BY HAND DELIVERY

The Honorable Pryor Gibson
419-A Legislative Office Building

Gentlemen:

Thank you for your letter of January 31, 2007 requesting specific proposals to improve the permitting and management of solid waste landfills. The Division of Waste Management is developing specific recommendations, but has not yet completed work on those proposals.

As you may recall, the Division reported to the Environmental Review Commission in January on its survey of solid waste management practices in sixteen eastern seaboard states. Since that meeting, the Division has been evaluating standards and practices identified in the survey for possible use in North Carolina. The Division also needed to do more work to fully develop some of the ideas for improvement in landfill permitting and management previously presented to the ERC. A few issues required additional legal research.

Work on the recommendations is nearing completion and the Department should be ready to provide specific proposals for the Environmental Review Commission's consideration by February 16, 2007.

I appreciate the ERC's strong interest in the environmental and public health

The Honorable William G. Ross, Jr.
Secretary of Environment and Natural Resources
1601 Mail Service Center
Raleigh, North Carolina 27699-1601

By Hand Delivery and Electronic Mail

Dear Secretary Ross:

As you are aware, the 2006 General Assembly imposed a 12-month moratorium on the issuance of permits by your Department for new landfills in the State. The legislation that imposed this moratorium, S.L. 2006-244 directed the Environmental Review Commission (ERC), "*with the assistance of the Division of Waste Management of the Department of Environment and Natural Resources*," (emphasis added) to study issues related to solid waste and report its findings and recommendations to the 2007 Regular Session of the General Assembly.

The ERC has devoted a great deal of time and attention to the study of solid waste and, consistent with the legislative directive, has sought and received the assistance of the Division of Waste Management and the Department. This assistance has been generously provided and has been quite valuable to the ERC but is, regrettably, incomplete for the following reason. At the 17 January 2007 meeting of the ERC, we expected to hear specific legislative proposals from the Division and the Department that would address many of the outstanding concerns over landfills and other solid waste management issues that have been considered by the ERC at earlier meetings. Our expectation was that the presentation of these proposals would provide the ERC with the opportunity to evaluate them for possible inclusion in the report of the ERC to the General Assembly.

Instead, the ERC was presented with general recommendations that, although helpful, lack the detail and specificity required of legislative proposals. This was particularly frustrating because we believe that the general recommendations aim in the right direction and would, if presented as specific legislative proposals, address many of the solid waste management problems that led to the moratorium. In other words, in our opinion many, if not all, of the general recommendations, if presented as specific legislative proposals, would be adopted as recommendations by the ERC and ultimately would be enacted by the General Assembly.

Accordingly, pursuant to S.L. 2006-244, G.S. 120-19 and G.S. 120-70.44 we ask that you immediately provide the ERC with specific legislative proposals that, if enacted, would implement the general recommendations presented to the ERC by Assistant Secretary Smith on 17 January 2007.

We understand that specific legislative proposals are being withheld while the Administration determines its position on the issues involved. We welcome the Administration's interest in these issues and we understand and respect the right of the Administration to develop its own policy recommendations at its own pace. We do not wish to interfere with that process. Our request is not for policy recommendations or for the Administration's position, but rather is for specific legislative proposals that would implement each of the general recommendations that have already been presented publicly to the ERC. Our understanding is that these proposals either have already been drafted or are in the process of being drafted and could be made available to the ERC more or less immediately.

In this same vein, we note that G.S. 130A-309.06(c) directs the Department of Environment and Natural Resources to report to the ERC on or before 15 January of each year on the status of solid waste management efforts in the State. This annual report is to include, among other information, "[r]ecommendations to the Governor and the Environmental Review Commission to improve the management and recycling of solid waste in the state, including any proposed legislation to implement the recommendations." (G.S. 130A-309.06(c)(7)). The ERC has not received the report due 15 January 2007. We request that you provide this report, including proposed legislation, without further delay.

As you are aware, the 2007 Session of the General Assembly in now underway. The ERC needs to complete its work. Our legislative leadership has asked us to move swiftly on the landfill issue. We in turn have directed our staff to begin working with legislators and interested parties to develop a comprehensive solid waste management bill. We urgently need the best thinking that your Department can provide to us on this issue now, and we welcome the continued involvement of your Department as we all move forward on this issue in the coming weeks and months.

Your prompt attention to this matter will be most appreciated.

Respectfully yours,

Charles W. Albertson, Cochair

Re: RTI Proposal No. 0280700.388 in response to the Environmental Review Commission of the North Carolina General Assembly Request for Proposal to ***"Report on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients"***

Dear Mr. Enichen:

This will confirm our telephone conversation earlier today. I am pleased to inform you that the Environmental Review Commission has accepted the RTI, International proposal referenced above. Note that this acceptance is subject to the approval of the Legislative Services Commission.

Enclosed is a draft contract for your review. Please advise me of any changes that RTI, International believes are necessary or desirable. Note in particular the highlighted provisions of the contract.

I look forward to hearing from you shortly.

Respectfully yours,

George F. Givens
Commission Counsel

State of North Carolina

County of Wake

CONTRACT FOR A STUDY OF THE COSTS ASSOCIATED WITH PROVIDING NUTRIENT CONTROLS THAT ARE ADEQUATE TO OFFSET POINT SOURCE AND NONPOINT SOURCE DISCHARGES OF NITROGEN AND OTHER NUTRIENTS.

THIS AGREEMENT, made and entered into this the [redacted] day of February, 2007, by and between RTI International, hereinafter referred to as the "RTI", and the Environmental Review Commission, hereinafter referred to as the "ERC", with the approval of the Legislative Services Commission established pursuant to Article 7 of Chapter 120 of the General Statutes, hereinafter referred to as the "Commission.

WITNESSETH:

Whereas, S.L. 2006-215 became law on August 8, 2006.

Whereas, Section 2 of S.L. 2006-215 directs the ERC, with the assistance of the Division of Water Quality of the Department of Environment and Natural Resources, to study issues related to the nutrient offset payment program and to specifically study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen; whether nutrient offset payments should be authorized for additional nutrients, including phosphorus; and whether the nutrient offset program should be expanded to other areas of the State.

Whereas, Section 2 of S.L. 2006-215 directs the ERC to report its findings, together with any recommended legislation, to the 2007 General Assembly.

Whereas, the ERC issued a Request for Proposal on 15 December, 2006, seeking a consultant to:

1. Estimate the length of time that the existing North Carolina Nutrient Offset Fee Payments Program (NOFPP) will be able to continue as a

completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen.

2. Study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen in the Neuse River Basin.
3. Study how a total nutrient offset payment fee should be determined.
4. Provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in deciding whether nutrient offset payments should be authorized for additional nutrients, including phosphorus, and whether the NOFPP should be expanded to other river basins, including the Tar-Pamlico River Basin.
5. Evaluate the ability of public entities other than the Environmental Enhancement Program (EEP) and private entities to provide nutrient offsets.
6. Prepare a comprehensive review and discussion of the types of potential nutrient mitigation efforts available.

Whereas, RTI's response has been accepted by the ERC.

Whereas, the parties to this agreement desire to reduce the terms of their agreement to writing.

NOW THEREFORE, for and in consideration of the mutual promises made to each other, as hereinafter set forth, the parties do hereto mutually agree as follows:

1. Performance of Study

RTI shall perform services in a manner consistent with the degree of care and skill ordinarily exercised by members of the same profession and consistent with this agreement to accomplish the study described in the Request for Proposal, Appendix B. RTI agrees to perform the study as provided in RTI's response, Appendix C. In the event of a conflict of terms between this agreement, the Request for Proposal, and RTI's response, the provisions of the designated documents shall control in the following order: First, this agreement; second, the Request for Proposal; and third, RTI's response.

2. Contract Period and Schedule

RTI agrees that time is of the essence in the completion of this agreement and agrees that services under this agreement are to commence on the execution date of this agreement and shall terminate on May 1, 2007, or upon the filing of the final report, whichever occurs first, unless extended or terminated as provided herein.

RTI agrees to the following reporting schedule:

First Phase Report:	16 February 2007
Presentation of draft final results:	20 April 2007
Final Report:	1 May 2007

3. Contract Administrator

George F. Givens, Commission Counsel, ERC, is designated as the Contract Administrator for the ERC. The contract administrator shall be responsible for ensuring that RTI complies with the terms, conditions, and performance specifications set forth in this contract, and an evaluation of RTI's performance. The ERC has complete discretion in replacing the contract administrator with another person of its own choosing. The ERC shall notify RTI of any replacement of the contract administrator.

4. Availability of Funds

The payment of compensation specified in this agreement, its continuation, or any renewal or extension thereof, is dependent upon and subject to the allocation or appropriation of funds to the ERC for the purposes set forth in this agreement.

5. Payments

ERC shall make payments to RTI for its services as provided below:

a. An invoice for the first payment of thirty percent (30%) of the contract amount twenty-seven thousand nine hundred and forty dollars ($27,940) may be submitted by RTI upon signing of the contract. Payment shall be made within thirty (30) days of approval of the invoice by the Contract Administrator.

b. An invoice for the second payment of thirty percent (30%) of the contract amount twenty-seven thousand nine hundred and forty dollars ($27,940) may be submitted by RTI upon submittal of a progress report five weeks after the contract signing date. Payment shall be made within thirty (30) days of approval of the invoice by the Contract Administrator.

c. An invoice for the third and final payment of forty percent (40%) of the contract amount thirty-seven thousand two hundred fifty-three dollars ($37,253) may be submitted by RTI upon delivery of the final report. Payment shall be made within thirty (30) days of approval of the invoice by the Contract Administrator.

Notwithstanding any other provision of this contract, total payment under this contract, including expenses, shall not exceed ninety-three thousand one hundred and thirty-three dollars ($93,133) for services described in this agreement.

6. Additional Contract Expenses

The contract for the project is not a time and materials agreement. Any expenses of RTI in addition to those contracted for are the sole responsibility of RTI.

7. Independent Contractor

RTI shall be considered to be an independent contractor and shall be wholly responsible for the work to be performed and for the supervision of its employees. RTI shall hold and save the ERC harmless from any and all claims, demands, or causes of action that may be asserted due to the production activity of RTI under this contract. RTI represents that it has, or will secure at its own expense, all personnel required in performing the services under this agreement. These employees shall not be employees of, or have any individual contractual relationship with the ERC or the Legislative Services Commission.

8. Key Personnel

RTI shall not substitute key personnel designated in the RTI's response and assigned to the performance of this contract without prior written approval by the ERC. The individuals designated as key personnel for purposes of this contract are those specified in the RTI's response.

9. Subcontracting

Work proposed to be performed under this contract by RTI or its employees shall not be subcontracted without prior written approval of the ERC.

10. Confidentiality

RTI agrees to protect the confidentiality of any files, data, or other materials provided by the ERC and to restrict their use to the purpose of performing the contract. RTI shall comply with the provisions of Article 17 of Chapter 120 of the General Statutes of North Carolina regarding confidentiality between the RTI and members of the General Assembly. For purposes of this paragraph only, employees of RTI shall be considered "legislative employees" as defined in General Statute 120-129.

11. Care of Property

RTI agrees to be responsible for the proper custody and care of any files or other property furnished by the ERC. RTI shall take all steps necessary to safeguard any property, including data, files, reports, or other information from loss, destruction, or erasure. Any costs or replacement expenses, or damages resulting from the loss shall be borne by RTI when the loss occurred through its negligence.

12. Copyright

No deliverable items produced in whole or in part under this agreement shall be the subject of an application for copyright by or on behalf of RTI or any employee of RTI.

13. Advertising

RTI agrees not to use the existence or results of the contract, or the products produced pursuant to the contract as a part of any news release or commercial advertising without the prior written approval of the ERC.

14. Access to Persons and Records; Public Records

The State Auditor shall have access to persons and records as a result of all contracts or grants entered into by State agencies or political subdivisions in accordance with General Statute 147-64.7. RTI shall retain all records for a period of three years following completion of the contract.

To the extent that RTI acts on behalf of the ERC pursuant to this contract, RTI shall comply with and take any action necessary to facilitate compliance by the ERC with the provisions of Chapter 132 of the General Statutes.

15. Transfer or Assignment

This contract shall not be transferred or assigned to a third party.

16. Termination and Default

(a) Mutual Termination. -- Upon mutual written agreement of the ERC and RTI, the contract may be terminated at any time.

(b) ERC Termination. – The ERC has the right to terminate the contract at its discretion with 10 days written notice. In the event of termination under this subparagraph, RTI will be paid or reimbursed an amount commensurate with work completed or expenses incurred. In the event that RTI has received funds in excess of the amount commensurate with work completed or expenses incurred, RTI shall repay the excess funds to the ERC.

(c) RTI failure to perform. -- If, for any reason, RTI shall fail to fulfill in timely and proper manner the obligations under this agreement, the ERC shall thereupon have the right to terminate this contract by giving written notice to RTI and specifying the effective date thereof. In that event, all finished or unfinished deliverable items under this contract prepared by RTI shall, at the option of the ERC, become its property, and RTI shall be entitled to receive just and equitable compensation for any satisfactory work completed on these items. RTI shall not be relieved of liability to the ERC for damages sustained by the ERC by virtue of any breach of this agreement, and the ERC may withhold any payment due RTI for the purpose of setoff until a time that the exact amount of damages due the ERC from the breach can be determined. In case of default by RTI, the ERC may procure the services to which it is entitled under this contract from other sources and hold RTI responsible for any cost occasioned thereby.

(d) Liability of RTI. -- In the case of termination or default, the total liability of RTI shall not exceed the total contract amount.

(e) Acts of God, etc. -- No party to this agreement shall be deemed to be in default of any obligation hereunder if and so long as it is prevented from performing the obligation by any act of war, hostile foreign

action, nuclear explosion, riot, strikes, civil insurrection, earthquake, hurricane, tornado or other catastrophic natural event or act of God.

17. General Indemnity

RTI shall hold and save the State of North Carolina, its officers, agents, and employees harmless from liability of any kind, including liability from all claims and losses accruing to any other person, firm, or corporation furnishing or supplying work, services, materials, or supplies in connection with the performance of this contract, and from any and all claims and losses accruing to any person, firm, or corporation that may be injured or damaged by RTI in the performance of this contract and that are attributable to the negligence or intentionally tortious acts of RTI if RTI is notified in writing that the State has knowledge of a claim within 30 days after the State acquires actual knowledge of the claim. RTI represents and warrants that it shall make no claim of any kind or nature against the State's agents who are involved in the delivery or processing of RTI's goods to the State. The representation and warranty in the preceding sentence shall survive the termination or expiration of this contract.

18. Bankruptcy

Upon the filing for bankruptcy or insolvency by or against RTI, the ERC may terminate the contract, and the provisions of the paragraph entitled "Termination and Default" shall apply.

19. Compliance with Laws

RTI shall comply with all laws, ordinances, codes, rules, regulations and licensing requirements that are applicable to the conduct of its business, including those of federal, state, and local agencies having jurisdiction or authority.

20. Applicability of State Ethics Laws

RTI is subject to all applicable provisions of Chapter 138A of the General Statutes, including but not limited to the prohibition on the acceptance of specified gifts from lobbyists and lobbyist's principals, the required reporting of authorized gifts from lobbyists and lobbyist's principals, identification and reporting of names of assigned personnel, and required ethics training.

21. Equal Opportunity Statement

The nondiscrimination clause contained in Section 202 of Executive Order 11246, as amended by Executive Order 11375, relative to equal employment opportunity for all persons without regard to race, color, religion, sex, age or national origin, and the rules and regulations prescribed by the United States Secretary of Labor, are incorporated herein by reference. The program for Employment of the Handicapped (Affirmative Action) Regulations issued by the Secretary of Labor of the United States in Title 20, Part 741, Chapter VI, Subchapter "C" of the Code of Federal Regulations, pursuant to the provisions of Executive Order 11758 and Section 503 of the Federal Rehabilitation Act of 1973, are incorporated herein by reference.

22. Workers Compensation Insurance

RTI shall obtain, pay for, and keep in force, for the duration of the contract, worker's compensation insurance, as required by the laws of North Carolina, covering all employees of RTI engaged in any work pursuant to this contract performed in the State.

23. Amendment

This contract may be amended only by written agreement duly executed by the ERC and RTI and approved by the Commission.

24. Incorporations by reference

S.L. 2006-215, is attached to this contract as Appendix A and incorporated herein by reference. The Request for Proposal issued by the ERC, entitled "Report on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients", is attached to this contract as Appendix B and incorporated herein by reference. RTI's response is attached to this contract as Appendix C and incorporated herein by reference.

25. Entire agreement

This contract, including any documents or exhibits specifically incorporated by reference, represents the entire agreement between the parties and supersedes all prior oral or written statements or agreements.

26. Notice

Any notice under this contract to the ERC shall be sufficient if mailed to the Legislative Services Office as indicated below:

George F. Givens, Commission Counsel
Environmental Review Commission
General Assembly of North Carolina
300 North Salisbury Street
545 Legislative Office Building
Raleigh, NC 27603

Any notice under this contract to RTI shall be sufficient if mailed to RTI as indicated below:

Don Enichen
Office of Research Contracts
RTI International
3040 Cornwallis Road
Research Triangle Park, NC 27709-2194

27. Governing Law

This contract is made under and shall be governed and construed in accordance with the laws of the State of North Carolina.

28. Situs

The place of this contract, its situs and forum, shall be Wake County, North Carolina, where all matters, whether sounding in contract or tort, relating to is validity, construction, interpretation, or enforcement, shall be determined.

29. Applicability of terms

All promises, requirements, terms, conditions, provisions, representations, guarantees, and warranties contained herein shall survive the contract expiration or termination date unless specifically provided otherwise herein, or unless superseded by applicable Federal or State statutes of limitations.

IN WITNESS THEREOF, the parties have executed this agreement in duplicate originals, one of which is retained by each of the parties effective this the day and year first written above.

EXECUTIVE DIRECTOR
Peter Anderson

December 19, 2006

Mr. George Givens, Counsel
Environmental Review Commission
North Carolina Legislature
300 N. Salisbury Street - 5th Floor
Raleigh, NC 27602

Dear Mr. Givens:

Please find enclosed copies of our report for the California Integrated Waste Management Board, *Day of Reckoning: Protecting California Taxpayers from the Looming Landfill Crisis*," for the members of the Environmental Review Commission and its staff.

The report explains [1] the enormity of the risks posed by the new generation of mega-sized landfills, [2] the utter inadequacy of current financial assurance regulations to protect the state's taxpayers from a bailout in similar proportions to the Savings and Loan debacle, and [3] the steps needed to protect the taxpayers' interests.

Two further things to mention, if I may. First, we stand ready to provide detailed analysis of landfill liabilities particular to the situation in North Carolina if the Commission desires. Second, the report is rather lengthy, and so I have attached a short summary of it to this letter.

Thank you for providing us with an opportunity to speak with the Commission, and we look forward to working together to develop a strategy to protect the state's taxpayers in the days ahead if that is desired.

Very sincerely yours,

Peter Anderson

THE CENTER FOR A COMPETITIVE WASTE INDUSTRY

Summary of North Carolina's Looming Landfill Liabilities

⊡ The Issue

Many legislators are evaluating what to do after the landfill moratorium ends next year based upon an inaccurate balancing of interests.

Often the question of how to evaluate the national trash companies' mega-sized landfill proposals is determined by weighing, on the one hand, some minor nuisance from trucks and odors, and host fees that some low-income communities believe will relieve their immediate fiscal needs, on the other.

However, because it can no longer be responsibly controverted that the entire basis of today's landfill designs are fatally flawed, this incorrectly represents the real trade offs to North Carolina. The following summarizes the *Day of Reckoning* report with reference to the situation in North Carolina, the citations for which may be found in the full report.

⊡ The Facts

In fact, the costs to all of the state's taxpayers to bail out failed mega-fills in the future will be incalculable and dwarf those host fees to a small number of communities.

① Landfills "will ultimately fail," says EPA.

First, although not generally understood in the general population, among those in the waste industry there is no longer any debate over the fact, that EPA itself stated several times in the runup to the its federal standards. That is the elaborate liners upon which the rules are based "will ultimately fail" in decades, while the wastes remain a threat to the environment for "thousands of years."

That is to say, those rules have not prevented pollution, but rather only postponed it, and to the worst time, when the responsible parties have left the scene, the remediation pumping and monitoring systems are no longer functional, and thousands more people have sprawled out around once remote sites to be placed at risk.

How could such a thing have happened. According to an investigation by the EPA Inspector General, the final rule was based "on a compromise...not scientific criteria" in order to keep short term costs low. However, in the not to distant future, those once hidden costs will be coming home to roost, as we have been warned by Dr. John Skinner, who is the same person who supervised writing those rules 15 years ago where he headed the solid waste office, and who has

recently written that "the responsibility of responding to long-term problems at dry-tomb landfills will fall on future generations, and the funding requirements could quite likely fall on state and local governments."

② Shift to mega-sized landfills ramps up costs of inevitable failures.

Second, in order to reduce the cost *per ton* for the liners, the industry shifted from modest sized facilities perhaps 75 feet high with less than a million tons of trash to ones several hundred feet high containing more than 100 million tons. That is the volume of more almost 200 football stadiums, and that is what is meant when you hear the term "mega-fills." This is of major import for the states for this reason.

Landfills today have become too big to fix and when they ultimately fail, such has already happened at the Rumpke landfill near Cincinnati in 1996, they can do so catastrophically in major landslides. Not only does this risk life and limb for the workers and those residing, shopping or working in the vicinity, but it also has the most profound implications for the costs of cleaning up.

Although not widely known, Superfund, whose efforts have cost about $25 million per site, almost never actually cleans up failed sites. Rather, it usually just papers over the problem with fencing, temporary covers and bottled water, leaving the problem to resurface all over again in a very few decades. They can get away with that for the short term because most of the Superfund sites are very small.

However, catastrophic site failures at megafills will be too large to paper over, and they will have to really be cleaned up. Just excavating, stabilizing and reburying wastes will cost $50 - $100 per ton, hundreds of millions – if not billions – of dollars for large sites in populated areas.

③ Most mega-landfill proposals are for sites at the worst sites most susceptible to major failures.

Third, the proposed mega-sized landfill sites are congregated on the coast for barge access, placing them at risk to major to hurricanes, which are only expected to increase in severity with global warming. Also, these sites in coastal wetlands, marshes and estuaries do not have the required separation from groundwater. This has forced the companies to propose elevating the base of these landfills on fill above grade, instead of being buried 25-50 feet into the ground as is done elsewhere in appropriate settings with at least 10 feet of separation to groundwater. That makeshift work around will tend to further increase the risks of massive site failures.

④ The states stand exposed to bear all of the clean up costs.

Finally, the original intent of EPA's landfill regulations, which are followed in North Carolina, was to provide something called financial assurance as a last line of defense to protect states from the costs of failed sites. However, the details of these rules were specifically written to

exclude any of these major costs from coverage for several reasons. For one thing, in practice only minor maintenance costs wound up in these assurances, leaving no coverage for cleaning up failed sites. For another, even that coverage only extends for 30 years after closure, while the sites remain a threat to the public for hundreds if not thousands of years. Finally, the mechanisms for providing even those hopelessly inadequate assurances includes ones, like corporate IOUs that are, themselves, worthless in the face of major failures that will dwarf their assets.

⊡ The Solution

What is involved in today's mega-fills, which will fail in the future, many of which will fail catastrophically, is risk management involving protection for North Carolina's taxpayers against unprecedented clean up costs totally hundreds of millions of dollars, if not cumulatively more.

These fatally flawed proposal should be rejected for the reasons described above. However, if they are not, the next fall back is for the state to look to the marketplace for a solution so that its taxpayers are not exposed to outsized risks. Our economy already has an institution to provide coverage against risks, including major ones such as hurricanes. That is the insurance industry, and, more recently, related off-shoots from option and hedging instruments. The advantages of using the market to manage the state's risks under government supervision so that the taxpayers do not stand exposed are four-fold:

① The insurance industry is trained at assessing risks.

② It will not provide conflicted information, as the waste industry must do in order to shift as much of the risks it creates to the public so as to protect its stockholders from future bankruptcies that would wipe out their investment.

③ It has to stand behind its assessment reflected in its premiums or it will lose money, unlike the waste industry's consultant who are paid to see no risks, and will not make good if their assurances are proved wrong.

④ Insurance will be far less costly because it manages the diversity of different risks than imposing a bonding requirement on each landfill equal to the maximum risk, when some sites create far less chances of failure than others that are poorly sited.

Today, long-term catastrophic coverage for landfill failures is not commercially available, but that is only because the probabilities of an occurrence are high, which would make the premiums expensive. The commercial insurance industry is based upon high consequence/low probability events, for which premiums are low. However, that commercial hurdle can and will be overcome if the state requires insurance as a condition of operation. Furthermore, all of the elements necessary to constitute this sort of policy already exist in the market. It only requires piecing them together in the specific fashion needed by states to protect their taxpayers from yet another Savings and Loan magnitude bailout. ⊡

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
17 January 2007

The Environmental Review Commission (ERC) met on Wednesday 17 January 2007 at 9:30 a.m. in Room 544 of the Legislative Office Building. Representative Gibson presided.

The following members were present: Senators Albertson, Bingham, Dorsett, Kinnaird and Swindell; and Representatives Gibson, Harrell, Harrison, Justice, McComas and Warren. Mr. George Givens, Commission Counsel; Jeffrey Hudson, Assistant Commission Counsel; Jennifer McGinnis, Assistant Commission Counsel; Susan Iddings, Assistant Commission Counsel; Jennifer Mundt, Commission Analyst; Jessica DeCapua, Research Assistant; and Dot Waugaman, Commission Clerk, were also present.

On 3 January 2007, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. Copies of the agenda for the meeting and visitor registration sheets are included in the attachments as **Exhibits B** and **C**.

Representative Gibson called the meeting to order. He then asked George Givens to present his report and explain the agenda items. Mr. Givens pointed out that a packet of Read Only reports received since the last meeting of the Commission with an explanation memorandum from Ms. Jennifer Mundt was placed at their desks (see **Exhibit D**). The first group of reports consists of an Interim Report on the Costs and Benefits of Reducing Oxides of Nitrogen, Particulate Matter, and other Greenhouse Gases from Motor Vehicles dated 15 January 2007 (see **Exhibit D-1**); and the Annual Report on the Evaluation and Adjustment of the Boundaries of the Area Served by Each Metropolitan Planning Organization, dated 1 November 2006 (see **Exhibit D-2**). The second group of reports consists of those that have been submitted to the Commission since the last meeting and are distributed in connection with various items on the day's agenda. Three other reports are being held that refer to agenda items for the 23 January meeting.

Mr. Givens noted that the public-staff planning meeting for this meeting was held at 10:00 a.m. on Monday, 8 January 2007. He commented that the continuation of the study of solid waste issues would not include specific recommendations from the Department. He announced the next meeting of the Commission would be Tuesday, 23 January 2007, and that the Commission would probably have to meet once or twice after the beginning of the Session to complete its work.

Mr. Givens next commented on the proposals received in response to the two Requests for Proposals (RFPs) that the ERC had authorized him, by motions adopted by the Commission at previous meetings, to act on. With regard to the study of the merger of the organization and functions of the Ecosystem Enhancement Program and the Clean Water Management Trust Fund, which is a joint study with the Joint Legislative Transportation Oversight Committee (JLTOC), the JLTOC approved the proposal submitted by DYE Management Group, Inc. with a modified total price of $162,393 (see **Exhibit E**). Mr. Givens stated he would act on behalf of the ERC to join with JLTOC to go forward with that recommendation. Four proposals were submitted; DYE Management was not the lowest bid, but it was felt that, taking all factors into account, it was the best proposal.

With regard to the study of issues related to the nutrient offset payment program, the motion to accept the RFP carried at the December meeting. A proposal in response to the RFP was received from the Research Triangle Institute International with a total cost of $93,133 (see **Exhibit F**). Mr. Givens said, pursuant to the authorization already voted on, he would contract with them to conduct the study. The results should be available in May of this year so the General Assembly will have a chance to act prior to the September 2007 sunset.

Representative Gibson recognized Dr. David Moreau, Chair of the Environmental Management Commission, to present the quarterly report on behalf of the Commission for the period October 2006 through December 2006. Dr. Moreau focused on two matters that had been under discussion for at least

two years. The first is the mercury rule applied to coal-fired power plants. The second is the interbasin transfer (IBT) issue involving Kannapolis/Concord.

Formulation of the mercury rule was concluded in November 2006. Phase 1 will take advantage of the Clean Smokestacks Act in which mercury emissions reduction is a co-benefit of the actions in the Act to reduce nitrogen oxides and sulfur dioxides. There will be a series of reports to the Commission on progress made under the Clean Smokestacks Act. Phase 2 will begin in 2013. That phase will require control plans to be submitted to identify the technology proposed to be used and to provide for the installation and operation of technologically and economically feasible mercury controls at all coal-fired power plants at the earliest date. There are criteria for the Director to use in reviewing the control plans and to approve, disapprove, or conditionally approve them. In dealing with new sources, the rule adopted requires the installation of the best available control technology for mercury. Periodic evaluations will be made every five years with specific requirements for reporting in 2013. At that time, the Commission shall determine mercury control requirements for all units and decide if any further rule changes are needed.

The co-benefit under the Clean Smokestacks Act is estimated at about 70% reduction for the units covered by the Clean Smokestacks Act; an overall reduction of approximately 60% with most being achieved by 2010. The discussion on the mercury rules began with debate about whether or not to exceed the federal rule to reach a 90% reduction across the board. The final decision on what level of controls will be required will be made in 2013. Dr. Moreau said that achieving the federal caps in-state will push the limits of technology known today. All the estimates of emissions, performance and effects are based on secondary sources of information. The rules require the Division of Air Quality to report to EMC on all factors as additional information is gathered about emissions—what types or species of mercury, whether solid or vapor, have a profound effect on what kind of control strategies, what the projected mercury emissions will be, the state of technology, and the cost of the technology. There was a lot of debate about the use of the trading rule. The issue of using a cap-in-trade program is still in the courts. The debate about the program concerns whether the trading program would or should be used. It is seen as a safety valve in case other provisions of the rules cannot be achieved.

The other difficult issue the Commission considered was the inter-basin transfer request, reviewed in depth at the December ERC meeting. The key facts are that Kannapolis and Concord based their request for an IBT on a supply need of 53 million gallons a day, which included a 25% added factor to deal with the 80% rule. DENR requires the community to begin planning for a new source when its demand reaches 80% of supply. That value was rejected by the Commission, and the request for water from the Catawba was reduced from 26 million gallons a day to 10, which is 40% less than requested from the Catawba basin. As the recommendation was originally written, Kannapolis and Concord would have to adopt the same conservation protocol that applies to the Catawba. In discussion, the concern was extended to include the conservation protocol on the Yadkin as well.

Representative Harrell asked about the court case brought by the Attorney General of South Carolina. Dr. Moreau replied that the last he had heard is that if the EMC did not take any action on the IBT, they would not file a law suit. Mr. Givens commented that a meeting on the IBT matter had been held on December 22, convened by Representatives Gillespie and Church. At that time, a representative of the South Carolina Attorney General's office delivered a letter from the Attorney General of South Carolina to the Attorney General of North Carolina indicating that any action by the EMC to approve any kind of inter-basin transfer would result in a lawsuit by the State of South Carolina. It did not state what the grounds would be.

Representative Gibson next recognized Mr. Jim Simons, State Geologist and Director, Division of Land Resources (DLR), DENR, to discuss the annual report on the implementation of the Sedimentation Pollution Control Act of 1973 (see **Exhibit H**). The current report is similar to last year's report. The State is still experiencing a high level of development, with many of the same challenges. DENR is trying to address the challenges with new technology and better guidelines. Express permitting is available in every regional office and is very popular in the coastal areas. Mr. Simons reported that no one has taken advantage of the partial delegation allowed by new legislation last year.

Senator Bingham asked if there is a map showing locations of inspections and violations of the sedimentation legislation across the state. Mr. Simons replied that many violations occur in urban areas that do not have a local sedimentation control program and added that DLR does not have a map at present. However, when the state database is complete, DLR will be able to create such a map.

Senator Albertson asked how far inspectors have to travel to do their inspections. Mr. Simons replied that they work out of the seven regional DENR offices. Travel time can vary from minutes to 2-1/2 hours one way. Some live closer to inspection sites, and they are allowed to work from home part-time, although they are required to go to the office on certain days to handle paperwork, complaints, and public inquiries.

Mr. Givens asked if there are metrics showing what part of the state is served by local program and what is under the state-wide program. Mr. Simons yielded to Mr. Mell Nevills, Chief of the Land Quality Section, DLR, for an answer to the question. Mr. Nevills replied there is none at present, but part of the database they are developing will help them establish one and allow them to determine how many projects are handled by local programs and how many projects are handled by the state. DOT also has a number of projects under their program. They have asked the local governments to send information on sedimentation control programs to the Division, but a number do not.

Representative Gibson recognized Ms. Mary Penny Thompson, Assistant General Counsel, Office of the Secretary, DENR, to give an update on the approval of plans for land-disturbing activity along waters that have been classified as trout waters. She has been working with the Division of Land Resources on clarifying an interpretation of the Sedimentation Pollution Control Act as it relates to trout stream buffers. The Act itself protects all areas near natural water courses. The default is to contain all sediment within the first 25% of a stream buffer. For trout streams there is an additional requirement that the buffer be at least 25 feet wide.

In December, developers moved forward with a project called "Mountain Air Golf Course" that included new development along a trout stream. The project would involve piping of streams and tree cutting along the buffers. DLR worked with the developers to modify the project until they felt it met Sedimentation Pollution Control Act standards and ultimately approved the plan for development. Local citizens and environmental groups challenged the agency's decision and it went through a contested case procedure. Late in 2005, an administrative law judge interpreted the act as saying there could be no activities within the buffer that left a permanent impact. After that decision came down, the Department looked at the law and actually stopped approving trout stream buffer waivers until some clarification was made on the statute's meaning. In the 2006 session, legislation was introduced to provide further specification on how to handle trout stream buffers, but it failed to get out of committee. DENR then turned their attention back to the contested case decision which was scheduled to come before the Sedimentation Control Commission (SCC). DENR worked with the parties and with the administrative law judge to expedite the case and get it in front of the SCC in November.

In November of 2006, the SCC reversed the administrative law judge's decision and did allow development to move forward in the buffers. Their decision hinged on the definition of land disturbing activity, which had a phrase that says, "Land disturbing activity is activity that may cause or contribute to sedimentation." The SCC noted that and directed DLR to return to their previous procedure of approving plans based on that definition. They also noted that piping a stream or selectively thinning or cutting trees may not cause nor contribute to sedimentation. Therefore it will be in the staff's expertise and best professional judgment to determine what activities will cause or contribute to sedimentation. If the activities do not cause nor contribute to sedimentation, the developer would be eligible for approval for a trout buffer waiver. That decision is being reduced to writing and will be sent to the concerned parties. It might still be appealed in the courts. If the courts change that decision, the interpretation of the statute may be affected once again.

In addition to the contested case, the Department worked with parties to bring forth two declaratory rulings that touched on issues the contested case issue did not. The first involved another golf course, an existing development that involved stream restoration activity. The Department sought clarification on

whether stream restorations were permanent impacts that would cause or contribute to sedimentation. The SCC found that indeed stream restorations improved the situation rather than caused or contributed to further sedimentation; therefore, they would be eligible for trout buffer waivers. Part of the decision included guidance about avoiding and minimizing impacts. DLR is to work with developers to make those impacts as small as possible, and if over all, the project results in improvements to the environment, it will be eligible for a trout buffer waiver.

The second type of declaratory ruling looked at was the Department of Transportation's secondary road paving in the mountains. Here, when an unpaved road is paved, that activity actually reduces erosion and sedimentation from the pathway, so again, it improves the environment, reduces erosion and sedimentation, and therefore would be eligible for trout buffer waivers. Those declaratory rulings have been issued and so far there have been no appeals. The Division is now back to where they were before the contested case decision with further clarification on stream restorations and secondary road pavings. Litigation may continue when the decision is finalized and issued, which may provide some new developments as the cases move through the courts.

Senator Bingham asked if the decision meant lumber could be cut within the 25 foot buffer of a trout stream. Ms. Thompson replied that it would be eligible for review, because not all timbering would cause erosion and sedimentation. Clear cutting might not be allowed, but a plan including some timbering would be eligible for review.

Representative Gibson asked if the problem of cutting the trees was one of rising water temperatures because of increased sunlight. Ms. Thompson replied that was not an issue cited in the reversal. The SCC's rules do address temperature, but rising temperatures were not the basis of the decision. Representative Gibson then asked if the courts discussed the double jeopardy situation in which people were getting notices of violation or fines, but were not allowed to correct the violation because there was a trout stream involved. Ms. Thompson said if someone is doing something to make a stream better, they will be allowed to carry out their plan.

Representative Justice asked about what can be done to improve the stream. Ms. Thompson replied there are stream restoration activities which initially will cause impacts. With DOT, there are situations, particularly in the mountains, where the only place a road can be placed is near a stream. Sometimes the bank would be failing from other types of erosion, and rip rap can be installed to stabilize the bank. Or the roadway could be moved so there would be enough of a buffer to prevent erosion or collapse.

Representative Gibson recognized Mr. Dexter Matthews, Director, Division of Waste Management (DWM), DENR, to present a report on the solid waste management regulations of other states and on issues related to the processing of solid waste management permits by DWM (see **Exhibit I** for a copy of the PowerPoint presentation he used). He complimented staff of the Solid Waste Section for their compilation of information from other states to be used to look at areas that the Division feels need improvement.

