, either through an original equipment manufacturer or that has been retrofitted with a certified kit under the supervision or approval of a certified AFV technician approved by the administering agency, is eligible for the following rebates, subject to a maximum of one hundred thousand dollars ($100,000) in total annual rebates:

(1) Eighty percent (80%) of the incremental cost for a dedicated vehicle, up to a maximum of twenty-five thousand dollars ($25,000) per vehicle.

(2) Fifty percent (50%) of the incremental cost for a bi-fuel, flex-fuel, or hybrid vehicle, up to a maximum of twenty-five thousand dollars ($25,000) per vehicle. Availability of the alternative fuel in the particular area the vehicle will be used must be documented prior to payment of the rebate.

(3) Twenty percent (20%) of the total purchase price of a low-speed electric vehicle or one thousand dollars ($1,000), whichever is less.

(4) Ten percent (10%) of the total purchase price for all other dedicated alternative fuel vehicles and hybrid vehicles designated as eligible by the administering agency that have no comparable conventional model on which to base incremental cost calculations, up to twenty-five thousand dollars ($25,000) per vehicle.

(c) A person who leases an alternative fuel vehicle is eligible for the rebates in subsections (a) and (b) in the same manner as those persons who purchase an alternative fuel vehicle.

(d) A person seeking a rebate must complete a rebate form and provide proof of ownership and license registration of the alternative fuel vehicle. The rebate form may be obtained from automotive dealers, the State Energy Office, or the Division of Motor Vehicles.

"**§ 113B-33. Infrastructure grant program.**

(a) A person is eligible for a grant in an amount of up to fifty percent (50%) of the cost of an alternative fuel vehicle infrastructure project that is selected by the State Energy Office, subject to a maximum of five hundred thousand dollars ($500,000) per project.

(b) A person is eligible for a grant in an amount of up to seventy-five percent (75%) of the total cost of installing an ethanol infrastructure project, subject to a maximum of five hundred thousand dollars ($500,000) per project, not to exceed one million dollars ($1,000,000) annually.

(c) Any residual funds shall be available, on a quarterly basis, to State agencies for grants for alternative fuel infrastructure projects.

(d) To qualify for a grant under this program, the infrastructure must be accessible to the public, or serve vehicles used by the public, or for the public benefit by reducing harmful air emissions. Priority shall be given to projects serving 10 or more vehicles and to other persons before State agencies.

(e) Up to forty-five percent (45%) of funds collected annually will be awarded as grants for infrastructure projects during the first two years of the program. During the first two years of the program, priority for infrastructure grants will be awarded in those counties at risk for nonattainment penalties under federal EPA regulations.

"**§ 113B-34. Education fund for promotion of alternative fuel vehicles.**

Up to ten percent (10%) of the funds from the Alternative Fuel Vehicle Rebate and Infrastructure Grant Program may be used for education and awareness about the applications, advantages, and environmental benefits of alternative fuel vehicles.

"**§ 113B-35. Funding.**

The alternative fuel vehicle rebate and infrastructure grant program shall be funded for the first three years beginning on January 1, 2002, from a one-dollar ($1.00) increase in the cost of registering each motor vehicle licensed in this State. For the next seven years, beginning on January 1, 2005, the program shall be funded from a two-dollar ($2.00) increase in the cost of registering each motor vehicle in this State. At the end of 10 years, the program shall expire unless further action is taken by the General Assembly. Any residual funds shall then be transferred to the General Fund.

"**§ 113B-36. Reporting.**

(a) The State Energy Office shall provide a written report of the number of alternative fuel vehicles registered in North Carolina and of the expenditure of funds associated with this program to the Joint Transportation Oversight Committee on an annual basis for review of program effectiveness.

(b) The Division of Motor Vehicles shall provide to the State Energy Office quarterly reports of all registered vehicles identified by fuel type as required by G.S. 20-50.5."

SECTION 2. Chapter 20 of the General Statutes is amended by adding a new section to read:

"**§ 20-50.5. Division to furnish State Energy Office reports of registered alternative fuel vehicles.**

The Division shall provide to the State Energy Office quarterly reports of registered vehicles identified by fuel type."

SECTION 3. G.S. 20-57(b) reads as rewritten:

"(b) The registration card shall be delivered to the owner and shall contain upon the face thereof the name and address of the owner, space for the owner's signature, the registration number assigned to the vehicle, the fuel type of the vehicle, and a description of the vehicle as determined by the Commissioner, provided that if there are more than two owners the Division may show only two owners on the registration card and indicate that additional owners exist by placing after the names listed "et al." An owner may obtain a copy of a registration card issued in the owner's name by applying to the Division for a copy and paying the fee set in G.S. 20-85."

SECTION 4. G.S. 20-87 reads as rewritten:

"**§ 20-87. Passenger vehicle registration fees.**

(a) These shall be paid to the Division annually, as of the first day of January, for the registration and licensing of passenger vehicles, fees according to the following classifications and schedules:

...

(b) Upon initial registration or renewal, the following additional fee shall be paid to the Division during the specified time periods in addition to the fees authorized by subsection (a) of this section to fund the Alternative Fuel Vehicle Rebate and Infrastructure Grant Program created by G.S. 113B-30 through 113B-36:

January 1, 2002-December 31, 2004 $1.00

January 1, 2005-December 31, 2011 2.00".

SECTION 5. The North Carolina Department of Transportation is directed to study the feasibility of allowing alternative fuel vehicles to have access to high occupancy vehicle lanes and special parking privileges and to provide its findings and recommendations to the Joint Transportation Oversight Committee by June 1, 2002. The Joint Transportation Oversight Committee is directed to evaluate the success of the Alternative Fuel Rebate and Infrastructure Grant Program after 10 years and report its findings and recommendations to the 2011 General Assembly, including whether the program should be continued.

SECTION 6. This act becomes effective January 1, 2002, and expires on January 1, 2012.

HOUSE BILL 806
Committee Substitute Favorable 6/30/03

Short Title: Rebate and Grant Program for AFVs. (Public)
Sponsors:
Referred to:

March 31, 2003

A BILL TO BE ENTITLED

AN ACT TO ESTABLISH AN ALTERNATIVE FUEL AND VEHICLE REBATE AND INFRASTRUCTURE GRANT PROGRAM.

The General Assembly of North Carolina enacts:

SECTION 1. Chapter 113B of the General Statutes is amended by adding a new Article to read:

"Article 3.

"Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program.

"**§ 113B-30. Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program established.**

(a) There is created an alternative fuel and vehicle rebate and infrastructure grant program to be administered by the State Energy Office.

(b) The program shall provide for all of the following:

(1) Partial rebates to first owners for incremental cost differences for eligible alternative fueled and hybrid vehicles.

(2) Limited rebates for State taxes paid on the incremental costs of alternative motor fuels.

(3) Grants for alternative motor fuel infrastructure projects.

(c) The program shall include a cap on the number and amounts of rebates and grants to limit them to the available funds. There shall be no entitlement to any rebate or grant under the program.

"**§ 113B-31. Implementation and administration.**

(a) The State Energy Office shall adopt rules implementing the program established in G.S. 113B-30.

(b) These rules shall be adopted after consultation with other State agencies, including the Departments of Transportation, Correction, Public Instruction, Revenue, and Environment and Natural Resources, and interested organizations and businesses.

(c) These rules shall comply with environmental and energy regulations issued by the United States Department of Energy and the Environmental Protection Agency.

(d) The rules shall provide that State and local government entities are not eligible for rebates or grants under the Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program.

"**§ 113B-32. Funding.**

(a) The program established pursuant to G.S. 113B-30 shall be funded by an increase in motor vehicle registration fees as provided in G.S. 20-87(b) and G.S. 20-88(i2).

(b) The funds collected by the Division of Motor Vehicles shall be transferred quarterly to a special account in the Department of Administration for the State Energy Office to administer the program and provide the rebates and grants.

(c) The State Energy Office and the Division of Motor Vehicles may use up to five percent (5%) of the funds collected under this section for the administration of the program.

(d) The State Energy Office may use up to ten percent (10%) of the funds collected under this section for education and awareness about the applications and advantages of alternative fuels and vehicles.

"**§ 113B-33. Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program Fund established.**

The Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program Fund is created as a nonreverting account within the Department of Administration. All fees collected pursuant to this Article shall be credited to the Fund. The Fund shall be used for the purposes set out in this Article.

"**§ 113B-34. Reports.**

(a) The Division of Motor Vehicles shall provide to the State Energy Office quarterly reports of all registered motor vehicles identified by fuel type.

(b) The State Energy Office shall provide an annual report to the Joint Legislative Transportation Oversight Committee on the expenditure of funds associated with the program established by G.S. 113B-30 and the number of alternative fuel vehicles registered in North Carolina."

SECTION 2. G.S. 20-87 reads as rewritten:

"**§ 20-87. Passenger vehicle registration fees.**

(a) ~~Those~~ There shall be paid to the Division annually, as of the first day of January, for the registration and licensing of passenger vehicles, fees according to the following classifications and schedules:

...

(b) Upon initial registration or renewal, an additional one-dollar ($1.00) fee shall be paid to the Division in addition to the fees authorized by subsection (a) of this section to fund the Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program established in G.S. 113B-30."

SECTION 3. G.S. 20-88 is amended by adding a new subsection to read:

"(i2)Upon initial registration or renewal, an additional one-dollar ($1.00) fee shall be paid to the Division in addition to all other fees authorized by this section to fund the Alternative Fuel and Vehicle Rebate and Infrastructure Grant Program established in G.S. 113B-30."

SECTION 4. This act is effective when it becomes law. The State Energy Office shall adopt the rules to implement the program established by this act on or before January 1, 2004. This act shall expire on January 1, 2007.

Triangle J Council of Government Launches Biofuels Program To Reduce Transportation Emissions And Stimulate Use of Domestically Produced Fuels

RESEARCH TRIANGLE PARK - Imagine giving money away in an effort to support clean air and agricultural interests in North Carolina. With funding provided from the NC Department of Transportation's Congestion Mitigation Air Quality program and additional assistance from the NC Department of Administration State Energy Office, Triangle J Council of Government (TJCOG) is launching a Biofuels Program to rebate the incremental costs of biodiesel and ethanol. Both of these transportation fuel alternatives reduce harmful emissions and can be grown and produced in North Carolina. Through the Biofuels Program, TJCOG will be awarding $265,000 in grants to eligible entities in Wake and Durham- the only counties in the Triangle Region eligible to receive these federal funds. A request for proposals is being issued to area fleets and service station operators with an application deadline of January 22, 2003 for the first round of funding.

Biodiesel (B100 / B20) is a renewable fuel that can be used in any diesel vehicle with no modifications. It can be blended with diesel fuel in any proportion although it's most commonly used as B20- a 20% blend with petroleum diesel . Biodiesel is a naturally oxygenated fuel produced from organic feed stocks such as soybeans, cooking oil and animal fats. Biodiesel use results in lower emissions of particulate matter, carbon monoxide, toxic contaminants, sulphur dioxide, hydrocarbons, visible smoke and noxious odors. B100 is also non-toxic and biodegradable and therefore does not pose a threat to water and soil resource if spilled.

Ethanol is a naturally oxygenated fuel produced by fermenting organic materials such as corn, grains, crop waste materials, and forestry waste materials. Ethanol is usually blended with gasoline at different levels. E10 is a premium high-octane gasoline for cars and E85 (85% ethanol 15% gasoline) is used as an alternative fuel for light-duty vehicles. Many vehicles on the road today are E85 capable flex fuel vehicles (FFVs). FFVs can operate on either gasoline or E85 and are readily available from auto manufacturers at no additional cost.

Because they rely on readily available vehicles and use the same refueling infrastructure as conventional vehicles both biodiesel and E85 offer 'pour and go' technology and provide vehicle operators an easy way to support initiatives aimed at reducing dependence on imported petroleum and improving emissions. The transportation sector of the U.S. economy is 97% dependant on petroleum and over 50% of the oil used is imported - often from parts of the world hostile to the U.S. Stimulating the use of American fuels such as biodiesel and E85 can help with domestic security and support agricultural interests in North Carolina. Program organizers at TJCOG and the Triangle Clean Cities Coalition, a public private partnership of over 40 stakeholders committed to accelerating the use of alternative fuels, hope that the Biofuel Program will provide assistance to open North Carolina's first commercially accessible service station that features biodiesel, ethanol and other American fuels. Currently these fuels are only available to fleets with their own private fueling facilities such as NC DOT, the City of Raleigh and the State Motor Fleet Management Division.

In reference to the launch of the new Biofuels Program, TJCOG's Clean Cities Coordinator, Anne Tazewell stated that " We are pleased to have the opportunity to serve the residents Wake and Durham and support the dual interests of improving emissions and supporting the state's agricultural heritage through the use of alternative fuels such as biodiesel and ethanol.

TRIANGLE J COUNCIL OF GOVERNMENT AND NCDOT PARTNER TO EXPAND BIOFUEL PROGRAMS IN THE TRIANGLE

Grants Will Help Reduce Transportation Emissions in Wake and Durham Counties

Raleigh - Triangle J Council of Governments (TJCOG) today awarded $183,000 for seven local organizations to expand their use of B20, a blend of 20% biodiesel and 80% diesel fuel. The funds were provided from the N.C. Department of Transportation through a federal Congestion Mitigation Air Quality grant.

Biodiesel is renewable fuel made from crops such as soybeans or waste oil that burns cleaner than petroleum diesel. It results in significantly lower emissions of carbon monoxide, toxic contaminants, sulfur dioxide, hydrocarbons, visible smoke and noxious odors than petroleum diesel. B20 can be grown and produced in North Carolina, reducing the state's dependence on imported petroleum.

"We are delighted to award grants to organizations who share our interest in supporting the state's agricultural heritage and protecting the environment through use of alternative fuels such as biodiesel," said TJCOG Executive Director Dee Freeman.

"Our support of TJCOG's Biofuels Program demonstrates the department's commitment to provide a transportation system that protects and enhances North Carolina's natural environment," said State Transportation Secretary Lyndo Tippett. "I look forward to working with local governments to help expand the use of this environmentally-friendly fuel."

Triangle J Council of Governments is home to the Triangle Clean Cities Coalition, a group of over 50 stakeholders working with the U.S. Department of Energy to increase the use of alternative transportation fuels such as Biodiesel to reduce our nation's dependence on imported petroleum and improve air quality.

TJCOG has awarded seven grants in Wake and Durham counties, the only counties in the region eligible for these federal funds. The grant recipients are : the Town of Cary, Duke University, Durham Public Schools, the City of Raleigh, N.C. State University, the Raleigh-Durham International Airport and Wake County. (A list of programs is attached.) Through the Biofuels Program grant recipients will displace almost 200,000 gallons of diesel fuel. Funded programs range from purchasing B20 to operate transit fleets to promotions educating the public on the importance of alternative fuels.

Biofuel Program Awards

City of Raleigh

- Received $41,000 to expand B20 use to operate 15 daily feeder and connector service buses.
- Already using biodiesel- in 2002 used over 300,000 gallons of B20 in 75% of its diesel fleet.
- Active participant on the Triangle Clean Cities Coalition Steering Committee

Duke University Transportation Services

- Awarded $28,120 to assist with the purchase of B20 to operate 31 campus transit buses and 14 other vehicles used for sanitation and recycling.
- These vehicles travel 2,800 miles daily, over 1,000,000 annually.

NC Department of Public Instruction /Durham Public Schools

- Awarded $75,000 towards the purchase of B20 to operate 284 Durham Public School buses.
- Biodiesel pilot project will run through June 2004. DPI/DPS are contributing over 60% of the additional costs of B20 for this project. Biofuel Program funding will cover the remaining 40%.
- Buses travel over 4,000,000 miles annually. Will share experiences with other schools systems

NC State University Biodiesel Committee

- Awarded $7,250 to operate campus transit system and other diesel equipment/vehicles such as recycling trucks, street sweepers, forklifts, tractors and mowers on B20.
- NC State Biodiesel Committee is a partnership of three University departments, a student and Connex, the bus contractor responsible for operating Wolfline services.
- Proposed a five-phase program over 2 ½ years to get all diesel vehicles and buses operating on B20. Current award will cover Phase I and II.

Raleigh-Durham International Airport

- Awarded $8,250 to operate lawn and construction tractors on B20. Will add passenger buses as leases which prohibit B20 use expire in September 2003.
- Converting diesel tank to biodiesel as part of expansion of existing refueling infrastructure.
- RDU encouraging the development of NC's first publicly accessible biofuels station by providing incentives for such in Mixed-Use Service Station bid solicitation.

Town of Cary

- Awarded $3,256 to assist with purchasing B20 to operate 6 buses and 2 vans that travel 1,700 miles/day in the C-Tran system. C-Tran is a shared-ride transit service operated by the Town that picks up and drops off riders at the door of pre-selected arrival/destination points.
- Town of Cary already utilizes B20 in 152 vehicles/equipment and have dispensed over 60,000 gallons of B20 during the past 6 months. Will continue the use of Biodiesel after grant expires.
- Town contracts with First Transit who will fuel with B20 at Town refueling.

Wake County Environmental Services Department

- Awarded $23,350 to offset 67% of the additional cost of operating 48 ¾ ton to 1 ½ ton diesel vehicles on B20.
- Willing to fuel commercially to support the availability of alternative fuels for the general public at commercial service stations.
- Educational promotions will appear on county vehicles to inform public they can "Breath easier - alternative fuels in use."

News Release

Triangle J Council of Governments

FOR IMMEDIATE RELEASE
July 1, 2003

(919) 558-9400

Research Triangle Park- For the first time in North Carolina, diesel vehicle drivers can fill up with B20 at a retail service station in Garner. B20 is a cleaner burning, agriculturally derived blend of 20 percent biodiesel and 80 percent petroleum diesel. This opportunity has been made possible through a federal grant provided to the Triangle J Council of Governments (TJCOG) from the NC Department of Transportation with additional assistance from the NC Department of Administration State Energy Office. TJCOG has established a Biofuels Program to rebate the incremental costs of biodiesel and ethanol. Both of these transportation fuel alternatives reduce harmful emissions and can be grown and produced in North Carolina. Through the Biofuels Program, TJCOG has contracted with United Energy, Inc the operator of the BP/Han-Dee Hugo service station that is now providing B20 to the motoring public. In addition to the established customers of the station, line and service trucks from Progress Energy will serve as an "anchor fleet" for the new fuel at the 401 Benson Rd location in Garner. Because of the grant, B20 is being sold for the same price as conventional diesel in the area, increasing sales opportunities and the potential to educate the broader public about fueling alternatives.

Biodiesel (B100) is a renewable fuel that can be used in any diesel vehicle with no modifications. It can be blended with diesel fuel in any proportion although it's commonly used as B20 - a 20 percent blend. Biodiesel is a naturally oxygenated fuel produced from organic feed stocks such as soybeans, cooking oil and animal fats. Biodiesel use results in lower emissions of particulate matter, carbon monoxide, toxic contaminants, sulphur dioxide, hydrocarbons, visible smoke and noxious odors. B100 is also non-toxic and biodegradable and therefore does not pose a threat to water and soil resources if spilled. The biodiesel at the Garner station is being provided through the Grain Growers Cooperative, a farmer's group working to build a soy biodiesel plant in North Carolina. They have a marketing agreement with West Central Soy, a farmers' cooperative in Iowa, to supply soy biodiesel until the North Carolina plant is built.

Biodiesel is referred to as 'pour and go' technology because it relies on readily available vehicles and uses the same refueling infrastructure as conventional vehicles. This provides vehicle operators an easy, familiar way to support initiatives aimed at reducing dependence on imported petroleum and improving emissions. The transportation sector of the U.S. economy is 97 percent dependant on petroleum and over 50 percent of the oil used is imported. Stimulating the use of American fuels such as biodiesel can enhance domestic security, reduce harmful emissions and support agricultural interests in North Carolina. Program organizers at TJCOG and the Triangle Clean Cities Coalition, a public private partnership of over 40 stakeholders committed to accelerating the use of alternative fuels, hope that the Garner station will become one of several outlets in the Triangle area to offer this domestic fuel choice.

"We are interested in experimenting with B20 and examining potential benefits to the public and the environment. We know there are questions about it, but we're happy to do our part to participate in a meaningful way and learn what we can," said Progress Energy Northern Region General Manager Dewitt Smith. Further, at an event recognizing the launch of the B20 pump, Garner mayor Sam Bridges stated that "I am very proud that Garner is a leader in bringing alternative transportation fuels like biodiesel to the general public. Making B20 more available is an important step towards solving our air quality problems." State Representative Deborah Ross, Energy Office Director Larry Shirley and other local leaders spoke at the event which was highlighted by the presence of a BMW biodiesel race car, Progress Energy line trucks and the colorful soybean covered diesel pump.

Fueling Alternative Choices Today

Biofuels Program Grant

TRIANGLE J COUNCIL OF GOVERNMENTS BIOFUELS PROGRAM GRANTS

Current funds available for this round of funding (September 2003-November 2003): **$71,000**

Deadline for submitting proposals: End of business ***November 5, 2003*** for this round of funding. Applications will be accepted on a rolling basis after this date if any un-obligated funds remain. You may download an application for the current round of funding here, or you may receive a copy by calling 558-9400. Awards will be announced in December 2003.

Initial awards of $183,000 were awarded in February 2003 (application deadline was January 22, 2003). The winners of the first round of funding include:

- Duke University Transportation Division
- Wake County
- City of Raleigh
- RDU Airport
- Depart of Public Instruction/Durham Public Schools
- N.C. State University
- Town of Cary

Check this website for upcoming invitations for proposals, or contact Anne Tazewell (phone: (919) 558-9400, email: annet@tjcog.org) for more information.

The purpose of this project is to increase the use of ethanol and biodiesel as a means to reduce transportation related emissions in Wake and Durham Counties.

Triangle J Council of Governments (TJCOG) in cooperation with the Triangle Clean Cities Coalition is issuing a new request for proposals (RFP) from fleet operators and fuel providers in Wake and Durham counties for projects that use E-85 (85% ethanol/15 % gasoline) and/or biodiesel (B20 - 20% biodiesel/80% diesel or B100 -100% biodiesel).

Both ethanol and biodiesel are renewable fuels that reduce harmful emissions when used in place of/or in conjunction with conventional gasoline and diesel. In addition, both fuels can be produced in North Carolina using agricultural products such as corn for ethanol and soy for biodiesel. Use of these fuels requires no vehicle or fueling infrastructure changes. Biodiesel can be blended with diesel fuel in any proportion but is typically formulated as B20. E-85 can be utilized in flex fuel vehicles (FFVs). Thousands of FFVs - vehicles capable of operating on either E-85 or gasoline - travel the roads today in Wake and Durham counties. However, vehicle operators are often not aware that they are driving a FFV. Accompanying these guidelines is a list of FFV models and instructions on their identification.

Funding for the Biofuels Program is provided through the North Carolina Department of Transportation's Congestion Mitigation Air Quality (CMAQ) Program. Typical emission reductions from biodiesel and ethanol are listed in the table below. One component of CMAQ funded projects is to track and quantify emission reductions.

FUEL	Carbon Monoxide (CO)	Hydrocarbons (HC)	Nitrogen Oxides (NOx)	Particulate Matter (PM)
ETHANOL- E85	40%	15%	10%	
BIODIESEL-B100	43%	56%	+5.8%	55.4%
BIODIESEL-B20	12.6%	11.0%	+1.2%	18%

Expanded use of E-85 and biodiesel is hampered by the increased costs of these fuels as compared to their conventional counterparts. Eligible fleet operators and fuel providers may apply for funding through this program to offset the added cost incurred with biodiesel and /or E-85. Funding will be awarded based on criteria outlined below. No more than 80% of the additional cost of the eligible fuels will be funded. THIS IS A REBATE PROGRAM. Funds must be expended first and will then be reimbursed to eligible users on a quarterly basis. Eligible entities must estimate annual usage of proposed fuel and will be granted a specific, not-to-exceed amount of funding based on estimated fuel usage and estimated incremental costs of proposed fuel. Applicants whose proposals are accepted will invoice TJCOG for their incremental fuel costs and TJCOG will pay up to the agreed-upon amount as stated in the grant proposal. Based on documentation provided by program participants, TJCOG will track fuel usage, mileage, and emission reductions as part of an overall final report on the Biofuels Program. Only fuel costs are eligible for reimbursement. No administrative costs incurred by grantees while documenting this program are eligible for reimbursement.

All proposals will be reviewed by a TJCOG selection committee.

Only entities purchasing and/or providing fuel in Wake and Durham counties are eligible to apply.

Evaluation Criteria

Priority shall be given for strength in the following criteria:

1. **New Users** - Program organizers are interested in expanding the use of biofuels beyond those entities already using E-85 and/or biodiesel in Wake and Durham counties and will give priority to new, "first time" users. However, existing users are eligible to apply for any incremental increase over the previous six months of use (see example below). This "new use" must be explained and documented in some manner in the application. This provision is not intended to fund current fuel users to drive more miles in vehicles that are already operating on a biofuel.

   Example: If an eligible entity was purchasing X amount of biodiesel for 50% of its fleet and wanted to expand usage to 100% of its fleet, it may apply for funding to assist with the expanded usage, above and beyond the current usage.

2. **Cost-share contribution** - Program organizers are interested in encouraging partnerships with grant recipients as demonstrated through the percentage of incremental costs that applicants are willing to contribute. Cost share is the portion of the incremental fuel cost that an applicant provides. Although up to 80% of the incremental costs of ethanol and biodiesel are eligible for reimbursement, program planners are requesting that applicants offer the maximum cost-share contribution they are able to provide. A minimum cost-share of 20% is required. Any applicant that provides for a higher percentage cost share contribution will be given more weight in the review process.

Example - If the average incremental cost of biodiesel is .15 cents/gallon and XYZ uses 50,000 gallons of fuel annually the total incremental costs would be $7,500. A cost- share of 20% would provide a $1,500 contribution to offset the total incremental cost. All other things being equal, an applicant that provides for a 40% cost share or $3,000 in the case of this example will be ranked higher in the review process than an applicant offering the 20% cost share match.

3. **Education/Increase Awareness** - Program planners are interested in the applicant's potential to educate and increase awareness of employees and the public about the benefits of the proposed fuel use. Applicants should describe how their proposal would contribute towards this goal. Some examples may include issuing press releases, in-house educational promotions and ways that applicants can partner with the Triangle Clean Cities Coalition to highlight the visibility of the project to the general public. Program organizers will rank applications based on the degree that the applicant can demonstrate the ability to promote and advertise the project, thereby leading by example and encouraging others to do the same.

4. **Potential for continued/expanded use** - Program planners are interested in increasing the likelihood that fuel use will continue after the grant ends. Letters of support from governing boards or organizational leaders that express the intent of continued use based on fuel satisfaction and budgetary provisions will be weighted more favorable in the application process.

5. **Potential to increase commercial fuel availability** - A goal of the Triangle Clean Cities Coalition is to develop commercially accessible refueling infrastructure so that the general public and fleets that do not have their own refueling station may have the opportunity to use fuels such as biodiesel and ethanol. Applicant fleets that are able/willing to fuel at a commercial location can serve as "anchor tenants" for fuel providers to ensure throughput activity. The flexibility of proposed applicant to fuel at publicly accessible stations when such stations become available in Wake and Durham counties will be given weight in the application process. Providers that operate commercial fueling facilities in Wake and Durham counties are especially encouraged to apply for assistance to offset the incremental costs of biofuels that they incorporate into new or existing operations.

TJCOG and Triangle Clean Cities members can assist applicants with any technical issues concerning fuel access, delivery and estimated fuel costs. Awardees will receive assistance in emissions calculations and tracking for the duration of the grant period. Applicants should base their proposals on annual estimated fuel purchases. Awardees may re-apply for a second year of assistance, if funding is available, but will only be eligible to receive ½ of the incremental cost share assistance awarded the first year. However, if they are expanding fuel use over the first year into more of their fleet than that expanded use would be eligible for up to 80% incremental cost share assistance. This provision is not to encourage the same vehicles to consume more biofuel but to allow for a broadened use of biofuels with in a fleet.

Example: If XYZ transit agency received 80% incremental cost rate funding for a demonstration project using B20 on half of their routes/buses the first year, they may reapply for assistance the second year at a 40% rate for ½ of their fleet. If they wish to expand use to the entire fleet, they may apply for up to 80% of the incremental costs for the portion of the fuel that is being utilized by the expanded fleet.

Program guidelines allow for funding projects until August 2005. After the initial round of projects, applications will be considered on periodic basis, based on the merits of the subsequent proposals. TJCOG reserves the right to set aside program funds for later rounds of funding. All applicants that

respond to this initial request will be notified of any subsequent rounds.

Proposals must be headed with the applicant's name, affiliated organization, mailing address, phone and email address. In a narrative form, applicants should address the above stated evaluation criteria. A brief description of overall operations, fleet composition, estimated annual fuel usage, number of vehicles involved with proposed project, procedural plan to incorporate the use of ethanol and/or biodiesel into current or future operations, and an estimate of incremental costs for proposed fuel are required. Refer to/use enclosed application form. Applications are also available electronically here.

Grant recipients will be funded a specific not-to-exceed dollar amount based on estimated annual usage of fuel, estimated incremental costs and the percentage of cost-share contribution requested. **Annual awards are capped at a fixed amount.** Fuel prices may fluctuate thereby changing incremental cost estimates. Grantees may have to adjust their purchases accordingly. The percentage of cost share contributions will remain constant while overall quantities of fuel purchased through the grant may vary depending on fluctuations in fuel price.

Example: ABC may be awarded $32,000 to reimburse 80% of the incremental cost of E-85 based on an estimated annual usage of 160,000 gallons and an incremental cost of .25 cents /gallon. If the annual incremental cost of E-85 averages $0.30 rather than the $0.25/gallon estimate, ABC is still only eligible to receive 80% of the incremental cost up to a total $32,000 for that award year. However, if ABC uses fewer gallons than estimated and the incremental cost of E-85 increases, they may apply the funds available based on the estimated number of gallons as long as the total does not exceed $32,000 and is not greater than 80% of the incremental cost.

If selected for funding, awardees will be required to submit an invoice with the dollar amount being requested, the quantity, date and fuel type purchased, the unit cost of fuel purchased, the cost of an equivalent quantity of conventional fuel and the cost-share percentage and contribution provided by awardees. Invoices will be accepted for reimbursement on a quarterly basis. TJCOG will assist grantees with emission reduction calculations and conduct a site visit to each award location at least once during each annual grant cycle.

Questions regarding this proposal should be directed to Anne Tazewell at (919)558-9400 or emailed to annet@tjcog.org. Completed applications must be received by TJCOG no later than ***November 5, 2003***. Applications may be mailed to:

Airport Workshop to Explore Alternative Fuel Options

RALEIGH DURHAM INTERNATIONAL AIRPORT (RDU)- At the December 4th Airports and Alternative Fuels Workshop, participants will learn about improving air quality and domestic security through the use of biodiesel, ethanol, propane, and natural gas as transportation fuel choices. Speakers from Dallas/Fort Worth International Airport, Seattle-Tacoma International Airport and United Parcel Service will share alternative fuel success stories at the workshop being held from 9:00-3:00 at the RDU Center.

"At this crossroads, when our dependence on foreign oil is coming under increased scrutiny, alternative fuels offer a way to stimulate the domestic economy and clean up the air," said Anne Tazewell, Clean Cities Coordinator for the Triangle region.

The region's attention to air quality concerns is increasing as the Triangle becomes designated a "non-attainment" area in 2004 with regards to National Ambient Air Quality Standards. Alternative fuels provide a realistic solution to these concerns, as well as those of domestic security. The U.S. transportation sector is 97% reliant on petroleum and over 50% of the oil consumed is imported - approximately 10 million barrels a day. Much of this oil is from countries hostile to the U.S. Agriculturally based fuels such as biodiesel and ethanol can be produced in North Carolina, bolstering our rural economies. In addition, fuels such as natural gas and propane significantly reduce tail pipe emissions as compared to gasoline and diesel and are also produced in America.

At the workshop, a representative from the NC Division of Air Quality will speak about the Early Reduction Credit system they are establishing to track voluntary measures to improve air quality and the RDU Authority will speak about a planned Multi-Use Service Station at the airport. Workshop organizers hope that this station will become North Carolina's first commercially accessible refueling for biodiesel and ethanol. Clean Cities Coordinator Anne Tazewell stated, "This service station could be a model for the future - one where renewable fuels such as biodiesel and ethanol are offered along with conventional fuels to the public." In addition, workshop participants will have an opportunity to test drive a natural gas Honda Civic - rated as the cleanest burning vehicle on the road today.

The Triangle Clean Cities Coalition and the NC Solar Center are sponsoring the workshop with funding provided through the NC Department of Administration's State Energy Office. Triangle Clean Cities is a coalition of over 40 public and private stakeholders dedicated to increasing the use of alternative fuels and is hosted regionally by the Triangle J Council of Governments. The coalition in part of the U.S. Department of Energy's National Clean Cities program. Further workshop information available at http://www.trianglecleancities.org/ or by calling Anne Tazewell at 558-9400.

COASTAL HABITAT PROTECTION PLAN PROGRAM

2002 - 2003
ANNUAL REPORT

TO THE

JOINT LEGISLATIVE COMMISSION ON SEAFOOD AND AQUACULTURE

AND

ENVIRONMENTAL REVIEW COMMISSION

OF THE

NORTH CAROLINA GENERAL ASSEMBLY

FROM

NORTH CAROLINA MARINE FISHERIES COMMISSION,
NORTH CAROLINA COASTAL RESOURCES COMMISSION, AND
NORTH CAROLINA ENVIRONMENTAL MANAGEMENT COMMISSION

September 2003

SUMMARY

September 2002 – August 2003 Actions

- All six of the plan's basic habitat chapters are drafted; they are in various stages of technical review and revision.
- The Intercommission Review Committee is taking a very active role in the process, reviewing each habitat chapter and developing the draft management options.
- Staff of the divisions of Marine Fisheries and Coastal Management began detailed presentations on each of the six types of fish habitats to the Marine Fisheries and Coastal Resources commissions in January 2003.
- The public outreach process is underway; including an enhanced web site, an informational video, a brochure, a tabloid inserted in coastal newspapers, and a series of public information meetings during July – September 2003.
- The North Carolina General Assembly approved an extension of the Coastal Habitat Protection Plan deadline to 31 December 2004.
- Members of the Coastal Resources, Marine Fisheries, and Environmental Management commissions met together in October 2002 at the North Carolina Aquarium at Ft. Fisher to share information about the Coastal Habitat Protection Plan and to visit nearby coastal habitats.
- Elizabeth City State University has implemented a federal grant to establish a remote sensing program, partly to support the Coastal Habitat Protection Plan Program. Mapping of sea grass in the Albemarle Sound system is underway.

September 2003 – August 2005 Planned Actions

- Complete informational presentations on the six types of fish habitats to the Marine Fisheries and Coastal Resources commissions in Winter 2004.
- IRC complete development of initial management options during Spring 2004.
- Continue the public outreach effort on the draft North Carolina Coastal Habitat Protection Plan during Summer 2004
- Submit the Coastal Habitat Protection Plan to Commissions for adoption in Fall 2004.
- Begin development of management unit (watershed) plans in early 2005.

Introduction

Fisheries Reform Act

The North Carolina General Assembly established the Coastal Habitat Protection Plan program within the North Carolina Department of Environment and Natural Resources with passage of the Fisheries Reform Act of 1997. The Act (General Statute 143B-279.8) requires preparation of Coastal Habitat Protection Plans (CHPPs) for critical fisheries habitats in the coastal area. The Act states "[t]he goal of the Plans shall be the long-term enhancement of coastal fisheries associated with each coastal habitat." The Divisions of the Marine Fisheries, Water Quality, and Coastal Management are designated as the lead agencies for the program. The plans will:

1. Describe fisheries habitats and their biological systems;
2. Evaluate the functions, fisheries values, status, and trends in the habitats;
3. Identify existing and potential threats to the habitats and impacts on coastal fishing; and
4. Recommend actions to protect and restore the habitats.

Role of the Commissions

The Coastal Resources, Environmental Management, and Marine Fisheries commissions must each adopt the plans for them to become effective. Once the plans are approved, rule making and policy actions taken by all three commissions, are to comply, "to the maximum extent practicable" with the plans.

The three commissions are to report by 1 September each year to the Joint Legislative Commission on Seafood and Aquaculture and the Environmental Review Commission on progress in developing and implementing the plans. This document reports on progress made on Coastal Habitat Protection Plans during September 2002 – August 2003.

Recent Progress

North Carolina Coastal Habitat Protection Plan (NC CHPP)

The first draft of this document was sent out for initial Department review in January 2002. Due to the broad scope of the document, the complexity of the issues, and comments received on the draft, DENR staff realized that extensive restructuring, revisions, and additional coordination would be required to finalize the North Carolina Coastal Habitat Protection Plan.

The document has been reorganized to simplify the basic approach to discussion of fish habitats and threats to their productivity, while adhering to guidance provided in G.S. 143B-279.8. Accordingly, the plan is based on six basic types of fishery habitat: the water column, shell bottom, submerged aquatic vegetation, wetlands, soft bottoms, and ocean hard bottom. A chapter is devoted to each type. Each of the habitat chapters is organized to provide the information specified in the Act:

- Description and distribution of the habitat,
- Ecological role and function,
- Status and trends,

- Threats, and
- Recommended management actions to deal with the threats.

The NC CHPP will describe the function of habitats necessary for production of important fish stocks and the links between those habitats and various life history stages of the fish. The NC CHPP will also describe the various types of threats to the habitats upon which productive fisheries depend. The plan will also summarize the institutional structures for management of fisheries habitat, water quality, and fisheries in eastern North Carolina. Finally, the Plan will include management recommendations for the three regulatory commissions, DCM, DWQ, and DMF to implement in order to address the identified threats.

In support of this revised approach, the Intercommission Review Committee (IRC), composed of two members each from the Environmental Management, Coastal Resources, and Marine Fisheries commissions, is taking a more active role in the process. Specifically, members of the IRC are meeting every other month with technical staff from DENR divisions and the Wildlife Resources Commission (CHPP Development Team) to review each chapter in detail and to develop draft management options. This process should be completed by April 2004.

Attachment 1 lists the members of the IRC.

Attachment 2 shows the major milestones anticipated for development of the NC CHPP.

Meetings and Products

The CHPP Development Team, including staff from the divisions of Marine Fisheries, Coastal Management, Water Quality, Environmental Health (Shellfish Sanitation and Recreational Water Quality Section), and the Wildlife Resources Commission assisted DMF staff with writing and review of each chapter of the CHPP. The Development Team met four times with the IRC to review individual chapters and develop initial management options. Progress reports have been provided to all three commissions, the Intercommission Review Committee, and senior DENR staff.

Numerous presentations were made by DMF staff and Team members at various meetings addressing coastal issues. Sponsors of those meetings included the Coastal Resources Advisory Council, North Carolina Coastal Federation, Albemarle-Pamlico National Estuary Program Coordinating Council, and several local civic organizations. The CHPP poster was displayed at several public events, such as the "One North Carolina Naturally" conference in Raleigh (April 2003). Technical presentations were made at the Coastal GeoTools Conference in Charleston, S.C. and at the American Fisheries Society Southern Division meeting in Wilmington, N.C. The Massachusetts Office of Coastal Zone Management invited a CHPP Team member to Boston to explain the North Carolina program to assist them undertake a similar initiative.

Public Outreach

Using federal grant funds, the Department began a public outreach program. This activity included a four-part effort:

- An informational video describing the NC CHPP and inviting viewers to participate in the process (March – April 2003).
    - Over 200 copies of the video were distributed to local cable TV systems, educational groups, individual members of the Marine Fisheries and Coastal Resources commissions, members of the Coastal Resources Advisory Council, the North Carolina Ferry Division, the North Carolina Aquariums, the Estuarium, and other groups and individuals for public showing.

- An informational brochure that described the six types of coastal fish habitats and invited readers to participate in the process (May – June 2003).
    - About 15,000 copies of the brochures were distributed similarly to the video.
- A 12-page newspaper tabloid further describing the six types of fish habitat and threats to them was printed and inserted in coastal newspapers. The insert also invited readers to participate in the process, and listed the dates and locations for ten public meetings later in the year (July 2003).
    - About 250,000 copies of the insert were distributed via local coastal newspapers. Several thousand additional copies were mailed to interested persons and groups.
- Ten public meetings were convened throughout the coastal area, as well as inland as far west as Mooresville.
    - Participants provided comments on threats to the fish habitats and suggested potential management actions to address the threats.

Future Actions

North Carolina Coastal Habitat Protection Plan Development

Through the end of calendar year 2004 staff will concentrate on preparation of the NC CHPP to address threats facing coastal fisheries habitats throughout eastern North Carolina. It is being prepared using a wide variety of information sources including wetlands maps from the Division of Coastal Management; data on distribution of submerged aquatic vegetation from the National Oceanic and Atmospheric Administration, DMF, and DWQ; and data on topics as diverse as soil types, agricultural and forestry acreage, point source discharges, Natural Heritage sites, and recreational and commercial fisheries landings.

Plan Adoption

The process of working with the three commissions to lay the basis for consideration and adoption of the NC CHPP began in October 2002, with a tri-commission meeting, consisting of presentations and local field trips. DENR Secretary Ross addressed the commissions and discussed the NC CHPP with commissioners in a workshop setting. The meeting emphasized the importance of the CHPPs Program and began the process of developing a strategy for adoption and implementation of the plans. The divisions are presenting information from draft chapters of the NC CHPP to the commissions over several meetings in order to allow time for consideration of the plan in phases rather than all at once. This process began in January 2003 and will end during February – March 2004.

Management Unit Plans

Early in 2005 work will begin on development of the plans that will cover 11 specific geographic areas similar to the Division of Water Quality's river basins (see Attachment 3). These areas are referred to as Management Units, and the plans will provide more area-specific information and recommendations. It will take approximately 12 - 18 months to complete each Management Unit Plan. These documents will focus on identification and improved management of site-specific habitat areas.

Other Accomplishments and Issues

With assistance from the divisions of Coastal Management and Marine Fisheries, Elizabeth City State University received a grant to establish a remote sensing program and laboratory. Much of the justification for the grant was based on the need to obtain and analyze satellite data to aid in preparation of the NC CHPP and management unit documents. Under this program, staff initiated mapping of sea grass beds in the Albemarle Sound system late in 2002. This work is being expanded during 2003 – 04.

The 2001 - 2002 Annual Report noted several impediments to success of the CHPP Program. As in previous years, insufficient funding has prevented obtaining the following items that would greatly enhance the development of the NC CHPP:

- Dedicated environmental scientists (one each in DWQ, DCM, and DMF) to support work on CHPPs,
- Funds to subscribe to electronic scientific literature databases at DMF offices in Wilmington and Morehead City, and
- Funds to hire graduate students to assist in locating data and reports, either directly or through contracts with laboratories in Wilmington and Morehead City-Beaufort.

Mr. George Givens, Commission Counsel
Environmental Review Commission
Room 545
Legislative Office Building
Raleigh, NC 27601-1096

Dear Mr. Givens:

Pursuant to G.S. 130A-294(i), the Department of Environment and Natural Resources is required to develop a comprehensive hazardous waste management plan for the state at two-year intervals and report on that plan annually. The most recent hazardous waste management plan was developed in 2002.

The 2003 Hazardous Waste Management Report discusses:

- North Carolina waste management;
- amount of waste generated;
- resource recovery, reuse and conservation;
- minimization of the amount of disposed hazardous waste; and
- implementation of recommendations in the 2002 Plan as noted in GS 130A – 294(i).

The 2003 Hazardous Waste Management Report is attached. If you have any questions, please contact Jill Pafford, Chief, Hazardous Waste Section at (919) 733-2178, ext. 219.

Sincerely,

William G. Ross Jr.
Secretary

HAZARDOUS WASTE MANAGEMENT

2003 REPORT

Presented to

The Environmental Review Commission

October 1, 2003

NCDENR

North Carolina Department of
Environment and Natural Resources

INTRODUCTION

The State of North Carolina requires that the Department of Environment and Natural Resources (DENR) develop a comprehensive hazardous waste management plan every two years. The first plan was completed on July 1, 1990; the latest plan was completed in 2002. Beginning October 1, 2003, the department must also make an annual report on the hazardous waste management plan per GS 130A – 294(i). This report includes an evaluation of hazardous waste management in North Carolina and identifies DENR activities and recommendations in the following areas: improving waste management; cleaning up of hazardous waste; reducing the amount of waste generated; minimizing the amount of hazardous waste which must be disposed of; and maximizing resource recovery, reuse and conservation.

This report includes North Carolina data from the Environmental Protection Agency's 1999 "Biennial Report of Hazardous Waste Generation" (1999 BR). All North Carolina generators that reported Large Quantity Generator status in 1999 were required to provide EPA with 1999 waste generation and management information. The 1999 BR was published in June 2001 and can be found at http://www.epa.gov/epaoswer/hazwaste/data/#br. EPA has not published the 2001 report yet, so more recent data is not available at this time.

NORTH CAROLINA HAZARDOUS WASTE SECTION

The Hazardous Waste Section was authorized by EPA in 1980 to implement the Resource Conservation and Recovery Act (RCRA) in North Carolina in lieu of the EPA. Continuing developments in the hazardous waste program nationwide have required the section to continually apply for authorization in program areas, such as case development audits (criminal and administrative investigations), corrective action, and alternatives to permitting and emission monitoring. The Hazardous Waste Section has a staff of 54 people working in three branches: compliance, facility management and programs. Collectively, the branches' duties include, but are not limited to, the following areas:

- Regulate the management of hazardous waste by generators, transporters, treaters, storers, and disposers;
- Educate the public and the hazardous waste community by providing technical assistance through individual consultations and seminars;
- Protect public health and the environment through waste reduction, sound recycling methods, safe management practices and proper disposal as a last resort;
- Issue permits specifying requirements that each hazardous waste treatment, storage or disposal facility must meet;
- Conduct compliance audits and, with the cooperation of the North Carolina Attorney General's Office, take enforcement actions against those found in violation;
- Require groundwater assessments, facility investigations and corrective measures at facilities where hazardous wastes have previously been released into the environment;

- Ensure section staff is properly trained to implement their duties; and
- Ensure environmental improvement through emergency response and site cleanup.

The section participates in a national data management system that tracks hazardous waste activity. This system, RCRAInfo, is especially designed for the RCRA program. The Programs Branch maintains the information in RCRAInfo for North Carolina, by entering data on closure activities, corrective action activities, permitting activities, enforcement actions, compliance inspections, financial and other record reviews as reported by the Facility Management, Compliance and Programs Branches.

For RCRAInfo information, as well as other regulatory information for a particular site, visit http://www.epa.gov/enviro/. For more details about the Hazardous Waste Section and the Division of Waste Management visit http://www.wastenotnc.org/.

HAZARDOUS WASTE GENERATION, MANAGEMENT AND CLEANUP

In 1999, 508 North Carolina large quantity generators (LQGs) reported that 74,757 tons of hazardous waste were generated. Of the 508 LQGs, the top 10 facilities generated 34,405 tons, or 46 percent, of the total quantity of hazardous waste generated in North Carolina.

In 1999, 75 North Carolina treatment, storage or disposal facilities (TSDFs) reported they managed 20,405 tons of hazardous waste through treatment, storage or disposal. Of the 75 TSDFs, the top 10 facilities managed 20,352 tons, or 99.7 percent, of the total hazardous waste managed in North Carolina. Common hazardous waste management methods include solvent recovery, incineration, fuel blending, energy recovery, sludge treatment, stabilization and metals recovery.

Although only LQGs and TSDFs are required to report their hazardous waste generation and management amounts, it is important to note that North Carolina also has 2,024 small quantity generators and 3,984 conditionally exempt small quantity generators. These facilities do not generate enough hazardous waste in a year to qualify for reporting purposes. However, these facilities collectively generate a significant amount of hazardous waste that needs to be managed properly and in compliance with all applicable laws and rules.

North Carolina has 39 facilities in the permitting workload universe and 61 facilities in the post-closure workload universe. Approximately 97 percent of these facilities are under a permit, order or other approved control for management or remediation of their hazardous waste. This includes corrective action sites, where remediation progress is tracked through environmental indicators. Currently, 48 percent of high priority corrective action sites have human exposures under control and 52 percent of high priority corrective action sites have groundwater migration under control.

NORTH CAROLINA HAZARDOUS WASTE REDUCTION INITIATIVES

A. North Carolina Hazardous Waste Commitment toward Waste Minimization

The EPA is in the process of using its final "Waste Minimization" priority chemicals list to set regional waste minimization program priorities using a three-year time horizon. Once established, these program priorities will focus on industrial sectors that generate hazardous wastes containing priority chemicals and/or on specific priority chemicals that may be generated by several sectors. EPA will then assist states in determining the appropriate sectors to target in waste minimization efforts.

Until the priority chemical list is established, the Hazardous Waste Section has taken the following actions:

- Incorporate general pollution prevention training into annual generator workshops, industry meetings and enforcement settlement negotiations;
- Review facility requests for alternative uses of hazardous waste (use/reuse, substitution, reclassification and delistings).
- Conduct inspections that include monitoring facility compliance with Land Ban/Land Disposal restrictions, air rules, universal waste streams and used oil regulations. These regulations are all designed to reduce exposures and fugitive emissions, while they improve recycling options for all waste streams.

B. Environmental Stewardship Initiative Award

DENR's Environmental Stewardship Initiative promotes and encourages superior environmental performance by North Carolina's regulated community.

This voluntary program establishes incentives to stimulate the development and implementation of programs that use pollution prevention and innovative approaches to meet and exceed regulatory requirements. There are two levels of participation. "Environmental Partners" is for organizations interested in developing a systematic approach to improving their environmental performance. The "Environmental Steward" level is for those organizations that already display a commitment to exemplary environmental performance beyond what is required by law.

This program is implemented by the Division of Pollution Prevention and Environmental Assistance (DPPEA); however, the Hazardous Waste Section reviews the candidate list to determine the candidate's compliance with the appropriate hazardous waste laws and regulations. This information is shared with DPPEA for their final decision of the candidate's eligibility in the Environmental Stewardship Program.

C. Reduction of Hazardous Waste in the Dry Cleaning Industry

The North Carolina General Assembly has recently enacted legislation that provides state tax credits for those who purchase and install certain types of dry cleaning equipment and processes.

The two current predominant dry cleaning processes in North Carolina are PERC and Petroleum Class II. The Hazardous Waste Section assists the Solid Waste Section in reviewing the applications for the tax certification requests for dry cleaning recycling equipment.

OTHER INITIATIVES

Predicting trends from the 1999 BR data presented in the 2002 plan and this report is difficult. However, North Carolina facilities clearly generate and manage a significant amount of hazardous waste that must be managed properly. In addition to continuing its work with EPA and other DENR agencies on the waste reduction initiatives previously discussed, the Hazardous Waste Section has also accomplished the following:

- Received the necessary authorization updates for the Hazardous Waste Section from EPA in order to continue enforcing existing laws and regulations for the comprehensive management of hazardous waste.
- Made data management a priority, so that the necessary data for hazardous waste generation, management and enforcement is available to the regulatory agency, the regulated community and the public for sound decision-making and hazardous waste trend analysis. Both the Hazardous Waste Section and DPPEA have developed new databases within the approved DENR framework in order to share information easier internally. This service will expand eventually to the public. Both agencies also keep heavily requested documents electronically available on their web pages.
- Held three generator workshops in May 2003. These workshops help educate LQGs on hazardous waste regulations, the expectations of hazardous waste inspectors, and pollution prevention opportunities.
- Started a new initiative in 2002 to target the vast SQG universe through the use of a SQG self-certification form. This form was again sent out in 2003. Data collected after two years will be used to establish management trends and help identify educational needs of SQGs.
- Established a committee recently with DPPEA to identify North Carolina waste generation trends and mutual waste management goals and objectives.

An additional recommendation that was outlined in the 2002 Hazardous Waste Management Plan, but has not been implemented, is as follows:

- Find a source of revenue for the Hazardous Waste Emergency Response Fund. Fund revenue used to come from penalties levied on compliance orders. The practice was halted a few years ago due to a court ruling that requires all penalty money must go to the state school fund. Once this fund is depleted, the state will no longer be able to respond to emergency spill situations.
- Continue to support the passage of HB 1312, to establish a process where LQGs and SQGs would pay a security deposit before receiving an EPA ID number and commencing HW management. This deposit would be refunded in the event the generator notifies the agency of closure and cleans up their site. Should the generator abandon the facility, this deposit would be used to stabilize the site by overpacking, labeling and possibly disposing of drums left behind.

Mr. George Givens, Commission Counsel
Environmental Review Commission
Room 545
Legislative Office Building
Raleigh, NC 27601-1096

Dear Mr. Givens:

The Division of Waste Management is required under N.C.G.S. 130A-295.02 to employ resident inspectors to monitor the activities of all the commercial hazardous waste facilities within the state to ensure their compliance with laws and rules administered by the Department of Environment and Natural Resources.

Pursuant to N.C.G.S. 130A-295.02(m), I am transmitting an annual report on the implementation of this Resident Inspector Program. The attached report is for the fiscal year 2002-2003. If you have any questions, please contact Michael Brailsford, program supervisor for the Resident Inspector Program, Hazardous Waste Section, (919) 733-4996, ext. 359.

Sincerely,

for William G. Ross Jr.
Secretary

RESIDENT INSPECTOR PROGRAM
2003 ANNUAL REPORT

This annual report is presented to the Environmental Review Commission pursuant to Article 9, G.S. 130A 295.02(m). The report covers the activities of the Resident Inspector Program from July 1, 2002 through June 30, 2003.

I. OVERVIEW

The Resident Inspector Program has been operating for more than 12 years in the Division of Waste Management. This program monitors all aspects of the commercial hazardous waste facilities in North Carolina and assures compliance with all laws and rules administered by the Department of Environment and Natural Resources. It may also enforce laws or rules administered by any other state agency through a memorandum of agreement.

The Resident Inspector Program was established "... to enhance the ability of the Department to protect the public health and the environment by providing the Department with the authority and resources necessary to maintain a rigorous inspection and enforcement program at commercial hazardous waste facilities" [G.S. 130A-295.02(f)].

II. PROGRAM STAFFING

For this fiscal year, the program was comprised of two resident inspectors assigned to home duty stations, one administrative assistant and a program supervisor (See Attachment 1 for the Organization Chart). The Resident Inspector Program resides within the Hazardous Waste Section's Compliance Branch.

III. THE RESIDENT INSPECTOR

Most state agencies perform their compliance monitoring inspections as required from their specific respective regulations. The Resident Inspector Program, however, is unique in that its inspections utilize a multi-media approach. This approach covers all regulatory responsibilities for which DENR is authorized, such as hazardous waste management and treatment requirements, workplace safety, air emissions requirements, waste water treatment and discharge requirements, etc.

There are inherent overlaps of DENR's regulatory requirements with regulations administered by other departments. Two examples include the Department of Labor's Occupational Safety & Health Act and the Department of Transportation's hazardous materials transportation regulations. Deviations from these various departments' regulations could adversely affect public health and the environment, as well as a facility's compliance with air, water or hazardous waste management regulations. As part of

the Resident Inspector Program's comprehensive approach to monitoring commercial hazardous waste facilities, resident inspectors also evaluate these sites for potential violations in these other regulatory areas. When necessary, they make recommendations to the facilities and/or make referrals to the authorized agency or agencies. The mandated frequency of inspection at each facility gives resident inspectors the time needed to achieve this high degree of oversight.

To prepare resident inspectors for their multimedia approach to inspections, initial training typically consists of Hazardous Waste Operations and Emergency Response (24 or 40 hours), Environmental Surveillance, RCRA Hazardous Waste Training, Hazardous Materials Transportation and the care and use of Level B / Personal Protective Equipment.

Annual training for resident inspectors includes an 8-hour Health & Safety Basic Refresher, Level B Update and Environmental Surveillance Update. Depending upon the inspector's area of expertise and responsibility, other miscellaneous training may be received, including Hazardous Waste Incineration, Ambient Air Monitoring, Air Pollution Control Devices, Chemical Safety Audit, OSHA Inspector's Course, Hazardous Materials Management and various EPA regulatory workshops.

IV. SUBJECT FACILITIES

To be subject to oversight by the Resident Inspector Program, the facility must be a commercial hazardous waste facility. The term "commercial," as it relates to a hazardous waste facility, is defined as a facility " ... that accepts hazardous waste from the general public or another person for a fee" [G.S. 130A-290(a)(3)]. Presently, there are 12 permitted commercial hazardous waste treatment, storage, and disposal facilities in North Carolina under the jurisdiction of the Resident Inspector Program. The formerly "interim status" (not yet permitted) facility, Carolina Solite Corporation, has withdrawn its application for a Part "B" Permit (a permit to operate light weight aggregate kilns fueled by hazardous waste) and has met the RCRA closure standards, in accordance with the North Carolina and federal regulations. The Carolina Solite facility continues to operate the light weight aggregate kilns utilizing "used oil" as a fuel and continues to be monitored by the Division of Air Quality. The permitted treatment, storage and disposal facility, Giant Resource Recovery, (which owns the Carolina Solite facility) continues with its previously announced intention to close all hazardous waste operations at the Stanley County, North Carolina location. The permitted treatment storage and disposal facility formerly known as EnviroChem Environmental Services had been in the process of closure due to the owner's bankruptcy. It has been purchased through foreclosure proceedings conducted by the mortgage holder. After a thorough background investigation, the permit was re-assigned to the new owner. The new owner/operator, EQ – North Carolina Inc., ceased closure proceedings and began hazardous waste storage operations at the Apex facility in January, 2003.

V. FACILITY CATEGORY RANKINGS

Each commercial hazardous waste treatment, storage and disposal facility is ranked to determine its required inspection fees and minimum inspection frequency as required under 15A NCAC 13A .0116. The frequency of the inspections at each facility is dependent upon its qualification as a "special purpose" commercial hazardous waste facility and the category ranking assigned to it. Currently, all

existing commercial hazardous waste treatment, storage and disposal facilities in North Carolina qualify as special purpose facilities. (See Attachment 2 for current category rankings and primary waste treatment activities for these facilities.) The designated categories of 1, 2 or 3 correspond to a minimum inspection frequency of two, four or six times per month, respectively.

VI. FUNDING & EXPENSES

The Resident Inspector Program is completely funded by fees collected from the commercial hazardous waste facilities. These fees are based upon each facility's category ranking and volume (tons) of hazardous waste handled. The category ranking system is designed to be an indirect measure of the costs associated with the oversight at each commercial hazardous waste facility. With the overall reduction of hazardous waste generation by industry, the commercial hazardous waste facilities' tonnage throughput has decreased. Consequently the fees received from these facilities have decreased. Currently, it is necessary for the Resident Inspector Program supervisor to conduct a portion of the required inspections in order to meet the Program's mandates.

For FY 2002-2003, the budget was developed using anticipated revenues from Resident Inspector Program fees of approximately $275,000. The actual hazardous waste tonnage received by many of the commercial facilities remains lower than projected due to the impact to general industry by the continued weakened economy. (A detailed list of the individual tonnages received by each of the commercial hazardous waste facilities in FY 2002-2003 can be found in Attachment 3.) The Actual Program receipts in FY 2002-2003 totaled $264,524. With the limited budget projections, and in accordance with state budget mandates, restrictions for travel, training and supplies were imposed and expenses were held to $236,955.

VII. INSPECTION GOALS & ACHIEVEMENT

During this past fiscal year, the program staff conducted a total of 567 inspections. Additional inspections, over the required minimum of 528 inspections, were performed to monitor closure activities at two facilities and to assist in improving compliance performance by other facilities. (A detailed list of the inspections performed by program staff at the commercial hazardous waste facilities in FY 2002-2003 can be found in Attachment 4.)

VIII. ENFORCEMENT & COMPLIANCE

Enforcement Activities

In general, the commercial hazardous waste facilities continue to be cooperative and have rapidly responded with corrective action in most cases when deficiencies or violations were cited or recommendations made. When either of these actions do not result in timely and consistent compliance, more severe enforcement action, such as compliance orders with administrative penalties, is taken.

During the past fiscal year, resident inspectors issued three Notices of Violation to commercial facilities (see Attachment 5). This translates to an overall compliance rate of 99.5 percent.

Compliance Assistance Activities

Compliance assistance activities offered under this program are conducted routinely during the inspectors' site visits. Since the inspectors are at these facilities at least semi-monthly, they have the opportunity to become very familiar with the operations of each facility and may offer compliance assistance in several ways. Inspectors identify past trouble areas and work with the facility toward a permanent solution. They also increase scrutiny of these areas during each visit to keep the facility's compliance awareness high. Inspectors communicate frequently with facility management and front-line workers to clarify the permit and current regulatory requirements, the reasons for the requirements, and the potential risks incurred for noncompliance. Inspectors continue to develop and schedule roundtable training workshops customized for each specific facility. These workshops cover the most frequent violations observed at commercial facilities, the most frequent violations observed at their particular facility, any potential areas of concern and positive facility operations.

If a facility repeats a violation, the primary inspector and program supervisor will set up an informal enforcement conference with the local facility compliance managers, the plant manager, and, if applicable, the corporate compliance officers. They discuss the facility's current compliance issues and work with the facility to find a permanent solution, which may include formal enforcement.

IX. PUBLIC MEETINGS / HEARINGS & PERMIT RENEWALS

Resident Inspector Program staff continue to observe and assist/support public meetings/hearings that involve existing and proposed commercial hazardous waste facilities in this state. A continuing program goal is for the staff to be fully aware of public concerns and to be conscious of these concerns during oversight efforts at these facilities. Program staff have provided assistance in facility compliance audits by generators, consultants, other agencies and the public. Program staff work with area schools to provide information in the classroom about environmental responsibility and how the facilities help with that responsibility.

The Resident Inspector Program staff continue to work with the Facility Management Branch (the permitting arm of the Hazardous Waste Section) and each commercial hazardous waste facility during the permit application process and permit renewal review periods. The purpose of this joint effort is to provide clarification, address areas of concern, and assist in ensuring the permit application accurately reflects the facility as it is operated.

X. SUMMARY

At the conclusion of the program's 12th year, Resident Inspector staff continue to provide rigorous oversight of the commercial hazardous waste facilities in this state. This is reflected in the facilities' overall compliance rate of 99.5 percent. Staff constantly seek new approaches and initiatives to improve the department's ability to protect public health and the environment. Staff also work to ensure that new regulatory requirements are fully understood by the facilities so they can be implemented rapidly and correctly. Proactive approaches, such as workshops, program oversight and compliance assistance efforts, have clearly demonstrated a heightened level of compliance at the commercial hazardous waste facilities in North Carolina.

RE: Report on Mining Permit Fee Use

Pursuant to G.S. 74-54.1(c), I am transmitting a report on the mining permit fees collected in FY 02-03.

The report was prepared by DENR's Division of Land Resources, which administers the Mining Program. If you have further questions or would like additional information, please contact Mell Nevils at 733-4574.

1601 Mail Service Center, Raleigh, North Carolina 27699-1601

MINING PERMITTING PROGRAM

1. Monies Collected:

   Total fee monies of $70,904 were collected during fiscal year 2002-2003.

2. Monies Expended:

Salaries and Benefits	$33,189.00*
Purchased Services	4,056.00
Supplies	409.00
Intragovernmental Transfer	25,012.00
Total	$62,666.00

One position, an assistant mining specialist, was funded this year to assist in application review and permit issuance.