The acronym MSWLF in the 15th PowerPoint slide stands for Municipal Solid Waste Landfills; the acronym CESQG in the 16th PowerPoint slide stands for Conditionally Exempt Small Quantity Generator waste, which under federal rules can be disposed of if you are a generator of hazardous waste and generate less than 220 pounds per month. Under the federal rules, that amount per month can be disposed of in a municipal solid waste landfill; however, North Carolina does not allow that. DWM did not find a difference in requirements for screening procedures in other states. Virginia was the only state that had some additional requirements to screen out waste. When waste comes from an area outside the state, there will need to be provisions for removing items banned in North Carolina landfills. Eleven of the sixteen states studied did have permit fees for the purpose of supporting their solid waste programs.

Representative Justice asked how expensive it is to test for leaks in lined landfills and who was responsible for paying for repairs. Mr. Matthews replied the permit applicant would pay for the test. He said he could get the information on the cost, but he did not have it on hand. Representative Justice then asked about sewer sludge not being banned from the landfill. Mr. Matthews replied that there are specific requirements on the allowance of municipal solid waste sludges in landfills. Some landfills want to receive

additional types of waste to promote degradation of the materials in the landfill and create a bioreactor type of landfill. Sludge is beneficial in landfills that are trying to promote that technology.

Senator Albertson asked how leaks are addressed when a test reveals a leak in the liner. Mr. Matthews said he was aware of only one landfill within the state that experienced a breach in the liner. In that case, the leak was on the side slope of the landfill and the liner was repaired without having to remove the waste.

Representative Harrison asked how the Division would know about breaches in the landfills if they are inspected only once a year. Mr. Matthews replied that the breaches usually occur during construction of the liner but with a 100% liner leak detection system, it will have been constructed in such a way as to insure there will be no leaks. Monitoring systems around landfills, such as groundwater monitoring and leak detection between the two liners if the landfill has a double liner, are required.

Senator Swindell commented that before the Subtitle D legislation was passed in the mid-1990's. there were over 60 landfills operating throughout North Carolina, and at one time, there were over 40 with ground water contamination. Subtitle D landfills are made like a garbage pie—with clay, with 60 mil plastic on the bottom, leachate collection systems to collect the liquids, methane gas collection system to collect the methane gas, and so forth. Landfills today are very different than they were prior to the Subtitle D legislation. Old landfills are still contaminating groundwater. Senator Swindell asked Mr. Matthews if he has any knowledge of leaks in the new landfills. Mr. Matthews replied there have been a couple of "hits" in monitoring. Most have been traced back to areas such as the leachate collection pond, and the problems have been addressed. He added that prior to the 1970s, the permitting system did not exist. Waste was put in open dumps, and those sites need to be addressed. The state then went to sanitary landfills, then in 1998 to lined landfills. So far they have been operating very well. The issue now is whether or not the state should take additional steps to use new technology to protect public health and the environment.

Representative Harrell asked if Mr. Matthews knows what the state's landfill capacity is. Mr. Matthews replied that Mr. Paul Crissman, Head, Planning and Program Management Branch, Solid Waste Section, Division of Waste Management (DWM), has been looking at that as part of the Division's annual report. He added that there are some capacity issues, but only in specific regions of the state. Some areas have plenty of landfill capacity; others do not. Mr. Crissman reported that their capacity study is not complete, but will be soon. Capacity is up slightly from previous years; however there is still need for additional capacity in the Piedmont area of the state. Representative Harrell commented that he is concerned that with the moratorium the costs of the landfill in his area would be affected. Mr. Matthews replied that the landfills halted under the moratorium basically were in site study; therefore they were not far along in the permitting process and the moratorium at this point would not be affecting the price.

In response to a comment from Representative Harrell, Mr. Givens explained the differences in radioactive and other solid waste. He said radioactive waste is different from any other type of waste because it is subject to a different regulatory scheme. High level radioactive waste is entirely the responsibility of the federal government. With regard to low level radioactive waste, Congress created a compact system which does allow for exclusion of waste from outside the compact region by compacts that have been approved by the Congress. North Carolina was at one time a part of a compact region, but is not now. If a state is not in a compact region, low level radioactive waste is subject to the same interstate commerce rules as apply to other kinds of waste. He added that some of our radioactive waste goes to a facility in Barnville, South Carolina, and other radioactive waste goes to Utah. The facility in Barnville is likely to close to radioactive waste from any state soon. For the long term, the disposal of North Carolina's low level radioactive waste is not determined. North Carolina does not have a facility to take our low level radioactive waste.

Representative Gibson recognized Ms. Robin Smith, Assistant Secretary for Environment, DENR, to speak about improving oversight of landfill construction and operation (see **Exhibit J** for a paper entitled, "Improving Oversight of Landfill Construction and Operation in North Carolina").

Currently a landfill operator is not required to provide financial assurance up front for cleanup of a potential release. The rules require only that financial assurance for some sort of remediation of a release be provided at the time the release is detected. The State needs to develop specific criteria to demonstrate financial assurance to take care of releases as well as financial ability to operate a landfill. One concept being considered would require financial assurance for certain types of actions, including remediation of a release, closure of a facility, and post-closure care. The assurance should consist of some sort of financial mechanism at the time the landfill is permitted, whether an insurance policy or a bond, to make certain that resources would be available to address any required situations.

The Department also looks at the financial qualifications of the landfill applicant as a business entity, whether it be a corporation, partnership or other type. The entity must have the financial ability to properly construct and maintain the landfill. One of the areas for improvement in the statutes or rules is to have more specific standards for financially qualifying an applicant to own and operate a landfill. The Department does not believe landfill permits should be issued to business entities that shield all of their shareholders and partners from liability in the event of a problem at the landfill.

Landfill applicants in North Carolina are not required to conduct a full environmental impact statement. Although the landfill permitting process is fairly comprehensive and looks at a great deal of information about the appropriateness of the site, design, and operating issues, it does not do everything that an environmental document would do. Large landfills should be required to complete the same kind of environmental document required routinely for other types of major projects under the state's Environmental Policy Act.

Specific standards for siting, designing and operating landfills should be investigated. One of the findings of the study reported on by Mr. Matthews is that there are some significant differences in specific design and siting criteria between North Carolina and other states. Ms. Smith commented It is worth taking a look at the differences to see if there improvement needs to be made in the siting and design of landfills. Other recommendations were addressed in the handout (see **Exhibit J**).

Senator Bingham asked what Ms. Smith envisioned in tip fees for the future. She replied that last year there was a proposal for a state tipping fee of $2.00 to fund the cleanup of the over 700 old dumps across the state that have not yet been addressed. Senator Bingham asked if there was an estimate of how much it would cost to clean up all the sites. Mr. Matthews replied that North Carolina estimates it would cost an average of $750,000 per landfill for cleanup. The $2.00 per ton tip fee across the state would bring in approximately $22 million a year. Senator Bingham asked if northeastern states have the same problem with old landfills. Ms. Smith replied she believed so.

Representative Harrison asked about the Department's reaction to using insurance as a means of financial assurance. Ms. Smith replied the Department is focused on the need for adequate financial assurance for remediation if needed, for closure, and for post-closure care. One of the ways to provide the assurance is through insurance. Representative Harrison asked if DENR is asking for a repeal of the exemption of landfills from the SEPA. Ms. Smith replied that SEPA applies only to publicly funded projects or projects on public land. She said that what is needed is the SEPA level of information for all large landfill applications, whether public or private. Representative Harrison asked if the Department is recommending increasing the buffer areas to protect streams from landfills. Ms. Smith replied the Department is looking at setting up a working group process to determine potential siting and design criteria rules or recommendations to the General Assembly for legislation. Others may be straightforward enough to be proposed as legislation, but the specifics have not yet been decided. In response to another question from Representative Harrison, Ms. Smith said that the tipping fee proposed during the 2006 session would have been used for cleaning up both hazardous waste and dump sites.

Representative Harrell asked what the market for insurance would be to demonstrate financial assurance for landfills. Ms. Smith replied that from looking at other areas of environmental regulation such as underground storage tanks, the insurance market is much more available and reasonable now than it was ten years ago.

Representative Harrison asked if legislation would be proposed for the 2007 session concerning landfills. Mr. Givens replied that the ERC was directed to study the issue during the 2006 session. The Governor's office has taken a direct interest in the matter and Mr. Givens hopes the ERC and the Governor's office will work cooperatively on developing legislation. He anticipates recommendations will be forthcoming from the Governor in a few weeks and wants the ERC to consider those recommendations before coming up with their legislative proposals. However, given the timing of the Governor's response to the study, legislation may need to be introduced as public bills, not as study commission bills.

Representative Gibson recognized Mr. Greg Peverall, Consultant, Solid Waste Management Services, who spoke on behalf of the Carolinas Chapter of the National Solid Waste Management Association (NSWMA) (see **Exhibit K** for a copy of his PowerPoint presentation). Mr. Givens commented that the environmental community and the local government associations have asked to be heard at a later date. Mr. Peverall stated that NSWMA members are private sector companies who collect solid waste materials, process recyclables, collect yard waste, and operate compost facilities. He said that each North Carolinian generates seven pounds of garbage daily. Safe disposal is an essential component to our society. Members of MSWMA include all the major solid waste management companies: Allied Waste Industries, Republic Services, Waste Management, Waste Industries, and DH Griffin, along with several smaller private companies originating and/or operating in North Carolina.

Mr. Peverall spoke about the Solid Waste Act of 1965, as amended by the Resource Conservation Act of 1976 and again in 1984. The legislation created the regulatory structure that governs solid waste management in the United States. The structure for managing solid waste is found in Subtitle D regulations. North Carolina adopted the federal laws that required that all new landfills, operating after October 1993 be built to the proven permitting design and operational standards of Subtitle D in order to protect the environment, human health, and public safety. He added that modern landfill development in North Carolina can take 2-3 years and up to $3 million at the local level, prior to submittal to the Division of Solid Waste. Mr. Peverall said the modern landfill is basically a large baggie in which solid waste is stored. The applicant has to determine where the seasonal high groundwater is on the site. The liner has to be four feet from the seasonal high groundwater. The liner system is four to six feet thick. It includes clay, leachate collection systems, and a synthetic liner as well as a lower permeability liner system on top to separate the particulate from the solid waste materials. Additional safeguards for Subtitle D landfills include closure plans, long-term monitoring plans after closure, financial instruments for closure, post-closure and potential remediation, along with operational qualifications that sites are fenced and secure, and that landfill operators are trained and certified. He showed photographs of the landfill at the Charlotte Motor Speedway, the North Wake Landfill and the Mecklenburg County Landfill showing residential development around the landfills (see **Exhibit K**).

Mr. Peverall spoke about recycling efforts of the private companies and showed photographs of facilities where recycled materials are separated by type. He commented that even with an aggressive recycling program, landfills will also be needed for the foreseeable future. Another recycling program is the use of landfill gas to provide heat and electricity. In the United States, modern landfills have never required any funding for cleanup costs associated with leaks or failures. In North Carolina, no base liner leaks have been detected from any of the 42 lined facilities permitted since 1990, excluding incidences of leaks from leachate lagoons, side slope leaks, and leaks of methane gas,. The important part of those features is that the protection mechanisms worked in those events, and they were remedied and properly reconstructed so the leaks would not recur.

In summarizing, Mr. Peverall said the industry is committed to protecting the environment and to reducing the amount of solid waste going into landfills or disposal in North Carolina. The North Carolina existing rules and laws protect the public and insure that all stakeholders are included in all phases of the landfill development process. The use of available technology and continued operational improvements has rendered landfills to be a safe and important component of any local government's infrastructure. He invited the Commission members to tour any of their landfills, operations, or materials recovery facilities so the industry could show how protective they are of the environment.

Senator Kinnaird asked if the industry would accept the recommendations put forth by the Assistant Secretary for Environment of DENR. Mr. Peverall replied they are very interested in being engaged in the dialog about the recommendations. They would support a permit fee structure to provide a way for the Division to sustain the quality of people on Division staff and to review the permit applications that will be ongoing. There is a study going on in Buncombe County exploring the benefits of bioreactors. There are great technological improvements available in the national marketplace that at the present time cannot be implemented because there is no staff to analyze them or incorporate them into operational practices. Therefore, the industry would endorse anything to strengthen the Division of Solid Waste in their permit review process and improving the technology already in use in North Carolina. They support the idea of funding for monitoring and repairing unlined landfills; however, they do not believe the solid waste industry is the best way to collect the fees. They would propose the fees be billed by the state and the benefit of all the revenue would be employed to the remediation of the sites. The industry would be against a tipping fee to raise money for remediation of leaking landfills because private enterprise works under contracts that preclude them from raising their rates to recover increased costs. Senator Kinnaird asked if the material used for the liner is made from recycled material. Mr. Peverall replied the liners are made from high quality initial product. It would not be recovered.

Senator Bingham asked if the industry had any recommendations for the ERC to help them improve or strengthen recycling. Mr. Peverall replied recycling is market driven. The industry is cautious about any stimulus outside of the international market driving the markets. Collection systems would probably be the most advantageous for the industry. They would include educating about how local communities can save money by being involved with an aggressive recycling program. He commented about a program in Craven County in 1990. Along with implementation of a new tipping fee to dispose of solid waste materials, they went with a sticker program in which citizens paid by the bag that was thrown away. Everyone had a curbside bin, so it encouraged moving the solid waste materials from the bag to the recycling bin, resulting in a reduction from 100,000 tons of solid waste garbage a year to 60,000 tons a year. It was a phenomenally successful program, but it was not without its costs, both political and otherwise.

Representative Gibson recognized Mr. David Barnes, Attorney at Law, Poyner & Spruill, LLP, to speak on behalf of the National Solid Waste Management Association, on the industry perspective. He said the NSWMA is still developing its positions, but the industry does want to be involved in formulating the policy.

The first distinction he made is between the Subtitle D landfills and the old unlined landfills. He represents the businesses that operate new modern Subtitle D landfills, and wants to be sure policies developed relate to the new landfills. The NSWMA objected and still objects to the landfill moratorium. The current regulations in place adequately protect the health and safety of North Carolinians as well as the environment. In the absence of evidence that the current process produces flawed landfills or is itself flawed, the NSWMA believes the moratorium is not justified and not necessary. The industry wants to keep up with the technology, and they have the expertise to help the State. A number of landfill projects that had been permitted under the current regulations were allowed to go forward. Many people wanted the moratorium to stop the mega landfills, but the current moratorium has an exemption that if someone has a currently permitted landfill, it can be expanded either vertically or horizontally, so that current landfills can become mega landfills.

Mr. Barnes cautioned that the moratorium operates to prohibit only landfills that will receive, in part, waste from out of state. He cited Professor Richard Whisnant who told the Commission that the importation of out of state garbage cannot be prohibited. Any attempt to stop out of state garbage is unconstitutional and should not be the basis of any landfill moratorium. The current process North Carolina has in place allows local control over landfills. The state cannot permit a landfill unless the local authorities where the landfill is to be located say it is all right. All landfills that were stopped by the moratorium had been approved by the local jurisdiction. Mr. Barnes commented that it seemed unfair that local governments and landfill companies that have spent millions of dollars and years trying to get the landfills permitted under the current process in good faith are not able to do it. He commented that changing the rules in mid-stream, when there is no evidence that the process is flawed, does not seem to be fair. For the time being and into the future, landfills will be the most cost effective way of dealing with garbage.

He went on to comment about an LLC as a business entity operating landfills. Regardless of the kind of entity, the entity still needs to provide the financial assurance required by the Environmental Protection Agency (EPA). According to EPA, an entity can use letters of credit, surety bonds, or corporate guarantees as long as the corporation is rated high enough by the rating agency. There has to be an estimate of how much it costs to close the landfill, how much it will cost to monitor the landfill, and how much any necessary remediation would cost in order to determine how much financial assurance would be required..

Mr. Barnes spoke about the concept of requiring tighter regulations in sensitive areas. He said that to the industry, every area is sensitive. If a landfill is built pursuant to the regulations with a modern liner, the industry believes it is being careful with the environment. Height requirements and setbacks are local issues and should be regulated by local zoning boards. He believes each landfill that has been proposed has had a traffic study; therefore, the industry would have no problem if that requirement is added.

The regulation of collection and disposal of municipal solid waste is a governmental function somewhat like regulation of water and sewer systems, police systems, and so forth. There is a better way to fund taking care of the old orphan dumps and landfills than imposing a garbage surtax. It is a core governmental function that should be taken care of by all, not just the specific solid waste disposal industry. The cost of remediation of old leaking landfills should be borne by everyone.

The NSWMA is against permit fees unless those fees are used to train and staff the people who are processing landfill permits. The Department has done a good job but they need more people. The only caveat the NSWMA has is that if they are going to process landfill permits, there should be a time limit so that after the designated amount of time, the applicant can get an opinion about the application from their independent engineers to determine if it meets regulations.

Senator Bingham asked how successful the tipping fees have been in Tennessee and Georgia. Mr. Barnes replied that a distinction needs to be made between a "gate fee" (what the industry calls the "tipping fee") which is how much it costs to dump trash in the landfill, as opposed to a surcharge or tax per ton. Mr. Matthews said many states had a fee at the landfill per ton as is being proposed in North Carolina. Each state may have a difference about how they collect the fees, but it is on a per ton basis based on the amount of waste that was disposed. Mr. Matthews added that he has asked the industry for language to help with their concerns about passing increased costs along to consumers.

Representative Gibson recognized Mr. Scott Mouw, Chief, Community and Business Assistance Section, Division of Pollution Prevention and Environmental Assistance, DENR, to speak about the status of recycling and recycling markets in North Carolina (see **Exhibit L** for a copy of his PowerPoint presentation, **Exhibits M** and **N** for brochures describing recycling in the state, and **Exhibit O** for an article from *The New York Times*).

Senator Kinnaird asked if recycling now costs less than it produces. Mr. Mouw replied that the operating cost to recycle is less than the operating cost to collect and dispose of garbage. The programs that run well, defined by having high participation, and citizens who are engaged and educated on recycling collect a wide range of materials and have modern collection systems. In many cases, it is more economical to recycle than to collect and dispose of garbage. In addition, there is a cost-avoidance every time a ton of garbage is recycled.

Senator Bingham asked why China is able to use recycled mixed paper. Mr. Mouw explained that China has almost no forest resources, so they have to make paper in large quantities to package products they sell in the United States from other sources of fiber. They made an industrial decision years ago that they would build their papermaking, steelmaking and plastic industries around recovered materials.

Representative Gibson recognized Mr. Steven Burke, Senior Vice President for Corporate Affairs, North Carolina Biotechnology Center, to give an interim report from the Biofuels Energy Strategic Plan Work Group on the development of the Strategic Plan (see **Exhibit P** for the Interim Status Report).

North Carolina has embarked on a strategic plan for biofuels leadership, a multi-party partnership long-term based endeavor, triggered by Senate Bill 2051 in the 2006 session of the General Assembly. Mr. Burke described three premises, one definition, the process to date, and a way of thinking to envision a shared future about liquid biofuels in the State. North Carolinians use 5 billion gallons of liquid fuel a year, and it all comes from outside the State.

- We use just 2 million gallons of bioethanol produced fuels per year. It would be good to change the balance and not be as dependent on fuel that comes from somewhere else.

- It is a matter of common sense as well as security that we in North Carolina think about ways to gain more alternative sources of biofuels. In fact, it is not only a matter of policy and strategy, it is also a provident way to draw on the State's agricultural resources, strong competencies in biotechnology and related technology, and to benefit both individual consumers as well as rural parts of the State.

- Few states in the country are as well prepared and well equipped to address a future of increased biofuels development, because in addition to our capabilities in agriculture and generated biomass, the source of new feed stocks, an international leadership in science and biotechnology to prepare for new alternatives, we have a tradition in agricultural and rural based economic development, and an extraordinary will to work together as partners to solve compelling problems for the State.

Biofuels is an umbrella term for liquid fuels developed from living sources. There is a category called bioethanol, generated from plants (primarily from corn), but which in the future will be generated from other sources such as sorghum, soy beans and wheat straw. A second kind of biofuel is called biodiesel. It comes from soy beans, but it could also come from extracted recycled restaurant oils. A third source of biofuels is animal waste, which has been barely explored.

Senate Bill 2051 was triggered by recognition among a number of state leaders that the state had no coordinated way to bring together thinking and entities around the topic of a biofuels future. The legislation called for convening parties to catalyze the partnership required to bring diverse groups together. The five convening parties are listed on page 4 of **Exhibit P**. The list of steering committee members is given on page 5 of the interim report.

The group met on a number of occasions to devise an operational plan and a vision for the future to unfold over coming years. The 131 strategies resulting from brainstorming will be shaped, coalesced and shortened to yield a cohesive set of possible outcomes for the endeavor. There are some guiding premises that the State must embody as it thinks about its biofuels leadership future (see page 2 of **Exhibit P**). The report of the project will be submitted to the ERC in early April, 2007. It will include strategic recommendations, operational and tactical matters of tax credits, new facilities, and research funding. Mr. Burke described the strategies outlined on page 7 of **Exhibit P**. He said that North Carolina can be an east coast leader in a new and unshaped industry, processing, and extracting fuels from plants grown and developed in the state. The report will include a compelling mandate to set a behavioral imperative to meet by 2015.

Representative Gibson recognized Mr. Andy Adams, Chief, On-Site Wastewater Section, Division of Environmental Health, DENR, to present the annual report on the Wastewater Discharge Elimination Program (see **Exhibit Q** for a copy of the Annual WaDE Program Report). The Section oversees the on-site wastewater septic systems in the state, and will soon begin overseeing the construction of private wells. WaDE is an acronym for Wastewater Discharge Elimination.

In the past year, surveyors took a centralized training class and became authorized, just as local health department environmental health specialists are authorized, to issue permits. Previously the program would identify problems and turn the location of the problems over to the local health department for remediation. Staffing issues at the health departments would at times not allow timely follow-up. To

improve the rate of repair of the systems, the WaDE surveyors are now classified as environmental health specialists and can not only identify the problems but also actively write permits and help find funding to repair the problem systems.

Mr. Givens reminded Commission members that there was a recommendation for additional funding to expand the WaDEprogram in 2006, but it was not part of the budget. He commented that such a recommendation could be brought forward this session should the ERC so desire.

Mr. Givens announced the next meeting of the Commission will be 23 January 2007 in Room 1228 of the Legislative Building.

The meeting adjourned at 1:15 p.m.

Representative Pryor Gibson, Co-Chair, Presiding

Senator Charlie Albertson, Co-Chair

Dot Waugaman, Commission Assistant

Senator Daniel Clodfelter, Co-Chair

Schedule of Future Meetings
Meetings of Interested Parties (605 Working Groups)
Additional Information

COMMISSION MEETING:

The Environmental Review Commission (Commission) will meet at 9:30 a.m. Wednesday 17 January 2007 in Room 544 of the Legislative Office Building in Raleigh.

At this meeting, the Commission will continue studies for which the Commission is responsible, hear reports from State agencies, discuss topics to be considered at future meetings, and attend to other matters. Listed below are potential agenda topics for this meeting and for future meetings. More specific information regarding the agenda for the 17 January meeting of the Commission will be developed at the staff planning meeting discussed below.

STUDIES

1) Issues related to solid waste management (S.L. 2006-244, Sec.4)

2) Issues related to the nutrient offset payment program with regard to the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen; whether nutrient offset payments should be authorized for additional nutrients, including phosphorus; and whether the nutrient offset program should be expanded to other areas of the State (S.L. 2006-215, Sec. 2)

3) The merger of the organization and functions of the Ecosystem Enhancement Program and the Clean Water Management Trust Fund with the Joint Legislative Transportation Oversight Committee (S.L. 2006-248, Sec. 16)

REPORTS *(Report due dates are indicated in parentheses)*

General/Miscellaneous:

4) Annual report on the evaluation and adjustment of the boundaries of the area served by each Metropolitan Planning Organization (G.S. 136-202(d)) *(1 November)*

5) Annual report on the mercury minimization plan prepared by the Department of Environment and Natural Resources (G.S. 130A-310.57) *(1 November)*

6) Quarterly report on the activities of the Environmental Management Commission (G.S. 143B-282(b)) *(15 January)*

7) Interim Report by the Biofuels Energy Strategic Plan Work Group on the Development of the Strategic Plan (S.L. 2006-206, Sec. 3.2) *(15 January 2007)*

Air Quality:

8) Interim Report on the Costs and Benefits of Reducing Oxides of Nitrogen, Particulate Matter, and Other Greenhouse Gases from Motor Vehicles (S.L. 2006-248, Sec. 43) *(15 January 2007)*

Hazardous Waste Management:

9) Annual report on the Effectiveness of the Brownfields Property Reuse Act (G.S. 130A-310.40) *(1 October)*

10) Report on the findings and recommendations of the Governor's Hazardous Waste Task Force

Land Resources:

11) Annual report on implementation of the Sedimentation Pollution Control Act of 1973 (G.S. 113A-67) *(1 October)*

Parks and Recreation:

12) Parks and Recreation Trust Fund Annual Report, Fiscal Year 2005-2006 (G.S. 113-44.15(c)) *(1 October)*

13) Report on the Conservation Easement Program and inventory of all conservation easements held by the Department of Environmental and Natural Resources (G.S. 113A-235(c), S.L. 2004-124, Sec. 2.2) *(1 October)*

14) Report on acquisitions made with funds from the Natural Heritage Trust Fund (G.S. 113-77.9(e)) *(Semi-annually, within 30 days of revision)*

15) Annual report on the State's progress made towards Preserving One Million Acres of farmland, open space, and conservation lands (G.S. 113A-241(c), S.L. 2004-195, Sec. 2.3) *(1 October)*

16) Report on the Feasibility and Desirability of Acquiring Land and Establishing a State Park at Cabin Lake (S.L. 2006-138, Sec. 3) *(15 January 2007)*

Solid Waste Management:

17) Solid Waste Management Annual Report (G.S. 130A-309.12(c), G.S. 130A-309.06(c)(8), G.S. 130A-309.63(e), G.S. 130A-309.06(c)(10), G.S. 130A-309.85, G.S. 130A-309.06(c)(11), G.S. 130A-309.06(c)(12), 136-28.8(g), G.S. 130A-309.06(c)(13), 143-58.2(f)) *(15 January)*

18) An evaluation of the recycling industry, the markets for recycled materials, the recycling of polystyrene, and the success of State, local, and private industry efforts to enhance the markets for these materials. (G.S. 130A-309.06(c)(6)) *(15 January)*

Water Quality:

19) Annual report on the Wastewater Discharge Elimination Program (S.L. 2001-452, Sec. 2.9) *(15 October)*

20) Implementation of the Clean Water Management Trust Fund; projects and awarded grants. (G.S. 113-145.6A(a) and S.L. 2002-148, Sec. 3) *(1 December)*

21) Implementation of the Ecosystem Enhancement Program and use of the Ecosystem Enhancement Fund, including inventory of property and easements. (G.S. 143-214.13) *(1 November)*

22) Follow-up discussion of the report on the evaluation of the training and qualification requirements for approval as an animal waste management systems technical specialist (S.L. 2006-38, Sec. 2) *(15 November 2006)*

Water Quantity:

23) Annual report by the Catawba/Wateree River Basin Advisory Commission and the Yadkin/Pee Dee River Basin Advisory Commission (G.S. 77-117) *(1 October)*

PLANNING MEETING:

To facilitate development of the agendas for the 17 and 23 January meetings of the Commission, to plan for subsequent meetings of the Commission, and to receive input from interested persons regarding the work of the Commission, the Commission Counsel will hold an informal planning meeting at **10:00 a.m. on Monday 8 January 2007 in Room 605 of the Legislative Office Building**. Persons who wish to participate in the development of the agenda for meetings of the Commission, or who are interested in any matter before the Commission, are invited to attend.

SCHEDULE OF FUTURE MEETINGS:

The Environmental Review Commission is scheduled to meet at 9:30 a.m. on Tuesday 23 January 2007 in Room 1228 of the Legislative Building. It may be necessary to reschedule this meeting.

The Commission may also meet once the General Assembly is in session (G.S. 120-70.44). When the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representative as provided by G.S. 143-318.12(b) and will be distributed by email. The Commission will resume a regular schedule of monthly meetings following adjournment of the 2007 Session of the General Assembly.

MEETINGS OF INTERESTED PARTIES (605 WORKING GROUPS):

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

Underground Storage Tank Working Group
10:00 a.m. Friday 26 January 2007 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, you may contact the Commission Counsel or other Commission staff at (919) 733-2578.

AGENDA
9:30 a.m. Wednesday 17 January 2007
Room 544 Legislative Office Building
Raleigh, North Carolina

1. Call to order
   Representative Pryor A. Gibson, Presiding

2. Introductory remarks by Cochairs *(5 minutes)*
   Representative Pryor A. Gibson
   Senator Charles W. Albertson
   Senator Daniel G. Clodfelter

3. Report to the Commission and explanation of agenda items *(10 minutes)*
   George F. Givens, Commission Counsel

4. Quarterly reports by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress for the period of October 2006 through December 2006 (G.S. 143B-282(b)) *(30 minutes)*
   David H. Moreau, Chairman
   Environmental Management Commission

5. Discussion of issues related to erosion and sedimentation control
   Annual report on the implementation of the Sedimentation Pollution Control Act of 1973 (S.L. 20004-195, Sec. 2.1, G.S. 113A-67) (*5 minutes)*
   Jim D. Simons, State Geologist and Director
   Division of Land Resources, Department of Environment and Natural Resources (DENR)

   Update on the approval of plans for land-disturbing activity along waters that have been classified as trout waters by the EMC (G.S. 113A-57(1)) *(5 minutes)*

Mary Penny Thompson, Assistant General Counsel
Office of the Secretary, DENR

6. Continuation of the discussion of issues related to solid waste management (S.L. 2006-244, Sec.4) (*1 hour and 15 minutes*)

Improving oversight of landfill construction and operation (*15 minutes*)
Robin W. Smith, Assistant Secretary for Environment
DENR

Report on the solid waste management regulations of other states; report on issues related to the processing of solid waste management permits by the Division of Waste Management (*15 minutes*)
Dexter R. Matthews, Director
Division of Waste Management, DENR

Solid waste management industry perspectives (*25 minutes*)
Gregory A. Peverall, Consultant
Solid Waste Management Services on behalf of
Carolinas Chapter of the National Solid Waste Management Association

David M. Barnes, Attorney-at-Law
Poyner & Spruill, LLP on behalf of
National Solid Waste Management Association

Status of recycling and recycling markets in North Carolina *(20 minutes)*
Scott B. Mouw, Chief
Community and Business Assistance Section
Division of Pollution Prevention and Environmental Assistance, DENR

7. Interim Report from the Biofuels Energy Strategic Plan Work Group on the development of the Strategic Plan (S.L. 2006-206, Sec. 3.2) *(15 minutes)*
W. Steven Burke, Senior Vice President for Corporate Affairs
North Carolina Biotechnology Center

8. Annual report on the Wastewater Discharge Elimination Program (S.L. 2001-452, Sec. 2.9) (*10 minutes)*
W. Andy Adams, Chief
On-Site Wastewater Section
Division of Environmental Health, DENR

9. Report on the findings and recommendations of the Governor's Hazardous Materials Task Force *(30 minutes)*
Robin W. Smith, Assistant Secretary for Environment
DENR

10. Commission discussion and announcements

11. Adjourn

SCHEDULE OF FUTURE MEETINGS:

The Commission will meet next on Tuesday 23 January 2007 at 9:30 a.m. in Room 1228 of the Legislative Building in Raleigh.

The Commission may also meet once the General Assembly is in session (G.S. 120-70.44). When the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representatives as provided by G.S. 143-318.12(b) and will be distributed by email, if possible. The Commission will resume a regular schedule of monthly meetings following adjournment of the 2007 Session of the General Assembly.

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

Underground Storage Tank Working Group

10:00a.m. Friday 26 January 2007 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

Persons having questions about the Commission meeting or other matters related to the Commission may contact Commission Counsel or other Commission staff at (919) 733-2578.

MEMORANDUM

To: Members of the Environmental Review Commission
From: Jennifer Mundt, Commission Analyst
Re: Reports to the Commission

The following report has been submitted by the Department of Environment and Natural Resources (DENR) to the Environmental Review Commission since the last reports distribution on 13 December 2006. This report is designated as a read only and is attached to this memorandum:

1. Interim Report on the Costs and Benefits of Reducing Oxides of Nitrogen, Particulate Matter, and other Greenhouse Gases from Motor Vehicles. 15 January 2007. Authority: S.L. 2006-248, Sec. 43.

The following report has been submitted by the Department of Transportation to the Environmental Review Commission since the last reports distribution on 13 December 2006. This report is designated as a read only report and is attached to this memorandum:

1. Annual report on the Evaluation and Adjustment of the Boundaries of the Area Served by Each Metropolitan Planning Organization. 1 November 2006. Statutory Authority: G.S. 136-202(d).

The following report has been submitted by the Environmental Management Commission (EMC) to the Environmental Review Commission and will be distributed in connection with today's ***Agenda Item # 4:***

1. Quarterly report by the EMC as to its operations, activities, programs, and progress during the previous quarter. 15 January 2007. Statutory Authority: G.S. 143B-282(b).

The following report has been submitted by North Carolina's Strategic Plan for Biofuels Leadership to the Environmental Review Commission and will be distributed in connection with today's ***Agenda Item # 7:***

1. Interim Status Report on the Strategic Plan for North Carolina's Biofuels Industry. 15 January 2007. Authority: S.L. 2006-206, Sec. 3.2.

The following reports have been submitted by Department of Environment and Natural Resources (DENR) to the Environmental Review Commission and will be distributed in connection with today's Agenda Items as noted below:

1. Annual Report by DENR on the Implementation of the Sedimentation and Pollution Control Act of 1973. 1 October 2006. Statutory Authority: G.S. 113-67. ***Agenda Item # 5***

2. Annual Report on the Wastewater Discharge Elimination Program. 15 October 2006. Authority: S.L. 2001-452, Sec. 2.9 ***Agenda Item # 8***

3. Report on the Findings and Recommendations of the Governor's Hazardous Waste Task Force. ***Agenda Item # 9***

MEMORANDUM

TO: Senator Dan Clodfelter, Co-Chair
Representative Pryor Gibson, Co-Chair
Senator Charlie Albertson, Co-Chair

FROM: Keith Overcash, Division Director

Re: Submittal of interim report, "Study of Costs and Benefits of Reducing Emissions of Oxides of Nitrogen, Particulate Matter, and Greenhouse Gases from Motor Vehicles"

Session Law 2006-248 Section 43 requires the Division of Air Quality to study the costs and benefits of reducing emissions of oxides of nitrogen, particulate matter, and greenhouse gases from motor vehicles. The attached interim report evaluates the desirability and air quality benefits of adopting motor vehicle emissions standards adopted in other states. If you have specific questions or comments, please contact Mike Abraczinskas at (919) 715-3743.

Study of Costs and Benefits of Reducing Emissions of Oxides of Nitrogen, Particulate Matter, and Greenhouse Gases from Motor Vehicles

Interim Report to the Environmental Review Commission and the Legislative Commission on Global Climate Change

January 15, 2007

The Requirement: Excerpted from SESSION LAW 2006-248, HOUSE BILL 1723

PART XLIII. DIVISION OF AIR QUALITY STUDY OF COSTS AND BENEFITS OF REDUCING EMISSIONS OF OXIDES OF NITROGEN, PARTICULATE MATTER, AND GREENHOUSE GASES FROM MOTOR VEHICLES. (S.B, 1006 – Clodfelter)

SECTION 43. The Division of Air Quality of the Department of Environment and Natural Resources shall study the costs and benefits of reducing emissions of oxides of nitrogen, particulate matter, and greenhouse gases from motor vehicles in this State. In particular, the Division shall evaluate the desirability and air quality benefits of adopting motor vehicle emissions standards adopted in other states. The Division of Air Quality shall submit an interim report on its findings and recommendations, including any legislative proposals, no later than January 15, 2007 and shall submit a final report no later than April 1, 2007 to the Environmental Review Commission and the Legislative Commission on Global Climate Change.

Purpose

The objective of this report is to summarize the estimated emissions benefits of adopting the California Low-Emission Vehicle II (CA LEV-II) standard in North Carolina (NC). The emissions benefits analysis includes an examination of nitrogen oxides (NOx), volatile organic carbons (VOCs), fine particles (PM2.5) and carbon dioxide (CO2). Using air quality modeling sensitivities recently conducted by the North Carolina Division of Air Quality (NCDAQ), potential ozone benefits were also estimated. Additional data was collected and analyzed to better understand the costs associated with implementing a CA LEV-II program in North Carolina.

Background

The United States Environmental Protection Agency (USEPA) has adopted national motor vehicle and fuel standards which include the Tier 2 vehicle and gasoline standard (phase-in began in 2004), and the heavy-duty diesel vehicle and fuel standard (phase-in begins in 2006 with the release of the model year 2007 heavy-duty diesel vehicles and low sulfur diesel fuel).

Beyond the federal standards, North Carolina has expanded its Inspection and Maintenance (I/M) program, which covers 48 of the State's 100 counties, to ensure that vehicle emission controls are properly working.

The federal Clean Air Act (CAA) provides the framework for regulating emissions from on-road mobile sources. The CAA set the first federal vehicle emission standards. However, because California already had vehicle emission standards when this occurred, the CAA authorized California (and only California) to continue setting its own vehicle emission standards. Therefore all new vehicles sold in the United States (U.S.) are subject to emission standards set by either the federal government or the State of California. Other states have the option to adopt the California vehicle emission standards in lieu of the federal standards. This authority was granted under Section 177 of the CAA. Section 177 also guarantees the automakers that they will not have to meet more than two regulatory regimes by explicitly prohibiting any requirements that result in a "third vehicle".

Overview of Federal Tier 2 and California LEV-II Programs

Federal Tier 2 vehicle and gasoline standards and the CA LEV-II program were each effective with model year 2004 vehicles. Both regulations set emission standards for light-duty vehicles such as passenger cars, trucks, and sport utility vehicles. Both programs are phased in over several years and become progressively more stringent providing significant emission reductions from evaporative and exhaust motor vehicle activity. The auto manufacturers have flexibility in how they meet the annual fleet average emissions standards. Tier 2 and CA LEV-II programs have the following differences:

- Federal Tier 2 program requires all light-duty fleet averages to meet the NOx standard of 0.07 grams per mile phased-in between years 2004 and 2009. CA LEV-II fleet average standards are based on non-methane organic gases (NMOG), also referred to as hydrocarbons (HC) or VOCs.
- CA LEV-II program requires a portion of the light-duty fleet to be "zero-emission vehicles" (ZEVs) which originally mandated the electric ZEVs. This requirement has been changed to allow partial credit for vehicles with advanced technologies and fall in the categories of Partial ZEVs (PZEVs) or advance technology partial ZEVs (AT-PZEVs).
- The evaporative requirements of the CA LEV-II standard appear to be more stringent than the Tier 2 standard, however the Tier 2 evaporative standard provides for evaporative system durability which USEPA indicates make the Tier 2 evaporative requirements identical to that of the CA LEV-II requirements. Additionally, in February 2006, the USEPA proposed rules that codify the approach that manufacturers are already taking for 50-state evaporative systems. The proposal requires implementation of the "California equivalent" evaporative emission standards in 2009 for lighter vehicles and 2010 for the heavier vehicles.

On-Road Mobile Source Emissions – NOx and VOC

The NCDAQ conducted a technical modeling analysis study in 2006 to begin to understand the emissions benefits of adopting CA LEV-II in North Carolina. The emissions benefits analysis included a comparison of statewide on-road mobile source NOx and VOC emissions resulting from the current federal level of control (Tier 2), and from the CA LEV-II level of control. It should be noted that the emission differences were calculated in context of the entire on-road mobile source emissions inventory. This method for comparison enabled the NCDAQ to apply the knowledge gathered in emissions/air quality modeling studies to assess the air quality (ozone) benefits that might result from the CA LEV-II emissions benefits. The details of the technical modeling study including the approach, methods and data used in estimating the benefits are described in the attached Technical Support Document "*Analysis of the California Low Emission Vehicle II Standards in NC.*" Also attached is the power point presentation given by Brock M. Nicholson, P.E., Deputy Director of the NCDAQ to the Environmental Review Commission (ERC) on May 3, 2006.

As can be seen in Table 1, the statewide NOx and VOC emissions from adopting a CA LEV-II program are lower relative to the Federal Tier 2 level of control. CA LEV-II was assumed to begin in NC in the year 2010 in this analysis. Emissions were estimated for the years 2010, 2020 and 2030. As CA LEV-II vehicles make up a more significant portion of the overall vehicle fleet with time, the CA LEV-II standards show an increasing emissions benefit (i.e., on a percentage basis) over time relative to the Tier 2 level of control.

Table 1. CA LEV-II Reductions Compared to Federal Tier 2: Entire Fleet

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

Figure 1 below presents the North Carolina statewide on-road mobile source NOx emissions inventory with a Tier 2 control program for years 2004, 2010, 2020, and 2030 (blue line), and also with a CA LEV-II control program for years 2010, 2020, and 2030 (magenta line). Figure 2 is a similar graph for VOC emissions. (It should be noted that the NOx and VOC emission estimates with a Tier 2 control program, assume there are no CA LEV-II compliant vehicles in North Carolina already. While NCDAQ does not have any official data, informal surveys have shown there are North Carolinians already driving CA LEV-II compliant vehicles. Therefore, the emission benefits of the CA LEV-II program shown in Table 1 and Figures 1 and 2 are likely over-estimated.)

Also noteworthy, these figures illustrate the significant reductions in on-road mobile emissions, regardless of the control program, expected over time in North Carolina. These reductions will occur despite significant estimated increases in VMT (see Figure 3).

Figure 1. Estimated NOx Emissions – Federal Tier2 vs. CA LEV-II

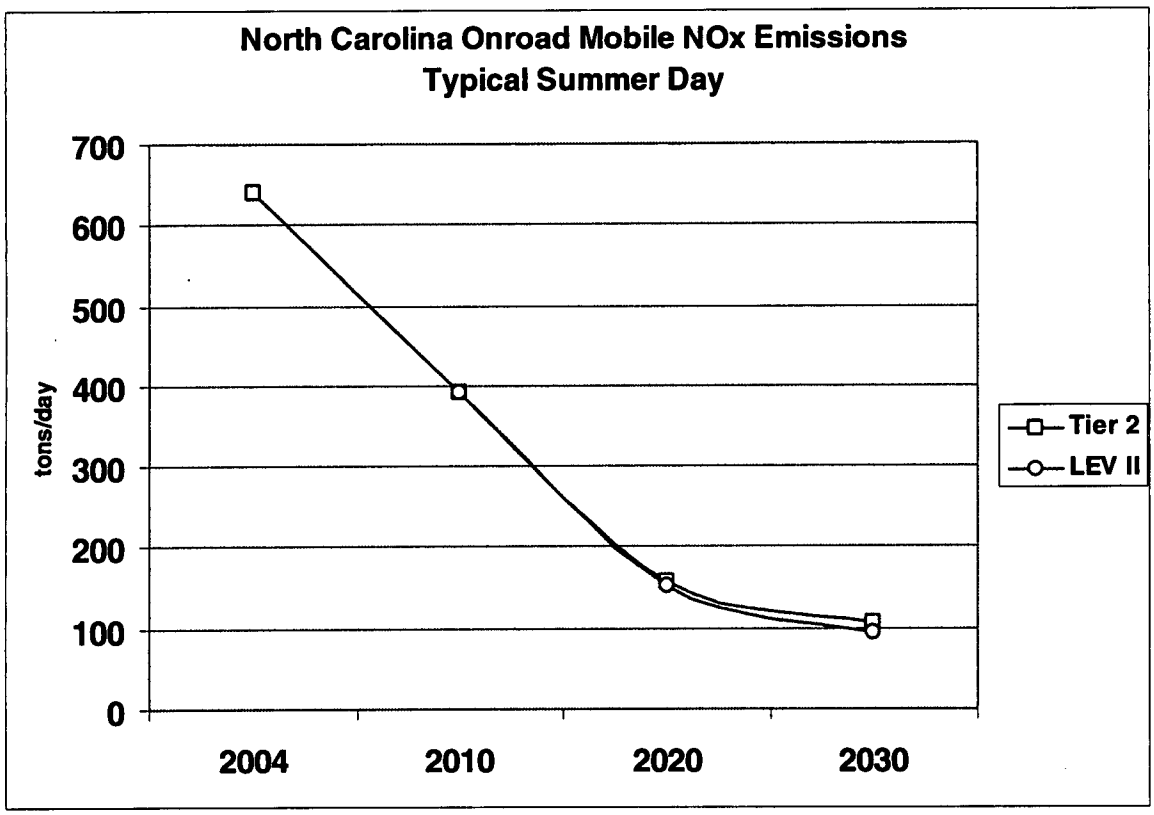

Figure 2. Estimated VOC Emissions – Federal Tier2 vs. CA LEV-II

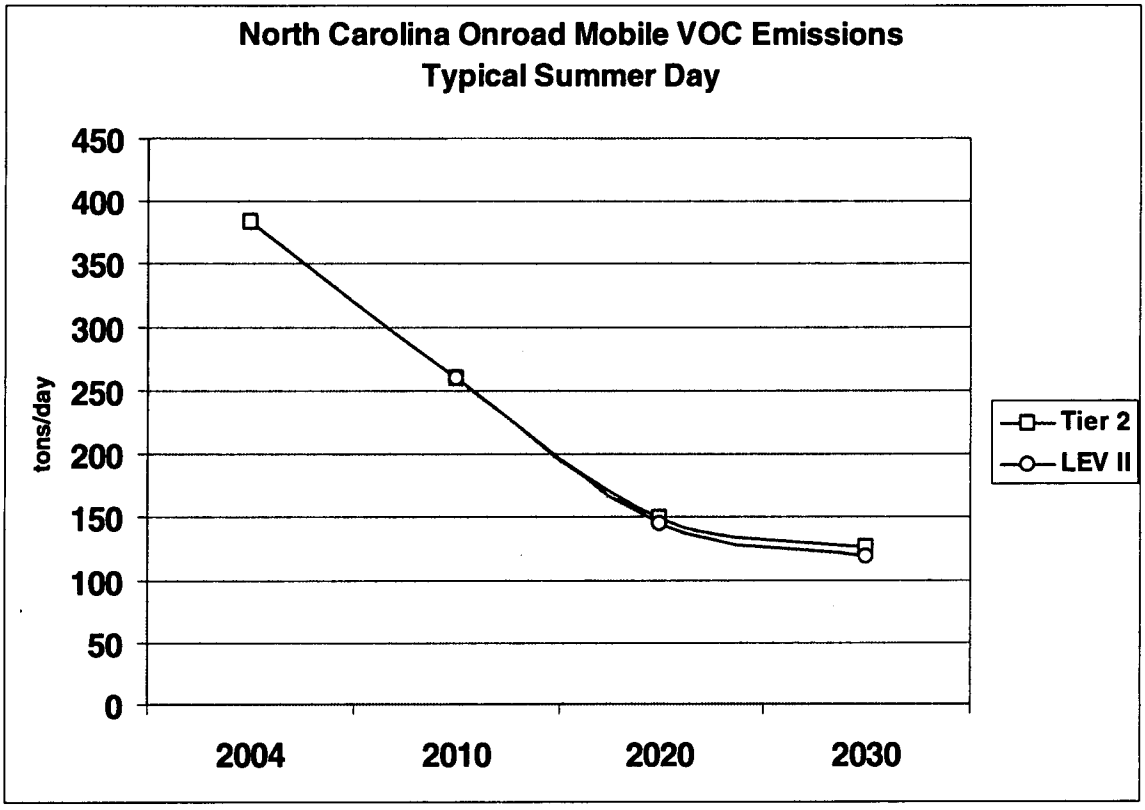

Figure 3. Estimated Vehicle Miles Traveled

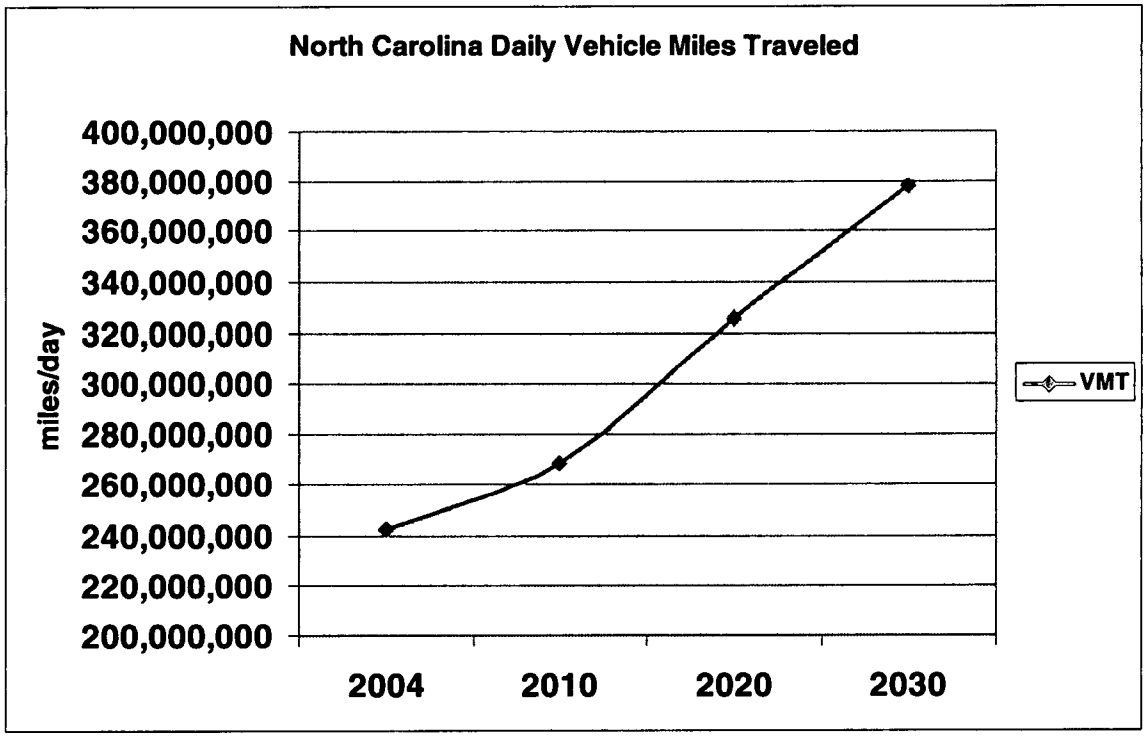

Particulate Matter

Particle pollution (also known as "particulate matter") is a mixture of tiny solids and liquid droplets suspended in air. Airborne particles are the main ingredient in haze, smoke and airborne dust. Particles less than 2.5 micrometers in diameter are called "fine" particles or "PM2.5", and are of special concern because they can penetrate deeply into the lungs.

Potential particulate matter emissions impacts were not specifically evaluated in the NCDAQ modeling study for several reasons. First, based on North Carolina's 2002 PM2.5 emissions inventory, on-road mobile sources only contribute approximately 5% to the total statewide PM2.5 emissions inventory. Secondly, a study of North Carolina's vehicle registration database suggests only 0.3% of the light duty vehicles registered in NC are diesels. This is important because the PM2.5 vehicle standards are for all practical purposes only relevant to diesels, since gas vehicles easily meet the standards. Therefore the most relevant impact of adopting the CA LEV-II program might be on the sales of diesel vehicles themselves. However, major vehicle manufacturers have recently indicated their intention to develop light duty diesel vehicles that meet the CA LEV-II requirements. Overall, the impacts to particulate matter emissions would be negligible if NC adopts the CA LEV-II program.

Greenhouse Gases – Status of Pavely

The Pavley requirements of the CA LEV-II standards are designed specifically to reduce greenhouse gases (GHG) from light duty vehicles. Named after California Assembly woman Fran Pavely, it became California law in 2002, and pending a waiver from USEPA, takes effect in model year 2009. If granted the Pavely waiver from USEPA, all states that have adopted the CA LEV-II standards would automatically be subject to the Pavely component of the standard. If USEPA does not grant the waiver to California, the decision may be challenged in the Federal Court of Appeals in Washington DC.

NCDAQ is aware of several pending court cases involving the CA LEV-II standards and specifically the Pavely requirements in California, Vermont and Rhode Island. The Pavely requirements must survive the lawsuits and get the waiver from USEPA to be "available" to North Carolina. These legal issues are discussed below.

In California, auto industry filed a lawsuit under the California Environmental Quality Act (CEQA) challenging the Pavely requirements directly. The plaintiffs challenges are procedural, although should the plaintiff prevail, the rules could be nullified in California, which could undercut the rules in all other states that have adopted them. Recently, the federal district court judge threw out two of the auto industry's five claims against the Pavely regulations. No decisions have been issued on the other three claims.

In Maine, the Alliance of Automobile Manufacturers filed a lawsuit against the Maine Board of Environmental Protection asking that Maine's rules be stayed. The court rejected the claim on two grounds: First, Maine state law does not allow a court to issue a stay in a challenge to a rulemaking proceeding. Second, even if the court could issue a

stay, the plaintiff had not demonstrated that it would suffer irreparable injury, because: 1) the rules cannot be implemented until a waiver is issued by USEPA and 2) the rules do not go into effect until 2009 anyway. Later, the case was dismissed without prejudice (meaning they can file again within one year) because they filed under the wrong administrative provisions.

In Vermont, the auto industry filed a lawsuit in federal court in November 2005. Since then, the state moved the court to dismiss the case claiming the case was not ripe. On November 30, 2006 the District Court denied the state's motion to dismiss finding that the "purely legal questions raised in this lawsuit are as well determined now as later" despite the uncertainty as to whether a determination will even be necessary given the pending EPA waiver.

Finally, in Rhode Island, the Association of International Automobile Manufacturers filed suit on February 13, 2006 in federal district court asking the court for a declaratory judgment that the Rhode Island regulations violate federal law and a preliminary injunction enjoining Rhode Island from implementing or enforcing the regulation. They also claimed that because California has not obtained a waiver for Pavely, the Clean Air Act expressly prohibits the Rhode Island from adopting and enforcing the regulations. On April 6, 2006 the state filed a motion to dismiss claiming the case was not ripe for judicial review. The Court has not ruled on this motion.

Greenhouse Gases – Potential Emissions Benefits

The GHG emissions addressed by Pavely focus mostly on carbon dioxide (CO_2), but also include methane (CH_4), nitrous oxide (N_2O), and hydrofluorocarbon (HFC) 134a reductions as well. The purpose of the Pavely requirement is to "achieve the maximum feasible and cost effective reduction in GHG emissions from motor vehicles." The standard will require that tailpipe GHG emissions from new vehicles be reduced by 22 percent by the 2012 model year and 30 percent by the 2016 model year.

California and other opt-in states expect that automobile manufacturers will apply technological improvements to meet the Pavley requirements. Specific measures identified include discrete variable valve lift, dual cam phasing, turbo charging with engine downsizing, automated manual transmissions and cam-less valve actuation.

Costs of Vehicles

The initial purchase price of a new vehicle could increase if North Carolina adopts California's vehicle emissions standards. However, these advanced vehicles, especially those meeting the Pavely requirement, are likely to be more fuel efficient, producing savings to the consumer in fuel costs. The anticipated costs have been studied by several organizations including California's Air Resources Board (CARB). These cost ranges are summarized below.

The State of Oregon recently estimated that the CA LEV-II program would increase average vehicle cost $115 to $271. These estimates – based on a CARB Staff report

(http://www.arb.ca.gov/regact/zev2003/isor.pdf) - were based on the incremental costs of ZEVs, PZEVs and AT-PZEVs in 2012.

The average fleetwide incremental costs associated with the Pavley requirement over the 2009 to 2016 phase-in period, as estimated by CARB, are as high as $1,000 per vehicle as shown in Table 2 below. CARB also found this initial increase in purchase price to be more than offset by reduced operating costs. Using the average increase in vehicle prices associated with the fully phased-in regulation (2016), and an assumed fuel price of $1.74 per gallon, CARB calculated that the increased vehicle payment minus the reduction in operating cost would result in a monthly savings of about $3.50 to $7.00. At today's higher fuel prices, the monthly savings increase.

Table 2. Potential Vehicle Cost Increase due to Pavely

Tier	Year	Average cost of control	
		PC/LDT1 (Passenger cars and small trucks/SUVs)	LDT2 (Large trucks/SUVs)
Near-term	2009	$17	$36
	2010	$58	$85
	2011	$230	$176
	2012	$367	$277
Mid-term	2013	$504	$434
	2014	$609	$581
	2015	$836	$804
	2016	$1,064	$1,029

(from: http://www.arb.ca.gov/regact/grnhsgas/fsor.pdf, pg 11)

California's Pavely emissions standards are required by law to achieve maximum feasible and cost effective GHG emissions reductions without reducing vehicle weight or banning the sale of any vehicle category such as sport utility vehicles or light duty trucks. Therefore, the estimated costs represent the cost of applying additional technology to the kinds of vehicles known today to achieve emission reductions.

During California's rulemaking process, the auto industry commented that the Pavely requirement of CA LEV-II standard would not produce an overall savings to consumers. The industry's position was based on a study by Sierra Research, which concluded that the average per-vehicle cost of technology required to comply with Pavely was $3,000 per vehicle. The report also concluded the lifetime gasoline savings would average about 1,000 gallons. CARB's response to these comments was that Sierra's research rejected promising and cost-effective emerging engine technologies as elements of a GHG regulatory compliance strategy. CARB also noted the industry assumed the use of expensive aluminum body structures and assigned higher estimated costs for vehicle components than CARB thought was appropriate. (see http://www.arb.ca.gov/regact/grnhsgas/fsor.pdf, pg 168)

Conclusions

The CA LEV-II program (assuming statewide implementation in 2010) could provide NOx reductions on the order of 0.1% in 2010, 4% in 2020 and 10% in 2030 and VOC reductions of 0.1% in 2010, 3% in 2020 and 6% in 2030 as compared to the Federal Tier 2 program already in place. It should be noted that in 2030, the estimated 10% on-road mobile NOx reduction is equivalent to only 10 tons/day of NOx reduced statewide. This is because of the overall on-road mobile NOx emissions are significantly lower by that time due primarily to the Federal Tier 2 program. NCDAQ has estimated this additional level of NOx reduction, due to CA LEV-II in these future years, will not significantly impact North Carolina's ability to attain the National Ambient Air Quality Standard for 8-hr ozone. The CA LEV-II program would have an insignificant impact on particulate matter emissions from vehicles. Greenhouse gas emissions from light duty vehicles could be reduced by an estimated 22 percent by the 2012 model year and 30 percent by the 2016 model year if Pavely survives several lawsuits and if California is granted a waiver from USEPA.

Costs associated with the CA LEV-II program vary depending on how the program is structured. Increased costs from $115 to $271 per vehicle have been estimated for CA LEV-II vehicles. If Pavely becomes part of the program, cost increases could be as high as an additional $1,000 per vehicle. Additionally, NCDAQ has estimated that moderate staffing implications could result from enforcement of CA LEV-II and from the impact to tasks such as transportation conformity, SIP modeling and emission inventories.

Executive Summary

Introduction

The North Carolina Division of Air Quality (NCDAQ) conducted a technical emissions benefit analysis and air quality sensitivity study to evaluate whether reduced emissions from passenger cars and light-duty trucks by adoption of California Low Emission Vehicle II standards (CA LEV-II) would be realized as compared to the current Federal Tier 2 standards program.

The United States Environmental Protection Agency (USEPA) has adopted national motor vehicle and fuel standards which include the Tier 2 vehicle and gasoline standard (phase-in began in 2004), and the heavy-duty diesel vehicle and fuel standard (phase-in begins in 2006 with the release of the model year 2007 heavy-duty diesel vehicles and low sulfur diesel fuel). Beyond the federal standards, North Carolina has expanded its Inspection and Maintenance (I/M) program, which covers 48 of the State's 100 counties, to ensure that vehicle emission controls are properly working.

The federal Clean Air Act (CAA) provides the framework for regulating emissions from on-road mobile sources. The CAA set the first federal vehicle emission standards. However, because California already had vehicle emission standards when this occurred, the CAA authorized California (and only California) to continue setting its own vehicle emission standards. Therefore all new vehicles sold in the United States (U.S.) are subject to emission standards set by either the federal government or the State of California. Other states have the option to adopt the California standards in lieu of the federal standards. This authority was granted under Section 177 of the CAA. Section 177 also guarantees the automakers that they will not have to meet more than two regulatory regimes by explicitly prohibiting any requirements that result in a "third vehicle".

Overview of Federal Tier 2 and California LEV-II Programs

Federal Tier 2 vehicle and gasoline standards and the CA LEV-II program were each effective with model year 2004 vehicles. Both regulations set emission standards for light-duty vehicles such as passenger cars, trucks, and sport utility vehicles, which are programmed to phase in over several years and become progressively more stringent. Both programs provide significant emission reductions from evaporative and exhaust motor vehicle activity. The auto manufacturers have flexibility in how they meet the annual fleet average emissions standards. Tier 2 and CA LEV-II programs have the following differences:

Federal Tier 2 program requires all light-duty fleet averages to meet the Nitrogen Oxides (NOx) standard of 0.07 grams per mile phased-in between years 2004 and 2009. CA LEV-II fleet average standards are based on non-methane organic gases (NMOG), also referred to as hydrocarbons (HC) or volatile organic carbons (VOCs).
CA LEV-II program requires a portion of the light-duty fleet to be "zero-emission vehicles" (ZEVs) which originally mandated the electric ZEVs. This requirement has been changed to allow partial credit for vehicles with advanced technologies and fall in the categories of Partial ZEVs (PZEVs) or advance technology partial ZEVs (AT-PZEVs).

The evaporative requirements of the CA LEV-II standard appear to be lower than the Tier 2 standard, however the Tier 2 evaporative standard provides for evaporative system durability which USEPA indicates make the Tier 2 evaporative requirements identical to that of the CA LEV-II requirements.

Overview of Mobile Source Emissions

On-road mobile source emissions make up a significant portion of the total statewide NOx emissions. For 2002, this sector comprised approximately 45% of the North Carolina NOx inventory. This analysis looked at both NOx and VOCs emissions for all of North Carolina for a typical summer weekday. The impacts on future year ozone concentrations also were estimated. NOx and VOC emissions are both ozone precursor compounds however NOx controls are of particular importance for addressing higher 8 hour ozone levels in North Carolina due to the abundance of VOC from biogenic (natural) sources.

USEPA's MOBILE6.2 emission factor model was used to generate NOx and VOC emission factors for both regulatory scenarios, adoption of CA LEV-II starting in 2009 and the status quo of the federal Tier 2 program. The most current state and region specific data was applied including speeds, fuel parameters, vehicle age distribution and vehicle mix and ambient temperature. Motor vehicle activity - defined as vehicle miles traveled (VMT) - was matched with emission factors resulting in a typical summer day VOC and NOx emissions inventory. After a baseline mobile inventory was developed assuming purely a federal Tier 2 program in effect starting in 2004, future years mobile inventories for 2010, 2020, and 2030 were compared to this baseline inventory. The year 2004 was chosen because it represents the start year of the federal Tier 2 program. Then, the same future year mobile inventories were developed using CA LEV-II assumptions and compared to the existing Tier 2 results. Table ES-1 below shows the percent NOx and VOC emissions reduction expected if CA LEV-II standards were implemented in 2010.

Table ES-1. CA LEV-II Reductions Compared to Federal Tier 2: On-Road Mobile Emissions

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

Between 2004 and 2030 North Carolina will realize significant reductions in the on-road NOx mobile emissions on the order of 83%. This is primarily due to fleet turnover and the ongoing Federal Tier 2 program. It is noteworthy to mention that the reductions in NOx emissions are occurring even as the daily VMT (dVMT) is expected to increase by 57 %. See Figures ES-1 and ES-2 below for the inverse trend in NOx emissions for the onroad mobile sector emissions and how daily VMT is expected to grow in the future.

Figure ES-1. Estimated NOx Emissions – Federal Tier 2 vs. CA LEV-II

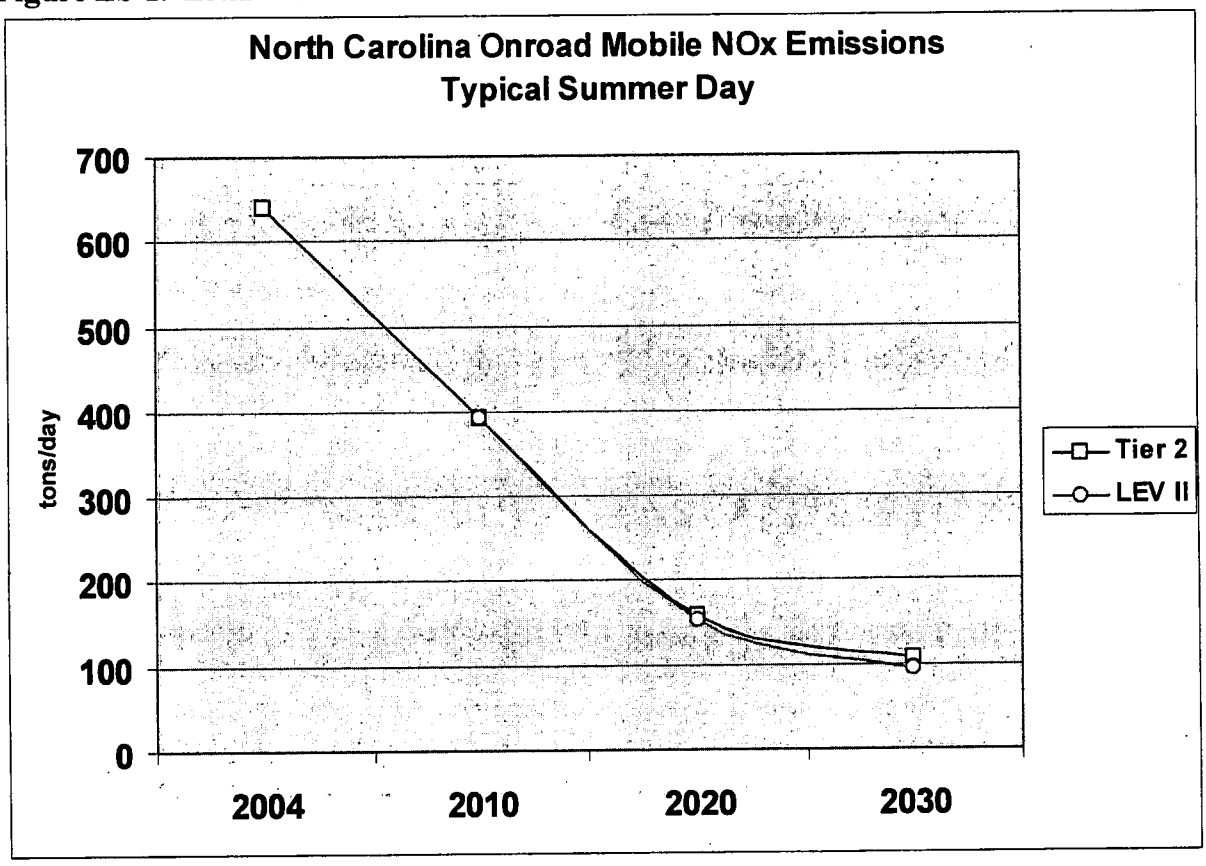

Figure ES-2. Estimated Vehicle Miles Traveled

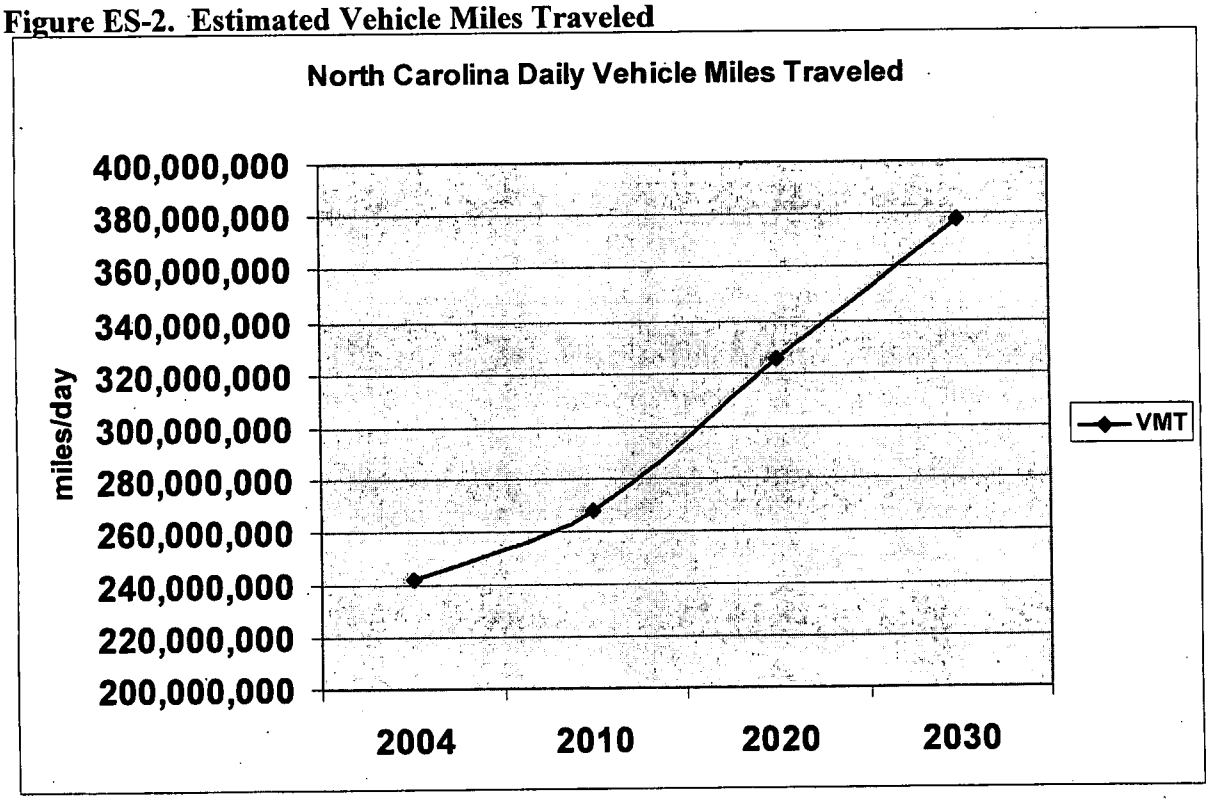

Overview of Air Quality Impacts – Ozone Sensitivity

During the development of the 8-hour ozone State Implementation Plans (SIP) for North Carolina's nonattainment areas, the NCDAQ conducted several air quality modeling sensitivities to evaluate potential NOx control strategies to help reduce future year ozone concentrations. The emissions sensitivity used in this analysis reduced on-road mobile source NOx emissions in the Metrolina (Greater Charlotte area) 8-hour ozone nonattainment area by 10% from year 2009 emission levels. The Metrolina region was chosen because they currently show the highest ozone concentrations in North Carolina.

Results of the air quality model simulations indicated that a 10% NOx reduction in 2009 for on-road mobile source emissions was equivalent to a 10 ton/day reduction in the Metrolina region. The 10 ton/day on-road NOx reduction was then compared back to the "baseline" year 2009 emissions that included only the current federal Tier 2 level of control. Therefore these results would suggest that an additional 10% NOx reduction would basically lower the 8-hour ozone concentrations anywhere between 0.1 and 1.0 parts per billion (ppb) in year 2009.

DAQ next assessed the ozone benefits in future year 2020 with the CA LEV-II program implementation in year of 2010. The year 2020 would afford a significant fleet turnover for CA LEV-II vehicles with NOx emissions reduction on the order of 4%. A 4% NOx reduction equates to 1 ton/day in 2020 and lower 8 hour ozone levels by 0.1 ppb in the Metrolina region.

Summary of Air Quality Impacts

For the Metrolina Area...

- 2009 on-road mobile NOx ~ 100 tons/day (w/ Tier 2)
- 2020 on-road mobile NOx ~ 25 tons/day (w/Tier 2)

If a 10% NOx reduction = 10 tons/day in 2009 = 1 ppb maximum ozone benefit

Then a 4% NOx reduction = 1 ton/day in 2020 = 0.1 ppb maximum ozone benefit

DAQ concluded the 4% on-road mobile NOx reduction in year 2020 due to a CA LEV-II program would have a very limited impact on maximum 8-hour ozone.

Overview of CA LEV-II Fleet Analysis and Enforcement

Any state adopting the CA LEV-II regulation is not required to enforce measures associated with tracking vehicle sales or registration data (each auto manufacturers must comply with the fleet average NMOG emissions values). As a qualitative measure, DAQ compared several fleet demographic parameters of California versus North Carolina's fleets to estimate whether "fleet average" enforcement is critical to the program. When looking at the applicable vehicles in each state based on gross vehicle weights (GVW), North Carolina has 11% more passenger cars, 7%

fewer light-duty trucks (under 6,001 lbs.) and 6% fewer light-duty trucks (6,001-8,500 lbs.) than in California.

The second fleet demographic is vehicle age distribution expressed as a percent based on the number of vehicle within a vehicle class and model year. North Carolina has a slightly lower percentage of 1 and 2 year old passenger cars than California and equal percentages of 3-year-old passenger cars. North Carolina has a greater percentage of 4 through 12 year old passenger cars and fewer 13 to 25 year olds. Generally fleets weighted towards newer vehicles will more quickly benefit from a control program due to the acceleration toward a newer fleet.

Finally, a comparison of the fraction of VMT driven by each vehicle class in 2010 was analyzed based on USEPA guidance. California light-duty gasoline car and truck owners are projected to drive their vehicles slightly more than North Carolinians in year 2010.

Overview of Qualitative Assessment of Enforcement Options

If one generally assumes passenger vehicles are cleaner emitting vehicles than light-duty trucks, and newer vehicles generally emit less than older vehicles, then one can qualitatively assert that the light-duty gasoline vehicle fleet registered in North Carolina is cleaner than California's registered light-duty gasoline vehicle fleet. This data (i.e., especially the greater percentage of passenger cars) may be an indicator that a fleet average requirement will not be difficult to meet in North Carolina and thus a "simple certification" enforcement program might result in similar benefits, while requiring fewer state resources.

Overview of Staffing and Enforcement Resources

NCDAQ contacted several state air quality agencies including Washington State Department of Ecology, Air Quality Program to better understand staffing needs associated with implementing and enforcing a CA LEV-II program. Washington indicated both New York and Massachusetts have staffs at 2 to 3 people (not full time) on CA LEV-II tasks.