*The position was vacant for approximately four months

RE: Annual Admission Fund Report

Pursuant to NCAC 143B-289.44 (d), please find attached a report detailing revenues to and expenditures from the North Carolina Aquariums' Admission Fund (Fund 2865) during fiscal year 2003. This report also includes information on the disposition of exhibits and exhibit components no longer needed by the Aquariums during fiscal year 2003 (NCAC 143B-289.41(a)(1c)).

Memorandum

To: Joint Legislative Commission on Governmental Operations
Natural and Economic Resources Appropriations Subcommittees
Fiscal Research Division

From: David R. Griffin, Director
Aquariums Division

Subject: Aquariums Exhibit Disposal
Aquariums Admission Fund

Date: September 25, 2003

During the 2002-2003 fiscal year, a collection of miscellaneous exhibit components was sold by the NC Aquarium at Pine Knoll Shores to the National Aquarium in Baltimore, MD totaling $1265, and six exhibit light boxes were sold to The History Place, Morehead City, NC for $150 (Ref. S.L. 1999-49).

Following is a report on the revenues and expenditures of the Aquariums Special Admission Fund (Fund 2865) for the 2002-2003 fiscal year (Ref. G.S. 143B-289.44(d)).

Total Admission Fund Revenues:	**$3,510,789**

Expenditures:

Admissions Administration & Staff	350,000
Seasonal/Temporary Positions	220,000
Maintenance/Repairs	300,000
Operating Support (Replace Cuts in State Appropriations)	370,000
Husbandry Support	220,000
Exhibits Support	88,000
Education Program Support	40,000

Advertising/Promotions	75,000
Printing/Publications	50,000
New Changing Exhibit (R/I)	250,000
Expansion Design Fees (PKS)	915,000
Total:	**$ 2,878,000**

Admission Fund Growth '02-'03 (Revenues – Expenditures)	**$ 632,789**

RE: Report on Pilot Program for Animal Waste Inspection

This memorandum transmits the June 2003 Report on the Pilot Program for Animal Waste Inspection in accordance with Session Law 2003-340, Section 6.2. The statute requires the Department to provide reports to the Environmental Review Commission and the Fiscal Research Division regarding progress on the Pilot Program. This report is presented in the form of an Addendum to the May 2002 Interim Report.

If you have any questions or need additional information, please contact David Vogel, Director of the Division of Soil and Water Conservation, at 715-6097 or by e-mail at david.vogel@ncmail.net.

THE ENVIRONMENTAL REVIEW COMMISSION AND FISCAL RESEARCH DIVISION OF THE NORTH CAROLINA GENERAL ASSEMBLY

INTERIM REPORT ON THE PILOT PROGRAM FOR INSPECTIONS OF ANIMAL WASTE MANAGEMENT SYSTEMS June 30, 2003

North Carolina Department of Environment and Natural Resources

I. REPORT CONTENTS

- Introduction
- Site Visit Findings for 2002
- Categorizing Farms and Targeting Potential High Impact Farms
- New Technical Assistance Site Visit Reporting Form
- Estimated Program Implementation Costs
- Conclusions

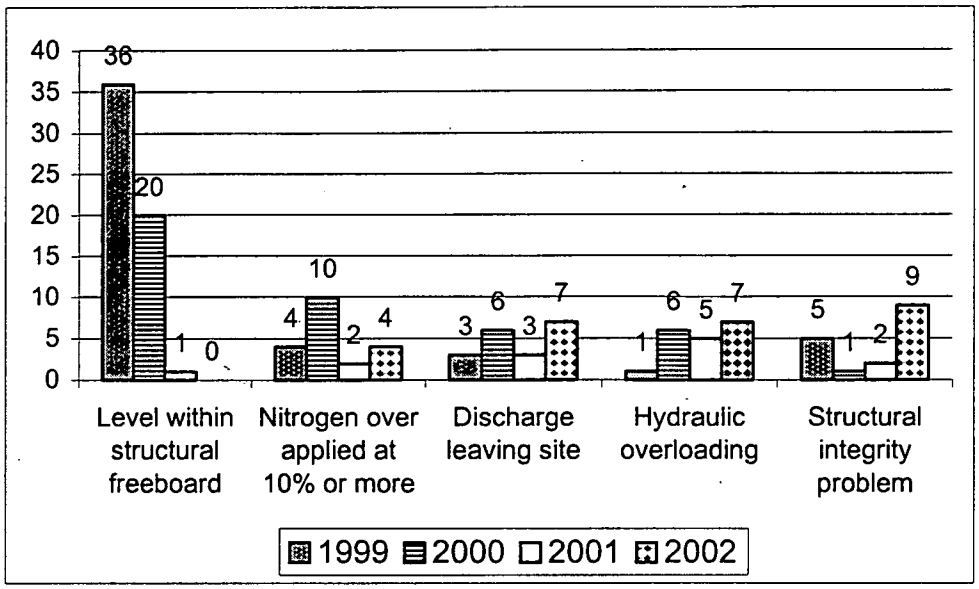
II. INTRODUCTION

This interim report is intended to supplement information provided in the Department's November 2001 interim and May 21, 2002 addendum Environmental Review Commission (ERC) reports on the Pilot Program for Inspections of Animal Waste Management Systems. It contains updated results from the continuation of the Pilot Program as extended by the 2002 General Assembly. The reader is encouraged to refer to details in the November 2001 and May 21 reports for a full explanation of data collection and analysis, and for a detailed description of findings regarding compliance for swine farms for previous program years. This report includes new 2002 data and outlines DENR's continued targeting of technical assistance and enforcement resources within the pilot program area of Brunswick, Columbus and Jones Counties.

III. SITE VISIT FINDINGS FOR 2002

Program year 2002 was a period of mixed compliance trends, particularly given that 2001 and 2002 were similar. Both years documented below average rainfall and were similar in other factors such as technical assistance, directed enforcement and operator initiatives. The number of farms categorized as having "low environmental impact" remained fairly constant (to be discussed in more detail in the next section). The number of recorded "Immediate Threat" problems on High Impact Farms either equaled or slightly increased over 1999 numbers for every category except structural freeboard lagoon. There were no structural freeboard violations noted in 2002. See Figure 1.

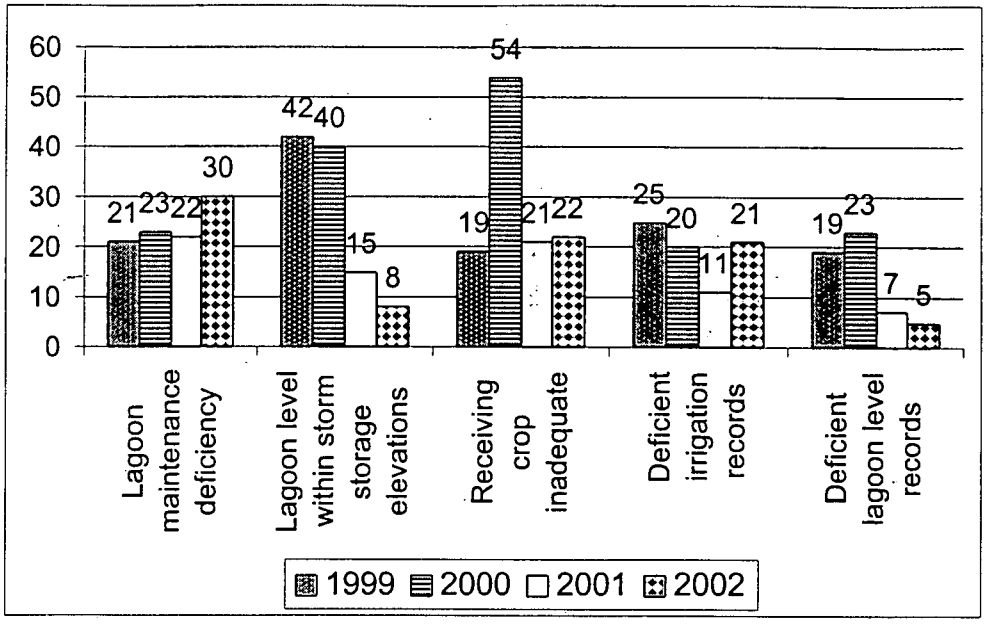
Figure 1: "Immediate Threat" Problems for Pilot Farms Recorded 1999 - 2002



NOTE: Y-axis represents number of recorded "Immediate Threat" Problems. These results are based on 1,252 site visits by DENR staff.

Deficiencies recorded as "Potential Threat" problems for the pilot program farms from 1999-2001 are shown in Figure 2. The data shows continued improvement for managing lagoons below the storm storage elevations and properly managing lagoon levels records. Again, this may be a direct function of below average rainfall documented for 2002. However, other "Potential Threat" problems such as lagoon maintenance deficiencies and irrigation record deficiencies reveal flat or increasing noncompliance trends for the four-year period.

Figure 2: "Potential Threat" Problems for Pilot Farms Recorded 1999 - 2002



NOTE: Y-axis represents number of recorded "Potential Threat" Problems.
These results are based on 1,252 site visits by DENR staff.

Previous pilot program reports have focused on compliance comparisons between company-owned operations and contract grower/independently-owned farms. During 2002, economic factors within the industry caused five swine operations in the pilot counties to switch ownership status from company-owned to contract grower, thus changing the make up of the established control groups and affecting the data sorting and comparison. This report does not include trends between ownership status and compliance due to ever-shifting numbers between these categories.

IV. CATEGORIZING FARMS AND TARGETING POTENTIAL HIGH IMPACT FARMS

In the May 21, 2002 Addendum ERC Report, an illustrative Environmental Scale was used to illustrate a process for separating livestock operations based on their compliance performance and relative (potential) environmental impact. The two main purposes of this point system are to recognize that some parameters are more significant than others relative to environmental impact, and that not all problem occurrences should be treated equally.

This process was used for categorizing farms at the end of the 1999, 2000, 2001 and 2002 program years. Annually, problem parameters were (1) noted in all DENR site visit reports for a specific program year, (2) compiled for each swine farm, and (3) matched with the appropriate environmental points as outlined in Figure 3. The 108 pilot program farms were then scaled in ascending order of points received as a measure of compliance performance and to determine the level of potential environmental impact for each farm for a specific program year.

Figure 3: DENR Environmental Scale Problem Parameters & Point Assignments

PROBLEM PARAMETERS TRACKED THROUGH PILOT PROGRAM	Environmental Points
Lagoon level in the structural freeboard	16
Lagoon level in the storm storage elevations	11
Nitrogen over-application =/> 10%	12
Nitrogen over-application < 10%	8
Waste spill or discharge leaving the site	20
Waste spill or discharge contained on site	12
Hydraulic overloading by excessive ponding or exceeding CAWMP	15
Structural integrity compromised	18
Structural maintenance deficiency	10
Marginal sprayfield conditions	9
Receiving crop needs improvement	8
Receiving crop inconsistent with CAWMP	10
Irrigation system maintenance deficiency	11
Irrigation records deficient	10
Late or missing waste analysis	8
Late or missing soils analysis	7
Late or missing lagoon level records	9

* Problem parameters were scaled from 1 to 20 with 20 representing the highest potential for environmental impact.

Swine farms in the pilot counties were categorized into three groups as determined by their compliance performance and the environmental scaling process. Figure 4 shows how pilot farms performed for each of the four program years of 1999-2002.

Figure 4: 1999–2002 Performance Comparisons of Pilot Program Farms Based on DENR Environmental Scale Results

	1999	2000	2001	2002
Farms receiving perfect scores of "0"	36	37	68	71
Low Impact Farms (0-12 points per year)	58	55	86	87
Medium Impact Farms (13-30 points per year)	25	29	9	11
High Impact Farms (31+ points per year)	25	24	13	10
Maximum points received (with duplications)	123	193	289	356
Total number of site visits by DENR personnel	311	395	264	282

From Figure 4, the following items are noteworthy:

- After the 2001 dramatic increase in farms receiving perfect scores (no points assigned for deficiencies or violations) for compliance performance, the number slightly increased for 2002.
- In 2002, farms determined to be "low impact" remain relatively constant at 81% while farms categorized as "high impact" decreased to less than 10% of the pilot program's 108 farms.
- The maximum number of points received by one farm for documented problems in 2002 increased from 2001, and is at an all time high of 356 points. It should be noted that the number of points received may be a result of duplication in points counted between DSWC and DWQ since each division is generating more

site visit reports related to problem farms, and due to repeat visits associated with improved identification, surveillance and resource targeting.

During the 2002 program year, DSWC and DWQ continued the process of targeting potential high impact farms for joint compliance auditing, and the transfer of inspection responsibility from DSWC to DWQ for farms with continual noncompliance. The process was more formally established by applying the following criteria to farms:

- Level 1: farm in good compliance status and subject to a *routine* operation review and *routine* compliance inspection by DSWC staff.
- Level 2: due to noncompliance factors (points received) farm is subject to an environmental audit by team of DSWC (*routine* operation review) & DWQ (*other* compliance inspection) staff. If audit reveals farm is in compliance and/or has corrected deficiencies, the farm returns to Level 1. If audit indicates continued noncompliance, farm is elevated to Level 4 by team.
- Level 4: farm is subject to routine and other compliance inspections by DWQ staff. Farm can be referred to DSWC by DWQ for technical assistance. Farm will remain at this level until compliance is achieved or farm is deactivated. If the farm returns to compliance, it is lowered to Level 3 by DWQ.
- Level 3: farm is subject to an environmental audit by team of DWQ (*routine* compliance inspection) and DSWC (*other* operation review) staff. If audit reveals continued compliance, farm is returned to Level 1. If audit indicates noncompliance, farm returns to Level 4 by team.

Figure 5: Tracking Chart for Pilot Audits & DWQ Routine Inspections

Region/Date	Level 1	Level 2	Level 3	Level 4	Comments
Brunswick & Columbus (WiRO) July-Dec 2001	54	8	-	-	Auditing process initiated by Wilmington staff
Jones County (WaRO) July-Dec 2001	46	-	-	-	Washington DWQ unable to participate due to workload
Brunswick & Columbus (WiRO) Jan-June 2002	58	3	-	1	Second round of audits and site visits by Wilmington staff
Jones County (WaRO) Jan-June 2002	38	7	1	-	Auditing process initiated by Washington staff. One farm was moved to level 3 due to recent spill & noncompliance history.
Brunswick & Columbus (WiRO) July-Dec 2002	61	-	1	-	Third round of audits and site visits by Wilmington staff
Jones County (WaRO) July-Dec 2002	38	3	-	5	Second round of audits and site visits by Washington staff
Brunswick & Columbus (WiRO) Jan-June 2003	60	2	-	-	Fourth round of audits and site visits by Wilmington staff
Jones County (WaRO) Jan-June 2003	40	-	-	6	Third round of audits and site visits by Washington staff

Figure 5 summarizes the tracking of the auditing and inspection process for pilot farms since its implementation in the last half of 2001. The tracking chart was broken down into six-month increments and by DENR region with Jones County located within the Washington region and Brunswick and Columbus located within the Wilmington region.

DSWC and DWQ staff assigned to work in the pilot counties confirms that the team auditing approach provides a comprehensive evaluation of each targeted farm, improves communication between division staff, and relays a consistent and unified message to all farms about the state's regulatory approach to noncompliance.

Figure 6 shows the 2003 targeted efforts and projected January through June workload for DENR regional staff related to individual farms. Of the 108 farms in the pilot counties, the top 20 farms receiving the highest points for 2002 are listed. Farms with an indicated status of "DWQ only" are Level 4 farms, considered Potential High Impact due to noncompliance, and are subject to DWQ inspections. It should also be noted that although this process is the first quantitative approach used to categorize farms based on compliance performance, DENR regional staff retained its authority to immediately elevate Low Impact Farms to Level 2 requiring a "joint audit" based on occurrence(s) of "Immediate Threat" problems. See farms #19 & #20 in Figure 6.

Figure 6: 2003 DENR Targeting Efforts of Potential High Impact Farms

POTENTIAL HIGH IMPACT FARMS – Revised 1-28-03

V. NEW TECHNICAL ASSISTANCE SITE VISIT REPORTING FORM

Conclusion #4 of the November 30, 2001 ERC Interim Report states that "*Due to the increased level of field effort, the pilot program's data set is larger, more complete and more robust than data contained in the state database for non-pilot farms.*" It is this discrepancy in data that has prevented a simple comparison between pilot counties and other counties as to the exact nature of improvement in compliance. While staff see evidence in the field that their increased level of effort and assistance to pilot farms is paying off, the overall statewide database for non-pilot farms does not contain sufficient data for comparative purposes. DSWC recognized that better data are needed for technical assistance efforts statewide, and developed a revised tracking form to compile information about technical assistance activities associated with operation reviews.

Attachment A is the new Technical Assistance Site Visit Reporting Form for use by DSWC and its partners, statewide, in reporting operation review and technical assistance efforts. The new form was designed to:

- Document site visits related to operation review and technical assistance. Staff will continue to document compliance inspections on the current state inspection form.
- Capture noncompliance data specifically related to the 17 problem parameters (page 2 of form) as established and tracked through the Pilot Program.
- Determine technical assistance needs (page 2 of form) for individual farms as well as technical assistance needs trends for the animal industry.
- Determine if a relationship exists between provided technical assistance and compliance. For example - Did failure to secure technical assistance result in continued noncompliance?
- Document positive improvements made to animal operations (page 2 of form).
- Account for and evaluate the substantial level of technical assistance provided to animal operations from public sector technical specialists employed with DSWC, Natural Resources Conservation Services, local Soil and Water Conservation Districts, Cooperative Extension Service and the North Carolina Department of Agriculture and Consumer Services.

Questions 1-6 on page 1 of the new form are written for "Immediate Threat" problems that require direct referral to DWQ by state and county staff pursuant to G.S. 143-215.10E. A majority of the noncompliance issues represented in the current state inspection form are also represented in the parameter section of the new form, and contribute to data used to provide the needed information for DENR's quarterly reports to the ERC (e.g., lagoon maintenance).

DWQ will maintain the data generated from the new form within the statewide DENR database. It is anticipated that within two years these data will allow comparisons between pilot and non-pilot farms for compliance trends related to the parameters outlined in the pilot program reports.

VI. ESTIMATED PROGRAM IMPLEMENTATION COSTS

This section is presented in response to language included in the Pilot Program's reauthorization by the 2002 General Assembly, and questions raised by ERC members and staff about costs associated with the Pilot Program.

Since its establishment in 1997, no additional resources were appropriated or allocated to DSWC for the Pilot Program. Because existing staff resources were used, DSWC efforts through additional site visits and related pilot work have resulted in reduced technical assistance opportunities for farms in non-pilot counties. However, program implementation costs and the impact of reduced services in non-pilot counties were not routinely tracked.

The DSWC operation review program's operating costs and work performance for 2001 and 2002 were evaluated to determine the pilot program's implementation costs.

Figures 7a and 7b outline operating costs and site visit numbers for 2001, 2002 and an average of the two years for farms in pilot and non-pilot counties. The data is based on the following:

- Overall statewide, DSWC maintains an operation review eight-member core staff for which statewide operation review data are compiled. Other DSWC technical staff members occasionally assist with the operation review workload. In addition, technical specialists with local Soil and Water Conservation Districts perform approximately 8.5% of the annual routine operation reviews statewide. However, this report is based on the operation review core staff hours and site visits only.
- The Pilot Program is carried out by four of the eight DSWC operation review staff members.
- For both tables (both pilot and non-pilot counties), reductions in hours (line B) and number of site visits (lines C & D) from 2001 to 2002 are a direct result of extended staff vacancies in two of the eight DSWC operation review positions.
- Base operating costs for operation reviews was used as a *unit cost*. Technical assistance provided in pilot counties essentially represents greater units than non-pilot counties.

Figure 7a: Operating Costs for Farms in Non-Pilot Counties

NON-PILOT FARMS	2001	2002	2001-02
A. Current annual employee salary & benefits for operation review core staff; average operating costs (office space rental, admin assistance, supplies, etc.); and base mileage (mileage based on min. motor fleet requirement of 1050 miles/month at $0.31/mile cost). Figure is calculated as a unit cost per hour.	$24.22	$24.22	$24.22
B. Hours coded for operation review work conducted in non-pilot counties plus pro-rated admin time coded for program administration, training, prep time, etc.	12,252.23	10,039.61	
C. Total site visits made to non-pilot farms by core DSWC staff.	2,055	1,709	
D. Total "routine" site visits made to non-pilot farms by core staff. Since farms receive only one "routine" review per year, this number will represent number of farms in non-pilot counties that are reviewed by core staff.	2,017	1,690	
E. Average number of site visits made to an individual non-pilot farm. (Line C/D)	1.02	1.01	1.015
F. Average time in hours (travel, on-site & report processing times) per non-pilot farm site visit. (Line B/C)	5.96	5.87	5.92
G. Average total time in hours (prep, travel, on-site & report processing times) per each non-pilot farm. (Line B/D)	6.07	5.94	6.01
H. DSWC cost per each site visit to a non-pilot farm. (Line A x F)	$144.35	$142.17	$143.26
I. DSWC cost per non-pilot farm. (Line A x G)	$147.02	$143.87	**$145.45**

Figure 7b: Operating Costs for Farms in Pilot Counties

PILOT FARMS	2001	2002	2001-02
A. Current annual employee salary & benefits for operation review core staff; average operating costs (office space rental, admin assistance, supplies, etc.); and base mileage (mileage based on min. motor fleet requirement of 1050 miles/month at $0.31/mile cost). Figure is calculated as a unit cost per hour.	$24.22	$24.22	$24.22
B. Hours coded for operation review work conducted in pilot counties, plus pro-rated admin time coded for program administration, training, prep time, etc.	1745.77	1106.39	
C. Total site visits made to pilot farms by DSWC pilot program staff.	261	235	
D. Number of farms in the pilot program area of Brunswick, Columbus & Jones counties.	108	108	
E. Average number of site visits made to an individual pilot farm. (Line C/D)	2.42	2.18	2.30
F. Average time in hours (travel, on-site & report processing times) per each pilot farm site visit. (Line B/C)	6.69	4.71	5.70
G. Average total time in hours (prep, travel, on-site & report processing times) per pilot farm. (Line B/D)	16.16	10.24	13.20
H. DSWC cost per each site visit to a pilot farm. (Line A x F)	$162.03	$114.08	$138.06
I. DSWC cost per pilot farm. (Line A x G)	$391.40	$248.01	**$319.71**

The 2001-2002 DSWC average cost per site visit to a non-pilot farm is $143.26 and slightly higher than the same 2001-2002 average cost per site visit to a pilot farm at $138.06. The difference is attributed to differences in travel distances and additional training costs for new employees working outside of pilot counties.

The significant difference between efforts by DSWC staff in pilot versus non-pilot counties is a direct function of the number of site visits (line "E") and as reflected in line "I" of figures 7a and 7b. Pilot farms, on average, cost $319.71 per farm per year and non-pilot farms cost $145.45 per farm per year. In other words, the annual cost to the DSWC is almost 120% higher per farm in a pilot county than a farm in a non-pilot county.

VII. CONCLUSIONS

1. Based on the DENR Environmental Scale, pilot county farms continued the level of improvement shown in 2002, with almost 66% of the farms receiving perfect scores for compliance performance.

2. In 2002, the number of pilot farms determined to be "low impact" remain relatively constant at 81% while farms categorized as "high impact" decreased to less than 10% of the pilot program's 108 farms.

3. The maximum number of points received by one farm increased in 2002 to an all time high of 356 points. Aside from poor performance by the farm, this increase may be attributed to better identification and surveillance of problem farms as reflected in duplication points received for noncompliance documented by DSWC and DWQ staff through targeting and team audits.

4. DSWC and DWQ staff working in the pilot counties confirm that the team auditing approach provides a more comprehensive evaluation of potential "high impact" farms and improves communication between DENR staff, and with farm operators. Future records will help determine how effective this increased coordination and partitioning of farms between divisions is in improving compliance.

5. DENR is providing a unified message to all farms in the pilot counties about the state's regulatory approach to noncompliance, with direct targeting of DWQ's enforcement resources to farms that were poor performers and were determined to be of potential "high impact" to the environment. All other pilot farms were rewarded with a continuing technical assistance focus through a working relationship with DSWC.

6. DSWC's new Technical Assistance Site Visit Reporting Form was implemented in early 2003 to generate the necessary information to allow comparison between compliance performance in pilot and non-pilot counties beginning within two years, and to collect the necessary data to better determine the impact of targeting technical assistance and regulatory resources on compliance performance.

7. Based on DSWC 2001-2002 operating costs and site visit numbers, the annual inspections and technical assistance cost per farm in a pilot county is 120% higher than the cost of DSWC services provided to a farm in a non-pilot county. This increased cost is a direct function of the increased number of site visits made to pilot county farms.

8. Past and current findings support continuation of the Pilot Program. Because the department continues to experience problems with limited resources, DENR needs to continue to "test" technical assistance and enforcement targeting programs, and to evaluate the resulting data to identify those measures that best

promote improved compliance in the overall operation of the animal waste management system.

UPPER NEUSE RIVER BASIN ASSOCIATION FACTS

Date Established:	March 22, 1996 (By-laws approved. Non-profit status gained in 1999)
Geographical Area:	771-square mile watershed above the Falls Lake Dam
Organizational Partners:	13 Local Governments With Local Planning and Zoning Control County Soil and Water Conservation Districts (SWCD)(See list of UNRBA members below)
Board of Directors:	13 Directors appointed to represent each organization partner with planning and zoning control; 1 Director appointed to represent all six SWCDs; Each partner also appoints one Alternate Director.

GOALS OF THE ASSOCIATION

The mission of the Upper Neuse River Basin Association is to preserve the water quality of the Upper Neuse River Basin through innovative and cost-effective strategies, and to constitute a forum to cooperate on water supply issues within the Upper Neuse River Basin by:

1. Forming a coalition of units of local government, public and private agencies, and other interested and affected communities, organizations, businesses, and individuals to secure and pool financial resources and expertise;
2. Collecting and analyzing information and data and developing, evaluating and implementing strategies to reduce, control and manage pollutant discharge and to manage water resources; and
3. Providing accurate technical, management, regulatory and legal recommendations regarding the implementation of strategies and appropriate effluent limitations on discharges into the upper portion of the Neuse River.

UNRBA MEMBERSHIP

The UNRBA Board of Directors is comprised of one Director and one Alternate Director from each of the thirteen jurisdictions in the watershed. Additionally, the County Soil and Water Conservation Districts elect one Director and Alternate Director to the UNRBA Board. The Directors and Alternates are listed below.

Corporate Members	Director	Alternate Director
Town of Butner	Tom McGee	(no alternate)
City of Creedmoor	Joel Cross	Tony Hammond
City of Durham	William Bell	Cora Cole-McFadden
Durham County	*Becky Heron, Chair*	Ellen Reckhow
Franklin County	Dr. John Ball	Kevin Martin
Granville County	*Ronald R. Alligood, Vice Chair*	Dudley Watts
Hillsborough	Joe Phelps	Margaret Hauth
Orange County	Barry Jacobs	Paul Thames
Person County	Jimmy Clayton	Steve Carpenter
City of Raleigh	Janet Cowell	Dale Crisp
Town of Stem	Jack Day	(no alternate)
Wake County	*Kenn Gardner, Secretary/Treasurer*	Herb Council
Town of Wake Forest	Vivian Jones	Mark Williams
Soil and Water Conservation Districts	Tom Davidson (Durham County)	Donnie Woodlief (Wake County)

Italics denotes Executive Officer

FY 2002 - 2003 ACCOMPLISHMENTS

The year 2002 - 2003 was a successful one for the Association. In April, the UNRBA Board of Directors accepted the first Upper Neuse Watershed Management Plan for review by the member local governments. This is an exciting step in the Upper Neuse because it means that, for the first time in North Carolina, local governments have worked together in a voluntary association to create a comprehensive watershed management plan. In many cases, the strategies go beyond state and federal requirements. We are proud of this accomplishment, and we look forward to implementing the management strategies in the year ahead.

Below is a brief list of the major accomplishments of the Association for this year.

Finalization of first Upper Neuse Watershed Management Plan

- *UNRBA Board of Directors accepted the Plan for local government review (April 29, 2003)*
- *Plan acceptance accomplished with a minimum of additional UNRBA funds (over $71,000 balance in funds for continued work on Plan).*

Implementation of key components of the Management Plan

Plan recommendations to local governments (present recommendations to each member local government)--*The UNRBA began presenting the findings and recommendations from the Plan to local government staff and decision-making bodies. Thus far, the UNRBA has:*

- *Presented to staff in Durham City, Durham County, Granville County, Franklin County, Orange County, Person County, Raleigh, Wake County, and Wake Forest.*
- *Presented to Councils/Commissions/Planning Boards in Raleigh, Wake Forest, Franklin County, and Person County. Of note, Raleigh is now considering the adoption of several recommendations, most notably a performance standard for limiting phosphorous in runoff from new developments in the Upper Neuse.*
- *Presented to the NC Division of Soil and Water Conservation and the NC Homebuilder's Association.*

Appendix A includes meeting summaries from staff meetings.

Basinwide monitoring planning (demonstrate progress toward establishing a water quality monitoring network)--*The UNRBA negotiated a contract between the USGS and the NC*

Wetlands Restoration Program to create a "watershed evaluation tool" for local governments. This tool will be based on nationally standardized data and will facilitate several facets of watershed planning. A deliverable of the project, to be completed by the USGS, is a guidance document for creating a water quality-monitoring network in the Upper Neuse. The project will begin this fall.

Critical land protection efforts (assist local governments with identifying critical sites and securing funding, and document UNRBA involvement)--*The Upper Neuse Watershed Management Plan includes an analysis of potential wetland and riparian protection and restoration sites in the Upper Neuse. The NC Wetlands Restoration Program helped to develop this analysis. The UNRBA has been encouraging local governments to use the analysis to support their restoration efforts.*

LID model sites in urban areas, including retrofits--*The UNRBA has been working with the Wake County Public School System to encourage funding for a stormwater LID retrofit project.*

Fundraising efforts to support implementation

***USGS "watershed evaluation tool"**--$150,000 of work to be done by USGS, funding from USGS and NCWRP*

***Upper Neuse Watershed Evaluation Tool**--The UNRBA has received a grant of $39,750 from the State of NC Division of Water Quality Nonpoint Source (Section 319, Clean Water Act) Program to support the Upper Neuse Watershed Site Evaluation Tool.*

Ellerbe Creek Watershed Management Plan

- *The UNRBA was a stakeholder in the Ellerbe Creek Local Watershed Management Plan. The Draft Plan was finished by stakeholder group in April, and the UNRBA will support the City of Durham in its efforts to adopt specific recommendations.*

UNRBA budget

The UNRBA has made several strides toward improving financial stability and accountability. These include:

- *Unanimously passing a FY 2004 budget of $104,582 with local government dues of $86,242 (the highest amount of dues yet committed by the UNRBA members). The budget is summarized on page 11.*
- *Working with TJCOG Finance staff to establish a spreadsheet for managing the UNRBA budget*
- *Receiving regular, end-of-month reports from the TJCOG financial department regarding revenues and expenses. In addition, the financial department has agreed to itemize separate projects in the UNRBA budget.*
- *For the second time, filing with the Internal Revenue Service on time.*

Improved marketing of Upper Neuse Watershed Management Plan

- *Eno River Festival--an estimated 350 people visited the booth, receiving information about local government efforts to protect the watershed. The "Know your watershed" map and handouts were a great success, and the UNRBA will host a booth again next year.*
- *March Association of Environmental Professionals meeting--The UNRBA Coordinator presented "Watershed Planning and Water Conservation", focusing on opportunities to clean up our streams and conserve water.*

Improved community outreach

- *The UNRBA Coordinator was a member of the group that planned the statewide LID Summit, hosted by the Water Resources Research Institute in Pinehurst in early 2003. The Summit is an early step in establishing statewide guidance for Low-Impact Development.*

Internship to support watershed protection efforts

The UNRBA hired an intern, Ben Bearden, for the summer (June-August). Ben:

- *Supported local government presentations;*
- *Coordinated the Eno River Festival booth;*
- *Completed a local government ordinance review; and*
- *Supported the Watershed Evaluation Tool by completing an analysis of subwatersheds in the Upper Neuse.*

FY 2003 - 2004 GOALS

In the 2003-2004 fiscal year, the UNRBA hopes to provide more and better assistance to the local communities that it serves. The primary goal is adoption of recommendations in the Upper Neuse Watershed Management Plan. However, meeting the overall challenge of protecting water quality will require improved technical support, more community outreach, and more direct grants writing assistance to local communities. Below is a list of some of the UNRBA goals for the coming year.

Goal 1: Implement recommendations from the Upper Neuse Watershed Management Plan--Work with key staff members from local governments to implement specific recommendations in the Plan. Work with these staff members to complete the necessary research and recommendations, and propose specific recommendations to the appropriate decision-makers in each community. Some specific objectives of this goal are:

- Make progress on implementing phosphorous and nitrogen performance standards
- Begin developing a basinwide monitoring plan for the Upper Neuse
- Facilitate pilot stormwater low-impact development projects (focus on Wake County School System and the NC Museum of Life and Science)
- Team with local stakeholders to win grants toward specific recommendations in the Plan
- Adoption of Ellerbe Creek Local Watershed Plan in Durham
- Team with local stakeholders to begin other local watershed plans in the Upper Neuse

Goal 2: More frequent and effective direct technical assistance to local governments--In presenting recommendations to the local governments, I have been challenged to answer a host of detailed questions and provide information to local government staff. The site evaluation tool and watershed evaluation tool projects are efforts to both implement plan recommendations and provide a high level of technical support to local governments. In addition, I will attend the

Center for Watershed Protection's Watershed Restoration Institute in Reiserstown, Maryland in September and will share this information with local stormwater managers in a meeting.

Goal 3: Support land protection efforts that will have beneficial effects on water in the Upper Neuse--Partly as a result of UNRBA efforts, the NC Natural Heritage Program is proposing to the Natural Heritage Trust Fund to complete Natural Heritage Inventories for Person and Granville Counties. The UNRBA will support this effort whenever possible and to use the results from the inventories to encourage the protection of any land that will have positive water resource effects.

Goal 4: Support local watershed plans--Work with local governments to encourage the NC Wetlands Restoration Program to fund more local watershed plans in the Upper Neuse. Eight local watersheds in the Upper Neuse are "targeted" for local watershed plans.

Goal 5: Better bookkeeping and finances--As previously mentioned, the UNRBA worked with TJCOG finance to create a spreadsheet for our budget and receive regular reports from the Finance Department. The following are additional objectives to improve finance practices:

- Make regular reports to the UNRBA's Treasurer (Kenn Gardner of Wake County) and
- Seek opportunities to offset UNRBA member government costs (for example, work done for TJCOG's Water Resources Advisory Committee).

Goal 6: Improve Marketing of the UNRBA and Plan--The UNRBA will take the following efforts to increase awareness of the effort.

- Eno Festival 2004
- Increase media coverage of the effort
- Present to the NC House Committee on the Environment

- Team with the Eno River State Park and the City of Durham to hold another of the successful "Living Water Workshops" for educators in the area.

Goal 7: Improve Organizational Effectiveness--The UNRBA will continue to seek the most efficient approaches for maximizing our effectiveness and minimizing the work asked of our members. This year, the UNRBA will continue to:

- Strengthen Partners Network;
- Use task groups on issues for which full TAC involvement is not necessary; and
- Use the website wherever possible to communicate with members.

FY 2003 - 2004 BUDGET

	FY 2002-2003	FY 2003-2004
Salary	$33,057	$36,363
+ Fringe (80% time)	+ $9,917	+ $10,909
Water Resources Mgr. (5% time)	$ 3,407	$ 3,407
Information Systems Mgr. (5% time for regular support)	$ 3,963	$ 3,963
Indirect Cost (56% salary & fringe)	$28,193	$30,599
Travel (workshops, conferences)	$ 0	$ 1,000
Subtotal Costs	**$78,537**	**$86,242**
Paid from dues	$70,961	$86,242*
Implementation Activities Expenses (travel, presentation materials, web support copies of plan, aditional time, intern)	$ 7,370	$18,340
FY 2004 Expenses	**$78,537**	**$104,582**

Total Increase = $26,045

Option chosen for meeting expenses increase

1) Increase dues to $86,242 and meet additional implementation costs with up to $18,500 from State Appropriation (from $90,000 remaining in State Appropriation). $71,500 of Appropriation available for consultant support.

*Board of Directors accepted this budget and new dues schedule on April 29, 2003

RE: Report on the Wastewater Discharge Elimination Program

Pursuant to S.L. 1996-18es, Section 27.26, I am transmitting a report on the progress of the Wastewater Discharge Elimination (WaDE) Program. This program was established to identify and eliminate discharges from straight pipes and failing septic systems to land surface and streams primarily in western North Carolina.

This report was prepared by DENR's Division of Environmental Health, On-site Wastewater Section, which oversees the WaDE Program. If you have further questions or would like additional information, please contact Terrell Jones at (828) 686-9077.

NC Wastewater Discharge Elimination Program
2003 Report

The NC Wastewater Discharge Elimination (WaDE) Program is located in the On-site Wastewater Section of DENR's Division of Environmental Health. The WaDE Program was established pursuant to S.L. 1996-18es, Section 27.26, to identify and eliminate discharges from straight pipes and failing septic systems to land surface and streams primarily in western North Carolina. The Program was created as a result of requests from Governor James B. Hunt, Jr., and delegates at the 1995-1996 Year of the Mountains Conference. Funds appropriated by the NC General Assembly support a two-member team to address the straight pipe and failing septic system issues in North Carolina. Additional financial support has been secured through grants from the NC Clean Water Management Trust Fund (CWMTF) and the US EPA 319 Nonpoint Source Program. Strong collaboration with local and federal agencies as well as the public, the media, and environmental groups is the hallmark of the WaDE program and the key to its successes thus far.

Program Goals

The primary goal of the WaDE Program is to identify and correct violations of on-site wastewater systems through door-to-door surveys in collaboration with local health departments. The Program also identifies sources of financial assistance for low-income homeowners in need of septic system repairs. This financial assistance is usually in the form of grants and loans issued through collaboration with regional councils of government and non-profit housing rehabilitation agencies. The WaDE Program also provides public health and environmental education to homeowners and other stakeholders at the community, county, regional, state, and federal levels related to on-site wastewater issues. In addition, to meet the statewide demand for septic system repair and straight pipe elimination, the WaDE Program is currently developing a model for a statewide septic repair program that will include financial assistance.

Previous Accomplishments

During the first four years of the program, the two-person WaDE Team directed one survey project (Buncombe County) and assisted in four other independent county surveys funded by the CWMTF, NC Department of Commerce/Division of Community Assistance (DCA), and NC Rural Communities Assistance Project (NCRCAP). Those counties targeted in the independent surveys were Alleghany/Ashe, Jackson, Madison, and Avery/Mitchell/Yancey. There were approximately 19,150 homes surveyed during these independent efforts, and violations were found at 2,505 (13%) of these homes. To date, 1,244 (50%) of those violations have been corrected, with 480 (39%) violations being corrected with financial assistance (see attachment for additional survey statistics). At the minimum rate of 240 gallons of wastewater per household per day, this represents 298,560 gallons of untreated wastewater removed from the streams daily.

The Expanded WaDE Program

In 2001, the WaDE Team proposed a new model for achieving the goals of the Program, and this model was approved and funded for three years by the CWMTF ($1.2 million over three years)

and the US EPA 319 Nonpoint Source Program ($500,000 over three years). Under the new model, five new team members (surveyors) were added to the WaDE staff. The additional surveyors provide support to county environmental health specialists who have the responsibility for issuing septic system repair permits and inspecting the repaired work. These surveyors are needed due to the volume of violations identified from WaDE surveys, which significantly add to the already full workloads of the local health departments' normal day-to-day operations. In the past ten months alone, WaDE Team members have surveyed 1,419 homes and identified 161 violations (11% violation rate) in Macon, Wilkes, Watauga, and Burke counties. About 20 repairs have been completed, 6 of them with financial assistance (see attachment for additional survey statistics).

The expanded WaDE Program provides financial assistance for septic system repairs in 19 counties in western North Carolina. Financial assistance is being provided through collaboration with CWMTF, DCA, USDA's Rural Development Program, and regional councils of government that have experience with similar housing rehabilitation programs. In addition, the WaDE Program works to identify sources of temporary financial assistance for septic repairs in 26 counties in western North Carolina.

The WaDE Program also provides public education on various public health concerns and environmental issues. This information is offered to the public through such mechanisms as door-to-door visits by trained WaDE surveyors, teachers' guides and videos for school children, outreach to the NC Real Estate Commission on property disclosure requirements, and other various publications, slide shows, and talks geared toward local, state, and national audiences. The program has also received positive attention from the local media, which has aided in getting the public informed and encouraging owners of failing systems and straight pipes to come forward for assistance.

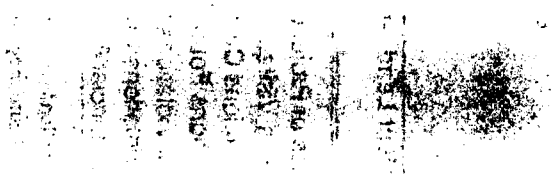
Ongoing Challenges

The WaDE Program is performing well within its limited mandate and scope, but there are several challenges that need to be addressed to realize the full potential of this Program: limited human capacity, limited geographical scope, and limited financial resources for system repair/replacement.

- *Limited human capacity.* As previously mentioned, the WaDE Program provides services with a small staff, in conjunction with the already full workloads of local health departments. While the Program has developed strong relationships with the local health departments serving the 26 counties in which it works, as well as with state and federal funding agencies, the number of failing on-site wastewater systems that can be addressed is limited by the small staff.

- *Limited geographical scope.* The WaDE Program currently serves 26 western counties in North Carolina. However, the impacts of straight pipes and failing septic systems are not limited to these counties. Failing septic systems present a threat to public health and to the environmental quality of North Carolina's waterways in communities across the State.

- *Limited financial resources available for repair/replacement.* A large number of systems in need of repair or replacement are identified during each door-to-door survey. Many of these systems belong to people with limited financial resources who are unable to pay for system repairs even when the local health departments waive the repair permit fees. Therefore, sources of financial assistance are critical for these systems. Temporary funding for financial assistance has been secured by the WaDE Program, but a permanent funding source for system repairs needs to be identified to remove more untreated waste from North Carolina's streams and rivers.



WaDE Program Straight Pipe and Failing Septic System Survey Summary 1998-2003

Project Lead Agency	WaDE/ Buncombe	Madison	Toe River	Jackson	Ashe-Alleghany	WaDE	Totals
Dates of Project	01/00-03/02	03/98-05/03	04/99-12/03	06/98-09/03	04/00-30/03	06/02-06/05	
Homes Visited	2,027	10,000 (est.)	1,100 (est.)	2,844	6,200 (est.)	2,150	24,321
Inspections Completed*	1,844	5,360	707	2,354	2,800 (est.)	1,419	14,484
Violations Found**	265	996	213	179	625	161	2,666
Total Violations Corrected	151	446	194	129	324	16	1,260
Violations Corrected with Financial Assistance	12	143	127	4	295	10	591

*Inspections were not completed at every home visited due to some residents not being at home when visits were made

**This figure may be lower for some counties due to a higher concentration of vacation homes in those counties

MEMORANDUM

To: Members of the Environmental Review Commission
Interested parties

From: George F. Givens
Commission Counsel

Re: Potential Agenda Topics—24 and 25 February 2004

The following have been identified as potential agenda topics for the 24 and 25 February 2004 meeting of the Environmental Review Commission.

Air Quality:

1) *Annual Report on implementation of S.L. 2002-4 (Clean Smokestacks Act).* DENR and the North Carolina Utilities Commission. 30 May 2003. Statutory Authority: S.L. 2002-4, Sec. 14.

2) *Annual Report on issues related to the development and implementation of standards and plans to implement programs to control emissions of mercury and carbon dioxide from coal-fired generating units and other stationary sources of air pollution.* Division of Air Quality, DENR. 1 September 2003. Statutory Authority: S.L. 2002-4, Sec. 12-13.

3) *Discussion of current State and federal air quality issues, including:*
   - Proposed modification of rules governing Prevention of Significant Deterioration (PSD) and Nonattainment New Source Review (NSR) as a result of modification of federal air quality regulations by the U.S. Environmental Protection Agency that became final on 31 December 2002 (the "December rule")
   - Proposed modification of the rule setting out the acceptable ambient level (AAL) for hydrogen sulfide
   - The non-attainment process for fine particulate matter (PM2.5)
   - The non-attainment process for ozone

4) *Report on the progress in implementing the motor vehicle inspection and maintenance (I/M) program.*

General:

5) *Report on the activities of the Environmental Management Commission.* Environmental Management Commission. Statutory Authority: G.S. 143B-282(b).

6) *Annual report on the resolution of submerged lands claims.* DENR. 2 October 2003. Statutory Authority: G.S. 113-206(f).

7) *Semiannual report on agency litter enforcement, litter prevention, and litter removal efforts.* Office of the Governor. 1 September 2003. Statutory Authority: G.S. 147-12(b).

8) *One-Stop Permit Assistance and Coordination Program status report.* DENR. 29 July 2003. Statutory Authority: S.L. 2001-424, Sec. 19.6.

Hazardous Waste Management:

9) *Annual report on the Inactive Hazardous Sites Program.* Division of Waste Management, DENR. 29 September 2003. Statutory Authority: G.S. 130A-310.10.

10) *Report of Superfund cost share fund expenditures for cleanup of sites on the National Priorities List.* Division of Waste Management, DENR. 29 September 2003. Statutory Authority: S.L. 1999-237(15.6)(b).

11) *Report on the management of low-level radioactive waste in North Carolina.* Radiation Protection Commission, DENR. April 2003. Statutory Authority: G.S. 120-70.33(7).

12) *Annual report on the Effectiveness of the Brownfields Property Reuse Act.* DENR. 13 January 2004. Statutory Authority: G.S. 130A-310.40.

Parks and Recreation / Land Conservation:

13) *Parks and Recreation Trust Fund Annual Report, Fiscal Year 2002-2003.* Division of Parks and Recreation, DENR. 1 October 2003. Statutory Authority: G.S. 113-44.15(c).

14) *North Carolina Natural Heritage Trust Fund Award Report, Fiscal Year 2002-2003.* Division of Parks and Recreation, DENR. 12 November 2003. Statutory Authority: G.S. 113-77.9(e).

RE: Phase II Stormwater

DATE: February 6, 2004

FEDERAL REQUIREMENTS

Beginning in 1990, EPA required large municipalities to get an NPDES permit (a permit for discharge of pollutants to surface waters) for stormwater discharges from municipal storm sewer systems --the Phase I stormwater program. In 1999, EPA adopted rules extending NPDES stormwater permitting requirements to the next tier of small and medium sized communities--Phase II. The basic requirement is that "municipal storm sewer systems" must have NPDES permits – this would include any system owned or operated by a city, county, or other state or federal entity. Cities and counties subject to Phase II were required to apply for those permits by March 10, 2003. NPDES permits are enforceable by EPA, by the State (as the delegated permitting agency) and by any person through the filing of a citizen suit.

EPA has adopted federal rules that:

1. **Identify by name the cities and counties that must have Phase II permits for their storm sewer systems. (A copy of the federally designated cities and counties is attached.)**

2. **Require states to designate additional cities and counties as requiring Phase II permits based on potential to contribute to stormwater pollution.**

3. **Set the minimum requirements that cities and counties must meet in order to get a Phase II NPDES permit. The local government must develop a stormwater management program that includes the following six minimum measures ---**

    - **Public education and outreach (on stormwater pollution)**

- **Public involvement and participation (in development and implementation of the local program)**

- **Detection and elimination of illegal discharges to the municipal storm sewer system**

- **Construction site stormwater runoff control**. The intent is to require implementation of stormwater controls (primarily measures to prevent soil erosion and sedimentation runoff) at active construction sites.

- **Post-construction stormwater management for new development and redevelopment – which really means establishing design standards to be applied to new development for purposes of stormwater management**. Other than the requirement for construction-phase runoff controls, this is the only measure that potentially affects private development activities. It affects only future development or redevelopment; there is no direct requirement for installation of stormwater controls at existing development. **Under federal rules, the local government's post-construction stormwater program must control stormwater "to the maximum extent practicable" and protect water quality standards**.

- **Pollution prevention/good housekeeping measures for municipal operations.** This measure requires the local government to develop a pollution prevention program for their facilities.

STATE ROLE

EPA has delegated to North Carolina the authority to issue federal Clean Water Act NPDES stormwater permits to these local governments. To approve a Phase II stormwater permit, the State must find that the local government's proposed stormwater program will include all six of the minimum measures; be sufficient to control stormwater pollution to the maximum extent practicable; and protect water quality standards. Federal rules also require the State to identify additional local governments as needing Phase II permits based on potential for contributing to violations of water quality standards. The State may designate additional communities directly or in response to a petition from any person.

The proposed State rules: 1) establish the criteria for state designations of additional communities; 2) create a process for consideration of third-party petitions; and 3) provide

design standards for post-construction runoff controls that can be approved as controlling stormwater pollution "to the maximum extent practicable" and protecting water quality standards.

LOCAL GOVERNMENTS AFFECTED

In North Carolina, 123 cities and 33 counties have been identified by EPA as potentially needing Phase II permits. (The EPA designations basically covered cities and counties that are "urbanized" under the federal census definition of that term.) The State can identify additional State and local government entities as needing a Phase II permit because of their potential contribution to stormwater pollution. No State designations have been made; the proposed rules would set up the criteria for making State designations in the future. A citizen, group, or another government entity may also petition the State to require a local government or an individual discharge to get a Phase II permit.

Counties

EPA has specifically designated 33 North Carolina counties as jurisdictions subject to the federal Phase II rules. Only public entities that actually "own or operate" a municipal storm sewer system need a Phase II NPDES permit, however. In unincorporated areas (outside any city's extraterritorial jurisdiction), the most extensive stormwater system is associated with the public road system. In other states, county designation will generally lead to a county-wide Phase II stormwater permit based on the county's responsibility for the road drainage system. In North Carolina, all public roads and associated road drainage systems in unincorporated areas are maintained by the State Department of Transportation (NCDOT) (which already has a Phase I stormwater permit). As a result, North Carolina counties will require a Phase II NPDES stormwater permit only for any discrete storm sewer system actually owned or operated by county. An example would be a stormwater drainage system associated with a county facility – such as a park or large complex of government buildings.

North Carolina's unique situation left a potential gap in stormwater coverage unanticipated by the federal rules (which were drafted under the assumption that counties would be owners and operators of county-wide stormwater systems). NCDOT, as the owner or operator of the primary stormwater system in the unincorporated areas, has a Phase I NPDES stormwater permit for the entire State road system. Under the federal Clean Water Act, NCDOT is responsible for the water quality impacts of any discharges from that system -- although the DOT drainage system receives stormwater runoff from many private developments. Recognizing that it would be very difficult for NCDOT to manage new stormwater discharges to its drainage system, and looking for a consistent program, the Environmental Management Commission initially looked to the counties to set stormwater management standards for new development in the unincorporated areas –

CONTENT OF STATE RULES

The State rules:

1. Identify a level of development that would require no stormwater controls. Generally, stormwater controls would not be required for new development falling below a threshold of 24% built-upon area so long as the development used grassed swales to carry stormwater as much as possible and any built-on area was setback 30 feet landward of any surface waters. The threshold for stormwater controls is lower (12% built-upon area) for areas draining to shellfish waters because those waters have much stricter water quality standards for bacterial contamination in order to protect the public from disease potentially transmitted by eating infected shellfish. NOTE: These are thresholds above which stormwater control measures must be incorporated into the project design and not density caps.

2. Establish minimum stormwater control measures required for new development that exceeds the threshold level:

   •stormwater controls capable of controlling or treating the one-inch of runoff and controlling the 1-year, 24-hour storm so that its discharge does not exceed the pre-development discharge rate;
   •structural stormwater systems designed to remove an average of 85% of total suspended solids;
   •location of all built-on area at least 30 feet landward of surface waters;
   •recorded deed restrictions and protective covenants.

Many of these control measures are specifically identified in EPA guidance as appropriate measures to address urban stormwater.

3. Allow the option of developing local stormwater standards that differ from those set out in the State rules as minimum requirements so long as those standards are at least as effective.

4. Set some additional standards for particularly sensitive waters, such as shellfish waters and trout waters.

Application of the proposed State rules to counties identified as needing Phase II permits.

Under rule 2H.0126, the 33 designated counties must get a federal Phase II NPDES stormwater permit for any storm sewer system that the county actually owns or operates. The Phase II permit would cover only the jurisdictional area of the storm sewer system.

The EMC adopted a separate set of state stormwater rules to fill the gap in the NPDES program coverage with respect to the designated Phase II counties. For the areas outside of county-owned storm sewer systems (which would receive an NPDES permit under 2H.0126), DENR would implement the stormwater management program under the same standards that apply to local government jurisdictions requiring an NPDES stormwater permit.

Stormwater Management Regulations

Background Discussion

February 6, 2004

Federal NPDES Program

- 1987 Clean Water Act Reauthorization
  - Stormwater regulated under NPDES
- 1990 – Phase I Stormwater Regulation
- 1999 – Phase II Stormwater Regulation

Federal Program Design

- Recognize stormwater impacts to water quality
- Build on lessons learned
- Focus on urbanizing areas
- Establish a seamless program
- Designed for typical state

State Implementation

- Delegated federal program
- Federal rules adopted by reference
- Rules required on state level – designation, petitioning, administration.
- Approach to achieve evenhanded program envisioned in 214.7

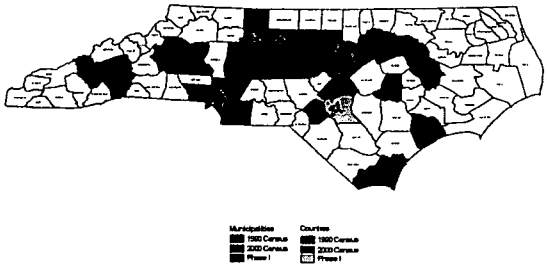
Development Process

- Workshops on federal rules – 1999
- Stakeholder Process & Education Efforts – 2000
- Rule Concept Workshops & Comment – 2001
- EMC Stakeholder Process & Temporary Rule Hearings – 2002
- Permanent Rule Hearings - 2003

Municipal NPDES Coverage

- Automatically Designated - *Urbanized Areas*
- State Designated Public Entities
- Petitioned Entities That Are State Designated

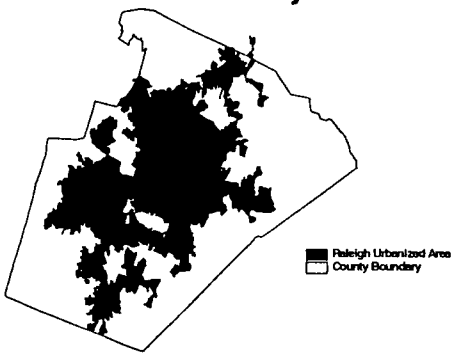
North Carolina - NPDES Stormwater Program
Automatic Designation



Minimum Control Elements

- Public Education and Outreach
- Public Involvement/Participation
- Illicit Discharge Detection & Elimination
- Construction Site Runoff Control
- Post-construction Stormwater Management
- Pollution Prevention/Good Housekeeping

Wake County



Wake County

Phase 2 Stormwater Management Program
Chronology of EMC/DENR Actions

Since 1999 the Environmental Management Commission (EMC) and the Department of Environment and Natural Resources (DENR) Division of Water Quality (DWQ) have undertaken extensive efforts in developing North Carolina's response to implementation of the federal phase 2 stormwater management requirements. This document summarizes major actions taken in this response. In addition to the numerous specific actions noted in the table below, Division staff has participated in sixty (60) or more presentations and workshops across the state related to the phase 2 stormwater program since 1999. The Division also worked with a Department wide team on this effort and presented information to the Water Quality Committee and EMC on a routine basis over the last few years.

EMC/DENR Action	**Timeframe**
Meetings with NCLM, APWA to develop workshop materials on draft federal rules	Early 1999
Phase 2 Site Visits – Brunswick Co, Wrightsville Beach, Hickory, Boone, Woodfin	03/1999
DWQ SW Workshop – Raleigh	05/18/1999
DWQ SW Workshop – Wilmington	06/02/1999
APWA,NCLM,DWQ Phase 2 Workshops – six total around the state	July – Sept. 1999
Presentation to WQC and EMC on proposed Federal Rules	09/08/1999
Urban Stormwater Conference and Symposium	11/01/1999
Final Federal Rules Published	12/06/1999
Federal Rules Become Effective	02/07/2000
EMC Starts Statewide Stormwater Stakeholder Process (lasts 6 months)	03/09/2000
Seven Stakeholder education meetings around the state to prepare for stakeholder process – meetings for environmental groups, local govs and developers	March & April 2000
Stormwater Stakeholder Meetings (12 days of facilitated meetings)	April – Sept. 2000
Stakeholder Report	10/01/2000
Stakeholder work session w/EMC	12/13/2000
Seven Workshops on components of Phase 2 Program held for public input in developing concept for rules	Aug 2000 – March 2001
EMC Approves Phase 2 Concept Document for statewide public meetings	04/12/2001
Seven phase 2 Concept Workshops held around state	May 2001
Draft rules available for review and comment by EMC and interest groups – number of versions	Oct 2001 – March 2002
EMC reconvenes Stakeholders group for work sessions on draft rules – EMC members participate these three days of meetings	Jan. 2002

RE: Phase II Stormwater

DATE: February 6, 2004

FEDERAL REQUIREMENTS

Beginning in 1990, EPA required large municipalities to get an NPDES permit (a permit for discharge of pollutants to surface waters) for stormwater discharges from municipal storm sewer systems --the Phase I stormwater program. In 1999, EPA adopted rules extending NPDES stormwater permitting requirements to the next tier of small and medium sized communities--Phase II. The basic requirement is that "municipal storm sewer systems" must have NPDES permits – this would include any system owned or operated by a city, county, or other state or federal entity. Cities and counties subject to Phase II were required to apply for those permits by March 10, 2003. NPDES permits are enforceable by EPA, by the State (as the delegated permitting agency) and by any person through the filing of a citizen suit.

EPA has adopted federal rules that:

1. **Identify by name the cities and counties that must have Phase II permits for their storm sewer systems. (A copy of the federally designated cities and counties is attached.)**

2. **Require states to designate additional cities and counties as requiring Phase II permits based on potential to contribute to stormwater pollution.**

3. **Set the minimum requirements that cities and counties must meet in order to get a Phase II NPDES permit. The local government must develop a stormwater management program that includes the following six minimum measures ---**

   · **Public education and outreach (on stormwater pollution)**

· **Public involvement and participation (in development and implementation of the local program)**

· **Detection and elimination of illegal discharges to the municipal storm sewer system**

· **Construction site stormwater runoff control.** The intent is to require implementation of stormwater controls (primarily measures to prevent soil erosion and sedimentation runoff) at active construction sites.

· **Post-construction stormwater management for new development and redevelopment – which really means establishing design standards to be applied to new development for purposes of stormwater management.** Other than the requirement for construction-phase runoff controls, this is the only measure that potentially affects private development activities. It affects only future development or redevelopment; there is no requirement for installation of stormwater controls at existing development. **Under federal rules, the local government's post-construction stormwater program must control stormwater "to the maximum extent practicable" and protect water quality standards.**

· **Pollution prevention/goodhousekeeping measures for municipal operations.** This measure requires the local government to development a pollution prevention program for their facilities.

STATE ROLE

EPA has delegated to North Carolina the authority to issue federal Clean Water Act NPDES stormwater permits to these local governments. To approve a Phase II stormwater permit, the State must find that the local government's proposed stormwater program will include all six of the minimum measures; be sufficient to control stormwater pollution to the maximum extent practicable; and protect water quality standards. Federal rules also require the State to identify additional local governments as needing Phase II permits based on potential for contributing to violations of water quality standards. The State may designate additional communities directly or in response to a petition from a citizen or group of citizens.

The proposed State rules: 1. establish the criteria for state designations of additional communities; 2. create a process for consideration of third-party petitions; and 3. Provide performance standards for post-construction runoff controls that can be approved as controlling stormwater pollution "to the maximum extent practicable" and protecting water quality standards.

LOCAL GOVERNMENTS AFFECTED

In North Carolina, 123 cities and 33 counties have been identified by EPA as potentially needing Phase II permits. (The EPA designations basically covered cities and counties that are "urbanized" under the federal census definition of that term.) The State can identify additional State and local government entities as needing a Phase II permit because of their potential contribution to stormwater pollution. No State designations have been made; the proposed rules would set up the criteria for making State designations in the future. A citizen, group, or another government entity may also petition the State to require a local government or an individual discharge to get a Phase II permit.

Counties

Based on the 1990 census, EPA specifically designated 33 North Carolina counties as jurisdictions subject to the federal Phase II rules. Only public entities that actually "own or operate" a municipal storm sewer system need a Phase II NPDES permit, however. In unincorporated areas (outside any city's extraterritorial jurisdiction), the most extensive stormwater system is associated with the public road system. In other states, county designation will generally lead to a county-wide Phase II stormwater permit based on the county's responsibility for the road drainage system. In North Carolina, all public roads and associated road drainage systems in unincorporated areas are maintained by the State Department of Transportation (NCDOT) (which already has a Phase I stormwater permit). As a result, North Carolina counties will require a Phase II NPDES stormwater permit only for any discrete storm sewer system actually owned or operated by county. An example would be a stormwater drainage system associated with a county facility – such as a park or large complex of government buildings.

North Carolina's unique situation left a potential gap in stormwater coverage unanticipated by the federal rules (which were drafted under the assumption that counties would be owners and operators of county-wide stormwater systems). NCDOT, as the owner or operator of the primary stormwater system in the unincorporated areas, has a Phase I NPDES stormwater permit for the entire State road system. Under the federal Clean Water Act, NCDOT is responsible for the water quality impacts of any discharges from that system -- although the DOT drainage system receives stormwater runoff from many private developments. Recognizing that it would be very difficult for NCDOT to manage new stormwater discharges to its drainage system, the Environmental Management Commission initially looked to the counties to set stormwater management standards for new development in the unincorporated areas – as the federal Phase II rules anticipated. The counties, rather than NCDOT, had the authority to adopt zoning and subdivision regulations needed to implement that part of the stormwater program.

The EMC proposed to address the problem by requiring the urbanized counties designated by EPA under the federal Phase II rules to get a state stormwater permit that would be identical to the NPDES stormwater permits issued to municipalities. Like the

cities, the designated counties would have been required to develop a stormwater management program. The last version of the EMC's rules (modified in response to a Rules Review Commission objection), dropped the requirement that the designated counties implement a stormwater program and instead proposed that DENR implement the stormwater program for the unincorporated areas and allow for voluntary delegation of the program to counties. The minimum stormwater management standards applied to new development in the designated cities and counties remained the same.

Impact on Private Development

With the exception of permits required for construction site runoff, the federal Phase II program did not directly apply to private entities. Instead, it required local governments to use their planning and regulatory powers to get stormwater management measures incorporated into new development proposals. For example, a subdivision with private streets would generally not be required to get a Phase II NPDES permit for its storm sewer system. But the owner or operator of the "municipal" storm sewer system that serves the subdivision (which could be a city, county, state or federal government entity) would have a Phase II NPDES permit and be required under that permit to insure that new subdivisions incorporate stormwater controls. Under the proposed State rules, permitting would work exactly that way for municipal storm sewer systems that require NPDES permits; in the unincorporated areas – where the State (NCDOT) rather than the counties "own or operate" the storm sewer system -- the State would directly require stormwater controls for new development. In that case, the State regulations simply take the place of county planning ordinances.