The primary point of enforcement/compliance would likely be the State's Division of Motor Vehicles (DMV) with the air quality agency staff conducting audits, monitoring program effectiveness, handling public outreach, registration, and vehicle availability issues.

Another possible resource concern considered by NCDAQ is the impact to existing tasks such as transportation conformity, SIP modeling and emission inventories. Due to more complicated mobile source emission estimation techniques involved with a CA LEV-II program, there is some concern that timelines on these core tasks could be lengthened.

Conclusions

The CA LEV-II program (assuming statewide implementation in 2010) could provide NOx reductions on the order of 0.1% in 2010, 4% in 2020 and 10% in 2030 and VOC reductions of 0.1% in 2010, 3% in 2020 and 6% in 2030 as compared to the Federal Tier 2 program already in place. It should be noted that in 2030, the estimated 10% on-road mobile NOx reduction is

equivalent to only 10 tons/day of NOx reduced statewide. This is because of the overall on-road mobile NOx emissions are significantly lower by that time. NCDAQ has estimated this level of NOx reduction in these future years will impact North Carolina's ability to attain the National Ambient Air Quality Standard for 8-hr ozone insignificantly. Additionally, moderate staffing implications could result from enforcement of CA LEV-II and from the impact to tasks such as transportation conformity, SIP modeling and emission inventories.

1. Description of Project

1.1 Purpose

The objective of this project was to estimate the emissions benefits of adopting California Low-Emission Vehicle II (CA LEV-II) standards in North Carolina (NC), as compared to the Federal Tier 2 standards already in effect. Using air quality modeling sensitivities recently conducted by the North Carolina Division of Air Quality (NCDAQ), potential ozone benefits were also estimated. Additional data was collected and analyzed to better understand the impact of implementing a fleet averaging enforcement option.

1.2 Background

On-road mobile source emissions make up a significant portion of the total statewide Nitrogen Oxides (NOx) emissions. For example, in year 2002, the NCDAQ estimated that 45% of North Carolina's NOx emissions came from on-road mobile sources. NOx and volatile organic compounds (VOC) are critical ozone precursors. Because of the generally warm and moist climate of North Carolina, vegetation abounds in many forms, and forests naturally cover much of the state. This "biogenic" sector is the most abundant source of VOCs in North Carolina and accounts for approximately 90% of the total VOCs statewide. The overwhelming abundance of biogenic VOCs makes the majority of North Carolina a NO_x limited environment for the formation of ozone. Therefore, reductions of only NOx emissions are targeted in North Carolina when aiming to reduce ozone.

Federal, State and local control programs have been implemented to help control NOx emissions from on-road mobile sources. At the state level, North Carolina has expanded its Inspection and Maintenance (I/M) program. The program now covers 48 of the State's 100 counties to ensure that vehicle emission controls are properly working.

At the federal level, the United States Environmental Protection Agency (USEPA) has adopted national motor vehicle and fuel standards. The most recent standards adopted by USEPA include the Tier 2 vehicle and gasoline standard (phase-in began in 2004)[1], and the heavy-duty diesel vehicle and fuel standard (phase-in begins in 2006 with the release of the model year 2007 heavy-duty diesel vehicles and low sulfur diesel fuel)[2].

The federal Clean Air Act (CAA) provides the framework for regulating emissions from on-road mobile sources. The CAA set the first federal vehicle emission standards. However, because California already had vehicle emission standards when this occurred, the CAA authorized California (and only California) to continue setting its own vehicle emission standards. Therefore all new vehicles sold in the United States (U.S.) are subject to emission standards set by either the federal government or the State of California. Other states have the option to adopt the California standards in lieu of the federal standards. This authority was granted under Section 177 of the CAA. Section 177 also guarantees the automakers that they will not have to meet more than two regulatory regimes by explicitly prohibiting any requirements that result in a "third vehicle".

1.3 Description of the Federal Tier 2 and California LEV-II Programs

USEPA's Tier 2 vehicle and gasoline standards, adopted in December 1999, took effect beginning with model year 2004 vehicles. Meanwhile, around the same time, the California Air Resources Board (CARB) amended their Low-Emission Vehicle (LEV) regulations to a more stringent program known as the California Low-Emission Vehicle Standard (CA LEV-II)[3]. Like Tier 2, CA LEV-II took effect beginning with model year 2004 vehicles. Both the Tier 2 and CA LEV-II regulations set emission standards for light-duty vehicles such as passenger cars, trucks, and sport utility vehicles. Both the Tier 2 and CA LEV-II standards become progressively more stringent with time and both classify vehicle types into several different groupings, setting emission standards for each grouping.

Significant emission reductions are realized from both the Tier 2 and CA LEV-II programs. The emissions are reduced through exhaust and evaporative emission standards and annual fleet average emission standards. Ultimately, auto manufacturers are given the flexibility to produce vehicles that emit both more and less than the fleet average, as long as the mathematical average is within the fleet limit.

There are several important differences between the Tier 2 and CA LEV-II programs. The federal Tier 2 program requires a total light-duty fleet NOx standard of 0.07 grams per mile, which is phased-in between years 2004 and 2009. In contrast, the CA LEV-II fleet average standards are based on non-methane organic gases (NMOG), also generally referred to as hydrocarbons (HC) or VOCs. A summary of the CA LEV-II exhaust emission standards can be found in Table 1.3-1.

Another important feature of the CA LEV-II program that differs from the Tier 2 program is the advanced technology vehicle component. This component requires a portion of the light-duty fleet to be "zero-emission vehicles" (ZEVs). Originally designed to mandate the introduction of electric ZEVs, California's ZEV requirement has been changed to allow credit for a variety of advanced automobile technologies. Partial ZEVs (PZEVs) and advance technology partial ZEVs (AT-PZEVs) meet the ZEV zero emissions evaporative standards, the individual vehicle exhaust standards, and the extended warranty and durability requirements. The ZEV component of the CA LEV-II program is discussed further in Section 2.3.3.

Finally, the evaporative requirements of the CA LEV-II standard appear to be lower than the Tier 2 standard. However, the test procedures used to determine compliance with the Tier 2 evaporative requirement has a provision requiring that evaporative system durability be demonstrated on fuels containing the maximum allowable alcohol levels, because the permeability of system components is increased with these fuels. Manufacturers are thus held to a tighter standard of durability under Tier 2, and they have indicated to USEPA that the emission control hardware required to meet the Tier 2 evaporative requirements is identical to that needed to meet the CA LEV-II requirements. NCDAQ assumed the evaporative requirements of the Tier 2 and CA LEV-II standards to be the same in this analysis.

1.4 Emission Factors

Emission factors used in this study were generated using USEPA's MOBILE6.2 model[4]. MOBILE6.2 was designed by USEPA to address a wide variety of air pollution modeling needs. The model calculates emission factors under various conditions effecting in-use emission levels (e.g., ambient temperatures, average traffic speeds) as specified by the modeler. MOBILE models have been used by USEPA to evaluate highway mobile source control strategies; by states, local and regional planning agencies to develop emission inventories and control strategies for State Implementation Plans (SIPs) under the CAA; by metropolitan planning organizations and state transportation departments for transportation planning and conformity analysis; by academic and industry investigators conducting research; and in developing environmental impact statements. Special input files and guidance were used in MOBILE6.2 to model the CA LEV-II standards. This is described in greater detail in Section 2.

Table 1.3-1 CA LEV-II Emissions Standards[3]

LEV II Exhaust Mass Emission Standards for New 2004 and Subsequent Model LEVs, ULEVs, and SULEVs in the Passenger Car, Light-Duty Truck and Medium-Duty Vehicle Classes							
Vehicle Type	*Durability Vehicle Basis (mi)*	*Vehicle Emission Category*	*NMOG (g/mi)*	*Carbon Monoxide (g/mi)*	*Oxides of Nitrogen (g/mi)*	*Formaldehyde (mg/mi)*	*Particulates (g/mi)*

		ULEV	0.167	7.3	0.4	21	0.06
		SULEV	0.117	3.7	0.2	10	0.06

1.5 Evaluation Years

In order to evaluate the emissions benefits of adopting a CA LEV-II program over time, several years were evaluated. Baseline emissions were estimated for years 2004, 2010, 2020, and 2030 for the Tier 2 program. Emissions were estimated for years 2010, 2020, and 2030 for the CA LEV-II program. The year 2004 was picked because it represents the start year of the Tier 2 program. The year 2010 was chosen because it is assumed in this analysis to be the earliest possible start date of a CA LEV-II program in NC. The basis for determining the earliest possible start date is a requirement that manufacturers be given a two year "lead-time." This means states cannot enforce such standards until model years beginning two years after the date of adoption. "Model year" actually begins on January 2nd, of the previous calendar year. In other words, in order for a state to adopt CA LEV-II for model year 2010, the state must adopt those standards two years before January 2, 2009 (i.e., prior to January 2, 2007).

Years 2020 and 2030 were picked based on the availability of local mobile model input data, such as future projected speeds and vehicle miles traveled (VMT).

1.6 Pollutants Addressed and Spatial/Temporal Resolution

On-road mobile emissions of NOx and VOCs were estimated for the entire state of North Carolina for a typical summer weekday. The impacts on future year ozone concentrations also were estimated. This is discussed further in Section 4 and 5.

2. Approximation of CA LEV-II Standard Using MOBILE6.2

2.1 General Approach

All vehicles manufactured in the U.S. are subject to either the Federal Tier 2 or the CA LEV-II standard and as discussed earlier, states other than California have the option to adopt the CA LEV-II program in lieu of the federal standards. However, states other than California do not have the option to use the California mobile emissions model, EMFAC[5]. In order to estimate the emissions benefits of adopting CA LEV-II standards in North Carolina, the only mobile emissions modeling tool available is USEPA's MOBILE6.2. The emissions standard default for light-duty vehicles in MOBILE6.2 is the Tier 2 standard. The upcoming sections detail the approximation of the CA LEV-II program in USEPA's MOBILE6.2 model and the methodology used by NCDAQ to estimate the emissions benefits of adopting a CA LEV-II program in North Carolina.

2.2 Vehicles Subject to the CA LEV-II Standard

The CA LEV-II standard is applicable to light-duty vehicles (i.e., passenger cars), light-duty trucks up to 8,500 lbs gross vehicle weight rating (GVW), and medium-duty vehicles that are up to 14,000 lbs GVW. Because terminology about truck weight classes can be very confusing, the best way to refer to vehicle classifications is by their actual weight. In this emission analysis, NCDAQ applied CA LEV-II to only passenger cars and light-duty trucks up to 8,500 lbs GVW. The population of medium-duty trucks between 8,500 lbs and 14,000 lbs in North Carolina is very small; therefore, the impact of adopting CA LEV-II for that

vehicle class would be minimal. Light-duty vehicle classes that NCDAQ applied the CA LEV-II program, in the emissions analysis defined by USEPA, are:

LDGV - light-duty gasoline vehicles (passenger cars)
LDGT1 – trucks up to 6,000 lbs GVW + 3,750 LVW
LDGT2 – trucks up to 6,000 lbs GVW + 3,751 LVW-5,750 LVW
LDGT3 – trucks between 6,001 lbs-8,500 lbs GVW + 3,751 LVW-5,750 LVW
LDGT4 – trucks between 6,001 lbs-8,500 lbs GVW + > 5,750 LVW

where GVW = maximum fully loaded vehicle weight,
LVW = nominal empty vehicle weight + 300 lbs.

2.3 Methodology: Modeling CA LEV-II using MOBILE6.2

As stated earlier, the default emission standards in MOBILE6.2 is the Federal Tier 2 standard. In order to simulate the CA LEV-II standard, NCDAQ consulted with USEPA Region IV, the USEPA Office of Transportation, and Air Quality (OTAQ). USEPA OTAQ provided much appreciated technical support during the design phases of this project, including a revised guidance document[6] that outlines the auxiliary files necessary to approximate the CA LEV-II program in MOBILE6.2. These auxiliary files were developed by OTAQ in consultation with CARB. The additional files are:

LEVIIPH.d – phase-in percentages by exhaust certification bin, vehicle class and pollutant. NCDAQ used this file as provided by USEPA OTAQ.

LEVIIEVP.d – phase-in percentages for evaporative standards by vehicle class. NCDAQ used this file as provided by USEPA OTAQ.

LEVIIST.d – the 50,000 mile standard levels by exhaust certification bin, vehicle class and pollutant. NCDAQ used this file as provided by USEPA OTAQ.

LEVII94.d – establishes the percentage of zero emitting exhaust vehicles. NCDAQ used this file as provided by USEPA OTAQ.

In conjunction with the above auxiliary files, analysis of the CA LEV-II program in MOBILE6.2 must be performed using these four commands:

T2 EXH PHASE-IN, which provides phase-in percentages by exhaust certification bin, vehicle class, and pollutant (corresponds with the LEVIIPH.d input file).

T2 CERT, which defines the 50,000 mile standard levels by exhaust certification bin, vehicle class, and pollutant (corresponds with the LEVIIST.d input file).

T2 EVAP PHASE-IN, which provides phase-in percentages for evaporative standards by vehicle class (corresponds with the LEVIIEVP.D input file).

94+ LDG IMP, which is used only to establish the fraction of ZEVs (corresponds with the LEVII94.D).

One complicating issue associated with modeling the CA LEV-II program in MOBILE6.2 is the inability to alter the start year. Working around this model limitation requires a significant post-process of the model output to "reconstruct" composite emission factors.

Implementing the post-processing technique required NCDAQ to apply the DATABASE OUTPUT commands in MOBILE6.2. This allows the user to obtain the most disaggregated output from the model. Emission factors per emission type (e.g. running exhaust, starting exhaust and evaporative), per facility type (e.g. freeway, arterial, local, ramp, none), per model year, and per pollutant were generated. This reconstruction technique was developed and successfully tested for a "Tier 2 only" approach where the post-processed emission factor matched the composite emission factor from MOBILE6.2 descriptive output.

Generally, in order to model the impacts of implementing a CA LEV-II program in year 2010 as accurately as possible, emission factors were generated for model year vehicles prior to year 2009 with Tier 2 level of control applied (noting the Tier 2 level of control would only apply to model years 2004-2009 vehicles). Those were combined with the emission factors for model year 2010 vehicles with CA LEV-II level of control applied. This method was applied to generate a composite year 2010 emission factor for each of the light-duty vehicle classes. Please see Appendix A for a detailed representation of the emission factor reconstruction post-process methodology applied by NCDAQ.

The reconstructed composite emission factors for each of the light-duty vehicle classes were combined with the emission factors from the vehicle classes not impacted by a CA LEV-II program and the VMT fraction to get the final composite NOx and VOC emission factors for each facility or roadway scenario. This data is shown in Appendix B. Comparable sets of tables with the Tier 2 emission factors are provided in Appendix C.

NCDAQ took advantage of several opportunities to implement "efficiencies" into the complex post-processing effort. One of those was modeling the State of North Carolina in four sections: Raleigh-Durham, Charlotte-Gastonia, other areas with an I/M program, and other areas without an I/M program. This was done to simply reduce the number of model input and output files to process while still taking advantage of local data sets, such as vehicle age distributions and VMT fractions in the Raleigh-Durham and Charlotte-Gastonia areas. An additional efficiency implemented was the use of weight-average speeds to limit the facilities or road types that needed to be modeled. Rural interstates, urban interstates, and other roads were the three facilities modeled. VMT was aggregated into similar groupings. This is explained further in Section 2.3.1.6.

The MOBILE6.2 input parameters used in this study represent North Carolina's "latest planning assumptions" and are the most up-to-date data available (as of March 2006) from the North Carolina Department of Transportation (NCDOT) and the NCDAQ. This North Carolina specific data was used for the following MOBILE6.2 input parameters: speeds,

VMT fractions, Reid vapor pressure, vehicle age distribution, temperatures, inspection, and maintenance program. These input parameters and others, are discussed below.

2.3.1 MOBILE6.2 Input Parameters

2.3.1.1 Evaluation Month

MOBILE6.2 can calculate emission factors that represent a January 1st or July 1st fleet age. Emissions for this project were calculated with the July 1st setting.

2.3.1.2 Vehicle Age Distribution

The vehicle age distribution comes from annual registration data for North Carolina from the NCDOT. For this analysis the data was generated from 2004. The NCDOT provided the latest available count data based on the number of vehicle types per year from 1974 through 2004. Vehicles greater than 25 years old were combined and included as the 25th model year. NCDAQ converted the data provided by the NCDOT into the MOBILE6.2 model format using a conversion utility. The count data provided by the NCDOT was converted to fractions by dividing each count per vehicle type per year by the total number of vehicles in that classification for all years. For example, the number of 2004 light-duty vehicles was divided by the total number of light-duty vehicles for all years. Comparisons of North Carolina and California vehicle age distributions are provided in Section 5.2.

2.3.1.3 Vehicle Miles Traveled Fractions

The vehicle miles traveled fractions (i.e., VMT fraction or VMT mix) refer to the percentage of different vehicle types on each of the Federal Highway Administration road types. It is critical when estimating mobile emissions in an area, to use data that accurately reflects vehicle types traveling on each different road types. The North Carolina Highway Performance Monitoring System (HPMS) information that was used to generate the statewide VMT fractions was based on years 1999 through 2001 length based counts. This is the latest North Carolina statewide count information available. The raw count information was processed consistent with USEPA methods and guidance[7] for each year in the analysis. Comparisons of the North Carolina and California VMT fractions are provided in Section 5.3

2.3.1.4 Temperatures

For this analysis, an average July 2005 minimum and maximum temperature was calculated from data at five Automated Surface Observing System (ASOS) sites as shown in Table 2.3-1 below. The overall average minimum and maximum temperatures were used in all MOBILE6.2 input files.

Table 2.3-1 July 2005 Average Minimum and Maximum Temperatures[8]

	Average Maximum	Average Minimum
Asheville	83.2	65.5
Charlotte	89.0	70.1
Greensboro	88.2	71.5
Raleigh	92.9	71.6
Wilmington	90.1	74.5
Overall Average	**88.7**	**70.6**

2.3.1.5 Vehicle Inspection and Maintenance (I/M) Program

As discussed earlier, North Carolina has implemented a vehicle emissions inspection program, onboard diagnostics (OBDII) in 48 counties. This program covers all light-duty gasoline powered vehicles that are model year 1996 and newer. The program was phased-in to include a total of 48 counties between July 2002 and January 2006. Therefore, the years 2010, 2020, and 2030, MOBILE6.2 model runs in this analysis; incorporate all of the appropriate I/M program parameters in the 48 counties. The OBDII compliance rate used in the MOBILE6.2 input files is 95 percent. In addition to applying the appropriate I/M commands in MOBILE6.2, NCDAQ applied anti-tampering commands. This statewide program ensures that emission control equipment on any vehicle model year of 1968 and newer has not been altered.

2.3.1.6 Speed Assumptions

Emissions from motor vehicles vary with the manner in which the vehicle is operated. Vehicles traveling at 65 miles per hour (mph) emit a very different mix of pollutants than the car traveling at low speeds. Average daily annual speeds were used in this analysis for each road type. The speeds were obtained from NCDOT. The speeds for the areas other than Raleigh-Durham and Charlotte-Gastonia areas are assumed to be the Wake County off-peak speeds. This assumption is consistent with what has been recommended by NCDOT in past efforts to develop statewide mobile source emission inventories.

In the Raleigh-Durham and Charlotte-Gastonia areas, for the years 2010, 2020, and 2030 average speeds were calculated for urban and rural interstates. The speeds used in the averaging are based upon the latest available information from local travel demand models. The "other roads" speeds for the entire state represent a VMT weighted average of the non-interstate speeds from the Wake County off-peak data sets for the years 2010, 2020, and 2030. Tables 2.3-2 through 2.3-4 provide a summary of the speeds used in this analysis.

Table 2.3-2 2010 Speeds

	Rural Interstate	Urban Interstate	Other Roads
Charlotte-Gastonia	53	51	46
Raleigh-Durham	53	51	46
Other Areas	66	61	46

Table 2.3-3 2020 Speeds

	Rural Interstate	Urban Interstate	Other Roads
Charlotte-Gastonia	53	51	45
Raleigh-Durham	53	51	45
Other Areas	62	62	45

Table 2.3-4 2030 Speeds

	Rural Interstate	Urban Interstate	Other Roads
Charlotte-Gastonia	49	48	44
Raleigh-Durham	49	48	44
Other Areas	61	61	44

2.3.1.7 Reid Vapor Pressure (RVP)

Reid Vapor Pressure reflects a gasoline's volatility. Lower RVP leads to lower VOC emissions from gasoline handling and lowers vapor losses from motor vehicles. North Carolina rules require lower RVP gasoline in the most urbanized areas of the state during the summer. Therefore, an RVP of 7.8 pounds per square inch (psi) was applied in this analysis for the Raleigh-Durham and Charlotte-Gastonia areas. Due to the input file grouping explained earlier in Section 2.3, an RVP of 9.0 was applied for the "other areas."

2.3.2 Vehicle Miles Traveled

In order to calculate emissions from on-road mobile sources, emission factors were developed as discussed throughout this document. The emission factors were then multiplied by an activity level, which is average weekday vehicle miles traveled (VMT). The VMT used in this analysis was derived from the latest county-by-county HPMS data available from NCDOT. The future years were projected using a growth rate from a linear regression completed on the last 10 years of HPMS data. The same VMT was used in the generation of emissions for the Tier 2 program as the CA LEV-II program. The county specific VMT used in this analysis is provided in Appendix D for years 2010, 2020, and 2030.

2.3.3 CA LEV-II Phase-in Schedule

As mentioned earlier in Section 2.3, USEPA OTAQ provided MOBILE6.2 auxiliary files necessary to approximate the phase-in CA LEV-II program. This file represents California's

assumptions on how manufacturers would meet the fleet average standards. This is the latest available CA LEV-II phase-in schedule in MOBILE6.2 format from USEPA OTAQ.

2.3.4 Zero Emissions Vehicle (ZEV) component

The CA LEV-II standards include a zero-emission vehicle (ZEV) component. This is considered an "option" for states wishing to "opt-in" to the CA LEV-II standards. Originally designed to mandate the introduction of electric ZEVs, California's ZEV program has been changed to allow credit for a variety of advanced automobile technologies besides electric vehicles. Partial ZEVs (PZEVs) and advance technology partial ZEVs (AT-PZEVs) meet the ZEV zero emissions evaporative standards, the individual vehicle exhaust standards, and the extended warranty and durability requirements.

Generally, California's basic ZEV rule requires that a manufacturer's annual sales of light-duty vehicles must consist of a percentage of ZEVs. This requirement first applied only as a percentage of passenger cars and LDT1 trucks. This is referred to as the ZEV baseline. The ZEV baseline was applied by NCDAQ in this analysis using USEPA's latest available MOBILE6.2 ready (levii94.d) auxiliary file.

CARB recognized the ZEV requirement would be difficult to meet and established a review by a technical panel every two years. The ZEV baseline has since been expanded to include LDT2 trucks to be phased in on a later schedule. Due to the fact that ZEV technology has not developed as quickly as California had hoped, they have added flexible ways to meet the requirement. Those flexibilities are discussed elsewhere[3].

3. Results: Emissions Benefits

3.1 NOx and VOC Benefits

To begin to understand the emissions benefits of adopting CA LEV-II in North Carolina, the NCDAQ applied the approach, methods and data summarized in previous sections. The emissions benefits analysis included a comparison of statewide on-road mobile source NOx and VOC emissions resulting from the current federal level of control (Tier 2), and from the CA LEV-II level of control. It should be noted that the emission differences were calculated in context of the entire on-road mobile source emissions inventory. This method for comparison enabled the NCDAQ to apply the knowledge gathered in emissions/air quality modeling studies to assess the air quality (ozone) benefits that might result from the CA LEV-II emissions benefits. The air quality benefits analysis is presented in Section 4.

As can be seen in Table 3.1-1, the statewide NOx and VOC emissions from adopting a CA LEV-II program are lower relative to the Federal Tier 2 level of control. As discussed previously, the earliest CA LEV-II can begin is in the year 2010. Since it will take time for the CA LEV-II vehicles to become a significant portion of the overall vehicle fleet, the CA LEV-II standards show an increasing emissions benefit (i.e., on a percentage basis) over time relative to the Tier 2 level of control.

Table 3.1-1. CA LEV-II Reductions Compared to Federal Tier 2: Entire Fleet

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

Figure 3.1-1 below presents the North Carolina statewide on-road mobile source NOx emissions inventory with a Tier 2 control program for years 2004, 2010, 2020, and 2030 (blue line), and also with a CA LEV-II control program for years 2010, 2020, and 2030 (magenta line). Figure 3.1-2 is a similar graph for VOC emissions. (It should be noted that the NOx and VOC emission estimates with a Tier 2 control program, assume there are no CA LEV-II compliant vehicles in North Carolina already. While NCDAQ does not have any official data, informal surveys have shown there are North Carolinians already driving CA LEV-II compliant vehicles. Therefore, the emission benefits of the CA LEV-II program shown in Table 3.1.1 and Figures 3.1-1 and 3.1-2 are likely over-estimated.)

Also noteworthy, these figures illustrate the tremendous reductions in on-road mobile emissions, regardless of the control program, expected over time in North Carolina. These reductions will occur despite significant estimated increases in VMT (see Figure 3.1-3).

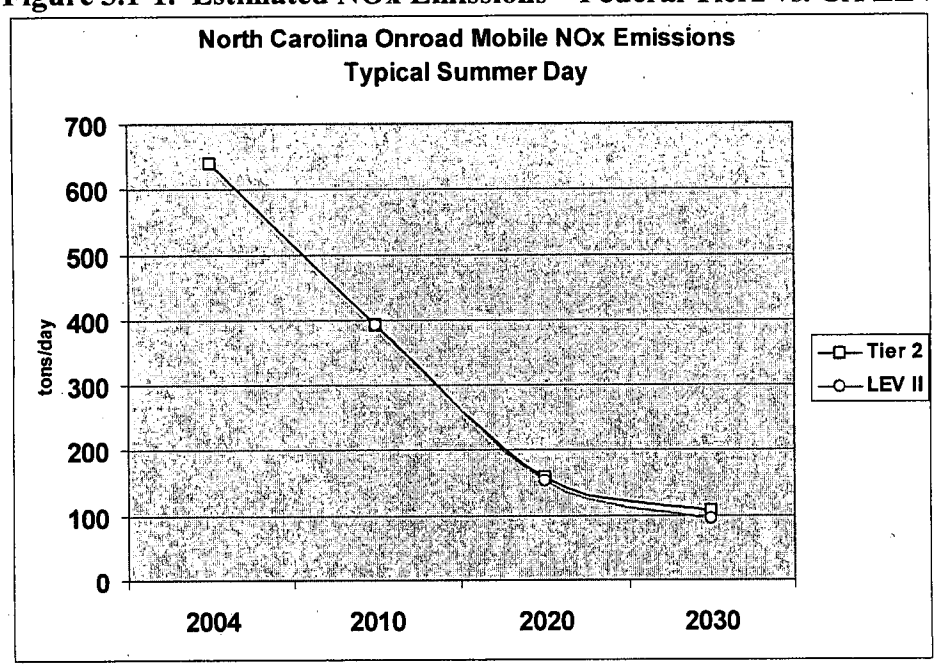

Figure 3.1-2. Estimated VOC Emissions – Federal Tier2 vs. CA LEV-II

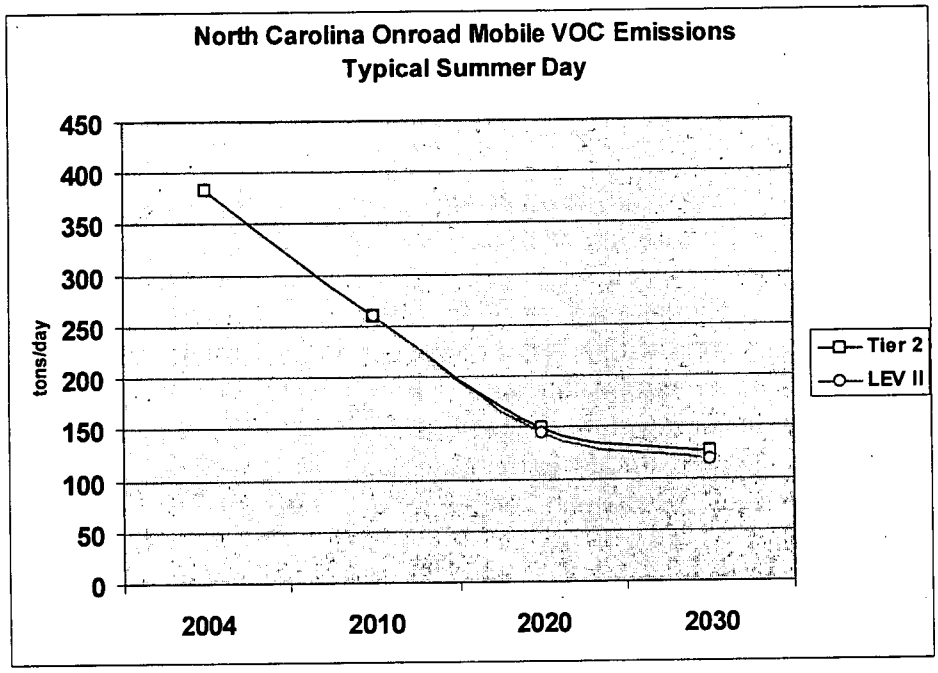

Figure 3.1-3. Estimated Vehicle Miles Traveled

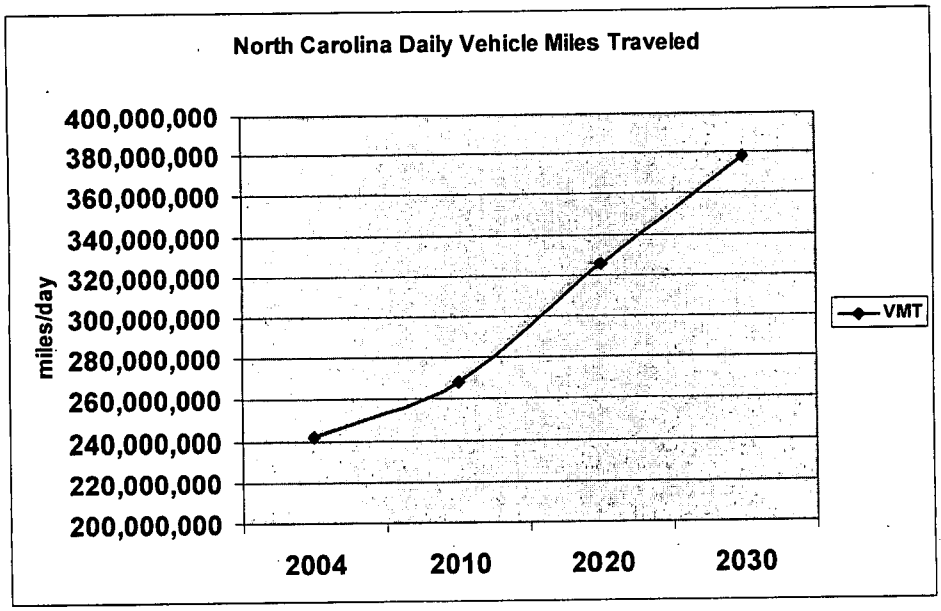


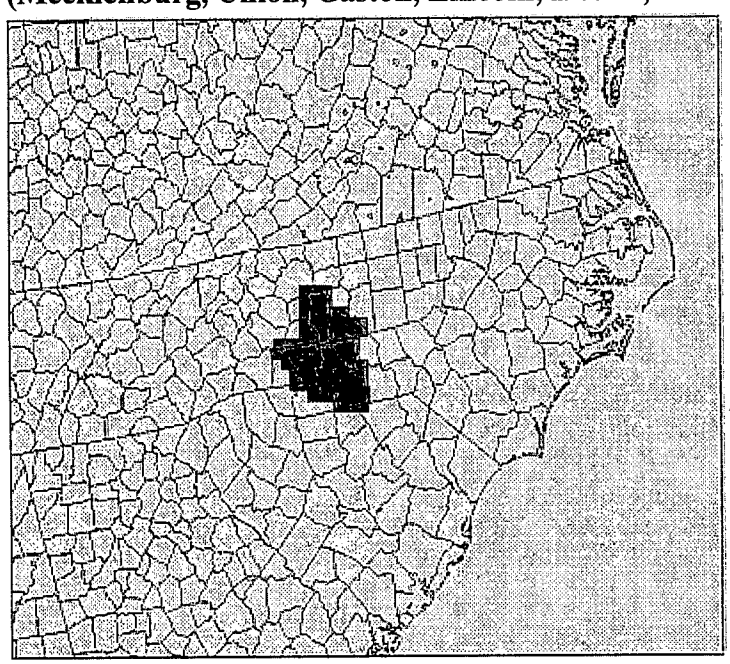
4. Results: Air Quality Impacts

4.1 Ozone Sensitivities

During the development of the 8-hour ozone SIPs for North Carolina's nonattainment areas, the NCDAQ conducted a number of modeling sensitivity tests to better understand how targeted emission reductions would impact future ozone concentrations. The modeling system used in this analysis consisted of three components: 1) the Penn State University/National Center for Atmospheric Research (PSU/NCAR) Mesoscale Model (MM5 version 3.6.1+)[9]; 2) the Sparse Matrix Operator Kernel Emissions Modeling System (SMOKE version 2.1)[10]; and, 3) the Community Multiscale Air Quality model (CMAQ version 4.4)[11,12]. Model configurations, input data, and modeling methods were consistent with those suggested by USEPA in "Guidance on the Use of Models and Other Analyses in Attainment Demonstrations for the 8-hour Ozone NAAQS" [13].

The emissions sensitivities were calculated by taking the difference between two air quality modeling simulations; one with "baseline" emissions and another with reduced emission inputs. This method is known in the modeling community as the "brute force" method[14]. Brute force sensitivity analyses have been widely used to better understand source/receptor relationships and aid in the design of control strategies for ozone[15]. The emissions sensitivity used in this analysis reduces on-road mobile source NOx emissions in the Metrolina 8-hour ozone nonattainment area, by 10% from year 2009 emission levels. The Metrolina nonattainment area was chosen because they currently have the highest ozone design values in North Carolina. The counties included in the emissions sensitivity modeling are shown in Figure 4.1-1.

Figure 4.1-1. North Carolina Counties included in the Metrolina Sensitivity (Mecklenburg, Union, Gaston, Lincoln, Iredell, Cabarrus and Rowan)



The 10% NOx reduction applied to the year 2009 on-road mobile source emissions is equivalent to a 10 ton/day reduction in this region. Again, this is a 10%, or 10 ton/day, on-road mobile source NOx reduction from the "baseline" year 2009 emissions that include the Tier 2 level of control. Air quality modeling results indicated this additional 10% NOx reduction resulted in lowering 8-hour ozone concentrations anywhere between 0.1 and 1.0 parts per billion (ppb) in year 2009. Only one of the seven modeled days resulted in changes in the maximum 8-hour ozone concentration, yielding a result as high as 1.0 ppb. This is shown in Figure 4.1-2. Only two of the seven modeled days resulted in changes as high as 0.5 ppb.

Using the CA LEV-II emission benefits analysis discussed in Section 3 above, NCDAQ assessed the 8-hour ozone benefits in year 2020, assuming a CA LEV-II program was implemented starting in year 2010. NCDAQ chose to analyze year 2020 to allow for a significant portion of the fleet to be CA LEV-II vehicles. As noted in Table 3.1-1 above, a 4% reduction of on-road mobile NOx emissions would be expected in year 2020 due to a CA LEV-II program. NCDAQ assumed the maximum ozone benefit shown in the year 2009 Metrolina sensitivity in estimating the year 2020 ozone impacts due to CA LEV-II, as shown in Table 4.1-1 below.

Table 4.1-1. Summary of Air Quality Impacts

For the Metrolina Area...

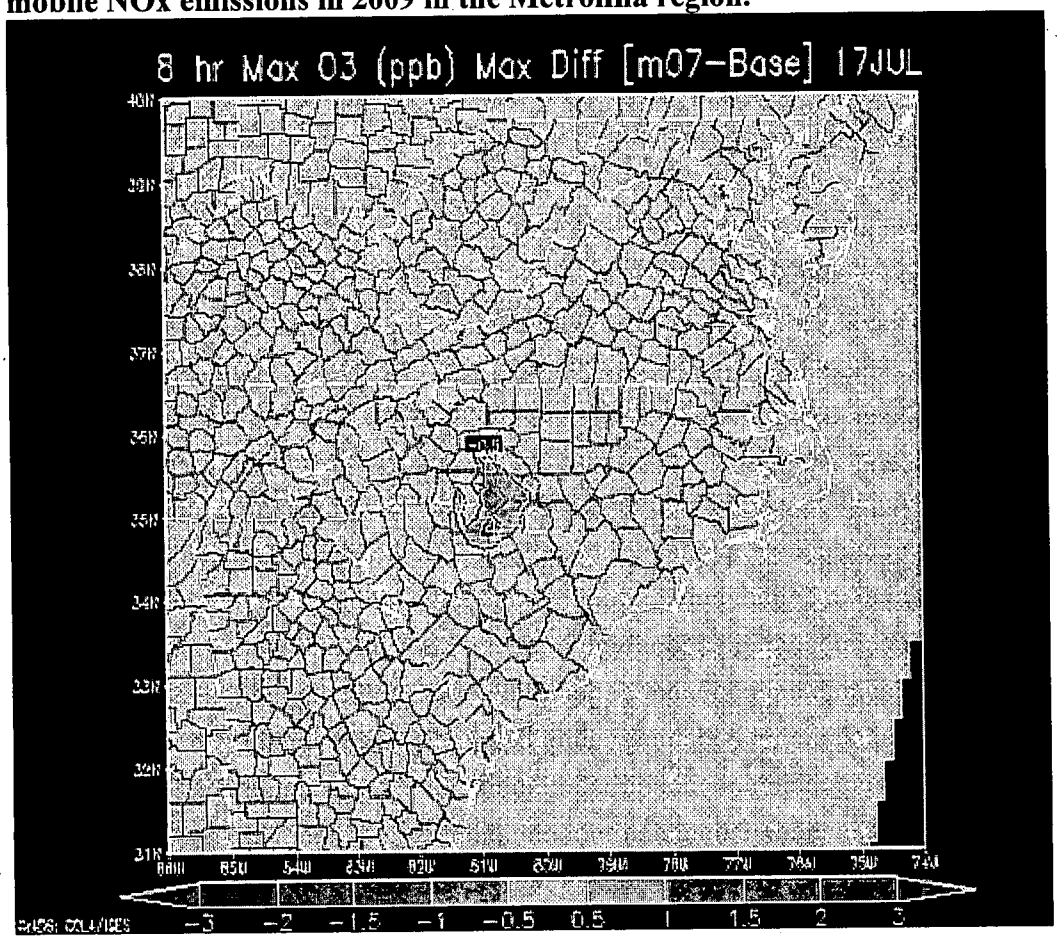
- 2009 on-road mobile NOx ~ 100 tons/day (w/ Tier 2)
- 2020 on-road mobile NOx ~ 25 tons/day (w/Tier 2)

If a 10% NOx reduction = 10 tons/day in 2009 = 1 ppb maximum ozone benefit

Then a 4% NOx reduction = 1 ton/day in 2020 = 0.1 ppb maximum ozone benefit

NCDAQ concluded the 4% on-road mobile NOx reduction in year 2020 due to a CA LEV-II program would have a very small impact on maximum 8-hour ozone concentrations (i.e., less than 0.1 ppb) in the Metrolina area. NCDAQ estimates the impact would be even less in areas where future projected ozone concentrations will be even lower.

Figure 4.1-2. Maximum 8-hour ozone reductions due to a 10% reduction of on-road mobile NOx emissions in 2009 in the Metrolina region.



5. CA LEV-II Enforcement Options – Fleet Analysis

One of the challenges put forth to NCDAQ was to assess the benefit of enforcing a fleet average requirement for the CA LEV-II control program versus simply requiring that all light-duty vehicles sold in North Carolina would have to be California certified (e.g., simple certification). A state adopting the CA LEV-II regulation is not required to undertake the additional activities associated with vehicle sales or registration enforcement.

A fleet average requirement would provide auto manufacturers the flexibility to produce vehicles that emit both more and less than the fleet average as long as their mathematical average is within the fleet average limit. This would mean state officials would work with auto manufacturers to calculate a fleet average NMOG value and check it against the applicable limits set in the rule. Details on how to offset "debits" or exceedances of the fleet average limit are discussed elsewhere[3].

While this analysis does not quantify the benefits of adopting a CA LEV-II program in North Carolina, with and without fleet averaging enforcement, several metrics were generated to

better understand North Carolina's fleet demographics and how it compares to California's fleet of light-duty vehicles. This analysis of the fleet information helped NCDAQ make some qualitative estimates on whether enforcement of a fleet average option would be needed in North Carolina.

5.1 Fleet Comparisons (NC vs. CA)

5.1.1 Fleet Composition

Figure 5.1-1 presents a simple comparison of California's fleet per vehicle type versus the North Carolina fleet composition[16,17]. The fleet was binned into the 5 MOBILE5 vehicle classification bins for simplicity. Table 5.1-1 provides the mapping from MOBILE5 vehicle bins to MOBILE6.2 and a detailed description of vehicle weights that fall into each category. Several noteworthy fleet differences are immediately shown. North Carolina has about 11% more light-duty gasoline vehicles (i.e., passenger cars) than California, 7% fewer light-duty gasoline trucks 1 (i.e., pickup trucks and SUVs under 6,001 lbs. gross vehicle weight rating), and 6% fewer light-duty gasoline trucks 2 (i.e., pickup trucks and SUVs between 6,001-8,500 lbs gross vehicle weight rating).

Figure 5.1-1. NC and CA Composition of Fleet per Vehicle Type[16,17]

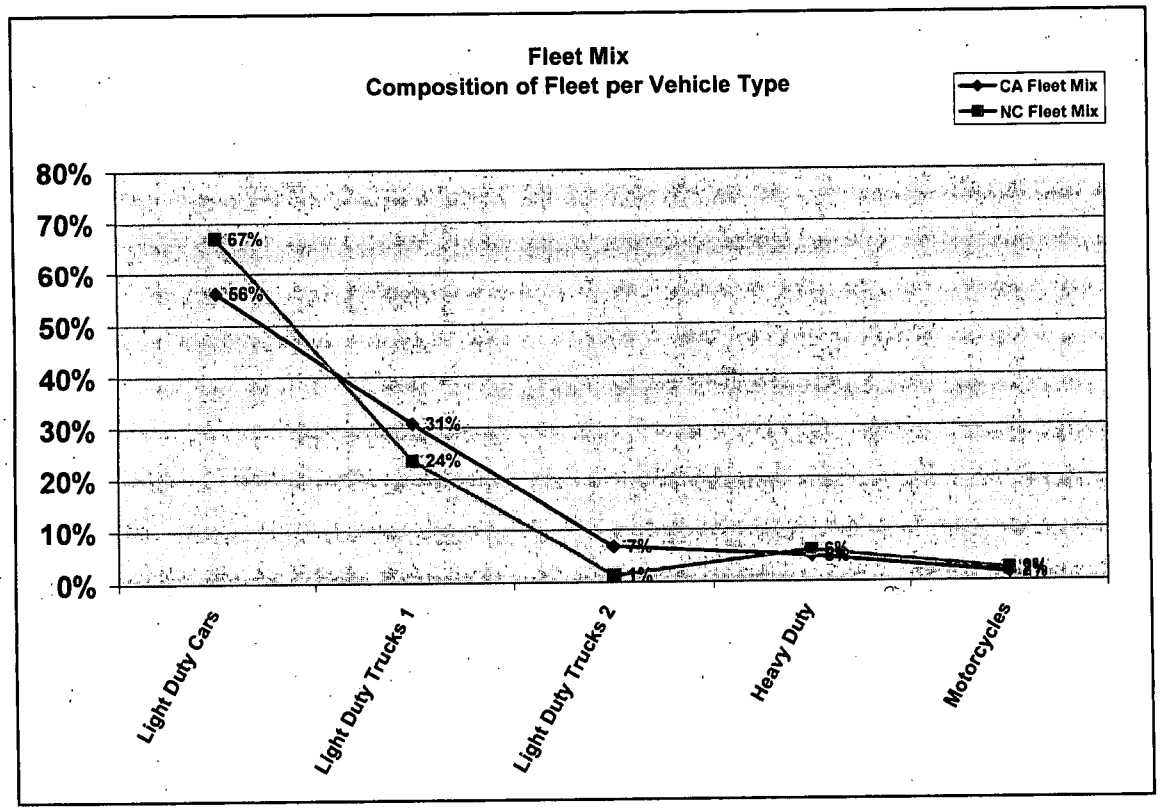


Table 5.1-1. Description of MOBILE5 and MOBILE6.2 Vehicle Classifications

MOBILE5	MOBILE6.2	Description
Light-Duty Cars	LDV	Light-Duty Vehicles (Passenger cars)
Light-Duty Trucks 1	LDT1	Light-Duty Trucks 1 (0-6,000 lbs. GVWR, 0-3750 lbs. LVW)
	LDT2	Light Duty Trucks 2 (0-6,001 lbs. GVWR, 3751-5750 lbs. LVW)
Light-Duty Trucks 2	LDT3	Light Duty Trucks 3 (6,001-8500 lbs. GVWR, 0-5750 lbs. ALVW)
	LDT4	Light Duty Trucks 4 (6,001-8500 lbs. GVWR, >5750 lbs. ALVW)
Heavy Duty Vehicles	HDV2B	Class 2b Heavy Duty Vehicles (8501-10,000 lbs. GVWR)
	HDV3	Class 3 Heavy Duty Vehicles (10,001-14,000 lbs. GVWR)
	HDV4	Class 4 Heavy Duty Vehicles (14,001-16,000 lbs. GVWR)
	HDV5	Class 5 Heavy Duty Vehicles (16,001-19,500 lbs. GVWR)
	HDV6	Class 6 Heavy Duty Vehicles (19,501-26,000 lbs. GVWR)
	HDV7	Class 7 Heavy Duty Vehicles (26,001-33,000 lbs. GVWR)
	HDV8A	Class 8a Heavy Duty Vehicles (33,001-60,000 lbs. GVWR)
	HDV8B	Class 8b Heavy Duty Vehicles (>60,000 lbs. GVWR)
	HDBS	School Buses
	HDBT	Transit and Urban Buses
Motorcycles	MC	Motorcycles (All)

5.1.2 Vehicle Age Distribution Comparison

Since light-duty gasoline vehicles (i.e., passenger cars) make up about two-thirds of North Carolina's registered fleet, NCDAQ examined the age of that vehicle class in North Carolina and California. Figure 5.1-2 shows the percent by age for passenger cars. While there is a slightly greater percentage of 1 and 2 year old passenger cars in California and equal percentages of 3 year old passenger cars, North Carolina has a greater percentage of 4 to 12 year old passenger cars and fewer 13 to 25 year olds. The yellow line on the graph represents a subset of the North Carolina statewide data for the Charlotte-Gastonia area. This subset indicates a much newer fleet of passenger vehicles in those counties. This is not unexpected however, due to Charlotte being the largest urban area in North Carolina. Generally, fleets weighted towards newer vehicles will result in quicker realization of control program benefits because of faster fleet turnover, even though the long-term benefits will be similar.

5.1.3 VMT Fraction Comparison

Finally, NCDAQ processed the California and North Carolina fleet demographic data to determine the fraction of VMT by vehicle class for the year 2010. This is often referred to as the VMT mix or VMT fraction. The methods used in determining the VMT fractions are consistent with USEPA guidance[7]. As shown in Figure 5.1-3, California light-duty gasoline car and truck owners are projected to drive their vehicles slightly more than North Carolinians in year 2010. Generally, however, there is not a great difference in the VMT fractions when using USEPA's methodology.

Figure 5.1-2. Light Duty Gasoline Vehicles, Percent by Age, NC and CA

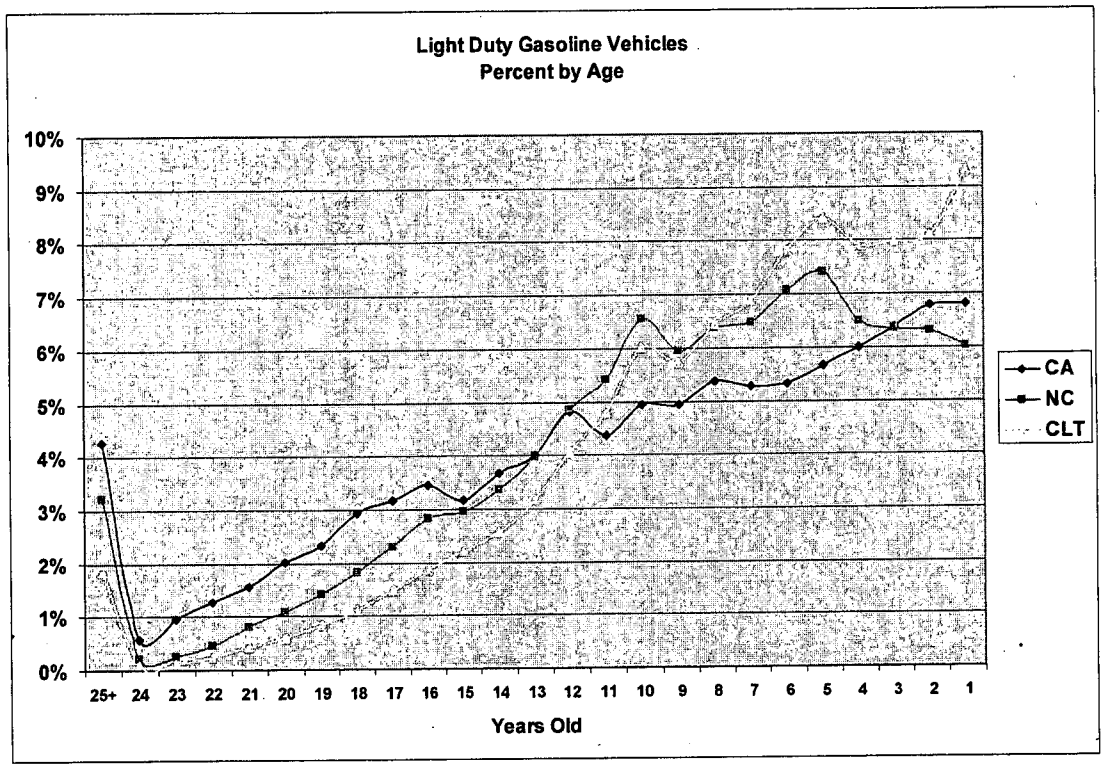

Figure 5.1-3. Percent of VMT per Vehicle

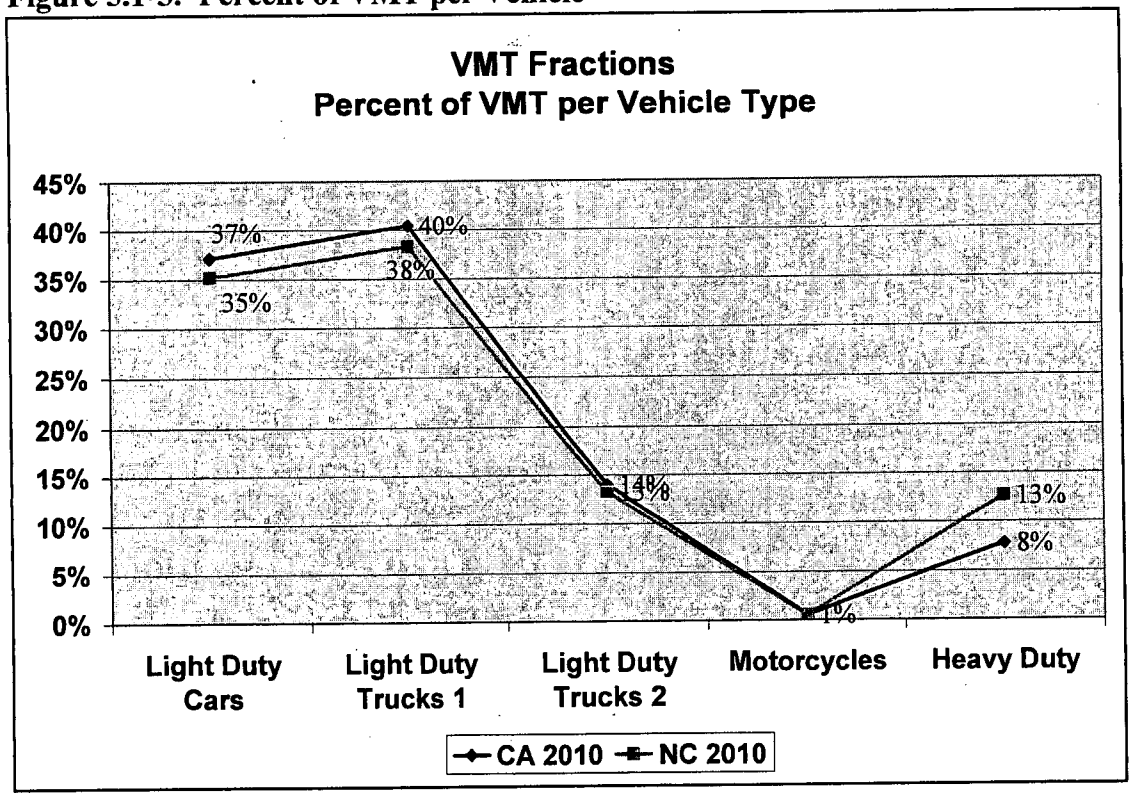

5.2 Qualitative Assessment of Enforcement Options

Based on the data summarized in Section 5.1 above, if one generally assumes passenger vehicles are cleaner emitting vehicles than light-duty trucks, and newer vehicles generally emit less than older vehicles, then one can qualitatively assert that the light-duty gasoline vehicle fleet registered in North Carolina is cleaner than California's registered light-duty gasoline vehicle fleet. This data (i.e., especially the greater percentage of passenger cars) may be an indicator that a fleet average requirement will not be difficult to meet in North Carolina and thus a "simple certification" enforcement program might result in similar benefits, while requiring fewer state resources. However, it should be noted that historical fleet demographic data would not necessarily represent future demographics, which will be impacted by short-term economic trends, long-term trends in vehicle longevity and use, and other factors such as fuel costs.

6. Staff Resource Needs

6.1 Enforcement at DMV and NCDAQ

NCDAQ collected information on state air quality agency staffing needs associated with implementing and enforcing a CA LEV-II program. Discussions with the Washington State Department of Ecology, Air Quality Program[18] revealed they had recently spoken with other states that had already adopted CA LEV-II programs to better understand staff resource needs. Washington indicated both New York and Massachusetts have staffs of two to three people (not completely full time) on CA LEV-II.

The primary point of enforcement/compliance for a CA LEV-II program would most likely be the State's Division of Motor Vehicles (DMV), while the air quality agency staff would perform audits, monitor performance of the program, handle public outreach, registration, and vehicle availability issues.

6.2 Impacts to Existing Tasks at NCDAQ

Another possible resource concern, considered by NCDAQ is the impact to existing tasks, such as transportation conformity, SIP modeling, and emission inventories. Due to the more complicated mobile source emission estimation techniques involved with a CA LEV-II program, there is some concern that timelines on these core tasks could be lengthened. This would not only impact NCDAQ, but the other groups involved in the transportation conformity process as well, such as local air quality agencies, metropolitan planning organizations, and rural planning organizations.

NCDAQ Analysis of CA LEV-II Vehicle Emissions Standards

Presented to the Environmental Review Commission

May 3, 2006

Brock M. Nicholson, P.E.
Deputy Director, NCDAQ

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Outline

- Air Quality in North Carolina
- Review of Vehicle Standards
- CA LEV-II Project
- CA LEV-II vs. Federal Tier 2
  - NOx and VOC emissions benefits
  - Projected impacts on ambient air quality
- Fleet Averaging
  - Comparison of CA and NC fleets
- Resources
- Options/Next Steps

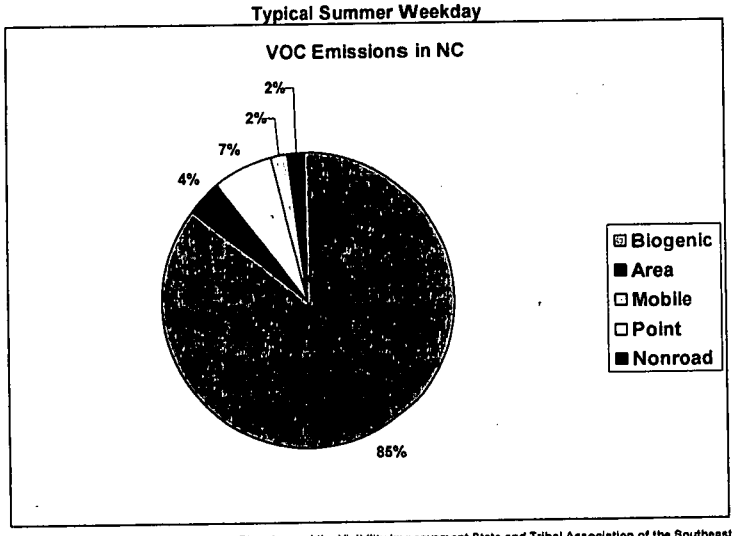
North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality - Ozone

- All* areas of NC are attaining the 8-hr ozone standard except the Charlotte area
  *Triangle status pending USEPA approval
- Recall... NOx + VOC + sunlight = ozone
- NOx
  - precursor pollutant of concern in NC
  - majority of VOCs come from natural sources
- On-road mobile sources contribute significantly to the total NOx emissions in NC

North Carolina Department of Environment and Natural Resources
Division of Air Quality

VOC emissions



Source: NCDAQ, Association of Southeastern Integrated Planning and the Visibility Improvement State and Tribal Association of the Southeast. Version BaseF4. 2009 estimates include all controls scheduled to be in place in 2009, including, but not limited to the NC Clean Smokestacks Act (point sources), Federal Tier 2 (on-road mobile sources) and the expanded NC Inspection and Maintenance Program (on-road mobile sources)

North Carolina Department of Environment and Natural Resources

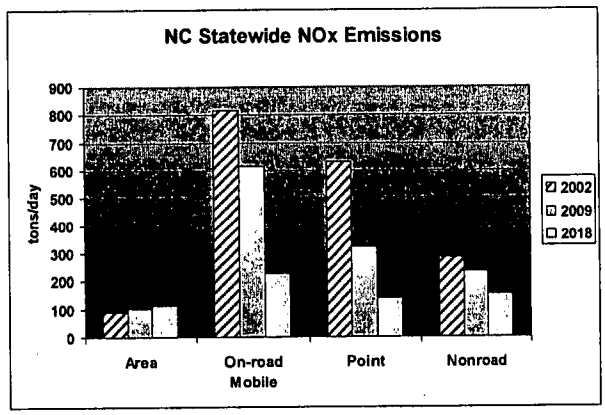
NOx emissions

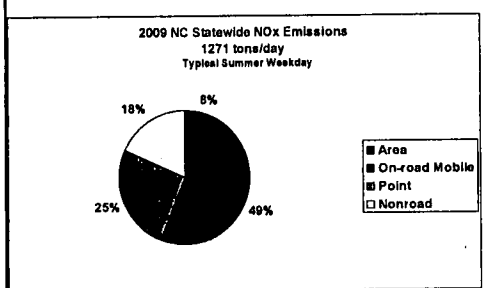
Typical Summer Weekday

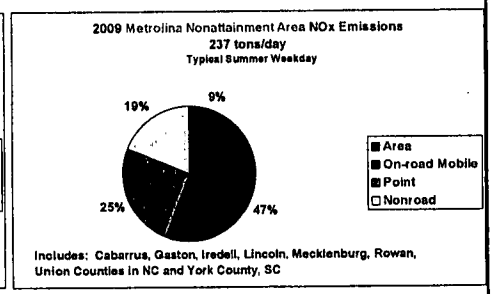


Source: NCDAQ, Association of Southeastern Integrated Planning and the Visibility Improvement State and Tribal Association of the Southeast, Version BaseF4. 2009 estimates include all controls scheduled to be in place in 2009, including, but not limited to the NC Clean Smokestacks Act (point sources), Federal Tier 2 (on-road mobile sources) and the expanded NC Inspection and Maintenance Program (on-road mobile sources)

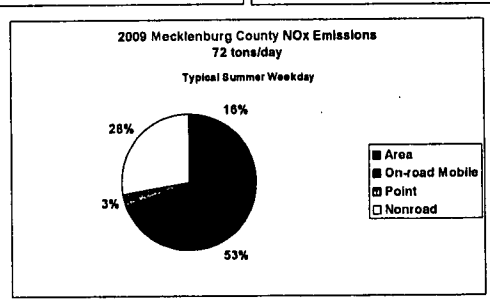
North Carolina Department of Environment and Natural Resources

Division of Air Quality





Includes: Cabarrus, Gaston, Iredell, Lincoln, Mecklenburg, Rowan, Union Counties in NC and York County, SC



Source: NCDAQ, Association of Southeastern Integrated Planning and the Visibility Improvement State and Tribal Association of the Southeast, Version BaseF4 2009 estimates include all controls scheduled to be in place in 2009, including, but not limited to the NC Clean Smokestacks Act (point sources), Federal Tier 2 (on-road mobile sources) and the expanded NC Inspection and Maintenance Program (on-road mobile sources)

North Carolina Department of Environment and Natural Resources

Division of Air Quality

Predicted Future Air Quality

Current Federal and State Rules

Example of expected ozone reductions between 2002 and 2009

Example of expected ozone reductions between 2002 and 2018

Scales are the same on both maps.
Purple indicates 8-hour ozone reductions greater than 15 ppb.

North Carolina Department of Environment and Natural Resources

Division of Air Quality

Vehicle Emissions Standards in the US

- Federal – Currently "Tier 2"
  - Adopted in 1999
  - Phased in 2004-2010
  - Fleet Average Requirement for NOx
  - Covers all States
  - Federal Clean Air Act (CAA) Section 209(a) "preempts" states from establishing separate standards
- California – Currently "CA LEV-II"
  - CAA Section 209(b) exempts California from the Sec 209(a) preemption
  - However, CA must obtain a waiver from USEPA for state standards to be effective
    - CA standards must be equal to or more stringent than the Federal standards
  - Fleet Average Requirement for VOC

Objective of this Analysis

- Estimate the NOx and VOC emissions benefits of adopting California Vehicle Emission Standards (CA LEV-II) in NC
- Apply knowledge from recent 8-hour ozone modeling studies to estimate the impacts of adopting CA LEV-II
- Compare the NC and CA vehicle fleet and age distributions to assess the need for "fleet averaging"
- Estimate State staffing resources needed if NC adopts CA LEV-II

North Carolina Department of Environment and Natural Resources
Division of Air Quality

CA LEV-II vs. Federal Tier 2

- CA LEV-II program starts with model year 2010 vehicles
- CA LEV-II emissions estimates include:
  - Fleet averaging enforcement
  - Zero Emitting Vehicle (ZEV) component
  - Phase-in percentages by exhaust certification bin
    - Provided by USEPA in MOBILE6.2 ready format
      - Represents the California Air Resources Board (CARB) phase-in schedule
      - It represents an estimate of the mix of vehicles that manufacturers will distribute to meet the fleet average standard

North Carolina Department of Environment and Natural Resources
Division of Air Quality

CA LEV-II vs. Federal Tier 2

Emission estimates were developed using:

- USEPA motor vehicle emissions model (MOBILE6.2)
- USEPA mobile modeling guidance
- NC specific input data including:
  - Vehicle mix, vehicle age distribution, vehicle miles traveled (VMT), speeds, Inspection/Maintenance Programs (I/M), fuels, temperatures
- Federal Tier 2 estimates for 2004, 2010, 2020 and 2030
- CA LEV-II estimates for 2010, 2020 and 2030

Methods: USEPA Technical Guidance on the Use of MOBILE 6.2 for Emission Inventory Preparation, August 2004

North Carolina Department of Environment and Natural Resources

North Carolina Department of Environment and Natural Resources

Division of Air Quality

CA LEV-II vs. Federal Tier 2

Emissions Reductions Summary

- On-road mobile sources only
- CA LEV-II Program in NC starting with model year 2010

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality Modeling

- During NCDAQ's current SIP modeling...

  Air Quality modeling sensitivities were performed by NCDAQ to assess the impacts of *additional* future year NOx emissions reductions from on-road mobile sources

North Carolina Department of Environment and Natural Resources

Division of Air Quality

Air Quality Modeling

Future year (2009) NOx emissions from on-road mobile sources were reduced by 10% in the following counties:

Mecklenburg

Union

Gaston

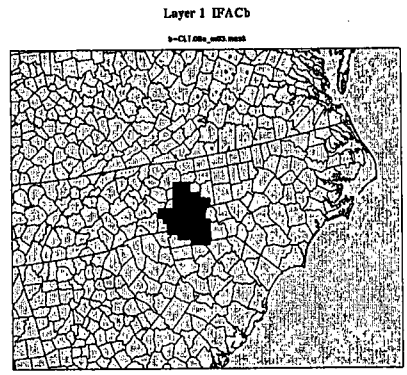
Lincoln

Iredell

Cabarrus

Rowan

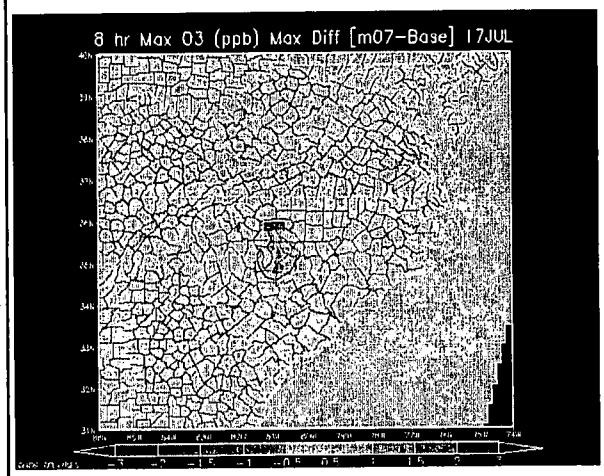
The 10% NOx reduction in 2009 is equivalent to ~10 tons/day in this region



North Carolina Department of Environment and Natural Resources

Division of Air Quality

Air Quality Modeling



- 10 tons/day on-road mobile NOx reduction across the Metrolina area resulted in lowering 8-hour ozone concentrations by 0.1 to 1.0 ppb in 2009
- Only 1 of the 7 modeled days resulted in changes as high as 1.0 ppb (shown)
- Only 2 of the 7 modeled days resulted in changes as high as 0.5 ppb

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality Modeling

For the Metrolina area...

2009 on-road mobile NOx ~ 100 tons/day (w/ Tier 2)

2020 on-road mobile NOx ~ 25 tons/day (w/ Tier 2)

If...

- 10% = 10 tons/day NOx in 2009 = 1 ppb max benefit

Then..

- 4 % = 1 ton/day NOx in 2020 = 0.1 ppb max benefit

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Fleet Characteristics

- Comparison of the NC and CA vehicle fleets
  - Composition
  - Age distributions
- Assess the value of "fleet averaging" enforcement

Division of Air Quality

Staff Resources

- DAQ and DMV
  - DMV: Primary point of enforcement
  - DAQ: Audits, monitor performance of program, public outreach and troubleshoot registration issues
- Fleet average enforcement
  - *Potential* State staffing requirements with fleet average enforcement
    - Washington, 1.5 full time employees (FTEs)
    - New York, 2-3 people (not full time)
    - Massachusetts, 2-3 people (not full time)
  - Potential duties of DAQ Employees
    - Enforce compliance of fleet average requirement
    - Work with manufacturers / dealers and public on vehicle model availability issues

Source: NCDAQ, Washington State Department of Ecology-Air Quality Program

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Staff Resource Impacts

- Existing Tasks:
  - Transportation conformity, SIP modeling and emissions inventories would require more time and resources due to more complicated mobile sources emissions estimation techniques
  - This would also impact Local Air Quality Agencies, Metropolitan Planning Organizations and Rural Planning Organizations involved in the transportation conformity process

Source: NCDAQ, Washington State Department of Ecology-Air Quality Program

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Summary

- CA LEV-II benefits relative to Federal Tier II in future years:
  - NOx emissions would be reduced by 0.1%, 4% and 10% in 2010, 2020 and 2030, respectively
  - VOC emissions would be reduced by 0.1%, 3% and 6% in 2010, 2020 and 2030, respectively
  - Air Quality benefits: Less than 0.1 ppb ozone reduction in 2020

Summary - continued

- Air Quality: Ozone concentrations would change *less than* 0.1 ppb in 2020
- Vehicle fleet age: NC currently has a newer fleet of light duty vehicles (passenger cars) than California
- Vehicle population: NC has a greater number of light duty vehicles (passenger cars) and fewer light duty trucks (including SUVs) than California
- Implementation Resources: Other States suggest 1-2 employees needed for enforcement of fleet average requirements
- Implications for ongoing DAQ activities: More complicated emission estimation techniques would lengthen NCDAQ timelines for transportation conformity, SIP modeling and emission inventories

EXHIBIT D-2

North Carolina General Statute 136-202
2006 Annual Report

Prepared by the NCDOT Transportation Planning Branch
November 2006

North Carolina General Statute 136-202
2006 Annual Report

North Carolina General Statute 136-202 concerning Metropolitan Planning Organizations (MPO) requires the Department of Transportation to report annually on the evaluation and adjustment of the boundaries of the areas served by each MPO in the state. The follow is a summary of MPO adjustments during the last calendar year.

Burlington-Graham MPO

The Burlington-Graham MPO includes Burlington, Graham, Elon College, Gibsonville, Mebane, Haw River, Whitsett, Green Level, Village of Alamance, and Alamance County. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Michael Abuya, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Burlington-Graham MPO.

Cabarrus-Rowan MPO

The Cabarrus-Rowan MPO includes Concord, Kannapolis, China Grove, Cleveland, Granite Quarry, Harrisburg, Landis, Mount Pleasant, Rockwell, Salisbury, Spencer and Rowan and Cabarrus Counties. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Ms. Linda Dossé, P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Cabarrus-Rowan MPO.

Capital Area MPO

The Capital Area MPO consists of the all the area inside of Wake County, and parts of Franklin, Granville, Harnett, and Johnston Counties, which includes the municipalities of Angier, Apex, Bunn, Cary, Clayton, Creedmoor, Franklinton, Fuquay-Varina, Holly Springs, Knightdale, Morrisville, Raleigh, Rolesville, Wake Forest, Wendell, Youngsville, and Zebulon. In June 2005, the Capital Area MPO expanded its boundary to include the previously unrepresented areas of Granville County, Creedmoor, Franklin County, Youngsville, Bunn, Franklinton, Johnston County, Clayton, Harnett County and Angier. The current Memorandum of Understanding establishing the structure and revised membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Scott Walston, P.E., Transportation Engineering Supervisor with the Transportation Planning Branch, with any questions or comments relevant to the Capital Area MPO.

Durham-Chapel Hill-Carrboro MPO

The Durham – Chapel Hill – Carrboro Urban Area MPO consists of the Durham, Chapel Hill, Carrboro, Durham County (all), Hillsborough, Orange County (part) and Chatham County (part). This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Scott Walston, P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Durham – Chapel Hill – Carrboro MPO.

Fayetteville Area MPO

The Fayetteville Area MPO includes the City of Fayetteville, the Towns of Hope Mills and Spring Lake, Fort Bragg Military Reservation, Pope Air Force Base, the urban portion of Cumberland County, portion of Harnett County, and portions of Hoke County. While the MPO boundary and membership has remained the same over the past year, FAMPO has invited a representative from Fayetteville State University to become a member of the Technical Coordinating Committee. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Darius Sturdivant, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Fayetteville Area MPO.

French Broad River MPO

The French Broad River MPO includes the urbanized areas of Buncombe County, Haywood County, and Henderson County. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Daniel Holt, P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the French Broad River MPO.

Gaston Urban Area MPO

The Gaston Urban Area MPO consists of the following member governments: Belmont, Bessemer City, Cramerton, Dallas, Gaston County, Gastonia, Lowell, McAdenville, Mount Holly, Ranlo, Spencer Mountain, and Stanley. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Ms. Shannon Ransom, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Gaston Urban Area MPO.

Goldsboro MPO

The Goldsboro Metropolitan Planning Organization includes the City of Goldsboro, Wayne County, the Village of Walnut Creek and the Seymour Johnson Air Force Base. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Ms. Earlene Thomas, P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Jacksonville Urban Area MPO.

Greater Hickory MPO

The Greater Hickory MPO includes the municipalities of Brookford, Cajah's Mountain, Catawba, Cedar Rock, Claremont, Conover, Connelly Springs, Drexel, Gamewell, Glen Alpine, Granite Falls, Hickory, Hildebran, Hudson, Lenoir, Long View, Maiden, Morganton, Newton, Rhodhiss, Rutherford College, Sawmills, Valdese and the urbanized areas of Alexander, Burke, Caldwell and Catawba Counties. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Linh Nguyen, P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Greater Hickory MPO.

Greensboro MPO

The Greensboro Urban Area MPO includes most of Guilford County, towns of Summerfield, Stokesdale, Oak Ridge, Pleasant Garden, and Sedalia, excluding the Gibsonville, Whitsett, High Point, and Jamestown areas. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Wayne Davis, Ph.D., P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Greensboro Urban Area MPO.

Greenville Urban Area MPO

The Greenville Urban Area MPO includes the City of Greenville, the Towns of Winterville and Ayden, the Village of Simpson, and surrounding areas of Pitt County. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Ms. Atefe Northcutt Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Greensboro Urban Area MPO.

High Point MPO

The High Point Urban Area MPO includes High Point, Thomasville, Archdale, Jamestown, Trinity, Forsyth County and portions of Guilford, Davidson and Randolph Counties. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Andy Bailey, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the High Point Urban Area MPO.

Jacksonville Urban Area MPO

The Jacksonville Urban Area MPO includes all incorporate areas of the City of Jacksonville and portions of Onslow County. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Ms. Tammye Fontenot, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Jacksonville Urban Area MPO.

Mecklenburg-Union MPO

The Mecklenburg-Union MPO consists of all of Mecklenburg County and the urbanized portions of Union County. Member jurisdictions include Charlotte, Cornelius, Davidson, Huntersville, Matthews, Mint Hill and Pineville in Mecklenburg County, and Indian Trail, Monroe, Stallings, Waxhaw, Weddington, Wesley Chapel and Wingate in Union County. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. Jonathan Parker, P.E., Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Mecklenburg-Union MPO.