Phase II also has no direct impact on existing development. The program focuses on stormwater management for development that occurs after the owner/operator of the storm sewer system has a stormwater management program in place. There are no new stormwater controls required for existing development.

The federal and State Phase II rules affect future development by setting minimum standards for stormwater programs. The program must include stormwater controls for future development that are sufficient to control stormwater to the maximum extent practicable and to protect water quality standards. Those are the review standards established in federal law. The state rules set performance standards as a guide to the types of controls that will be adequate to meet those very broad federal standards.

CONTENT OF STATE RULES

The State rules:

1. Identify a level of development that would require no stormwater controls. Generally, stormwater controls would not be required for new development falling below a threshold of 24% built-upon area so long as the development used grassed swales to carry stormwater as much as possible and any built-on area was setback 30 feet

landward of any surface waters. The threshold for stormwater controls is lower (12% built-upon area) for areas draining to shellfish waters because those waters have much stricter water quality standards for bacterial contamination in order to protect the public from disease potentially transmitted by eating infected shellfish. NOTE: These are thresholds above which stormwater control measures must be incorporated into the project design and not density caps.

2. Establish minimum stormwater control measures required for new development that exceeds the threshold level:

    •stormwater controls capable of controlling or treating the excess runoff (compared to pre-development conditions) from a 1 year, 24-hour storm;
    •structural stormwater systems designed to remove an average of 85% of total suspended solids;
    •location of all built-on area at least 30 feet landward of surface waters;
    •recorded deed restrictions and protective covenants.

Many of these control measures are specifically identified in EPA guidance as appropriate measures to address urban stormwater.

3. Allow the option of developing local stormwater standards that differ from those set out in the State rules as minimum requirements so long as those standards are at least as effective.

4. Set some additional standards for particularly sensitive waters, such as shellfish waters and trout waters.

Application of the proposed State rules to counties identified as needing Phase II permits.

Under rule 2H.0126, the 33 designated counties must get a federal Phase II NPDES stormwater permit for any storm sewer system that the county actually owns or operates. The Phase II permit would cover only the jurisdictional area of the storm sewer system.

The EMC adopted a separate set of state stormwater rules to fill the gap in the NPDES program coverage with respect to the designated Phase II counties. For the areas outside of county-owned storm sewer systems (which would receive an NPDES permit under 2H.0126), DENR would implement the stormwater management program under the same standards that apply to local government jurisdictions requiring an NPDES stormwater permit.

Re: **Advisory Opinion:** Application of the NPDES Storm Water Phase II Program to Local Governments; N.C. Gen. Stat. § 214.7; N.C. Admin. Code tit. 15A, r. 2H.0126; 33 U.S.C. § 1342(p); 40 C.F.R. §§ 122.26, 122.32, 123.35

Dear Coleen and Bradley:

You requested written advice on two questions concerning the State implementation of the federal National Pollutant Discharge Elimination System ("NPDES") Storm Water Phase II Program as it relates to local governments. The questions arose from a request by the North Carolina Association of County Commissioners to review the federal rule and determine whether State implementation would require a county to obtain a permit, notwithstanding the county does not own or directly operate the largest storm water conveyance system in its jurisdiction, i.e., the State road system and its associated drainageways.[1] In particular, you asked (1) whether a county may be required to obtain a NPDES Storm Water Phase II permit for the storm water conveyances within its jurisdiction notwithstanding that it does not own or operate roads and associated drainageways; and (2) if a county is required to obtain a permit, what permitting avenues would be available.

In regard to the first Issue our answer is "yes;" we conclude that there are four scenarios under which a county may be required by DENR to obtain a Phase II permit, notwithstanding that it does not own or operate roads and associated drainageways. The four scenarios arise when: (a) the county owns or operates a municipal separate storm sewer system ("MS4")[2] in an

---

[1] Letter from Ed Regan, Deputy Director of the North Carolina Association of County Commissioners to Bradley Bennett of the North Carolina Department of Environment and Natural Resources' Division of Water Quality dated September 27, 2000.

[2] Under either phase, "municipal separate storm sewer" means a conveyance or system of conveyances including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains owned by a public body designed or used for collecting or conveying storm water which is not a combined sewer or publicly owned treatment works. 40 C.F.R. § 122.26(b)(8).

urbanized area which discharges directly to receiving waters; (b) the county owns or operates a storm water conveyance in an urbanized area which is interconnected with a permitted MS4, but retains the authority to implement a measure of the program; (c) the State designates a county's MS4 as needing a permit, regardless of location; or (d) a third party successfully petitions the State to require county permitting. In response to the second Issue, if required to obtain a Phase II permit, a county may obtain a general permit, an individual permit or arrange to be co-permittees with existing or new permittees.

Issue 1. The NPDES storm water permitting program has two phases, Phase I for large and medium MS4s[3] and Phase II for smaller MS4s[4]. Phase II permits require implementation of a storm water management program which is composed of six minimum measures. The minimum measures consist of (1) public education; (2) public notice; (3) illicit discharge detection and elimination; (4) construction controls; (5) post-construction controls; and (6) pollution prevention. In certain instances, only the county may be able to implement one or more of these six minimum measures. One such example of municipal control over a minimum measure is the requirement of post-construction controls, i.e., requiring maintenance of installed best management practices after construction is complete. To this end, a county may exercise control over its jurisdiction through the land use authorities granted to it by statute. Counties have broad authority to regulate and restrict the size of buildings; the percentage of lots occupied, the size of open spaces; the density of population; the location and use of buildings, structures, and land for trade, industry, residence or other purposes; and provide density credits or severable development rights for dedicated rights-of-way. N.C. Gen. Stat. § 153A-340. Counties may adopt zoning regulations designed to facilitate the adequate provision of water, sewerage and other public requirements. N.C. Gen. Stat. § 153A-341. Counties also regulate subdivisions by ordinance. N.C. Gen. Stat. § 153A-330 *et seq.*

North Carolina is one of the few states in which roads and adjoining drainageways are owned and operated by the state's department of transportation[5] rather than by counties. Apparently for this reason, the Association of County Commissioners has questioned whether a county may be required to obtain a Phase II permit when a county does not own or operate the majority of storm water conveyances, namely road drainageways, in its municipal jurisdiction, despite their ability to implement the minimum measures contemplated under Phase II. However, it is our opinion that North Carolina counties may be required by DENR to obtain a permit under at least four scenarios, notwithstanding that they do not own or operate the majority of MS4s in their jurisdiction.

---

[3] Phase I covered discharges from MS4s serving populations of 100,000 or more. 33 U.S.C. § 1342(p)(2).

[4] Phase II covers discharges from MS4s serving populations of less than 100,000.

[5] North Carolina currently regulates NC DOT storm water under a statewide NPDES Stormwater Phase I permit (NPDES Permit No. NCS000250).

First, a county may be required by DENR to obtain a permit for any discrete system which it owns or operates in an urbanized area.[6] Road drainageways are not the only MS4s in a county. Counties own or operate jail facilities, hospital complexes, municipal buildings, maintenance facilities and parks which contain catch basins, ditches, storm drains and other features of storm drainage which discharge directly to waters of the State without passing through another storm system such as NC DOT's road system. These MS4 point sources must obtain Phase II permits to discharge storm water directly to waters of the State.

Second, a county may be required by DENR to obtain a permit when its storm water devices are interconnected in an urbanized area with a permitted MS4 and the county retains authority to implement one or more of Phase II's six minimum measures. Under Phase I, the permitting agency could include storm water conveyances that did not themselves constitute a large or medium MS4 under the permit for a large or medium MS4 due to the interrelationship between the discharges of the smaller system and the MS4, including the physical interconnections between the storm sewers and other factors. 40 C.F.R. §§ 122.26(b)(4) and (7). DENR issued a statewide NPDES Phase I permit to the NC DOT for its roadways, but did not require counties to be permitted at that time. Without the county as a co-permittee, NC DOT's Phase I permit fails to provide program coverage outside of the right-of-way although those areas contain storm water conveyances that drain to the right-of-way.

Third, a county may be required by DENR to obtain a permit when the State permitting authority designates it for coverage, even if it falls outside of an urbanized area. 40 C.F.R. §§ 122.32(a)(2) and 123.35(b). The rule's preamble discusses this extended coverage by indicating that "Permitting authorities may also decide to designate all MS4s within a county or township, if they believe it necessary to protect water quality." 64 Fed. Reg. 68751. As the NPDES permitting authority, DENR is required to develop a process, as well as criteria, to designate small MS4s outside of the urbanized area which have the potential to result in exceedances of water quality standards or other significant water quality impacts. 40 C.F.R. § 123.35(b). Other significant water quality impact criteria may consist of discharge to sensitive waters, high growth or growth potential, high population density, contiguity to an urbanized area, significant contributor of pollutants to waters, and ineffective protection of water quality by other programs. 40 C.F.R. § 123.35(b)(1)(ii). DENR may also designate any small MS4 that contributes substantially to the pollutant loadings of a physically interconnected MS4 that is regulated by the NPDES storm water program. 40 C.F.R. § 123.35(b)(4). Therefore, even if a county lies outside an urbanized area or is only physically interconnected with another regulated MS4, it may be required to obtain a Phase II permit through the State's own designation process.

Fourth, a county may be required by DENR to obtain a permit when it is subject to a successful third party petition. Even if DENR itself does not designate a county as needing a

---

[6] The Bureau of Census determines urbanized areas based upon the latest decennial census data. Appendix 6 of the Phase II rule lists 25 counties which are partially or fully located within an urbanized area.

Phase II permit, third parties may petition the permitting agency to do so. 40 C.F.R. §§ 122.26(f)(4) and 122.32(b). Under the petition process, ***any operator*** of a permitted MS4 may petition DENR to require a separate NPDES permit for a discharge entering the operator's MS4. 40 C.F.R. § 122.26(f)(1)(emphasis added). Moreover, ***any person*** may petition DENR to require a county to obtain an NPDES permit for a storm water discharge which contributes to a violation of a water quality standard or is a significant contributor of pollutants to receiving waters. 40 C.F.R. §§ 122.26(f)(2) (emphasis added).

The Phase II rule generally focuses on discharges from MS4s which, by definition, requires the county to own or operate the MS4.[7] However, the language of the rule addressing the Phase II petition process addresses "any discharge into [an MS4]."[8] This change in language creates some ambiguity as to the scope of coverage. In particular, it might be argued by the petitioning operator of a permitted MS4 that he must only show that the discharge reaches its system, not that the discharge comes from another MS4. The petition process also addresses "[any] discharge which is composed entirely of storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States."[9] In this instance, it might be contended that the third party must show that the discharge negatively affects water quality, without a requirement that the third party must show that the discharge emanates from an MS4.

It may be contended that the general intent of the statute would support such a construction. The structure of the CWA and its history indicate that all point sources should be permitted. *See Natural Resources Defense Council (NRDC) v. Train, 396 F. Supp. 1393 (D.D.C. 1975), affirmed, NRDC v. Costle*, 568 F.2d 1369 (D.C. Cir. 1977). With the adoption of the Water Quality Act of 1987, Congress amended the CWA and added section 402(p), which established the priorities, deadlines and permit requirements for storm water point sources, including MS4s. 33 U.S.C. § 1342(p).

The Phase II rule implements the Clean Water Act goal by seeking to provide comprehensive coverage of storm water control and to eliminate gaps in storm water coverage. As the rule's preamble states, "'Donut holes' are gaps in program coverage where a small unregulated MS4 is located next to or within a regulated larger MS4 that is subject to an NPDES permit under the Phase I NPDES storm water program. The existence of such 'donut holes' creates an equity problem because similar discharges may remain unregulated even though they cause or contribute to the same adverse water quality impacts. Using NPDES permits to regulate the unregulated discharges in these areas is intended to facilitate the development of a seamless

regulatory program for the mitigation and control of contaminated storm water discharges in an urbanized area." 64 Fed. Reg. 68739. The rule's preamble dedicates an entire subsection, Section II.H., to describing the municipal role in Phase II. 64 Fed. Reg. 68748 through 68771. The rule's appendix goes on to identify twenty-five North Carolina counties as being fully or partially located within an urbanized area. 64 Fed. Reg. 68822. It appears that EPA anticipated that North Carolina counties would be covered by the Phase II program and did not anticipate that whole areas would be left out simply because NC DOT rather than local government maintained the road system. Thus, the petition process may extend county coverage to county storm water discharges regardless of whether the discharge emanates from a conveyance that is owned and operated by the county and otherwise meets the definition of a small MS4.

Issue 2. If a county is required to obtain a NPDES permit under Phase II, it has several permitting options. It may request a general permit for all systems and components within the county boundaries. The Phase II program encourages the use of general permits on a system-wide or jurisdiction-wide basis. Under Phase I, NC DOT received a system-wide permit for its road system. Under Phase II, a county could receive a jurisdiction-wide permit for the systems within the county. In this regards, an NPDES general permit can cover a category of dischargers within a defined geographic area which may be defined broadly to include political boundaries, e.g., an entire county. 64 Fed. Reg. 68739. For the storm water systems which interconnect with NC DOT road systems, a county could join NC DOT as a co-permittee in its Phase I permit which would have to be modified to include the Phase II minimum measures. The Phase II rule allows a newly regulated MS4 to join as a "limited" co-permittee with a regulated MS4 by referencing a common storm water management program. 64 Fed. Reg. 68739. A "limited" co-permittee is only responsible for the measures not covered by the already-existing permit. Alternatively, a county could obtain its own Phase II permit for the systems that interconnect with NC DOT. Finally, a county may obtain or require individual permits for each system within its geographical area.

We trust this analysis proves helpful. If you have any questions or wish to discuss this matter further, please do not hesitate to contact us. With best wishes, we are

Very truly yours,

James C. Gulick

February 5, 2004

Ms. Dedra Alston
Environmental Management Commission
1601 Mail Service Center
Raleigh, North Carolina 27699-1601

Re: 15A NCAC 2H .0126, .0150 - .0156, and .1014 - .1019

Dear Ms. Alston:

At its January 15, 2004 meeting the Rules Review Commission voted to return the above rules to the Environmental Management Commission for failure to adopt the rules in accordance with Part 2 of Article 2A, Chapter 150B. The new rulemaking was conducted without compliance with Part 2 of Article 2A, Chapter 150B, and is returnable under N.C. Gen. Stat. § 150B-21.9(a) (2001), or objectionable under N.C. Gen. Stat. § 150B-21.9(a)(4)(2003), since the non-responsive rulemaking was concluded after October 1, 2003.

In addition, the Rules Review Commission objected to Rules .0126 and .0150 - .0156 on the basis of lack of statutory authority (N.C. Gen. Stat. § 150B-21.9(a)(1)), for failure to appropriately respond to the objection made at the RRC's October 16, 2003 meeting; and ambiguity (N.C. Gen. Stat. § 150B-21.9(a)(2)), for failure to appropriately respond to the objection made at the RRC's October 16th meeting. The RRC also objected to Rules .1014 - .1019 on the basis of lack of statutory authority (N.C. Gen. Stat. § 150B-21.9(a)(1)), for failure to appropriately respond to the objection made at the RRC's October 16th meeting; and ambiguity (N.C. Gen. Stat. § 150B-21.9(a)(2)), for failure to appropriately respond to the objection made at the RRC's October 16th meeting.

The changes to Rules .1014 - .1019 made by the EMC are not responsive to an objection by the RRC because the objection was to a lack of statutory authority to compel a local government to adopt ordinances and to require a local government which was not an owner or operator of a MS4 to adopt ordinances or obtain a permit. The responsive EMC change was to make application for a storm water permit optional for a local government which was not the owner or operator of a MS4. The EMC's changes went beyond this to require permits from

dischargers of storm water located within the counties from which the EMC had purported to require permits. Creation of a permit obligation for entities which are not owners or operators of MS4s and not governmental bodies is not responsive to the objection; it was new rulemaking designed to accomplish a comparable substantive result.

Sincerely,

Joseph J. DeLuca, Jr.

DRAFT

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
February 24, 2004

The Environmental Review Commission (ERC) met on Tuesday 24 February 2004 at 9:30 a.m. in Room 643 of the Legislative Office Building.

Representative Daniel McComas and Senator Charlie Albertson presided over the 24 February 2004 meeting. The following members were present: Senators Albertson, Dorsett, Forrester, Horton, Kinnaird, Swindell and Weinstein, and Representatives Fox, Gibson, Hackney, Justice, LaRoque, McComas, Weiss and Williams. Mr. George Givens, Commission Counsel, Jeffrey Hudson, Assistant Commission Counsel, Susan Iddings, Assistant Commission Counsel, Jennifer McGinnis, Assistant Commission Counsel, Tim Dodge, Research Assistant, and Mary Watson, Commission Clerk were also present.

On 17 February 2004, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. A copy of the visitor registration and the agenda for the meeting are included in the attachments as **Exhibits B and C**.

Representative McComas called the meeting to order and called on co-chairs for their remarks.

George Givens, Commission Counsel, was asked to explain the agenda.

Mr. Givens said that he had distributed to each member, copies of read only reports that are required by law to be made to the Commission. These reports are listed as **Exhibit D**.

Mr. Givens called to member's attention two additional handouts. One is a memorandum on leaking underground storage tanks. In 1998, at the request of various members, DENR took a look at all low risk sites and we have been receiving monthly and weekly reports on their progress over the last five plus years. This memo states that all of the low risk reviews have been completed and this is the final report. The second item is a spreadsheet prepared by the fiscal research division, which shows all the funds that have been transferred from various special funds within DENR to the General Fund to balance the budget for the past four fiscal years. These two items are listed as **Exhibit E**.

Mr. Givens said he was prompted to provide members with this information because of one particular fund, the Title V Fund. This is the only one for which funds had been returned to their source and not from the General Fund. The reason is that the federal law, which requires there to be a

Title V assessment, requires that those funds be used only for the Title V Air Quality Program.

Mr. Givens noted that the staff, planning meeting for this meeting was held on Tuesday 10 February 2004.

Mr. Givens said that the next meeting of the ERC is planned for Thursday 25 March 2004 and Friday 26 March 2004. He said that an option for a field trip, based on interest, would be to use the Friday date to tour Belews Creek Steam Power Plant, the first plant to be refitted under the Clean Smokestacks Acts.

Mr. Givens said that items for March focus on solid waste, surface water, animal waste issues and other water quality issues. More detail about this will be published in the next meeting notice.

Mr. Givens asked for feed back from members as to their interest in a field trip in March to Belews Creek. He also said that it had been proposed by the conservation groups that the April meeting should include a field trip to either Dupont State Forest in Brevard or in the Pittsboro area to some properties acquired by the Nature Conservancy. Either of these trips would not allow adequate business meeting time and therefore an additional meeting would be held in April, specifically on Tuesday morning, 20 April 2004.

Representative Gibson expressed concern that, before we arrange any field trips, we need to make sure we cover the issues that need to be addressed before the short session begins.

Representative McComas proposed that we proceed with the plans for a field trip to Belews Creek in March and that a trip to Dupont Forest be discussed at the March meeting. He asked Mr. Givens to make sure that each member received e-mail to that effect.

Mr. Givens asked members to sign the visitor registration forms and asked members to sign and send forward their reimbursement forms.

Dr. David H. Moreau, Chairman, Environmental Management Commission, presented a quarterly report by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress during 2003. A copy of the quarterly report is listed as **Exhibit F**.

Dr. Moreau acknowledged that there are 19 members of the EMC who have each given 16-20 days of service to the State of North Carolina in the past year. The Commission has considered at last 20 contested cases operating in a quasi-judicial process. Each of those cases carries with it reams of record that have to be read. In addition, there are probably 200 requests for civil penalty remissions that have been heard. All of this service is given without compensation and the citizens of North Carolina have been well served by the members of this Commission.

Dr. Moreau said that several other issues the EMC dealt with were the emission limits on hot mix asphalt plants. That rule was withdrawn to allow for extended comment period to account for additional information.

Dr. Moreau said that the EMC heard reports on mercury emissions and carbon dioxide emissions from coal-fired electric power boilers, those required under the Clean Smokestacks bill.

Dr. Moreau said that a set of rules has been enacted to implement the toxic air quality rules under Section 112j of the Clean Air Act. Those were sent out for notice and had to be re-noticed because of a settlement agreement with EPA that changed the language of the rules.

Dr. Moreau said that with regard to water quality they have maintained a schedule of preparation and public review of the various river basin water quality plans. They have been spending a great deal of time with the stormwater rules and approved a local ordinance for stormwater management in the Tar Pamlico basin and approved the agricultural accounting rule for the Tar Pamlico.

Dr. Moreau said that the EMC has sent to public hearing a request for reclassification for portions of Rocky River in Chatham County requested by Siler City for expansion of its public water supply. They have adopted the permanent rule for the Catawba River Basin and approved the temporary rule for reclassification of portions of Sandy Creek and Swift Creek with compliance with House Bill 566.

Dr. Moreau said there has been very little activity in the groundwater area over the past year; only one major action of granting a variance.

Representative McComas asked Dr. Moreau to explain the Municipal Waste Combustor Rule (MWC).

Dr. Moreau called on Mr. Keith Overcash to explain the rule.

Mr. Overcash explained that the MWC rule change in the rule to get it back into line with the federal requirements.

Representative McComas asked Mr. Overcash if this was the one that specifically applied in New Hanover County.

Mr. Overcash answered in the affirmative.

Dr. Moreau added that this is the only facility that was affected.

Senator Horton asked Dr. Moreau to address the Weyerhaeuser situation in the Roanoke River with regard to mercury emissions.

Dr. Moreau said that he believed it was related to the hydrogen sulfide.

Senator Horton asked Dr. Moreau to address the high content of mercury in the fish and the warning issued by the Department of Health and Human Services.

Senator Horton also asked Dr. Moreau to address the asphalt industry where a plant had dangerous levels of hydrogen sulfide emissions with a high degree of suicide rate in the area.

Dr. Moreau said that he had heard nothing about the latter case. However, the issue on the Weyerhaeuser was one in common with other pulp and paper mills in the state. There was a revised health guideline on hydrogen sulfide. There is some dispute over the exact level acceptable.

Dr. Moreau added that the proposal that went was to delay any action on those facilities until they gathered more information. So the rule was to exempt the waste lagoons at the pulp and paper mills until February 2007. In the meantime, the companies would be required to gather additional information through monitoring to determine what those ambient levels were.

Senator Horton said that 2007 seemed a long way off if we need to address these health problems and asked Dr. Moreau how 2007 was selected as the date at which they would revisit the problem.

Dr. Moreau said there was considerable uncertainty as to what the nature of the health risk is. They do not have the evidence to suggest that these facilities are, in fact, violating the guidelines.

Senator Horton asked if it would take three years to find out.

Dr. Moreau said that it would take at least that to get the preliminary information.

Representative McComas noted that there would be discussion on this issue further on the agenda.

Dr. Moreau said that others would speak to the stormwater issue but he wanted to explain what the EMC's response was to the Rules Review Commission on this subject.

Dr. Moreau said that urban stormwater runoff is not a new problem. One of the first studies done in the country that received widespread attention was a study done by Professor Ed Brown at Duke in the 1960's. The evidence was sufficient by the time the Clean Water Act passed in 1972 for Congress to identify urban stormwater runoff as one of those areas of pollution that needed attention. What Congress couldn't figure out then was what to do about it.

Dr. Moreau said that it took 15 years before the amendments of 1987 that directed EPA to bring the urban stormwater runoff under the discharge permit program. The EMC is operating in response to the federal directive.

Dr. Moreau said that the adoption of a stormwater program is not an option. If we don't adopt it, all permittees will have to deal with U.S. EPA through the regional office in Atlanta. By failure to adopt a set of regulations, we leave a number of municipalities in North Carolina open to a technical violation of federal law and open to third party lawsuits.

Dr. Moreau said that the rules were developed over a period of three years with extensive consultation with affected parties. The rules were rejected by the RRC and the EMC's response asked counsel to seek judicial review of that decision on any or all-appropriate grounds. Several members of the EMC had strong opinions about what those grounds ought to be but they used good judgment in leaving that to the attorneys to decide what was the best approach.

Dr. Moreau said that the EMC has agreed with the Department to adopt a general permit that would cover those entities, particularly the municipalities that are subject to the federal rule so that they are not left out there hanging. The content of that general permit will reflect what was in the rules that were adopted.

Dr. Moreau said another issue the EMC dealt with was what to do with those developments, which are outside of municipal boundaries, particularly those that drain into the systems of the DOT.

Dr. Moreau said that the EMC has urged the Department to reissue the Phase I permit to DOT, making it clear that DOT will be responsible for water quality that is drained from its right of way, including the effects of any off-site development that may drain to its right of way.

Dr. Moreau asked that the ERC give consideration to the development of a comprehensive state storm water policy. Our current situation is that we have at least nine different sets of stormwater regulations now in effect.

Dr. Moreau said that in regard to air quality, in the next few weeks, the EPA will make a final decision on what counties or portions of counties will be designated in non-compliance with the new ground level ozone standard. At least 17 counties in the state will be affected.

Dr. Moreau said that as part of the maintenance and attainment plan for those areas, and part of the SIP call as part of the Clean Smokestacks Bill, the EMC has adopted a set of numerical limits on nitrogen oxide emission caps for the designated areas and for other parts of the state. These caps set numerical limits as to how much nitrogen oxide emissions are allowable. Even if we project compliance to meet the letter of the federal regulations, there will not be much room left under those caps to accommodate growth.

Dr. Moreau said that the question arises as to how much reserve do we have, what steps should we take now to ensure we have opportunities for offsets when the need arises, who is going to decide who gets the offsets, and what criteria are they going to use in making those decisions.

Dr. Moreau said there is no comparable training program at the state level for nitrogen oxide emissions and the characteristics of the sources from air pollutant emissions are quite different than those in the area of air quality. There are a very small number of corporations that hold substantial pieces of the nitrogen pie.

Dr. Moreau said that as we continue to pursue large manufacturing operations to provide jobs for the citizens, we should be prepared in advance to deal with the issues of nitrogen oxides.

Senator Albertson asked Dr. Moreau about changes in MTBE, chromium and arsenic and how those changes will track what the federal government requires.

Dr. Moreau said that those issues have come up and there is a revised health guideline for those issues. The EMC was faced with the issue of whether or not to issue temporary rules to address those issues and chose not to issue any temporary rule. It is clear that those substances are harmful but the question is whether to adopt a temporary rule invoking emergency powers or to wait and go through the regular rulemaking process. They were not presented with any requests or evidence that the citizens of North Carolina were facing an emergency situation being exposed to those chemicals. Without that information, they chose to follow the regular rulemaking path.

Senator Albertson asked Dr. Moreau if it had to do more with process than changing the standard itself.

Dr. Moreau said there was a change in the federal standard and the EMC is responding to part in that change in the federal standard.

Senator Albertson said he had read where the federal government was relaxing the standard for MTBE and asked Dr. Moreau if this was correct.

Dr. Moreau said he was not aware of this.

Senator Kinnaird asked Dr. Moreau if there is any hope if we put more resources into Greenpower it might mitigate some of these really serious problems.

Dr. Moreau said that he was not an expert on energy policy and believes we can make some strides in that area and an aggressive program in that direction might provide some benefit.

Dr. Moreau said that he believed we would have to rely on cleaner vehicles and one of the questions would be to just follow the federal standards on that or consider an option of a program such as the one in California for acceleration of clean vehicles.

Mr. Givens said that there has been some discussion at the federal level about providing some liability immunity to the petroleum companies who use MTBE in their products.

Senator Kinnaird asked Mr. Givens if we have ever had MTBE in the State of North Carolina.

Mr. Givens said that we have had MTBE and we do have some contaminated sites.

Senator Albertson asked if MTBE was one of the big holdups we have with regard to underground storage tank cleanups.

Mr. Givens said that the release of MTBE complicates the cleanup because it is harder to clean up than some of the other petroleum constituents.

Ms. Robin Smith, Assistant Secretary for Policy and Planning, DENR, gave an update on issues related to the Phase II stormwater rules.

Ms. Smith said that the Department has been working with the Attorney General's office on developing the appropriate appeal of the RRC decision. The EMC also asked the Department to go back to the RRC and ask them to stay its own decision while the appeal was pending. One of the reasons they were looking at a stay was once the permanent Phase II rules were disapproved and returned to the agency that causes the temporary rule to also expire and it carries with it direction to both state and local governments as to how certain decision will be made and what criteria will be used on things like designation of additional communities on Phase II permitting and responses to third party petitions for designation of additional communities.

Ms. Smith said that with regard to development of general permits, one of the issues the Department had recommended to the EMC was that while the rules were in a state of uncertainty the Department felt it would be a good idea to go ahead and development a general Phase II stormwater permit that would allow municipalities that require NPDES coverage to come in and get coverage under a general permit. The intent was to develop a general permit that would incorporate the same minimum requirements and standards as those that appear in the rule that was proposed and disapproved by the RRC.

Ms. Smith said that the Department has exisiting authority both by statute and by the EMC's rules to implement the NPDES permitting program in North Carolina.

Ms. Smith said that option that local governments would have if they need the NPDES they can chose to get coverage under the general permit if they are willing to meet all of the standards described in the permit. If they elect to do a program that does not meet those standards, they can apply for an individual NPDES permit. The Department will review the application and a decision to issue a permit would be made on a case-by-case basis.

Representative Hackney asked Ms. Smith to remind the Commission of the coverage to which these rules apply.

Ms. Smith said that the rules apply to any public entity located in specific cities and counties in North Carolina. If you are a public entity that owns and operates a separate storm sewer system, you must have the NPDES permit.

Representative Fox asked Ms. Smith what criteria is used to determine those areas.

Ms. Smith said that the areas were listed by name in the original federal rules based on the 1990 Census definition of what an urbanized area is. There is a second set of communities in North Carolina that because they grew in population and increased in density between 1990 and 2000 fall under the federal designations.

Mr. James C. Gulick, Senior Deputy Attorney General, Environmental Division, North Carolina Department of Justice, gave a report on the status of petitions to the Administrator of the United States Environmental Protection Agency (EPA) that may be filed by North Carolina under Section 126 of the federal Clean Air Act for purposes of reducing interstate transport of ozone and its precursors. Handouts accompanying his presentation are listed as **Exhibit G**.

Mr. Gulick said that Section 126 petitions refer to Section 126 of the federal Clean Air Act which authorizes states to petition the EPA for relief with respect to specific sources or groups of sources of air pollutants in upwind states outside of their own jurisdiction which are significantly contributing to non attainment of a national air quality standard or are interfering with maintenance of national air quality standards in the petitioning state.

Mr. Gulick added that the Clean Smokestacks Act, specifically in Section 10, authorized and directed state officials to seek a variety of methods to seek similar reductions in air pollutants, particularly SO2 (sulfur dioxide) and oxides of nitrogen in other states on a similar schedule. There have been efforts by DENR, the Governor's office and the AG's office to engage other states to seek those things. There has been activity in other states but there have not been the kinds of reductions assured that the AG's office would like to see.

Mr. Gulick gave an example as the State of Virginia who has a bill introduced that is very much like our Clean Smokestacks Act; however, it was recently learned that their bill will be held up and not enacted this year.

Mr. Gulick said that the AG's office, in conjunction with DENR's Air Quality Division, is actively preparing to file petitions under Section 126 of the Clean Air Act. This process is well underway and will be filed in the near future in several upwind states.

Senator Horton asked Mr. Gulick if he was speaking of the Tennessee Valley Authority (TVA).

Mr. Gulick said that the TVA is certainly one of the ones mentioned specifically as well as those in other states. He added that they have a list of states they are working with but declined to disclose the names until petitions have been filed.

Representative Gibson asked Mr. Gulick if we are headed in the right direction with the Clean Smokestacks bill and is it giving the AG's office the juice to make other states stop polluting us upwind.

Mr. Gulick said that it would have that effect. Similar legislation has been proposed in the State of Virginia and there are proponents of such legislation in other states, so the Clean Smokestack legislation is giving it a boost.

Mr. Gulick said that his colleague, Mr. Bernstein, will be addressing the ERC shortly on a transport rule that has been proposed by the EPA which would address similar issues in the eastern half of the state. Whether that rule will eventually be adopted is an open question. It said it was fair to say there was a variety of ways to accomplish the same results but the time has come to ask for the transport rule method as another method of achieving that result of reductions in upwind states that affect us.

Representative Gibson asked Mr. Gulick if EPA is looking favorably on the Clean Smokestacks legislation and are we headed in the right way.

Mr. Gulick said that was absolutely true. Mr. Bernstein said the EPA is looking to requiring similar levels of reduction in those pollutants in the eastern half of the country.

Representative Gibson asked if the Ohio Valley had made any efforts in this area.

Mr. Gulick said the AG's office recently had letters from both Ohio and West Virginia which were not encouraging that voluntary actions was going to be taken in those states.

Mr. Gulick said there were two new source review rules and Mr. Keith Overcash would be addressing the earlier rule also known as the December rule.

Mr. Gulick said that he would give a brief description of the later rule, also known as the Labor Day rule, and its current status.

Mr. Gulick said that in August 2003, the EPA issued a final rule, which indicates what activities at coal fired plants would be treated as routine maintenance for purposes under the Clean Air Act.

Mr. Gulick said that at the time of the Clean Air Act and new source review provisions, old facilities were grandfathered in. And, if provision was made that if they made changes in the process or in their plant or facility, physical or otherwise that resulted in an increase in emissions, they would

have to go into new source review, which could result in their having to install the large scale and expensive up to date pollution control systems. There have been a lot of complaints by industry and others about the case-by-case nature of the routine maintenance exception that had been adopted for dominimous increases by the EPA. This rule was designed to resolve those issues.

Mr. Gulick explained that under the rule, any equipment replacement activity, will automatically be excluded from new source review requirements if it involves replacement of any existing component of a process unit with an identical or functional equivalent component, the fixed capital cost of the replacement component plus the cost of repair does not exceed twenty percent of the replacement value of the entire process unit and the replacement does not change the specific design parameters of the unit.

Mr. Gulick added that EPA says this would not cause the unit to exceed the emissions requirements. This is a very controversial contention. Opponents argue that this will permit the reconstructions of these old units without their having to adopt or install up to date pollution controls. It also argues that they would be allowed to retain their life indefinitely. This rule has been challenged in the District of Columbia Circuit Court of Appeals. In December, shortly before it became effective, the DC Court of Appeals did several things with respect to this rule and the earlier new source review rule, which Mr. Overcash will describe.

The DC Court of Appeals denied a request to consolidate the two rules for argument, they granted a request that the same panel of the district court hear both cases, they granted the request of the opponents of the routine maintenance rule, they granted request to stay the effectiveness of that rule, pending their final decision. They stated their reasons that irreparable harm and likelihood of success on the merits required for the issuance of this stay and hearing of this case would be expedited.

Mr. Gulick said that since the request is stayed, unlike the earlier NSR rule, DAQ will not be under any obligation to start deciding what kind of rules they would need to adopt in order to deal with that new EPA rule. This would not happen unless the ruling is upheld.

Mr. Givens asked Mr. Gulick if the Labor Day rule is the one the State of North Carolina declined to join with other states in that lawsuit.

Mr. Gulick said that the State did not join in either litigation.

Mr. B. Keith Overcash, Director of Air Quality, DENR, gave a report on where the state is in the rulemaking process for the December rule, the new source review rule that was made final by EPA in December 2002. A handout accompanying Mr. Overcash's presentation, containing his comments, is listed as **Exhibit H**.

Mr. Givens asked Mr. Overcash what the consequences would be for failure to meet the March 2006 deadline.

Mr. Overcash said that EPA could file an action against DENR saying their program was deficient and step in to run the program.

Representative McComas asked how often has EPA been known to do that in the past.

Mr. Overcash said he was not aware that EPA had ever filed such action in the past. Actually, there are states in the northeast, called delegated states, which had to start using the rule on the effective date in 2003. Some of those states have filed litigation against EPA on the rule. He added that he is not sure whether or not EPA has stepped in and started issuing permits in those states but believes they have.

Mr. Marc D. Bernstein, Assistant Attorney General, Environmental Division, North Carolina Department of Justice, gave a report on the regulations proposed by EPA to reduce interstate transport of fine particulate matter and ozone.

Mr. Bernstein told members he had been asked to speak on the Interstate Air Quality (IAQR) rule and the Utility Mercury Rule (UMR) proposed by the EPA.

Mr. Bernstein said that the IAQR was signed by the Administrator for EPA in December 2003 and published in the federal register in January 2004. The EPA has set forth an approximate schedule for finalizing this rule sometime between December 2004 and June 2005. So far, they have only published a preamble to the rule, which is the description of the legal basis for the rule, the general design parameters and some of the discussion of the technical backdrop of the rule. EPA has not shown the rule language but will put this forth in a supplemental federal register note later this year.

Mr. Bernstein said the schedule for the rule shows that the comment deadline for this rule is March 30, 2004 and hearings will be held this month. What this rule deals with is the interstate transport of precursors of ground level ozone and fine particulate matter, also known as (PM2.5). The basis for these rules generally was the fact that new federal ambient air quality standards were promulgated for these particular pollutants. In the late 1990's, there was some litigation surrounding those national ambient air quality standards but the U.S. Supreme Court eventually upheld them.

Mr. Bernstein said that the issue surrounding these particular national ambient air quality standards is the fact that they are generally not formed at the source but can be formed by sources that emit precursors to these pollutants. In the case of ozone, the primary precursor that EPA is looking at is nitrogen oxide. In the case of PM2.5, the general precursors are SO2 and nitrogen oxides. There are other precursors to the pollutants but are not for regulation at this point.

Mr. Bernstein said that this rule deals with transport of SO2 and NOx in the eastern part of the United States where transport is generally a problem.

EPA has defined the eastern part of the state to include states from Louisiana up to Minnesota and all states east of that line. The exceptions to this are the states of Maine, New Hampshire and Vermont. The states that influence North Carolina are the Atlantic Seaboard states and West Virginia and Ohio.

Mr. Bernstein said that essentially this rule is targeted at electric generating units. EPA looked at all sources of pollution when developing this rule and determined that all sources upwind contribute to non-attainment or interfere with maintenance of attainment of the national ambient air quality standards. Downwind they are focusing their attention on electric generating units. This does not mean that the state needs to regulate electric generating units but the states can use their flexibility of the Clean Air Act to regulate other entities if they so desire. It is likely that most states under this rule, if it becomes final, will target their SIP processes at electric generating units.

Mr. Bernstein said that the methodology behind this rule, in general, follows the same structure as the NOx SIP call, which was promulgated back in the late 1990s. The NOx SIP call rule dealt with ozone pollution of the old ozone standard in the northeast and under that rule it was found that states in the southeast and Midwest were contributing to ozone pollution in the northeast. This rule is generally the same thing except it deals with a broader spectrum of pollutants in a broader spectrum of states.

Mr. Bernstein said that in general, what the EPA did was take the NOx SIP call methodology and applied it to this situation. They identified a basic threshold level of contribution that upwind states made to downwind states and all states that met that threshold level of contribution were included within the scope of the rule. EPA then determined what cost effective pollution control measures would apply to sources within those states and then developed emissions limitations budgets based on the application of presumed cost-effective controls in electric generating units (EGUs).

Mr. Bernstein added that what EPA ended up with was NOx and SO2 budgets for all the states that are included in the rule and these budgets are based on particular formulas. There are two budgets developed for SO2, one for the year 2010 and one for 2015. For SO2, EPA is looking for a budget that is 50 percent of the SO2 emissions limit under the current Title IV acid rain program under the Clean Federal Air Act. For 2015, each state's budget is going to be 35 percent of the total SO2 emissions limit under the acid rain program.

Mr. Bernstein said that with regard to NOx, the budgets are being calculated differently. They are based on heat input to electric generating units. For NOx in 2010, the budget was developed using an assumed control efficiency of emissions level of 1.5 pounds of NOx per million BTU's of heat input into these electric generating units. In 2015, it will be ratcheted down to 1.25 pounds. The State will have to comply with this SIP call by developing a SIP to meet those requirements and then submitting those SIPs to EPA for approval and then implementing the SIP.

Mr. Bernstein added that this rule in some ways relates to the Section 126 procedures that Mr. Gulick discussed earlier. The findings that EPA has made with regard to the IAQR SIP call are the very same findings that EPA would need to make under a 126 petition. Therefore, EPA has stated in the proposed IAQR that if the record for the 126 petitions is the same for the IAQR, EPA will presumably default to the same remedy.

Mr. Bernstein said that the IAQR budgets have already been published and are comparable to those under the Clean Smokestacks Act.

Senator Horton asked how interstate transport of fine particulate matter and ozone affect the citizens of North Carolina.

Mr. Bernstein said the health effects are what are documented when the rules for particulate matter and ozone were promulgated in the late 1990s. EPA did a great deal of work to identify the impacts of those particular pollutants on the health.

Senator Horton asked Mr. Bernstein if it caused people to fall down in fits or lose their eyesight or go crazy or just what.

Mr. Bernstein said that the effects are not that severe. The health effects generally range from increased incidences of asthma and respiratory disease in older adults and children.

Senator Horton asked Mr. Bernstein if what these rules do would be to limit upwind generators of pollutants from reaching North Carolina.

Mr. Bernstein said this is correct but is only a proposed rule at this time. They would like to see it finalized in some form.

Mr. Bernstein then spoke on the Utility Mercury Reductions Rule (UMRR). He said this rule has a similar time path as the IAQR, although it has a very different history.

Mr. Bernstein explained that the UMRR is based on different sections of the Clean Air Act but the final rule has not been developed. Section 112 of the Clean Air Act regulates what are called hazardous air pollutants and the standard is the Maximum Achievable Control Technology (MACT). The other option that has been set forth by the EPA is regulation under Section 111 more commonly referred to as the New Source Performance Standards, which allows for prescription of performance standards that carries over to existing sources.

Mr. Bernstein said that the genesis of this rule comes from a consent agree that was reached back in the mid 1990s. Under that consent agree, EPA was told that by December 2000 it had to determine whether regulation of hazardous air pollutants from EGUs was appropriate under Section 112.

Mr. Bernstein said that EPA determined in December 2000 that regulation was necessary and appropriate, was the technical determination

that it needed to make, and started moving forward with the a hazardous air pollutant regulation. The consent agree told EPA that by December 2003, it needed to propose regulations. So, in December 2003, at the same time that the IAQR was signed, EPA signed a proposal with regard to mercury emissions from EGUs. EPA proposed to rescind its finding of necessary inappropriate under Section 112, thus relieving it of the obligation to impose a maximum achievable control technology standard on these sources. EPA has proposed regulation under Section 112 as well as Section 111 regulations. The standard for a MACT under Section 112 is that the control standard has to match the control rate achieved by the best performing 12 percent of sources in a given category, which is a EGU.

Mr. Bernstein said that the alternative proposal is under Section 111, which is a cap in trade program. This program would have two phases, an initial phase in the year 2010, and a nationwide cap of 34 tons. The 34 tons is essentially the co-benefit that would be created by the implementation of the IAQR. The second phase would take effect in the year 2015 and would ratchet nationwide emissions to 15 tons.

Mr. Bernstein said the schedule for the mercury rule is December 2004. If EPA rescinds the necessary appropriate finding, they will then be required to finalize the rule.

Senator Kinnaird asked if the hearing tomorrow would be held at RDU.

Mr. Bernstein said he believed they were being held at RTP.

Representative Hackney asked Mr. Bernstein if our roughly 50 percent reductions under the Clean Smokestacks Act, will we meet either one of these proposed rules.

Mr. Bernstein said that the Section 112 rule is estimated to take the nationwide level down to 34 tons. The first phase of the Section 111 rule would bring total emissions down to approximately the same level. With regard to North Carolina's place and our co-benefit from Clean Smokestacks, he does not have the technical information to be able to answer Representative Hackney's question.

Mr. Givens asked Mr. Bernstein if the State of North Carolina was submitting comments on either of these rules at the hearing tomorrow.

Mr. Bernstein said that there may be some people from the State testifying with regard to the IAQR but he wasn't sure about the mercury rule.

Mr. Givens asked Ms. Smith to respond to his question.

Ms. Smith had stepped out of the room and Mr. Brock Nicholson stepped forward to answer the question.

Mr. Nicholson, Division of Air Quality, said that the State intended to submit written comments to both rules.

Representative Hackney asked Mr. Nicholson if the State is submitting comments on the mercury rule.

Mr. Nicholson said that the State is planning to submit written comments on both rules by the March 30, 2004 deadline, but not planning to present oral comments on either rule tomorrow.

Representative Hackney asked Mr. Nicholson to explain in a word what the comments say, does the State support the rules or not.

Mr. Nicholson said they are yet to develop those comments. A number of the concerns that Mr. Bernstein indicated are also concerns shared by the State.

Senator Kinnaird asked Mr. Nicholson what the State was going to say about the rules.

Mr. Nicholson said that the State would not be submitting oral comments tomorrow but are instead developing more detailed written comments by the March 30, 2004 due date for those comments.

Senator Kinnaird asked again what the State is going to say.

Mr. Bernstein said that the AG's office is yet to develop these comments. They are working in tandem with the Division of Air Quality to develop their record for the 126 petitions and those will dovetail with the comments of the Air Quality Division. Once they are able to finalize their litigation position with regard to 126, they will start to move forward with the comments. The technical work they are doing to support the 126 petitions will form the basis for their comments.

Representative McComas asked Mr. Bernstein and Mr. Nicholson to submit copies of their comments, once they are developed, to members of the ERC.

Representative Weiss asked Mr. Bernstein about cap in trade with regard to mercury. She said she is concerned about the health impact with the cap in trade program with other states.

Mr. Bernstein said that there are always arguments under cap in trade programs that hot spots will develop. There is research to show that hot spots did not develop under the acid rain program but acid rain is not the acute toxic that mercury is. So, there has been a heightened level of concern with regard to a cap in trade program with mercury.

Senator Kinnaird asked Mr. Bernstein if North Carolina is potentially a hot spot.

Mr. Bernstein said he would leave the answer to this question to the technical folks.

Mr. Nicholson answered by saying that they are concerned because we do have numerous fish advisories in place in North Carolina and mercury from our utilities. One thing we are blessed with is that we burn bituminous coal and will realize the greatest co-benefit of mercury reduction with our SO2 and NOx reduction in the Clean Smokestacks Act. A provision of that Act requires that we report to the legislature on the technical issues surrounding mercury control. Presently the calculations are a 66 percent total reduction in all mercury from all utilities from the Clean Smokestacks Act as it currently exists.

Mr. Givens added that the first of those mercury reports that Mr. Nicholson referred to are in the read only packet distributed to members today in Exhibit D.

Dr. Luanne Williams, Toxicologist with the North Carolina Department of Health and Human Services came forward to say that she would be presenting tomorrow-oral comments in opposition to the UMRR that the EPA is proposing. Her reasons for opposition are the type of coal our coal-fired power plants use in this state have a lot of chloride in it which releases me curate chloride. If we do have a cap in trade, the coal-fired power plants in North Carolina could potentially release a higher amount of mercury than those plants in Tennessee and it would all be acceptable to EPA. So, Tennessee's fish would be okay but North Carolina's fish would not be okay.

Dr. Williams added that there is data with DWQ that shows that just through rainwater deposition alone, the mercury levels are very high in our state. They are five time higher in the rain than what you would want statewide to protect the majority of our sunfish and less than 50 percent of our bass. The level in water in our state that we would want to protect 95 percent of our sunfish and less than 50 percent of our large mouth bass, we would want .1 across our state in water. The rainwater level is .5. So, if WQ controlled permit for everyone to meet the .1, the mercury levels in the rainwater would be five times higher than they should be and we would have elevated levels of mercury in our sunfish and bass.

Representative McComas asked Dr. Williams that once she had finalized her comments, would she share them with the ERC.

Dr. Williams said she would be happy to do so.

Mr. Givens asked Dr. Williams if she was with the Department of Health and Human Services.

Dr. Williams said this was correct.

Mr. Givens asked if the comments she was submitting tomorrow were on behalf of the Department.

Dr. Williams answered in the affirmative.

Mr. Givens said that there seem to be two different departments going in different directions with their comments. He was asking who would be speaking on behalf of the State.

Senator Kinnaird said she was glad to hear the comments of Dr. Williams and was disappointed that DENR did not share the same concerns.

Representative Gibson said it thought it was necessary to hear the expertise of all three divisions of the State at the appropriate time. He urged all interested parties to take their time and present their positions when they felt they are ready to do so because this is an expensive and important issue that we don't need to rush.

Mr. Nicholson said he would like to emphasize that tomorrow is a public hearing where people can give limited oral comments on both rules. The detailed comments are not due until March 30, 2004 and they think it is a lot more appropriate to present very careful and detailed comments at that time.

Representative McComas asked Mr. Nicholson if he would give the ERC members the time and location of the public hearings.

Mr. Nicholson said it was his understanding that they would be at the Holiday Inn near the Airport, just off of I-40, tomorrow and run for two days. The starting time is 8:00 a.m.

Mr. Givens followed up on comments from Representative Gibson and Mr. Bernstein regarding the filing of the 126 petitions. These petitions have not been filed and therefore the State is not going to tip its hand in advance of the filing of those petitions. What they will say in the petitions and what they will say in their comments are closely interlocked. So, as a matter of timing, it is to the benefit of the State from a litigation strategy point of view to wait and submit in more extensive written comments by the March 30, 2004 deadline by which time something will have happened on the 126 petitions. He asked Mr. Bernstein if this was a fair assessment.

Mr. Bernstein said this was a fair assessment but he could not guarantee that something will have happened with regard to 126, but they should be far enough along to make substantial comments on the rule at that point. They are working very closely with the Division of Air Quality to develop the legal position and the record that is needed to support that position. They will also be consulting on the health issues.

Senator Kinnaird asked Mr. Bernstein if the 126 petitions have to do with other states in the airstreams but have nothing to do with the caps on mercury. So, she cannot understand what his earlier explanation was about.

Mr. Bernstein said that the mercury process and the interstate NOx and SOx processes are interrelated because there may be substantial cost savings to industry by going forward with them in a coordinated manner, but from a legal prospective, they are somewhat diverse.

Representative Weiss said it would be helpful to hear from Dr. Williams on the public health aspect of this issue. We have been hearing a lot of technical and legal language and she feels it is critical that we hear the health aspects and the cost issues with regard to high mercury levels.

Dr. Williams said that she reviews all of the fish tissue sampling data for the State and determines if a fish advisory should be issued. She said that we now have a mercury fish advisory for two-thirds of the State, south and east of Interstate 85 with large mouth bass, bowfin and chain pickerel. It has been recommended that women of childbearing age and children not eat these three types of freshwater fish. In addition to these three freshwater fish, women of childbearing age are urged not to eat shark, swordfish, king mackerel and tilefish. They have sampling data to show that very high levels of methyl mercury can be found in these seven types of fish and the predominant concern is for the developing child.

Dr. Williams said that a fish advisory is issued in our state when the tissue concentration, in a given species in a given water body is around .3 milligram per kilogram.

Senator Albertson asked Dr. Williams to provide a copy of her report to the ERC.

Representative Williams asked Dr. Williams what the number reading was of the level of mercury in the Ferrells Island study.

Dr. Williams said the readings were greater than 1 mg. per kg. in the pilot whale and those are similar to the levels we are seeing in our fish in North Carolina waters.

Representative Williams asked if our readings are .3 and the Ferrells Island study reading was .1.

Dr. Williams said we would like to see our target level in fish where we don't issue advisories as .3.

Mr. Brock M. Nicholson, Deputy Director, Division of Air Quality, DENR, gave a report on the process and status of designation of non attainment areas to comply with the revised national ambient air quality standard (NAAQS) for fine particulate matter (PM2.5). Two handouts, which accompanied his presentation, are listed as **Exhibit I**.

Representative Hackney asked Mr. Nicholson about New Source Review before he began his presentation. Why is it necessary for us to change our rules if they are stricter than the ones that EPA is putting into effect.

Mr. Nicholson said this was a fair questions asked by a number of other states and a good answer has not come out of EPA to answer this.

Mr. Nicholson said there are some features of that rule that are attractive but they feel like need some modification from the EPA version. For instance, the plant-wide applicability level is a concept where you place a cap on a plant. Under that cap, the plant has some flexibility to change operations or increase operations as long as they stay under a cap that has been preset through an analysis of its acceptability. The State does not presently provide for that in our rules.

Mr. Nicholson said that another area of difference is the baseline calculations in our rules do not tie down the issue like EPA does. So, there are several reasons why they are looking at modifications to the State's rules. Another simple reason is that the signals they have gotten from EPA would indicate there could be a fight.

Representative Hackney said that sometimes you have to fight with EPA.

Mr. Nicholson covered the bullet points in his handout Exhibit I. He said that the designation is a federal rulemaking action, not a state action. Presently North Carolina is designated for attainment for all the previous ambient air quality standards. This is a requirement of the Federal Clean Air Act.

Mr. Nicholson said that the standards are particulate matter or PM fine, very small particles that get deep into the lungs and cause health effects, some of which are quite severe. Fine particles have been attributed to causing premature death and are a respiratory as well as a heart issue. Typically they are secondarily formed particles and in the eastern U.S. is usually ammonium sulfate, hence the reason to control sulfur dioxide from power plants. There is ammonium nitrate, which comes from NOx, so NOx control also helps fine particle reductions. There are also organic particles from various organic aerosols, and there are directly emitted fine particles from diesels.

Mr. Nicholson said that PM fine is a very serious issue from a health standpoint as is ozone. Ozone is formed secondarily typically from volatile organic compounds or VOCs and NOx, one of the major pollutants the Clean Smokestacks Act is focusing on.

Mr. Nicholson said the state's role in designations is to make recommendations to the US EPA. It is recommendations on the boundaries of the areas to be designated.

Mr. Nicholson said the recommended action on PM fine is due to EPA by December 21, 2004. For ozone the recommendations were presented July 15, 2003 and the final rulemaking is due by EPA by April 15, 2004. These recommendations submitted by the State were made on behalf of the Governor. Secretary Ross submitted those in consultation with DOT, Commerce and Agriculture.

Mr. Nicholson said the requirements for setting boundaries is areas with a measured violation and the areas contributing to the violation. We monitor more locations than many states.

Mr. Nicholson said that EPA's presumption is that all Metropolitan Statistical Areas (MSA)s and all counties of MSA and whole counties be measured. Areas smaller than EPA's presumption can be measured based on EPA's published guidance.

Mr. Nicholson said that the basis for North Carolina's recommendations came from urban versus rural, contributing to problem or not, whether existing controls were there. His Department did not fully recommend the full areas as EPA has as their presumption. For Ozone they are recommending 12 full counties and 24 partial counties as opposed to the sum of that in whole counties.

Mr. Nicholson said that North Carolina supports areas less than EPA's presumption through extensive technical analysis and documentation, existing measures put into place, and air quality forecasting. North Carolina can control emissions without designation of non-attainment.

Mr. Nicholson said that no additional control strategy requirements are expected and attainment should be fulfilled by 2007 except for a couple of monitors near Charlotte and those will be in attainment by 2010.

Mr. Nicholson said that the issue EPA has with NC's ozone and PM fine recommendations is the size of the designated area. North Carolina followed the process of public meetings, meetings with local officials, consulted and concurred with DOT, and the Departments of Commerce and Agriculture.

Mr. Nicholson said the consequences for areas designated as non-attainment are that of new source review (NSR) for major new or modified industry, best control technology, offset emissions, conformity analysis required; implication for Federal highway funds, both transportation and general, and an impact on economic development.

Mr. Nicholson said that the basis for EPA's rejection of North Carolina's recommendations is primarily the desire to be uniform across the country and secondary growth issues. Letters are being written and meetings are being held to try to change EPA's mind.

Mr. Nicholson said there are currently only two sites in the state that are violating the standard—Hickory and Lexington. They are trying to be consistent with the ozone recommendation and received input from local government officials in those areas.

Mr. Nicholson said that the basis for limiting the monitoring to those areas is the fact that they are the only counties in non-attainment

Mr. Nicholson continued by saying that attainment has been met in Asheville and some of the higher elevations.

Senator Swindell said that he is pleased with the way DENR is working with Nash and Edgecombe counties. Nothing can be controlled with what happens on Interstate 95, and at the same, when you look at what has happened and why the Atlanta office of EPA has chosen to come back and target Leggett as a monitoring station, is very unfortunate because there are some things being done right down there.

Mr. Nicholson agreed with Senator Swindell.

Representative Gibson asked Mr. Nicholson if there is an argument with DENR and EPA over this.

Mr. Nicholson said there is a very big argument.

Representative Gibson asked Mr. Nicholson if any other states are in this predicament and are joining our argument with EPA.

Mr. Nicholson said there are a few other states and we are one of the few states that took advantage of the guidance issued by EPA to look at partial counties. Georgia did propose a number of counties but whole counties be admitted from the Atlanta MSA. EPA approved some partial counties in Maine but the argument there is OMB, who determines metropolitan statistical areas, defines an MSA by townships, not by county boundaries.

Mr. Nicholson said that we went to townships for our exclusion, townships being a legal fraction of a county, and did whole townships other than Leggett and Taylorsville. There are a few other states, Tennessee, South Carolina, North Carolina, Georgia and Arizona who are in the same boat.

Mr. Nicholson said that one of the reasons EPA said they are reluctant to let us have what we have requested in our recommendations is if we get it they will also have to address Pennsylvania's and Ohio's request to reduce some of the sizes of their counties.

Representative Gibson asked if Pennsylvania and Ohio have the same number of monitoring stations that we have and can they do what we have done here.

Mr. Nicholson said he could not answer for those states, but he said they have the minimum sufficient monitors. Georgia has fewer monitors than we have for half the population per geographic area. So, in a sense, we are being penalized for trying to do the modeling on the ozone.

Mr. Givens asked Mr. Nicholson if the EPA doesn't move substantially in the direction that the State has recommended, what are our options.

Mr. Nicholson said that perhaps this would open it up for litigation if this is the course the State wants to follow.

Mr. Bernstein was asked to respond to this. He said the action the EPA takes to finally designate those areas would open them up to a challenge under Section 307 of the Clean Air Act.

Senator Kinnaird asked Mr. Nicholson what we are doing to take a global look at the economic consequences and what is being done to regulate small trucks and the large 18-wheelers.

Mr. Nicholson said that the 2007 heavy-duty diesel truck standards will be very crucial for North Carolina. The State is very supportive of the federal rule on this and has been for quite a while. This will make a huge difference in lowering NOx emissions. The SUV's will be coming under a tighter regulation under the new federal standards. As far as the health costs, our state plan to achieve the standards in this short timeframe is taking this into account because we are going to obtain the health based standards.

Representative Weiss asked Mr. Nicholson what the impact of hybrid vehicles and alternative fuels will have on this problem.

Mr. Nicholson said that anything that gets us to lower emissions the better off we will be. One thing we need to be very careful about with alternative fuels is which choice of fuel we use because not all alternative fuels are necessarily cleaner. Gasoline powered cars are very clean. The IM program is necessary to make sure those cars are kept very clean and function properly.

Mr. A. Preston Howard, Jr., P.E., President, Manufacturers and Chemical Industry Council of North Carolina, gave his remarks to the Commission. A copy of Mr. Howard's remarks is listed as **Exhibit J**.

Mr. J. David Farren, Senior Attorney, Southern Environmental Law Center gave his remarks on Ozone non-attainment.

Mr. Farren said that on behalf of the environmental community and citizen groups in North Carolina and other states in the southeast, he would like to address this boundary issue from a slightly different perspective. This is a major public health issue in North Carolina where we have three of the twenty-five most ozone metropolitan polluted areas in the United States. Charlotte, for example, is the ten worst metropolitan polluted area in the U.S.

Mr. Farren said that ozone is a lung-scarring irritant and results in multiple asthma attacks across the state per year. It is also a quality of life issue, which ultimately will affect economic recruitment just as much as some of the factors that have already been discussed.

Mr. Farren said that when you look at the public health cost in North Carolina, the cost of complying with air pollution control requirements is much less than the public health costs. For example, the OMB report that President

Bush put out last year, the cost of cleaning up air pollution problems is roughly one-fifth to one-seventh the cost of the health effects. So, having air pollution controls in place saves our economy about $150 billion. In North Carolina, this is about a $5 billion savings.

Mr. Farren said that ozone is a little different than some of the other pollutants in that it is a very pervasive pollutant that spreads across wide areas. This is because ozone comes from a number of sources: power plants, other industry, automobiles, machinery equipment and is a very pervasive problem.

Mr. Farren said it is very important that the entire metro areas be included as part of the solution to clean up the ozone problem.

Mr. Farren said the submission by North Carolina, in some cases, left out some of these rapidly growing areas, it left out areas with power plants and other facilities that clearly contribute to ozone pollution and contribute to the problem across the state.

Mr. Farren said that another problem with narrow boundaries is that areas outside the boundaries will not have any incentive to be part of the solution. In addition to EPA's recommendation, it is interesting to not that the early impact program referred to earlier that the Triad is participating in, for their ozone abatement plan, they are looking at whole counties.

Mr. Farren said that if we don't comply with EPA by these deadlines, we are going to be facing more severe sanctions and penalties than what we are going to have to do with the non-attainment areas.

Mr. Farren concluded by saying that EPA's position on this is well within reason and taking any other approach would be shortsighted both for public health and economic development for the future of North Carolina.

Senator Kinnaird said she would like to see someone do another study on jobs versus environmental regulation.

Senator Horton asked what other fast growing areas should be included in the delineation.

Mr. Farren said that most of the counties around Charlotte, in the Triad area and in the Triangle where the State recommended partial counties, they are fast growing areas and have a number of commuters.

Senator Horton asked if this includes Caswell and Person counties.

Mr. Farren said that portions of those counties fit the demographics.

Senator Swindell asked Mr. Farren if it would be fair to say that maybe most of North Carolina should be within the ozone non-attainment areas.

Mr. Farren said no. If you apply EPA's guidance faithfully, what EPA came back with on November 2, 2003 is a reasonable compromise.

Senator Swindell said that the reason he says this is because Edgecombe County has a monitor set up by choice but it is puzzling to see that other counties within the Raleigh-Durham area and the Piedmont that should be included.

Mr. Farren said that anywhere you have a monitor showing non-attainment; you have an indication that there is a public health problem.

Mr. Overcash was called back to present a report on proposed modification of the rule setting out the acceptable ambient level (AAL) for hydrogen sulfide under rules adopted by the Environmental Management Commission (EMC) that govern the emission of toxic air pollutants. A handout accompanying Mr. Overcash's presentation is listed as **Exhibit K**.

Mr. Overcash said that he would be speaking about a process that was underway to adopt a new standard in North Carolina for hydrogen sulfide. There is currently an air toxics program in North Carolina that regulates 105 different compounds, one of which is hydrogen sulfide. The current standard was put into place in 1990 based on short term effects of high level exposure and set at 15 parts per billion.

Mr. Overcash said that in 2001, the Division did some studies and found there was some hydrogen sulfide in areas that had not previously had a problem. The Secretary's Scientific Advisory Board (SAB) was asked to look at the literature and see if there was new literature available to readjust that standard. They discovered new literature and came up with recommendations for the Division on new standards.

Mr. Overcash said that all of the numbers in the new standards are more stringent than the one in place today. The EMC had given directions to have number they could chose from when a change was made in the acceptable ambient levels.

Mr. Overcash said that in early 2003, the EMC was given information provided by the SAB and emission sources that would be affected by any changes to the AAL. In May, those options were taken to the EMC, which added some additional options to be taken to hearing. Also, as part of the changes to the rule and due to some potentially high costs of new controls of certain facilities, there were some options included in the proposed rule to give a waiver to some facilities on their wastewater treatment plant emissions.

Mr. Overcash said that in late October and early November 2003, two public hearings were held in North Carolina to the proposed H2S standard, one in Winterville and one in Asheville. Numerous comments have been received on the changes to the rule. From November 2003 until recently, hearing officers have been reviewing those comments and are preparing to bring a final recommendation to the EMC in March for a vote to decide what the new standard will be.

Mr. Overcash said that if the EMC approves the option in March for a new rule, the new rule would be taken to the RRC in April 2004. If the RRC approves the rule and there are less than 10 objections, they plan to make the rule effective in May 2004.

Senator Albertson asked Mr. Overcash who the effected facilities are.

Mr. Overcash said there are five pulp and paper plants affected and one fertilizer manufacturing facility.

Senator Albertson asked Mr. Overcash what the cost would be for the companies to do these upgrades with the new rules.

Mr. Overcash said that they are in the tens of million of dollars.

Senator Forrester asked Mr. Overcash if there is any public health problem associated with hydrogen sulfide emissions as with ozone or is it a quality of life issue with odor from that product.

Mr. Overcash said that H2S is a toxic pollutant that does affect people if they breathe it at very high levels and can be fatal.

Senator Forrester asked if the communities around the pulp and paper mills were affected by exposure to H2S or would it more likely be people who worked with it in a laboratory setting.

Mr. Overcash said he is speaking of exposures at plant level.

Representative Fox asked Mr. Overcash how we find out if the findings recommended from studies done in 1990 are correct or the findings we have today.

Mr. Overcash said there was quite a bit of literature available on H2S on the studies done in 1990 and there are some new studies that have come out since then that indicates that the number ought to be quite a bit lower than what it is. He said he believes that North Carolina has the highest number than any other state that is currently regulating H2S.

Representative Fox asked Mr. Overcash what the average other states are currently using for their standard.

Mr. Overcash said he did not know the average but if we took the lowest number that has been recommended, we would most stringent as any other state.

Representative Fox said it would be helpful if we could see the numbers from other states.

Representative McComas asked Mr. Overcash to put together a chart that would show this information for members of the committee.

Mr. Givens asked Mr. Overcash about the charts in his handout and what the asterisks stood for.

Mr. Overcash said the charts were copied directly out of the rule, so he could not tell him what the asterisks stand for, but told Mr. Givens he would get this information for him.

Mr. Givens asked Mr. Overcash to tell what the pros and cons are and the basis for exempting paper mills and wastewater treatment systems because of the cost and do paper mills emit hydrogen sulfide from sources other than their wastewater treatment system.

Mr. Overcash said that paper mills do emit hydrogen sulfide from sources other than their wastewater treatment systems. There is an economic analysis portion in the current rules. They can look at individual sources. Once a rule is put into place, a facility can plead a hardship demonstration to show it is not economically feasible to comply with the rule. In this case, they ask for economic information up front because they realize in the early process that some of these facilities would have to do some drastic reductions and would need to know what it would cost them. Therefore, they would need to get the cost information up front and is part of the reason that there are proposed waivers in the rule for these facilities.

Mr. Overcash said there are different options, also. One of the options is for that exemption to run out in 2007 and the other is open-ended. Part of what the new rule will require the facilities to do is to verify what their emission numbers are and provide more information on how they can treat their wastewater in a cost effective manner.

Representative Weiss said it would be helpful to know what percentages of the H2S are caused by pulp and paper mill emissions.

Mr. Overcash said that of the five facilities he referred to earlier, it is about 99 percent of the H2S inventory in the State from regulated, permitted facilities.

Representative Weiss commented that if we know it is a public health risk and that a large percent is coming from one place, we should also look at the health impact before we go exempting these industries.

Mr. Givens asked Mr. Overcash if any of these options provide for a phase in time for existing facilities.

Mr. Overcash said that there are different ways to trigger into the program. For existing facilities, if they have already triggered into the program for H2S, that new standard would become effective immediately and they would have to make a demonstration next time they took action on their permit. If a facility has never been triggered in before, the first time they make a modification that increases those emissions; they would have to make a demonstration of compliance. Other ways are if a facility has been required to

comply with their last MACT that triggers them into the toxic program. A new facility would have to demonstrate compliance upon issuance of a permit.

Mr. Givens asked Mr. Overcash of these five or six facilities that constitute 99 percent of the emissions, are they disbursed around the state or all in one geographic area.

Mr. Overcash said that five of the six are in the eastern part of the state and one is in the Asheville region.

Mr. Givens asked Mr. Overcash if, based on his experience in the public comment, are there any of the six options that are likely to draw less than ten objections or would be supported by the regulated industries.

Mr. Overcash said it was his understanding that regulating community would be happy with the higher number and some allowance for exemption.

Mr. Givens asked if this was reflected in any of the existing options.

Mr. Overcash said it was reflected in the existing options.

Mr. Givens said that if we go according to schedule, these rules would be subject to legislative review in the Short Session. If that is the case, it would seem advisable to come back at another meeting and spend more time with this and look at the fiscal note and have a more detailed explanation of the options under the question of what other state's standards are and to hear from representatives of interested parties.

Mr. Overcash said that the EMC will hopefully make a decision on this rule in March.

Senator Albertson said if he was a facility that had to spend million of dollars to comply, he might be resentful if he had to pay and someone else was exempt. He asked someone on staff or from DENR if there were any other areas where we require some people to pay and some are exempt because of the high cost associated with meeting the regulations.

Mr. Overcash said there is a provision in our temporary toxic rule to allow a facility to come and make an economic feasibility demonstration in compliance and there is a possibility for a facility not to comply to the letter of the law based on that showing.

Senator Forrester asked if industry was in favor of the higher numbers and not the lower numbers.

Mr. Overcash said that industry would be in favor of the higher concentration, 83 parts per billion. He referred members to the front page of Exhibit K for clarification.

Senator Horton asked Mr. Overcash how many North Carolina workers have had their health affected by this.

Mr. Overcash said he could not answer the question.

Senator Horton asked if there was anyone present at the meeting who could answer the question.

Mr. Givens said he thought this was an issue we should address at a later time.

Senator Dorsett referred to the back page of Exhibit K and asked if any attempt is made to evaluate objections made to the rule and determine the seriousness of those objections.

Mr. Overcash said that is the way the EPA process is set up and is state law.

Mr. Givens said this is a change made in the APA in 2003 in an effort to streamline the rulemaking process. Under the old process, no rule could become effective until the 31st legislative day in order to give any single member an opportunity to file a bill to object. That part of the process still exists however the rule can become effective if there are less than ten written objections from any person in the state.

Mr. Givens said that he believed there would be more than 10 objections. He asked Mr. Overcash if the numbers on the front and back of Exhibit K were the same numbers.

Mr. Overcash said that they were.

Representative Weiss said it was important to take a look at this more carefully and hoped that DHHS would respond to this as to what they believe is an acceptable level.

Representative McComas said that this issue would be revisited by the ERC at a later date.

Mr. Donnie Redmond, Jr., Assistant Chief, Planning Section, Division of Quality (DAQ), DENR, gave an update on the implementation of the inspection and maintenance program. A copy of a handout accompanying his presentation is listed as **Exhibit L**.

Mr. Redmond said there was legislation back in 1999 and 2000 that directed DAQ to change the test procedures used and to expand the program from nine counties to 48 counties.

Mr. Redmond said that the new test procedure is called on board diagnostics or OBD2, a new way to determine if a car is meeting the standards it should meet. On 1996 or newer cars, built with a special computer system and monitors, if the car itself determines that something is out of spec, it will put a code on the computer to tell what is wrong the car. If that malfunction would cause the emissions to be 1.5 times the emissions

standard, a light would come on to alert the owner that the car is emitting higher emissions than it should.

Mr. Redmond the first OBD test was performed in North Carolina in July 2002 and currently over 5,000 of these tests are being daily. The program is still in expansion and by the time it is complete, those numbers will double for performing the OBD test.

Mr. Redmond reported that there has been a very position reaction to the new OBD test. The inspectors like it because it is fast and easy. It also helps the technicians with the diagnosis of the car. The failure rate for the test is four percent compared with less than one percent with the old test.

Mr. Redmond said that our fail rate is consistent with that of other states.

Mr. Redmond said that the expansion from nine to 48 counties was in the statute. To date, there are 23 counties doing the OBD2 test and the next expansion is on July 1, 2004 for Buncombe, Cleveland, Granville, Harnett and Rockingham counties. On January 1, 2005 there will be another expansion.

Mr. Redmond said that on January 1, 2006 the expansion would be complete.

Mr. Redmond said that a lot of advance preparation had been done to lay the groundwork for this test and make citizens aware of the test and why it is being done.

Mr. Redmond said that DMV is busy licensing new stations and inspectors to perform this test and they are working closely with community colleges to train both the inspectors and repair technicians. The stations do have to buy their test equipment with six different vendors available to sell this equipment.

Mr. Redmond said that both DMV and DAQ have been doing a lot public outreach with radio ads and car care clinics to try to get the word out as to what to expect.

Mr. Redmond concluded by saying that the OBD2 introduction and inspection program is going well. The fail rates have been what has been expected and response has been good.

Senator Swindell asked Mr. Redmond if the equipment on the cars is going to change with the 2005 models and the testing equipment would then be obsolete.

Mr. Redmond said there are communication protocols for the emissions analyzers and with the newer model years, EPA is putting new communication software in them, which will require stations to do a software upgrade to their equipment, but the equipment would not be obsolete.

Senator Swindell said that he had heard the equipment was very costly and that it could not be converted over to the changes.

Mr. Redmond said that this was incorrect information and that they were working closely with industry association on their changes. The software updates are included in the price of the machine. Later, if changes are made to the statutes, software charges would have to be incurred.

Senator Weinstein asked Mr. Redmond what the cost to the consumer is for the new OBD2 test.

Mr. Redmond said the cost was about $6,000 for the OBD2 inspection machine. If extra diagnostic equipment or service contract is purchased, it could cost more, but the average cost is around $5,000.

Senator Weinstein asked Mr. Redmond what the customer is charged to do the test.

Mr. Redmond said the fee is set in the statute and is anywhere from $6.50 to $30.00, whatever they want to charge.

Senator Kinnaird asked if the shade tree mechanic is out of business.

Mr. Redmond said that there are waivers to protect people from this.

Representative McComas asked Mr. Redmond why the owner of the automobile has to take the time to go for an inspection when the onboard computer will do the job.

Mr. Redmond said that OBD3 will have a transponder that will call into the state with the problems but there is a lot of legal ramification concerning this. One of the reasons for inspection is that if the light comes on, a person may or may not get the car repaired. Inspection forces this.

Representative McComas asked if one of the hoses with the error emissions should break or one of the sensors should fail, and the car stopped running, why would you need to have an inspection.

Mr. Redmond said that with computerization some cars would still be drivable although the emissions would not be operating properly.

Senator Dorsett asked what criteria were used to determine which counties to expand the test to.

Mr. Redmond said that the counties were listed in the statute as part of the bill. A number of factors were used including anticipated population growth, degree of traffic involved and commuting patterns.

Mr. Givens said that the counties and sequence were enacted as recommended by DAQ when the bill passed in 1999 and there is a provision

in the statute that after 2006, the EMC can adopt rules to add additional counties. The same criteria will be used to determine this.

Mr. Givens also added that the equipment cost for the new OBD testing device at $6,000 is contrasted with the old testing equipment priced at $20,000 to $30,000.

Representative Gibson asked Mr. Redmond how the phone call issues are currently working out with the equipment calling into the state system.

Mr. Redmond said he is not aware of any current problems with that.

Ms. Charlotte V. Jesneck, Head, Inactive Hazardous Sites Branch, Superfund Section, Division of Waste Management, DENR, gave a status report on the Inactive Hazardous Sites Program. A copy of this report is listed as **Exhibit M**.

The Inactive Hazardous Sites program was established by the legislature to identify, control and correct property contaminated with hazardous substances. To date, 1816 sites have been catalogued, 416 sites have all work complete and are now closed. There are 95 sites currently undergoing program assessment and cleanups being conducted by owners and responsible parties, and 33 sites have been identified without responsible parties. These sites also have higher priorities such as being residential or have drinking water supplies threatened. These 33 sites require various levels of work.

Ms. Jesneck reported that at these sites, three cleanups have been completed using IHS funds. These sites include a battery disposable with lead contamination at a residential area in Concord, some lead contamination from another battery dump on agricultural land in Chadbourn in Columbus County where crops had to be banned from the market because of lead content, contamination from pesticide disposal on church property in Nashville in Nash County. Funds have also been spent to abate immediate risk posed to the City of Fayetteville's drinking water supply. Groundwater contamination at the bankrupt Tex Five facility in Fayetteville has migrated across the property lines onto the City of Fayetteville's water plant property and has come in contact with their below ground finished drinking water holding tank.

Ms. Jesneck went on to say that the contamination not only threatens the drinking water supply by coming in contact with the tank, but is also in close proximity to their drinking water intake on the Cape Fear River.

Ms. Jesneck said that some of the cleanup funds were used to construct a below ground barrier to divert the contaminated water from moving toward the tank and installed extraction wells to remove contaminated groundwater around the tank and have been successful in significantly reducing contamination around the tank.

Ms. Jesneck said that monies have also been used from the Fund to assess the extent of the source of contamination on the Tex Five property.

There is hope of obtaining funds from a bankruptcy settlement. However, except for a minor amount of money left in the cleanup fund dedicated towards a contract for monitoring the city's drinking water and groundwater in that situation, while they are waiting on monies from the bankruptcy settlement, the IHSF is now deplete of revenue.

Ms. Jesneck said they are currently aware of 35 to 50 sites where there are no responsible parties. Many of these are residential areas. There are also widespread areas such as Paw Creek in Charlotte and several areas in and around Gastonia that have numerous drinking water wells but numerous sources of contamination.

Ms. Jesneck said that in addition to the chemical spills and disposals, about 750 old unlined landfills have been catalogued and need attention. Based on data from USEPA and from other sources, the majority of these are expected to have groundwater contamination with hazardous substances.

Ms. Jesneck said, that with the limited information and funds available, research was being done to search the locations to determine their use. And, based on data from 39 counties completed so far, 72 percent either have a residence, school, daycare, church, or private drinking water well within 1000 feet of the landfill. Particular statistics are that in each of Duplin, Harnett, and Nash counties there is a drinking water well within 1000 feet of the landfills. Fifty percent of the same landfills have a residence, school, daycare or church within 1000 feet, and all three sites in Pender County have a well within 1000 feet.

Ms. Jesneck said that while evaluation and some creative use solutions to solve some of the exposure concerns is being done, it is likely that many of the sites will require some special abatement measures to come up with a final public health measure of protection. All immediate concerns are being referred to the US EPA Federal Superfund Program for review.

Ms. Jesneck said that most of these landfills will not be considered a serious enough threat to a large enough number of people to get EPA's attention for sampling.

Ms. Jesneck said that federal funds have been obtained to fund one full-time position to help locate and determine the use of these old landfills in the other 61 counties. At the level of funding currently available, the work is expected to be complete within five years. This position would also be tasked with developing safe redevelopment options, possibly as Green space.

Ms. Jesneck concluded by saying that sampling would only be done at those sites that are the most threatening. To get more done, efficiencies are being sought in the program with the use of private environmental consulting firms to do the state's oversight role at lower priority voluntary cleanups. The legislature has authorized the use of such firms in the past.

Representative Gibson said that he would defer his questions to staff.

Mr. David J. Lown, Head, Federal Remediation Branch, Superfund Section, Division of Waste Management, DENR, gave a report of Superfund cost share fund expenditures for cleanup of sites on the National Priorities List (NPL). A copy of fund expenditures for North Carolina's 10 Percent Share for July 2003 and January 2004 are listed as **Exhibit N**.

Mr. Lown said that there are 29 NPL sites in North Carolina, 13 without responsible parties that can be cleaned up using the federal Superfund. If these funds are used for cleanup, EPA pays 90 percent of the cleanup cost and the state's cost share fund pays 10 percent.

Mr. Lown said that whenever payment is made from the cost share fund to EPA, a report to the ERC is required.

Mr. Lown said that $87.5 million is being used for cleanup of 250,000 cubic yards of contaminated soil and over 300 million gallons of contaminated groundwater. The cost share fund amount pays out $8.7 million.

Mr. Lown listed some examples of cleanup sites: $7.5 million for cleanup of the North Belmont PCE site in Gaston County, $3.9 million for the Davis Park Road TCE site, also in Gaston County. The cleanup involves connecting Groundwater users to city water lines and treating and monitoring contaminated groundwater. In Gaston County, for site cleanups estimated over $10 million, the cost share fund commits a little over $1 million.

Mr. Lown said the present Fund balance is over $5 million. Most of this balance is committed to cleanups now underway. Presently there is $1.7 million available for new cleanups.

Mr. Lown said that there are also possible new cleanups, sites eligible for the new federal Superfund that are being investigated with cleanup options being considered. Barber Orchard, in Haywood County, is a residential area where the soil and groundwater are contaminated with pesticides. EPA and the Division of Waste Management are presently considering cleanup options for this site and the cost is estimated to be between $22 and $36 million. This would require $2.2 to $3.6 million from the cost share fund.

Mr. Lown listed other sites that are being considered for cleanup which are: Reason Chemical in New Hanover County, Ward Transformer Site in Wake County and RAM Leather site in Charlotte. The cost for cleanup of these sites should be around $2 million with cost share funds being responsible for $100,000 to $200,000 per site.

Mr. Lown said that according to superfund law, ten years after a groundwater remediation system is declared operational and functional, the cost share fund must take over 100 percent of the operation and maintenance (O and M) costs. Presently the operation and maintenance costs are estimated between $200,000 and $250,000 per site.

Mr. Lown concluded by saying that the first O and M site would be transferred to the state in 2008 with other being transferred in following years.

Annual O and M costs in 2008 are $200,000. Based on present commitments, the total of $9.5 million of o and m costs will be required through 2020.

Representative McComas asked Mr. Lown if the owners of the super fund sites were still responsible for the cleanup.

Mr. Lown said this was correct.

Senator Horton asked Mr. Lown to what extent are these sites remediated.

Mr. Lown said that EPA does a risk assessment and the guidelines set out by EPA are used to clean sites to 10 of the minus six risk levels.

Senator Horton asked Mr. Lown if this found as standard through the nation.

Mr. Lown said that in North Carolina, a compromise would be done with what the state requirements are and those of EPA.

Senator Horton asked if the orphan sites would get a higher degree of cleanup than the negotiated sites.

Mr. Lown said it would be the same negotiation done on every site.

Mr. Bruce Nicholson, Manager, Brownfields Program, Division of Waste Management, DENR, gave a report on the effectiveness of the Brownfields Property Reuse Act. A copy of Mr. Nicholson's remarks, a copy of the annual report and list of site locations for the Brownfields Program are listed as **Exhibit O**.

Senator Horton asked Mr. Nicholson if only 15 sites were licensed in 2003.

Mr. Nicholson said this was correct.

Senator Horton asked Mr. Nicholson how many people were employed in the Brownfields Program.

Mr. Nicholson said that there is three technical staff positions held in the Brownfields Program, including him.

Senator Horton asked Mr. Nicholson what the reason for the delay is in issuing Brownfields permits.

Mr. Nicholson said he was not aware it was taking so long for these agreements to be issued. A process of start to finish takes approximately six months to one year.

Representative McComas asked Mr. Nicholson if the negotiated fees covered the cost of staff running the program.

Mr. Nicholson said the program has not had to rely on increasing fees or fees greater than $2,000 in the state statute largely because they have been able to work with EPA and grant monies used for funding.

Representative McComas asked Mr. Nicholson if North Carolina is one of the few states that have taken the course of not releasing liability to owners of Brownfields properties and therefore slows down the process.

Mr. Nicholson said that our process in North Carolina is unique in that we treat prospective developers who did not cause the contamination differently than a polluter. In the Brownfield agreement, the only entity eligible under our state statutes are entities that did not cause or contribute to the contamination. These entities can receive a liability protection.

Mr. Givens said that nobody is providing a complete release from liability of responsible parties in Brownfields agreements. There are some options for release of liability.

Mr. Dexter R. Matthews, Director, Division of Waste Management, DENR, gave a report on the options as to the future direction of Brownfields and other remediation programs.

Mr. Matthews said that with responsible parties, both inactive hazardous sites and cost share programs have been successful in getting cleanups. Where there has not been a responsible party, state resources have been used to address those sites.

Mr. Matthews said that the HIS fund is deplete of funds and the NPL fund will be deplete by the end of 2004.

Mr. Matthews said that we are seeing a very successful program with the Brownfields.

Mr. Matthews said that in September 2002, a letter was sent out to all local health departments across the state, that site new private wells, to alert them to the issue of contaminated sites across the State.

Mr. Matthews said that the Division has established goals for active remediation that would involve programs in hazardous waste, solid waste, the underground storage tank program, the dry cleaning solvent cleanup program and also the inactive sites in the NPL.

Mr. Matthews said that one-year and five-year goals for the cleanup of 11,535 sites currently on inventory. In the one-year goal, they are looking for 408 sites to be cleaned up and the five-year goal, 2,027 sites. Those goals are part of a strategic plan for the Department as well.

Mr. Matthews said that the Brownfields program has also been reorganized. This program was previously in the Superfund section and dealt only with inactive sites. The Brownfields program was brought to the Division of Waste Management level and look at other remediation programs to expand what the Brownfield successes had been.

Mr. Matthews said that they had been successful in gaining federal funding for the underground storage tank cleanup program in conjunction with the Brownfields program.

Mr. Matthews said the two primary challenges in moving these programs forward is brining clarity and consistency in state law for liability of innocent property owners and potential purchasers and to provide a funding source for emergency actions and cleanup of those sites where no viable and responsible party exists.

Mr. Matthews said that Senate Bill 908 provides an avenue to begin meeting these challenges.

Mr. Matthews said that the DWM is currently working with Senator Hartsell on language in the bill to further cleanups and redevelopment of cleanup of these sites.

Mr. Matthews said SB908 provides mitigation payments that must be paid by a person that is responsible for groundwater contamination until the site is remediated. The Department may use the fees for such purposes as the extension of water lines to those sites with contaminated water supplies, emergency removal actions and cleanup of sites where the responsible party does not exist or is not financially capable of cleanup. The bill further seeks to bring clarity to the issue of liability for someone purchasing property that is contaminated.

Mr. Matthews said that SB908 would also allow UST sites to come under the Brownfields program.

Mr. Matthews added that there is currently a question as to whether the mitigation payments in the current bill are a fee and are therefore eligible in the short session.

Mr. Matthews said that DWM might have to come back to the ERC for draft legislation.

Mr. John N. Morris, Director, Division of Water Resources, DENR gave a report on water conservation measures being implemented in the State and incentive programs and other voluntary programs that can help foster water conservation and reuse. A copy of his report is listed as **Exhibit P**.

Mr. Morris said there are two kinds of water conservation. The first kind of water conservation is those things that are needed on a short-term emergency basis. The other kind of water conservation is water use efficiency.

Mr. Morris said that Section 5 of House Bill 1215 asked DWR to report on voluntary and incentive measures that could bring about greater water use efficiency. A list of representatives of all types of water users was developed and a workshop was conducted. This was followed up with e-mail messages to gather further information.

Mr. Morris said another source of information was the water supply plans developed by 600 local governments.

Mr. Morris said that in Exhibit P list most of the cost effective water efficiency measures that have been adopted.

Mr. Morris said that water use efficiency is a very practical issue for North Carolina. If we start to use water more efficiently, we can extend our existing water supply and make water available for healthy economic growth.

Mr. Morris added that by being more efficient with water use, we lower our impact on the environment.

Mr. Morris said that in his report, he had tried to recommend what would be the most practical approaches at achieving water use efficiency. What they are recommending the representatives of industry, agriculture and municipalities to review their recommendations and to work together toward a consensus of what the most practical and realistic approaches are to take in North Carolina.

Mr. Morris said the input would be compiled into another report to bring before the ERC.

Mr. Morris said that another aspect of HB 1215 is Section 3. Section 3 deals with the short-term emergency response water conservation. This part of the bill directs the EMC to adopt an administrative rule that would set minimum standards of water conservation during a drought. This applies to all kinds of water users.

Mr. Morris said that the legislative motivation was during the 2002 drought with the lack of the way communities approached the drought. They are currently working with an advisory committee to get their input and come up with the most effective way to handle emergency water conservation.

Mr. Morris then gave a report on water supply planning. A copy of the status of water supply planning for October 1, 2002 through August 31, 2003 and a report on What North Carolina Needs to Do to Provide Water Supplies for Future Needs is listed as **Exhibit Q**.

Mr. Morris said that water supply planning needs to be put in context. What we need in North Carolina is the right combination of three things. First, we need the right kind of monitoring of our water resources. We need good data on the ability of water and good data on how much water we are using

and withdrawing from streams and rivers or groundwater and how that use of water is impacting the resource.

Mr. Morris said that secondly, we need good planning. Planning builds on the good data and projects our need of water into the future and seeks the best solution to provide those future water needs.

Mr. Morris said that the third aspect is regulation. Regulation is needed to assure that everyone has fair access to water resources and to allocate water among users if there is a shortage.

Mr. Morris said that with regard to monitoring groundwater, there has to be an understanding of the nature of the underground formations. Underground there are layers of various types of geological material that has been deposited over time. Each of these layers has its own distinctive ability to store and transmit water. Data is taken from over 500 monitoring wells over the state to tell the status of our groundwater.

Mr. Morris said that of the three components for water supply planning, planning is the one that is on the most critical path right now. We have an excellent plan authorized by the actions of the General Assembly. For example, HB 1215 was passed and the Drought Management Council was formed. This council pulls together all of the interest groups in water supply planning to monitor the drought and get good information out as to what to expect and what actions need to be taken to protect water supplies.

Mr. Morris said that under our legislation in North Carolina, local governments are required to do local water supply plans. There are about 600 local governments who do this. The plans are updated every five years.

Mr. Morris said that the way the process works, guidelines are provided to local governments, workshops are held and assistance is provided in preparing the plans.

Mr. Morris added that they are reviewed and approved by the Division of Water Resources and local governments adopt plans. This information is posted on a website.

Mr. Morris said that the planning process and the data that results from it are unmatched in any other state.

Mr. Morris said that plans have been completed for the Cape Fear River Basin and are posted on a website which is listed in the handout. The Yadkin and Catawba basins will be the next plans completed.

Mr. Morris concluded by saying that we need to take water supply planning to the next level to assure that we are doing what we need to do to have sustainable water supplies for the future. If we do it right, we can make sure that water supply is not a restraint to having a healthy economy in the future.

Senator Albertson commended Mr. Morris on the efforts of the Department in their planning for any future problems that we may encounter.

Mr. Givens thanked members for their attendance.

Representative Gibson asked members to read their reports and to come forward with any questions they may have. He urged members to continue their good attendance at the meetings.

Mr. Givens said that he would be polling members as to their interest in a field trip to the Belews Creek steam facility on Friday 26 March 2004, their interest in a field trip for the 22 and 23 April 2004 to either Brevard and Dupont Forest or to the Chatham County region, and whether they would be available to meet on Tuesday 20 April 2004 for a business meeting.

Representative McComas suggested to Mr. Givens if we should schedule an official meeting to take up some more items on the agenda, especially regarding air quality.

Mr. Givens said that if we do have a field trip on 22 and 23 April, there would be a business meeting for at least two hours to cover land conservation and a half-day business meeting on Tuesday 20 April 2004.

The meeting was adjourned at 3:20 p.m.

Representative Daniel McComas
Presiding Co-Chair

Mary R. Watson
Commission Clerk

RE: **Notice of Meeting; Additional Information**

COMMISSION MEETING:

After evaluating the number of agenda items that are appropriate for presentation in February, the Environmental Review Commission meeting will be held on one day rather than two. **Accordingly, the Environmental Review Commission meeting will be held at 9:30 a.m. Tuesday 24 February 2004 in Room 643 of the Legislative Office Building in Raleigh**. Please be prepared to meet until late afternoon. The Commission will not meet on Wednesday 25 February 2004.

At this meeting, the Commission will hear reports from State agencies, consider studies for which the Commission is responsible, discuss topics to be considered at future meetings, and attend to other matters. Listed below are anticipated agenda topics for this meeting.

1) Report on the activities of the Environmental Management Commission (G.S. 143B-282(b)

2) Continuation of the discussion of development and implementation of rules and programs to control stormwater runoff

3) Discussion of current State and federal air quality issues

4) Report on the progress in implementing the motor vehicle inspection and maintenance (I/M) program

5) Annual report on the Inactive Hazardous Sites Program (G.S. 130A-310.10)

6) Report of Superfund cost share fund expenditures for cleanup of sites on the National Priorities List (S.L. 1999-237(15.6)(b))

7) Annual report on the Effectiveness of the Brownfields Property Reuse Act (G.S. 130A-310.40))

8) Discussion of the future direction of the brownfields and other remediation programs

9) Interim report on water conservation measures being implemented in the State and incentive programs and other voluntary programs that can help foster water conservation and reuse (S.L. 2002-167, Sec. 5)

10) Annual report on the progress of water supply planning (G.S. 143-355(n))

11) Any other matters that were listed in the meeting notice of 6 February 2004 or that were discussed during the staff planning meeting held on 10 February 2004

SCHEDULE OF FUTURE MEETINGS:

Below is a schedule of meetings of the Commission for March through May 2004. Please note the following:

1. This schedule provides for two-day meetings in March and April. In some months it may be desirable to have a two-day meeting to accommodate the workload. This also allows for the possibility of one or more out of town meetings that could include field trips. Thus this schedule is tentative and subject to adjustment. For planning purposes, however, please reserve these dates.

2. Meetings normally begin at 9:30 a.m., include a lunch break, and run until mid-afternoon. Please plan on meeting from 9:30 a.m. until 3:30 p.m.

3. To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel holds informal planning meetings for staff and interested parties. Commission members are not expected to attend these meetings.

4. The 2004 Regular Session is scheduled to begin at 12:00 noon on Monday 10 May. The Commission normally meets shortly after the beginning of the session to complete work on legislative proposals prior to the commission/committee bill request deadline, which in 2004 is 4:00 p.m. Wednesday 12 May. The Tuesday 11 May meeting date is tentatively scheduled for this purpose.

Commission Meeting	Staff Planning Meeting
9:30 a.m. Thursday and Friday 25 and 26 March	10:00 a.m. Friday 12 March
9:30 a.m. Thursday and Friday 22 and 23 April	10:00 a.m. Tuesday 13 April
9:30 a.m. Wednesday 5 May	
2:30 p.m. Tuesday 11 May	

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Chronic Rainfall Working Group
2:00 p.m. Monday 9 February 2004 – 605 Legislative Office Building

Leaking Petroleum Underground Storage Tank Working Group
10:00 a.m. Friday 27 February 2004 – 605 Legislative Office Building

Stormwater Management Working Group
10:00 a.m. Friday 5 March 2004 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, please feel free to contact the Commission Counsel at (919) 733-2578.

AGENDA
9:30 a.m. Tuesday 24 February 2004
Room 643 – Legislative Office Building

1. Call to order
   Representative Daniel F. McComas, Presiding

2. Introductory remarks by Cochairs
   Representative Daniel F. McComas
   Representative Pryor A. Gibson
   Senator Daniel G. Clodfelter
   Senator Charles W. Albertson

3. Report to the Commission and explanation of agenda items
   George F. Givens, Commission Counsel

4. Quarterly reports by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress during 2003 (G.S. 143B-282(b)); Annual report on progress in developing and implementing basinwide water quality management plans (G.S. 143-215.8B(d))
   Dr. David H. Moreau, Chairman
   Environmental Management Commission

5. Update on issues related to the Phase II stormwater rules
   Robin W. Smith, Assistant Secretary for Policy and Planning
   DENR

Discussion of current State and federal air quality issues

6a. **Section 126 petitions** -- Status of petitions to the Administrator of the United States Environmental Protection Agency (EPA) that may be filed by North Carolina under Section 126 of the federal Clean Air Act for purposes of reducing interstate transport of ozone and its precursors
   James C. Gulick, Senior Deputy Attorney General
   Environmental Division, North Carolina Department of Justice

6b. **New Source Review** -- Proposed modification of rules governing Prevention of Significant Deterioration (PSD) and Non-Attainment New Source Review (NSR)

Equipment Replacement provision of the Routine Maintenance, Repair, and Replacement Exclusion as a result of the modification of federal air quality regulations by EPA that became effective 26 December 2003 (**the "Labor Day rule"**)

James C. Gulick, Senior Deputy Attorney General
Environmental Division, North Carolina Department of Justice

Baseline emissions determination, actual-to-future-actual methodology, plantwide applicability limitations, clean units, and pollution control projects as a result of the modification of federal air quality regulations by EPA that became effective 3 March 2003 (**the "December rule"**)

B. Keith Overcash, Director
Division of Air Quality, DENR

6c. **Interstate Air Quality Rule** -- Regulations proposed by EPA to reduce interstate transport of fine particulate matter and ozone

Marc D. Bernstein, Assistant Attorney General
Environmental Division, North Carolina Department of Justice

6d. **Utility Mercury Reductions Rule** -- Regulations proposed by EPA to modify national emission standards for hazardous air pollutants (NESHAP) for mercury

Marc D. Bernstein, Assistant Attorney General
Environmental Division, North Carolina Department of Justice

6e. **Fine particulate nonattainment** -- Process and status of designation of nonattainment areas to comply with the revised national ambient air quality standard (NAAQS) for fine particulate matter ($PM_{2.5}$)

Brock M. Nicholson, Deputy Director
Division of Air Quality, DENR

6f. **Ozone nonattainment** -- Process and status of designation of nonattainment areas to comply with the revised national ambient air quality standard (NAAQS) for ozone (the 8-hour standard)

Brock M. Nicholson, Deputy Director
Division of Air Quality, DENR

A. Preston Howard, Jr., P.E., President
Manufacturers and Chemical Industry Council of North Carolina

J. David Farren, Senior Attorney
Southern Environmental Law Center

6g. **Hydrogen sulfide** -- Proposed modification of the rule setting out the acceptable ambient level (AAL) for hydrogen sulfide under rules adopted by the Environmental Management Commission that govern the emission of toxic air pollutants

B. Keith Overcash, Director
Division of Air Quality, DENR

6h. **Motor vehicle emissions** -- Report on progress in implementing the motor vehicle inspection and maintenance program

Brian C. Phillips, Acting Supervisor
Mobile Source Compliance Branch, Technical Services Section, Division of Air Quality, DENR

LUNCH BREAK – Estimated for 12:30 p.m. to 1:15 p.m.

7. Annual report on the Inactive Hazardous Sites Program (G.S. 130A-310.10)

Charlotte V. Jesneck, Head
Inactive Hazardous Sites Branch, Superfund Section, Division of Waste Management, DENR

8. Report of Superfund cost share fund expenditures for cleanup of sites on the National Priorities List (S.L. 1999-237(15.6)(b))

David J. Lown, Head
Federal Remediation Branch, Superfund Section, Division of Waste Management, DENR

9. Annual report on the effectiveness of the Brownfields Property Reuse Act (G.S. 130A-310.40))

Bruce I. Nicholson, Manager
Brownfields Program, Division of Waste Management, DENR

10. Discussion of options as to the future direction of brownfields and other remediation programs

Dexter R. Matthews, Director
Division of Waste Management, DENR

11. Interim report on water conservation measures being implemented in the State and incentive programs and other voluntary programs that can help foster water conservation and reuse (S.L. 2002-167, Sec. 5)

John N. Morris, Director
Division of Water Resources, DENR

12. Annual report on the progress of water supply planning (G.S. 143-355(n))

John N. Morris, Director
Division of Water Resources, DENR

13. Commission discussion and announcements

14. Adjourn

SCHEDULE OF FUTURE MEETINGS:

Below is a schedule of meetings of the Commission for March through May 2004. This schedule provides for two-day meetings in March, and April. Two days have been reserved in these months because it may be necessary or desirable to have a two-day meeting to accommodate the workload.

This also allows for the possibility of one or more out of town meetings that could include field trips on one of the two days. Thus this schedule is tentative and subject to adjustment.

To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel holds informal planning meetings for staff and interested parties. The schedule of these public Commission Staff Planning Meetings is also set out below.

Thursday 25 March 2004
Location: 643 Legislative Office Building
Staff Planning Meeting: 10:00 a.m. Friday 12 March 2004 – 605 Legislative Office Building

Friday 26 March 2004
Location: Possible field trip to Belews Creek Steam Station (Stokes County)
Staff Planning Meeting: 10:00 a.m. Friday 12 March 2004 – 605 Legislative Office Building

Thursday 22 April and Friday 23 April 2004
Location: To be determined
Staff Planning Meeting: 10:00 a.m. Tuesday 13 April 2004 – 605 Legislative Office Building (This meeting will also serve as the public Commission Staff Planning Meeting for the Commission meetings scheduled for 5 May 2004 and 11 May 2004.)

Wednesday 5 May 2004
Location: 643 Legislative Office Building

Tuesday 11 May 2004
Location: 643 Legislative Office Building

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below.

Leaking Petroleum Underground Storage Tank Working Group
10:00 a.m. 27 February 2004 – 605 Legislative Office Building

Stormwater Management Working Group
10:00 a.m. Friday 5 March 2004 – 605 Legislative Office Building

MEMORANDUM

To: Members of the Environmental Review Commission
From: Tim Dodge, Research Assistant for Environmental Issues
Re: Reports distribution – 24 February 2004

Attached to this memorandum are copies of the following reports submitted to the Environmental Review Commission that are not scheduled to be presented orally at the 24 February 2004 Commission meeting.

Air Quality:

1) *Annual Report on implementation of S.L. 2002-4 (Clean Smokestacks Act).* DENR and the North Carolina Utilities Commission. 30 May 2003. Statutory Authority: S.L. 2002-4, Sec. 14.

2) *Annual Report on issues related to the development and implementation of standards and plans to implement programs to control emissions of mercury and carbon dioxide from coal-fired generating units and other stationary sources of air pollution.* Division of Air Quality, DENR. 1 September 2003. Statutory Authority: S.L. 2002-4, Sec. 12-13.

General:

3) *Annual report on the resolution of submerged lands claims.* DENR. 2 October 2003. Statutory Authority: G.S. 113-206(f).

Water Quality:

4) *Annual report on fish kills within the preceding year.* DENR. 13 January 2004. Statutory Authority: G.S. 143B-279.7(c).

5) *Annual report on the effectiveness of projects funded under the Agricultural Cost Share Program for Nonpoint Source Pollution Control.* Division of Soil and Water Conservation, DENR. 25 November 2003. Statutory Authority: G.S. 143-215.74(e).

Please contact George Givens, Jeff Hudson, Jennifer McGinnis, Susan Iddings, or Tim Dodge at (919) 733-2578 if you have any questions or comments.

Subject: Report on "Implementation of the Clean Smokestacks Act"

Dear Mr. Givens,

Enclosed is the report entitled "Implementation of the Clean Smokestacks Act." This report is to both the Environmental Review Commission and the Joint Legislative Utility Review Committee. It has been prepared and is submitted jointly by the department and the N.C. Utilities Commission. We are submitting it pursuant to the requirement of Section 14 of Session Law 2002-04, Senate Bill 1078, enacted on June 20, 2002.

I have included 30 copies for all Environmental Review Commission members in addition to the two original, signed copies for the commission chairs. Robert Bennink, General Counsel to the N.C. Utilities Commission, will provide copies to the Joint Legislative Utility Review Committee.

Please feel free to contact me with any questions at (919) 733-4984.

Sincerely,

Bill Ross

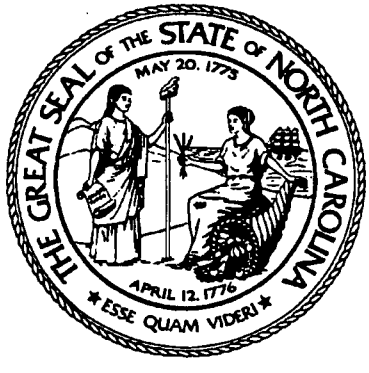
Implementation of the "Clean Smokestacks Act"

A Report to The Environmental Review Commission and The Joint Legislative Utility Review Committee

Submitted by The North Carolina Department of Environment and Natural Resources and The North Carolina Utilities Commission



May 30, 2003

Implementation of the "Clean Smokestacks Act"

A Report to the Environmental Review Commission and the Joint Legislative Utility Review Committee

Submitted by the North Carolina Department of Environment and Natural Resources and the North Carolina Utilities Commission

This report is submitted pursuant to the requirement of Section 14 of Session Law 2002-4, Senate Bill 1078 enacted June 20, 2002. The actions taken to date by Progress Energy Carolinas, Inc. and Duke Power, a Division of Duke Energy Corporation, appear to be in accordance with the provisions and requirements of the Clean Smokestacks Act.

Signed: William G. Ross, Jr.

William G. Ross, Jr., Secretary

Jo Anne Sanford, Chair
North Carolina Utilities Commission

May 30, 2003

Implementation of the "Clean Smokestacks Act"

A Report to the
Environmental Review Commission and the Joint Legislative Utility Review Committee

May 30, 2003

The General Assembly of North Carolina, Session 2001, passed Session Law 2002-4 also known as Senate Bill 1078. This legislation is titled "*An Act to Improve Air Quality in the State by Imposing Limits on the Emission of Certain Pollutants from Certain Facilities that Burn Coal to Generate Electricity and to Provide for Recovery by Electric Utilities of the Costs of Achieving Compliance with Those Limits*" ("the Clean Smokestacks Act" or "the Act"). The Clean Smokestacks Act, in Section 14, requires the Department of Environment and Natural Resources (DENR) and the Utilities Commission ("Commission") to report annually, i.e., by June 1 of each year, on the implementation of the Act to the Environmental Review Commission and the Joint Legislative Utility Review Committee.

This report is presented to meet this requirement of the Act and is submitted jointly by DENR and the Commission. The report is structured to address the various actions that have occurred pursuant to the provisions of Sections 9, 10, 12 and 13 of this Act. Reports of actions under these Sections describe the extent of implementation of the Act to this date.

I. Section 9(c) of the Act, Codified as Section 62-133.6(c) of the North Carolina General Statutes

G.S. 62-133.6(c) provides: *The investor-owned public utilities shall file their compliance plans, including initial cost estimates, with the Commission and the Department of Environment and Natural Resources not later than 10 days after the date on which this section becomes effective. The Commission shall consult with the Secretary of Environment and Natural Resources and shall consider the advice of the Secretary as to whether an investor-owned public utility's proposed compliance plan is adequate to achieve the emissions limitations set out in G.S. 143-215.107D.*

Status: North Carolina's investor-owned electric utilities, Progress Energy Carolinas, Inc. (Progress Energy) and Duke Power, a division of Duke Energy Corporation (Duke Energy), filed their initial compliance plans as required in June and July of 2002, in accordance with G.S. 62-133.6(c), Section 9(c) of S.L. 2002-4, the Clean Smokestacks Act. DENR reviewed this information and determined that the submittals comply with the Act and, as proposed, appear adequate to achieve the emission limitations set out in G.S. 143-215.107D.

II. Section 9(i) of the Act, Codified as Section 62-133.6(i) of the North Carolina General Statutes

G.S. 62-133.6(i) provides: *An investor-owned public utility that is subject to the emissions limitations set out in G.S. 143-215.107D shall submit to the Commission and to the Department of Environment and Natural Resources on or before 1 April of each year a verified statement that contains all of the following [specified information]:*

The following are the eleven subsections of G.S. 62-133.6(i) and the related responses from Progress Energy and Duke Energy for each subsection:

1. **G.S. 62-133.6(i)(1) requires:** *A detailed report on the investor-owned public utility's plans for meeting the emissions limitations set out in G.S. 143-215.107D.*

Progress Energy Response: "The plan for Progress Energy Carolinas, Inc. was originally submitted on July 29, 2002. Appendix A (of the attached Progress submittal dated April 1, 2003) contains an updated version of this plan, effective April 1, 2003."

Duke Energy Response: "Exhibits A and B (of the attached Duke submittal dated March 31, 2003) outline the technology selections by facility and unit, projected operational dates, expected emission rates, and the corresponding tons of emissions that demonstrate compliance with G.S. 143-215.107D."

2. **G.S. 62-133.6(i)(2) requires:** *The actual environmental compliance costs incurred by the investor-owned public utility in the previous calendar year, including a description of the construction undertaken and completed during that year.*

Summary of Progress Energy Report: The actual environmental compliance costs incurred by Progress Energy in calendar year 2002 were $830,000. The Company reported that no construction was undertaken in 2002. Progress Energy further advised that the costs incurred were related primarily to preliminary engineering and planning activities.

Summary of Duke Energy Report: The actual environmental compliance costs incurred by Duke Energy in calendar years 2001 and 2002 were $800,000 and $3.6 million, respectively. The Company reported that such costs were incurred for such things as a variety of project studies and investigations, engineering, equipment specifications development, equipment layout, contracting related costs, and logistics.

3. **G.S. 62-133.6(i)(3) requires:** *The amount of the investor-owned public utility's environmental compliance cost amortized in the previous calendar year.*

Summary of Progress Energy and Duke Energy Reports: Neither Progress Energy nor Duke Energy amortized any environmental compliance costs in calendar year 2002.

4. **G.S. 62-133.6(i)(4) requires:** *An estimate of the investor-owned public utility's environmental compliance costs and the basis for any revisions of those estimates when compared to the estimates submitted during the previous year.*

Summary of Progress Energy Report: Progress Energy reported that, while some unit total and annual costs have changed, the total project cost in future dollars remains at $813 million. The Company observed that changes at the unit level were due to additional project scope definition and refinement of project schedules.

Summary of Duke Energy Report: Duke Energy reported that its expected costs are not significantly different than the estimates provided in 2002 in its initial filing, and the technologies expected to be required to support compliance have not changed. The Company further stated that the minor adjustments to the estimates at the project level are the result of additional project scope definition and refinement of project schedules only. Duke Energy continues to estimate its total program costs, in future dollars, to be in the range of $1.5 billion.

5. **G.S. 62-133.6(i)(5) requires:** *A description of all permits required in order to comply with the provisions of G.S. 143-215.107D for which the investor-owned public utility has applied and the status of those permits or permit applications.*

Progress Energy Response: "As of April 1, 2003, Progress Energy Carolinas, Inc. had not yet applied for any permits associated with compliance with G.S. 143-215.107D. A description of the anticipated permit applications is presented in the response to item 7 below." (See Section 7)

Duke Energy Response:
"Allen Steam Station SNCR, Unit 1

- Air Permit Application completed and final permit received for temporary trial
- NPDES Permit Modification completed and permit modification received for temporary trial
- Air Permit Application completed and final permit received for permanent equipment installation

Marshall Steam Station SNCR, Unit 4

- Air Permit Application completed and final permit received for temporary trial
- NPDES Permit Modification completed and permit modification received for temporary trial"

6. **G.S. 62-133.6(i)(6) requires:** *A description of the construction related to compliance with the provisions of G.S. 143-215.107D that is anticipated during the following year.*

Progress Energy Response: See Appendix C of the attached letter from Progress Energy dated April 1, 2003, for details of construction and installation of equipment.

Duke Energy Response: See attached letter from Duke Energy dated March 31, 2003, for details of construction anticipated for the next year for:

- Allen Steam Station Scrubbers
- Belews Creek Steam Station Scrubbers
- Cliffside Steam Station Scrubbers
- Marshall Steam Station Scrubbers
- Allen Steam Station SNCR, Unit 1

7. **G.S. 62-133.6(i)(7) requires:** *A description of the applications for permits required in order to comply with the provisions of G.S. 143-215.107D that are anticipated during the following year.*

Progress Energy Response: "Permit applications for the construction and operation of scrubbers for SO2 control for Asheville Plants Units 1 and 2 and for Roxboro Plant Units 2 and 3 are planned for submittal in the spring of 2003. These permit applications will be for:

- Air construction and operation permit
- Erosion and sediment control permit
- Treatment and processing permit for storage of scrubber by-product
- Wastewater permit to construct for treatment of scrubber blowdown
- A potential permit application for constructed wetlands (not yet determined)"

Duke Energy Response:

"Marshall Steam Station Scrubbers, Units 3 & 4

- Landfill Site Suitability Application - Plan to submit 6/6/03
- Sedimentation and Erosion Control - Plan to submit 6/9/03
- Air permit application - Plan to submit 8/22/03
- NPDES Permit Modification - Plan to submit 3/31/04
- Landfill Construction Permit Application - Plan to submit 11/17/04

Allen Steam Station SNCR, Units 2, 3, 4, and 5

- Air Permit application - Plan to submit 10/22/04
- Sedimentation and Erosion control (if needed) - Plan to submit 11/5/04
- NPDES Permit Modification (if needed) - Plan to submit 11/5/04"

8. **G.S. 62-133.6(i)(8) requires:** *The results of equipment testing related to compliance with G.S. 143-215.107D.*

Progress Energy Response: "No equipment testing related to compliance with G.S. 143-215.107D occurred in 2002."

Duke Energy Response:

"Allen Steam Station SNCR, Unit 1

- Technology demonstration in December, 2001 (one week test)
  - Nominal 30% reduction in NOx with ammonia slip of 5 to 10 ppm at full load
  - Average NOx outlet rate of 0.15 #/MMBTU for the test period

Marshall Steam Station SNCR, Unit 4

- Technology demonstration in October - November, 2002 (one month test)
  - Average 24% - 25% reduction in NOx with ammonia slip of 5 to 10 ppm at full load
  - Average NOx outlet rate of 0.163 #/MMBTU for the test period "

9. **G.S. 62-133.6(i)(9) requires:** *The number of tons of oxides of nitrogen (NOx) and sulfur dioxide (SO2) emitted during the previous calendar year from the coal-fired generating units that are subject to the emissions limitations set out in G.S. 143-215.107D.*

Progress Energy Response: The total calendar year 2002 emissions from the affected coal-fired Progress Energy Carolinas units were:

- NOx - 58,793 tons
- SO2 - 195,734 tons

Duke Energy Response: In the 2002 calendar year, the following were emitted from the North Carolina based Duke Energy coal-fired units:

- NOx - 81,896 tons
- SO2 - 263,909 tons

10. **G.S. 62-133.6(i)(10) requires:** *The emissions allowances described in G.S. 143-215.107D(i) that are acquired by the investor-owned public utility that result from compliance with the emissions limitations set out in G.S. 143-215.107D.*

Progress Energy Response: "No emissions allowances resulting from compliance with G.S. 143-215.107D were acquired in 2002."

Duke Energy Response: "No emissions allowances have been acquired by Duke Power Company resulting from compliance with the limitations set out in G.S. 143-215.107D."

11. **G.S. 62-133.6(i)(11) requires:** *Any other information requested by the Commission or the Department of Environment and Natural Resources.*

Summary of Commission Request: The Commission submitted data requests to Progress Energy and Duke Energy on April 29 and May 16, 2003. The information requested concerned projected amortization schedules over the entire seven-year

accelerated cost recovery period, whether certain costs deferred in calendar years 2001 and 2002 represented portions of compliance costs that would be amortized over the accelerated cost recovery period, and matters related to how the Companies proposed to account for the present costs.

Progress Energy Response: Progress Energy responded that it currently expects to amortize the compliance costs as follows: 2003 - $100 million; 2004 - $106.5 million; 2005 – $113.5 million; 2006 - $121 million; 2007 – $129 million; 2008 - $121.5 million; and 2009 - $121.5 million.

Duke Energy Response: Duke Energy responded that it currently expects to amortize the compliance costs as follows: 2003 - $70 million; 2004 - $158 million; 2005 – $281 million; 2006 - $281 million; 2007 – $281 million; 2008 - $214 million; and 2009 - $214 million.

Attached, and made part of this report, are the statements from Duke Energy and Progress Energy dated March 31, 2003, and April 1, 2003, respectively, which were submitted by the Companies to meet the requirements of G.S. 62-133.6(i).

In addition, the Secretary of DENR wrote the Commission on May 13, 2003, as follows:

"North Carolina's investor owned electric utilities, Duke Energy and Progress Energy, have filed their compliance plan annual updates for 2003 in accordance with N.C.G.S. 62-133.6(i), Section 9(i) of S.L. 2002-4, known as the 'Clean Smokestacks Act'. Pursuant to N.C.G.S. 62-133.6(j), the Department of Environment and Natural Resources has reviewed this information, and the submittals comply with the Act and the initial plans, as proposed, appear adequate to achieve the emission limitations set out in N.C.G.S. 143-215.107D."

III. Section 10 of the Act provides: *It is the intent of the General Assembly that the State use all available resources and means, including negotiation, participation in interstate compacts and multistate and interagency agreements, petitions pursuant to 42 U.S.C. § 7426, and litigation to induce other states and entities, including the Tennessee Valley Authority, to achieve reductions in emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO2) comparable to those required by G.S. 143-215.107D, as enacted by Section 1 of this act, on a comparable schedule. The State shall give particular attention to those states and other entities whose emissions negatively impact air quality in North Carolina or whose failure to achieve comparable reductions would place the economy of North Carolina at a competitive disadvantage.*

DENR and Division of Air Quality (DAQ) Activities to implement this Section:

- The Governor, the Attorney General, the Secretary of DENR, and the Director of DAQ have all sent letters to their counterparts in other States in the region urging similar emissions controls in those States and requesting information in order to evaluate the impacts of upwind sources on North Carolina's air quality.

- DAQ is continuing to identify sources of air pollution problems, including out-of-state contributions. DAQ and the Attorney General's Office are evaluating strategies to achieve compliance with upcoming federal mandates regarding particulate matter and ozone (including visibility), which will improve air quality and alleviate the adverse health and welfare impacts facing North Carolina. The western part of the State will especially benefit from these emission reductions.

- A meeting was held between DENR/DAQ and the Tennessee Valley Authority (TVA) and the Tennessee air program officials in August 2002, to discuss actions planned by TVA that would be comparable to the Clean Smokestacks Act. TVA presented their plans to add five additional SO2 scrubbers to power plants primarily in the eastern portion of the TVA system. These new scrubbers should benefit North Carolina most. TVA plans to complete installation of the new facilities by 2010 and the first plant, Paradise, will be installed by 2006. Regarding NOx control, TVA is on schedule to have the first 8 of its selective catalytic reduction (SCR) systems in place. TVA plans to have 25 boiler units controlled by 2005 at a cost of $1.3 billion which will reduce ozone season NOx by 75 percent.

- Through DENR's efforts, the Clean Smokestacks Act is achieving notoriety nationally and is being touted in other States as a model for State action. The Secretary of DENR and the Chief of Planning of DAQ made presentations about the Clean Smokestacks Act at two national state environmental organization meetings in the fall of 2002. The Chief of Planning of DAQ testified in 2002, at a U.S. Senate Environment and Public Works Committee Hearing on the features and benefits of North Carolina's Clean Smokestacks Act. The Deputy Director of DAQ participates on a national dialogue workgroup addressing ideal features of national multi-pollutant legislation for coal-fired utility boilers. The Clean Smokestacks Act is held up as an ideal example.

- The State also has been active in maintaining federal standards. In an April 2003 letter to EPA Administrator Whitman, Governor Easley urged the Administration to ensure that the federal Clear Skies bill not override State initiatives such as the Clean Smokestacks Act. The Governor also indicated the State's opposition to bill text that would extinguish the statutory rights of States regarding interstate pollution abatement. DAQ and the Attorney General commented last month in opposition to a proposed federal rule that would

weaken the federal New Source Review program and potentially result in significant new upwind emissions.

IV. Section 12 of the Act provides: *The General Assembly anticipates that measures implemented to achieve the reductions in emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO2) required by G.S. 143-215.107D, as enacted by Section 1 of this act, will also result in significant reductions in the emissions of mercury from coal-fired generating units. The Division of Air Quality of the Department of Environment and Natural Resources shall study issues related to monitoring emissions of mercury and the development and implementation of standards and plans to implement programs to control emissions of mercury from coal-fired generating units. The Division shall evaluate available control technologies and shall estimate the benefits and costs of alternative strategies to reduce emissions of mercury. The Division shall annually report its interim findings and recommendations to the Environmental Management Commission and the Environmental Review Commission beginning 1 September 2003. The Division shall report its final findings and recommendations to the Environmental Management Commission and the Environmental Review Commission no later than 1 September 2005. The costs of implementing any air quality standards and plans to reduce the emission of mercury from coal-fired generating units below the standards in effect on the date this act becomes effective, except to the extent that the emission of mercury is reduced as a result of the reductions in the emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO2) required to achieve the emissions limitations set out in G.S. 143-215.107D, as enacted by Section 1 of this act, shall not be recoverable pursuant to G.S. 62-133.6, as enacted by Section 9 of this act.*

DAQ Actions to Implement this Section: The DAQ is presently developing a draft report for presentation by September 1, 2003, as required by this section. The first report will primarily focus on the "state of knowledge" of the co-benefit of mercury control that will result from the control of NOx and SO2 from coal-fired utility boilers. Also, there will be preliminary estimates made for this co-benefit for the North Carolina utility boilers based on the initial plans submitted by Progress Energy and Duke Energy. Two public workshops are planned for June and July 2003, to meet with all interested stakeholders to begin review of the draft DAQ report.

V. Section 13 of the Act provides: *The Division of Air Quality of the Department of Environment and Natural Resources shall study issues related to the development and implementation of standards and plans to implement programs to control emissions of carbon dioxide (CO2) from coal-fired generating units and other stationary sources of air pollution. The Division shall evaluate available control technologies and shall estimate the benefits and costs of alternative strategies to reduce emissions of carbon dioxide (CO2). The Division shall annually report its interim findings and recommendations to the Environmental Management Commission and the Environmental Review Commission beginning 1 September 2003. The Division shall*

report its final findings and recommendations to the Environmental Management Commission and the Environmental Review Commission no later than 1 September 2005. The costs of implementing any air quality standards and plans to reduce the emission of carbon dioxide (CO2) from coal-fired generating units below the standards in effect on the date this act becomes effective, except to the extent that the emission of carbon dioxide (CO2) is reduced as a result of the reductions in the emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO2) required to achieve the emissions limitations set out in G.S. 143-215.107D, as enacted by Section 1 of this act, shall not be recoverable pursuant to G.S. 62-133.6, as enacted by Section 9 of this act.

DAQ Actions to Implement this Section: The DAQ is presently developing a draft report for presentation by September 1, 2003, as required by this section. The first report will primarily focus on the "state of knowledge" and actions being taken or planned elsewhere regarding CO2 control from coal-fired utility boilers. Two public workshops are planned for June and July 2003, to meet with all interested stakeholders to begin review of the draft DAQ report.

VI. Supplementary Information: The Public Staff – North Carolina Utilities Commission (Public Staff) will audit the books and records of Progress Energy and Duke Energy in regard to the costs incurred and amortized by the Companies concerning their compliance with the provisions of the Clean Smokestacks Act. The audits are to be of a nature such that they will be on-going, continuing throughout completion of the accelerated cost recovery process and beyond as circumstances and events may require. The Public Staff expects to begin the audits later this calendar year.

CONCLUSION

Actions taken to date by Progress Energy and Duke Energy appear to be in accordance with the provisions and requirements of the Clean Smokestacks Act.

Duke Power Compliance Plan Annual Update

Record No. NC CAP 002
Certified: 7002 0860 0006 5842 6314

E-7 SUB 718

Dear Ms. Sanford:

As required by Senate Bill 1078, Duke Power is required to file information on or before 1 April of each year to update the Commission on progress to date, upcoming activities and expected strategies to achieve the emissions limitations set out in G.S. 143-215.107D.

The current plan to meet the emission requirements for NO_x and SO_2 continues to include:

NO_x Control – The installation of Selective Catalytic Reduction (SCR) on Cliffside Steam Station Unit 5 and Belews Creek Steam Station Units 1&2; the installation of Selective Non Catalytic Reduction (SNCR) with Low-NO_x burners on the 24 remaining units.

SO_2 Control – The installation of wet scrubbers on our largest twelve generating units.

Exhibits A and B outline the unit specific technology selections, projected operational dates, expected emission rates, and the corresponding tons of emissions that demonstrate compliance with the legislative requirements. The projected 'environmental compliance costs' for these pollution control projects are included in Exhibit C.

Duke Power will continue to optimize the technology selection, implementation schedule and cost, and will provide annual updates to the NC Utilities Commission as required. If you have questions regarding any aspect of our plan, please do not hesitate to contact my office at 704-373-4363.

Sincerely,

George T. Everett

Duke Power Company

General Assembly of North Carolina Session 2001
Senate Bill 1078 – Improve Air Quality/Electric Utilities (NC Clean Air Legislation)
Annual Data Submittal

1. **A detailed report on the investor-owned public utility's plans for meeting the emissions limitations set out in G.S. 143-215.107D.**

   Exhibits A and B outline the technology selections by facility and unit, projected operational dates, expected emission rates, and the corresponding tons of emissions that demonstrate compliance with the provisions of G.S. 143-215.107D.

2. **The actual environmental compliance costs incurred by the investor-owned public utility in the previous calendar year, including a description of the construction undertaken and completed during that year.**

   In the 2002 calendar year, Duke Power Company spent $3,622,600 on activities in support of compliance with the provisions of G.S. 143-215.107D. Exact amounts associated with each project are provided in Exhibit C, and a description of the associated activities is provided below:

   Allen Steam Station Scrubbers
   - Project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics initiated

   Belews Creek Steam Station Scrubbers
   - Project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics initiated

   Cliffside Steam Station Scrubbers
   - Project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics initiated

   Marshall Steam Station Scrubbers
   - Project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics initiated

   Allen Steam Station SNCR, Unit 1
   - Project study, scope development and equipment specifications completed
   - Engineering, Procurement and Construction (EPC) contract awarded

   Marshall Steam Station SNCR, Unit 4
   - Project study and technology demonstration/testing completed

Dan River Steam Station Burners, Unit 3

- Project study and boiler modeling completed
- Electrical and mechanical design continued and specification issued
- CO and O_2 Analyzers installed within scheduled unit outage

Riverbend Steam Station Burners, Units 5&6

- Project study and boiler modeling completed
- Engineering design work completed and specification issued
- CO and O_2 Analyzers installed within scheduled unit outages

3. **The amount of the investor-owned public utility's environmental compliance costs amortized in the previous calendar year.**

In the 2002 calendar year, **$0** was amortized related to construction work activity in support of compliance with the provisions of G.S. 143-215.107D.

4. **An estimate of the investor-owned public utility's environmental compliance costs and the basis for any revisions of those estimates when compared to the estimates submitted during the previous year.**

The estimated 'environmental compliance costs' as defined in G.S. 143-215.107D are provided in Exhibit C.

These expected costs are not significantly different than the estimates provided in 2002 in the initial filing, and the technologies expected to be required to support compliance have not changed. The minor adjustments to the estimates at the project level are the result of additional project scope definition and refinement of project schedules only.