Rocky Mount Urban Area MPO

The Rocky Mount Urban Area MPO consists of the City of Rocky Mount, Town of Nashville, part of Edgecombe County, and part of Nash County. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch.

Please contact Ms. Anna Meares, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Rocky Mount Urban Area MPO.

Wilmington MPO

The Wilmington MPO consists of the City of Wilmington, the Town of Carolina Beach, the Town of Kure Beach, the Town of Wrightsville Beach, New Hanover County, the Town of Belville, the Town of Leland, the Town of Navassa, Brunswick County and Pender County. In August 2006, The Wilmington MPO expanded the MPO boundary to include the previously unrepresented area of Pender County. The current Memorandum of Understanding establishing the structure and revised membership of the MPO is on file within the Transportation Planning Branch. Please contact Mrs. Earlene Thomas, P.E., Transportation Engineer with the Transportation Planning Branch for any questions or comments relevant to the Wilmington MPO.

Winston Salem MPO

The Winston-Salem MPO includes Winston-Salem, Bermuda Run, Bethania, Clemmons, Kernersville, King, Lewisville, Rural Hall, Tobaccoville, Walkertown, and parts of Davidson, Davie and Stokes Counties. This MPO experienced no boundary adjustments during the last year. The current Memorandum of Understanding establishing the structure and membership of the MPO is on file within the Transportation Planning Branch. Please contact Mr. James Upchurch, Transportation Engineer with the Transportation Planning Branch, for any questions or comments relevant to the Winston-Salem MPO.

EXHIBIT E

NORTH CAROLINA GENERAL ASSEMBLY

Report on the study of the merger of the Ecological Enhancement Program and the Clean Water Management Trust Fund

REQUEST FOR PROPOSALS

November 21, 2006

Proposals subject to the conditions made a part hereof will be received until **5:00 p.m. EST December 22, 2006** for furnishing services described herein. Send all proposals to the following:

Lisa Hollowell
Fiscal Research Division
General Assembly of North Carolina
Room 619 Legislative Office Building
300 N. Salisbury St.
Raleigh, NC, 27603
Phone: 919-733-4910

Email: lisah@ncleg.net

Questions about the RFP should be sent by email to Ms. Hollowell.

NOTE: Indicate firm name on the front of each sealed proposal envelope or package.

Introduction

The Joint Legislative Transportation Oversight Committee (JLTOC) of the North Carolina General Assembly and the Environmental Review Commission (ERC) of the North Carolina General Assembly are seeking a consultant to study the merger of the organization and functions of the Ecological Enhancement Program (EEP) and the Clean Water Management Trust Fund (CWMTF).

Section 16 of Part XVI of Session Law 2006-248, House Bill 1723, directs the ERC and JLTOC to jointly study the merger of the organization and functions of the two programs.

> **PART XVI. MERGER OF ECOLOGICAL ENHANCEMENT PROGRAM AND THE CLEAN WATER MANAGEMENT TRUST FUND (Jenkins)**
>
> **SECTION 16.** The Environmental Review Commission and the Joint Legislative Transportation Oversight Committee shall jointly study the merger of the organization and functions of the Ecological Enhancement Program with the Clean Water Management Trust Fund. The Commission and the Committee may hire consultants to assist with the study. The final report shall be made to the 2007 General Assembly.

Ecosystem Enhancement Program

In 2003, the United States Army Corps of Engineers (USACE), North Carolina Department of Transportation (NCDOT) and North Carolina Department of Environment and Natural Resources (NCDENR) signed a memorandum of agreement (MOA) that created the Ecosystem Enhancement Program (EEP). The agreement created procedures and guidelines for providing the compensatory mitigation to offset impacts to waters and wetlands due to transportation activities and construction. The MOA provided for the incorporation of the Wetlands Restoration Program (WRP), which had been established by State law in 1996 to provide the compensatory mitigation required by the section 404 permit issued by the USACE for land development impacting wetlands, into the EEP. The MOA also provided that the WRP would be renamed as the EEP, which was confirmed by the enactment of conforming legislation in 2005.

Clean Water Management Trust Fund

The Clean Water Management Trust Fund (CWMTF) is a non-regulatory agency that administers a water quality grants program. The grant funds are awarded to local governments, State agencies, nonprofit conservation organizations, and other subdivisions of the State and may be used to acquire conservation easements or fee simple ownership of land in order to "preserve riparian buffers, wetlands, floodplains, and greenways; to restore riparian buffers, streams and wetlands; to repair failing wastewater collection and

treatment systems; to eliminate failing septic tanks and straight pipes, to prevent, reduce, collect and treat stormwater pollution and to plan water quality projects". (*Annual Report 2005, The North Carolina Clean Water Management Trust Fund*)

A brief history of the CWMFT follows:
In 1996 the General Assembly created the Clean Water Management Trust Fund with a prescribed mission to "clean up pollution in the State's surface waters and to protect and conserve those waters that are not yet polluted" (GS 113A-251). The General Assembly provided a dedicated and recurring funding source and required a Board of Trustees, Executive Director and staff. The Board of Trustees was empowered to establish a grant funding program to advance the mission. Since 1996, the CWMTF Board has approved over $595.8 million in grants for projects which have leveraged significant additional funds in private and other public funding.

During the 2005-2006 biennium the General Assembly appropriated recurring funding of $100 million for each year of the biennium for the grant program. During 2005, the CWMFT Board of Trustees approved funding for 159 projects for a total amount of $112.7 million and approved an administrative budget of $1.663 million for fiscal year 2006.

Scope of Study

I. The study will fully analyze, describe, and compare the organizational structures, missions, and budgets (both administrative and programmatic) of the EEP and the CWMTF. The comparison will identify whether there have been land purchases that may be utilized in both mitigation for North Carolina Department of Transportation projects and aid in cleaning up pollution in waters or preventing waters from becoming polluted. The consultant will analyze and may recommend whether to combine some or all of the activities of the two programs into one organization.

The Consultant shall provide the following detailed information on the EEP:

- Full description of the mitigation process including: selection of target areas, acquisition of land, crediting of land, use of the land, banking of surplus or unused credits. Describe how the EEP approach differs from the past approach when NCDOT handled mitigation within the agency. Describe the guidelines and requirements of the USACE and relate how these guidelines impact the policies established within EEP.
- Inventory the acquisitions and credits and restored or preserved lands accrued to date and describe how these acquisitions and credits have been assigned to projects and the process by which they may be reassigned or re-categorized for future projects. Include in a separate inventory the NCDOT transferred land credits and assigned projects.
- Detail the process for valuing the credits and restored acres assigned to projects in the near future and the surplus credits. Calculate the value of the credits currently in inventory with EEP. Identify options for the State

regarding the surplus land acquisitions that is not needed in the near future for mitigation purposes.

- The consultant shall identify best practices for mitigation processes and provide examples from other states.

II. The consultant will conduct a mitigation banking analysis that compares the relative effectiveness, efficiency, and total cost of the State's mitigation program to that of private mitigation banks. The consultant shall identify the State's processes and private sector processes of mitigation including Design, Bid, Build (EDP) and Full Delivery Procurement (EDP). The consultant will review current State policies with respect to the activities that private mitigation banks may undertake with respect to the services that private mitigation banks provide. The consultant will make recommendations for future mitigation banking policies as a result of the analysis.

III. The consultant will provide (1) alternative options to the merger of the programs into one entity, and (2) detail other collaborative arrangements that could exist in lieu of a complete merger and (3) identify other ways in which to provide mitigation in a more cost-effective way.

IV. The consultant will review and analyze pending and likely changes at the Federal level that may impact the State's programs.

V. The consultant will create an implementation schedule with timeline on any consultant-recommended options including projected budgets.

Qualifications

Potential vendors submitting proposals must demonstrate their knowledge of states' environmental preservation and mitigation processes, federal government environmental regulations related to highway/road building and construction, and demonstrated capability to produce clear, well-written reports by providing examples of completed projects.

Project Timeframe

The schedule is listed below:

Activity	Date
RFP Distributed	November 21, 2006
Proposals from Vendors Due	December 22, 2006
Award Contract	January 10, 2007
Sign Contract/Begin Work	January 22, 2007
Final Report	The consultant will propose a delivery date not to exceed 20 weeks.

Reports

The consultant will deliver up to four legislative presentations. The consultant will provide interim written reports and the final report will include an electronic version and 100 hardcopy reports.

Required Contents for Proposal

The response to this request for proposals shall consist of the following sections:

a) Executive Summary
   The executive summary shall consist of a brief summary of the contents of the proposal.
b) Corporate Background and Experience
   This section shall include:
   1) Background information on the organization and details of experiences with similar projects.
   2) A list of at least three references, including contacts and telephone numbers, for whom similar work has been performed.
   3) Samples of work products.
c) Financial Statement
   The vendor's most recent financial statement or similar evidence of financial stability.
d) Project Staffing and Organization
   This section shall include:
   1) Proposed staffing, deployment and organization of personnel to be assigned to this project.
   2) The vendor shall include resumes of key personnel who will actually be assigned to the project, describing experience with similar projects and the responsibilities to be assigned to each person.
   3) How the study will be planned, organized and conducted.
e) Technical Proposal
   This section shall include, in narrative, outline or graph form, the vendor's approach to accomplishing the tasks outlined in the project description section of this RFP. A description of each task and the schedule for accomplishing each shall be included.
f) Cost Proposal
   The cost proposal must contain the following information:
   1) Personnel costs (including hourly rates and total hours)
   2) Travel and subsistence expenses
   3) Office space, telephone, and other support needs, if any, anticipated from the General Assembly
   4) Subvendor costs (if any)
   5) Other costs
   6) Total cost for completing the project
   7) Rates for additional analyses requested during the project period

Proposal Submittal Process

a) Two original and 10 copies of the proposal plus electronic copy, PDF preferred.
b) Each original shall be signed and dated by an official authorized to bind the firm.

Vendor Selection Process

The selection of the vendor will be determined by a "Best Value" methodology, with key factors to be considered to include experience of the vendor and its consultants with related projects and price.

General Conditions Related to Submittal of Proposals

Right to Reject

The Joint Legislative Transportation Oversight Committee (hereinafter "Committee") reserves the unqualified right to reject any and all proposals when such rejection is deemed to be in the best interest of the State of North Carolina.

Right to Accept Part of Proposal, Negotiate Content and Cost

The Committee reserves the right to accept part of any proposal, and to divide any proposal into parts deliverable in stages over an extended time period. The Committee reserves the right to negotiate and alter the content, form, schedule, and deliverables of any proposal or portion of a proposal accepted. The Committee reserves the right to negotiate the cost of any proposal or portion of a proposal accepted.

Time for Acceptance

Each proposal shall state that it is a firm offer that may be accepted within a period of 30 days from the date of submission.

Unsolicited Proposal Changes

Any unsolicited change to a proposal that is received after the closing date of this RFP will be rejected.

Responsibility to Make Timely Submission

The vendor is responsible for assuring the timely delivery of a proposal. Late proposals will be rejected without review.

Cost for Proposal Preparation

Any costs incurred by vendors in preparing or submitting offers are the vendor's sole responsibility; the Committee will not reimburse any vendor for any costs incurred prior to award.

Elaborate Proposals

Elaborate proposals in the form of brochures or other presentations beyond that necessary to present a complete and effective proposal are not desired. Vendors are encouraged to limit proposals to approximately 10 pages or less (not including examples of work products).

Oral Explanations

The Committee shall not be bound by oral explanations or instructions given at any time during the competitive process or after award.

Confidentiality of Proposals

In submitting its proposal the vendor agrees not to discuss or otherwise reveal the contents of the proposal to any source outside of the Committee or its Legislative Services Office staff until after the award of the contract.

Form of Proposal

Proposals shall be submitted in a form that, in the opinion of the Committee, may be incorporated verbatim into a contract.

Exception to Terms

Any exception, interpretation, or suggestion for clarification by the vendor to any of the terms and conditions of this RFP must be clearly stated by the vendor.

Competitive Offer

Pursuant to the provision of G.S. 143-54, and under penalty of perjury, the signer of any proposal submitted in response to this RFP thereby certifies that this proposal has not been arrived at collusively or otherwise in violation of either Federal or North Carolina antitrust laws.

Right to Submitted Materials

All responses, inquiries, and correspondence relating to or in reference to this RFP shall become the property of the State of North Carolina when received.

Vendor's Representative

Each vendor shall submit with its proposal the name, address, telephone number, and email address of the person(s) with authority to bind the firm and answer questions or provide clarification concerning the vendor's proposal.

Proprietary Information

All vendors' information submitted in the proposal has the potential to become public information. Vendors are cautioned that any proprietary information contained in the proposal may not be protected as confidential and should not be submitted in response to this RFP.

Terms and Conditions of Resulting Contract

The following are terms and conditions that will be included in the contract for conducting the project. Other terms and conditions may be added prior to the signing of the contract.

Vendor

The contract is between the Joint Legislative Transportation Oversight Committee (subject to the approval of the Legislative Services Commission) and the selected vendor (hereinafter referred to as "Vendor").

Governing Law

This contract is made under and shall be governed and construed in accordance with the laws of the State of North Carolina.

Situs

The place of this contract, its situs and forum, shall be Raleigh, North Carolina, where all matters, whether sounding in contract or tort, relating to its validity, construction, interpretation and enforcement shall be determined.

Contract Period

The terms of the contract shall begin at its signing and shall end twelve weeks after contract signing, unless extended or terminated as provided in this document.

Termination

Upon mutual written agreement of the Committee and the Vendor, the contract may be terminated at any time. Failure to perform by the Vendor may result in termination by the Committee. In addition, the Committee has the right to terminate the contract at its discretion with 10 days written notice. In the event of termination, the Vendor will be paid an amount commensurate with work completed.

Independent Vendor

The Vendor shall be considered to be an independent vendor and as such shall be wholly responsible for the work to be performed and for the supervision of its employees. The Vendor represents that it has, or will secure at its own expense, all personnel required in performing the services under this agreement. Such employees shall not be employees of, or have any individual contractual relationship with the Committee or the Legislative Services Office.

Key Personnel

The Vendor shall not substitute key personnel assigned to the performance of this contract without prior written approval by the Committee. The individuals designated as key personnel for purposes of this contract are those specified in the Vendor's proposal.

Subcontracting

Work proposed to be performed under this contract by the Vendor or its employees shall not be subcontracted without prior written approval of the Committee.

Performance and Default

If, through any cause, the Vendor shall fail to fulfill in timely and proper manner the obligations under this agreement, the Committee shall thereupon have the right to terminate this contract by giving written notice to the Vendor and specifying the effective date thereof. In that event, all finished or unfinished deliverable items under this contract prepared by the Vendor shall, at the option

of the Committee, become its property, and the Vendor shall be entitled to receive just and equitable compensation for any satisfactory work completed on such materials. Notwithstanding, the Vendor shall not be relieved of liability to the Committee for damages sustained by the Committee by virtue of any breach of this agreement, and the Committee may withhold any payment due the Vendor for the purpose of setoff until such time as the exact amount of damages due the Committee from such breach can be determined. In case of default by the Vendor, the Committee may procure the services from other sources and hold the Vendor responsible for any excess cost occasioned thereby. Neither party shall be deemed to be in default of its obligations hereunder if and so long as it is prevented from performing such obligations by any act of war, hostile foreign action, nuclear explosion, riot, strikes, civil insurrection, earthquake, hurricane, tornado or other catastrophic natural event or act of God.

Bankruptcy

Upon the filing for bankruptcy or insolvency by or against the vendor, the Committee may terminate the contract, and the provisions of paragraph entitled "Performance and Default" shall apply.

Performance Bond

The Committee may require either a performance bond up to the full amount of the contract or another performance guarantee.

Availability of Funds

Any and all payments to the Vendor are dependent upon and subject to the availability of funds to the Committee for the purpose set forth in this agreement.

Confidentiality

The vendor agrees to protect the confidentiality of any files, data, or other materials provided by the Committee and to restrict their use to the purpose of performing the contract. The vendor shall comply with the provisions of Article 17 of Chapter 120 of the North Carolina General Statutes regarding confidentiality between the vendor and members of the General Assembly.

Care of Property

The Vendor agrees that it shall be responsible for the proper custody and care of any files or other property furnished by the Committee.

Copyright

No deliverable items produced in whole or in part under this agreement shall be the subject of an application for copyright by or on behalf of the Vendor.

Access to Persons and Records

The State Auditor shall have access to persons and records as a result of all contracts or grants entered into by State agencies or political subdivisions in

accordance with General Statute 147-64.7. The Vendor shall retain all records for a period of three years following completion of the contract.

Transfer or Assignment

The contract shall not be transferred or assigned to a third party.

Compliance with Laws

The Vendor shall comply with all laws, ordinances, codes, rules, regulations and licensing requirements that are applicable to the conduct of its business, including those of federal, state, and local agencies having jurisdiction or authority.

Equal Opportunity Statement

The nondiscrimination clause contained in Section 202 Executive Order 11246, as amended by Executive Order 11375, relative to equal employment opportunity for all persons without regard to race, color, religion, sex, age or national origin, and the rules and regulations prescribed by the Secretary of Labor, are incorporated herein. The program for Employment of the Handicapped (Affirmative Action) Regulations issued by the Secretary of Labor of the United States in Title 20, Part 741, Chapter VI, Subchapter "C" of the Code of Federal Regulations, pursuant to the provisions of Executive Order 11758 and Section 503 of the Federal Rehabilitation Act of 1973, are incorporated herein.

Insurance

The Vendor shall obtain, pay for, and keep in force, for the duration of the contract, worker's compensation insurance, as required by the laws of North Carolina, covering all of the Vendor's employees engaged in any work on the project in the State.

Additional Contract Expenses

The contract for the project is not a time and materials agreement. Any expenses of the vendor in addition to those contracted for, or above the contract amount, are the sole responsibility of the Vendor.

Advertising

Vendor agrees not to use the results or existence of the contract, or the products produced pursuant to the contract as a part of any news release or commercial advertising without the prior written approval of the Committee.

ATTACHMENT A

SESSION LAW 2006-178
House Bill 2208

AN ACT TO REPEAL THE REQUIREMENT THAT CERTAIN STATUTORY CRITERIA RELATED TO GRANTS FROM THE CLEAN WATER MANAGEMENT TRUST FUND FOR WASTEWATER AND STORMWATER COLLECTION AND TREATMENT PROJECTS HAVE PRIORITY OVER CRITERIA ESTABLISHED BY THE BOARD OF TRUSTEES OF THE CLEAN WATER MANAGEMENT TRUST FUND, TO CLARIFY THE AUTHORITY OF THE BOARD OF TRUSTEES WITH RESPECT TO MATCH REQUIREMENTS IN CONNECTION WITH GRANT AWARDS, AND TO ESTABLISH TERM LIMITS FOR THE BOARD OF TRUSTEES.

The General Assembly of North Carolina enacts:

SECTION 1. G.S. 113A-254 reads as rewritten:

"**§ 113A-254. Grant requirements.**

(a) Eligible Applicants. – Any of the following are eligible to apply for a grant from the Fund for the purpose of protecting and enhancing water quality:

(1) A State agency.
(2) A local government unit.
(3) A nonprofit corporation whose primary purpose is the conservation, preservation, and restoration of our State's environmental and natural resources.

(a1) Criteria. – The criteria developed by the Trustees under G.S. 113A-256 apply to grants made under this Article. The common criteria for water projects set in G.S. 159G-23 and the criteria set out in this section also apply to wastewater collection system projects, wastewater treatment works projects, and stormwater quality projects. ~~The common criteria set in G.S. 159G-23 have priority over the criteria set under this Article for wastewater collection system projects, wastewater treatment works projects, and stormwater quality projects.~~ An application for a wastewater collection system project or a wastewater treatment works project that serves an economically distressed local government unit has priority.

(b) Matching Requirement. – The Board of Trustees shall establish matching requirements for grants awarded under this Article. ~~The Board of Trustees may require a match of up to twenty percent (20%) of the amount of the grant awarded.~~ This requirement may be satisfied by the donation of land to a public or private nonprofit conservation organization as approved by the Board of Trustees. The Board of Trustees may also waive the requirement to match a grant pursuant to guidelines adopted by the Board of Trustees.

(c) Restriction. – No grant shall be awarded under this article to satisfy compensatory mitigation requirements under 33 USC § 1344 or G.S. 143-214.11.

(d) Wastewater Limits. – A wastewater collection system project or a wastewater treatment works project is eligible for a grant under this Article only if it is a high-unit-cost project, as defined in G.S. 159G-20. A grant made under this Article for a wastewater collection system project or a wastewater treatment works project is subject to the cost limits and recipient limits set in G.S. 159G-36 for a grant awarded from the Wastewater Reserve.

(e) Stormwater Limits. – The amount of a grant awarded under this Article for a stormwater quality project may not exceed the construction costs of the project. The total amount of grants awarded under this Article to the same recipient for stormwater quality projects for a fiscal year may not exceed the limit set in G.S. 159G-36(c)(1) for grants to the same recipient from the Wastewater Reserve.

(f) Withdrawal. – An award of a grant under this Article is withdrawn if the grant recipient fails to enter into a construction contract for the project within one year after the date of the award, unless the Trustees find that the applicant has good cause for the failure. If the Trustees find good cause for a recipient's failure, the Trustees must set a date by which the recipient must take action or forfeit the grant."

SECTION 2. G.S. 113A-255 is amended by adding a new subsection to read:

"(b2) Limitation on Length of Service. – No member of the Board of Trustees shall serve more than two consecutive four-year terms or a total of 10 years."

SECTION 3. Sections 1 and 3 of this act are effective retroactively to 1 January 2006. Section 2 of this act is effective retroactively to 1 July 2006. This act shall not apply to any person who is a member of the Board of Trustees of the Clean Water Management Trust Fund on 30 June 2006.

In the General Assembly read three times and ratified this the 17th day of July, 2006.

EXHIBIT F

NORTH CAROLINA GENERAL ASSEMBLY

Report on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients

REQUEST FOR PROPOSAL

15 December 2006

Sealed proposals subject to the conditions made a part hereof will be received until **5:00 p.m., Friday 5 January 2007,** for furnishing services described herein. Send all proposals to the following:

George F. Givens, Commission Counsel
Environmental Review Commission
General Assembly of North Carolina
545 Legislative Office Building
300 North Salisbury Street
Raleigh, North Carolina 27603
Phone: 919-733-2578

The contact persons to whom you should direct all inquiries and questions about the request for proposal are George F. Givens and Jeffrey Hudson at the above address. E-mail: georgeg@ncleg.net and jeffreyh@ncleg.net.

NOTE: Indicate firm name, "Technical Proposal" or "Cost Proposal" on the front of each sealed proposal envelope or package, along with the date for receipt of proposals specified above.

Introduction

In accordance with Section 2 of Session Law 2006-215 and pursuant to G.S. 120-70.44(c), the North Carolina Environmental Review Commission (ERC) is seeking a consultant to:

1. Estimate the length of time that the existing North Carolina Nutrient Offset Fee Payments Program (NOFPP) will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen.
2. Study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen in the Neuse River Basin.
3. Study how a total nutrient offset payment fee should be determined.
4. Provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in deciding whether nutrient offset payments should be authorized for additional nutrients, including phosphorus, and whether the NOFPP should be expanded to other river basins, including the Tar-Pamlico River Basin.
5. Evaluate the ability of public entities other than the Environmental Enhancement Program (EEP) and private entities to provide nutrient offsets.
6. Prepare a comprehensive review and discussion of the types of potential nutrient mitigation efforts available.

Qualifications

Potential vendors submitting proposals must demonstrate:

1. Knowledge of and experience with the NOFPP.
2. An ability to estimate the length of time that the existing NOFPP will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen.
3. An ability to determine an accurate cost per pound factor for nitrogen, phosphorus, and other nutrients from point and nonpoint sources based on the cost of providing the appropriate mitigation that is required to offset this additional nutrient loading in accordance with Session Law 2006-215, 15A NCAC 2B .0235, and 15A NCAC 2B .0240.

4. An ability to recommend how a total nutrient offset payment fee should be determined.
5. Knowledge of and experience with nutrient issues in the river basins of North Carolina.
6. Knowledge of and experience with public entities other than the EEP and private entities that are capable of providing nutrient offsets.
7. Knowledge of and experience with the types of potential nutrient mitigation efforts available.
8. The ability to produce clear, well-written, and well-illustrated reports by providing examples of completed projects.

Work Plan

The vendor shall prepare a report that will:

1. Estimate the length of time that the existing NOFPP will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen as authorized in Session Law 2006-215.
2. Contain a proposed cost per pound for nitrogen point and nonpoint source loading in the Neuse River Basin for potential use in the NOFPP.
3. Make specific recommendations as to how a total nutrient offset payment fee should be determined, including any formula and the specific factors that should be incorporated into the calculation of the total nutrient offset payment fee.
4. Provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in deciding whether:
    a. Nutrient offset payments should be authorized for other nutrients, including phosphorous, and present a proposed cost per pound factor for the point and nonpoint source loading from these additional nutrients.
    b. The NOFPP should be expanded to other areas of the State, including specifically the Tar-Pamlico River Basin.
5. Evaluate the ability of public entities other than the EEP and private entities to provide nutrient offsets. This evaluation shall include a determination of whether, in comparison with the EEP, other entities are able to:
    a. Provide nutrient offsets of comparable effectiveness with respect to water quality.
    b. Deliver nutrient offsets in a comparable or shorter time period.

c. Deliver nutrient offsets at a comparable or lower cost.

6. Contain a comprehensive review and discussion of the types of potential nutrient mitigation efforts available.

The vendor shall contact and consult officials from State and local government agencies, interested stakeholders, and other individuals and organizations having knowledge and information about the NOFPP, nutrient issues in the river basins of North Carolina, and nutrient offsets generally. The vendor shall specifically evaluate the analysis of costs for nutrient offsets conducted by the Department of Environment and Natural Resources that was the basis of the Environmental Management Commission's March 2006 amendments to 15A NCAC 2B .0235 and 15A NCAC 2B .0240.

The vendor shall prepare the first phase report by 16 February 2007 and shall complete the entire report, including any revisions needed in the first phase report by 1 May 2007. The vendor shall provide the contracting officer an opportunity to review the draft first phase report one week before it is due and the final report two weeks before it is due and shall take review comments into account when preparing the first phase and final reports. The report shall be prepared in both paper and electronic formats.

In addition to a proposal based on the foregoing schedule, the vendor may propose a study based on an alternate schedule that allows additional time for completion of a thorough study. Preference will be given to proposals that envision completion of a thorough study of the following issues according to the foregoing schedule or in an alternative timeframe that will ensure that the study will be useful to the 2007 Regular Session of the General Assembly:

1. Estimate the length of time that the existing North Carolina Nutrient Offset Fee Payments Program (NOFPP) will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen.
2. Study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen in the Neuse River Basin.
3. Study how a total nutrient offset payment fee should be determined.
4. Provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in deciding whether nutrient offset payments should be authorized for additional nutrients, including

phosphorus, and whether the NOFPP should be expanded to other river basins, including the Tar-Pamlico River Basin.

Report Requirements

First Phase Report

The vendor shall prepare a first phase report that includes:

1. A detailed discussion of the methodology that will be utilized by the vendor to estimate the length of time that the existing NOFPP will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen as authorized in Session Law 2006-215.
2. A detailed discussion of the methodology that will be utilized by the vendor to examine the costs associated with providing nutrient controls and the methods that will be employed to determine an appropriate cost per pound factor for nitrogen loading from point and nonpoint sources.
3. A detailed discussion of the methodology that will be utilized by the vendor to determine the formulation of a fee equation and the factors included in that equation.
4. A review of the methods that will be used by the vendor to assist the ERC in determining whether to include nutrients other than nitrogen and whether to expand the NOFPP into other areas of the State.
5. A review of the methods that will be used by the vendor to evaluate the ability of public entities other than the EEP and private entities to provide nutrient offsets.
6. A review of the methods that will be used by the vendor to prepare a comprehensive review and discussion of the types of potential nutrient mitigation efforts available.
7. Any preliminary findings and recommendations that the vendor determines to be appropriate.

Final report

Self-Sustainability of the Current Nutrient Offset Fee Payments Program (NOFPP)

The report shall include an estimate of the length of time that the existing NOFPP will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen as authorized in Session Law 2006-215.

Examination of Costs Associated with Providing Nitrogen Controls

The report must provide a thorough examination and discussion of the current costs associated with providing nutrient controls that are adequate to offset point and nonpoint source discharges of nitrogen. This examination should include a description of the types of projects that can be implemented to achieve necessary reductions and their respective costs. Because buffer restoration is one of the cost-effective approaches to achieve nutrient reductions, an analysis of the extent of buffer restoration opportunities that may be pursued to achieve reductions should also be included.

Proposed Cost per Pound of Nitrogen

The report shall propose and justify a cost per pound for nitrogen loading from point and nonpoint sources. This cost factor must be sufficient to allow the NOFPP to continue in operation for the indefinite future as a totally self-sustaining program while successfully mitigating all nitrogen loads for which payments are made into the program.

Nutrient Offset Payments for Additional Nutrients

The report shall provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in determining whether nutrient offset payments should be authorized for other nutrient loads, including phosphorus. For any additional nutrients that the report will examine for inclusion in the NOFPP, the vendor shall provide and fully justify a proposed cost per pound factor for loading from point and nonpoint sources of these additional nutrients. These proposed cost factors must be sufficient to allow the NOFPP to continue in operation for the indefinite future as a totally self-sustaining program while successfully mitigating all additional nutrient loads for which payments are made into the program.

Calculation of Total Nutrient Offset Payment Fee

In addition to the cost per pound factors for nitrogen, phosphorus, and any other nutrients that the vendor may examine for inclusion in the NOFPP, the report shall examine and provide a recommendation for the use of a comprehensive formula and the specific factors that will be included in that formula for the calculation of the total nutrient offset payment fee for each option that will be required for nutrient loadings to meet the objectives of the NOFPP. Examples of specific factors that may be considered for inclusion in a comprehensive fee formula might include, but are not limited to:

- **Annual Adjustment Factor:** A factor that may be applied on an annual basis to automatically adjust the cost per pound nutrient factors in order to ensure that these cost factors keep pace with inflation.

- **Land Cost Factor:** A factor that may be included in the total fee equation in order to allow for the incorporation of land costs in the final fee calculation. This factor may be deemed necessary in order to establish a spatial relationship between additional nutrient loading and the mitigation needed to offset that loading.

- **Maintenance Factor:** A factor that may allow the EEP or other State agency tasked with the monitoring and maintenance of mitigation projects to recoup their costs associated with monitoring and maintenance.

- **Administrative Costs Factor:** A factor that may allow the EEP or other State agency, tasked with providing the mitigation funded by the NOFPP to recoup their administrative costs associated with the management of the program.

Regardless of the specific factors included in the calculation of the total nutrient offset payment fee, the vendor must provide the documentation necessary to demonstrate that the proposed total fee calculation method will be sufficient to allow the NOFPP to continue in operation for the indefinite future as a totally self-sustaining program while successfully mitigating all additional nutrient loads for which payments are made into the program.

Expansion to Other Geographic Areas of the State

The report shall provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in determining whether the

NOFPP should be expanded to other areas of the State beyond the Neuse River Basin. The report shall specifically address the expansion of the NOFPP to the Tar-Pamlico River Basin for nitrogen and phosphorus. The vendor shall provide information necessary for the ERC to determine whether to expand the NOFPP to other areas of the State beyond the Neuse River Basin.

Evaluation of Other Nutrient Offset Providers

The report shall evaluate the ability of public entities other than the EEP and private entities to provide nutrient offsets. This evaluation shall include a determination of whether, in comparison with the EEP, other entities are able to:

a. Provide nutrient offsets of comparable effectiveness with respect to water quality.
b. Deliver nutrient offsets in a comparable or shorter time period.
c. Deliver nutrient offsets at a comparable or lower cost.

Types of Mitigation

The report shall contain a comprehensive review and discussion of the types of nutrient mitigation that would adequately protect water quality that could be provided using the fees and cost factors recommended in the report. The report shall include:

1. Figures regarding the design, construction, and 30-year monitoring and maintenance costs of the types of nutrient mitigation.
2. Details regarding the nutrient removal rate for each type of nutrient mitigation that is discussed.
3. An analysis of the availability of the types of mitigation identified in order to ensure the long-term sustainability of the NOFPP.
4. A discussion of the adequacy and effectiveness of each type of nutrient mitigation in achieving reductions in nutrient loading and protecting water quality.

Meetings with Affected Stakeholders

Under the auspices of the Commission Counsel, the vendor will be required to periodically consult with and brief the stakeholders that are affected by, or interested in, this process in order to gather input from these affected parties. In

addition, the vendor may be required to present the First Phase Report, the Final Report, or both to the stakeholder group.

Presentations

The vendor may be required to present a final report to the ERC. The vendor may also be expected to give several presentations of the final report to various other legislative committees.

Project Timeframe

The schedule is listed below:

Activity	Date
Request for Proposals Distributed	15 December 2006
Proposals from Vendors Due	5 January 2007
Award Contract	19 January 2006
First Phase Report	16 February 2007
Final Report	1 May 2007

In addition to a proposal based on the foregoing schedule, the vendor may propose a study based on an alternate schedule that allows additional time for completion of a thorough study. Preference will be given to proposals that envision completion of a thorough study of the following issues according to the foregoing schedule or in an alternative timeframe that will ensure that the study will be useful to the 2007 Regular Session of the General Assembly:

1. Estimate the length of time that the existing North Carolina Nutrient Offset Fee Payments Program (NOFPP) will be able to continue as a completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen.
2. Study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen in the Neuse River Basin.
3. Study how a total nutrient offset payment fee should be determined.
4. Provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in deciding whether nutrient offset payments should be authorized for additional nutrients, including

phosphorus, and whether the NOFPP should be expanded to other river basins, including the Tar-Pamlico River Basin.

Required Contents for Proposal

Please limit the proposal to approximately 10 pages, excluding examples of prior work.

The response to this request for proposals shall consist of the following sections:

(a) Executive Summary – The Executive Summary shall consist of a brief summary of the contents of the proposal.

(b) Corporate Background and Experience – This section shall include:
   (1) Background information on the vendor's organization and details of vendor's experiences with similar projects.
   (2) A list of at least three references, including contact persons and telephone numbers, for whom the vendor has performed similar work.
   (3) Examples of previous work performed.

(c) Financial Statement – The vendor's most recent financial statement or similar evidence of financial stability.

(d) Project Staffing and Organization – This section shall include:
   (1) Proposed staffing, deployment, and organization of personnel to be assigned to this project.
   (2) Resumes of key personnel who will actually be assigned to the project, describing experience with similar projects and the responsibilities assigned to each person.
   (3) A description of how the study will be planned, organized, and conducted.

(e) Technical Proposal – This section shall include, in narrative, outline, or graphical form, the vendor's approach to accomplishment of the tasks outlined in the project description section of this request for proposals. This section shall include a description of each task and a schedule for completion of each task.

(f) Cost Proposal – The cost proposal must be submitted in a separate sealed package and must contain the following information:

(1) Personnel costs, including hourly rates and total hours.
(2) Travel and subsistence expenses.
(3) Fixed, overhead, support, or administrative costs, if any.
(4) Sub-vendor costs, if any.
(5) Other costs.
(6) Total cost for completion of the project.
(7) Rates for any additional analysis that may be requested during the project period.

Proposal Submittal Process

1. The vendor shall submit two original and 10 copies of both the technical proposal and cost proposal, in separate sealed packages.

2. Each original shall be signed and dated by an official authorized to bind the firm.

Vendor Selection Process

The selection of the vendor shall be determined by a "Best Value" methodology, with key factors to be considered to include experience of the vendor and its consultants with related projects and price.

General Conditions Related to Submittal of Proposals

1. Right to Reject
The ERC reserves the unqualified right to reject any and all proposals when such rejection is deemed to be in the best interest of the State of North Carolina.

2. Right to Accept Part of Proposal, Negotiate Content and Cost
The ERC reserves the right to accept part of any proposal, and to divide any proposal into parts deliverable in stages over an extended time period. The ERC reserves the right to negotiate and alter the content, form, schedule, and

deliverables of any proposal or portion of a proposal accepted. The ERC reserves the right to negotiate the cost of any proposal or portion of a proposal accepted.

3. **Time for Acceptance**
Each proposal shall state that it is a firm offer that may be accepted within a period of 30 days from the date of submission.

4. **Unsolicited Proposal Changes**
Any unsolicited change to a proposal that is received after the closing date of this request for proposal will be rejected.

5. **Responsibility to Make Timely Submission**
The vendor is responsible for assuring the timely delivery of a proposal. Late proposals will be rejected without review.

6. **Cost for Proposal Preparation**
Any costs incurred by vendors in preparing or submitting offers are the vendor's sole responsibility. The ERC will not reimburse any vendor for any costs incurred prior to award.

7. **Elaborate Proposals**
Elaborate proposals in the form of brochures or other presentations beyond that necessary to present a complete and effective proposal are not desired. Contractors are encouraged to limit proposals to approximately 10 pages or less (not including examples of work products).

We solicit your cooperation in the efforts of the State of North Carolina to promote sustainability. It is desirable that responses meet the following standards:

- Copies should be printed double sided.
- All submittals and copies should be printed on recycled paper with a minimum post-consumer content of 30% and indicate this information accordingly on the response.
- To the maximum extent practicable, all submittals and copies should minimize or eliminate use of non-recyclable or non re-usable materials.