5. **A description of all permits required in order to comply with the provisions of G.S. 143-215.107D for which the investor-owned public utility has applied and the status of those permits or permit applications.**

Allen Steam Station SNCR, Unit 1

- Air Permit Application completed and final permit received for temporary trial
- NPDES Permit Modification completed and permit modification received for temporary trial
- Air Permit Application completed and final permit received for permanent equipment installation

Marshall Steam Station SNCR, Unit 4

- Air Permit Application completed and final permit received for temporary trial
- NPDES Permit Modification completed and permit modification received for temporary trial

6. A description of the construction related to compliance with the provisions of G.S. 143-215.107D that is anticipated during the following year.

Allen Steam Station Scrubbers

- Continuation of project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics throughout year

Belews Creek Steam Station Scrubbers

- Continuation of project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics throughout year

Cliffside Steam Station Scrubbers

- Continuation of project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics throughout year

Marshall Steam Station Scrubbers

- Continuation of project studies and investigations related to reagent handling, equipment optimization, byproduct handling, equipment layout and logistics throughout year
- EPC contract expected to be awarded in 4th Quarter of 2003
- Earthwork expected to begin in the latter part of 2003
- Site mobilization expected to begin in the latter part of 2003
- Stack foundation work expected to begin in January, 2004
- Underground piping, grounding, duct bank and foundation work expected to begin in the 1st Quarter of 2004
- Fencing, lighting, roadwork and drainage construction expected to begin in the 1st Quarter of 2004

Allen Steam Station SNCR, Unit 1

- Equipment installation expected to be completed in spring 2003
- Equipment testing expected in 2nd and 3rd Quarters of 2003

7. A description of the applications for permits required in order to comply with the provisions of G.S. 143-215.107D that are anticipated during the following year.

Marshall Steam Station Scrubbers, Units 3&4

- Landfill Site Suitability Application – Plan to submit 6/6/03
- Sedimentation and Erosion Control – Plan to submit 6/9/03
- Air Permit Application – Plan to submit 8/22/03
- NPDES Permit Modification – Plan to submit 3/31/04
- Landfill Construction Permit Application – Plan to submit 11/17/04

Allen Steam Station SNCR, Units 2 - 5

- Air Permit Application – Plan to submit 10/22/04
- Sedimentation and Erosion Control (if needed) – Plan to submit 11/5/04
- NPDES Permit Modification (if needed) – Plan to submit 11/5/04

8. The results of equipment testing related to compliance with G.S. 143-215.107D.

Allen Steam Station SNCR, Unit 1

- Technology demonstration in December, 2001 (one week test)
  - ➢ Nominal 30% reduction in NO_x with ammonia slip of 5 to 10 ppm at full load
  - ➢ Average NO_x outlet rate of 0.15 #/MMBTU for the test period

Marshall Steam Station SNCR, Unit 4

- Technology demonstration in October - November, 2002 (one month test)
  - ➢ Average 24% - 25% reduction in NO_x with ammonia slip of 5 to 10 ppm at full load
  - ➢ Average NO_x outlet rate of 0.163 #/MMBTU for the test period

Note: Actual short term test results do not necessarily guarantee long term results. Expected annual emission rates are provided in Exhibit A.

9. The number of tons of oxides of nitrogen (NO_x) and sulfur dioxide (SO_2) emitted during the previous calendar year from the coal-fired generating units that are subject to the emissions limitations set out in G.S. 143-215.107D.

In the 2002 calendar year, 81,896 tons of NO_x and 263,909 tons of SO_2 were emitted from the North Carolina based Duke Power Company coal-fired units.

10. The emissions allowances described in G.S. 143-215.107D(i) that are acquired by the investor-owned public utility that result from compliance with the emissions limitations set out in G.S. 143-215.107D.

No emissions allowances have been acquired by Duke Power Company resulting from compliance with the emissions limitations set out in G.S. 143-215.107D.

11. Any other information requested by the Commission or Department of Environment and Natural Resources.

No additional information has been requested as of this date.

Expected Duke Power Company Compliance Plan for NC Clean Air Plan

Re: Annual NC Clean Smokestacks Legislation Compliance Report

Dear Mrs. Thigpen:

Progress Energy Carolinas, Inc. submits the attached report for calendar year 2002 regarding the status of compliance with the provisions of the North Carolina Clean Smokestacks legislation. Section 9(i) of the legislation requires that an annual report of compliance progress be submitted to the Commission by April 1 of each year for the previous calendar year.

Very truly yours,

Len S. Anthony
Manager - Regulatory Affairs

Progress Energy Carolinas, Inc.
Senate Bill 1078 – Clean Smokestacks Law
Calendar Year 2002 Progress Report

On June 20, 2002, North Carolina Senate Bill 1078, also known as the "Clean Smokestacks Law," was signed into effect. This law requires significant reductions in the emissions of nitrogen oxides (NOx) and sulfur dioxide (SO_2) from utility owned coal-fired power plants located in North Carolina. Section 9(i) of the bill, which is now incorporated as Section 62-133.6(i) of the North Carolina General Statutes, requires that an annual progress report regarding compliance with the Clean Smokestacks Law be submitted on or before April 1 of each year. The report must contain the following elements, taken verbatim from the statute:

1. A detailed report on the investor-owned public utility's plans for meeting the emissions limitations set out in G.S. 143-215.107D.
2. The actual environmental compliance costs incurred by the investor-owned public utility in the previous calendar year, including a description of the construction undertaken and completed that year.
3. The amount of the investor-owned public utility's environmental compliance costs amortized in the previous calendar year.
4. An estimate of the investor-owned public utility's environmental compliance costs and the basis for any revisions of those estimates when compared to the estimates submitted during the previous year.
5. A description of all permits required in order to comply with the provisions of G.S. 143-215.107D for which the investor-owned public utility has applied and the status of those permits or permit applications.
6. A description of the construction related to compliance with the provisions of G.S. 143-215.107D that is anticipated during the following year.
7. A description of the applications for permits required in order to comply with the provisions of G.S. 143-215.107D that are anticipated during the following year.
8. The results of equipment testing related to compliance with G.S. 143-215.107D.
9. The number of tons of oxides of nitrogen (NOx) and sulfur dioxide (SO_2) emitted during the previous calendar year from the coal-fired generating units that are subject to the emissions limitations set out in G.S. 143-215.107D.
10. The emissions allowances described in G.S. 143-215.107D(i) that are acquired by the investor-owned public utility that result from compliance with the emissions limitations set out in G.S. 143-215.107D.
11. Any other information requested by the Commission or the Department of Environment and Natural Resources.

Information responsive to each of these report elements follows. The responses are given by item number in the order in which they are presented above.

1. **A detailed report on the investor-owned public utility's plans for meeting the emissions limitations set out in G.S. 143-215.107D.**

The plan for Progress Energy Carolinas, Inc. was originally submitted on July 29, 2002. Appendix A contains an updated version of this plan, effective April 1, 2003.

2. **The actual environmental compliance costs incurred by the investor-owned public utility in the previous calendar year, including a description of the construction undertaken and completed that year.**

Appendix B contains the costs incurred toward compliance with G.S. 143-215.107D in 2002 and the projected costs for future years through 2013. No construction was undertaken in 2002.

3. **The amount of the investor-owned public utility's environmental compliance costs amortized in the previous calendar year.**

No costs associated with compliance with G.S. 143-215.107D were amortized in 2002.

4. **An estimate of the investor-owned public utility's environmental compliance costs and the basis for any revisions of those estimates when compared to the estimates submitted during the previous year.**

Appendix B contains the costs incurred toward compliance with G.S. 143-215.107D in 2002 and the projected costs for future years through 2013. While some unit total and annual costs have changed, the total project cost in escalated dollars remains $813M.

5. **A description of all permits required in order to comply with the provisions of G.S. 143-215.107D for which the investor-owned public utility has applied and the status of those permits or permit applications.**

As of April 1, 2003, Progress Energy Carolinas, Inc. had not yet applied for any permits associated with compliance with G.S. 143-215.107D. A description of the anticipated permit applications is presented in the response to Item 7 below.

6. **A description of the construction related to compliance with the provisions of G.S. 143-215.107D that is anticipated during the following year.**

Appendix C presents the planned construction schedule for compliance with G.S. 143-215.107D. Note that this is a projected schedule of construction activity through 2013 that will be subject to modification. The schedule will be updated as part of this report each year.

7. **A description of the applications for permits required in order to comply with the provisions of G.S. 143-215.107D that are anticipated during the following year.**

Permit applications for the construction and operation of scrubbers for the removal of sulfur dioxide are planned for submittal in the spring of 2003. The scrubbers are planned for Asheville Plant Units 1 and 2 and for Roxboro Plant Units 2 and 3. The following permit applications are anticipated to be submitted to the Department of Environment and Natural Resources (DENR) for review and approval:

- Air construction and operation permit
- Erosion and sediment control permit
- Treatment and processing permit for storage of scrubber by-product
- Wastewater permit to construct for treatment of scrubber blowdown
- A potential permit application for constructed wetlands (not yet determined)

Progress Energy Carolinas, Inc. will work with DENR in order to ensure that all applicable permits are obtained in order to support the planned scrubber construction and operation.

8. The results of equipment testing related to compliance with G.S. 143-215.107D.

No equipment testing related to compliance with G.S. 143-215.107D occurred in 2002.

9. The number of tons of oxides of nitrogen (NOx) and sulfur dioxide (SO_2) emitted during the previous calendar year from the coal-fired generating units that are subject to the emissions limitations set out in G.S. 143-215.107D.

The total calendar year 2002 emissions from the affected coal-fired Progress Energy Carolinas units are:

NOx 58,793
SO_2 195,734

10. The emissions allowances described in G.S. 143-215.107D(i) that are acquired by the investor-owned public utility that result from compliance with the emissions limitations set out in G.S. 143-215.107D.

No emissions allowances resulting from compliance with G.S. 143-215.107D were acquired in 2002.

11. Any other information requested by the Commission or the Department of Environment and Natural Resources.

As of April 1, 2003, no additional information has been requested by the Commission or the Department of Environment and Natural Resources.

Appendix A

Progress Energy's Air Quality Improvement Plan Supplement
April 1, 2003

On June 20, 2002 Governor Easley signed into law SB1078 which caps emissions of nitrogen oxides (NOx) and sulfur dioxide (SO_2) from utility owned coal-fired power plants located in North Carolina. Progress Energy's annual NOx emissions must be less than 25,000 tons beginning in 2007 and annual SO_2 emissions must be less than 100,000 tons beginning in 2009 and less than 50,000 tons beginning in 2013. The emissions caps are cumulative for all coal-fired units in North Carolina. These caps represent a 56% reduction in NOx emissions from 2001 levels and a 74% reduction in SO_2 from 2001 levels for Progress Energy.

Progress Energy owns and operates 18 coal-fired units at seven plants in North Carolina. The locations of these plants are shown on Attachment 1.

Nitrogen Oxides Emissions Control Plan

Progress Energy has been evaluating and installing NOx emissions controls on its coal-fired power plants since 1995 in order to comply with Title IV of the Clean Air Act and the NOx SIP Call rule adopted by the Environmental Management Commission (EMC). Substantial NOx emissions reductions have already been achieved (59,000 tons of NOx in 2002 compared with 112,000 tons in 1997) and further reductions will ensure compliance with the SB1078 target of 25,000 tons in calendar year 2007. This target will be achieved with a mix of combustion controls (which minimize the formation of NOx) such as low NOx burners and over fire air technologies, and post-combustion controls (which reduce NOx produced during the combustion of fossil fuel to molecular nitrogen) such as selective catalytic reduction and selective non-catalytic reduction technologies. Attachment 2 details Progress Energy's North Carolina coal-fired electric generating units, their name plate generation capacity, and identifies the control technologies already installed and planned for installation. As technologies evolve or other circumstances change, a different mix of controls may be selected. Attachment 2 also projects the NOx emissions on a unit by unit basis based on the energy demand forecast and expected efficiencies of the NOx emissions controls employed. This information is provided only to show how compliance may be achieved and is not intended in any way to suggest unit specific emission limits. Actual emissions for each unit may be substantially different in 2007.

Flue Gas Desulfurization (FGD)

Progress Energy is completing FGD screening studies on its coal-fired units. Babcock and Wilcox has been selected as the equipment supplier. Specific SO_2 control technologies have not yet been finally determined but a combination of wet scrubbers

(limestone forced oxidation) and dry scrubbers (spray absorbers) will likely be selected. Both are proven technologies and provide greater than 90% SO_2 removal efficiencies.

Wet scrubbers and dry scrubbers produce unique waste and by-product streams. Issues related to wastewater permitting and disposal must be addressed for each site. Discussions with various permitting divisions within DENR have begun and a permit application submittal schedule will be provided.

Specific units are listed on Attachment 3 with data on projected schedules and projected annual emissions for 2009 and 2013. These projections are based on a 92% SO_2 removal efficiency and on forecasted energy demand. Note that these are projected schedules and will be subject to revision. Individual FGD in-service dates may occur later than shown.

During 2002, FGD studies were completed for Asheville , Roxboro , and Mayo Plants. Design activities have begun for Asheville 1 and 2, and Roxboro 2, with construction work anticipated to begin in the fourth quarter of 2003 or first quarter of 2004.

Particular units controlled and control technologies utilized are subject to change depending on future developments in SO_2 removal technologies, energy demand, and other circumstances which may produce a more optimal plan for meeting the SO_2 emissions limits in 2009 and 2013. DENR will be advised as changing circumstances dictate.

RE: Report on Submerged Lands Claim Resolution

Pursuant to G.S. 113-206(f), I am transmitting a report on the resolution of submerged lands claims. This report covers the preceding year's progress in resolving private claims to ownership of submerged lands in North Carolina's twenty-five coastal counties.

The report was prepared by DENR's Division of Marine Fisheries, with assistance from the Department of Justice. If you have any questions or would like additional information, please contact Preston Pate at (252) 726-7021.

TO THE
JOINT LEGISLATIVE COMMISSION ON
GOVERNMENTAL OPERATIONS

ON

SUBMERGED LANDS CLAIM RESOLUTION

OCTOBER 1, 2003

BY

Secretary William G. Ross, Jr.
Department of Environment and Natural Resources

INTRODUCTION

General Statute (G.S.) 113-206(f) requires the Secretary of the Department of Environment and Natural Resources (DENR) to submit an annual report concerning resolution of submerged lands claims to the Joint Legislative Commission on Governmental Operations on October 1 of each year. This report covers the preceding year's progress in resolving private claims to ownership of submerged lands in North Carolina's twenty-five coastal counties. This report was prepared by the Division of Marine Fisheries (DMF), DENR, with assistance from the Department of Justice (DOJ).

BACKGROUND

As a general rule of law, the State owns all lands below the mean high water mark of its "navigable" waters in trust for the use and benefit of all its citizens. This principle of law dates from Roman times, was firmly established in English Common Law, and has been recognized in American law since independence was declared from Great Britain. The North Carolina Supreme Court most recently reaffirmed this rule of law in Gwathmey v. State, 342 NC 287, 464 S.E.2d 674 (1995). The decision in RJR Technical Co. v. Pratt 339 N.C. 588, 453 S.E.2d 147 (1995) also reaffirmed that exclusive or several fishery rights to fish in navigable waters has never been authorized under North Carolina law. In the Gwathmey decision, the Supreme Court defined "navigable" waters as those waters which are navigable in-fact in their natural condition by "useful vessels," including "small craft used for pleasure."

Since Colonial times there have been a number of infringements on this public trust area. Grants and franchises for fishing purposes and shellfish cultivation were issued, as well as wharf and pier rights. Deeds for fee title to marshlands and open waters were issued by various state agencies, principally the State Board of Education. Lands once submerged were filled and became uplands. Various other sales, leases, and easements have been made by the Department of Administration, State Property Office. Since the early nineteenth century, the State's courts have been required to adjudicate competing claims and protect public rights of navigation, fishing, hunting, and recreation.

In order to equitably resolve these questions of ownership and public rights, the General Assembly in 1965 enacted legislation (G.S. 113-205 and 113-206) requiring registration of private claims to lands beneath navigable waters, in 25 coastal counties. Some 3,263 files were opened in response to the January 1, 1970 deadline for registration. After preliminary review of the files, it was estimated that there would be approximately 10,000 individual claims.

Between 1970 and 1974 preliminary maps of the claims were prepared. During 1983-1985, preliminary legal analysis of the claims was conducted, and in 1985 the General Assembly, following the report of a special legislative research commission, enacted five bills to clarify the claims resolution process and facilitate completion of the process by 31 December 1990. The 1985 report reflected limited claim resolution, with emphasis on planning, staffing, equipping and organizing the new program within the Division of Coastal Management. During the years covered by reports in 1986 and 1987, emphases included adoption of departmental regulations following public hearings, personnel training, basic claim analysis, development of computer support systems, and claims resolution.

As the program moved into the phase of updating and investigating the estimated 10,000 claims, it became increasingly evident that very extensive claimant contact and work in the coastal courthouses would be required. To meet this need, the program was transferred from the Division of Coastal Management in Raleigh to the Division of Marine Fisheries in Morehead City in late 1987.

An additional significant change in operating procedures occurred as a result of the North Carolina Supreme Court's June 1988 decision in State v. Credle, 322 N.C. 522, 369 S.E.2d 825 (1988). That decision held, most significantly, that grants of fee title under the entry and grant laws to submerged lands, before or after July 4, 1776, are void, and that fee title or other rights to lands covered by public trust waters cannot be gained by adverse possession or prescriptive use. The Court's holdings in State v. Credle clarified resolution of many pending submerged lands claims.

During investigations of Board of Education claims, we have found that many people thought they had an exclusive shellfish right and, in fact, have been cultivating shellfish on those sites. It is the State's position that Board of Education deeds did not convey an exclusive shellfish right. Consequently, the General Assembly ratified Senate Bill 428 in 1989, which allows the Secretary to grant a shellfish cultivation lease to those persons who have been cultivating shellfish on lands described in their Board of Education deeds. The passage of this bill recognized the time and money spent by those who were cultivating shellfish on properties described in their Board of Education deeds and G.S. 113-205 claims. This amendment, codified as G.S. 113-206(a1), provides an equitable resolution for those who have been cultivating shellfish under the assumption that they had an exclusive shellfish right under the Board of Education deeds.

On 9 July 1990, the General Assembly ratified Senate Bill 1496, which amended G.S. 113-205(e) and (f) and G.S. 105-151.12(e). Due to increased complexity of the remaining files, it was necessary to request an extension of the deadline to resolve the claims for an additional four years. On 7 July 1994, the General Assembly ratified Senate Bill 1437, which amended G.S. 113-205(a1), (e), and (f), and G.S. 105-

151.12(e). On 8 October 1998, the General Assembly ratified House Bill 1490, which extended G.S. 113-205(e) and (f). In addition, it amended G.S. 105-151.12(e), which extended the North Carolina Conservation Tax Credit Program for donations of marshland. The passage of this bill recognized the program accomplishments, and the extension of time reiterated that the best interest of the public and the State would be served by continuing the program.

On 18 July 1990, the General Assembly enacted G.S. 113-202.2 authorizing the issuance of water column aquaculture leases within duly recognized shellfish franchises. The successful incorporation of perpetual franchises into the Shellfish Leasing Program should facilitate continued production and management of franchises and improve their management.

The Public Trust/Submerged Lands Director retired effective 1 December 1999. The DMF was not able to fill the position during the 1999-2000 Fiscal Year because of the requirement to revert 30% of the funds allocated to that position, which reduced the salary below the minimum rate for that position. In the 2000-2001 Fiscal year, DMF was able to fully fund the position, post it and conduct interviews. However, the position was frozen before it could be filled. Since that date, the 2001-2002 Budget removed funding for the vacant position, and it has been eliminated. However, Session Law 2001-424, Sec. 19.9 required the Secretary "to designate from existing staff within the Department, a staff position to be responsible for managing the Submerged Lands Program." The Director of the Division of Marine Fisheries has been so designated. Responsibility for notification of claimants, tracking the resolution process by computer database, and other necessary tasks was delegated to DMF's Habitat Protection Section.

Three state agencies are involved in the processing of submerged lands claims with overall guidance provided by a memorandum of agreement among the agencies.

1. The Habitat Protection Section of the Division of Marine Fisheries, Department of Environment and Natural Resources, is responsible for coordinating the entire program, including notification of each claimant in order to bring their claim to the point of resolution and rendering a final departmental decision for each claim.

2. The Air and Natural Resources Section of the Environmental Division of the Department of Justice is responsible for advising DENR on legal issues and the validity of specific claims. They handle all court actions concerning claims to enforce the state's policy to conserve and protect its lands and waters for the benefit of all its citizens, consistent with the Public Trust Doctrine.

3. The State Property Office of the Department of Administration is responsible for all title issues involving land above the high water mark which arise from

the claims. All files which contain islands or questionable high ground are forwarded to the State Property Office for review.

PROGRESS REPORT

Resolution of existing claims continued throughout the 2002-03 reporting period.

1. During the reporting period, we processed 99 original files and 190 files that were in the "NOT SUBMERGED" category, leading to the resolution of 414 claims. As of the date of this report, the Division of Marine Fisheries has 82 files opened and in progress. In addition, 56 files will be resolved by publication as described in paragraph 2 below.

2. In order to achieve the resolution of all claims by the end of this year, we have reviewed and categorized all remaining claims. Those that are consistent with State law will be recognized; those that are not consistent will be denied. DMF will then undertake a certified mail notification to each claimant. For those claimants who cannot be notified by certified mail, DMF will follow-up with a newspaper notification, in at least four (4) papers having general circulation along the coast. The notifications will advise the claimants of their appeal rights.

3. Pursuant to the authority delegated to the Director of the Division of Marine Fisheries, in accordance with G.S. 143B-10, the Habitat Protection Section reviewed and commented on permit applications submitted to the State agencies which affect public trust areas and resources pursuant to G.S. 113-131. As needed, support was also provided to the Marine Patrol when seeking removal of unlawful encroachments upon or other violations of the public trust rights of the people of the State of North Carolina, or legal rights of access to such public trust areas, pursuant to G.S. 76-40 and G.S. 113-131.

4. Claims that were submitted pursuant to G.S. 113-205 which were located outside the 25 coastal counties are being held until resolution of those claims within the 25 coastal counties. After review of the 189 non-coastal files which need to be addressed, it was determined that there are an additional 502 claims (tracts of land) which need to be resolved. (See Attachment 1).

5. Due to the complexity of the remaining files, it is often necessary to meet with individual claimants to prevent misunderstandings and avoid additional court action. The remaining files have multiple claims as well as multiple tracts of lands, many of which are now subdivisions. This situation results in an

increase of the number of claimant files which need to be opened. Public trust issues may arise from these claims, which require additional research time to provide answers to claimants and other inquiring citizens.

6. Throughout the reporting period, in addition to assisting DMF with reviewing and updating remaining claims, paralegals in the Air & Natural Resources Section also supported requests for assistance from the Division of Marine Fisheries and other Divisions of the Department of Environment and Natural Resources, the Wildlife Resources Commission, the Department of Administration, and attorneys in the Environmental Division of the Department of Justice. These projects included determination of the responsible parties for leaking underground storage tanks; assisting other agencies such as the Division of Coastal Management (CAMA), the Division of Land Quality, and Division of Water Quality, as well as providing litigation support in significant cases such as Giampa, et al. v. Currituck County, et al. (Currituck Co., No. 98 CVS 153), which challenges the right of the public to use the ocean beaches between the dunes and the mean high water line, and PCS Phosphate, Inc. v. State of North Carolina, et al, (Beaufort Co., No. 03 CVS 75), which contests the navigability of, and State title to certain tributaries of the Pamlico River and South Creek.

7. During the reporting period the Habitat Protection Section was managed the Division of Marine Fisheries Habitat Alteration Permit Review Program, under authority of G. S. 113-131. The Section provided 1,075.5 man-hours to ensure Division comments on habitat alteration permit applications were provided to the appropriate state and federal agencies for CAMA major permits, NPDES permits, Section 401 certifications, U. S. Army Corps of Engineers notices, numerous environmental assessments, environmental impact statements, and other documents.

   The Habitat Protection Section devoted most of its resources to the Coastal Habitat Protection Plan program, as provided in G. S. 143B-279.8. Section staff, working with staff of several other DENR agencies, is writing the Coastal Habitat Protection Plan (CHPP) to achieve the legislative goal of enhancing the coastal fisheries associated with each habitat. Several plan chapters are drafted; technical reviews are underway. Two members each of the Environmental Management, Marine Fisheries, and Coastal Resources commissions serve on the Intercommission Review Committee (IRC). The IRC is reviewing the technical drafts, and they will develop the actual management recommendations to include in the CHPP, which is to be adopted by the three commissions by 31 December 2004.

The accomplishments made this year have been the result of the continued aggressive action on the part of the Public Trust/Submerged Lands staff within the Habitat Protection Section of the Division of Marine Fisheries and the attorneys and staff of the Air and Natural Resource Section of the Environmental Division of the Department of Justice.

The cumulative accomplishments made by the Public Trust/Submerged Lands staff are as follows:

1. Original files opened by 1 January 1970 totaled 3,263 Of these, 189 files were for claims outside the 25 coastal counties, leaving a total of 3,074 files. As of the date of this report, 82 original files asserting private rights in state owned submerged lands remain to be resolved. All claims will be resolved by 31 December 2003.

2. Each file may contain multiple claims. Claims handled and entered into the computer system now total 14,499. Of these, 4,825 were original claimants, and 9,674 are current claimants. Current claimant figures do not include original claimants whose claim was resolved as a result of a deed conveying their interest or by an estate filing. Consequently, to date, we have resolved 12,287 claims.

3. The attached charts in Attachment 2 show the distribution of claims by counties, categories, and disposition. Chart 1 shows the number of claims processed by county. Additionally, Chart 1 shows the type of claims processed by county, and cumulative numbers by category (right hand column). Lastly, Chart 2 shows the disposition of files processed by county and cumulatively (right hand column).

4. We continued to pursue donations pursuant to G.S. 105-151.12, the North Carolina Conservation Tax Credit Program. Since 1988, we have been successful in resolving claims through the State Tax Credit Program and donations of lands to conservation groups. The total acreage donated to date is approximately 12,372.83 acres, with two donations pending, consisting of 52 acres.

OBJECTIVES FOR 2003-2004

1. We intend to attain successfully the goal of resolving all remaining claims asserting private rights in State-owned submerged lands prior to 31 December 2003. However, the Division has other duties and obligations under G.S. 113-205 and -206 which do not end as of December 31, 2003.

For example, G.S. 113-206(a) imposes upon the Secretary the duty to chart the claims. This is a significant requirement. A final map is essential to meet the ultimate goal of the statute, and will constitute a lasting record identifying submerged lands in which private rights have been recognized. This will not only benefit the State agencies responsible for management of those submerged lands, but will provide accurate notice of them to the public. The Division is presently developing a plan to map the recognized claims using DMF's existing Geographic Information System (GIS) capabilities. In addition, a claimant who is unsatisfied may continue to negotiate the resolution of the claim during the running of the three-year statute of limitations, or file a lawsuit contesting the resolution of his claim. Litigation may result from the resolution of some claims.

2. After meeting the 31 December 2003 deadline, personnel which have been supporting the resolution process will be able to devote additional needed resources to assist the Division of Marine Fisheries, other DENR Divisions, the Wildlife Resources Commission, the Department of Administration, and attorneys in the Environmental Division of the Department of Justice.

3. Continue to review permit applications submitted to State agencies as they pertain to public trust resources pursuant to G.S. 113-131, upon request.

4. Continue to support the Marine Fisheries Law Enforcement Officers in identifying and seeking removal of signs and other obstacles unlawfully placed in navigable waters pursuant to G.S. 76-40 and G.S. 113-131.

5. Continue to provide personnel and clerical support for Fisheries Reform Act of 1997 and House Bill 1448 of the 1998 Fisheries Reform Act amendments, as assigned by the Fisheries Director.

ANNUAL REPORTING REQUIREMENTS

G.S. 113-206(f) requires that on or before October 1 of each year, the Secretary shall report to the Joint Legislative Commission on Governmental Operations stating the following:

1. The number of claims registered pursuant to G.S. 113-205 that were resolved during the preceding year: Between 30 September 2002 and 1 October 2003, 414 claims were resolved.

2. The cost of resolving these claims: The cost of resolving claims during fiscal year 2002-03 period was:

AGENCY	EXPENSES	SALARIES	TOTAL
DENR	$ 5,416.21	$ 24,562.18	$ 29,978.39
DOJ	$ 7,125.38	$ 190,813.33	$197,938.71
TOTAL	**$ 12,541.59**	**$ 215,375.51**	**$227,917.10**

NOTE: The salaries have been prorated for time devoted to submerged lands claim resolution.

3. The number of unresolved claims:

Approximately 304 tracts of submerged lands claims to State-owned submerged lands (contained in about 82 original claim files) remain to be resolved. Using the rationale that there will be at least three current claimants to each tract of land unresolved, the estimated number of submerged lands claims to be resolved is 912. These will all be resolved as of 31 December 2003, either by certified mail or publication.

4. Payments made to acquire claims by condemnation:

No payments have been made for condemnation acquisitions.

DEFINITIONS

1. **ABANDONED (AC):** Issued when a claimant has failed to respond to the letter of inquiry or no requested supporting documentation is received with the established time following service of the letter or request.

2. **BOARD OF EDUCATION (BOE):** The claim is premised upon a deed issued by the State Board of Education.

3. **CONDEMNATION PROCEEDINGS (CP):** The property is now owned by the State of North Carolina or the U.S. Government.

4. **COURT JUDGMENT (CJ):** The property is now owned by the State of North Carolina or the U.S. Government.

5. **CURRENT CLAIM:** Each tract or lot in a subdivision is a claim.

6. **CURRENT CLAIMANT:** The person who now owns an interest in a tract of land.

7. **DENIAL (LD):** Sent to those claimants whose claims have been determined not to have any validity to the land being claimed.

8. **DONATIONS (DO):** Property donated to the State by a claimant.

9. **EXCLUSIVE FISHERY (EF):** The claim is to exclusive finfishing rights (as opposed to shellfishing), usually a form of net fishing, premised upon custom and usage, or a seine fishery grant.

10. **INLAND POCOSIN (IP):** The property is a swamp in an inland coastal region.

11. **INTEREST TERMINATED (IT):** Original claimant has conveyed all of this interest or passed interest by will or intestate succession.

12. **LATE FILING (LF):** The claim was filed after January 1, 1970. If the claim was postmarked on January 2, 1970 or before, it should be considered timely filed, unless contrary information appears in the file.

13. **LEASE (LE):** Perpetual franchise converted to a lease; i.e. a lease in lieu of a perpetual franchise.

14. **LIMITED PURPOSE (LP):** Such rights of use; i.e., piers for access or mooring, shellfish cultivation, duck blinds, etc.

15. **LOW WATER (LW)**: The claimant asserts that his property line extends to the low water mark. In New Hanover County, such claims are premised on Chapter 757 of the 1903 Sessions Laws.

16. **MARSH NOT BOE (MS):** The claimant asserts title to flooded marshland, (i.e.; below the high water mark) not conveyed by the Board of Education. Irregularly flooded marshland, (i.e.; above the high water mark) may initially be included in the category where the file lacks sufficient information to determine whether the marshland is flooded.

17. **MUNICIPALITIES (MU):** Property now owned by incorporated cities, towns, and villages.

18. **NON-205 (N2):** The property claimed does not lie within one of the 25 coastal counties covered by General Statute 113-205.

19. **NOT SUBMERGED (NS)**: The claimant's deeds and maps did not describe an interest in lands beneath navigable waters or below the mean high water line.

20. **NULL & VOID (NV):** Failure by a claimant to provide evidence to the Division within 90 days which results in a reversal of the initial determination shall render the claim null and void.

21. **OPEN WATER (OW):** The claim describes lands submerged by open water, claiming the lands in fee simple. There are three possible types:
    1. Navigable water body: Waters which are subject to the influx of salt water or are navigable-in-fact.
    2. Non-navigable water body: Waters which are neither subject to the influx of salt water nor are navigable-in-fact.
    3. Supported by deed: Generally, the claimant submitted a deed describing lands which are "Not Submerged", but extends his/her property line into navigable waters.

22. **ORIGINAL CLAIM:** Each tract of land is a separate claim.

23. **ORIGINAL CLAIMANT (OC):** Each person who has an interest in a tract of land is a claimant.

24. **ORIGINAL FILE:** File that was opened when claim was received between 1965 and 1970. File includes multiple claimants (persons) and tracts.

25. **PRIVATELY OWNED BED (PO):** The beds of water bodies created by the excavation of lands above the high water mark.

26. **PRIVATELY OWNED BED/DENIAL (PD):** Recognizes beds of water bodies created by the excavation of lands above the high water mark; denial of any natural bed covered by water which is superjacent to the excavated lands.

27. **PRIVATELY OWNED LAKE (PK):** An inland body of water or basin, either natural or man-made, being permanent in nature, surrounded by land, and not fed by navigable waters of the State, privately owned.

28. **RELINQUISHED CLAIM (RC)**: Is issued when a claimant answers our letter requesting a chain of title. Requires a letter from the current claimant or his/her attorney stating that they do not want to assert their claim or words to that affect.

29. **SHELLFISH (SF):** The claim is to exclusive shellfishing rights. These are variously called "deeded bottoms," "oyster bottoms," "oyster gardens" and the like. They are usually premised on perpetual franchises, clerk of court issued licenses, or long and continuous usage.

30. **STATE PROPERTY (SP):** Property conveyed to the State by whatever means.

31. **TRUST LAND (TR):** Property conveyed to North Carolina Land Trusts, National Audubon Society, or other authorized conservation trusts.

32. **U.S. GOVERNMENT OWNED (US):** Property conveyed to the U.S. Government by whatever means.

33. **WHARF EASEMENT (WE):** The claim is based on a wharf grant issued to the riparian owner.

North Carolina Division of Water Quality
Annual Report of Fish Kill Events
2003

Water Quality Section
Environmental Science
Branch
Raleigh, NC
December 2003

Introduction

The investigation of fish kill activity across North Carolina currently involves protocols established by the North Carolina Division of Water Quality (DWQ) in 1996. The protocols were developed with assistance from DWQ Regional Office staff, North Carolina Wildlife Resources Commission biologists, and Division of Marine Fisheries personnel as a means to improve the tracking and reporting of fish kill events throughout the state. Fish kill and fish health investigation data are recorded on a standardized form and sent to the Division's Environmental Sciences Branch (ESB) where the data are reviewed and compiled. Data from fish kill investigation forms, laboratory test results and supplemental information sent to the ESB are entered into a central database where the information can be managed, queried and reported. The procedure also requires the notification of appropriate state officials and scientists associated with the investigation of such events. In addition, reported kill information is updated weekly on the ESB website at: **www.esb.enr.state.nc.us/Fishkill/fishkillmain.htm**.

DWQ fish kill protocols have proven successful in standardizing the methods for investigations and improving the quality and quantity of information reported from the scene of a kill event. Meaningful conclusions about where and why fish kills occur across North Carolina demand accurate and timely data. It is the intent of DWQ to generate this information through the current investigation process.

This document is a summary of fish kill events reported to the DWQ from January to mid December, 2003. The report is mandated under Section 4 of Chapter 633 of the 1995 North Carolina General Assembly Session Laws.

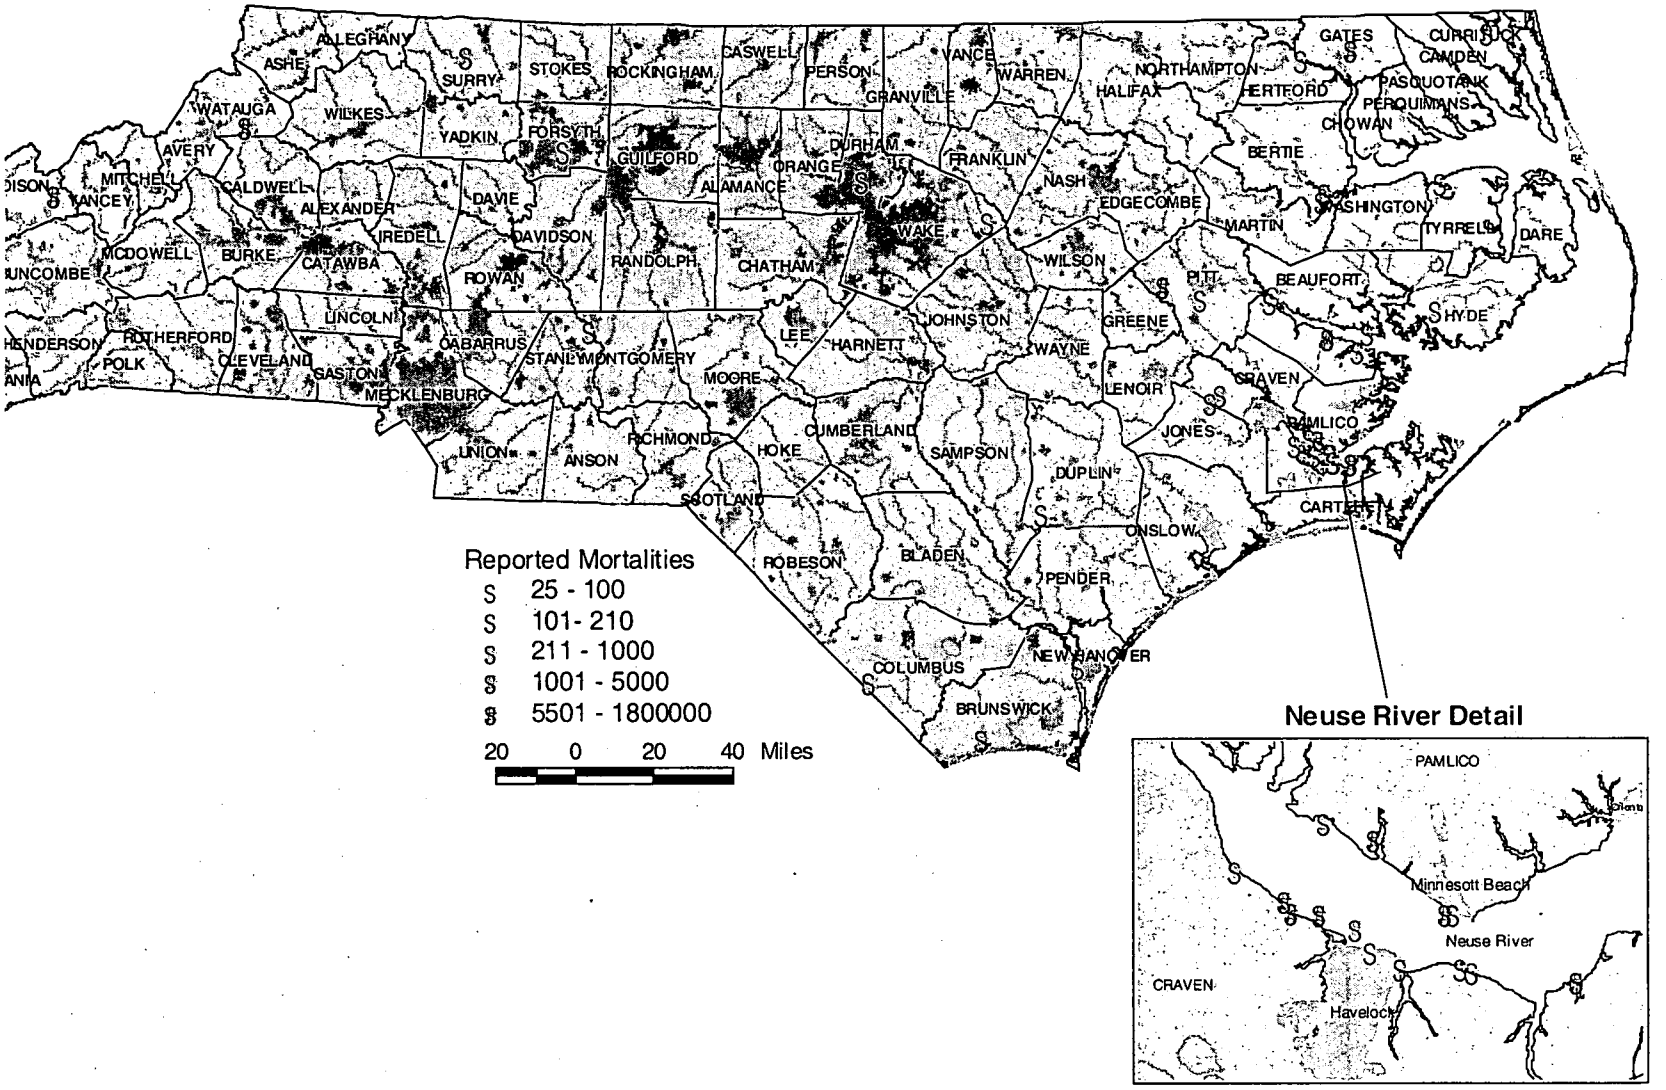
2003 Fish Kill Summary

Field investigators reported 43 fish kill events from January to December, 2003. Kill events were reported from coastal estuarine waters westward as far as Madison County. Kill activity was documented during the year in 10 of the state's 17 major river basins. The ESB tracks fish kill events when at least 25 fish are affected and the event is confirmed by investigators.

The cumulative fish mortality for all 2003 reports was over 3.6 million. This represents a significant increase over the 2002 total and is the highest mortality total since systematic fish kill reporting began in 1996. It is important to note that 3.1 million (86%) of the 2003 total was reported from just two large events on the Neuse River (See Notable Events below). Mortality totals for individual events ranged from 50 to 1.8 million with a median mortality of 1400. Reported activity was evenly divided between freshwater and estuarine waters although the largest events occurred in the estuaries. No reports were received from the Atlantic Ocean.

• **Total Kill Events for 2003**	**43**
• **Cumulative Mortality for 2003**	**3,694,053**
▪ *Estuarine*	*3,450,250*
▪ *Freshwater*	*243,803*
• **Report Mortality Range**	**50 to 1.8 million**
• **Report Median Mortality**	**1400**
• **Basins with Activity**	**10 (of 17)**
• **Freshwater Kills**	**22**
• **Estuarine Kills**	**21**
• **Ocean Kills**	**None**

Figure 1 : Fish Kill Events Reported to NCDWQ During 2003



Basin Activity

Investigators reported fish kill events in 10 of the state's 17 major river basins during 2003 (Figure 1, Table 1). Nearly half of the year's kills occurred in the Neuse Basin with activity being especially heavy below New Bern in the Neuse River estuary. A total of 15 kills were reported in the area of the Neuse stretching from New Bern to Long Creek. This area has been plagued by environmental factors such as low dissolved oxygen, high water temperatures, and fluctuating salinities. Activity in other river basins across North Carolina was relatively light although a number of severe fish kills were observed in the Chowan, Pasquotank and Roanoke basins following Hurricane Isabel in September (see Notable Events below). No fish kill reports were received from the Broad, Catawba, and White Oak basins in 2003. Since 1996 annual totals of statewide events peaked in 2001 with 77 reports but continued to decreased in 2003 to only 43, the lowest total for this time period. Most reports were received during the months of July, September, and October.

Table 1: Fish kill reports by basin, 1996 – 2003

	YEAR							
River Basin *	**1996**	**1997**	**1998**	**1999**	**2000**	**2001**	**2002**	**2003**

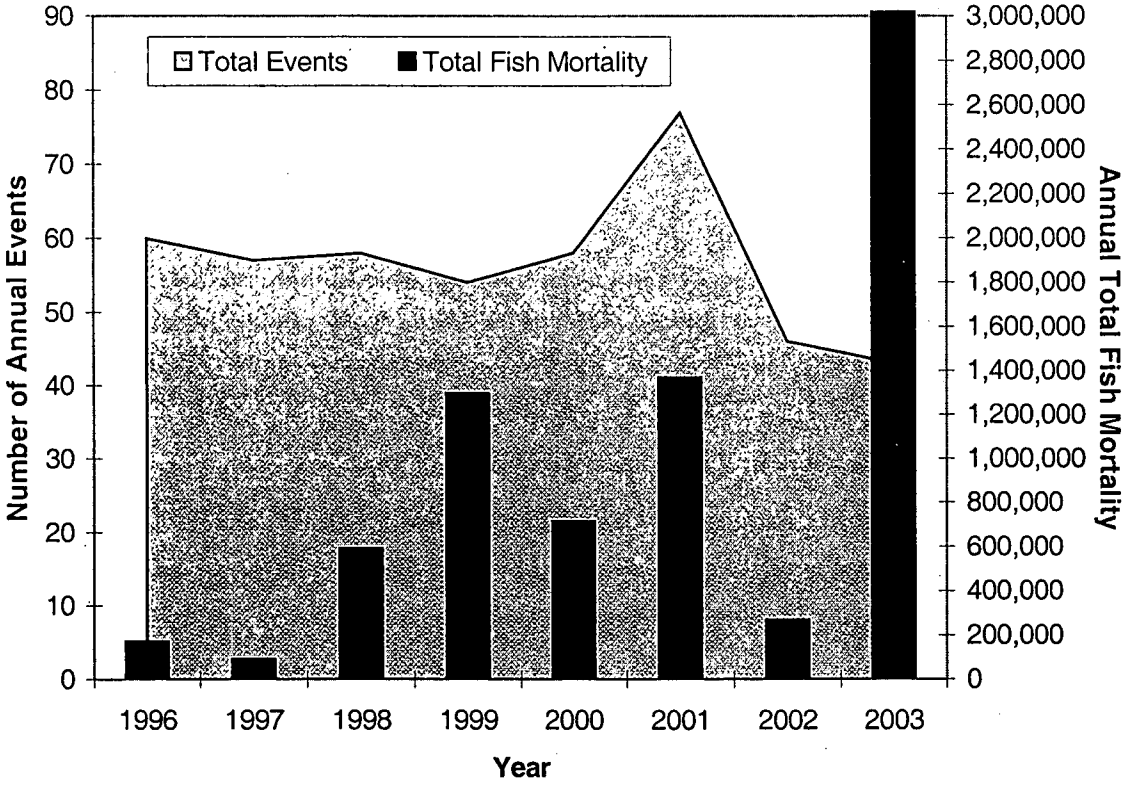
** No fish kill reports have been received from the Hiwassee, Little Tennessee., and Savannah basins since 1996.*

Fish Mortality

Although 2003 produced the lowest number of fish kill events since 1996, the cumulative fish mortality for 2003 was the highest reported in the last eight years (Figure 2). Investigators reported a total of over 3.6 million fish killed for the year. The majority of the year's total (3.1 million) was reported from just two large events in the lower Neuse River near Carolina Pines. Fish mortality figures on 2003 reports ranged from 50 to 1.8 million with a median mortality of 1400 fish.

Figure 2: Reported annual fish kill events and mortality, 1996 to 2003

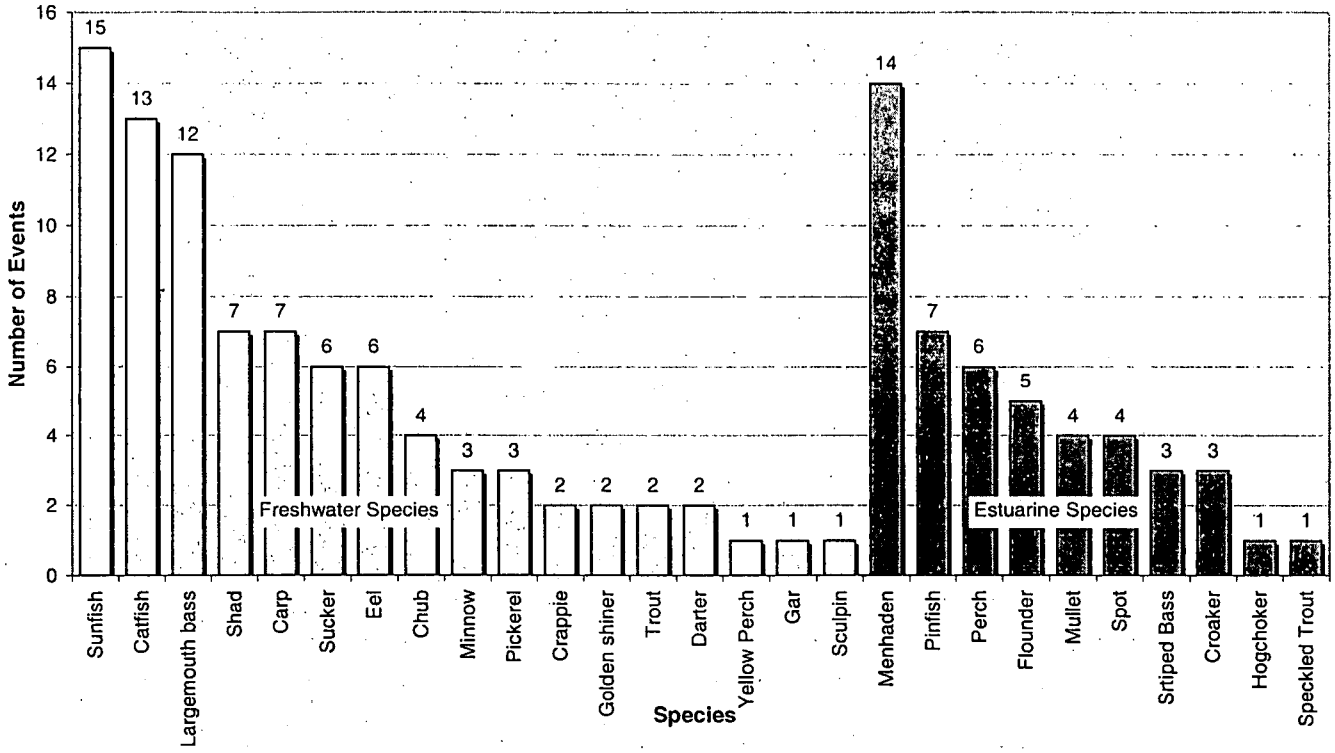


Fish and Other Species Reported

Fish kill events in 2003 involved 27 different species of fish in both estuarine and fresh waters (Figure 3). Freshwater species most commonly identified during investigations included sunfishes, catfishes, and largemouth bass. Estuarine species most commonly reported included menhaden, pinfish, and perch. Atlantic menhaden have historically been involved in a majority of estuarine kill events and have exhibited stress and disease in conjunction with fish kills. Menhaden often display gross or microscopic lesions along with chronic symptoms and fungal infections consistent with ulcerative mycosis described by Noga, et al (1993).

Other non-fish species were also cited on 13 reports. Freshwater species included aquatic insects, salamanders, frogs, turtles, snakes, and crayfish. Estuarine reports included two kills of *Macoma* clams in Beaufort County during June and July. Several reports also noted kills of blue crab in addition to finfish species.

Figure 3: Finfish observed during 2003 fish kill events

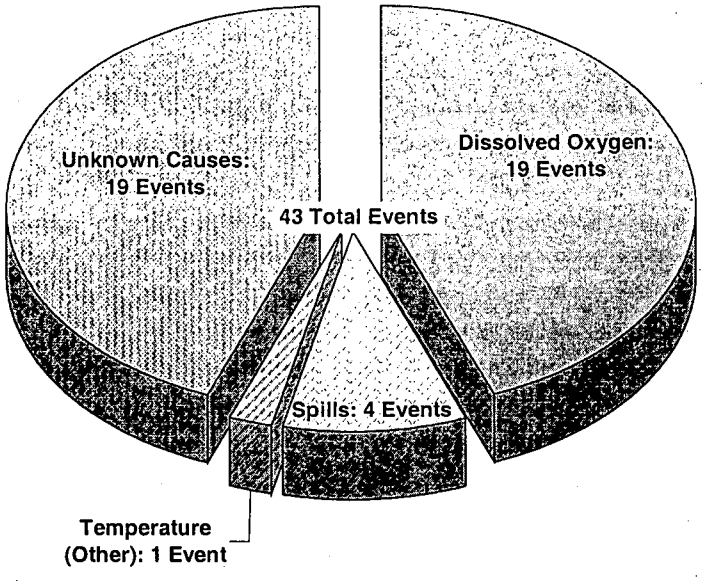


Suspected Causes of 2003 Events

Specific causes of fish kill events may or may not be obvious to investigators depending on a host of factors. Many causes are identified, but others remain unconfirmed or unclear due to an investigation occurring hours or days after the actual event. Kill events often result from many environmental conditions, and sorting out the major reason(s) why a fish kill occurs is frequently a difficult and often subjective task. Investigators are encouraged to submit suspected causes on reports along with supporting information as part of DWQ fish kill investigation protocols. Suspected cause reports aid in evaluating potential water quality trends and problems, and assist scientists and decision-makers with formulating future courses of action. Suspected causes on reports should not be viewed as a definitive label for a particular event.

Reported causes of 2003 kill events are summarized into four categories –dissolved oxygen (DO) induced events, spills, and other (miscellaneous) causes. Those events where no specific causes could be determined were assigned as "unknown" (Figure 4).

Figure 4: Reported Causes for 2003 Fish Kill Events



Dissolved Oxygen Depletion: Poor dissolved oxygen (DO) was cited as a factor in 19 kill events during 2003. DO depletion was also reported as a factor in the years largest fish kills observed in the lower Neuse estuary during August and September (see Notable Events). Events in the lower Neuse were associated with upwelling of hypoxic water from the river bottom or depletion of DO in warm shallow areas. Hypoxic conditions have historically occurred in North Carolina's estuaries as nutrient and organic loading coupled with water column stratification deplete DO levels during the summer months. Several large fish kills in the Chowan/Pasquotank and Roanoke river basins were also attributed to DO depletion following Hurricane Isabel. Severe runoff, flooding of agricultural areas, and flushing of swamps and backwaters resulted in high inputs of oxygen demanding organic material into the northeastern North Carolina waters. The hurricane effects resulted in a DO level of 0.5 mg/L or less in portions of the Chowan and Roanoke rivers for a period of weeks. DO kills on several freshwater impoundments were associated with high water temperatures and heavy infestation of decomposing vegetation/algae.

Spills: Toxic spills may deplete DO levels in receiving streams or induce kills outright through physical or chemical toxicity. Spills were reported as a cause in four kill events during 2003 (Table 2).

Table 2: Spill-induced fish kills during 2003.

Date Investigated	Waterbody	County	Mortality	Comments
1/7/2003	California Creek	Madison	83000	Kill caused by a tanker truck spill of propionic acid directly into California Creek.
4/23/2003	Core Creek	Craven	1200	Kill likely caused by spill of chlorpyrifos. Analyses showed levels as high as 5.1 ppb in water samples.
5/3/2003	Grape Creek	Craven	2000	The kill was reported by a local citizen after noticing a white substance in a pile in the stream. The substance was toxic to aquatic organisms killing all aquatic fauna in the affected area. Three organophosphates were identified : chlorpyrifos, fenamiphos, and malathion.
10/15/2003	Middle Fork South Fork New River	Watauga	14300	Fish kill was the result of a 3000 gallon spill of sodium hydroxide from the town of Blowing Rocks water filtration plant. The spill caused a kill extending at least 5.8 miles below the plant. The pH of the stream below the spill was measured at 11.5. DWQ issued a notice of violation to the town.

Unknown Causes: Causes for kill events are reported as unknown when investigators fail to cite specific reasons for an event. Investigations may not provide definitive causes when they are conducted too long after an event and no clear factors are determined, or when causes are suspected but not confirmed. Investigators failed to cite or confirm causes for 19 of the year's reports. Reports with unknown causes were received from both estuarine and fresh waters. Many of the reports with unknown factors involved atlantic menhaden in coastal estuaries with a high incidence of lesions.

Other: Investigators reported a kill of at least 2000 speckled trout on the Pamlico River during the month of January. Fish were seen dying over a broad area stretching from Blount's Creek downstream to the Pungo Creek area. Investigators cited extremely low water temperatures as a cause for the event. Reports of cold weather events or "winter kill" are not uncommon in North Carolina. Records show the events usually occur in the months of January and February following periods of extreme cold.

ESB Examinations for Harmful Algae: During 2003, the ESB staff routinely examined water samples associated with estuarine fish kills for the presence of *Pfiesteria* and *Pfiesteria*-like organisms. ESB examinations were performed using light and epifluorescent microscopy. Suspect samples warranting further confirmation for toxic *Pfiesteria* species were also forwarded to UNC-Greensboro and the NCSU Center for Applied Aquatic Ecology for further tests. These tests include fish bioassays, scanning electron microscopy, and an RNA probe that can discern the presence of actual *Pfiesteria* cells. *Pfiesteria*-like cells examined by ESB staff during 2003 appeared as nontoxic obligate autotrophs and not forms historically associated with fish health events. At the time of this report, all confirmatory tests results have been reported as negative and all involved laboratories have reported that toxic *Pfiesteria* was not a causal factor in any of the 2003 events.

ESB staff members identified a number of dense algal blooms in the White Oak, Tar/Pamlico, and Neuse River basins. Some of these blooms were associated with fish kill events (occurring around the time of the event) but could not be determined as a cause. Notable were elevated levels of the algal flagellate *Heterosigma akashiwo*. The alga can produce brevetoxin and facilitate the growth of bacteria in fish. *H. akashiwo* has been associated with fish kills in other regions of the world but has yet to be linked to events in North Carolina. ESB staff members will continue to monitor the occurrence of the species.

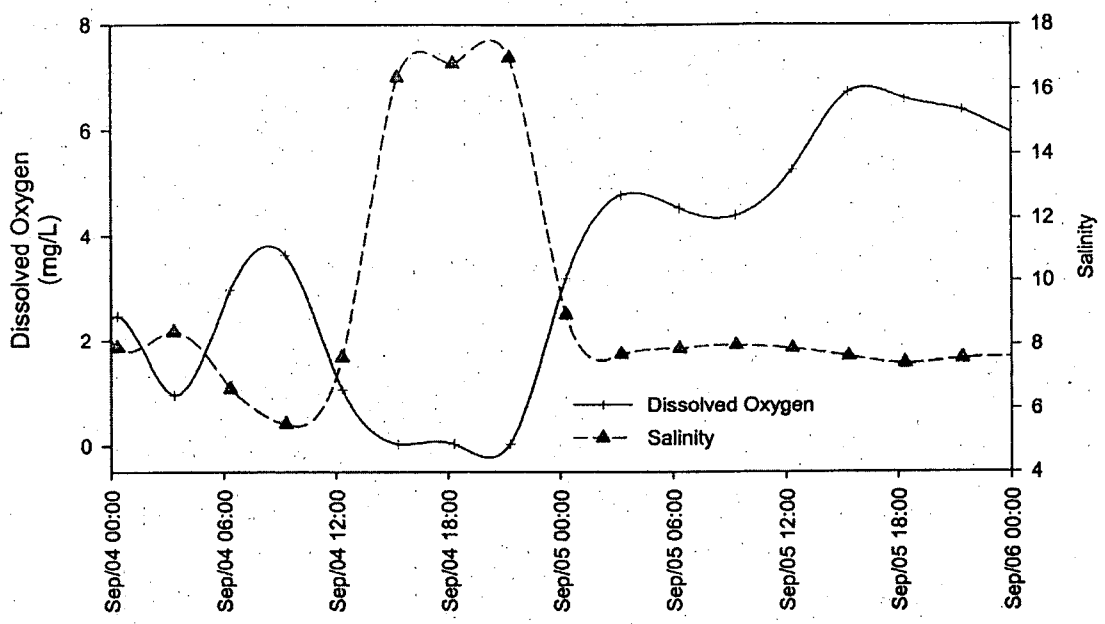
Notable Events

Pesticide Spills, Core Creek and Grape Creek, April and May, 2003: During the Spring of 2003 investigators reported fish kills on Core and Grape creeks near Cove City (Craven County) as a result of pesticide spills. The Core Creek event occurred in April apparently as a result of a spill of chlorpyrifos (Dursban), a broad range insecticide that poses acute toxicity risks to aquatic life. A second pesticide event occurred on Grape Creek, a tributary to Core Creek in early May. Water samples collected in the wake of both events showed chlorpyrifos levels as high as 5.1 ug/l in addition to the presence of fenamiphos (a highly toxic organophosphate) and malathion. The subsequent concern over the risk from dermal exposure and consumption of fish exposed to fenamiphos and the other organophosphates resulted in the Craven County Health Department temporarily posting a human health advisory in Core and Grape Creeks for swimming and fishing. During this time the DWQ perfomed fish tissue sampling in Core Creek to assess pesticide contamination. Fish tissue (as well as previous water samples) were delivered to Dr. Damian Shea of the North Carolina State University Department of Environmental and Molecular Toxicology for analyses. Dr. Shea reported no detectable levels of the target pesticides in fish tissue. Further water sampling throughout June showed chlorpyrifos, fenamiphos and other organophosphate levels had decreased below recommended levels of concern for ingestion and dermal exposure. The Craven County Health Department lifted the advisory for Core and Grape creeks in July.

Large Fish Kill Events, Neuse River near Carolina Pines, August And September 2003: The section of the lower Neuse River between New Bern and Minnesott Beach has historically been a trouble spot for fish kill activity. Fish kills in the area were especially prevalent during 2003 with 15 events reported. During late August and early September the Neuse River Response Team (NRRT) investigated two very large kill events near Carolina Pines (Craven County). Together the events involved at least 3.1 million individuals comprised of menhaden and other estuarine species. Data from US Geological Survey and North Carolina State University monitoring equipment indicated that mixing or upwelling of hypoxic water from stratified layers in the river was largely responsible for the kills. Instruments recorded a severe drop in DO levels in adjacent areas of the Neuse prior to both events (Figure 4). DO depletion matched an increase in wind speed that likely caused the mixing events. ESB staff analyses of phytoplankton samples collected during the events showed a very diverse mix of algal species commonly seen in the Neuse that may have also contributed to the fish kills. Pfiesteria-

like dinoflagellates were absent in phytoplankton samples or present at insignificant levels. NRRT reported few fish exhibiting lesions in either event.

Figure 4: NCSU Neuse River monitoring data near Carolina Pines showing depletion of dissolved oxygen and changes in salinity prior to fish kill – September 5, 2003



Hurricane Isabel Fish Kill Events, September 2003: On September 18 Hurricane Isabel came ashore on the Outer Banks as a category two storm and passed over the northeast region of North Carolina roughly from Ocracoke to Roanoke Rapids. The storm dumped from three to eight inches of rain in its path causing severe flooding in the Chowan/Pasquotank, Roanoke, Tar/Pamlico and Neuse drainages. Heavy rains flushed swamps and backwaters washing large quantities of oxygen demanding organic matter into rivers and estuaries. Investigators reported seven fish kill events directly related to Isabel. In addition, there were as many as twenty anecdotal reports of dying fish that could not be confirmed by response teams or agency staff.

Conditions were the worst in the Chowan and Roanoke rivers. DO levels on the Chowan were depressed for a period of weeks after the storm to as low as 0.2 to 0.3 mg/L from Tunis to 10.5 miles below Holiday Island. A kill was reported at Tuscarora Beach (400 fish), but reports of dispersed fish, dead and in distress, were numerous. Anecdotal reports suggest massive kills occurred throughout the Chowan in weeks following Isabel that were not recorded. The Roanoke River also suffered intense kill activity following Isabel. Approximately 21 river miles were affected from just above Jamesville to the river mouth below Plymouth. Over 93,000 dead fish were found in this stretch and thousands more were distressed. DO levels were at or below 0.42 mg/l throughout the entire zone.

2003 Summary

Investigators reported fish kill events in 10 of the state's 17 major river basins during 2003 with nearly half of the year's events occurring in the Neuse Basin. The number of fish kills reported across North Carolina during 2003 decreased from previous yearly figures to 43. This is the lowest number of reports since the DWQ began systematically tracking fish kill activity in 1996. Reported fish mortality, however reached the highest level since 1996 with over 3.6 million fish killed. Nearly half of the 2003 reports indicated DO depletion as a causal factor. Other reported causes included spills of toxic substances and winter kill.

Several notable events occurred during the year resulting in significant fish kills in eastern North Carolina. Pesticide spills in Grape and Core creeks in Craven County resulted in the Craven County Health Department posting a temporary advisory for the waterbodies. DO depletion in the Neuse River near Carolina Pines caused the year's two largest events that affected nearly 3.1 million fish. Hurricane Isabel caused severe flooding in the northeast corner of the state and subsequent fish kills on the Roanoke and Chowan rivers.

REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION AND FISCAL RESEARCH DIVISION OF THE NORTH CAROLINA GENERAL ASSEMBLY
ON
WATER QUALITY ACCOUNTABILITY FOR THE AGRICULTURE COST SHARE PROGRAM FISCAL YEAR 2002

INTRODUCTION

In 1983 the North Carolina Agriculture Cost Share Program (ACSP) was authorized by the General Assembly to improve water quality associated with agriculture in three nutrient sensitive areas of the state covering 16 counties. It was expanded in 1990 to include all 96 Soil and Water Conservation Districts covering all 100 counties.

While the Soil and Water Conservation Commission (Commission) has the statutory responsibility to create, implement and supervise the Cost Share program, it is delivered at the local level by 492 elected and appointed soil and water conservation district supervisors who are assisted by their staff and partners in natural resource conservation. These partners include technical and professional employees of the U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS), the District or county, the Division of Soil and Water Conservation (Division), the Cooperative Extension Service, and the North Carolina Department of Agriculture and Consumer Services.

In this very popular program, participating farmers receive up to 75 percent of the average cost of an installed best management practice (BMP) with the remaining 25 percent paid by the farmer directly or through in-kind contributions (e.g., labor). When complete cost information is not available, the farmer is required to submit invoices and is paid at 75 percent of actual cost rather than average cost. Cost Share payments cannot exceed $75,000 per year per applicant.

The Commission continues to adapt the program to respond to changing needs and technology. For Program Year 2002, there were 44 approved BMPs grouped under 26 definitions in the ACSP. BMPs include both short-term and

long-term practices. The definitions of approved BMPs for the Cost Share program are provided in the Detailed Implementation Plan (Attachment A).

For a BMP to be approved by the Commission for the ACSP, there must be 1) an NRCS technical standard addressing that BMP, and 2) sufficient cost information to determine the appropriate cost share amount. Occasionally, BMPs are approved on a limited scale for evaluation purposes (District BMPs).

For most practices, the amount provided in cost share is based on 75% of a predetermined average cost for the practice. However, some practices are cost shared on 75% of actual cost due to the variable nature of the practice. (In the 2003-04 Budget Bill, the General Assembly approved a special budget provision that modified N.C.G.S 143-215.74(b) to allow beginning farmers and limited resource farmers to receive up to 90% cost share beginning in the 2004 program year.) The Commission conducts a wholesale review of its cost rates every three years, but it can make necessary mid-course corrections when presented with information that one of its predetermined costs is inaccurate.

Districts spot check a minimum of 5% of randomly selected active contracts each year to ensure that practices are being maintained properly. Further Division and NRCS also spot check contracts as part of regular reviews of district office implementation of the ACSP. Spot checks have shown excellent compliance with maintenance requirements by participating farmers. When practices are discovered to need additional maintenance, the district is usually able to assist the cooperator to restore the practice.

PROGRAM ACCOMPLISHMENTS

Since the first Cost Share contracts were issued in 1984, there have been 32,559 contracts for installing BMPs (through the end of program year 2002, which ended on June 30, 2002). Most BMPs have a life expectancy of ten years, which is how long participating farmers must agree to maintain the practices.

Early in the program, the major factor used for determining success was tons of soil saved because the program funded predominantly sediment and erosion control practices. It is estimated that an average of 5.54 million tons of soil have been saved annually during the life of the program. Since the mid-1990s, while continuing its attention on minimizing soil loss and erosion, the program has increased its attention on reducing and managing nutrients from cropland and livestock production. Part of the impetus for this new attention was the promulgation of the 15A NCAC 2H.0200 animal waste management rules and the nutrient sensitive waters strategies for the Neuse and Tar-Pamlico River Basins.

Highlights of additional accomplishments include the following:

- Over 100,000 acres of marginal or environmentally sensitive cropland have been converted to trees, grass, or wildlife habitat
- 2,029 waste management structures have been constructed to properly store and manage dry and wet animal waste
- 3,570 water control structures have been installed improving water management on and reducing nutrient loss from approximately 288,000 acres
- Over 820 miles of fencing have been erected, in combination with other practices (e.g., watering sources) to exclude livestock from streams
- Over 550,000 acres of cropland acres have been converted to no-till or conservation tillage to reduce sediment loss associated with traditional practices
- Over 80 miles of forested riparian buffer have been established
- 80 structures have been built for the proper handling and storage of agricultural chemicals (pesticides and fertilizers)

REPORTING REQUIREMENTS

Projects Receiving State Funds

Participating farmers have up to three years to complete the work included in ACSP contracts. Therefore, cost share payments made each year may be for contracts written in the current fiscal year or in the two previous fiscal years. For this reason the fund balance for the program may appear higher than expected, but it is important to remember that the vast majority of cost share funds are encumbered to contracts with cooperating producers.

Each contract is considered a "project." Each project may include only one BMP or a system of practices that include several BMPs. Cost share payments are made only when installation of the BMP is completed and certified to be in accordance with current NRCS or Commission standards.

Cost Share payments were applied to **1,845** projects between July 1, 2001 and June 30, 2002. These contracts received total payments of **$6,855,250**. A list of individual contracts to which Cost Share funds were applied in Program Year 2002 is available upon request.

New Contracts for Fiscal Year 2002

For Fiscal Year 2002 soil and water conservation districts requested **$23,920,210** to address identified water quality needs. The General Assembly appropriated **$5,669,897** in recurring general funds for BMP installation. Current funding levels give the ACSP the potential to serve less than one out of every four producers requesting financial assistance for installing BMPs to protect water quality in North Carolina.

For Fiscal Year 2002, the Commission allocated $10,450,228 to districts, from 2002 appropriations, from funds that were not encumbered to contracts in 2001, and from funds recovered from completed and expired contracts from Program Year 1999. (As noted in the 2001 Annual Report, there was a budget-related temporary freeze on program funds in 2001 that resulted in districts not being able to fully contract program funds in 2001.) The allocation included $1,000,000 earmarked by the Commission for installing BMPs in watersheds of streams on the state list of impaired waters due to sediment from agricultural sources. It also included a $500,000 earmark to be used for installing riparian buffers, which provides a portion of the state match for the Conservation Reserve Enhancement Program.

In Fiscal Year 2002 districts obligated **$8,582,513** to **1,937** new contracts with farmers.

Due to delays imposed related to the FY-2002 budget process, the Commission was not able to allocate ACSP funds to districts until its November 2001 meeting, which limited the ability of districts to write contracts to utilize all of the funds allocated by the Commission in 2002. Other districts experienced extended vacancies in technical assistance positions that are essential to working with farmers to develop and implement conservation plans, which also limited their ability to contract all funds available in 2002. Tight budgets at both the state and local level affected implementation of the program.

As shown in Figure 1, 35% of the 2002 funds were directed toward erosion and nutrient-reducing BMPs (e.g., conservation tillage, cropland conversion to grass or trees), 24% were directed toward stream protection systems (e.g., livestock exclusion from streams), 21% were directed toward animal operations for waste management BMPs (e.g., poultry litter storage structures, closure of inactive lagoons, livestock feeding/waste storage structures), 18% were directed toward sediment and nutrient-reducing BMPs (e.g., riparian buffers, field borders, grassed waterways), and 2% were directed toward agrichemical pollution prevention practices (e.g., agrichemical handling facilities).

Attachment B is a chart displaying a summary of contracts initiated during the 2002 program year (July 1, 2001 - June 30, 2002). This chart shows the planned as well as installed BMPs. The most-used single BMP from a financial and acres affected standpoint (nearly $1.7 million affecting over 18,000 acres) was the 3-year conservation tillage incentive. Attachment C presents the number and value of 2002 contracts by soil and water conservation district and each district's allocation of cost share funds for 2003.

Figure 1: Breakdown of 2002 ACSP Contracts by BMP Type

- Waste Management
- Agrichemical Pollution Prevention

Estimated Water Quality Benefits of ACSP Contracts Initiated in 2002

N.C.G.S 143-215.74(b)(7) requires that each project's benefits to water quality be estimated before funding is awarded. To meet this requirement, the Commission chose three indicators of water quality benefits: tons of soil saved, pounds of nitrogen saved or managed, and pounds of phosphorus saved or managed. Soil savings estimates have been required on all Cost Share contracts since the beginning of the program. Beginning with the 1997 program year, estimates of nitrogen and phosphorus savings were required to be reported. The Division continues to work with the Division of Water Quality, NRCS, and North Carolina State University to improve and refine our method to estimate and account for nutrient reductions.

These estimates have been very useful to help track progress by agriculture relative to the nutrient reduction requirements in the Neuse and Tar-Pamlico Nutrient Reduction Rules for agriculture. The ACSP is playing a key role in helping farmers achieve the 30% nutrient reduction required in these rules.

Local soil and water conservation districts determine which projects are eligible for funding in their districts according to a required priority ranking process, tailored to each district's water quality concerns. The water quality evaluations on each project are carried out at the district level, and the water quality benefit estimates are provided to the Division on each contract form. The data are entered from the contract form into the Division's cost share database and tracked by Division staff. The estimated sediment and nutrient reduction benefits for program years 2000-2002 are summarized in Table 1.

Some BMPs standing alone will not directly result in sediment or erosion reductions or nitrogen or phosphorus savings, but are used in conjunction with other practices. These BMPs are called "facilitating practices" and are necessary to facilitate and ensure that other practices in the BMP system are effective at reducing nutrient or sediment loading to a water resource. Therefore, their reduction credit is linked to the facilitated practice. An example of a facilitating practice is a water tank, which must be installed for livestock drinking water purposes before fencing can be put up to keep livestock out of a stream.

Table 1: Sediment and Nutrient Reduction Benefits for Program Years 2000 through 2002.

	2000	2001	2002
Number of Contracts	2,226	2,060	1,937
Acres Affected	121,854 acres	112,377 acres	82,543 acres
Soil Saved	373,915 tons	377,713 tons	263,256 tons
Nitrogen Saved	2,673,321 pounds	2,092,966 pounds	1,744,041 pounds
Phosphorus Saved	879,323 pounds	253,392 pounds	405,078 pounds
Waste Nitrogen Managed	5,478,403 pounds	6,530,669 pounds	4,710,852 pounds
Waste Phosphorus Managed	6,162,512 pounds	6,689,546 pounds	3,973,017 pounds

Effectiveness of Each Project to Accomplish Its Primary Purpose

The statutory purpose of the program and each project is to reduce the input of agricultural non-point source pollution into the water courses of the state, which is for water quality improvement. Each BMP approved for the Cost Share program is designed for one of five major purposes to protect the water resources of the state:

1) sediment/nutrient delivery reduction through reduction of applied nutrients, reduction of soil loss, or interception of nutrients from fields;

2) erosion reduction/nutrient loss reduction in fields through reduction of applied nutrients or prevention of soil detachment;
3) prevention of agricultural chemical pollution of ground or surface water from improper handling or accidents;
4) reduction of nutrient loading through proper management of animal waste; and
5) stream protection measures to reduce the delivery of sediment and nutrients by animals and stabilize streambanks to minimize further erosion and sediment contribution.

Attachment D is a chart showing the approved BMPs in these categories and their relationship to water quality improvement.

Staff of the Division, soil and water conservation districts, and NRCS has verified every project for which program year 2002 funds have been expended to have been installed in accordance with program standards and to be accomplishing its primary purpose.

TARGETING ACSP FUNDS TO WATERSHEDS OF IMPAIRED WATERS

The Commission continues to exercise leadership in allocating ACSP resources to local districts containing impaired waters and in encouraging district supervisors to use ACSP funds to address impaired waters. This is best illustrated by the fact that the Commission targeted $1,000,000 of funds available in 2002 for the specific purpose of installing erosion- and sediment-reducing best management practices into watersheds of waters listed on the State's 303(d) list of waters as impaired due to sediment from sources including agriculture in sixteen counties.

Historically, about 30% of ACSP funds have been used to implement BMPs in watersheds of impaired waters. Considering that only 3% of North Carolina's stream miles are attributed to being impaired by agricultural sources, this demonstrates that the ACSP funds are being significantly targeted toward improving streams that do not fully meet their uses.

Further, over 25% of funds contracted in Program Year 2002 were contracted with farmers in the Neuse and Tar-Pamlico River Basins, where farmers are required to reduce agricultural nitrogen loading by 30%.

The Commission also earmarked $500,000 of Program Year 2002 funds to seventeen districts to assist with implementation of riparian buffers in nutrient sensitive watersheds under the Conservation Reserve Enhancement Program.

NEW PROGRAM ENHANCEMENTS TO IMPROVE EFFICIENCY

Because of the need to continually improve the program's cost effectiveness, and because of recurring budget reductions in the program's appropriation, the Commission made several enhancements that took effect for the 2002 program year. These enhancements were designed to improve the efficiency by which program funds are used by agricultural cooperators to install best management practices.

One efficiency modification was to adopt a rule to revise the Commission's formula for allocating program funds to each soil and water conservation district. The revised formula improves fairness in allocating funds and will help ensure that districts with the greatest water quality needs and that have a proven track record of successful implementation receive a higher proportion of program funds each year.

Another efficiency improvement was designed to accelerate installation of BMPs under the program's multi-year contracts described earlier. This improvement targets program funds toward cooperators who are prepared to implement best management practices within 12 months of contract approval. If a cooperator fails to complete at least 1/3 of the work included in the cost share contract within 12 months of the contract approval date, then the contract will terminate. Because cooperators sometimes encounter conditions beyond their control, local soil and water conservation districts can grant an extension of up to 6-months to complete at least 1/3 of the work. This improvement was added to establish a better incentive for cooperators to begin work early during the contract period. This will result in fewer contracts terminating after lengthy contract periods, and more efficient use of program funds as cooperators and districts become accustomed to this higher standard. Of course, every attempt is being made to be fair and to work with cooperators who voluntarily participate in the cost share program to get practices installed.

COST-EFFECTIVENESS CONSIDERATIONS

The ACSP is an extremely cost-effective program from both a state expenditure perspective and the farmer's perspective. Without the program, progress under state water quality initiatives would be far less, and many farmers could not afford to implement BMPs (many of which are required by regulations). Because a farmer must invest at least 25% of the cost for BMPs, the farmer has ownership in the practice and is more likely to maintain it. The education value of local farmers participating the program is substantial in helping to change local practices.

The program has been effective in leveraging federal and local funds for conservation and nonpoint source pollution control efforts. Whenever possible,

the districts use the ACSP in conjunction with other programs, such as the federal Environmental Quality Initiative Program and the Conservation Reserve Enhancement Program, to stretch scarce resources as far as possible, and partner to meet the needs of cooperating producers and landowners.

Many districts also use program funds to leverage other grant funds (e.g., EPA 319, CWMTF) to maximize service to local farmers and local benefits for water quality.

Attachment E is an overview of the funding and compliance process used for implementing the Agriculture Cost Share Program.

This program is delivered locally by 492 elected and appointed volunteer Soil and Water Conservation District Supervisors. They receive no state salary, yet are responsible for seeing that state funds are spent where they are needed to improve water quality. District supervisors are required to develop a prioritization ranking system for administering the Cost Share Program in their respective district to maximize the water quality benefits of the program. Applications to each district are judged and prioritized according to this system. District supervisors also must inspect at least five percent of all Cost Share contracts in their District every year to ensure the BMPs are properly maintained.

The ACSP is also heavily dependent on the technical resources of the local soil and water conservation districts and the NRCS. District and federal employees develop conservation plans, design BMPs, and provide engineering assistance for water quality improvements at no cost to the farmers whose applications are accepted for Cost Share assistance. These staff also assist farmers and other landowners in implementing water quality projects using other funding sources such as the USDA's Environmental Quality Incentives Program and Conservation Reserve Enhancement Program, the U.S. Environmental Protection Agency's Section 319 Non-Point Source Program, and North Carolina's Clean Water Management Trust Fund.

A portion of the General Assembly's appropriation for the program is used to provide a state match for salaries of these district technical employees and for operating expenses to carry out the Cost Share program. For 2002, the General Assembly appropriated $1,875,000 in recurring funds for cost sharing technical assistance positions in local districts, and directed DENR to transfer $240,000 from BMP assistance to support technical assistance. County commissions provide 50% match, office space, and administrative support. In program year 2002 the cost share technical assistance program cost shared on 124 technical positions (118.94 FTEs) in 89 counties to assist farmers in designing and installing BMPs. These state match funds help to sustain local county support and funding for local delivery of the program.

NRCS engineers and conservation specialists are also available to each District. These federal employees carry out a portion of the Cost Share work support without cost to the state, and they provide additional technical resources and expertise to ensure that cost-shared practices are properly installed and maintained for the expected life of the practice.

In addition, NRCS permits district staff to use federal vehicles for use on state Cost Share work. NRCS also provides computers and sophisticated natural resources materials and computer software in all 100 county field offices, and develops the technical standards for most of the BMPs used in the Cost Share program. This state program leverages an equal or greater amount of federal funding for water quality improvements in North Carolina.

PROGRAM MANAGEMENT

A Division program staff of four FTEs (one position was eliminated in the 2002 budget) reviews approximately 2,000 contracts annually and processes about 3,000 requests for payment each year. The Division also maintains the ACSP Manual, trains local personnel, provides daily technical assistance to the districts, and conducts oversight through district program reviews in at least 24 Districts per year to ensure proper record keeping and BMP maintenance for continued water quality protection. In 1998 the Division requested a financial audit of the program by the State Auditor so that further improvements, if needed, can be implemented. A 1997 performance audit by a team of Duke University graduate students found the Agriculture Cost Share Program to function effectively, but it included some recommendations for improving the marketing, targeting, and accountability of the program, many of which have been or are being implemented.

Because the state specifies that the purpose of the program is to assist agricultural operations in addressing an existing water quality problem, the program does not assist new operations to go into business. It is the policy of the Commission that new producers or companies constructing new agricultural operations should be aware of the existing environmental requirements and technical standards and should be prepared to meet them without state funding assistance. This is especially important when existing operations are struggling to comply with new requirements that were not in place when they began operating. Therefore, the Commission has restricted eligibility for Cost Share funds to those operations already in existence as of May 1992 (the date that the .0200 rules were proposed) that need help to meet new regulations designed to protect ground and surface water. Operations that were not in existence as of May 1992 may still be eligible for cost-share if changes in environmental statutes or regulations (e.g., SB 1217 in June 1996) create new requirements that could,

without assistance, make the facility out of compliance. These exceptions require Commission approval.

IMPACT OF BUDGET REDUCTIONS IN 2001 AND 2002

For Fiscal Year 2001 the Department was directed to transfer $240,000 appropriated for BMP assistance to overcome a projected shortfall of funds for cost sharing for essential technical assistance staff in local soil and water conservation districts. This transfer represented a 3.4 percent reduction in the funding available for assisting farmers with costs to install best management practices for Fiscal Year 2002.

The 2002 budget bill made the transfer for technical assistance permanent. Further, for 2002 the recurring appropriation for the Agriculture Cost Share Program was reduced by another $1,000,000. The net effect of the reduction and diversion is that for Fiscal Year 2002 the funding available for assisting farmers to install best management practices was reduced by $1,240,000 (17.9%) relative to the Fiscal Year 2000 funding level.

This recurring loss of funds for the ACSP has had several negative consequences. These include:

- Reduction in the number of agricultural producers assisted, turning away an estimated 200-250 additional producers per year.
- Threatened the state's ability to provide the required 20% match for the $221 million in federal funds for the Conservation Reserve Enhancement Program (CREP). The non-federal match for CREP relies on $8.84 million of ACSP funds over 5 years used to establish riparian buffers on agricultural land enrolled in CREP. DENR may be forced to seek additional legislative appropriations or other non-federal revenue sources (e.g., Tobacco Trust Fund) or risk loss of federal funds through termination of the State's CREP agreement by USDA.
- Significant reduction in the financial assistance available to assist agricultural producers in the Neuse and Tar-Pamlico river basins to implement BMPs and achieve 30% nutrient reduction requirements.
- Reduction in financial assistance available to assist livestock and poultry producers to respond to new phosphorus management requirements resulting from modification to the NRCS Nutrient Management Standard and NPDES permitting requirements. These changes are creating enormous new demands on ACSP, even in advance of approaching federal regulation deadlines, as producers try to prepare to meet new requirements.
- Reduction in funds available for installing BMPs in watersheds of streams impaired by sediment from agricultural sources. The Agricultural

Sediment Initiative is a priority for the Soil and Water Conservation Commission and the Sediment Control Commission.

- Reduction in available funding for installing new riparian buffers and protecting streams from impacts from livestock and cropland. DENR wants to rely on voluntary approaches to establish and protect buffers, but ACSP is primary state program for this purpose.
- Perhaps the most significant consequence has been the danger of diminishing the local impact of the ACSP to the point that it may weaken and undermine local governments' support (match) for soil and water conservation district technicians who provide technical assistance (BMP design and installation oversight) to agricultural producers. The Soil and Water Conservation Commission has worked diligently with a reduced program appropriation over a number of years to build and maintain local support for district technical assistance. A reduction in local support will seriously jeopardize the state's ability to maintain a local technical support workforce for conservation programs. For example, if local county match for technical assistance funding is reduced or eliminated because BMP funds are reduced to a point of diminishing returns, local technical positions will be lost permanently, regardless of availability of state funds for match.

CONCLUSION

Based on the above considerations, the Commission believes the ACSP is being administered very cost-effectively and that considerable water quality benefits are being realized for the investment made with state funds. The program aids agricultural operations in making essential water quality improvements, the cost of which cannot be passed on to the consumer in the price of the food or fiber product, and thereby contributes both to water quality and to sustaining a strong state agricultural economy. The Commission continues to emphasize prioritizing, targeting, accountability, leveraging, and adaptability in managing these public funds to further improve the water quality benefits intended by the General Assembly.

The Commission believes that budget reductions have impacted the program's effectiveness and local support to a serious degree. However, the Commission also believes that actions taken to improve program efficiencies can help to partly offset these impacts. The ACSP plays a vital role in assisting farmers and ranchers with voluntary water quality protection and with compliance with state and federal regulatory requirements. The program is our state's cornerstone in efforts to support private lands stewardship for the benefit of water quality and all the citizens of North Carolina.

###

Definition of Practices

(1) An agrichemical handling facility means a permanent structure that provides an environmentally safe means of mixing agrichemicals and filling tanks with agrichemicals for application and storage to improve water quality. Benefits may include prevention of accidental degradation of surface and ground water.

(2) A conservation tillage system means any tillage and planting system in which at least (60) sixty percent of the soil surface is covered by plant residue to improve water quality. Benefits may include reduction of soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

A. An annual conservation tillage for small grain system means a one year tillage and planting system using a small grain crop.

B. A three-year conservation tillage system means a tillage and planting system using the same fields for three consecutive years.

(3) A critical area planting means an area of highly erodible land that cannot be stabilized by ordinary conservation treatment on which permanent perennial vegetative cover is established and protected to improve water quality. Benefits may include reduced soil erosion and sedimentation.

(4) A cropland conversion practice means to establish and maintain a conservation cover of grasses, trees, or wildlife plantings on fields previously used for crop production to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(5) A diversion means a channel constructed across a slope with a supporting ridge on the lower side to control drainage by diverting excess water from an area to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(6) A field border means a strip of perennial vegetation established at the edge of the field that provides a stabilized outlet for row water to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(7) A filter strip means an area of permanent perennial vegetation for removing sediment, organic matter, and other pollutants from runoff and waste water to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination and pollution from dissolved, particulate, and sediment-attached substances.

(8) A grade stabilization structure means a structure (earth embankment, mechanical spillway, detention-type, etc.) used to control the grade and head cutting in natural or artificial channels to improve water quality. Benefits may include reduced soil erosion and sedimentation.

(9) A grassed waterway means a natural or constructed channel that is shaped or graded to required dimensions and established in suitable vegetation for the stable conveyance of runoff to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(10) A heavy use area protection means an area used frequently and intensively by animals, which must be stabilized by surfacing with suitable materials to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved, particulate, and sediment-attached substances.

(11) A livestock exclusion system means a system of permanent fencing (board or barbed, high tensile or electric wire) installed to exclude livestock from streams and critical areas not intended for grazing to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination and pollution from dissolved, particulate, and sediment-attached substances.

(12) A long term no-till practice means planting all crops for five consecutive years with at least 80 percent plant residue from preceding crops to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(13) A pastureland conversion practice means establishing trees or perennial wildlife plantings on excessively eroding land with a visible sediment delivery problem to the waters of the state used for pasture that is too steep to mow or maintain with conventional equipment to improve water quality. Benefits may include reduced soil erosion and sedimentation.

(14) A nutrient management practice means a definitive plan to manage the amount, form, placement, and timing of applications of nutrients to minimize entry of nutrients to surface and groundwater and improve water quality.

(15) A rock-lined outlet means a waterway having an erosion-resistant lining of concrete, stone or other permanent material where an unlined or grassed waterway would be inadequate to improve water quality. Benefits may include safe disposal of runoff, reduced erosion and sedimentation.

(16) A sediment basin means a basin constructed to trap and store waterborne sediment where physical conditions or land ownership preclude treatment of a sediment source by the installation of other erosion control measures to improve water quality.

(17) A sod-based rotation practice means an adapted sequence of crops, grasses and legumes or a mixture thereof established and maintained for a definite number of years as part of a conservation cropping system which is designed to provide adequate organic residue for maintenance or improvement of soil tilth to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(18) A stock trail or walkway means to provide a stable area used frequently and intensively for livestock movement by surfacing with suitable material to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved, particulate, and sediment-attached substances.

(19) A stream protection system means a planned system for protecting streams and stream banks that eliminates the need for livestock to be in streams by providing an alternative-watering source for livestock to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination, and pollution from dissolved, particulate and sediment-attached substances. System components may include:

(A) A spring development means improving springs and seeps by excavating, cleaning, capping or providing collection and storage facilities.

(B) A trough or tank means devices installed to provide drinking water for livestock at a stabilized location.

(C) A well means constructing a drilled, driven or dug well to supply water from an underground source.

(D) A windmill means erecting or constructing a mill operated by the wind's rotation of large vanes and is used as a source of power for pumping water.

(E) A stream crossing means a trail constructed across a stream to allow livestock to cross without disturbing the bottom or causing soil erosion on the banks.

(20) A stripcropping practice means to grow crops and sod in a systematic arrangement of alternating strips or bands on the contour to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances. The crops are arranged so that a strip of grass or close-growing crop is alternated with a strip of clean-tilled crop, fallow, or no-till crop, or a strip of grass is alternated with a close-growing crop.

(21) A terrace means an earth embankment, a channel, or a combination ridge and channel constructed across the slope to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(22) A waste management system means a planned system in which all necessary components are installed for managing liquid and solid waste to prevent or minimize degradation of soil and ground and surface water resources. System components may include:

(A) A waste storage pond means an impoundment made by excavation or earthfill for temporary storage of animal waste, waste water and polluted runoff.

(B) A drystack means a fabricated structure for temporary storage of animal waste.

(C) A livestock mortality management system means a facility for managing livestock mortalities such as to minimize water quality impacts or to produce a material that can be recycled as a soil amendment and fertilizer substitute. Cost sharable

mortality management system components include: composter, mortality freezer, and mortality incinerator.

(D) A waste treatment lagoon means an impoundment made by excavation or earthfill for biological treatment and storage of animal waste.

(E) A waste application system means an environmentally safe system (such as solid set, dry hydrant, mobile irrigation equipment, etc.) for the conveyance and distribution of animal wastes from waste treatment and storage structures to agricultural fields as part of an irrigation and waste utilization plan.

(F) A constructed wetlands for land application practice means an artificial wetland area into which liquid animal waste from a waste storage pond or lagoon is dispersed over time to lower the nutrient content of the liquid animal waste.

(G) A controlled livestock lounging area means a planned, stabilized and vegetated area in which livestock are kept for a short duration.

(H) A closure of abandoned waste treatment lagoons and waste storage ponds means the safe removal of existing waste and waste water and the application of this waste on land in an environmentally safe manner.

(I) A storm water management system means a system of collection and diversion practices (guttering, collection boxes, diversions, etc.) to prevent unpolluted storm water from flowing across concentrated waste areas on animal operations.

(J) An offsite or an alternative poultry dry litter waste utilization means applying, processing and/or transporting poultry dry litter such that it is properly utilized to reduce nutrient impacts.

(K) A feed/waste storage structure means a fabricated structure for the temporary storage of animal waste.

(23) A water control structure means a permanent structure placed in farm canals and ditches which provides control of surface and subsurface drainage to improve water quality. The primary benefit is to reduce nutrient pollution. Other benefits may include reduced pollution from other dissolved and sediment-attached substances, reduced sedimentation and reduced stormwater surges of fresh water into estuarine areas.

(24) An insect control system means a practice or combination of practices (planting windbreaks, pre-charging structures, incorporation of waste into soil, etc.) which manages or controls insects from confined animal operations, waste treatment and storage structures, and waste applied to agricultural land.

(25) A riparian buffer means an area adjacent to solid blue line streams as shown on 7.5 minute USGS maps where a permanent, long-lived vegetative cover (sod, shrubs, trees, or a combination of vegetation types) is established to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen

contamination and pollution from dissolved, particulate and sediment-attached substances.

(26) An odor control management system means a practice or combination of practices (planting windbreaks, pre-charging structures, incorporation of waste into soil, etc.) which manages or controls odors from confined animal operations, waste treatment and storage structures and waste applied to agricultural land.

(27) A streambank stabilization system means the use of bio-engineering practices, native material revetments, channel stability structures, and/or the restoration or management of riparian corridors in order to protect upland BMPs, restore the natural function of the stream corridor and improve water quality by reducing sedimentation to streams from streambank erosion and decreasing the delivery of nitrogen, phosphorous and other pollutants to the stream from adjacent pasture or cropland.

(28) A backflow prevention system means a system for preventing backflow of fertilizers or chemicals from contaminating water sources in fertigation and or chemigation applications. It can include retrofitting or installing injection equipment, check valves, gauges, drains, and vacuum breakers. It does not include items unrelated to backflow prevention (e.g., tanks, mixers, or filters).

(29) A wetland restoration system means a system of practices designed to restore the natural hydrology of an area that had been drained and cropped.

(30) A precision land leveling practice means reshaping the surface of agricultural land to planned grades for the purpose of improving water quality.

*To be used in conjunction with the most recent version of the APA Rules for the North Carolina Agriculture Cost Share Program for Nonpoint Source Pollution Control and the NC-ACSP Manual.

BEST MANAGEMENT PRACTICES ELIGIBLE FOR COST SHARE PAYMENTS

(1) Best Management Practices eligible for cost sharing include the practices listed in Table 1 and any approved District BMPs. District BMPs shall be reviewed by the Division for technical merit in achieving the goals of this program. Upon approval by the Division, the District BMPs will be eligible to receive cost share funding.

Table 1

Practice	Minimum Life Expectancy (years)
Agrichemical Handling Facility	10
Backflow Prevention System	10
Conservation Tillage System :	
Annual for small grain	1
Three year	3
Critical Area Planting	10
Cropland Conversion	10
Diversion	10

NC Agriculture Cost Share Program

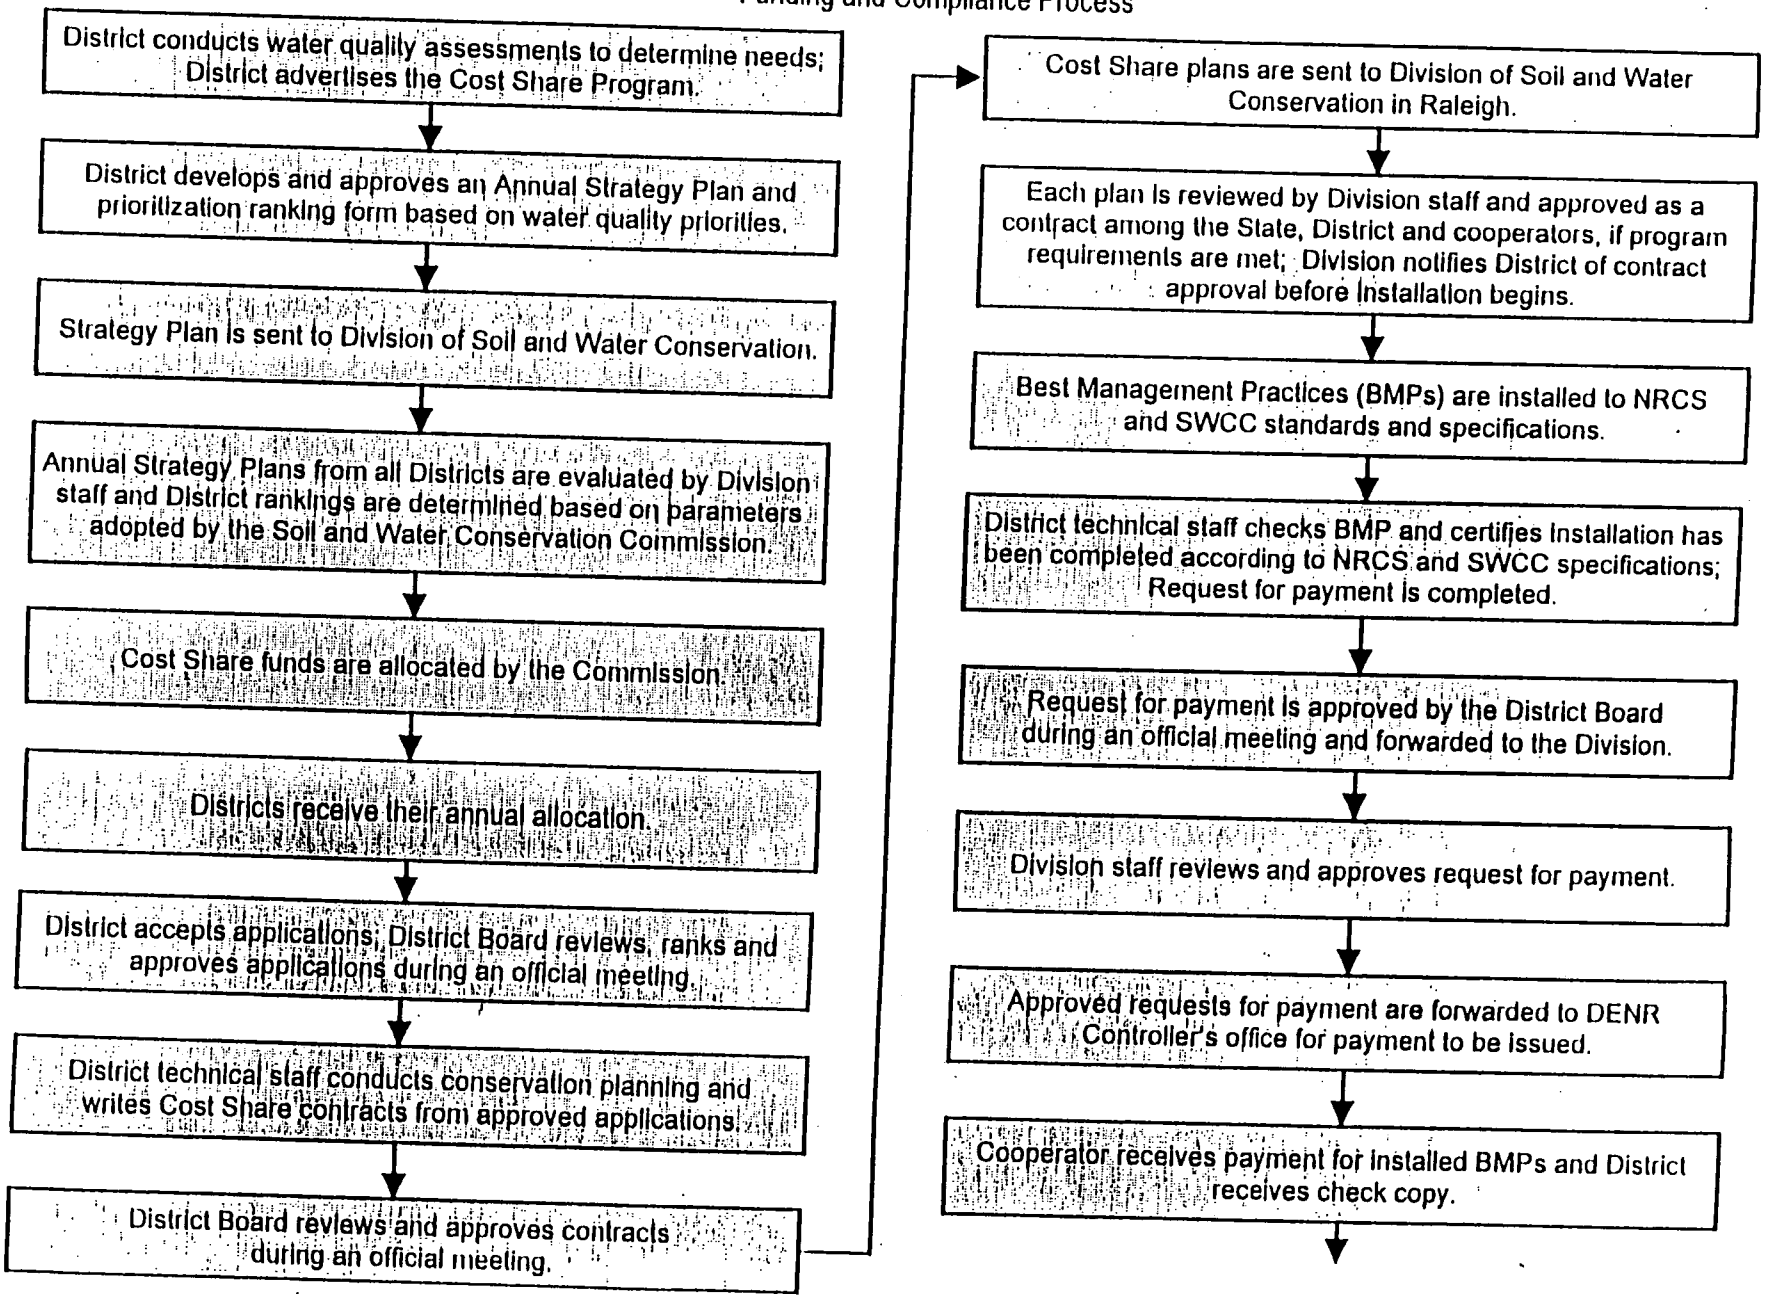
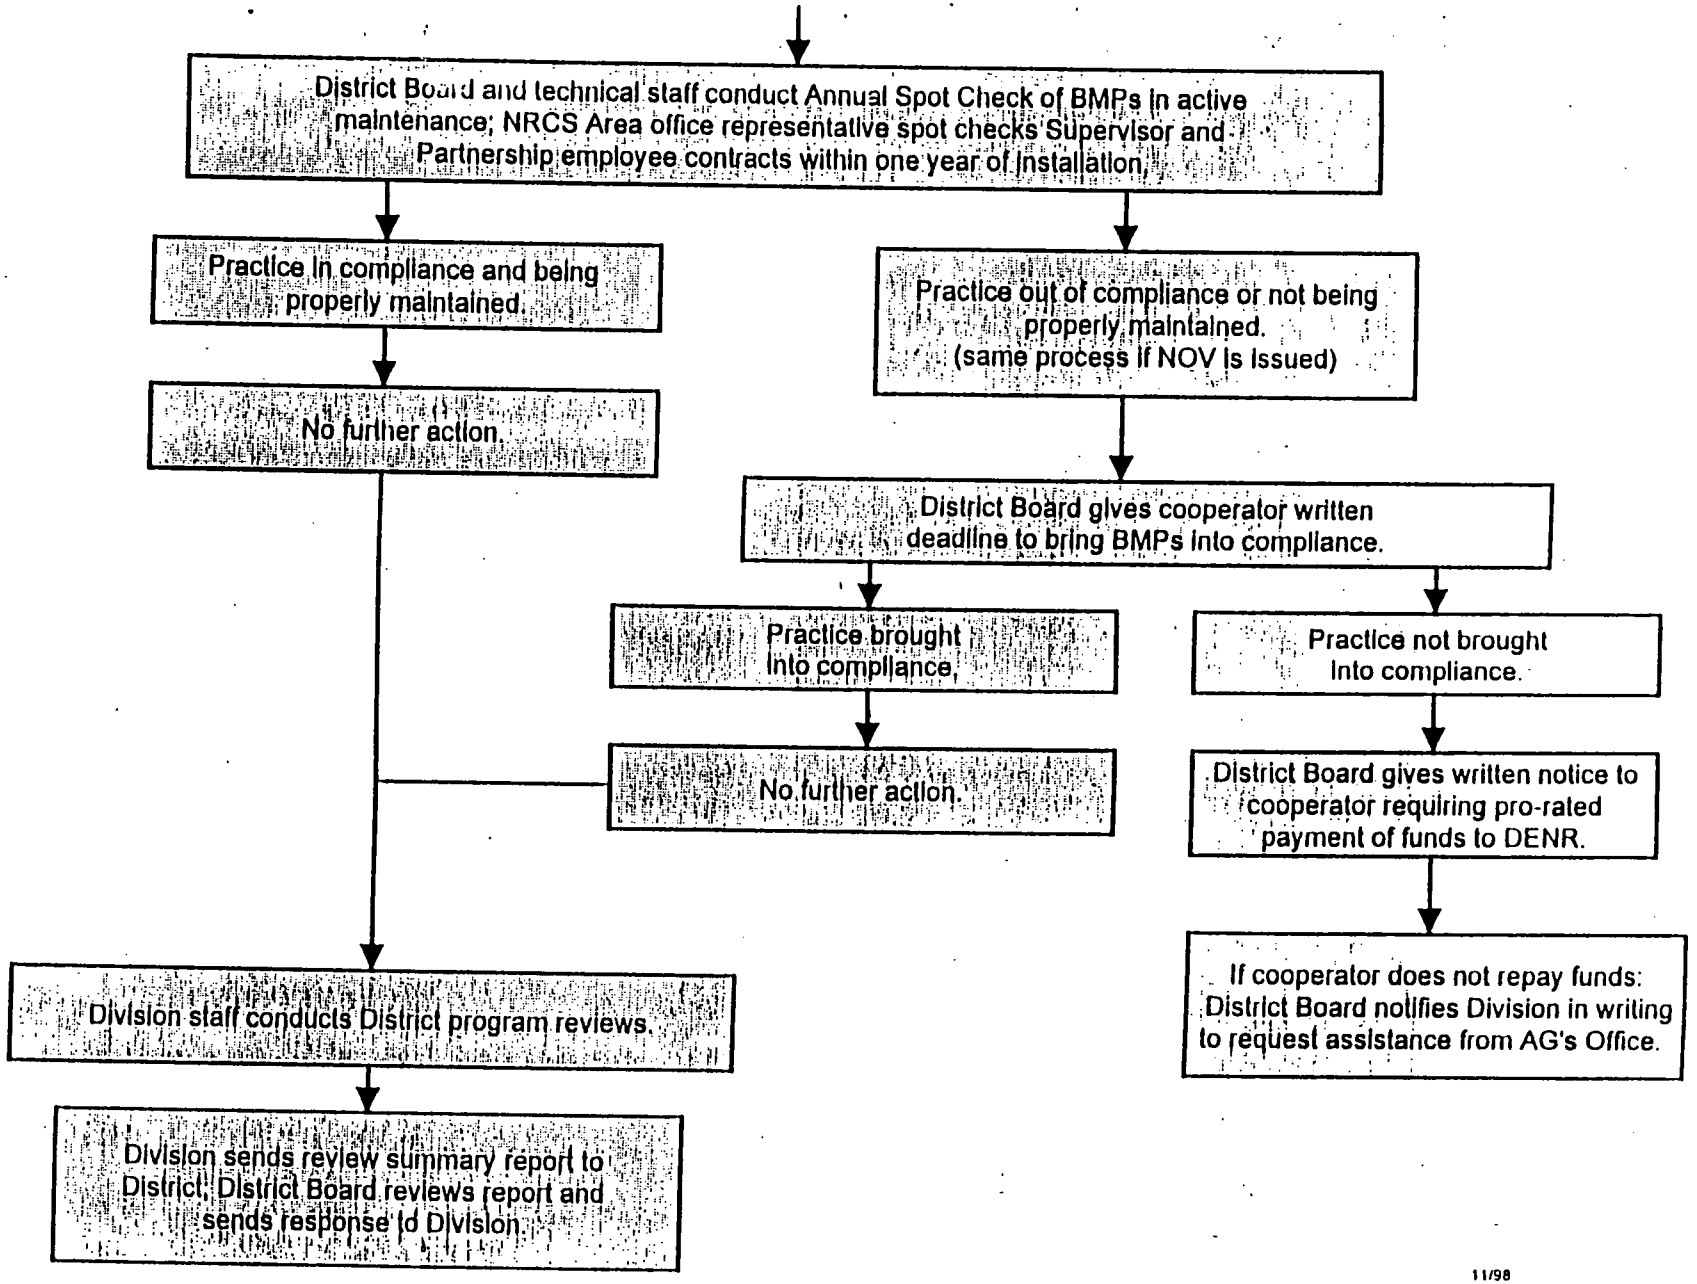
Funding and Compliance Process





District Board and technical staff conduct Annual Spot Check of BMPs in active maintenance; NRCS Area office representative spot checks Supervisor and Partnership employee contracts within one year of installation.
Practice in compliance and being properly maintained.
No further action.
Practice out of compliance or not being properly maintained. (same process if NOV is issued)
District Board gives cooperator written deadline to bring BMPs into compliance.
Practice brought into compliance.
No further action.
Practice not brought into compliance.
District Board gives written notice to cooperator requiring pro-rated payment of funds to DENR.
If cooperator does not repay funds: District Board notifies Division in writing to request assistance from AG's Office.
Division staff conducts District program reviews.
Division sends review summary report to District. District Board reviews report and sends response to Division.

FEB 20 2004
RESEARCH DIVISION

TO: George Givens, NC General Assembly

FROM: Grover Nicholson, Section Chief
Underground Storage Tank (UST) Section

Subject: Review of Leaking Underground Storage Tank (UST) Sites

The following is an update of the UST Section's review of default low-risk (formerly "CDE") leaking underground storage tank sites. We are reviewing these sites to determine if they can be closed in accordance with the risk-based corrective action rule.

In the month of January 2004, we reviewed 67 low-risk sites and were not able to issue a Notice of No Further Action to any site. A total of 9,368 sites have been reviewed and 3,010 (approximately 32.1 %) issued a Notice of No Further Action since August 1, 1998, when we began counting the review of low-risk sites. Since the risk-based corrective action (RBCA) rule went into effect on January 2, 1998 a total of 3,437 sites have been issued a Notice of No Further Action. **We have completed all of our low risk reviews.** This will be the final report.

If you have any additional questions, please call me at (919) 733-1300.

MEMORANDUM

TO: George Givens, Environmental Review Commission Counsel

FROM: for Brock M. Nicholson Keith Overcash

SUBJECT: Reports on Mercury and CO_2 Pursuant to Clean Smokestacks Act Requirements

The **Clean Smokestacks Act (CSA)** Sections 12 and 13 require the Division of Air Quality (DAQ) to provide the Environmental Review Commission and the Environmental Management Commission with reports and recommendations annually by September 1 relative to controls for mercury and CO_2. The attached reports constitute the first interim reports in fulfillment of these requirements.

These first interim reports are intended to provide an initial summary of the "state of knowledge" on the emissions and controls for these two substances. Mercury is designated as Hazardous Air Pollutant (HAP) and a Toxic Air Pollutant (TAP) under the federal and state programs, respectively. However, CO_2 is not currently clearly classified as an air pollutant in the historic definitions and interpretation of federal and state statutes and regulations/rules.

Significant activities are underway at the federal level and state levels (NC, as well as many other states) for both substances and these are addressed in the reports. Federal actions and decisions will likely be forthcoming shortly, making North Carolina's decisions particularly critical. The nature of these pending actions constrains the ability of DAQ to make specific recommendations at this time. Finals reports, due before September 2005, are planned to provide the Division's and Department's more specific conclusions and recommendations.

If you desire DAQ to provide any presentations, or otherwise discuss these reports, we will gladly comply. Any reactions and specific guidance for future reports would be helpful.

Requirement For This Report

Excerpted from the *North Carolina Clean Smokestacks Act*

[**Title**: An Act to Improve Air Quality in the State by Imposing Limits on the Emission of Certain Pollutants from Certain Facilities that Burn Coal to Generate Electricity and to Provide for Recovery by Electric Utilities of the Costs of Achieving Compliance with Those Limits]

SECTION 12. The General Assembly anticipates that measures implemented to achieve the reductions in emissions of oxides of nitrogen (NO_x) and sulfur dioxide (SO2) required by G.S. 143-215.107D, as enacted by Section 1 of this act, will also result in significant reductions in the emissions of mercury from coal-fired generating units. The Division of Air Quality of the Department of Environment and Natural Resources shall study issues related to monitoring emissions of mercury and the development and implementation of standards and plans to implement programs to control emissions of mercury from coal-fired generating units. The Division shall evaluate available control technologies and shall estimate the benefits and costs of alternative strategies to reduce emissions of mercury. The Division shall annually report its interim findings and recommendations to the Environmental Management Commission and the Environmental Review Commission beginning 1 September 2003. The Division shall report its final findings and recommendations to the Environmental Management Commission and the Environmental Review Commission no later than 1 September 2005. The costs of implementing any air quality standards and plans to reduce the emission of mercury from coal-fired generating units below the standards in effect on the date this act becomes effective, except to the extent that the emission of mercury is reduced as a result of the reductions in the emissions of oxides of nitrogen (NO_x) and sulfur dioxide (SO2) required to achieve the emissions limitations set out in G.S. 143-215.107D, as enacted by Section 1 of this act, shall not be recoverable pursuant to G.S. 62-133.6, as enacted by Section 9 of this act.

GENERAL ASSEMBLY OF NORTH CAROLINA - SESSION 2001 – (SENATE BILL 1078)

FROM: William G. Ross, Jr. WGR/

SUBJECT: Mercury and CO_2 Reports Required by Clean Smokestacks Act

When the North Carolina General Assembly passed, and Governor Easley signed the Clean Smokestacks Act in June of 2002, our State took two crucial steps toward addressing several of the most pressing environmental and public health issues of our time. One step was highly visible, the other less so.

The visible step was to attack the problems of ozone, smog and pollution from fine particles by requiring North Carolina's fourteen coal-fired power plants to make deep cuts in sulfur dioxide and nitrogen oxides, and to do so quickly. The utility companies swung into action and are on schedule to achieve the required reductions.

The less visible, but nonetheless crucial, steps that North Carolina took under the leadership of the General Assembly and Governor Easley was to call for our state to address the issues related to the emissions of carbon dioxide from coal-fired power plants and other stationary sources also related to the emissions of mercury from power plants. Under the new law, our department, through our Division of Air Quality, will study and make findings and recommendations on both subjects in reports due in September 2003, 2004 and 2005. We are this week issuing the 2003 reports on CO_2 and mercury.

Why is it crucial that North Carolina address emissions of CO_2 and mercury? In my view it is crucial that we focus on the biggest problems facing us, and mercury and carbon dioxide emissions seem clearly to be among our biggest problems. With mercury, there is a growing concern about its impacts on public health. With carbon dioxide, there is the concern that we are changing the climate in a manner and pace that are unprecedented.

In his 2002 book, The Earth Remains Forever, Professor Rob Jackson of Duke University frames the question this way:

> "Based on current scientific evidence, I believe that by the end of the twenty-first century:
>
> I. There will be at least nine billion people on earth.
> II. Annual global energy use will be at least fifty percent higher per capita than at the end of the twentieth century, and total energy consumption will triple.

1601 Mail Service Center, Raleigh, North Carolina 27699-1601
Phone: 919-733-4984 / FAX: 919-715-3060 /Internet: www.enr.state.nc.us/ENR
An Equal Opportunity \ Affirmative Action Employer – 50% Recycled \ 10% Post Consumer Paper

III. Atmospheric carbon dioxide concentrations will be more than five hundred parts per million, double the pre-industrial levels and higher than at any time in the past forty million years. In consequence, the average temperature of the earth will be at least 5° F warmer.
IV. Thousands, perhaps millions, of species will be extinct.
V. The demographic and economic momentum behind these changes is immense." (p 129)

"Most of all, I want to know that we did our best, that we tried everything we could to preserve the quality of life for people today and tomorrow and saved as much room as possible for the rest of life on earth. Who doesn't want this? The moral, the practical, the ultimate question is what we do about it, what we will give up today so that we and our descendants and the rest of life on earth may have their tomorrow." (p.132)

Thanks to the leadership of the General Assembly and Governor Easley, our state is a national leader in reducing emissions of SO_2 and NOx from coal-fired power plants. To answer Professor Jackson's question, we are doing our best as a state on these two issues.

What will we do about mercury and carbon dioxide? Thanks again to our legislators and the Governor, we also have a chance to answer Professor Jackson's question, this time for mercury and carbon dioxide in a similar, positive way.

We appreciate your attention to these two reports. We look forward to your comments and questions about them.

Thank you.

Preface

This report has been produced by a working group within the North Carolina Division of Air Quality. Stakeholders from industry, environmental and other organizations were also invited to provide their insights, comments and other input. The Division appreciates the efforts of all the stakeholders and other individuals who committed their time and effort to the development of this preliminary report. This open process will continue in the development of subsequent and final reports on this topic.

Many portions of this document were taken directly from other government (non-copyrighted) documents in the interest of time and completeness. Some of these sections may have only minor wording changes from the original documents. Quotations are not strictly used to identify these parts, but a strong effort has been made to reference these documents and acknowledge them. The purpose has not been to claim credit for original work of others, but to provide as much detail and accuracy as possible within a limited time.

This report consists of two volumes. Volume One includes technical information that has been condensed and summarized from technical reports and Volume Two contains background information. The objective of this first interim report is to provide a technical background and provide results or summaries of investigations and studies

CONTENTS OF VOLUME ONE

CHAPTER 1 - EXECUTIVE SUMMARY 1-1

SUMMARY OF STATUTE 1-1
SCOPE & OBJECTIVES 1-1
Purpose of the Report 1-1
Expectations For Future Reports 1-1
Summary of Scope of Problem 1-2
ACTIONS CURRENTLY BEING TAKEN IN NC 1-3
ACTIONS CURRENTLY BEING TAKEN BY THE FEDERAL GOVERNMENT 1-3
PRELIMINARY FINDINGS AND ANTICIPATED FUTURE ACTION 1-4

CHAPTER 2 - MERCURY PROBLEMS 2-1

CHEMICAL AND PHYSICAL ATTRIBUTES OF MERCURY 2-1
ELEMENTAL MERCURY, INORGANIC MERCURY, AND METHYLMERCURY 2-2
MERCURY CYCLES IN THE ENVIRONMENT 2-3
General Assumptions And Efforts To Date 2-3
PATH FROM COAL-FIRED BOILERS TO BIOACCUMULATION OF METHYLMERCURY 2-4
Other Uncertainty Factors 2-5
MERCURY IN WATER 2-6
Mercury In Drinking Water and Scrubber Blow Down 2-6
MERCURY IN SOIL 2-6
MERCURY IN AIR 2-7

CHAPTER 3 - MERCURY CONCERNS SPECIFIC TO NC 3-1

HISTORY: MERCURY IN NORTH CAROLINA 3-1
Mercury in Fish Tissue 3-1
Human Mercury Burden 3-3
Estimated Risk to Newborns in North Carolina 3-4

List of Acronyms Used in This Report

BAF – Bioaccumulation factors
CAA – Clean Air Act – Primary federal clean air statute
CAPA – Clean Air Planning Act – Carper Bill
CEM – Continuous Emission Measurement
CPA – Clean Power Act – Jeffords-Waxman Bill
CSI – Clear Skies Initiative – Proposal for revised CAA legislation by the Bush Administration (also recently referred to as Clean Skies Act, though not yet an actual Act)
CSA – NC Clean Smokestacks Act
DAQ – NC Division of Air Quality
DEHNR – Former NC Department of Environment, Health, and Natural Resources, now DENR and DHHS
DENR – NC Department of Environment and Natural Resources
DENOX – A selective catalytic named DENOX®
DHHS – NC Department of Health and Human Services
DMF – Division of Marine Fisheries
DWQ – Division of Water Quality
EMC – NC Environmental Management Commission
EPA – US Environmental Protection Agency
EPRI – EPRI Journal Online
FGD – flue gas desulfurization
Hg^0 – elemental mercury
Hg^+ – inorganic mercury compounds (e.g., mercuric chloride)
Hg^{++} – organic mercury compounds (primarily methylmercury)
Hg^P – elemental mercury attached to particulate
HAP – hazardous air pollutant
HCl – hydrochloric acid
$HgCl_2$ – mercury chloride
HgS – mercuric sulfide
MACT – Maximum Achievable Control Technology
MDN – Mercury Deposition Network
N_2 – nitrogen
NAAQS – National Ambient Air Quality Standards
NAS – National Academy of Science
NC – North Carolina
NCSU – North Carolina State University
NHANES –National Health and Nutrition Examination Survey
NO – nitric oxide
NO_x – Oxides of Nitrogen, including NO_2, the primary nitrogen species from combustion.
OH – The Canadian Ontario-Hydro (OH) utility company
RELMAP – the Regional Lagrangian Model of Air Pollution
RGM – Reactive Gaseous Mercury
SCR – Selective Catalytic Reduction

SIP – State Implementation Plan
SNCR – Selective Non-Catalytic Reduction
SO_2 – Sulfur Dioxide
SO_3 – Sulfur Trioxide
SO_x – Oxides of Sulfur, including SO_2, the primary combustion product of sulfur
TGM – Total Gaseous Mercury
TMDL – Total Maximum Daily Load
TRI – Toxic Release Inventory

CHAPTER 1 - EXECUTIVE SUMMARY

SUMMARY OF STATUTE

The *Clean Smokestacks Act* (CSA) directs the Department of Environment and Natural Resources, Division of Air Quality (DENR-DAQ) to:

- ✓ study issues related to monitoring emissions of mercury and the development and implementation of standards and plans to implement programs to control emissions of mercury from coal-fired generating units,
- ✓ evaluate available control technologies,
- ✓ estimate the benefits and costs of alternative strategies to reduce emissions of mercury,
- ✓ annually report its interim findings and recommendations to the Environmental Management Commission and the Environmental Review Commission beginning 1 September 2003, and
- ✓ report its final findings and recommendations to the Environmental Management Commission and the Environmental Review Commission no later than 1 September 2005.

SCOPE & OBJECTIVES

Purpose of the Report

This report provides a background understanding of the properties of mercury and its compounds, health effects of methylmercury, mercury emissions, the effects of various air pollution control devices on mercury emissions, and estimated reductions of mercury emissions in North Carolina as a result of controls to be installed for other pollutants under requirements of the CSA. Information presented herein is largely a result of a literature search and summary of several pertinent and recent publications of the U.S. Environmental Protection Agency (EPA), U.S. Department of Energy (DOE), and other similar documents and their supporting scientific studies.

Expectations For Future Reports

This 2003 report will be supplemented each year for the next two years to include more technical detail gained over time, results of related federal and state regulations, and recommendations for any new standards based on further

knowledge and implementation of standards resulting from the CSA and other legislation.

Summary of Scope of Problem

Mercury has been found in fish tissue, primarily in Eastern North Carolina, and fish advisories have been in effect for some time. Determination of the sources and routes by which mercury may reach this food chain are thus of concern. In North Carolina, coal-fired power plants are one of the likely suspects. Other suspects for large contributions have been a now closed chlor-alkali plant in southeastern NC and many smaller emission sources. Many localized sources (e.g., incineration, mercury battery disposal, fluorescent tube disposal, etc.) are much smaller in terms of emission quantity, but they may have a significant impact on their immediate surroundings. The focus of this report is coal-fired power plants, as directed by the CSA.

Mercury is a naturally occurring metallic mineral contaminant in coal. Air emissions of mercury result from burning coal in coal-fired electric power generating units. Elemental mercury is the only form of this metal found in the actual boiler firebox exhaust. Inorganic mercury compounds are formed when the stack gases begin to cool in the presence of chlorine and fly ash. After these transitions, the only forms of mercury at the exit of the smoke stack remain elemental mercury and inorganic mercury compounds. Although these compounds can represent a health risk if directly ingested, adsorbed through the skin, or inhaled as fine particulate, their impact potential is minimal compared to methylmercury, which is the harmful form of mercury.

Methylmercury (an organic or carbon-containing compound) does not form until inorganic mercury compounds are deposited in water, and soil (with subsequent physical transport to water bodies) and exposed to waterborne bacteria. Methylmercury compounds can then bioaccumulate in the food chain of fish, animals and eventually humans. Human exposure to methylmercury comes primarily from consumption of contaminated fish. Methylmercury has a relatively long biological half-life in humans; estimates ranging from 44 to 80 days before one half of the intake of this compound is exhausted from the human body. Methylmercury compounds break down readily when exposed to the atmosphere. They then may undergo complex chemical reactions, many of which are believed to be reversible in typical environments.

The United States Environmental Protection Agency (EPA) and DENR information indicate that approximately 1.5 tons/year of inorganic mercury are emitted to the air of NC from coal-fired power plants in NC. A recently closed chlor-alkali plant in the eastern part of the state is strongly implicated as a significant contributor to localized mercury emissions and residues. Some unknown portion of this atmospheric mercury is deposited on the land and waters of North Carolina. The deposits that occur on land are fairly fixed to the

deposit site (non-transient), but some can be washed into the waters where they can combine with those deposited in the water and be converted to methylmercury. At the same time, a large quantity of mercury exists in the "global" air that enters North Carolina, from both natural and man-made sources. Some small portion (again, not well quantified or quantifiable) of this mercury is likely deposited within the state boundaries. A portion of the deposited mercury from all these sources is likely to again be re-emitted into the air. Thus, the quantified realities are complex and elusive. If one makes a gross assumption that *all* (probably at least a factor of 10 to 100 too high) of the 1.5 tons per year is deposited within the state and equally spread throughout the 53,821 square miles of the state, this would equate to roughly 0.0569 pounds per square mile per year, or about 0.000000002 pounds/ft^2.

Actions Currently Being Taken In NC

Coal-fired generating units currently account for approximately 75 percent of mercury emissions estimated to be emitted into the air in North Carolina. Emission control equipment planned and proposed for installation to meet the *North Carolina Clean Smokestacks Act* (CSA) is estimated to capture about 55 percent of current mercury emissions from coal-fired generating units in North Carolina. Though the Act does not prescribe mercury-specific controls, these substantial mercury emission reductions are achieved as a secondary benefit. The proposed addition of wet scrubbers to control sulfur oxides (SO_x) is expected to reduce total mercury emissions from coal-fired electrical generating units from an estimated 3,052 pounds per year (ppy) to about 1,363 ppy.