- Submittals and copies should be submitted in a format which allows for easy removal of recyclable materials and recycling of paper materials.

8. Oral Explanations

The ERC shall not be bound by oral explanations or instructions given at any time during the competitive process or after award.

9. Confidentiality of Proposals

In submitting its proposal the vendor agrees not to discuss or otherwise reveal the contents of the proposal to any source outside of the ERC or its Legislative Services Office staff until after the award of the contract.

10. Form of Proposal

Proposals shall be submitted in a form that may be incorporated verbatim into a contract.

11. Exception to Terms

Any exception, interpretation, or suggestion for clarification by the vendor to any of the terms and conditions of this request for proposals must be clearly stated by the vendor.

12. Competitive Offer

Pursuant to the provision of G.S. 143-54, and under penalty of perjury, the signer of any proposal submitted in response to this request for proposals thereby certifies that this proposal has not been arrived at collusively or otherwise in violation of either federal or North Carolina antitrust laws.

13. Rights to Submitted Proposals

All responses, inquiries, and correspondence relating to or in reference to this RFP shall become the property of the State of North Carolina when received.

14. Vendor's Representative

Each vendor shall submit with its proposal the name, address, and telephone number of the person(s) with authority to bind the firm and answer questions or provide clarification concerning the vendor's proposal.

15. Proprietary Information

All vendors' information submitted in the proposal has the potential to become public information. Vendors are cautioned that any proprietary information contained in the proposal may not be protected as confidential and should not be submitted in response to this request for proposals.

16. Historically Underutilized Businesses

Pursuant to G.S. 143-48, the ERC invites and encourages participation in this procurement process by small contractors, minority contractors, physically handicapped contractors, and women contractors.

Terms and Conditions of Resulting Contract

The following are terms and conditions that will be included in the contract for conducting the project. Other terms and conditions may be added before the contract is signed.

1. Vendor

The contract is between the ERC, subject to the approval of the Legislative Services Commission (Commission), and the selected vendor (Vendor).

2. Contract Period

The terms of the contract shall begin at its signing and shall end on or before 1 June 2007, unless extended or terminated as provided in this document.

3. Availability of Funds

Any and all payments to the Vendor are dependent upon and subject to the availability of funds to the ERC or the Commission for the purpose set out in this agreement.

4. Additional Contract Expenses

The contract for the project is not a time and materials agreement. Any expenses of the vendor in addition to those contracted for, or above the contract amount, are the sole responsibility of the Vendor.

5. Independent Vendor

The Vendor shall be considered to be an independent vendor and as such shall be wholly responsible for the work to be performed and for the

supervision of its employees. The Vendor represents that it has, or will secure at its own expense, all personnel required in performing the services under this agreement. Such employees shall not be employees of, or have any individual contractual relationship with the ERC, the Commission, or the Legislative Services Office.

6. Applicability of State Law Ethics Provisions

Pursuant to G.S. 120C-100(6) and G.S. 138A-3(21), the Vendor is a legislative employee and is subject to the ethics requirements of Chapter 138A of the General Statutes (State Government Ethics Act) that are applicable to legislative employees. These ethics requirements include, but are not limited to, the prohibition on the acceptance of most gifts from lobbyists and lobbyists' principals and the mandatory ethics training required for all legislative employees. If the Vendor is a consulting corporation, the corporation will need to identify the individuals assigned to perform any work undertaken pursuant to any contract between the ERC and the Vendor as individual consultants so that these individuals' names can be provided to the State Ethics Commission for inclusion on the list of legislative employees subject to the lobbying laws. The Vendor shall familiarize itself with these and all other requirements of the State ethics law and shall ensure that it and its individual employees comply with these requirements.

7. Key Personnel

The Vendor shall not substitute key personnel assigned to the performance of this contract without prior written approval by the Commission. The individuals designated as key personnel for purposes of this contract are those specified in the Vendor's proposal.

8. Subcontracting

Work proposed to be performed under this contract by the Vendor or its employees shall not be subcontracted without prior written approval of the ERC.

9. Confidentiality

The Vendor agrees to protect the confidentiality of any files, data, or other materials provided by the Commission and to restrict their use to the purpose of performing the contract. The Vendor shall comply with the provisions of Article 17 of Chapter 120 of the North Carolina General Statutes regarding

confidentiality between the Vendor and members of the General Assembly. For purposes of this paragraph only, employees of the Vendor shall be considered "legislative employees" as defined in G.S. 120-129.

10. Care of Property

The Vendor agrees that it shall be responsible for the proper custody and care of any files or other property furnished by the Commission. The Vendor shall take all steps necessary to safeguard any property, including data, files, reports, or other information from loss, destruction, or erasure. Any costs or replacement expenses, or damages resulting from the loss shall be borne by the contractor when the loss occurred through its negligence.

11. Copyright

No deliverable items produced in whole or in part under this agreement shall be the subject of an application for copyright by or on behalf of the Vendor.

12. Access to Persons and Records

The State Auditor shall have access to persons and records as a result of all contracts or grants entered into by State agencies or political subdivisions in accordance with General Statute 147-64.7. The Vendor shall retain all records for a period of three years following completion of the contract. To the extent that the Vendor acts on behalf of the ERC and the Commission pursuant to the contract, the Vendor shall comply with and take any action necessary to facilitate compliance by the ERC and the Commission with the provisions of Chapter 132 of the General Statutes.

13. Transfer or Assignment

The contract shall not be transferred or assigned to a third party.

14. Termination

Upon mutual written agreement of the ERC or the Commission and the Vendor, the contract may be terminated at any time. Failure to perform by the Vendor may result in termination by the ERC or the Commission. In addition, the ERC or the Commission has the right to unilaterally terminate the contract at its discretion with 10 days written notice. In the event of termination, either by mutual consent or by unilateral action of the ERC or the Commission, the Vendor will be paid an amount commensurate with

work completed and the Vendor shall deliver all work completed prior to the date of termination.

15. Performance and Default

If, through any cause, the Vendor shall fail to fulfill in timely and proper manner the obligations under this agreement, the ERC or the Commission shall thereupon have the right to terminate this contract by giving written notice to the Vendor and specifying the effective date thereof. In that event, all finished or unfinished deliverable items under this contract prepared by the Vendor shall, at the option of the ERC or the Commission, become its property, and the Vendor shall be entitled to receive just and equitable compensation for any satisfactory work completed on such materials. Notwithstanding, the Vendor shall not be relieved of liability to the ERC or the Commission for damages sustained by the ERC or the Commission by virtue of any breach of this agreement, and the ERC or the Commission may withhold any payment due the Vendor for the purpose of setoff until such time as the exact amount of damages due the ERC or the Commission from such breach can be determined. In case of default by the Vendor, the ERC or the Commission may procure the services from other sources and hold the Vendor responsible for any excess cost occasioned thereby. Neither party shall be deemed to be in default of its obligations hereunder if and so long as it is prevented from performing such obligations by any act of war, hostile foreign action, nuclear explosion, riot, strikes, civil insurrection, earthquake, hurricane, tornado, or other catastrophic natural event or act of God.

16. General Indemnity

The Contractor shall hold and save the State of North Carolina, its officers, agents, and employees harmless from liability of any kind, including all claims and losses, with the exception of consequential damages, accruing or resulting to any other person, firm, or corporation furnishing or supplying work, services, materials, or supplies in connection with the performance of this contract, and from any and all claims and losses accruing or resulting to any person, firm, or corporation that may be injured or damaged by the contractor in the performance of this contract and that are attributable to the negligence or intentionally tortious acts of the Contractor provided that the contractor is notified in writing within 30 days that the State has knowledge of such claims. The Contractor represents and warrants that it shall make no claim of any kind or nature against the State's agents who are involved in the delivery or processing of the Contractor's goods to the State. The

representation and warranty in the preceding sentence shall survive the termination or expiration of this contract.

17. Compliance with Laws

The Vendor shall comply with all laws, ordinances, codes, rules, regulations, other provisions of law, and licensing requirements that are applicable to the conduct of its business, including those of all federal, state, and local agencies that have jurisdiction or authority.

18. Equal Opportunity Statement

The nondiscrimination clause contained in Section 202 Executive Order 11246, as amended by Executive Order 11375, relative to equal employment opportunity for all persons without regard to race, color, religion, sex, age or national origin, and the rules and regulations prescribed by the Secretary of Labor, are incorporated herein. The program for Employment of the Handicapped (Affirmative Action) Regulations issued by the Secretary of Labor of the United States in Title 20, Part 741, Chapter VI, Subchapter "C" of the Code of Federal Regulations, pursuant to the provisions of Executive Order 11758 and Section 503 of the Federal Rehabilitation Act of 1973, are incorporated herein.

19. Insurance

The Vendor shall obtain, pay for, and keep in force, for the duration of the contract, worker's compensation insurance, as required by the laws of North Carolina, covering all of the Vendor's employees engaged in any work on the project in the State.

20. Bankruptcy

Upon the filing for bankruptcy or insolvency by or against the vendor, the ERC or the Commission may terminate the contract, and the provisions of paragraph entitled "Performance and Default" shall apply.

21. Performance Bond

The ERC or the Commission may require either a performance bond up to the full amount of the contract or another performance guarantee.

22. Advertising

Vendor agrees not to use the results or existence of the contract, or the products produced pursuant to the contract as a part of any news release or commercial advertising without the prior written approval of the ERC or the Commission.

23. Governing Law

This contract is made under and shall be governed and construed in accordance with the laws of the State of North Carolina.

24. Situs

The place of this contract, its situs and forum, shall be Raleigh, North Carolina, where all matters, whether sounding in contract or tort, relating to its validity, construction, interpretation, and enforcement shall be determined.

25. Schedule of Payments

The Legislative Services Office shall pay the Vendor according to the following schedule:

(a) Fifteen percent (15%) of the total cost for completion of the project within fifteen (15) days after the Vendor delivers the First Phase Report.

(b) Seventy percent (70%) of the total cost for completion of the project within fifteen (15) days after the Vendor delivers the Final Report.

(c) Fifteen percent (15%) of the total cost for completion of the project within fifteen (15) days of the end of the contract period.

The ERC shall request the Legislative Services Office to make payments to the Vendor as provided in this paragraph upon determination by the ERC that the Vendor has satisfactorily completed all work required to be completed under the foregoing schedule.

II. STANDING COMMITTEES

- A. WATER ALLOCATION COMMITTEE
- B. WATER QUALITY COMMITTEE
- C. GROUNDWATER COMMITTEE
- D. AIR QUALITY COMMITTEE
- E. STEERING COMMITTEE
- F. NPDES COMMITTEE

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION (EMC) ACTIONS

I. SESSION LAW 2005-190 REPORTING REQUIREMENTS

Based upon Section 2. (b) of Session Law 2005-190, the Environmental Management Commission continues to assess and identify nutrient control strategies and criteria necessary to prevent excess nutrient loading in each drinking water supply reservoir. In compliance with the goals of the Section, the Division of Water Quality received US EPA approval of a plan of action evaluating the current surface water quality standards to determine if adequate nutrient criteria controls are in place to prevent nutrient impairments in North Carolina lakes. Approval to continue with development of additional or revised lake nutrient criteria was granted by the US EPA on June 27, 2006.

Monitoring is continuing as scheduled in Falls Lake and the Falls Lake watershed and has been extended to September 2007. This extension will cover another growing season to accommodate the collection of adequate chlorophyll *a* data

Modeling tasks associated with this project have also progressed. Work has begun on three of the models to be developed of Falls Lake and the reservoir watershed. As of September 1, 2006, DWQ has a fully executed contract with NC State University to perform hydrodynamic and water quality modeling of Falls Lake. DWQ staff have begun to process data and information for another model, the watershed loading model.

Although Session Law 2006-259 technically corrected the target date for the EMC to develop a nutrient management strategy for the Falls Lake Reservoir from July 1, 2008 to July 1, 2009, the target date for the EMC to adopt the rules to implement the nutrient management strategy by the same date (July 1, 2009) does not allow rulemaking and rule adoption in accordance with the Administrative Procedures Act, General Statutes 150B. The inaccurate date will not interfere with the EMC's goal, however, to be technically correct, the Session Law should be corrected.

The ninth Falls Lake Reservoir Technical Advisory meeting was held on November 1, 2006 at the TJCOG offices. A review of monitoring data collected in 2005 was presented to concerned stakeholders by Peter Caldwell of the Modeling and TMDL Unit, as well as summaries of the current status of the watershed loading model (presented by Narayan Rajbhandari of the Modeling and TMDL Unit), and the lake hydrodynamic model and lake water quality model (presented by Jing Lin of the Marine Earth and Atmospheric Science Department at N.C. State University).

The next scheduled Falls Reservoir Technical Advisory meeting is scheduled for May 15, 2007, 9:30 am at the North Durham Reclamation Facility.

II. STANDING COMMITTEE MEETINGS

i. WATER ALLOCATION COMMITTEE
The Water Allocation Committee did not meet during this quarter.

ii. WATER QUALITY COMMITTEE
The Water Quality Committee conducted business in November 2006.

iii. GROUNDWATER COMMITTEE
The Groundwater Committee conducted business in November 2006.

iv. AIR QUALITY COMMITTEE
The Air Quality Committee conducted business in November 2006.

v. STEERING COMMITTEE
The Steering Committee did not meet during this quarter.

vi. NPDES COMMITTEE
The NPDES Committee did not meet during this quarter.

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION (EMC) ACTIONS

Agenda Item: Hearing Officers' Report on Clean Air Mercury Rules.

Explanation: On May 25 and June 1 and 8, 2006, Dr. David Moreau, Dr. Frank Shaw, and Stephen Smith held public hearings on proposed clean air mercury rules (CAMR).
On May 29, 2005, the EPA promulgated the emission guidelines to limit the emission of mercury from coal fired electrical generation units. The State plan is due November 17, 2006. The EPA will implement its rules in states that do not require affected sources to reduce emissions of mercury necessary to meet the mercury cap in its rules.

These rules apply to (1) any stationary coal-fired boiler or stationary combustion turbine fired with coal-derived fuel serving a generator with nameplate capacity of more than 25 MWe producing electricity for sale and (2) any coal-fired cogeneration unit serving at any time a generator with nameplate capacity of more than 25 MWe and supplying in any calendar year more than one-third of the unit's potential electric output capacity or 219,000 MWh, whichever is greater.

North Carolina received an allocation of 1.113 tons or 35,616 ounces for 2010-2017 and 0.447 tons or 14,304 ounces for 2018 and each year thereafter. These allocations are distributed among the affected sources.
The proposed rules incorporate by reference the EPA guideline rules on definitions, requirements for designated representative and alternate designated representative, permitting requirements, trading and banking provisions, and monitoring and reporting requirements.

Rule 15A NCAC 02D .2511, Mercury Emission limits, requires more stringent new source mercury emission limits than the EPA rules. It also requires reductions in mercury emissions for Duke Energy's and Progress Energy's existing coal-fired boilers.
More than 3000 comments were received. Many commenters supported the proposed rule. Most commenters wanted more reductions than expected under the EPA CAMR guidelines, and they wanted those reductions to occur sooner than required by the proposed rules. Several commenters discussed the health effects of mercury. Some discussed the cost of controlling mercury. EPA recommended several wording changes, which have been made.

The allocations given to the affected sources have been reduced by the new source growth set aside, which is five percent for each year from 2010 to 2017 and three percent for each year from 2018 and each year thereafter. The new source growth set aside has been placed in the new source growth rule.

A copy of the hearing record has been sent to you.

Recommendation: The Hearing Officers recommends that the Commission adopt the proposed rules as presented in Chapter II of the hearing record.

EMC Action: The EMC adopted the proposed rules.

Agenda Item: Hearing Officer's Report on Amendments to Various Air Quality Rules

Explanation: On July 12, 2006, Mr. John Gessaman held a public hearing on the adoption of rule on sales and service of I/M analyzers and amendments to new source performance standard, maximum achievable control technology, recordkeeping and reporting, gasoline bulk terminal, gasoline truck tank, and permitting rules.

The new source performance standards (15A NCAC 2D .0524) and maximum achievable control technology (15A NCAC 2Q .1111) rules are proposed to be amended to delegate the implementation and enforcement of the NSPS and MACT requirements for drycleaners to the Division of Waste Management.

The gasoline truck tank and vapor collection rule (15A NCAC 2D .0932) is proposed to be amended to make clarifications, corrections and updates. The definitions of "bulk gasoline plant" and " bulk gasoline terminal" are corrected. The pressure standard has been updated to the current Department of Transportation standard. The requirements for gasoline truck tanks and for vapor control systems have been more clearly delineated.
The general recordkeeping and reporting requirement rule (15A NCAC 2D .0605) is proposed to be amended to prohibit falsifying information and knowingly submitting falsified information.

The gasoline bulk terminal rule (15A NCAC 2D .0927) is proposed to be amended to add details on leak inspection and recordkeeping and requirements for repairing leaks.
A new rule (15A NCAC 2D .1006) is proposed on the sales and service of analyzers used to test automobile emissions under the inspection/ maintenance (I/M) program. This rule requires vendors to sell or lease only equipment that meet the requirements for on-board diagnostic testing equipment and has the software necessary to record and transmit data required by the Divisions of Motor Vehicles and Air Quality. The rule also requires vendors to make repairs to the hardware and software in a timely manner.

The rule that identifies permits requiring public participation (15A NCAC 2Q .0306) is proposed to be amended. The amendment requires permits with conditions that exempt a source from the 20-percent opacity standard to be noticed for public comment with an opportunity for public hearing. Also, permits using alternative monitoring procedures or methodologies than those specified in the monitoring rules would be noticed for public comment with an opportunity for public hearing.

The Title V permitting definition rule (15A NCAC 2Q .0503) is proposed to be amended to revise the definition of "insignificant activities because of category." Currently the definition does not limit the size of heating unit used for human comfort that is considered insignificant. The amendment considers only those less than ten million Btu as insignificant.

The Title V permit content rule (15A NCAC 2Q .0508) is proposed to be amended to change the requirement to report excess emissions that last less than four hours from two business days to quarterly. (Excess emissions lasting for more than four hours are covered under another rule and are required to be reported by the next business day.)

The Title V administrative permit amendment rule (15A NCAC 2Q .0514) is proposed to be amended to clarify that it is not to be used for the state-enforceable only part of a Title V permit. Administrative amendments to the state-enforceable only part of a Title V permit are to be made using the non-Title V administrative amendment permitting procedures.

One person commented on these rules; this person commented on three rules. The commenter requested clarification of the analyzer inspection criterion in 15A NCAC 2D .1006; clarification has been made that the criterion applies on an analyzer basis. The commenter suggested adding levels and methods for leak determination in 15A NCAC 2D .0927; leak levels and references to rules containing test methods have been added.

The commenter noted that all deviations be reported in 15A NCAC 2Q .0508; the rule as proposed does require all deviations to be reported. Finally, the commenter stated that records need to be maintained for all permit deviations lasting less than four hours in 15A NCAC 2Q .0508; the rule has been revised to re-instate this requirement.

Recommendation: The Hearing Officers recommends that the Commission adopt the proposed rules as presented in Chapter II of the hearing record.

EMC Action: The EMC adopted the proposed amendments and new rules.

Agenda Item: Request for Approval of the Proposed Reclassification of Select Tributaries to the North Shore of Fontana Lake (Swain County, Little Tennessee River Basin) to Class Outstanding Resource Waters (ORW)

Explanation: Session Law 2005-97 (House Bill 1189) states that "The Environmental Management Commission shall initiate a rule-making proceeding...to adopt rules to reclassify the entire watersheds of all creeks that drain to the north shore of Fontana Lake between Eagle and Forney Creeks, including Eagle and Forney Creeks, as outstanding resource waters..." Water quality studies conducted in August 2005 show that the waters proposed to be reclassified meet Class ORW criteria.

Acid-producing rock in the proposed ORW area could be a threat to water quality if waters in the area receive drainage from excavation of this rock. In addition, according to Great Smoky Mountains National Park (GSMNP) staff, there are plans for development in the proposed ORW area that solely consist of potential federal road construction and associated visitor amenities along the north shore of Fontana Lake. In light of these potential threats to the waters' quality and resource values, extra protections are proposed for the subject waters. These extra protections consist of control and treatment of stormwater generated for and by any new development equal to or greater than 5,000 square feet, and addressing runoff from excavation of acid-producing rock.

If reclassified, the standard ORW management strategies, along with the proposed extra protections (for control and treatment of stormwater as well as for addressing runoff from excavation of acid-producing rock), would affect new development projects, new and expansions of NPDES permitted facilities, new USTs, and new DOT projects. Please note that the ORW standard management strategies do not allow new or expanded wastewater discharges, which are not planned for the subject waters, and N.C. Department of Transportation (DOT) regulations for many types of road and bridge activities in ORW watersheds require use of Best Management Practices (BMPs) associated with sediment and erosion control. In addition, available information regarding a potential federal road and associated visitor amenities is very conceptual in nature, and several alternatives for this development are being investigated; therefore, it is difficult to estimate how this new development would be impacted by the proposed reclassification. However, the regulations associated with the proposed reclassification will NOT stop development.

In November 2005, the Water Quality Committee and the Commission approved the request to proceed with rule-making for the proposed reclassification. A public hearing was held in June 2006 in Bryson City, NC. 12 people spoke in favor of the proposed reclassification whereas five people voiced sentiments against the proposed reclassification. During the comment period, 62 letters were received in favor of the proposed reclassification; two of the 62 letters in support of the reclassification were templates that 61 people used to submit letters. Nine letters and a map were also submitted against the proposed reclassification during the comment period; one of the nine letters against the reclassification was also a template that 18 people used to submit letters.

The comments against the proposed reclassification cited several reasons opposing the proposal, which the Hearing Officers subsequently thoroughly considered. The Hearing Officers' Report of Proceedings sent to the EMC includes further details.

Recommendation: The Hearing Officers recommend that the proposed reclassification be approved by the Commission. If reclassified as proposed, the effective date is estimated to be November 1, 2006.

EMC Action: The EMC adopted the proposed reclassifications.

Agenda Item: Request to Proceed to Public Hearing with the Proposed Reclassification of Deep Creek in Person and Durham Counties (Neuse River Basin) to Class Outstanding Resource Waters (ORW)

Explanation: From a review of available data for Deep Creek, which currently carries the Water Supply-III (WS-III) Nutrient Sensitive Waters (NSW) designation, DWQ staff determined that these waters: (a) are a fish community site serving as a regional reference site because of the high quality instream and riparian habitat characteristics, (b) support a very diverse fish community, (c) include a portion of the North Carolina Natural Heritage Program's Flat River Aquatic Habitat, a state-significant site that is home to rare and endangered mussels, and (d) have excellent water quality, as confirmed by the most current (2005) good benthic and excellent fish community ratings. DWQ staff determined the ORW classification to be suitable for recognizing existing uses. This rule change would provide supplementary protection for the resources and quality of the subject waters.

If reclassified, regulations that affect several activities and operations, including development, NCDOT projects, and wastewater discharges, would apply. In the area to be reclassified, there is no known proposed development that would be impacted by the proposal, and no known plans for new or expanded discharges. NCDOT staff have determined that there is at least one planned DOT project in the subject area that would require additional stormwater control devices in order to meet the proposed reclassification's requirements.

The Water Quality Committee approved this request to proceed to rulemaking at their September 2006 meeting. The proposed effective date for this reclassification is September 1, 2007.

Recommendation: The Director and staff recommend that the Environmental Management Commission grant staff permission to proceed to public hearing with the proposed reclassification.

EMC Action: The EMC approved sending the proposed reclassifications to public hearing.

Agenda Item: Request to Proceed to Public Hearing with the Proposed Reclassifications of Unique Wetlands (UWL)

Explanation: On September 13, 2006 the Water Quality Committee approved the Division of Water Quality's recommendation to add the Unique Wetland classification to 33 wetland sites identified by DWQ staff. The 33 proposed UWL sites meet UWL criteria that were developed by a technical advisory committee made up of individuals representing DWQ, NHP, USFWS, other state and federal agencies, private consultants, and academia. The criteria have been used to evaluate an initial set of UWLs on lands owned by willing partners: the Nature Conservancy, the North Carolina Division of Parks and Recreation, and the Department of Defense. The wetlands managed by these agencies are located throughout North Carolina – Mountains, Sandhill, and Coastal Plain. UWLs provide habitat for state or federally listed species. Only public need projects would be permitted in Unique Wetlands and the mitigation required for impacts to such wetlands must constitute the mitigation defined at 15A NCAC 2H .0506 (h) (10).

Recommendation: The WQC and Division staff request permission from the EMC to proceed to public hearing with UWL reclassifications.

EMC Action: The EMC approved sending the proposed reclassifications to public hearing.

Agenda Item: Hearing Officers' Recommendations for the Adoption of 15A NCAC 2H .1020, the Universal Stormwater Management Program Rule

Explanation: Due to the substantial changes recommended by the Hearing Officers to the proposed Universal Stormwater Management Program Rule in the original Report of Proceedings it was necessary, under the provisions of the NC Administrative Procedures Act (APA), to re-notice the proposed, revised rule for additional public comment. Accordingly, the Environmental Management Commission (EMC) re-published the proposed Universal Stormwater Management Program (USMP) Rule to accept comments for an additional 60 days. This re-publication was required as a result of those substantial changes made to the text of the original proposed rule, which was published in the March 15, 2006, edition of the *North Carolina Register*. The substantial change made to the original text is the addition of the impervious surface limitations contained in Paragraphs (d) and (e) of the revised USMP Rule text. The revised rule was re-noticed in the *North Carolina Register* on Sept 1, 2006 for additional public comment until October 31, 2006. The Addendum to the original Report of Proceedings contains all the comments received during this additional public comment period. This Addendum also contains the Hearing Officers Recommendation regarding any further changes to the proposed rule as a result of these comments.

All of the comments and the Hearing Officers' responses to these comments are contained in the Addendum to the Report of Proceedings. The proposed revised rule is also included in this Addendum.

Recommendation: That the Environmental Management Commission adopt 15A NCAC 2H .1020 as recommended by the Hearing Officers in the Addendum to the Report of Proceedings.

EMC Action: The EMC adopted the Universal Stormwater Management Program rules. The rules will allow local governments to accept responsibility for implementing stormwater measures and consolidate up to twelve existing EMC stormwater programs.

Agenda Item: Approval of Water Quality Committee Recommendation Regarding a Site-Specific Variance for the Expansion of the Community Pier of the Windchase Subdivision

Explanation: In accordance with the provisions of 15A NCAC 2B .0226, the EMC will be requested to consider and approve a recommendation from the Water Quality Committee (WQC) regarding the granting of a site-specific variance from the Outstanding Resource Waters (ORW) Standards contained in 15A NCAC 2B .0225(e)(8) for an expansion of the community pier of the Windchase Subdivision in Wilmington, NC.

The activity for which this variance is sought is to add an additional 4 slips to the existing community pier of the Windchase Subdivision. This pier currently contains 14 slips. This variance will allow the expansion of the community pier to a total of 18 slips. As a condition of this variance, the Covenants, Conditions, and Restrictions of the Windchase Subdivision will be modified so that no additional piers or docks, beyond the 4 slips requested in this variance, will be authorized for any existing or future lots in this Subdivision. Furthermore, this variance will require the use of stormwater controls for any proposed development on 4 lots within the Subdivision that are currently undeveloped.

Recommendation: That the EMC consider and approve the WQC's recommendation in this matter.

EMC Action: The EMC approved the site-specific variance.

Agenda Item: Annual Progress Reports on the Tar-Pamlico and Neuse Agriculture Rules

Explanation: The Basin Oversight Committees (BOCs) for these two basins are required to report to the Commission each October on annual progress in implementation of the Neuse and Tar-Pamlico Agriculture Rules (15A NCAC 2B .0238 and .0256 respectively). For crop year 2005, the BOCs received and approved annual reports from 17 and 14 Local Advisory Committees (LACs) in the Neuse and Tar-Pamlico Basins respectively. The two basins report cumulative nitrogen loss reductions from baseline through 2005 above the required 30%. Reductions were accomplished through BMP installation, fertilizer application reduction, crop shifts, and cropland reduction. Separate report documents are provided for each basin from the respective BOCs.

In the Tar-Pamlico Basin, to date the EMC has granted full approval to thirteen local strategies and conditional approval to one. The BOC requests the EMC grant full approval to the last remaining conditional strategy.

Recommendation: That the EMC approve the BOC recommendation on the remaining Tar-Pamlico LAC strategy. Otherwise, no action is required on either report.

EMC Action: The EMC approved the BOC recommendations.

Agenda Item: Request to Proceed to Notice of Text and Hearing on the Ecosystem Enhancement Program Rule Revisions to 15A NCAC 2R .0101, .0201, .0203, .0401 and .0402

Explanation: Through the implementation of wetland and stream restoration projects throughout the state, the NC Ecosystem Enhancement Program has identified the need to adjust the schedule of fees in 15A NCAC .0402 that are applied in the administration of the in-lieu fee program. In addition to the fee revisions, language in the rules will be modified to address the Ecosystem Enhancement Program instead of its predecessor the Wetlands Restoration Program.

Recommendation: Today, the staff is seeking the approval from the Environmental Management Commission to publish the proposed rule text through a Notice of Text and Hearing. Information regarding the details of the proposed fee revisions were mailed to the EMC members for their consideration prior to the meeting today. At their meeting in September of 2006, the Water Quality Committee gave approval to presenting this request to the EMC.

EMC Action: The EMC approved sending the proposed rule revisions to public hearing.

Agenda Item: Request for Approval of Notice of Text and Hearing for Proposed Rules Establishing Secondary Containment Standards for all New and Replacement Underground Storage Tank Systems

Explanation: This is to request the EMC's approval of the Notice of Text and Hearing for proposed rules establishing secondary containment standards for all new and replacement underground storage tank (UST) systems. The proposed rules amend Subchapter 2N of the North Carolina Administrative Code and require that as of August 1, 2007, all new or replacement UST systems must be provided with secondary containment. Secondary containment means that all components of a UST system will have double-walled construction or will be contained within a liquid-tight containment sump. In addition, the double-walled portions of the UST system and the containment sumps will be monitored continuously for leaks. Attachment A portrays a single-walled UST system that meets the current minimum construction standards. Attachment B shows a double-walled UST system that meets the minimum proposed standards for secondary containment. Attachment C provides a summary of the rules and Attachment D contains the full text of the rules.

Purpose of Rulemaking and Rulemaking Authority
Source of release studies sponsored by EPA in 2003 and 2004 indicated that many upgraded UST systems are still leaking. (Upgraded UST systems are those that meet the requirements of the federal upgrade deadline including corrosion protection spill prevention and overfill control.) Further, these studies showed that about 60% of the releases from upgraded UST systems were from piping, dispensers, piping connections, pumps and other ancillary devices. Twelve percent of the releases were believed to come from the tank. Fuel delivery problems accounted for about 19 percent of the releases and the rest were from other sources such as drive-aways. In North Carolina, releases reported from upgraded systems average about 120 per year. Cleanup of these releases is very costly to the tank owners/operators, the state and the public. On average each release costs about $125,000 to cleanup even with the UST risk-based rules. Due to the difficulty of the state trust fund to meet the demands for reimbursement for cleanups, the state can only spend what it receives in revenue. Therefore, it can only direct cleanup at emergency sites and the highest risk sites (about 339 sites) at this time. The directed sites represent only 4% of the 9,000 total active release sites (sites that have not been closed and that require additional assessment/cleanup work).

In response to these data, changes were made in the state statute and the federal law requiring more stringent release prevention measures and prompting this rulemaking request. First, the General Assembly in 2003 (NC Session Law 2003-352) added Section (13) to G.S. 143-215.94T which states that the Environmental Management Commission (EMC) shall adopt standards and requirements for secondary containment for non-tank components of petroleum underground storage tank systems including dispensers. G.S. 143-215.94T is the statute that grants general rulemaking authority to the EMC for the design, construction, installation and monitoring of UST systems and the authority for the Subchapter 2N rules.

Second, the Federal Energy Policy Act of 2005 (enacted August 8, 2005) amends Subtitle I of the Solid Waste Disposal Act (42 USC 6991). It requires that a state receiving LUST Trust Funds must implement one of two additional measures to protect ground water: (1) secondary

containment for new or replacement UST systems installed within 1000 feet of a community water system or any existing potable drinking water well or (2) manufacturer and installer financial responsibility to cover costs of corrective action related to releases caused by improper manufacture or installation. The state must implement one of these provisions by February 7, 2007 in addition to other provisions in the Act or risk losing the federal monies that it receives for the UST program. North Carolina is a state that receives LUST Trust Funds – nearly $2M per year, which pays for 30% of program's salary and fringe (28 FTE) for oversight of the cleanup of releases from regulated tanks. The LUST Trust Funds also pay for alternate water for those with contaminated drinking water where there is no responsible party, the responsible party is recalcitrant or the responsible party is financially unable to pay the costs. In addition, it pays for contractors to perform actual cleanup work on orphan sites.

Please note that North Carolina already has some existing secondary containment rules in place for UST systems installed within 500 feet of drinking water supplies and certain surface water such as Outstanding Resource Water, High Quality water etc. These have been in place since 1991.

Given the existing rules and the new state and federal mandates, DENR has decided that the simplest, most practical, protective, and, in the long run, cost effective approach is to draft rules that provide for secondary containment for new and replacement UST systems at all locations. The rules that are before you will satisfy both the state and federal mandates. They will dramatically reduce the number of releases to the environment and the magnitude of any release that do reach the environment, and will substantially increase protection of the health and welfare of North Carolina's citizens.

Rule Development

The rules were developed as follows. Staff reviewed rules, regulations and guidance of other states such as Florida, New Hampshire, Maine and California that have had secondary containment requirements in place for a long period of time. In addition, staff reviewed rules, regulations and guidance for other states that have secondary containment requirements for UST systems installed near drinking water supplies similar to North Carolina. We reviewed industry standards and codes of practice developed by nationally recognized associations and independent testing groups, organizations such as Petroleum Equipment Institute and American Petroleum Institute. We also looked at UST equipment manufacturers' specifications and recommendations.

In May of 2005, we issued an informal draft of proposed secondary containment rules for review and comment. Reviewers included industry organizations such NC PMA, NC petroleum council, environmental groups such as Clean Water of NC, NC PIRG (Public Interest Research Group), equipment installers and manufacturers both local and national, State Fire Marshal, the PE Board, and representatives from EPA Headquarters, Region 4. The draft was generally well received and many useful comments were submitted and incorporated into this version as appropriate. These rules are based on all of these resources.

The rules are constructed such that all of the information needed to construct, install, monitor and maintain new and replacement systems after August 1, 2007 are contained in new rule 2N .0900. The other amendments are changes to existing rules to ensure that all future secondary

containment upgrades already required by the rules for single-walled UST systems near water supply wells and certain surface waters, will conform to the new standards.

Cost and Impact to Regulated Community
The cost difference between installing a single-walled UST system meeting the current minimum construction standards and installing a double-walled UST system meeting the secondary containment standards is about $10,000. However, nearly all tank owners already routinely install double-walled piping and under dispenser containment and most medium and large sized companies already routinely install double-walled tanks. Therefore the actual impact to the mid- and large size tank owners will be relatively small. However, there are still some small tank owners that continue to install single-walled tanks. For them, the cost to install a new tank will increase by $2,000 to $4,000 per tank. New periodic testing requirements for interstitial sensor operability and sump containment integrity along with overfill control maintenance checks will cost all tank owners about $750 per site per year.

Recommendation: Today, the staff is requesting the Environmental Management Commission's approval of the Notice of Text and Hearing for proposed rules establishing secondary containment standards for all new and replacement Underground Storage Tank (UST) systems.

EMC Action: The EMC approved sending the proposed rule to public hearing.

Agenda Item: Request for Adoption of Rule 15A NCAC 2T .0915, Local Program Approval of Programs for Permitting of Reclaimed Water Distribution

Explanation: In May 2006 the Environmental Management Commission (EMC) adopted 15A NCAC Subchapter 02T and repealed Section 15A NCAC 02H .0200 and Rules 15A NCAC 02H .0122 and .0123. At that time, the hearing officer's recommended, and the Commission approved, that no action be taken on Rule 15A NCAC 02T .0915 until statutory authority was established for the rule. With the ratification of Session Law 2006-250 (House Bill 1413) the Commission now has authority to adopt this rule.

The statutory change consisted of modifying G.S. 143-215.1(f) (Local Permit Programs for Sewer Extension) to include delegation of reclaimed water utilization systems to local governments. The proposed rule is similar to Rule 2T .0306 (Local Programs for Sewer Systems) adopted by the Commission in May, 2006 as part of the overall adoption of Subchapter 2T.

Recommendation: That the Commission adopt Rule 15A NCAC 02T .0915. If approved, the rule would proceed to the Rules Review Commission.

EMC Action: The EMC adopted the rule.

MEMORANDUM

To: The Honorable Pryor Gibson, Co-Chair, Environmental Review Commission
The Honorable Daniel Clodfelter, Co-Chair, Environmental Review Commission
The Honorable Charles Albertson, Co-Chair, Environmental Review Commission

From: William G. Ross, Jr.

Subject: Annual Sedimentation Report

G.S. 1 13A-67 of the Sedimentation Pollution Control Act of 1973 requires the Department of Environment and Natural Resources to report annually to the Environmental Review Commission on the implementation of the Act. Attached is this year's report. If you have any questions, please contact Mell Nevils in the Division of Land Resources, 733-4574.