Actions Currently Being Taken By The Federal Government

The EPA has already regulated mercury emissions from sources other than utilities combustion sources. EPA has proposed a regulation to limit mercury emissions from industrial boilers, which must be finalized by early 2004, under the terms of a consent decree. Also under the terms of a settlement agreement EPA has agreed to propose a standard for utility boilers by December 15, 2003, and to finalize it by December 15, 2004. Maximum Achievable Control Technology (MACT) requirements will have major impact and implications regarding the ultimate recommendations regarding mercury under Section 12 of the CSA. These MACT standards, consistent with other schedules under CSA, are currently scheduled to be met by December 15, 2007.

Nationally, mercury from industrial sources, municipal waste combustors and medical waste incinerators has been reduced by 90 percent from 1995 levels. Additionally, the intentional use of mercury in commercial products in the United States has declined by more than 75 percent from 1988 to 1996. This national finding is believed to be an accurate description of reductions in North Carolina also.

PRELIMINARY FINDINGS AND ANTICIPATED FUTURE ACTION

From studies to date, several basic findings can be made on emissions, effects, and control of mercury:

- Mercury is a potential threat to human health and well-being.
- Coal-fired power plants release both elemental and inorganic mercury compounds, but not methylmercury. Coal-fired power plants emit approximately 66 percent of the mercury that is omitted to the sky from NC sources.
- There are numerous ongoing studies of the impact of mercury emissions from the various sources, both natural and anthropogenic (created by human activity).
- Scientific study is underway to establish a quantitative relationship between reduced mercury emissions into the air in North Carolina and reduced methylmercury levels in fish tissues.
- Various types of air pollution controls on coal-fired power plants that are added primarily to control other pollutants (e.g., sulfur dioxide (SO_2) and oxides of nitrogen (NO_x) –pursuant to the *North Carolina Clean Smokestacks Act*) are expected to also reduce mercury emissions by approximately 55 percent.
- Mercury compounds reach the proper conditions (pH, sulfur concentrations, biological activity, etc.) in a water body, methylmercury forms.

In light of these basic findings, DAQ believes it important to pursue the following steps:

- ✓ Study the issues as directed by the CSA.
- ✓ Refine the estimated effects on mercury emissions of projected SO_2 and NO_x controls on electric utility emissions, and refine the estimates of levels and fate of mercury emissions that remain.
- ✓ Monitor changes in plans for application of control devices by the utility companies and adjust emission estimates and analysis accordingly.

- ✓ Monitor and evaluate outside influences and regulatory developments at the federal level, and with other states involved in similar efforts.

- ✓ Provide support for efforts to refine health effects and trends of mercury levels in fish and other potential routes of exposure.

- ✓ Determine funding needs to identify and study more closely the distribution of humans who are at risk of fish contaminated fish.

- ✓ Evaluate whether and to what extent global reductions in mercury emissions are causing changes in mercury depositions in NC.

- ✓ Evaluate and refine information on other potential sources of mercury in North Carolina.

- ✓ Address and respond to specific questions generated by this 2003 report.

- ✓ Assemble economic data and models to reflect multiple risk scenarios and costs of implementation of further controls.

CHAPTER 2 - MERCURY PROBLEMS

The species of mercury (elemental and inorganic mercury) and their ratio in coal-fired boiler emissions are important when devising capture and control techniques. The chemical species of mercury emitted from utility boilers vary significantly from one plant to another. Removal effectiveness depends on the species of mercury present. Elemental mercury passes through control devices. Capture efficiency is dependent on converting elemental mercury into inorganic mercury. To date, no single control technology has been identified that removes any elemental mercury and all inorganic mercury.

Elemental mercury passes readily through the body. Inorganic mercury compounds take several days to transit out of the body. Organic mercury (primarily methylmercury) has a strong propensity to be stored in the body (fatty tissues such as the brain) and is slowly removed from the body over a period of months. Methylmercury exposure to humans is dependent on the amount of fish consumed and the methylmercury concentration in the fish. Groups susceptible to the effects of methylmercury are children up to the age of six (developing neurological systems), women of child-bearing age, sports fishermen, and subsistence fishermen.

Mercury cycles through the environment as a result of both natural and human activity. Most of the mercury in the atmosphere is elemental mercury vapor, that circulates in the atmosphere for up to a year, and can be transported thousands of miles from the source. Mercury that is deposited to soil and terrestrial vegetation does not result in exposures likely to be detrimental to health.

CHEMICAL AND PHYSICAL ATTRIBUTES OF MERCURY

Elemental mercury is a heavy (weighing 13.53 times as much as water per unit volume) silver-white metal with an atomic weight of 200.59 grams per mole. By comparison, the atomic weight of iron is 55.847. At room temperature, mercury is a liquid and has a vapor pressure of 0.002 mm mercury at 25 degrees Centigrade (0.038 psi at 77 degrees Fahrenheit).[1]

Mercury is used widely in industrial applications. It conducts electricity, responds to temperature and pressure changes, and forms an alloy with almost all metals. In the electrical industry, mercury is used in florescent lights, in switches as part of wiring devices, and with instruments that measure temperatures and pressures. It is also a component of dental amalgams used in restoring teeth. In addition to its use in specific products, mercury is used in numerous industrial processes. The largest manufacturing use of mercury in

[1] Ref. 1, page 2.

the United States is associated with the production of chlorine and caustic soda by mercury-cell 'chlor-alkali' plants. Mercury has also been used in amalgamation with other metals (e.g., gold) and as an antifungal agent in vaccines and wood preserving.[2] Many of these uses have shrunk in recent years due to concerns over human exposures to mercury, and in many cases, due to regulations that did not previously exist.

ELEMENTAL MERCURY, INORGANIC MERCURY, AND METHYLMERCURY

The elemental and inorganic mercury that exits the smoke stack becomes part of the global pool of mercury in the atmosphere or falling on land or water. Elemental and inorganic mercury are not health hazards. However, when waterborne bacteria modify inorganic mercury, an organic mercury molecule is produced. Organic mercury, primarily methylmercury, accumulates in long-lived animals. Predatory fish at the top of the food chain accumulate increasing concentrations of methylmercury in their body tissues (i.e., bioaccumulation), which is a health threat to humans who eat quantities of these fish.

Mercury exists in three forms (species): elemental mercury (Hg^0), inorganic mercury compounds (Hg^+) (e.g., mercuric chloride), and organic mercury (Hg^{++}) compounds (primarily methylmercury).[3] Organic species of mercury (methylmercury) are harmful to humans. Elemental mercury passes rapidly through the body. Inorganic mercury compounds may take several days to transit out of the body, but like elemental mercury, causes no harm. Organic mercury has a strong propensity to be stored in the body's fatty tissues, such as the brain, but does slowly leave the body over a period of months.

Speciation is a term used to denote the relative amounts of elemental mercury, oxidized mercury, and mercury attached to particulate in flue gas. No methylmercury is emitted from the stacks of coal-fired boilers. The rate of conversion of the gaseous mercury is dependent on temperature, flue gas composition, and the amount and properties of entrained particles (fly ash and sorbents). Mercury speciation is a particularly important variable for flue gas cleaning as it directly impacts the capture of mercury. For example, mercury chloride ($HgCl_2$) is water-soluble and readily reacts with alkali metal oxides in an acid-base reaction; therefore, conventional acid gas scrubbers used for sulfur dioxide (SO_2) control are effective in controlling $HgCl_2$. However, elemental mercury Hg^0 is insoluble water and must be adsorbed onto a sorbent or converted to a soluble form that can be collected in a wet scrubber. In coal-fired combustion units, where concentrations of chlorine are low and SO_2 is present, mercury may remain predominantly in the elemental form.[4]

General Assumptions And Efforts To Date

Mercury moves about the environment because of both natural and human activity. Most mercury in the atmosphere is elemental mercury vapor, which circulates in the atmosphere for up to a year, and hence can be transported thousands of miles from the source.[5] Recent modeling indicates that the rate of oxidation of elemental mercury in the atmosphere may be occurring twice as fast as previously thought (half-life of six months instead of one year). If substantiated, this means that either there are unknown sources of elemental mercury contributing mercury to the global pool or the calculated release of elemental mercury vapor as a result of natural and human activity is understated by a factor of two.

Mercury modeling efforts initially made an assumption that all inorganic mercury compounds that settled on the ground would eventually enter the surface water drainage system and accumulate in rivers, streams, and lakes. Contrary to that assumption, inorganic mercury compounds have a strong propensity to attach to and remain on leafy vegetation and soil particles. The majority of inorganic mercury compounds found in water bodies arrived by way of atmospheric transport. However, mercury that is deposited to soil and terrestrial vegetation does not result in exposures likely to be detrimental to health through terrestrial exposure pathways.[6]

Mercury in the atmosphere comes both from natural resources and from human activities. Scientists continue to work to define the total and contributory amounts. Studies by Nriagu and Pacyna (1988) estimate global natural emissions at 3,000 tons per year (tpy) and the medium for global emissions from human activities at 3,560 tpy. A more recent critical review by Jackson (1997) estimates that 2,000 tpy from natural resources, while 4,000 tpy are emitted from sources attributed to human activities e.g., combustion of fossil fuel and solid waste.[7]

Anthropogenic mercury released directly to land or water bodies, or deposited on them from the atmosphere, undergoes transformations that are not fully understood. The amount of mercury transformed to methylmercury varies greatly from one water body to another. According to Krabbenholf, et al., (1999), many factors influence methylmercury production beyond mercury loading. These factors include environmental setting (e.g., climate, geology,

---

[5] Ref. 3, page 1.
[6] Ref. 7, page 18.
[7] Ref. 2, page 5.

land use, land cover), water chemistry, and wetland density. The latter is the most important basin-scale factor controlling methylmercury production.[8]

PATH FROM COAL-FIRED BOILERS TO BIOACCUMULATION OF METHYLMERCURY

Nearly all mercury that accumulates in fish tissue is methylmercury (an organic mercury compound). The EPA has found a plausible link between anthropogenic releases of mercury and methylmercury in fish tissue.[9] To transition from mercury in coal to methylmercury in fish, is a complex path.

To be converted to organic mercury, elemental mercury must combine with another element (such as sulfur, chlorine or oxygen) or combine with other compounds to form inorganic mercury compounds. Either a living organism must act on this inorganic mercury compound or an organic compound must react with it to obtain organic mercury. Coal-fired electric utility boilers produce no organic mercury compounds directly. Mercury that is deposited to soil and terrestrial vegetation does not result in exposures likely to be detrimental to health through terrestrial exposure pathways.[10]

The main pathway of introducing methylated mercury forms into aquatic systems is via *in situ* (natural) production, mediated by sulfate-reducing bacteria. Recent investigations suggest that a substantial portion of what is often considered "dissolved" mercury is actually mercury associated with macromolecular colloidal organic matter (submicroscopic particles that do not settle out). Focusing predominately on loading or abundance of inorganic mercury as the dominant controlling factor is often given excessive weight in assessing methylmercury concentrations and production in aquatic systems. While the amount of inorganic mercury is indeed an important factor, it is not the only important factor; nor is it necessarily the controlling factor. A number of parameters have been identified as important in influencing the production and abundance of methylmercury in aquatic systems. They include mercury loading, the chemical form of mercury (chemical speciation), temperature, the availability of organic substrate for sulfate-reducing bacteria (i.e., a food source), mercury de-methylation activity (by bacteria), natural reduction-oxidation conditions, and in some cases photo-demethylation (light induced).[11] To complicate the issue further, many of these parameters vary temporally and spatially in aquatic systems. Any of these parameters can potentially limit the abundance of bio-available methylmercury in an aquatic system.[12]

[10] Ref. 7, page 18.
[11] Ref. 4, page 1.
[12] Ref. 4, page 1.

Other Uncertainty Factors

Additional factors influence the bioaccumulation of mercury in aquatic biota. They include the acidity (pH) of the water, length of the aquatic food chain, temperature, and dissolved organic material. Physical and chemical characteristics of a watershed, such as soil type and erosion or proportion of area that is wetlands, can affect the amount of mercury that is transported from soils to water bodies. Interrelationships among these factors are poorly understood and are likely to be site-specific. No single factor (including pH) has been correlated with extent of mercury bioaccumulation in all cases examined. Two lakes that are similar biologically, physically, and chemically can have different methylmercury concentrations in water, fish, and other aquatic organisms.[13]

Benoit, Gilmour, Mason, and colleagues have recently proposed that sulfide levels in aquatic systems can be very important in controlling methylmercury production by sulfate-reducing bacteria. This influence arises from the strong interaction between inorganic mercury and sulfide to form mercury-sulfide complexes and the bioavailability of these complexes to sulfate-reducing bacteria. They hypothesize that only neutrally charged mercury complexes (e.g., elemental mercury, mercuric sulfide [HgS^0] or mercuric chloride [$HgCl_2^0$]) are capable of readily passing bacterial membranes for intra-cellular mercury methylation. Hence, the in situ chemical speciation of mercury is very important in controlling mercury methylation.[14] If this proposal is proven correct, then waters with high sulfide levels and low oxygen will have low methylmercury levels.

Not all mercury compounds entering an aquatic ecosystem are methylated (converted to methylmercury). Demethylation reactions (conversion of methylmercury into mercury compounds), as well as volatilization of dimethylmercury, decrease the amount of methylmercury available in the aquatic environment. In other words, physical and chemical forces are in action at various rates to deduce methylmercury concentrations in aquatic ecosystems. There is substantial scientific certainty regarding the rate at which these reactions take place.[15]

Additionally, scientific understanding of the environmental fate and transport of mercury is limited. Quantifying the contribution of United States anthropogenic emissions relative to other sources of mercury, including natural sources and re-emissions from the global pool (natural and anthropogenic), on methylmercury levels in fish consumed by the U.S. population is not possible at this time. Mercury methylation and subsequent uptake in fish is complex

---

[13] Ref. 5, Chapter 2, page 6.
[14] Ref. 4, page 1.
[15] Ref. 3, Chapter 2, page 5.

and not yet well understood. As a result, a change in total mercury emissions cannot be firmly established as being linearly related to any resulting change in methylmercury in fish. The time over which these changes will occur is also uncertain. This is an area of ongoing study.[16]

MERCURY IN WATER

Mercury In Drinking Water and Scrubber Blow Down

The EPA drinking water standard is 0.002 mg/liter for mercury. While this is on the basis of total mercury (elemental mercury and mercury compounds), it is not specific to or limited to methylmercury, which would not exist in scrubber blow down. Levels of mercury in scrubber blow down from coal fired utility boilers would likely be many times over the drinking water standard. Obviously, it would be ill advised to remove mercury from stack exhaust and then allow these emissions to be discharged into surface or other drinking water sources (where it could potentially interact with the biological mechanisms to form methylmercury). At time this document was prepared, insufficient information had been collected by DAQ to enable a reasonable determination of what the industry norm and expectations would be for collection and treatment of the blow down water to prevent it from being a water quality problem. This is an important potential issue and will be researched and addressed in the next subsequent report update.

Additional detailed discussions of mercury in North Carolina's waters are presented in Chapter 3 and Volume 2 of this report.

MERCURY IN SOIL

Mercury dispersion simulation modeling efforts initially followed an assumption that all inorganic mercury compounds that settled on the ground would eventually enter the surface water drainage system and accumulate in rivers, streams, and lakes. Contrary to that assumption, inorganic mercury compounds have a strong propensity to attach to leafy vegetation and soil particles. The majority of inorganic mercury compounds found in water bodies are believed to have arrived by way of atmospheric transport and not from local drainage.

One study shows the estimated release of mercury vapors from 200,000 tons of fly ash per year has a maximum potential release of 0.0044 pounds, or 2 grams of mercury per year.[17] Therefore, land disposal of fly ash does not appear to be a significant source of mercury contamination or emission.

---

[16] Ref. 3, Chapter 4, page 1.
[17] Ref. 15, page 1.

MERCURY IN AIR

Mercury in the atmosphere comes both from natural sources and from global emissions from human activities. Most of the mercury in the atmosphere is elemental mercury vapor, which may circulate in the atmosphere for years ("global pool") in a dynamic deposition/re-emission state of flux, and hence, can be transported thousand of miles from the source.[18] Modeling studies recently have suggested that the rate of oxidation of elemental mercury in the atmosphere may be occurring twice as fast (half-life of six months instead of one year) as previously believed. If true, either undefined sources of elemental mercury exist or the release of elemental mercury vapor because of natural and human activity may be in error by a factor of two, meaning total annual mercury emission rates might be up to two times greater than currently estimated.

However, recent experiments using plume chemistry in a static plume dilution chamber, developed by the Electric Power Research Institute, may change the interpretation of chemistry used to calculate percentages of elemental mercury and oxidized (inorganic) mercury transported in the plume. [19] This study suggests that oxidized mercury rapidly converts to elemental mercury near the stack. This finding may explain measurements made near a large coal-fired power plant in Georgia. Based on mercury concentrations in coal burned at the plant, scientists predicted that the stack gases would contain 60 percent oxidized mercury and 40 percent elemental mercury. Mercury measured in air 15 miles downwind was found to be 9 percent oxidized mercury and 91 percent elemental mercury.[19]

These two concepts - (that the oxidation of mercury occurs twice as fast as previously believed, and that oxidized mercury rapidly converts to elemental mercury near the stack) conflict and further demonstrate the need to further understand the science of mercury speciation in the atmosphere.

[19] Ref. 18

CHAPTER 3 - MERCURY CONCERNS SPECIFIC TO NC

HISTORY: MERCURY IN NORTH CAROLINA

Biologists suspected for many years that freshwater fish in the black water systems of eastern North Carolina would be prone to mercury contamination as found in other parts of the country sharing similar environmental conditions. In 1970 the Federal Water Quality Administration issued a report on mercury pollution that mentioned mercury contamination found in fish caught in the lower Cape Fear River basin. Industrial discharges of mercury to local waterways and mercurial pesticide use were scrutinized at that time, but no study was made of atmospheric contributions. Past studies of mercury levels in eastern North Carolina peat deposits discussed the possible contribution of atmospheric deposition of mercury to local waterways. However, no information was available on atmospheric mercury trends in the areas surrounding eastern North Carolina's sensitive waterways

Mercury in Fish Tissue

The rate and degree to which methylmercury bioaccumulates within a system is dependent on a number of factors. The most significant of these includes the water's pH, food chain length and composition (productivity), water temperature, water body chemistry, and the form and structure of the organisms present. Methyl mercury, the toxic and most bioaccumulative form of mercury in fish, can be concentrated in top predator species.

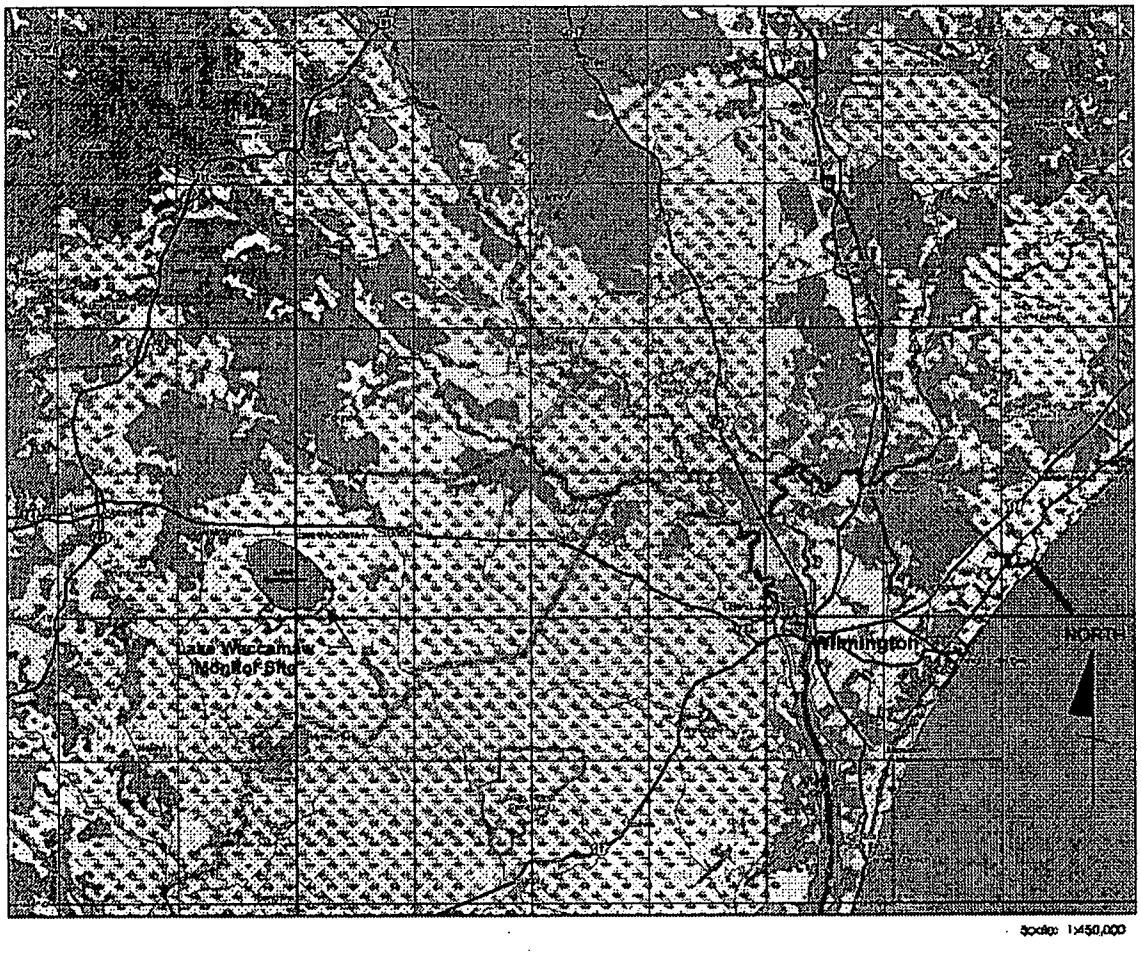
The Environmental Sciences Branch (fisheries programs) of the North Carolina Division of Water Quality (DWQ) conducts fish community assessments, fish tissue monitoring, fish kill data assessment, and supports special projects. In 1992, the DWQ conducted an intensive fish mercury survey in the vicinity of Lake Waccamaw, situated in the Lumber River Basin of southeastern North Carolina (Figure 3-1). In that study, 60 percent of largemouth bass samples from Big Creek and the Waccamaw River were found to contain mercury levels above one part per million (ppm), the threshold level for issuance of fish consumption NCDEHNR advisories at that time.

The DWQ's efforts from 1995 to 1999 consisted of monitoring for mercury and other contaminants under basin-wide assessments, sampling statewide, verification of the high levels of mercury in eastern piscivores (fish-eaters), and the king mackerel mercury survey (1998-1999) with the Division of Marine Fisheries (DMF). From 1998 to 1999, DWQ assisted with

Figure 3-1

Southeastern North Carolina

Including Lake Waccamaw and Surrounding Environs



the analyses of 112 king mackerel and Spanish mackerel samples that were collected by the DMF from recreational and commercial sources. The fish tissues were collected from a range of fish sizes and seasonal populations.

The Spanish mackerel samples contained low mercury levels. However, regression models using king mackerel tissue data demonstrates a strong relationship exists between king mackerel size and mercury concentration. From these regression curves, a mercury level over 1ppm is predicted for king mackerel over 13 pounds or 37 inches.

Human Mercury Burden

Mercury compounds can be converted in some aquatic environments into a more toxic form, methylmercury. The NC Department of Health and Human Services (DHHS) found that this is the form of mercury that is incorporated into the food chain. Fish consumption is the primary way that both humans and wildlife are exposed to methylmercury. Methylmercury can accumulate to harmful concentrations in predatory fish.

In North Carolina, high levels of methylmercury (levels at 0.4 mg/kg or greater) have been found in ocean fish like shark, swordfish, king mackerel, and tilefish, and in freshwater fish like largemouth bass, bowfin, and chain pickerel south and east of Interstate 85 (see Figures 3-2 and 3-3). Women of childbearing age and children have been notified through advisories to not eat the four ocean fish and the three freshwater fish south and east of Interstate 85. These advisories have been issued to protect the most sensitive population, the developing child. The developing human nervous system is particularly sensitive to methylmercury. Several studies have reported increasing effects on the developing nervous system of an unborn child with increasing maternal methylmercury exposure from routine fish and whale consumption. Neurological processes in the areas of language, attention, and memory have been most affected.

The NC DHHS is seeking funding from the Centers for Disease Control and Prevention to conduct biomonitoring in seven counties including Columbus, Brunswick, Bladen, Moore, Scotland, Duplin, and Martin Counties. The largemouth bass and bowfin in these counties have some of the highest methylmercury fish tissue concentrations in the state. Based on consultation with local residents from these counties and with the NC Wildlife Resources Commission, there are recreational and subsistence fishermen in these counties. The potential for exposure to high levels of methylmercury exists for individuals living in these counties. Even though there are advisories in these areas, the people may not be aware of the advisories or may choose to ignore them.

An epidemiological study consisting of blood and hair methylmercury analysis was completed in 1990 after discovering elevated fish tissue levels in largemouth bass and bowfin for Columbus and Brunswick Counties. Some of the highest levels of methylmercury in human hair and blood ever recorded in the United States have been identified among residents living in Columbus and Brunswick Counties. The purpose of this study was to determine if the subsistence fishermen in these counties had elevated methylmercury blood or hair levels. A total of 64 blood samples and 77 hair samples were collected for 81 residents living in these two counties. There was a positive correlation between residents with high rates of fish consumption from the waters under

advisory and elevated methylmercury hair and blood levels. The blood levels ranged from non detect to 141 ug/L (well above 5 percent effect level of 58 ug/L associated with abnormal neurodevelopmental scores above background). The hair levels ranged from non detect to 33.5 mg/kg (well above 5 percent effect level of 10 mg/kg associated with abnormal neurodevelopmental scores above background).

Additional biomonitoring is needed to prevent illness and improve public health through the following:

- To determine awareness of the fish advisories pertaining to methylmercury and to also communicate the fish advisories.
- To modify and/or expand approach for communicating fish advisories if decreased awareness or individuals are not following advice.
- To determine methylmercury body burden levels among women of childbearing age and children within the counties that have some of the highest methylmercury fish tissue levels in the state and to recommend low methylmercury fish choices.
- To determine methylmercury body burden levels among women of childbearing age and children within the counties that have some of the highest methylmercury fish tissue levels in the state and to recommend low methylmercury fish choices.

The results of the study will benefit women of childbearing age and their offspring. The program will obtain information about the proportion of women who are aware of the advisory and how to successfully distribute advisory information to women who are not getting the message. By increasing the proportion of women who are aware of the advisory, the program will decrease methylmercury exposure to the women and their offspring. In addition, the intervention design will be shared with other states so that their advisory information will be distributed successfully to this subpopulation. The end result is to ensure that women of childbearing age are getting the advisory information so that they will limit their exposure to methylmercury and other contaminants through consumption of fish.

Estimated Risk to Newborns in North Carolina

The potential number of newborns in North Carolina at risk from maternal exposure to methylmercury is calculated using data from the 1999 National Health and Nutrition Examination Survey (NHANES). This survey reported blood and hair methylmercury sample results for women ages 16 to

49. Approximately 10 percent of the women surveyed had hair methylmercury levels above the EPA-recommended hair level of 1 mg/kg to protect developing fetuses (corresponds to reference dose of 0.1 ug/kg-day). According to the Centers for Disease Control and Prevention, this indicates a narrow margin of safety for some fetuses. [20] EPA estimates that at or below the reference dose of 0.1 ug/kg-day or maternal hair level of 1 mg/kg, chronic non-cancer health effects are not likely to occur. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

Using this information, one may extrapolate to find the number of newborn infants in North Carolina that may potentially be at risk. This extrapolation assumes that the NHANES population surveyed is representative of a cross section of North Carolina and that women in North Carolina have methylmercury levels similar to levels found in the NHANES survey.

Based on the 1995 national fecundity rates for women ages 15 to 44 and the population data for North Carolina, it is estimated that there are 1,105,045 fertile women in North Carolina. [21] Using the North Carolina fertility rate of live births of 67.5 per 1,000 fertile women for 1999, one can expect 74,590 live births.[22] If one assumes that 10 percent of the maternal hair levels for the 74,590 births are greater than 1 mg/kg as reported in the national survey, then 7,459 North Carolina fetuses annually may be at a dose higher than that recommended by EPA. EPA estimates that chronic non-cancer health effects are not likely to occur at or below the reference dose. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

HEALTH EFFECTS

Human methylmercury contamination occurs primarily through diet. Fish and fish products are the predominate source.[23] Consumption of fish and marine birds and mammals represent 95 percent of the human intake of methylmercury. Within the United States, individual consumption of fish and seafood is highly variable. Approximately one to two percent of the U.S. population report eating fish daily, whereas about 10 percent rarely consume fish.[24]

Susceptible populations include people consuming above average amounts (greater than ten grams) of methylmercury contaminated fish on a

[24] Ref. 2, page 41.

regular basis. Ten grams per day is equivalent to 8 pounds of fish per year. Higher than average consumption of fish and other seafood is found among people of Asian and American Indian ethnicity and recreational anglers and their families. People who are subsistence fishers may be particularly important population with respect to methylmercury contamination. Methylmercury contamination depends on the amount of fish consumed and on the methylmercury concentrations in the fish.[25]

Methylmercury adversely affects the developing nervous system at lower exposure than it affects adult neurological functioning. Consequently, women of childbearing age, maternal and fetal pairs, nursing mother and infant pairs, and young children (up to age six) are all susceptible populations.[26] An analysis of dietary surveys led the EPA to conclude that between one and three percent of women of childbearing age (i.e., between 15 and 44) eat significant amounts of fish to be at risk from mercury exposure.[27]

The EPA has found mercury residuals in fish in 92 percent of 374 surface water bodies tested in the U.S. Eighty-five percent of the sites were found to have 0.0 to 0.5 ppm mercury levels. Mercury levels above 1 ppm were found in at least one fish at two percent of the sites surveyed, and above 0.5 ppm were found in at least one fish at 15 percent of the sites. The national average for freshwater fish is 0.3 ppm.[28] In humans, methylmercury has an estimated biological half-life of between 44 and 80 days.[29] Inorganic mercury, which is less efficiently absorbed and more readily eliminated from the body than methylmercury, does not tend to bioaccumulate.[30]

Findings By The NC Department of Health and Human Services

Consumption of fish can be beneficial for both pregnant and breastfeeding women, and their developing children. The developing retina and nervous system of an unborn child may benefit from maternal consumption of fish during pregnancy. Additionally, fish consumption has been associated with a decreased risk of heart attack and coronary artery disease in adults.[31,32,33] However, a form of mercury known as methylmercury can accumulate to

harmful concentrations in predatory fish.[34] Consumption of these fish by pregnant and/or nursing women and by children poses a health risk to children and fetuses.

The developing human nervous system is particularly sensitive to methylmercury. Several studies have reported increasing effects on the developing nervous system of an unborn child with increasing maternal methylmercury exposure from routine fish and whale consumption. Neurological processes in the areas of language, attention, and memory were most affected. According to the National Academy of Sciences, studies conducted in the New Zealand and Faroe Islands show that the deficits observed can be considered predictive of problems in cognitive and academic performance associated with methylmercury exposure, or can affect the way the children may think, learn, and problem solve. These studies have shown the developing fetus to be at least three times more sensitive than adults.[35]

Routine consumption of fish containing concentrations of 0.4 mg/kg or greater of methylmercury poses an increased risk of neuro-developmental effects for the developing fetus and children under 15 years of age.[36] The EPA reference dose for methylmercury is 0.1 ug/kg-day (corresponds to maternal hair level of 1 mg/kg and blood level of 5.8 ug/L). This is the dose that is not likely to be associated with health effects for the developing fetus and child. Routine consumption of fish containing 0.4 mg/kg of methylmercury can result in exceedances of the US EPA reference dose for methylmercury.

To derive the reference dose of 0.1 ug/kg-day, EPA calculated benchmark doses (BMD) or doses associated with a 5 percent incremental risk above background (background associated with 5 percent risk) of having abnormal neuropsychological test scores for children from the Faroe Islands located in the North Sea between Scotland and Iceland. These test scores provide a measure of the way children learn, think, and problem solve. The mothers of these children consumed three fish meals per week and less than one pilot whale meal per month.

The benchmark dose, based on EPA and National Academy of Science review was 85 ppb in cord blood, corresponds to 15 mg/kg in hair. At these

blood and hair levels, there is an estimated 5 percent incremental risk above background of having abnormal neuropsychological test scores. EPA determined the 95 percent confidence interval or the range of doses that would be expected to be associated with a total 10 percent risk of having abnormal scores or 5 percent incremental risk above background. The lowest dose of this interval was 58 ppb in cord blood or 10 mg/kg in maternal hair and is designated as the Benchmark Dose Limit (BMDL). This corresponds to an intake of 1.081 ug/kg-day. An uncertainty factor of 10 was applied to the 1.081 ug/kg-day to account for variability in susceptibility within the study cohort, variability in pharmacokinetic parameters for methylmercury, and lack of data on long term sequelae of in utero exposure. The resulting reference dose is 0.1 ug/kg-day or 0.0001 mg/kg-day corresponding to hair level of 1.0 mg/kg.[37]

The Center for Disease Control and Prevention's 1999 National Health and Nutrition Examination Survey (NHANES) reported blood and hair methylmercury sample results for women ages 16 to 49. Approximately 10 percent of the women surveyed had hair methylmercury levels above the EPA-recommended hair level of 1 mg/kg to protect developing fetuses (corresponds to reference dose of 0.1 ug/kg-day). According to the Centers for Disease Control and Prevention, this indicates a narrow margin of safety for some fetuses.[38] EPA estimates that at or below the reference dose of 0.1 ug/kg-day or maternal hair level of 1 mg/kg, chronic non-cancer health effects are not likely to occur. But as the exposure dose increases above the EPA reference dose, the probability of adverse health effects also increases.

North Carolina Safe Fish Eating Guidelines

The most recent safe fish eating guidelines issued by DHHS were prepared by the Medical Evaluation and Risk Assessment Unit (MERAU) and dated August 29, 2001. Women of childbearing age (15-44 years), pregnant women, nursing women, and children under 15 years may eat two meals per week of fish low in methylmercury, like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.[39] They should not eat shark, swordfish, tilefish, or king

---

[39] All fish and shellfish should be properly prepared and cooked.

mackerel.[40] Also, they should not eat bowfin (blackfish), chain pickerel (jack fish) or largemouth bass caught in North Carolina waters south and east of Interstate 85.

Other women, men, and children over 15 years may eat four meals per week of fish low in methylmercury, like farm-raised fish, canned tuna and other canned fish, fish sticks, shrimp, crab, lobster, clams, oysters, scallops, salmon, trout, cod, whitefish, pollock, mahi-mahi, ocean perch, halibut, haddock, flounder, croaker, herring, crappie, sunfish, white perch, yellow perch, and bream.[41] They should eat no more than one meal per week of shark, swordfish, tilefish, or king mackerel. Also, they should eat no more than one meal per week of bowfin (blackfish), chain pickerel (jack fish), or largemouth bass caught in North Carolina waters south and east of Interstate 85 see Figures 3-2 and 3-3).

MONITORING FOR ATMOSPHERIC MERCURY

The following discussion on monitoring North Carolina atmosphere and water mercury concentrations represents a condensed version of highlights from major scientific studies that are available for review in Volume 2 of this report.

Historical Data on Atmospheric Mercury in North Carolina

Very little historical data are available describing typical atmospheric mercury levels in North Carolina. Stopford anecdotally reported levels between 1.7 and 8.9 ng/m^3 in Durham, NC in 1978, with a short-term peak of approximately 400 ng/m^3 during a plume fumigation event arising from a nearby coal-fired power plant. Between 1998 and 2001, periodic measurements of TGM taken at a site in Research Triangle Park, NC indicated that levels rarely exceeded 2 ng/m^3, with values typically in a range between 1.4 - 1.7 ng/m^3.[41] TGM was measured over a 3-month period between June and August of 1996 at Phelps Lake, a remote site in northeastern North Carolina; 15-minute readings were consistently between 1 and 2 ng/m^3 and never exceeded 6 ng/m^3.

Mercury, in its various forms, is transported into and out of the atmosphere by several different means. Mercury can be absorbed by cloud formations and deposited to the earth's surface in rainwater or as dew. This is known as "wet deposition". Mercury can also adhere to particulate matter and settle out onto vegetation and the earth's surface. This mechanism is known as

---

[40] On January 12, 2001 EPA and FDA issued national fish consumption advisories due to high levels of mercury in some marine fish. These advisories recommend that women of childbearing age and children should not eat shark, swordfish, king mackerel or tilefish.

[41] Stevens

Figure 3-2

Contaminated Largemouth Bass

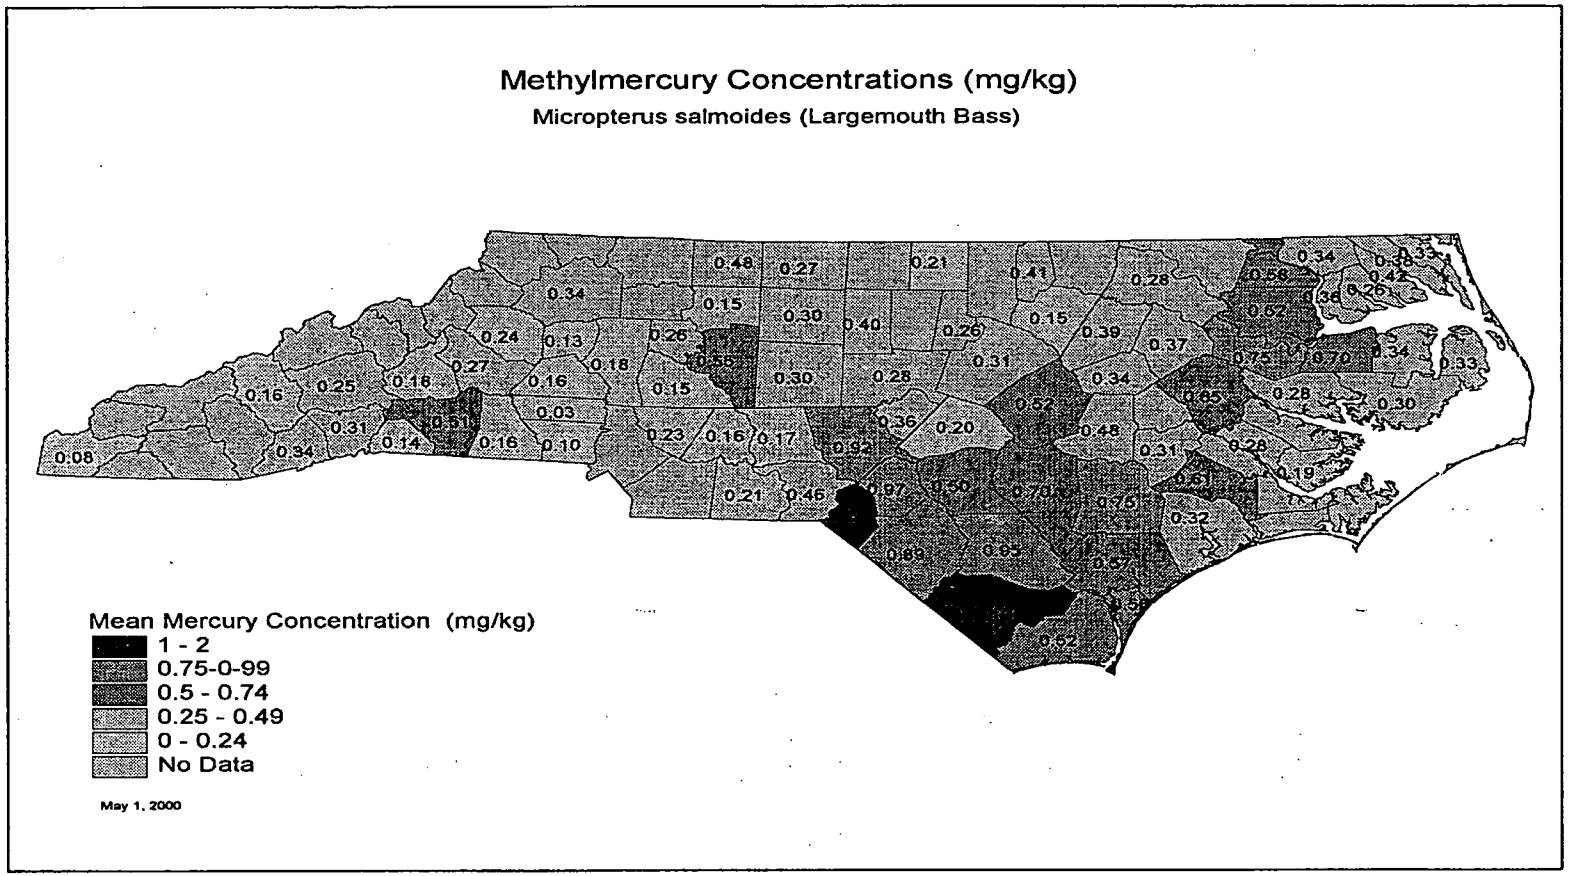

Figure 3-3

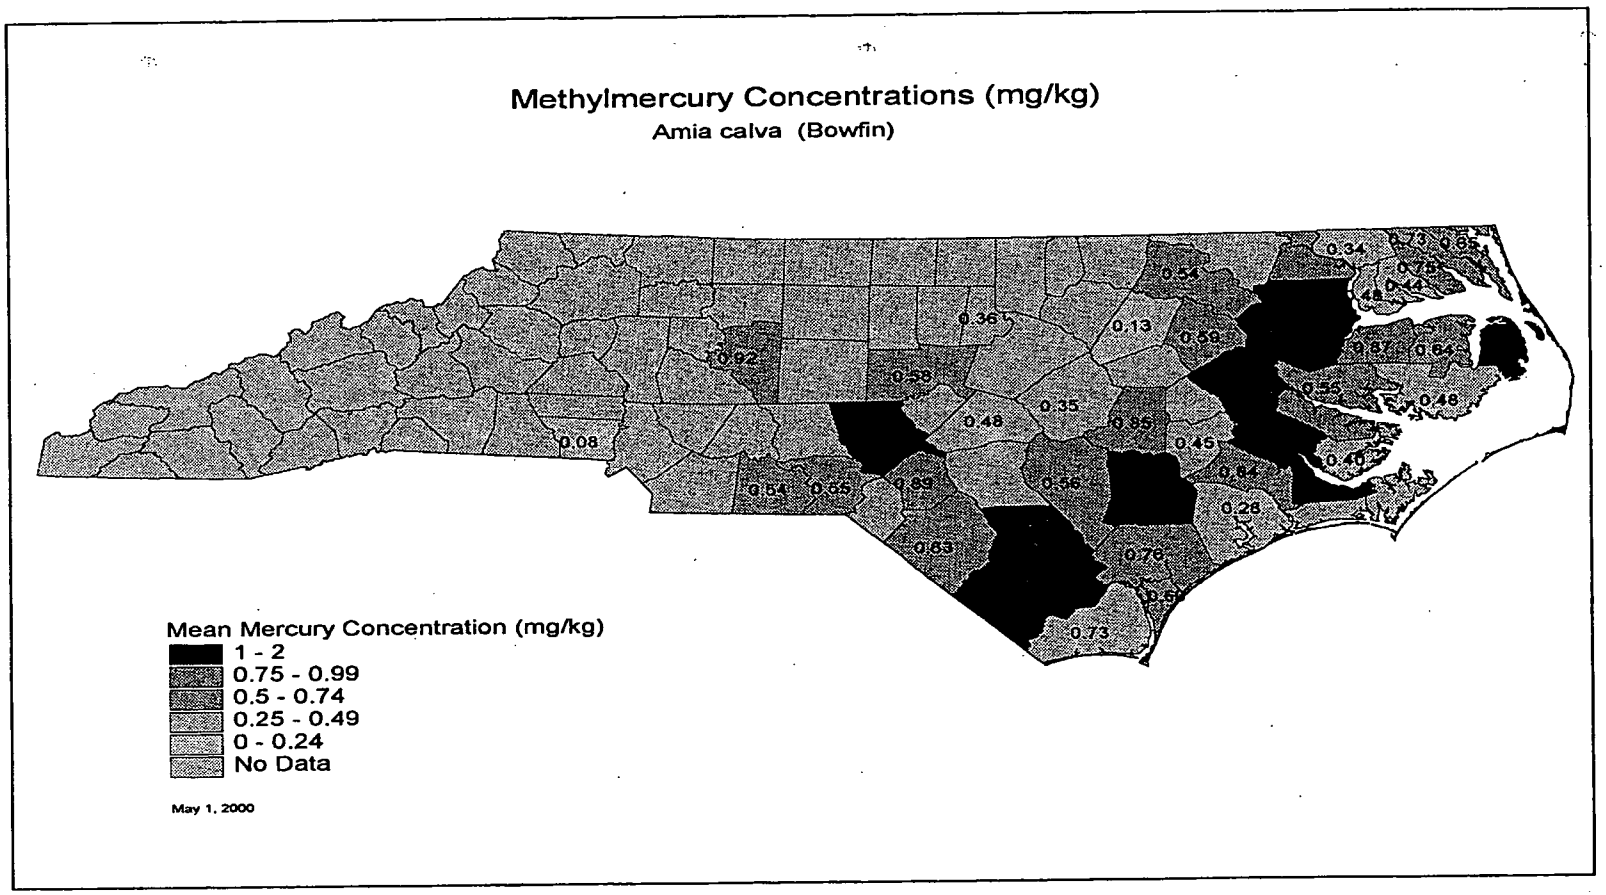
Contaminated Bowfin



"dry deposition". Levels of mercury in rainwater and adhered to particulate matter can both be measured. North Carolina has been measuring mercury in rainwater since 1996. Mercury that is not deposited out of the atmosphere remains suspended in the ambient air and exists either in its elemental form, *elemental mercury*, or its reactive form, which is referred to as reactive gaseous mercury (RGM). Together, elemental mercury and RGM comprise what is referred to as Total Gaseous Mercury (TGM). North Carolina has the ability to measure these two forms of mercury while still suspended in the air and can distinguish one from the other.

MERCURY WET DEPOSITION

Mercury wet deposition involves the transfer of mercury from the atmosphere to land or surface waters in precipitation or condensation of water vapor. Water-soluble species of gaseous or particulate mercury may be scavenged from the atmosphere by cloud water, rain, snowfall or water vapor. For many surface waters, atmospheric deposition is the most significant route of mercury loading. Dry deposition of particulate mercury or RGM also contributes to the overall rate of atmospheric deposition. Together, these phenomena contribute to raise methylmercury levels in fish residing in mercury-sensitive waters.

Mercury Wet Deposition Sites

Shortly after the discovery of widespread mercury contamination in Lumber River basin fish, the Division of Air Quality (DAQ) stationed air monitoring instruments at Lake Waccamaw and Pettigrew State Parks to measure mercury levels in rainfall. Measurement of mercury in rainwater can provide an estimated rate of atmospheric deposition and loading to local waters. The Waccamaw and Pettigrew stations were among the earliest sites in the National Atmospheric Deposition Network's Mercury Deposition Network (MDN). Composite rainwater samples were collected and analyzed weekly for total mercury content beginning in late 1995.

Recent data from both sites during 1999 and 2000 suggested that mercury levels in precipitation may be declining in these areas. The most dramatic drop occurred between 1998 and 1999 at Lake Waccamaw State Park, when levels declined to values typical of the more remote location at Pettigrew State Park. Since 1998 however, the levels have crept back up. The current theory of cause and effect for mercury levels increasing may be cleanup activities at the closed chlor-alkali facility.

There was a reduction in mercury deposition (a 30 percent drop compared to the previous three year average) at the Waccamaw site starting in 1999. This reduction coincides with the closure of the HoltraChem mercury cell chlor-alkali plant. However, concentrations increased in 2000 and 2001,

possibly due to plant clean-up efforts at the closed plant. The weighted concentration levels in 2000 and 2001 do not reach the magnitude of pre-1999 concentrations. Data from the Pettigrew site generally follow the same curve, but with lower weighted concentrations.

The Mercury Deposition Network

The National Atmospheric Deposition Program's Mercury Deposition Network (MDN) was designed to identify geographical and temporal trends in mercury deposition across North America. As of 2002 more than 50 sites were operating in more than 20 states and Canadian provinces. Precipitation levels, total mercury concentration, and mercury wet deposition rate are reported weekly. Volume-weighted mercury concentration is calculated on a quarterly and annual basis.

Ambient Gaseous Mercury

In recent years, ultra-sensitive techniques have been developed to measure and speciate mercury in ambient air and rainwater, allowing for the determination of temporal and spatial trends in atmospheric mercury. Mercury vapor analyzers are not dependent on precipitation events. They collect and record mercury concentrations 24-hours per day. The vast majority of these readings showed total gaseous mercury levels at or below 2 ng/m^3, which is in the range of concentrations considered "background" for this type of site. However, fluctuations of mercury vapor concentrations, up to twice background values, were periodically seen. Mercury data were matched to concurrent wind direction data to illustrate an association between elevated total gaseous mercury and winds originating from the east-northeast. This evidence suggested a fixed upwind source might be impacting atmospheric mercury levels at Lake Waccamaw State Park.

Atmospheric monitoring for total gaseous mercury was carried out concurrently at the Riegelwood and Lake Waccamaw locations during 1999 and 2000. The study, known as the Waccamaw Atmospheric Mercury Study, also involved chemical speciation of elemental and reactive gaseous mercury during 2000 at one of the Riegelwood sites.

Total Gaseous Mercury Summary

This section presents summation information on total atmospheric mercury levels collected over a three-year period between 1997 and 2000. Findings include:

- Data collected during 1998 at Lake Waccamaw State Park suggested that periodic spikes of total gaseous mercury exceeding 50 ng/m^3 were typical for this area during this time, but atypical for such a remote/rural location.

- On-site meteorology identified a relationship between elevations in total gaseous mercury and winds originating from the east-northeast.

- Beginning in early 1999, levels of atmospheric mercury at Lake Waccamaw state park returned to typical "background" levels (1.5 – 2.0 ng/m^3).

- Reduced atmospheric levels of total gaseous mercury were observed simultaneous with the cessation of chlorine production at a mercury cell chlor-alkali plant located approximately 25 kilometers to the east-northeast of Lake Waccamaw State Park.

- In Riegelwood, NC, measurements of atmospheric mercury included periodic spikes in total gaseous mercury throughout 1999 and 2000.

- Quarterly average total gaseous mercury levels during 1999 and 2000 were up to 166 percent higher at the Riegelwood monitoring locations versus coincident readings from Lake Waccamaw State Park. However, average values appeared to decline in Riegelwood over the course of this study and at one site decreased by roughly 40 percent between 1999 and 2000.

- Total gaseous mercury levels did not exceed 300 ng/m^3 (NC Acceptable Ambient Level and EPA inhalation reference concentration) at the Riegelwood sites for an extended period of time, suggesting that health risks from non-occupational inhalation of mercury were minimal for local citizens during the study period.

- Long-term continuous measurement of atmospheric mercury can be successfully achieved, even at the low levels found in the atmosphere. Data from these types of studies can be used in combination with on-site meteorological data to identify possible source-receptor relationships.

Reactive Gaseous Mercury Findings

Meaningful findings for reactive gaseous mercury include:

- Levels of atmospheric reactive gaseous mercury fluctuated significantly in the Riegelwood area throughout the last half of 2000.

- Short-term increases in reactive gaseous mercury frequently occurred in tandem with increases in elemental mercury when the monitoring site was downwind of the chlor-alkali plant and pulp and paper mill, suggesting that mercury emissions included both elemental and reactive gaseous mercury.

- In addition to source-related increases in reactive gaseous mercury, smaller scale increases also frequently occurred during afternoon hours, particularly on low humidity days, suggesting a natural diurnal cycle for reactive gaseous mercury.

- Meteorological conditions such as wind direction, precipitation, humidity and temperature appear to affect ambient air reactive gaseous mercury levels.

- New methods to measure and distinguish reactive gaseous mercury and elemental mercury performed well over extended periods of time; however, some modifications to the instrument assembly may be needed to maintain gold trap integrity over extended sampling periods.

Future DAQ Monitoring Efforts

The MDN sites at Lake Waccamaw and Pettigrew State Park will continue to collect data. If improvements in source emissions and total gaseous mercury at Lake Waccamaw in fact are related to declining mercury levels in regional precipitation, then rainwater data from this site should be comparable to results from Pettigrew State Park in future years. More data, collected over several years is needed to determine whether trends seen over the past three years support evidence for a relationship between regional anthropogenic activities and total gaseous mercury levels, or instead represent normal year-to-year variability in mercury wet deposition.

MONITORING MERCURY IN WATER

Waters affected by fish advisories by the DHHS are considered to be impaired by the DWQ. Therefore, DWQ is required to perform Total Maximum Daily Load (TMDL) studies. The TMDL is the amount of a given pollutant that a waterbody can assimilate while maintaining its designated uses (the current water quality standard for mercury of 0.12 ug/L). This allowable pollutant load must be allocated to the various point and area sources within the watershed. To establish a TMDL, the current level of contamination must be determined.

The DWQ has identified 4 major goals for this study. They are:

1. To determine levels of ambient mercury in the surface water system.

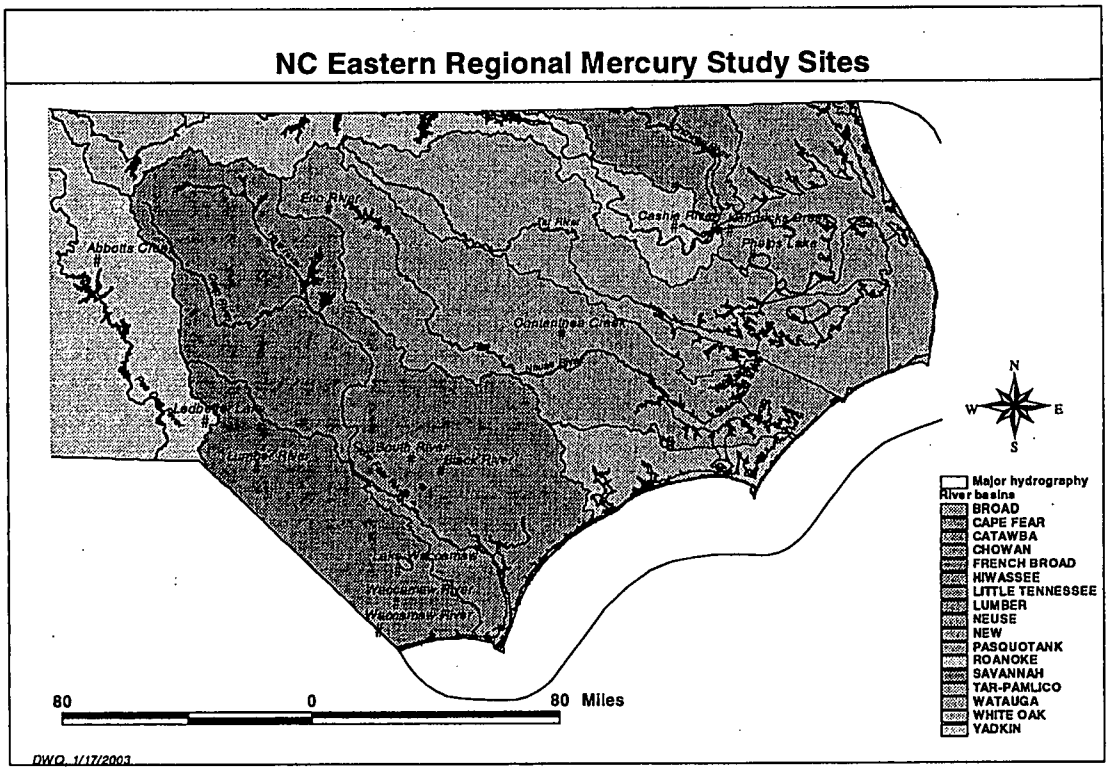
2. To estimate site-specific total mercury methylmercury translators to evaluate water quality criteria.

3. To develop site-specific water to fish bioaccumulation factors (BAFs).

4. To determine levels of mercury in treatment plant effluent.

Figure 3-4

Location of Water Study Areas



Future DWQ Monitoring Efforts

The DWQ will continue to monitor mercury in fish across North Carolina and has several studies in the works:

- Continue low-level waterborne mercury study in eastern NC.
- Monitor tissue analysis in marine species after removal of known atmospheric source.
- Operate six stations around the defunct Riegelwood chlor-alkali plant (begun in 2001 and will continue as resources allow for the foreseeable future).
- Monitor 12 sites for low-level ambient mercury.
- Determine ambient levels of mercury in surface water.
- Develop site specific BAF's with fish.
- Continue methylmercury analysis of marine species (Spot, Croaker, Speckled Trout, and Bluefish, with more species as resources allow) jointly with the DAQ, DHHS, and DMF.

CHAPTER 4 - NC MERCURY EMISSIONS RESULTING FROM PLANNED SO_2 AND NO_X CONTROLS

The two main North Carolina electrical utility companies are mandated to significantly reduce NO_x and SO_2 emissions by the amounts and schedule stated in the North Carolina. *Clean Smokestacks Act* (CSA). Each of the two major utility companies has submitted their plans identifying the boilers getting retrofitted with NO_x and SO_2 control technologies and the corresponding retrofit schedules. In contrast to the definitive CSA provisions and the definitive NO_x and SO_2 technology choices already made by the utilities, the new State law does not contain any specific requirements and technology choices for mercury emission reductions. Instead, mercury emission reductions are expected as side benefits to the specific reductions of NO_x and SO_2 emissions.

Coal-fired utility boilers produce the largest share of mercury emissions. The CSA is estimated to reduce current mercury emissions of 3,052 pounds to 1,363 pounds per year, based on the utilities initial compliance plans for NO_x and SO_2.

STATE-WIDE MERCURY EMISSION SOURCES

In 1998, sources in North Carolina reported a cumulative total mercury emission of 4,626 pounds. The 500 sources represent an estimated 95 percent of statewide mercury emissions. Table 4-1 displays the industrial categories of mercury source as a percent of total mercury emissions in North Carolina. The primary sources of mercury emissions in North Carolina are coal-fired electric utility boilers.

Table 4-1

Cumulative North Carolina Mercury Emissions

Industrial Category	Percent of NC Mercury Emissions
Manufacturing Processes	1
Municipal Waste Combustion	8
Medical/Hazardous Waste Incineration	11
Industrial Boilers	18
Electric Utility	62

Source: 1998-99 DAQ and Local Program Emissions Inventories, 1999 EPA Information Collection Request.

According to the EPA's 1997 *Mercury Study Report to Congress*, coal-fired electric utilities are the largest source of human-caused mercury air emissions in the United States. Nationally, utilities are followed by municipal waste combustors (19 percent), medical waste incinerators (ten percent), and hazardous waste combustors (four plus percent). The largest remaining identified source of mercury emissions are from coal-fired utility boilers.[42] Additionally, the intentional use of mercury in commercial products in the United States declined by more than 75 percent from 1988 to 1996.[43]

Coal-fired Utilities Boilers

In 1999, the U.S. Environmental Protection Agency (EPA) conducted the Electric Utility Steam Generating Unit Mercury Information Collection Effort (EU/ICE) to gather information about mercury emissions from the coal-fired electric utility industry. This effort led to the collection of stack test and coal mercury content reports on 80 furnace or boiler units. Information collected during the stack testing included operating control device configurations. Research Triangle Institute used this collected data to build the tool "Electric Power", "*EUCFF*" (Version 3.0.1). The tool was developed in June 2001 for estimating mercury emissions from coal combustion at electrical utilities in the United States.

Electric Power allows permitting authorities and others to evaluate the impact on mercury emissions if certain parameters including type of coal, boiler, or pollution control device are changed.[44] This program, does not account for any additional mercury capture if selective catalytic reduction (SCR) equipment is installed in the flue gas stream. Therefore, if an SCR is installed, the actual mercury emissions may be lower (more captured) than emissions reported in Table 4-2.

Table 4-2 shows three estimated mercury annual emission rates from each coal-fired electric utility boiler: mercury emissions based on mercury content in coal, current mercury emissions (total of 3,052 pounds per year), and the estimated mercury emissions after additional air pollution controls are operational to meet the NO_x and SO_2 emissions pollutant caps of the CSA.

The mercury emission data presented in Chapter 4 are characterized as *preliminary estimates*. This caveat was used because there is a limited database of speciated mercury emission measurements not only nationwide, but also here in NC. The emission data presented in this report was not based on individual measurements made on each NC boiler, but rather on correlations statistically.

[a] This numerical value represents the mercury in coal that is burned. However, a percentage of the mercury is converted from elemental to oxidized mercury, and a percentage of the oxidized mercury attaches to fly ash and is removed from the exhaust gas by electrostatic precipitators as it captures the fly ash.

derived from the available national database on speciated mercury emissions, largely stemming from the EU/ICR emission data.

Other Point Sources

Chlor-Alkali Plant

The only chlor-alkali plant operating in North Carolina has been shut down for approximately three years. Since the plant discontinued production, area air and water sampling are showing reduced mercury concentrations.

Medical And Municipal Waste

The EPA already has taken action to reduce mercury emissions from three significant industrial sources. In 1995, EPA issued final regulations cutting mercury emissions from municipal waste combustors, and in 1998, from medical waste incinerators. The same year, the EPA announced a final rule to reduce mercury emissions from hazardous waste combustion. These actions, once fully implemented, will reduce mercury emissions caused by human activities by over 50 percent of the 1990 levels.[45]

Nucor Steel

A new source in North Carolina that recently started full-scale operations is Nucor Steel in Cofield, North Carolina. This facility is basically a steel making facility that uses primarily scrap steel to recycle into new steel products. Recently, the facility was required to do some stack tests to determine

[45] Ref. 17, page 1.

levels of a number of pollutants as a result of their permit. The tests resulted in unexpectedly high levels of mercury being measured. These emissions, along with the refinement and lowering of emissions from several coal-fired utility units has given Nucor Steel the distinction of reporting the most mercury emissions from a single facility in the state for Calendar Year 2001. This came as a surprise to the company and to the DAQ. There is a strong possibility that mercury emissions originate from mercury switches that remained intact during automobile shredding as scrap.

These results have reportedly started a new, industry-wide reevaluation as to why the emissions were so high and whether the data are valid. More work continues on this and the situation will be watched very closely, but for now there is reason to believe these high mercury emission test results and estimates may be valid.

General Background for Emission Controls

Because the ratio of the two chemical species of mercury emitted from boilers varies from plant to plant, no single control technology removes all mercury.[46] Elemental mercury passes through control equipment. When elemental mercury is changed to inorganic mercury compounds, control equipment can capture the mercury. The ratio of the chemical species of mercury emissions also varies from boiler to boiler due to boiler design, power plant configuration (including controls), and the type and source of the coal burned. These variables affect flue gas chemical and particulate properties, increasing or reducing the percentage of inorganic mercury compounds.

Recent field tests indicate that significant mercury capture is being achieved at coal-fired electric utility boilers through inherent fly ash sorption and collection in existing particulate matter (PM) collectors. These data also show that even more substantial capture occurs for systems using sulfur dioxide (SO_2) scrubbers and post-combustion nitrogen oxide (NO_x) controls. Even greater mercury reductions will be achieved through implementation of advanced controls and strategies for compliance with fine PM, ozone non-attainment, regional haze, and new source review requirements.

The country's first full-scale program to test advanced mercury control technologies was completed in early 2002 by the Department of Energy (DOE) at Unit 3 of Alabama Power's Gaston plant. Testing results demonstrated that mercury can be removed at rates between 80 and 90 percent when activated carbon is injected ahead of the existing bag house ash collection system. Unit 3 is unusual in that it burns low sulfur bituminous coal and controls particulate with an electrostatic precipitator and a baghouse in series.[47]

---

[46] Ref. 3, page 3.
[47] Ref. 11, page 1.

Generally, the most important conclusions from the assessment of flue gas treatment technologies include:

1. Control devices operating at relatively low temperatures (300 to 400 ° Fahrenheit).

2. The presence of an effective mercury sorbent and a method to collect the sorbent (e.g., high levels of carbon in the fly ash enhance mercury sorption onto particulate matter, which is subsequently removed by the particulate control device).

3. Hydrogen chloride (HCl) presence in the flue gas stream, which can result in the formation of mercury chloride ($HgCl_2$), is readily adsorbed onto carbon-containing particulate matter, or can be efficiently scrubbed.

4. Conversely, sulfur dioxide (SO_2) in flue gas can act as a reducing agent to convert oxidized mercury into elemental mercury, which is more difficult to capture.[48]

All mercury leaving the furnace (before the preheater and controls) is elemental mercury (Hg^0), and its subsequent oxidation under typical exhaust-flue conditions is kinetically limited, so the abundance of oxidized mercury expected under thermo-chemical equilibrium does not materialize in the actual exhaust system. However, the predominate oxidized species, mercury chloride ($HgCl_2$), is water-soluble and, therefore, dissolves in scrubber solutions, whereas Hg^0 is insoluble and passes through the scrubber. In total, 102 elementary chemical reactions are included in the homogeneous Hg^0 oxidation mechanism.[49]

Over the last 22 years in the Netherlands, the behavior of mercury in coal-fired power plants has been studied extensively. On average, the fate of mercury entering the power station in the coal was as follows: less than 1 percent in the bottom ash, 49 percent in the pulverized fuel ash (ash collected by the electrostatic precipitator (ESP), 16.6 percent in the wet flue gas desulfurization (FGD) gypsum, 9 percent in the sludge of the wastewater treatment plant, 0.04 percent in the effluent of the wastewater treatment plant, 0.07 percent in the fly dust (leaving the stack), and greater than 24 percent as gaseous mercury in the flue gas and emitted into the air. DENOX® selective catalytic reduction (SCR) favors the formation of oxidized mercury (influencing oxidation of 2 to 12 percent of elemental mercury). Dutch electrostatic precipitators (ESPs) are operated at lower temperatures (lower temperatures

[48] Ref. 6, Chapter 4, page 7.
[49] Ref. 12, page 894.

encourage mercury oxidation) than in the United State because of lower sulfur concentrations in the Dutch coal. Higher concentrations of coal sulfur creates more sulfur dioxide (SO_2) in flue gas, which can act as a reducing agent to convert oxidized mercury back into elemental mercury. Additionally, higher concentrations of coal sulfur in the United States requires American ESPs to be operated at higher stack exhaust temperatures to prevent the condensation of sulfuric acid (H_2SO_4).[50]

Results show that some commercial SCR catalysts are capable of oxidizing elemental mercury in flue gas.[51] Recent results indicate that up to 60 percent of elemental mercury present in flue gas may be oxidized across an SCR.[52] Mercury oxidation by an SCR catalyst decreases as flue gas temperature increases from 650 to 800 °F. The addition of ammonia to the flue gas immediately upstream of the catalyst tends to decrease mercury oxidation.[53] However, when no absorber is present downstream from an SCR, increased levels of oxidized mercury may be emitted from the plant, creating a localized mercury deposition problem.[54]

Demonstrations of activated carbon injection for utility boilers have been conducted in the United States. Based on limited testing, using activated carbon injection to control of mercury for utility boilers varies greatly. The same technology might capture 20 percent of mercury at one plant and 80 percent at another. The addition of activated carbon to utility flue gas for mercury control would significantly increase the amount of particulate matter requiring disposal.[55]

The most important factors affecting mercury control on utility boilers include:[56]

1. flue gas volume,
2. flue gas temperature,
3. chloride content,
4. the mercury concentration, and
5. the mercury chemical form.

CONTROLLING COAL-FIRED UTILITIES MERCURY EMISSIONS

The issue of cost-effective control of mercury emissions from coal-fired utilities is indeed complex and in need of greater understanding. The issue facing the utility industry, its federal and state regulators, and the public is not merely the simple question of what is the single best add-on mercury emission control technology industry wide, but rather a multifaceted set of questions on what are the best candidate technologies for each boiler individually, including:

1. How much of each species of mercury is emitted from the existing boiler combustion process?

2. How much control of each mercury species is achieved by existing air pollution control equipment?

3. How much control of each mercury species will be achieved by installing new air pollution control equipment for NO_x, and the similar question for SO_2?

4. Is additional mercury control warranted to protect human health and the environment, and if so, how much further control is needed, what are the costs and level of control for each option, and can the cost/benefit of the selected option be justified?

5. What and when will the new federal standards be set for mercury?

An example of a multi-pollutant emission issue was experienced in the late 1970s / early 1980s when many utilities switched to low sulfur coal in order to reduce SO_2 emissions. What some utilities discovered was that while lowering SO_2 emissions, the low sulfur coal switch inadvertently increased particulate emissions on many cold-side ESPs due to high resistivity hard-to-collect flyash. To restore previous particulate emission levels, utilities had to further invest in enlarging their ESPs, installing flue gas conditioning systems to lower resistivity, reconfiguring their cold-side ESPs-to become hot-side units, or replacing their ESPs with fabric filters.

EXISTING MERCURY CONTROLS AND CONTROL PERFORMANCE

Certain fly ashes have been shown to promote oxidation of elemental gaseous mercury more than others. The difference in oxidation appears to be attributable to fly ash composition and flue gas composition. Trace levels of iron in the fly ash and the surface area of fly ash are also indicated to influence oxidation levels. Given this complexity of mercury speciation and behavior, the science of understanding how to best capture mercury with existing emission control equipment and emerging control technologies is actually in its early

stages. The following discussion is an attempt to present engineering material on the details and characteristics of mercury emission control performance, with emphasis given to parameters and conditions specific to NC coal-fired utility boilers.

Table 4-3 presents characteristics of each coal-fired utility boiler and its corresponding emission control equipment currently operating in NC. As shown, NC has approximately 50 coal-fired utility boilers burning eastern bituminous low sulfur (at or below 1 percent sulfur) coal belonging to two utility companies. Duke Power owns and operates 27 boilers and Progress Energy owns and operates 18 boilers for a combined total generating capacity of 13,308 megawatts (MW). Currently there are primarily two types of stand-alone particulate air pollution control systems on the Duke Power and Progress Energy NC utility boilers: Cold-side electrostatic precipitators (ESPs), and Hot-side ESPs. Other smaller industrial and utilities own and operate 4 cogeneration facilities with a total capacity of 465 MW, or 3 percent of the electricity produced in NC (Dwayne Collier Battle in Battleboro, Tobaccoville Plant in Tobaccoville, and Westmoreland-LG&E Partners Roanoke Valley I and II in Weldon). The cogeneration boiler facilities are controlled with spray dryer / fabric filters and a stand-alone fabric filter. The allocation of air pollution control systems in NC is not dissimilar from the national average, where ESPs are installed on 84 percent of the boilers nationwide (with most being stand-alone cold-side ESPs) and spray dryer / fabric filters are installed on just 4 percent of the units.

Table 4-4 is intended to show that the majority of the state's utility generating capacity will have NO_x and SO_2 emission controls installed. Table 4-4 summarizes each utility's generating capacity with controls and their percent of generating capacity with controls for NO_x and SO_2. The percent controlled is the percent of the utility's mega watt generating capacity, not the percent of controlled NO_x and SO_2.

Electrostatic Precipitators

Electrostatic Precipitators (ESPs) are very effective particulate emission control devices. While they remove a large percentage (98-99 percent) of fly ash and other particulate from the boiler combustion exhaust gas stream, they are ineffective in removing any gas phase pollutants, such as SO_2, NO_x, or gaseous elemental mercury. ESPs use high voltages on the order of 30,000 volts applied to wires or tubes to electrically charge particles that will cause them to be attracted to ESP collection plates. Periodic rapping removes the particles from the collection plates into hoppers located below where the dust is conveyed and either disposed of in an acceptable manner or recycled into useful products, such as cement or road material.

Typical "cold side ESPs" generally operate in the temperature range of 280 - 320 °F; the term cold side denotes the ESP is installed downstream (on the colder-side) of the air pre-heater. An air pre-heater is a heat exchange device downstream of the boiler furnace where thermal energy is extracted from the flue gas. The air preheater transfers thermal heat from the boiler exhaust gas stream at a temperature near 750 °F to preheat relatively cool combustion (ambient) air entering the boiler firebox. Preheating combustion air saves fuel and makes the boiler more efficient. The acronym for a cold side ESP is ESP-CS. For this study, cold-side ESPs treating bituminous coal-fired boilers remove 29.1 percent of the total mercury emissions entrained in the boiler exhaust gas stream. In comparison to other air pollution controls in use at utility boilers, cold-side ESPs exhibit mediocre efficiencies for mercury removal, as its temperature favor the mercury being in both the ionic and elemental gaseous forms. This allows the ionic mercury fraction to be absorbed onto the particulate for subsequent removal by the cold-side ESP. [EPRI 2000, p. 3-21 & 22] Roughly 60 percent of the state's utility boilers are controlled with cold-side ESPs.

A "hot side ESP" normally operates in the 700 - 800 °F temperature range; the term hot side denotes the ESP is installed upstream (on the hot-side) from the air pre-heater. Hot-side ESPs were intended to be an alternative solution to cold-side ESPs treating flue gas from boilers burning low sulfur coal producing high resistivity hard-to-collect flyash. The acronym for a hot side ESP is ESP-HS. For this study it is assumed that hot-side ESPs treating bituminous coal-fired boilers remove only 10.7 percent of the total mercury emissions contained in the boiler exhaust. In comparison to other air pollution controls, hot-side ESPs are among the least efficient mercury-removal air pollution control devices in use at utility boilers, as the high temperature favors mercury being in the elemental gaseous mercury, a form uncollectable by ESPs.

[EPRI 2000, p. 3-21] Nearly 40 percent of the state's utility boilers are controlled with hot-side ESPs.

Fabric filters

Fabric filters have similar collection and operating concepts to household vacuum cleaners, except they are a great deal bigger, use industrial strength bag materials, and have automatic bag cleaning mechanisms to remove collected dust. Fabric filters normally operate in the low 300 °F temperature range and are very efficient in particulate removal, usually at or above 99 percent for well designed and operated units. Like ESPs, as stand-alone devices they are primarily designed for particulate removal and usually ineffective in removing gaseous pollutants. However, when used in combination with sorbent injection systems, fabric filters become effective in removing gaseous pollutants as these pollutants come into close contact with the dust / sorbent collected on the bag surface and absorbed onto the sorbent. The average removal performance by existing fabric filters tested on bituminous coal-fired boilers in the EU/ICR was 90 percent of total mercury emissions. Fabric filters are installed on only 9 percent of utility boilers nationwide, and 16 percent of NC utility boilers. Average mercury capture by spray dryers / fabric filters was 98 percent. Relative to other air pollution controls, spray dryers and fabric filters show excellent mercury removal performance because of the additional gas–particle contact afforded by the filter dust cake along with its low temperature and oxidizing conditions favoring mercury speciation in the oxidized form. (EU/ICR data)

Spray Dryer and Fabric filters

Spray dryers use an alkaline (typically lime) solution that is atomized into small droplets when sprayed into the boiler exhaust gas stream for SO_2 control. They are also referred to as dry scrubbers or dry flue gas desulfurization (FGD) scrubbers. The hot gas stream vaporizes the droplets into small particles that are then collected downstream in a fabric filter. The alkaline droplets / particles absorb SO_2 while being transported in the ducting. Fabric filters offer an advantage because additional SO_2 is collected on the fabric filter bags, making fabric filters the particulate air pollution control method of choice with sprayed or injected sorbents. Spray dryer / fabric filters normally achieve a SO_2 control efficiency of 90+ percent. The average mercury capture by existing spray dryers / fabric filters tested on bituminous coal boilers in the EU/ICR was 98 percent of total mercury emissions. One major spray dryer manufacturer cites as one if its benefits is "inherent oxidized mercury emission reductions." [B&W Dry FGD brochure] Spray dryers are installed on less than 5 percent of utility boilers nationwide and on 6 percent of the NC boilers, with all of the NC units operating on the relatively small co-generation plants. (EU/ICR data)

Fabric filters downstream of spray dryers are designed and operated similar to stand-alone fabric filters. The biggest difference is that the particulate loading is roughly twice as much due to the increase in entrained solids produced from the spray dryer. The average mercury capture by existing spray dryers / fabric filters was 98 percent. Relative to other air pollution controls, spray dryers / fabric filters show excellent mercury removal performance because of the additional gas–particle contact afforded by the filter dust cake along with its low temperature and oxidizing conditions favoring mercury speciation and collection in the oxidized form. (EU/ICR data)

In summary, the EU/ICR data show that existing controls to meet particulate emission standards do capture some of the mercury emissions. However, the controls currently used at most NC power plants are not highly effective in capturing mercury. While fabric filters and spray dryer adsorbers remove 90 percent or more of the mercury released by burning coal in NC, Table 4-1 shows that these two systems only control 3.4 percent of the states generating capacity. The remaining 96+ percent of the states electrical generating capacity is controlled by less effective mercury control technologies: cold-side ESPs with about 30 percent removal and hot-side ESPs with only 10 percent removal. The last column in Table 4-1 provides a mass balance of the mercury released from NC coal-fired utility boilers, showing that roughly:

- four percent is collected by stand-alone hot-side ESPs,
- 17 percent is collected by stand-alone cold-side ESPs,
- 0.5 percent is collected by stand-alone fabric filters,
- three percent is collected by spray dryer / fabric filters,
- a total of 24 percent is collected by all the above control systems, and
- 76 percent is emitted to the atmosphere.

PLANNED SO_2 AND NO_x CONTROLS AND MERCURY CONTROL PERFORMANCE

In response to the Clean Smokestack Act of 2002, the utility companies are required to reduce their NO_x emissions 78 percent by 2009 and their SO_2 emissions 73 percent by 2013. In order to achieve these requirements, Duke Energy and Progress Energy plan to install flue gas desulfurization (FGD) wet and/or dry scrubbers to reduce SO_2 emissions, and combustion controls and post-combustion controls to lower NO_x emissions.

Wet SO_2 Scrubbers

Wet scrubbers are similar to dry scrubbers in that both use an alkaline solution to collect SO_2 and both are located downstream of a particulate air pollution control. However, wet scrubbers saturate the flue gas stream with water, as the complete scrubbing process, including by-products, remains liquid or in a slurry form. They are also referred to as wet FGD scrubbers and normally achieve a SO_2 control efficiency of 90+ percent. In this study it was estimated that wet scrubbers downstream of cold-side ESPs would remove almost 80 percent of total mercury emissions and wet scrubbers downstream of hot-side ESPs would remove nearly 40 percent of total mercury emissions. This decrease in mercury control performance in hot-side ESP is due to the relatively lower amount of mercury oxidized at elevated temperatures. Relative to other air pollution controls, wet scrubbers downstream of cold-ESPs show higher mercury removal performance because the gas temperature favors more oxidized mercury, with the oxidized fraction being more effectively removed in the scrubber. The challenge to improve performance of mercury capture in wet FGD is to find a way to oxidize the elemental mercury vapor before it reaches the scrubber or to modify the liquid phase of the scrubber to cause oxidation to occur. Wet FGD scrubbers are installed on about 15 percent of utility boilers nationwide, most of which are on the larger boilers, as these scrubbers control roughly 25 percent of the US power generating capacity. No wet FGDs are currently installed on any NC boilers. (EU/ICR data)

Consistent with this national profile, both NC utility companies plan to install 23 wet and dry FGD scrubbers on their largest units in response to the CSA requirements of reducing SO_2 emissions by 73 percent by 2013. Duke Energy is preparing to install wet scrubbers on its 12 largest boilers, representing 75 percent of its generating capacity. All of Duke Energy scrubber will be located downstream of cold-side ESPs. Progress Energy plans to install a combination of wet and dry FGD scrubbers on their 11 largest units, as both are proven technologies and provide greater than 90 percent SO_2 removal efficiencies. The Progress Energy scrubbers will control 90 percent of its generating capacity. However, FGDs will be installed on two of Progress Energy's largest units downstream of hot-side ESPs (700 MW or more at Mayo 1

and Roxboro 4); the remaining eleven FGDs will be installed on other large units downstream of cold-side ESPs.

Progress Energy recently contracted with McDermott Technologies / Babcock Wilcox to supply wet and dry FGDs on its NC coal-fired boilers. Two sets of experiments on a 10 MW test facility representative of utility boilers indicated 80+ percent mercury control with a McDermott proprietary reagent added to the FGD scrubber slurry; cost prediction for such a reagent is less than 5 percent of normal FGD cost. Another test on this 10 MW – FGD test facility showed an increase in the oxidized mercury species across a SCR, suggesting that improved mercury control would occur for FGDs and particulate control systems downstream of a SCR. Follow-up tests at full-scale utility boilers are scheduled on enhanced mercury control with FGD and SCR. (Reference: "Wet FGD Enhanced Mercury Control for Coal-Fired boilers" by M.G. Milobowski, B&W, et al with McDermott Technologies.)

Nitrogen Oxides Controls

Cost effective control techniques to reduce nitrogen oxides (NO_x) formation are typically accomplished by combustion and post-combustion control measures. Combustion measures consist of operating and equipment modifications that reduce the peak temperature and excess air in the boiler furnace. These modification / control practices generally consist of improvements known as low NO_x burners, overfire air, underfire air, rotating opposed-fired air, staged combustion, and various forms of gas reburn usually with natural gas. Low NO_x burners can lower NO_x emissions by about 25 – 55 percent. Overfire air can reduce NO_x emissions by about 15 – 50 percent. In combination, reductions up to 60 percent may result. The actual reduction achieved with a given combustion control measure can vary with boiler and fuel characteristics. Almost 60 percent of the US boilers were equipped with some form of combustion modification / controls to reduce NO_x emissions, according to the 1999 EU/ICR database. Combustion controls typically reduce coal-fired boiler NO_x emissions from uncontrolled levels near 0.7 – 0.8 down to 0.2 – 0.3 lb/MMBtu.

In order to achieve further reductions greater than 60 percent and below 0.2 – 0.3 lb/MMBtu (as is the case for NC CSA requirements), post-combustion controls for coal-fired utility boilers are necessary. The two predominant post-combustion control technologies are selective catalytic reduction (SCR) and selective non-catalytic reduction (SNCR). With both of these methods, a reducing agent such as ammonia (NH_3) or urea is injected into the duct to reduce NO_x to nitrogen (N_2). While the application of post-combustion NO_x controls is becoming more prevalent, less than four percent of boilers nationwide used either SCR or SNCR systems in 1999.

Selective Catalytic Reduction

The SCR process uses a catalyst with ammonia gas to reduce the nitric oxide (NO) and NO_2 in the flue gas to molecular nitrogen and water. Ammonia gas is diluted with air or steam, and this mixture is injected into the flue gas stream upstream of a metallic catalyst bed composed of vanadium, titanium, platinum, or zeolite. In the reactor, the reduction reactions occur at the catalytic surface. The SCR catalyst bed reactor is usually located between the economizer outlet and the air heater inlet, where temperatures range from 450 – 750 °F. Recent data suggests that SCRs tend to promote additional mercury oxidation, thereby enhancing mercury removal with most existing and emerging particulate / SO_2 control technologies.

Selective Non-Catalytic Reduction

The SNCR process is based on the same basic chemistry as SCR but does not require the use of a catalyst to produce the reactions. Instead, the reducing agent is injected into the flue gas stream at a point where the flue gas temperature is maintained with a specific temperature range. In the two most common SNCR processes, either ammonia or aqueous urea is injected upstream of the economizer where the temperature is in the range of 1600 – 2000 °F. If the flue gas temperature at the injection location gets above this range, the ammonia will oxidize and form more NO_x; if the temperature drops below this range, the effectiveness of the process drops significantly.

In summary, the estimated data in Table 4-3 show that the planned controls to meet the new SO_2 and NO_x emission requirements are expected to also significantly reduce mercury emissions. More than 50 percent of the statewide utility mercury emissions are estimated to be controlled by cold-side ESP / FGD configuration. Each of the remaining five types of emission control configurations is expected to account for nominal reductions individually (less than 5 percent). However, collectively it is expected that at least 63 percent of the potential mercury emissions will be captured by the planned and unchanged existing controls. This means that the coincidental reductions in mercury emissions approach the CSA required reduction levels of 73 percent and 77 percent for SO_2 and NO_x, respectively. This fact demonstrates the rationale and benefits of applying a multi-pollutant contained in the Bush administration proposed Clear Skies Bill and the other bills under consideration by the US Congress. Selection and deployment of new SO_2, NO_x, and fine particulate controls, which also control or contribute to the control of gaseous mercury in coal combustion, may reduce or eliminate the need for mercury-specific controls.

The last column in Table 4-3 depicts a mass balance of the mercury released from NC coal-fired utility boilers, showing that roughly:

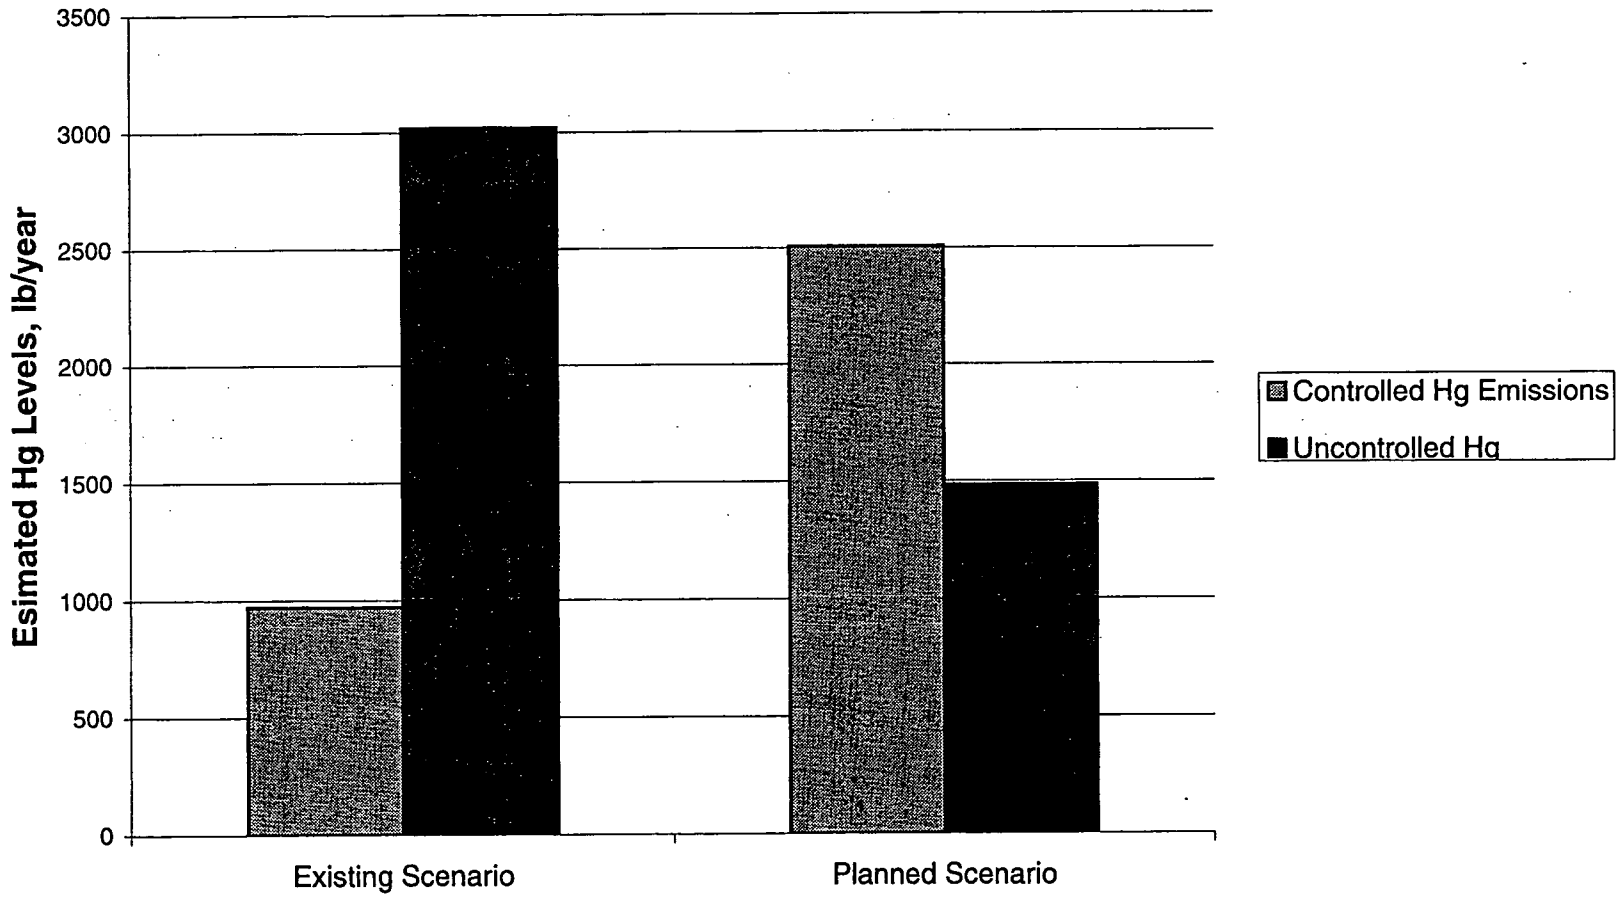
- 1.5 percent collected by stand-alone hot-side ESPs,
- 1.2 percent collected by stand-alone cold-side ESPs,
- 0.5 percent collected by stand-alone fabric filters,
- three percent collected by spray dryer / fabric filters,
- 53 percent collected by cold-side ESPs / FGD,
- three percent collected by hot-side ESPs / FGD,
- a sum of 63 percent collected by all the above control systems, and
- 37 percent emitted to the atmosphere.

Figure 4-1 presents statewide data for the existing and planned scenarios, comparing the uncontrolled (released to the atmosphere) mercury emission levels before and after adding FGD scrubbers to the 26 largest boilers statewide. This figure illustrates that the majority of estimated mercury emissions are emitted prior to the installation of FGD scrubbers. The majority of the mercury will be controlled after the installation FGD scrubbers.

Note it is possible that further mercury emission reductions could be realized from the planned SO_2 / NO_x controls than what is presented above. There are two mercury control enhancements suggested by certain testing that have not been considered in the above calculations because of the lack of hard data. These possible enhancements are:

1. Additional oxidation of gaseous elemental mercury afforded by SCRs for NO_x controls that could elevate mercury capture in the downstream new SO_2 controls and/or the existing particulate controls; certain data indicate that 90+ percent of the total mercury from bituminous coal-fired boilers is oxidized by SCRs. And
2. 78 percent level currently estimated in this report. Likewise, it is possible that levels above the 40 percent assumption are achievable by wet FGDs following hot-side ESPs.
3. Additional capture by wet FGD downstream of cold-side ESPs and/or hot-side ESPs; certain data indicate that 90+ percent mercury control is achievable by wet FGD following cold-side ESPs, notably above the 40 percent assumption are achievable by wet FGDs following hot-side ESPs.

Figure 4-1. Existing vs Planned Hg Control Scenario for NC Coal-Fired Utility Boilers



POTENTIAL RETROFIT MERCURY CONTROL TECHNOLOGIES

In the event that additional mercury control is found warranted on any NC coal-fired boiler, it is worthwhile to identify and study the performance and cost of potential cost-effective retrofit mercury control technologies. Most retrofit controls are a modification of, or distinct from, the existing and planned controls already discussed in this section.

Reducing Mercury In Coal

A data collection effort by the EPA showed that mercury levels could vary appreciably from one coal type to another, as well as within a particular coal type. Further, mercury levels in coal from the same coal seam at a mine can vary.[57]

Data are available from pilot and lab studies on the mercury concentrations in raw coal and cleaned coal and on the percent reduction of mercury reduction achieved by cleaning. These data, which includes a number of different coal seams in four states (Illinois, Pennsylvania, Kentucky, and Alabama), show that mercury reductions from 0 to 64 percent, with an overall average reduction of 21 percent. Conventional cleaning and column froth floatation (bench-scale) reduced mercury concentrations from raw coal by 40 to over 57 percent, with an average of 55 percent. Conventional cleaning and selective agglomeration (bench-scale) reduced mercury concentrations from the raw coal by 63 percent to 82 percent, with an average of 68 percent. In a second bench-scale study, in which three types of coal were cleaned with a heavy media cyclone (a conventional cleaning methods), followed by a water only cyclone and a floatation system, mercury concentrations in the raw coal were reduced by as much as 63 to 65 percent. The DOE is also carrying out bench-scale testing to investigate the use of naturally occurring microbes to reduce mercury (and other trace elements) from coal. Approximately 77 percent of the eastern and midwestern bituminous coal shipments are cleaned in order to meet customer specifications for heating, ash content, and sulfur content, but not for mercury reduction.[58]

Parallel to switching to low sulfur coal for SO_2 emission reductions, some may consider it a viable candidate control strategy to switch to a lower mercury coal. While coal type is a dominant factor for FGD and all other secondary mercury controls, changing suppliers of the low sulfur eastern bituminous coal burned in NC utility boilers appears to offer limited benefit. First, bituminous coal affords the best mercury capture fly ash properties relative to the other two common US coal types, sub-bituminous and lignite coals. Second, the NC utility boilers were designed for bituminous coal and, as

---

[57] Reference 10, page 1

[58] Ref. 6, Chapter 4, page 5.

a result of over 30 years of operating experience, their operation and maintenance has been maximized for bituminous coal. Third, from a near-term perspective, some reduction of the mercury content in certain coals burning at existing utility boilers can be achieved by physical coal cleaning processes. However, there is no easily identifiable coal deposits or coal types that will reliably benefit from cleaning with respect to reducing mercury content. In addition, even with use of widespread coal cleaning for mercury emission control, significant quantities of mercury will remain in the coal after cleaning, and thus require other control technologies be used to achieve additional mercury emission reductions.

Consideration for retrofitting controls to further improve mercury emission reduction would include several site specific factors, including coal properties, age and size of the boilers, condition and type of existing emission control configuration, facility's geographic location, state regulatory requirements, and preferences of the facility owner or operator. Additionally, there are other *caveats* and complicating factors to be considered, including:

1. The relative novelty of the various options encompassing mercury specific control technologies and modifications should be measured; the status and progress of each of these 'emerging' technologies or modifications should be monitored carefully; such inexperience should be cautiously addressed.

2. The identified options may not be technically feasible or economically practical to install and operate at all facilities. Networking among utilities is being practiced to share information on success and failure.

Control discussion is not necessarily in order of applicability, cost-effectiveness, or least-capital requirement

Cold-Side ESP Retrofit Options

Add Flue Gas Cooling

Lowering the flue gas temperature entering the ESP assists natural fly ash sorption of mercury, improves the performance of any sorbents injected upstream for mercury control, and inherently enhances particulate control performance by reducing gas velocity and lengthening residence time. However, the acid dew point temperature limits the extent of gas cooling when the flue gas has significant formation potential of hydrochloric acid or sulfuric acid.

Add Sorbent Injection

Gaseous mercury can be converted to particle–bound mercury by adsorption onto solid particles in the flue gas. Injecting suitable sorbents into the flue gas upstream of the ESP increases the amount of mercury captured. This modification may also require additional ducting between the injection location and the ESP inlet, and adding a gas absorber / humidifier upstream of the ESP. This approach may be limited to ESPs with a wide compliance margin, as boilers with marginally performing ESPs may have difficulty meeting existing particulate-related emission requirements due to the increased loading and likely high resistivity levels.

Add Downstream Fabric Filter with Sorbent Injection

Installing a fabric filter after the ESP allows most of the native collected fly ash in the ESP without reacted sorbent and enhances overall particulate control for marginally performing ESPs. Furthermore, due to the low particulate loading, the filter dust cake porosity is reduced, allowing use of a smaller, less expensive fabric filter with long cleaning cycles and high sorbent and bag life performance.

COHPAC Option

There is a patented variation of adding a downstream fabric filter (baghouse) to a cold- or hot-side ESP known as COHPAC (Compact Hybrid Particulate Collector) developed by the Electric Power Research Institute. It involves retrofitting a baghouse either in the space of the last field (or section) of an ESP or in a separate housing downstream of an ESP with a precharger located immediately upstream of the baghouse. In either case, the residual or induced charge on the particulate produces a marked effect in lowering the porosity of the filter dust cake. Such an arrangement allows use of a much smaller, less expensive fabric filter with long cleaning cycles and high sorbent and bag life performance. For example, COHPAC units are designed with filtration velocities of 8-12 feet per minute (fpm) as compared to the filtration velocities of 3-5 fpm typically used for pulse-jet fabric filters on coal-fired utility boilers.

Hot-side ESP Retrofit Option.

This entails conversion of a hot-side ESP to a cold-side ESP, and could then include any of the other cold-side ESP retrofit options mentioned above. Several hot-side ESPs in the US, including a few in NC (such as Duke Energy Allen Units 3-5), have been converted to cold-sides to improve particulate collection performance and ESP reliability. Depending on plant layout and design, this may be possible by reconfiguring the ducting, retuning the ESP to operate at lower temperatures, and perhaps installing a SO_3 or NH_3 gas conditioning system to restore performance.

Wet FGD Scrubber Retrofit Options

Previous research has shown that much of the mercury released during coal combustion is either removed with the flyash or can be absorbed in FGD units, if it is in the oxidized form. Oxidation of the gaseous elemental mercury is more readily captured by wet FGDs than gaseous elemental mercury. Several flue gas additives and scrubbing liquid additives are being developed to oxidize more of the gaseous elemental mercury and to prevent any re-conversion of oxidized mercury to gaseous elemental mercury. However, there is the caution that increasing oxidants in the flue gas or in the scrubbing liquid may also oxidize other species such as SO_2 and NO_x to sulfuric acid and nitric acid aerosols. Other options under development include use of oxidizing catalysts upstream of scrubbers, higher scrubber liquid-to-gas ratios, and scrubber tower design changes.

Dry Sorbent Injection.

For boilers with dry air pollution controls without FGD, injection of dry sorbents (such as powdered activated carbon [PAC] or less costly alternatives) offer a candidate control technology. Because of the added contact on the filter dust cake, it is estimated that FFs would require 1/10 of the sorbent rate as ESPs. Full scale tests with a small FF downstream of a hot-side ESP showed 90 percent mercury control with PAC injection. Such performance was achieved with a significant increase in bag cleaning frequency (a reliable surrogate indicator for a decrease in bag life and increase in bag replacement cost) with the suggestion of rather high overall cost for the PAC injection system. Further full scale tests have been performed at a Wisconsin electric utility. [Reference: "Full Scale Evaluation of Mercury Control with Sorbent Injection and COHPAC..."] Other tests have/ are being performed with Darco FGD™ carbon injection upstream of ESPs. Results with low sulfur bituminous coal show total mercury capture vary from 20 – 80 percent depending on ESP operating temperature ranging from 220 – 275 °F.

Sorbent collection performance for mercury is expected to depend on 5 key parameters, including sorbent size, sorbent capacity, residence time, type of dry air pollution control, and mercury level. Predicted costs for PAC using representative values for these parameters range from $4-12 million/year for ESPs and from $4-6 million/year for FFs for a 500 MW boiler. (Since these levels are considered prohibitive by some, many other candidate technologies target cost levels as ¼ to ½ of PAC costs.). Title: "Predicted Cost of Mercury Control at Electric Utilities Using Sorbent Injection"

Calcium-based Sorbent Injection

An alternative to PAC is calcium-based sorbent, such as limestone. EPA laboratory tests indicated that injection of calcium-based sorbents into flue gas could result in significant mercury removal and a small amount of SO_2 and SO_3 removal. Further testing by McDermott Technology, Inc. produced results slightly above 50 percent mercury capture. Comparison of these results with PAC results indicate that while PAC is a more effective sorbent than limestone on a mass basis, limestone is a more effective sorbent than PAC on a cost basis.

In summary, there are several emerging potential retrofit mercury control technologies at various stages of investigation and development. Further efforts to study and validate full-scale performance are underway, but it appears premature to obtain a complete set of definitive cost data for performing a robust cost analysis for many/most of the competing mercury control technologies.

Flue Gas Measurement Method For Speciated Mercury

Accurate measurements of the various forms of mercury present in coal combustion flue gas are important:

- To determine and characterize facility and/or fuel-type emissions,
- to understand the behavior of mercury in combustion processes and equipment configurations, and
- to evaluate the removal efficiency of mercury control technologies.

Generally, EPA develops manual reference test methods as a formal, accurate means of determining source emissions over a few-hour time period providing a "snap-shot" of emissions. Manual methods typically consist of a probe and nozzle inserted into the stack for extracting a representative sample, a filter to collect the particulate, and series of impingers with pollutant-specific liquid solutions to capture gaseous pollutants. In the case of speciated mercury, separate impinger solutions are used to collect the gaseous oxidized mercury fraction and the gaseous elemental mercury.

Formal manual reference methods are well established for measuring total mercury emissions from combustion systems. The EPA Method 101A and Method 29 were developed and validated to measure total mercury emissions (particulate phase and gas phase) for coal and waste combustors. These reference methods were developed and used to support total mercury

regulatory needs. A reference method for speciated mercury measurements does not currently exist because there are no regulations requiring speciated mercury emission measurements. However, a valid methodology was needed to characterize coal combustion speciated mercury emissions to better understand the performance variability in emission controls as well as to better assess the risk from this industry's contribution.

The Canadian Ontario-Hydro (OH) utility company developed a manual method known as the OH Method that is the manual test method currently designated as the method of choice by the EPA and the utility industry for the collection of speciated mercury emission data from coal combustion. The EPA first endorsed it in 1999, just prior to the start of their EU/ICR testing program. The OH Method has been submitted to the American Society for Testing and Materials (ASTM) for acceptance as a standard reference method. Since data collected with other methods are not considered valid and the OH Method has only been recently approved, there is limited database on valid, speciated mercury flue gas measurements on coal-fired boilers.

The precision of the OH Method has been recently demonstrated by paired train measurements at a DOE hazardous waste incinerator. In this evaluation consisting of 18 runs, correlation of the paired OH Method train measurements showed acceptable relative standard deviation (RSD) results, including:

- six percent RSD for elemental mercury in range of 0.2-180 ug/dscm,
- 21 percent RSD for oxidized mercury in range of 0.2-15 ug/dscm,
- five percent RSD for total mercury in range of 0.4-200 ug/dscm, and
- in relation to an target 20 percent RSD specification.

Such a high degree of precision across wide ranges in mercury concentration increases the confidence, and tends to rule out significant errors, in OH Method measurements.[59]

Continuous emission monitors (CEMs) are preferred because they have advantages over manual methods. A CEM can produce real-time or near real-time emission data over long periods of time. CEMs produce data that illustrates any short- and long-term emission variability, which in turn provides the opportunity to evaluate and gain insight on the effects of variations in process operating conditions, fuel properties, etc. Ultimately, the use of CEMs leads to a better understanding on how to minimize emissions.

---

[59] Dunn, J.E. et al., "Evaluation of Mercury Continuous Emission Monitors at the U.S. DOE TSCA Incinerator," National AWMA Conference, San Diego, CA, June 2003.

Given the benefits, EPA, DOE, and the utility industry are supporting the development of mercury CEMs.

A limited number of CEMs exist and are currently undergoing evaluation for the measurement of *total* gas-phase mercury and, to a lesser extent, *speciated* gas-phase mercury. Recent EPA and DOE sponsored mercury CEMS tests at the Progress Energy Cape Fear Power Plant and at the U.S. DOE TSCA Incinerator showed mixed results. Out of 5 mercury CEMS at the Cape Fear Plant, only one produced data meeting EPA CEMS data quality standards. However, at the TSCA Incinerator, 3 of 6 mercury CEMS produced data meeting EPA data quality standards. While experts use mercury CEMs as a research tool, mercury CEMs are not currently suitable for routine use on US power plants.

As an mercury CEMS alternative, the Electric Power Research Institute is in the process of developing a semi-continuous method known as the "Quick CEMS." This method collects a low-flow rate continuous sample into an activated carbon tube that can be removed intermittently (e.g., after a day or week) and then analyzed. The sponsor believes that this method would be suitable as a backup system when a mercury CEMS is not working or as the primary compliance method for smaller boilers operating only during peak demand periods.

Note that the mercury emission data presented in this section is characterized as *preliminary estimates*. This caveat was used because there is a limited database of speciated mercury emission measurements not only nationwide, but also here in NC. The emission data presented in this report was not based on individual measurements made on each NC boiler, but rather on correlations statistically derived from the available national database on speciated mercury emissions, largely stemming from the EU/ICR emission data. The known speciated mercury emission measurement database for NC coal-fired utility boilers consists of the following three plants:

1. Two plants were randomly selected by US EPA for the EU/ICR testing:

    a. Duke Energy's Cliffside facility with its hot-side ESPs, and

    b. Dwayne Collier Battle Cogeneration Facility with its spray dyer / fabric filter.

2. Progress Energy's Cape Fear facility with its cold-side ESPs hosted a several-month US EPA-sponsored mercury CEMS demonstration in 2002, including several sets of paired OH Method tests to evaluate the accuracy and reliability of five candidate mercury CEMs.

Preliminary estimate of mercury capture by *existing* controls for NC coal-fired utility boilers is shown in Table 4-5. For a comparison, Table 4-6 shows preliminary estimates of mercury capture for *planned* controls for NC coal-fired utility boilers.

Table 4-5

Preliminary Estimate of Mercury Capture by Existing Controls For NC Coal-Fired Utility Boilers[60]

Existing Controls	Control Configuration	Percent of NC Utility Boilers	Estimated Total Hg Capture	Percent of NC Utility Hg Emissions
PM Control Only	Hot-side ESP	38.6	10.7[a]	4.1 % captured
	Cold-side ESP	58	29.1[a]	16.9 % captured
	Fabric filter (FF)	0.6	90[b]	0.5 % captured
PM and Dry FGD	Spray dryer adsorber and FF	2.8	98[b]	2.7 % captured
Totals		100		24.3 % captured
				75.7% emitted

CHAPTER 5 - STATE AND NATIONAL LEGISLATION AND REGULATION

CLEAN AIR ACT REPORT TO CONGRESS

The Act required the EPA to address the toxic air pollutants from utilities. This report indicates that the vast majority of coal-fired plants (424 of the 426 plants) in the United States were likely to pose lifetime cancer risks (i.e., increased probability of an exposed person getting cancer during a lifetime) of less than one in a million due to inhalation exposure to utility hazardous air pollutant (HAP) emissions (which includes mercury). However, when the EPA conducted long-range transport analysis, using the Regional Lagrangian Model of Air Pollution (RELMAP) (a computer simulation of long-range transport of emissions), the results show that a significant percentage of the population exposure exists outside a 50 km radius. The EPA's 1997 Mercury Study Report to Congress suggests that approximately 52 tons of the 158 tons per year (tpy) of U.S. anthropogenic (human activities) emissions are deposited within the lower 48 states. The remaining two-thirds (107 tons) are transported outside of U.S. borders where they diffuse into the global reservoir. Additionally, the computer simulation suggests that another 35 tons of mercury from the global pool are deposited for a total deposition of roughly 87 tpy in the U.S. This type of modeling has a high level of uncertainty, but additional emissions to air will certainly contribute to levels in the global reservoir and increase deposition into water bodies.[62]

Furthermore, this study suggested an increased cancer incidence to be up to 1.3 cases per year. Thus, these efforts indicate that both local and distant sources, through long-range transport, contribute to increases in incidence of cancer. Mercury was included in the local (50 km) study, but was not included with arsenic, cadmium, chromium, and nickel in the RELMAP study.[63]

NORTH CAROLINA STATE REGULATION AND LEGISLATION

NC Clean Smokestacks Act

The CSA requires a 77 percent reduction in NO_x and a 73 percent reduction in SO_2, but does not specify any limits or specific control devices on specific plants. That management and trade off process is left to the utility to determined, based on technologies, costs and other plant specific factors. The plants do have to keep DENR informed and will have to apply for specific permit changes in each case. Both companies in NC that are affected by the requirements have provided lists of general types of devices that they are

[62] Ref. 7, page 17.
[63] Ref. 7, page 7.

considering that will provide initial plans regarding which units will receive certain control devices. Their planning maybe subject to revisions over time as design, cost and other factors become more specific and final decisions are made.

North Carolina's NO_X State Implementation Plan

On October 27, 1998, the EPA promulgated rules requiring certain states, which included North Carolina, to adopt rules to control the emissions of nitrogen oxides (NO_X) from large stationary combustion sources. These rules cover (1) fossil fuel-fired stationary boilers, combustion turbines, and combined cycle systems serving a generator with a nameplate capacity greater than 25 megawatts electrical and selling any amount of electricity, (2) fossil fuel-fired stationary boilers, combustion turbines, and combined cycle systems having a maximum design heat input greater than 250 million Btu per hour, and (3) reciprocating stationary internal combustion engines rated at equal or greater than 2400 brake horsepower (3000 brake horsepower for diesel engines and 4400 brake horsepower for dual fuel engines).

The EPA promulgated this requirement because it found that controls for NO_X emissions from large combustion sources in North Carolina and other states were not adequate to prohibit these sources and other activities from emitting NO_X in amounts that contribute significantly to nonattainment in one or more other states with respect to the one-hour ozone national ambient air quality standard. It also found controls for NO_X in North Carolina were not adequate to prohibit these sources and other activities from emitting NO_X in amounts that contribute significantly to nonattainment in one or more other states with respect to the eight-hour ozone national ambient air quality standard.

The EPA rules established a NO_X budget for sources in North Carolina and other states. The budgets were later revised and published in the March 2, 2000 Federal Register. North Carolina has a Phase II budget of 165,022 tons per ozone season. The EPA rules require continuous emission monitors to be used and allows compliance to be achieved through interstate trading.

Besides amending existing NO_X rules and adopting new NO_X rules specifically to address the EPA NO_X state implementation plan (SIP) call, the North Carolina rules also require new sources to control emissions of NO_X. The objective of this requirement is (1) to aid in meeting the NO_X budget for North Carolina for minor sources and (2) to aid in attaining and maintaining the ambient air quality standard for ozone in North Carolina.

The amended and new rules are in Section 15A NCAC 2D .1400, Nitrogen Oxide. Rules in this Section cover three types of programs. They are:

1. contingency plan for the three ozone maintenance areas,

2. the NO_x SIP call in 40 CFR Part 51, Subpart G, and

3. new sources of nitrogen oxides not covered under the NO_x SIP call.

The Environmental Management Commission (EMC) approved taking permanent rules to public hearing to satisfy the EPA's NO_x SIP call. After the EPA reviewed the submittal, it recommended several changes to the rules submitted. These recommended changes were incorporated in the rules taken to public hearing. Additionally, as a result of stakeholders meetings, several more changes have been included in the rules. Some important changes are:

1. specific allocations of NO_x for the boilers at the CP&L and Duke plants;

2. requiring all sources covered under the NO_x SIP call to use Part 75 continuous emission monitor systems;

3. changing emission allocations for 2004 from May 1 through September to May 31 through September 30 and reducing the 2004 allowable allocations to 80% of that allowed by the EPA for this period (thus, creating more than 8000 tons credit to be used in 2005);

4. extending full compliance for non-utility electric generating units (EGU), affected non-EGU, and internal combustion engines (ICE) from 2005 to 2006;

5. clarifying that if a source is replaced, the new source receives the old source's allocations;

6. adding criteria for the EMC to consider when deciding whether to reallocate emission allocations;

7. revising the reallocation calculation procedures to give credit to lower emitting sources; and

8. revising the procedures for allocating emission allocation from the new source set aside pool (a pro rata method is used instead of the first-come-first-receive approach in current rule).

In addition to the North Carolina's CSA and the NC NO_x SIP, the EPA (CAA) will propose the *Utility MACT*. Additionally, there are at least three federal legislative proposals that could affect coal-fired electric utility plants if one or more are passed. They are on parallel courses and have not been enacted (i.e., discussions, review, and proposed legislative activities continue).

EPA's Utility MACT

The *Utility MACT*, with the proposal of emission standards to be announced on or before December 15, 2003, and promulgation by December 15, 2004. The EPA has announced its finding that regulation of HAP emissions from oil- and coal-fired electric utility steam generating units is necessary and appropriate. This finding is based on the mandate given to EPA by Congress in Section (112)(n)(1)(A) of the CCA, that the EPA perform a study of the hazards to the public health reasonably anticipated to occur as a result of HAP emissions by electric utility steam generating units. The study was performed using data collected from power plants across the country, including those in North Carolina. The results of the study were released in a Report to Congress on February 24, 1998. The EPA was also required to determine whether, based on the results of the study and any other applicable information, regulation of HAP emissions from the industry was appropriate and necessary. On December 14, 2000, the EPA announced that it had found that such regulation is warranted. A project to develop emission regulations under section 112 consequentially is underway.

Since the determination to regulate utility boilers, EPA has conducted a series of public meetings of the Mercury MACT Workgroup, a Federal Advisory Committee under the Clean Air Act Advisory Committee. This workgroup included stakeholders from industry, states and the environmental community. The group evaluate data collected by EPA to determine the best performing plants, the most appropriate monitoring methods, etc. While no consensus was reached among the stakeholders, a variety of options (proposing 73-90 percent control of mercury) were presented to EPA for regulating emissions from utility boilers.

EPA is currently in the process of developing a draft regulation for proposal in December 2003. It is impossible to know at this time what form the standard will take, but the CAA requires that MACT standards "require the maximum degree of reduction in emissions" and shall not be less stringent than the average emission limitation achieved by the best performing 12 percent of existing sources. Once promulgated, sources will have three years to comply with the requirements of the MACT standard. This standard is expected to apply to every major source in the United States with a coal-fired electric utility

steam-generating unit, presumable to include units not currently being affected by the CSA.

Bush Administration's Initiative *Clear Skies Act*

A potential legislature impact on control of mercury emissions from coal-fired electric utility plants comes from the proposed *Clear Skies Act* (CSA), which has been drafted by the Bush Administration. This act proposes to amend Title IV of the CAA to establish new "cap-and trade" programs and reducing SO_2, NO_x, and mercury emissions. However, Some analyses indicate net reductions, but the predominant analyses indicate that this proposal would result in reduced control pressures on mercury emissions. The act calls for the specific reductions from electric generating facilities of:

1. SO_2 emissions by 73 percent, from year 2000 emissions of 11 million tons to a cap of 4.5 million tons in 2010 and to a cap of 3 million tons in 2018;

2. NO_x emissions by 67 percent, from year 2000 emissions of 5 million tons to a cap of 2.1 million tons in 2008 and to a cap of 1.7 million tons in 2018; and

3. reduce mercury emissions by 69 percent - the first-ever national cap on mercury emissions. Emissions would be cut from 1999 emissions of 48 tons to a cap of 26 tons in 2010 and to a cap of 15 tons in 2018.

Other Federal Initiatives

Other legislative initiatives have been proposed in both the US House and in the Senate. There has been debate as to whether any legislation would be three pollutants (SO_x, NO_x and Mercury) or four pollutants (add CO_2). All contain provisions for mercury control. The main legislative initiatives to date, in addition to the Clear Skies Act (CSA), are the Jeffords-Waxman Bills and the Carper Clean Air Planning Act (CAPA - S3135). Neither of the bills introduced to date has made significant progress toward full consideration by the Senate and House. Debate and behind the scene efforts remain quite active, however. The discussion below is not intended to encompass all actions and discussions underway, but to provide some major points.

Jeffords-Waxman Bills

The Senate Environment and Public Works Committee has held several hearings to date, and in June of 2002 narrowly passed the "Clean Power Act" (S.556, aka "CPA") proposed by Sen. James Jeffords. The House companion, Henry Waxman's "Clean Smokestacks Act" (H.R. 1256), has not been passed in committee or on the House floor. The final CPA, if passed generally as

proposed, would establish new controls on power plant emissions of SO_2, NO_x, mercury and CO_2. It would limit, by 2009, national emissions from all electricity generating facilities to not more than 2,250,000 tons of sulfur dioxide, 1,510,000 tons of nitrogen oxides, 2,050,000,000 tons of carbon dioxide, and reduce by 2008, the annual national emissions of mercury from electricity generating facilities to not more than 5 tons. Opponents say that these bills would abandon that common-sense approach and attempt to reduce pollution indirectly, by suppressing energy use.

Carper Bill

The Carper Bill, or CAPA, was introduced by Senator Thomas Carper during the last days of the 107th Congress. Primarily, it appeared because the CSA and CPA were so far apart. The proposal was a bipartisan effort, has not yet received full consideration in neither Committee nor the full Senate.

Legislative impacts could be influenced by information currently in a DOE report titled *Analysis Of Emissions Reduction Options For The Electric Power Industry*, March 1999 (Report#:SR/OIAF/2000-05).[64] This report is a continuation of multiple pollutant analysis for the electric power industry and is considered the basis for possible future actions. It proposes that if control of multiple pollutants is planned concurrently, the control cost tends to be less than if separately planning for the individual control of pollutants.

ACTIONS TAKEN BY OTHER STATE

Almost every state has mercury rules of some sort. However, most all of them relate to municipal or medical waste incinerators, battery and fluorescent bulb recycling, limits for disposal or mercury content in products. Many states seem to have taken the "wait and see" attitude for coal fired power plants, knowing that federal actions (whether from MACT or new legislation) are eminent. The potential for inconsistent overlapping requirements or confusion from different approaches is a concern. However, a limited few have taken individual action. This section is not intended to be complete nor to represent the activities in all other states, but as examples of what has happened in some selected states where information is readily available.

Connecticut

The Senate and House of Representatives passed a new law in Connecticut on June 3, 2003 in their General Assembly. This may be the only law specific to mercury from coal-fired power plants, of which the state has only one. This Act is aimed entirely at coal-fired utilities (any unit that generates electricity in the state and combusts coal in an amount greater than

[64] www.eia.doe.gov/oiaf/servicerpt/powerplants/appendixes.html#rpt

ten percent of its total heat input on a rolling twelve-month basis) mercury emissions and contains the main points listed below:

- "Mercury" means mercury and mercury compounds in either a gaseous or particulate form.

- On and after July 1, 2008, the owner or operator of an affected unit or units must meet an emissions rate of equal to or less than 0. 6 pounds of mercury per TBtu, or meet a mercury emissions rate equal to a ninety per cent reduction of mercury from the measured inlet conditions for the affected unit, whichever is more readily achievable.

- Interim alternative limits (with quarterly testing of emissions) are allowed and to be established by the Commissioner of Environmental Protection if the initial technology fails to perform to expectation, no later than April 1, 2010.

- Thereafter, upon any application for renewal of such Title V permit, the Commissioner of Environmental Protection shall conduct a review of such affected unit's alternative emissions limit and may impose a more stringent alternative emissions limit based upon any new data regarding the demonstrated control capabilities of the type of control technology installed and operated at such affected unit.

- Stack tests used to demonstrate compliance with the mercury emissions rate requirements or used in the establishment or compliance with an alternative emissions limit - based on the average of the stack tests conducted during the two most recent calendar quarters for an affected unit and conducted on a calendar quarter basis in accordance with the EPA Method 29 for the determination of metal emissions from stationary sources, as set forth in 40 CFR 60, Appendix A, as amended from time to time, or any other alternative method approved by the EPA or the Commissioner of Environmental Protection. Such stack tests must be conducted while combusting coal or coal blends that are representative of the coal or coal blends combusted at such affected unit during the calendar quarter represented by such stack test. CEMS may be allowed under approved situations.

- On or before July 1, 2012, the Commissioner of Environmental Protection must conduct a review of the mercury emission limits applicable to all affected units in the state and may adopt

regulations imposing mercury emission limits that are more stringent the initial requirements established in the beginning.

Title: AN ACT CONCERNING MERCURY EMISSIONS FROM COAL-FIRED ELECTRICITY GENERATORS – passed into law June 3, 2003.[65]

New Hampshire

The New Hampshire legislation is more typical of several states, which may also have other acts or rules within the same state for other components. The law for municipal combustors was passed May 15, 2002. This act set time frames within which certain municipal waste combustors must comply with mercury emission limits, and provides alternate compliance provisions, and extends the reporting date of an ash landfill study to May 30, 2002. The addresses mercury air emissions, but not from coal fired power plants. Title: CHAPTER 172 HB 253-FN - FINAL VERSION 4/10/02 3246s 2002 SESSION 01-035 08/10 HOUSE BILL 253-FN.[66]

Oregon

The Oregon Environmental Council (OEC) has petitioned Oregon to regulate mercury. The petition calls for Oregon DEQ to monitor mercury air emissions and set permit limits for mercury from any facility that discharges more than a pound of mercury in a year. In addition to the petition, OEC is also asking the Commission to take three other specific steps to reduce the discharge of mercury and other persistent pollutants, including:

1) The adoption of specific mercury reduction goals as a matter of state policy,

2) Directing DEQ to use its storm water rules to limit the discharge of mercury and other persistent pollutants, and

3) Eliminating "mixing zones" for persistent pollutants.

Wisconsin

Wisconsin may be more typical of states that has activity and may pass legislation, but it has not been accomplished, yet. A petition in 2000 was circulated trying to get state to control mercury from utilities. In response, in order to reduce the amount of mercury entering the environment, the WDNR proposed new mercury emission limits on coal-fueled power plants and other large sources in Wisconsin. Following this proposal, the Public Service Commission of Wisconsin (PSCW) began investigating the potential rule impacts on electric reliability, cost and fuel impacts.

Also, the state has an agreement with the utilities known as the "Multi Emission Cooperative Agreement: Commitments"-This agreement was signed on September 30, 2002 for the Wisconsin coal-fueled electric generation fleet. The utilities agreed to meet all legislative provisions of the Environmental Cooperation Pilot Program. The 10 year agreement commits them to invest $400 million to $600 million in environmental improvements to reduce sulfur dioxide, nitrogen oxide and mercury from their power plants by 45-50, 60-65 and 50 percent, respectively.[68]

CHAPTER 6 - ECONOMIC IMPACTS

COST OF ADDITIONAL CONTROLS

An approximation of control costs for controlling mercury emissions from utility boilers is reported in *Performance and Costs of Mercury Emission Control Technology Applications On Electrical Utility Boilers*, EPA-600/R-00-083, September 2000.[69] However, costs are base on limited data and the results of pilot projects. Stated assumptions are clear, but they are not yet scientifically documented. Therefore, in light of uncertainty and broad cost ranges, capital and operational control cost discussions will be addressed later.

Recently, the Department of Energy estimated that reducing mercury emissions by 90 percent could add $5 billion to $8 billion a year to the nation's utility bill.[70]

The EPA estimates that the implementation of the new fine particle standard for ambient air quality through regional control strategy that significantly reduces sulfur dioxide (SO_2) below the requirements of Title IV of the federal Clean Air Act can indirectly lower forecasted mercury emissions in 2010 by about 11 tons from power generation by units burning fossil fuel.[71] However, Duke Energy and Progress Energy's planned air pollution control equipment to meet the CSA should reduce North Carolina's mercury emissions by 55 percent instead of the 21 percent estimated by the EPA for the rest of the country.

There are no published studies, specific to North Carolina, which provides information on costs of implementing further mercury controls. However, work is being done at the EPA in regard to the mercury MACT that are due to be released in the near future. Additionally, the air agency in New York has studies underway that promise to provide substantial economic information that may be transferable to North Carolina. This report cannot as yet address this issue. However, efforts to develop such information are being undertaken within DAQ.

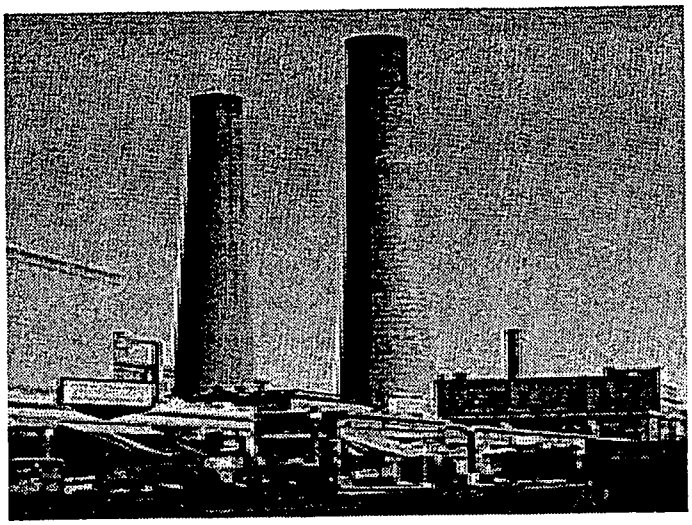
First Interim Report



Mercury Emissions and Mercury Controls For Coal-fired Electrical Utility Boilers

Volume Two Of Two
September 1, 2003

NCDENR

North Carolina
Department of Environment and Natural Resources
Division of Air Quality

Requirement For This Report

Excerpted from the *North Carolina Clean Smokestacks Act*

[Title: An Act to Improve Air Quality in the State by Imposing Limits on the Emission of Certain Pollutants from Certain Facilities that Burn Coal to Generate Electricity and to Provide for Recovery by Electric Utilities of the Costs of Achieving Compliance with Those Limits]

SECTION 12. The General Assembly anticipates that measures implemented to achieve the reductions in emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO2) required by G.S. 143-215.107D, as enacted by Section 1 of this act, will also result in significant reductions in the emissions of mercury from coal-fired generating units. The Division of Air Quality of the Department of Environment and Natural Resources shall study issues related to monitoring emissions of mercury and the development and implementation of standards and plans to implement programs to control emissions of mercury from coal-fired generating units. The Division shall evaluate available control technologies and shall estimate the benefits and costs of alternative strategies to reduce emissions of mercury. The Division shall annually report its interim findings and recommendations to the Environmental Management Commission and the Environmental Review Commission beginning 1 September 2003. The Division shall report its final findings and recommendations to the Environmental Management Commission and the Environmental Review Commission no later than 1 September 2005. The costs of implementing any air quality standards and plans to reduce the emission of mercury from coal-fired generating units below the standards in effect on the date this act becomes effective, except to the extent that the emission of mercury is reduced as a result of the reductions in the emissions of oxides of nitrogen (NOx) and sulfur dioxide (SO2) required to achieve the emissions limitations set out in G.S. 143-215.107D, as enacted by Section 1 of this act, shall not be recoverable pursuant to G.S. 62-133.6, as enacted by Section 9 of this act.

GENERAL ASSEMBLY OF NORTH CAROLINA - SESSION 2001 – (SENATE BILL 1078)
Ratified the 19th day of June 2002. (Ch. SL 2002-4 S.13)
Marc Basnight - President Pro Tempore of the Senate
James B. Black - Speaker of the House of Representatives
Michael F. Easley- Governor

Mercury Emissions and Mercury Controls For Coal-fired Electrical Utility Boilers

First Interim Report