One NorthCarolina Naturally

Report to the Environmental Review Commission On the Implementation of the Sedimentation Pollution Control Act By the Department of Environment and Natural Resources Division of Land Resources, Land Quality Section

§ 113A-67. Annual report. The Department shall report to the Environmental Review Commission on the implementation of this Article on or before 1 October of each year. The Department shall include in the report an analysis of how the implementation of the Sedimentation Pollution Control Act of 1973 is affecting activities that contribute to the sedimentation of streams, rivers, lakes, and other waters of the State. The report shall also include a review of the effectiveness of local erosion and sedimentation control programs.

The following information is submitted to fulfill this reporting requirement.

Background

Sedimentation is the number one pollutant in the State of North Carolina and in the United States. More stream miles are impaired by sediment than any other pollutant. When the Sedimentation Pollution Control Act became law in 1973, the words of the Preamble proved prophetic. *"The sedimentation of streams, lakes and other waters of this State constitute a major pollution problem. Sedimentation occurs from the erosion or depositing of soil and other materials into the waters, principally from construction sites and road maintenance. The continued development of this State will result in an intensification of pollution through sedimentation unless timely and appropriate action is taken. Control of erosion and sedimentation is deemed vital to the public interest and necessary to the public health and welfare, and expenditures of funds for erosion and sedimentation control programs shall be deemed for a public purpose".* The development of the State has indeed intensified, along with increased land-disturbance and stream sedimentation. The area of land-disturbance covered by approved erosion and sedimentation control plans reached a new record last year at 40,110 acres. This does not cover areas administered by local governments or land disturbances conducted by the Department of Transportation. The actual total number of disturbed sites at any one time under the exclusive jurisdiction of the State Sedimentation Control Program changes daily. As of September 30, 2006, there were 9140 active projects.

Implementation

The Division of Land Resources, Land Quality Section, administers the SPCA within the Department of Environment and Natural Resources. The Sedimentation Control Commission has also delegated administration of the SPCA to 45 county or municipal governments. These local program delegations do not include land-disturbing activities conducted by local, State or United States government or persons with the power of eminent domain (e.g. public utilities), which remain under jurisdiction of the Land Quality Section.

The Land Quality Section has 54 full time equivalent positions (FTE) to handle the administration, plan review, inspection and enforcement of the sedimentation program. In addition, there are 4.5 FTE positions funded through the Express Review program. Most of the personnel are located in the Department's seven regional offices, where they conduct inspections and review erosion and sedimentation control plans.

Regional activities for the 2005-2006 Fiscal Year include:

4870 erosion and sedimentation control plan reviews;
16,516 sedimentation site inspections;
731 notices of violation;
77 enforcement case referrals.

The Land Quality Section Program collaborates closely with the Division of Water Quality's Stormwater Management Program in permitting, inspection and enforcement activities. The Land Quality Section issues the required stormwater permits for construction activities in conjunction with the erosion and sedimentation control plan approval, and performs the compliance inspections for these sites. Any enforcement actions involving stormwater management violations are carefully coordinated between the Land Quality Section and the Division of Water Quality to avoid overlap and to ensure the most effective enforcement.

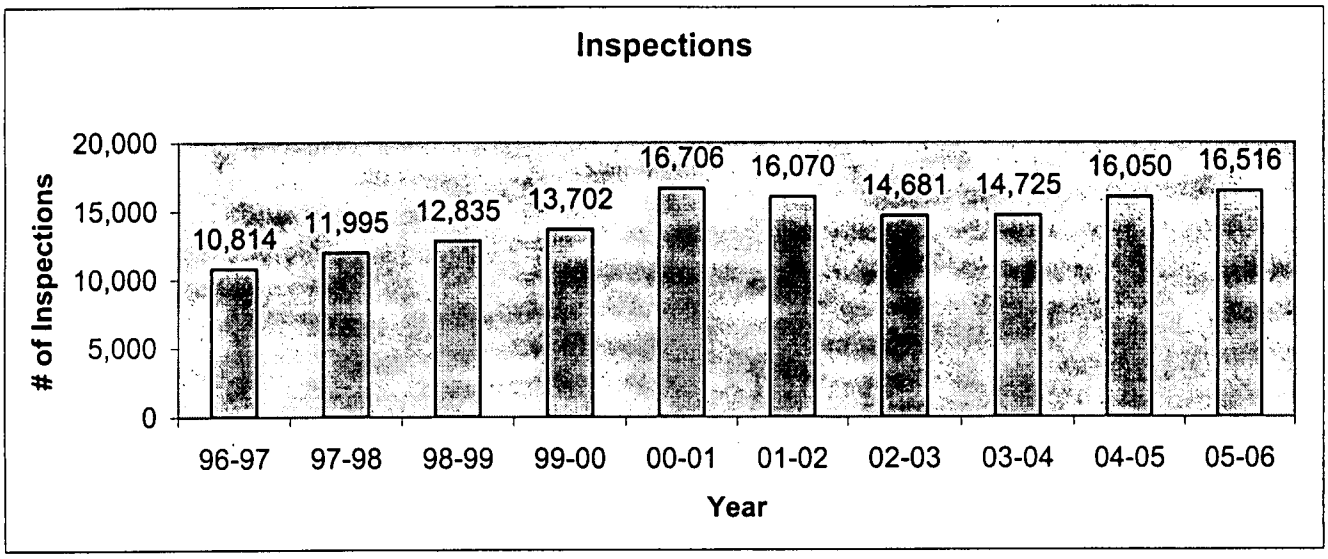
Plan Approval

The SPCA requires a review of the required erosion and sedimentation control plan within 30 days of first submittal or 15 days of resubmittal. Over 90% of the plans are reviewed with 25 days of first submittal and 10 days of resubmittal. However, an Express Permitting program for erosion and sedimentation control plans provides for plan review within three days for an additional fee and is now available at all regional offices. During the 2005-2006 Fiscal Year, 482 Express Permit reviews were performed, of which 164 were done by the Wilmington Regional Office.

Inspection

Land disturbing activities need to be frequently inspected because of the dynamic change that can occur on a construction site. Not only can new areas be affected, but existing erosion and sedimentation control measures can fail from lack of maintenance or be accidentally destroyed by construction equipment. The failure of existing measures can release previously trapped sediment into waterways.

The Land Quality Section is responsible for inspecting approximately 9100 constructions projects in North Carolina. Current staff conducted 16,500 inspections per year in spite of having a vacancy rate of 15-20% for the inspector positions for the year. This results in an average interval of 6.6 months between inspections. If all positions were filled the interval between inspections would be approximately 4.5 months. This long interval results in extended periods of time before violations are discovered result in sediment loss into streams, wetlands and on to adjacent property. Implementation of the SPCA and the State's Erosion and Sedimentation Program to require and maintain compliance is widely impacted by the infrequency of inspections.



Enforcement

Compliance or non-compliance with the SPCA is documented with Sedimentation Inspection Reports. Most violations are addressed by only sending an inspection report to the responsible party. Of the 16,516 inspections conducted during the 2005-2006 Fiscal Year, 731 resulted in Notices of Violations. Approximately ten percent of the Notices of Violation led to additional enforcement action. Enforcement summary statistics are compiled for each calendar year. In 2005, 54 civil penalties were assessed, including 17 for projects started without approved erosion and sedimentation control plans.

Local Programs

Well administered, local government sedimentation programs offer the advantages of inspecting sites more often than the state program, being more geographically accessible to their constituents, and incorporating plan reviews with planning, zoning and building approvals. Currently, 45 local governments have a delegated erosion and sedimentation control program. These include 25 municipal, 18 county and two joint city/county programs.

The Sedimentation Control Commission encourages local governments to administer a delegated erosion and sedimentation control program by providing a model ordinance, cost share funding for start-up and technical assistance. Once a program is delegated to a local government, the Land Quality Section provides periodic oversight to ensure that the local programs are meeting the standards for the state program. State personnel informally assist and advise the local staff on problematic sites. A review of each program is scheduled at least every two years. Land Quality and the Attorney General's Office review the city or county ordinance to ensure that it is as stringent as State law and rules. The Land Quality Regional Engineer and Sediment Specialist and/or their assistants meet with the local program staff during the review. A detailed report is provided back to the local government, noting strengths, deficiencies and corrective actions. A summary report is presented to the Sedimentation Control Commission at its quarterly meetings. The Commission then takes action to continue the

delegation, place the program on probation, or give 30 days' notice that the Commission will assume administration and enforcement of the program.

A new local program was delegated this past year to the Town of Lake Lure and the Town of Wake Forest. Nineteen local program reviews were conducted during the 2005-2006 fiscal year. Three programs were not functioning. Two of them asked the Commission to resume administration of the SPCA in their jurisdiction, and the Commission voted to rescind the other program. Small local governments, including rural counties, have difficulty hiring and maintaining trained personnel. Several local governments are currently working with Land Quality toward requesting the delegation of a program from the Commission.

Current Initiatives

Erosion and Sediment Control Planning and Design Manual

The *Erosion and Sediment Control Planning and Design Manual* revisions were released in June 2006. The manual is published as a loose-leaf book to facilitate insertion of revisions. Revision packets were printed and distributed at no charge to government agencies and design professionals. Standards and specifications for erosion and sedimentation control measures were updated to reflect current technology and provide consistency with adjacent states.

Database Management

Records of erosion and sedimentation control plan reviews and inspections are kept in diverse separate databases in each regional office, complicating statewide data gathering. Land Quality and Information Technology Services are working together to develop an online data management and word processing system that will be used by all offices. Plan reviews, fee receipts, inspections, complaints, notices of violation, local program activity, and NC DOT inspections will be tracked in a single database. The data entry and storage applications have been developed. Report and document generation capabilities have not been completed.

Sedimentation Program Employee Handbook

An electronic employee handbook to update and standardize operating procedures in the sediment program has been completed. The handbook is an electronic document on compact disc with embedded forms, documents and PowerPoint presentations. Standard operating procedures, policies, form letters, memorandum of agreement, memos from DENR and other agencies, and training aids have all been compiled into a single searchable document.

Statutory Amendments

Technical corrections to the appointment of members of the Sedimentation Control Commission were made in Session Law 2006-79. Session Law 2006-250 and Session Law 2006-255 amended the Sedimentation Pollution Control Act. Session Law 2006-250 added a provision to require self-inspection after completion of each phase of a project. The authority of the Commission to exercise

concurrent jurisdiction on local program sites was clarified. A local program delegation limited to site inspections was authorized. Session Law 2006-255 added a fifth mandatory standard to the SPCA requiring that the approved plan must be followed. The broader language of the mandatory standard augments an existing rule that erosion and sedimentation control measures must be installed and maintained according to the approved plan.

Education

Education efforts focused on the publication of *Design Manual* revisions. Four workshops were held for design professionals, along with the annual workshop for local programs. Language in the 2005-2007 budget prohibited training for grading contractors, or research on improving erosion and sedimentation control technology. Resumption of funding for contractor training remains one of the greatest needs of the program. The Clear Water Contractor program had been well received by both the environmental and development communities. Another vital need to the continued improvement of the program is research into improving and developing erosion and sedimentation control measures, practices and BMP's.

Regulatory Issues

Trout Stream Buffer Zone

G.S. 113A-57(1) requires a buffer zone along a lake or natural watercourse of sufficient width to confine visible siltation within the twenty-five percent (25%) of the buffer zone nearest the land-disturbing activity. Waters that have been classified as trout waters by the Environmental Management Commission shall have an undisturbed buffer zone 25 feet wide or of sufficient width to confine visible siltation within the twenty-five percent (25%) of the buffer zone nearest the land-disturbing activity, whichever is greater. Provided, however, that the Sedimentation Control Commission may approve plans which include land-disturbing activity along trout waters when the duration of said disturbance would be temporary and the extent of said disturbance would be minimal.

In a third party appeal of the issuance of such a variance, an administrative law judge granted a summary judgment in January 2006 that essentially ruled that the terms "temporary and minimal" applied to impacts during and after the construction phase whether or not those impacts may cause or contribute to sedimentation. This interpretation would mean that the effect of almost any land disturbing activity resulting in a permanent change in natural cover or topography would not be "temporary and minimal," and hence, no variance could be allowed. Consequently, the Division ceased to issue variances from land disturbing activity that created permanent changes in cover or topography within trout stream buffer areas, pending legal resolution.

Legislative efforts during the 2006 session to better define the terms "temporary and minimal" disturbance within trout stream buffers were unsuccessful. The Sedimentation Control Commission made a final agency decision during their November 16, 2006 meeting overruling the administrative law judge's January 2006 ruling. Pending further legal review of the contested case, the Sedimentation Control Commission directed the Division to return to the Division's earlier practices in applying the "temporary and minimal" variance standard to impacts that may cause or contribute to sedimentation in the review of request for variances for land disturbing activities within trout buffers. In addition, the

Sedimentation Control Commission declared that a project could meet the "temporary and minimal" variance standard when a project redisturbs an area so that the project ultimately reduces sedimentation and the impacts in the trout buffer are first avoided, then minimized, then restored to native vegetation characteristic of an undisturbed buffer as soon as practical after the completion of construction.

CONCLUSIONS

Land disturbance in North Carolina reached another record last year, at over 40,000 acres. New Express Review positions were added, funded by the additional fee charged for the expedited review. No additional inspectors were added to monitor compliance. The average interval between site inspections continues to increase. Delegated local erosion and sedimentation control programs were added in two small municipalities, but three delegations ended. Local governments with limited budgets are not going to fill the compliance-monitoring void that exists. Appropriations and/or additional user fees to fund additional field inspectors are badly needed.

EXHIBIT J

IMPROVING OVERSIGHT OF LANDFILL CONSTRUCTION AND OPERATION IN NORTH CAROLINA

Based on a survey of sixteen eastern states and on the Division of Waste Management's experience regulating North Carolina landfills, DENR has identified a need for improvement in the following areas to better protect public health and the environment:

Adequate Financial Resources for Landfill Operation and Closure

The State must require that business entities applying for landfill permits demonstrate sufficient financial resources and accountability to responsibly construct, operate and maintain a landfill. Given the significant cost of cleanup if contamination is released from a landfill, the State must also ensure that all landfill operators have financial mechanisms in place to provide resources for remediation before a release of contamination actually occurs.

- Permits for landfills should be conditioned upon demonstration of full and sustainable financial assurance, accessible by the Department, for the costs of assessment and cleanup of a release, prior to its occurrence.
- Landfill permits should not be issued to business entities that shield all shareholders and partners from liability for improper operation and closure of the landfill.
- Specific criteria should be adopted to demonstrate that an applicant for a permit for a landfill has the financial ability to carry out the activities authorized by the issuance of a landfill permit.
- Notice should be required of any changes in ownership or corporate structure of an entity holding a permit for a landfill. Authorization should be given to DENR to require new financial qualification and environmental compliance reviews based on those changes and to modify or revoke the permit based on the outcome of the reviews.

Protection of Communities and Environmentally Sensitive Areas

Existing statutes do not require a comprehensive study to evaluate the potential effects of a landfill on nearby communities and on environmentally sensitive areas. The State must require that applications to construct large landfills be given the same level of environmental review as that given to projects requiring an Environmental Impact Statement under the North Carolina Environmental Policy Act.

- An environmental document that meets the minimum requirements for an environmental document under the N.C. Environmental Policy Act (SEPA), including a traffic study, should be required for every large landfill that has the

potential for regional or statewide impacts -- whether the landfill is constructed by a public or private entity.

- Requirements for siting, design, and operation of landfills should be revised to reflect advances in technology and lessons learned by the state regulatory program; reduce potential impacts to more environmentally sensitive areas of the state; anticipate projected increases in waste disposal as a result of population growth; and to ensure that North Carolina citizens benefit from a level of protection of public health and the environment in the operation of its landfills equivalent to that afforded to citizens of other states.

State Franchise Review for Large Landfills

A state franchise must be required for landfills that have extended service areas to insure that both regional and statewide impacts are considered in approval of the franchise.

- A local government's authority to issue a landfill franchise should be limited to franchising the capacity required to meet waste disposal needs within the county where the landfill is to be located. Landfill permits proposed for service areas extending beyond the county in which the landfill will be located should be considered by the State with input from local governments within the proposed service area. State franchise decisions should consider factors such as the need for additional waste disposal capacity; consistency with North Carolina's solid waste management plan; the applicant's ability to ensure compliance with state law affecting solid waste disposal (including bans on disposal of certain types of waste in landfills); and the impact of landfill operation on resources of regional and statewide significance.

Improved Oversight of Landfill Operations

Given the increasing number and complexity of landfill permit applications, the State needs additional resources for permit review and for oversight of landfill operations. The State must also ensure that applicants for landfill permits have a good environmental compliance history.

- A permit and annual operating fee should be imposed on solid waste management facilities to strengthen the regulatory program in the Division of Waste Management.
- In making a permit decision, the compliance history review should extend to every party that would be considered an owner or operator of the landfill under state law. DENR should also be authorized to deny the permit application based on the applicant's total environmental compliance history, including environmental violations not directly related to landfill operation.

Cleanup of Soil and Groundwater Contamination

Past solid waste management practices can present a risk to public health and the environment. The State must provide a source of funding for cleanup of soil and groundwater contamination associated with the hundreds of old unlined landfills across the State. The State must also identify resources to cleanup other sites contaminated by hazardous substances.

- A statewide surcharge for each ton of waste disposed should be placed at landfills to support activities necessary to manage the environmental and public health impacts of solid waste disposal, including cleanup of old landfill sites where there is contamination and cleanup of sites contaminated by hazardous substances where there is no financially viable responsible party.

Municipal Solid Waste Landfills in North Carolina

Winston-Salem, NC 27104

Landfills in North Carolina

- Industry committed to reducing solid waste through various initiatives, including recycling
- Landfill locations decided at the local level
- Process involves public input and control
- Modern lined Subtitle D landfills are safe

Current Process

- Modern landfills located in open and public manner
- Local authorities control location and size of new landfills
- Opportunities for public comment and input

Federal Regulations

Federal law created regulatory structure that governs solid waste management in the United States.

Congress clear state and local governments, not the federal government, had final control over solid waste management.

Federal Regulations

- Federal laws required the US EPA to create regulatory structure for managing solid waste: Subtitle D regulations.
- North Carolina enacted a solid waste management program pursuant to the federal law.

Local Government Permitting

- Subtitle D landfill permitting begins at the local level many years before permit applications are submitted to the NC DENR.
- Cities and counties have authority to approve or deny the construction and operation of the Subtitle D landfill.

Local Government Permitting

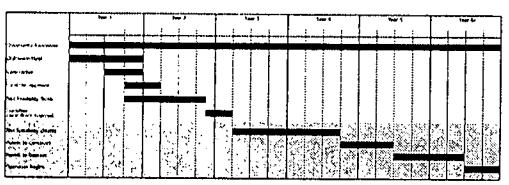
Local approval and permitting includes the following steps:

1. Franchise Ordinance
2. Franchise (Preliminary) Agreement and site identification
3. Zoning and Land-Use Approval
4. Local Government Approval and Final Franchise

Local Government Permitting

- Local permitting process includes at least 7 to 10 public meetings/hearings along with additional public education sessions
- Local permitting costs to private industry can range from $1 million to $3 million
- Many landfill projects do not get past this process (i.e., Franklin, Halifax, Forsyth, Guilford, Duplin, Green, Chatham, Union, Surry and Burke)

Municipal Solid Waste Landfill
Development Timeline Scenario



Local Government Permitting

- Franchise Statute Amendments enacted in 2006 Session to add flexibility and clarity to the franchise process
- Amendments provided that franchise awarded only after public notice of the location of the landfill

Permit application to NC DENR

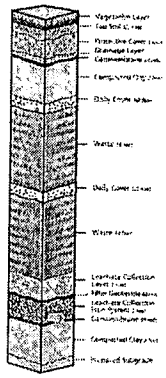
- After local government approval, Site Feasibility Study and Permit Application submitted to Division of Solid Waste
- Permit review involves exhaustive evaluation by state and federal agencies, including Water Quality, Fish and Wildlife, Corps of Engineers, Dept. of Interior

Landfill Design

Environmental safeguards in Subtitle D regulations provide:

- Location restrictions
- Protective liner systems
- Liquid collection systems, surface water management and groundwater monitoring
- Advance technology to manage methane
- Final caps

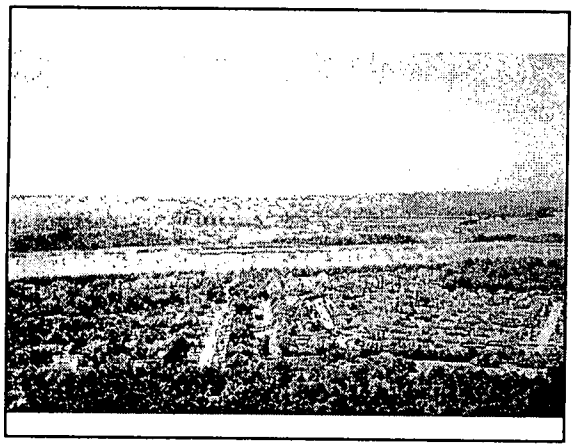
Typical Modern Landfill
Cross Section

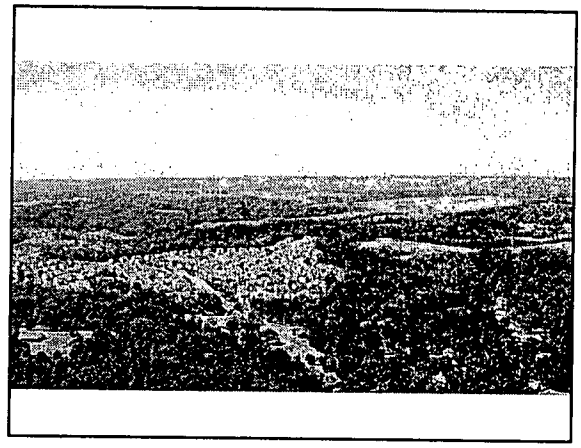


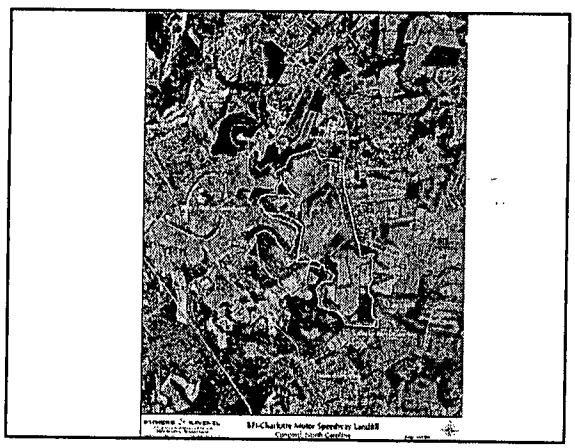
Landfill Design

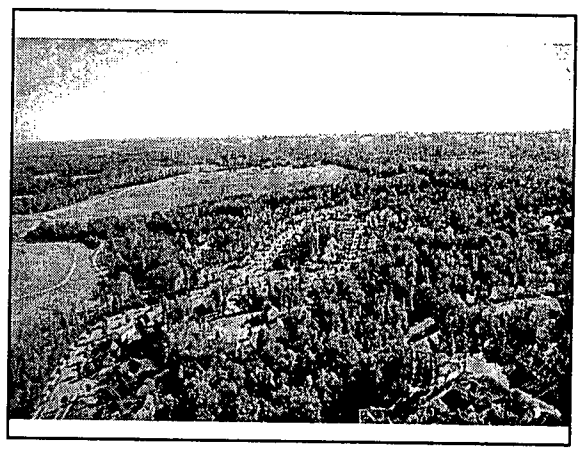
Additional environmental safeguards include:

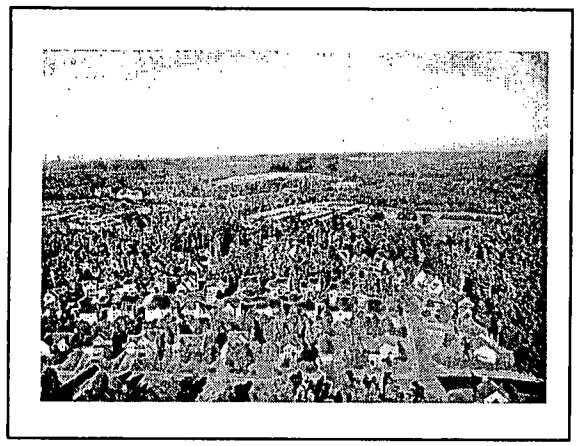
- Long-term monitoring after closure
- Financial Assurance
- Operational qualifications/restrictions

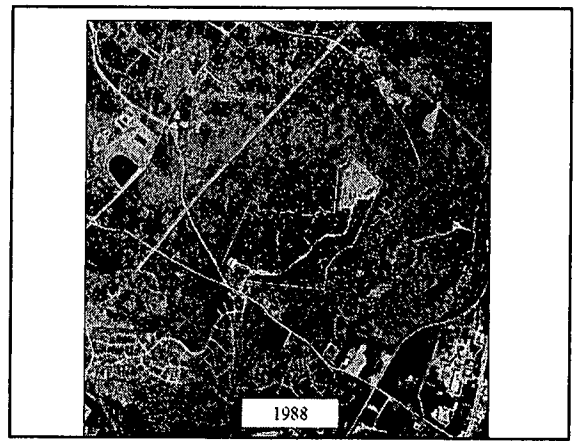




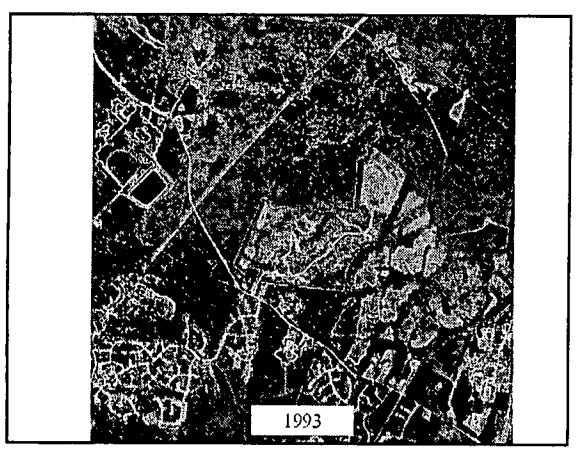




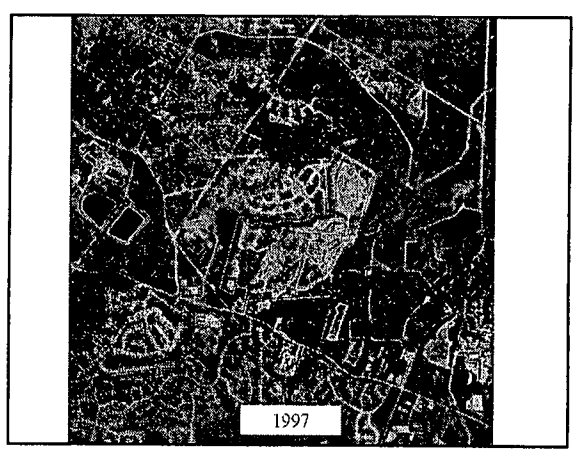




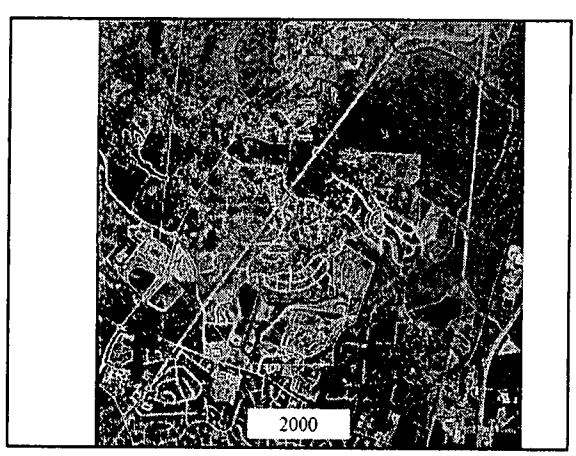
1988



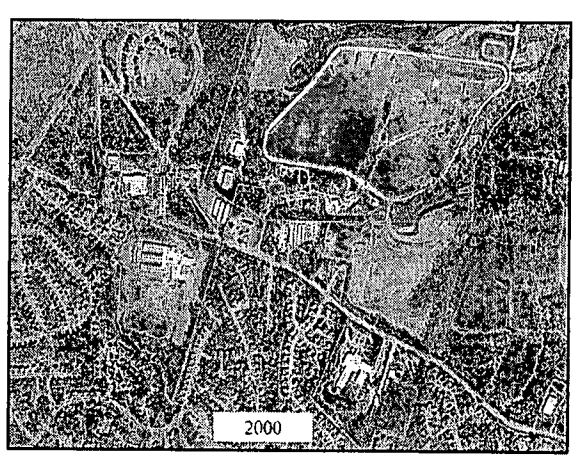
1993



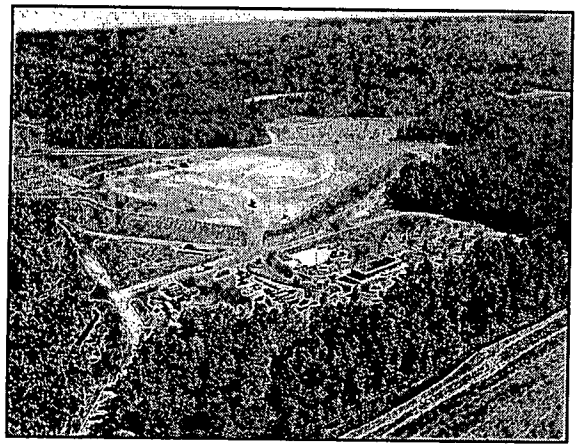
1997

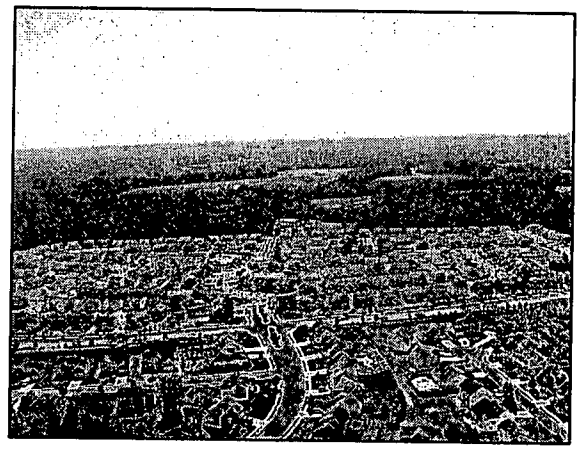


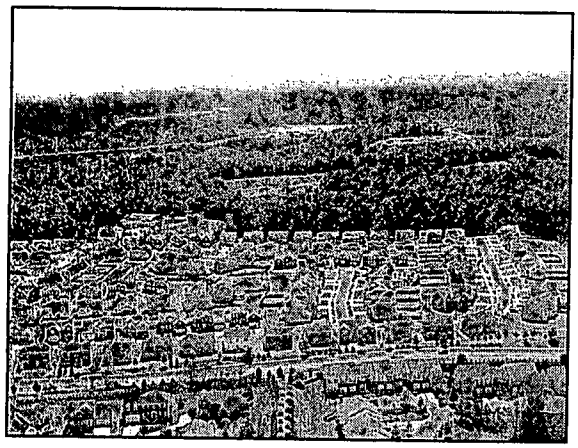
2000

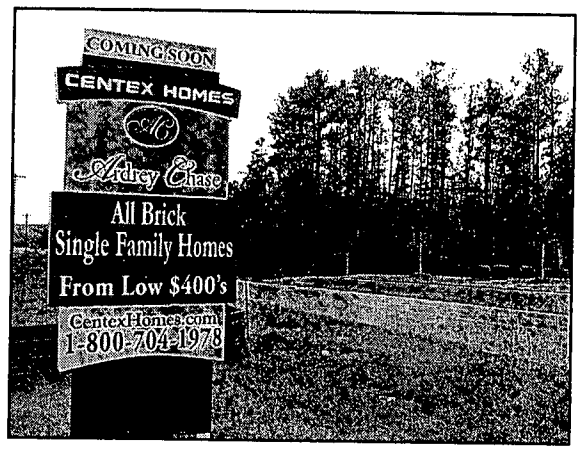


2000









Private Solid Waste Industry in NC

- Annual pay roll over $152,000,000
  Over 3,400 jobs
- Capital In vestment of over $600,000,000
- Annual ho st fees over $6,700,000
- Prope rty tax paid in exce ss of $4,000,000

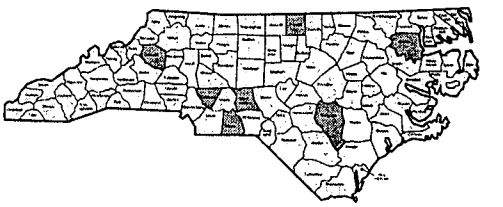
MSW Landfills in North Carolina

- The pri vate solid waste industry operates 7 of the 40 modern lined landfills located in North Carolina
- Bertie
- Samps on
- Pers on
- Anson
- Montgom ery
- Caba rrus
- Cald well

Privately operated Subtitle D landfills

- Private facilities in NC serve principally NC customers
- Represents 40% of the garbage managed by NC

North Carolina Privately Operated
Municipal Solid Waste Landfill



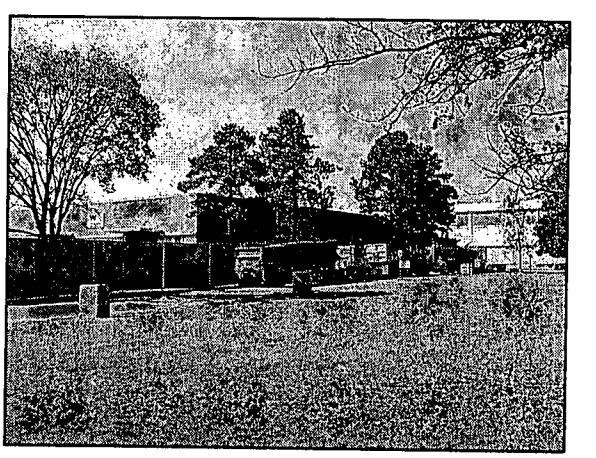
Private Regional
Municipal Solid Waste Landfill

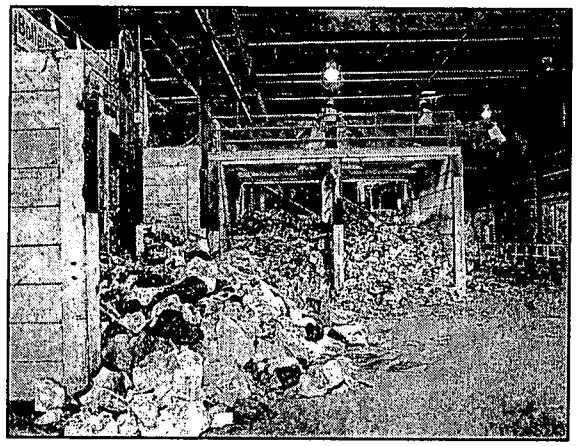
North Carolina Proposed Landfill

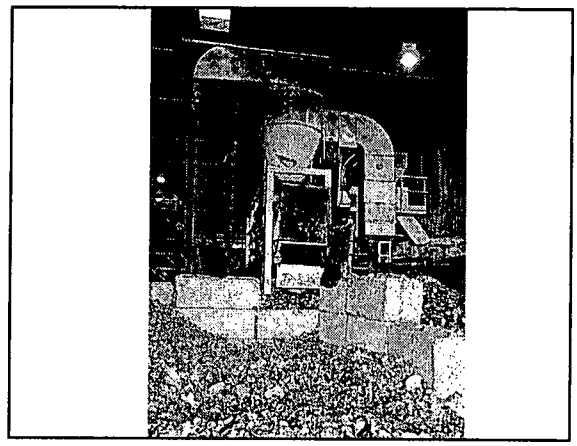
- Municipal Solid Waste
- Construction & Demolition
- Industrial Landfill

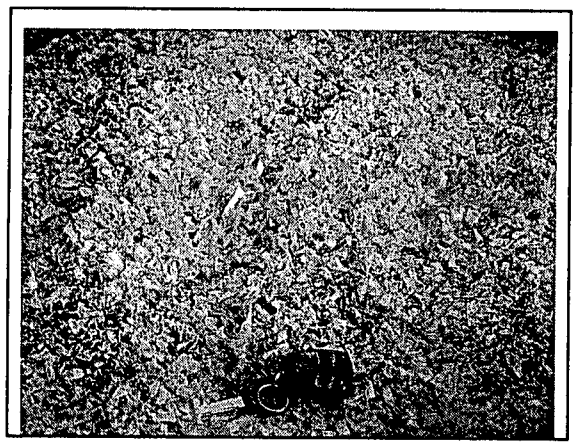
Recycling

- Members of the Solid Waste Industry are some of the largest recyclers
- Major private recycling facilities in NC, including, Raleigh, Conover, Winston-Salem, New Bern, Troy
- Examples, Raleigh MRF 5,200 tons/month
  Uwharrie MRF 1,000 tons/month









Industry commitment

- Industry committed to providing integrated services to assist in the reduction of the waste stream
- No matter how much recycling and source reduction, there will still be a need for Subtitle D landfills for the foreseeable future

Landfill Gas Program

- Twelve North Carolina landfills operate landfill gas (LFG) recovery projects
- The majority of these projects use LFG for heating and steam
- In four cases, the gas is used to generate electricity with a total of 12MW (power needs for @ 9,000 homes).

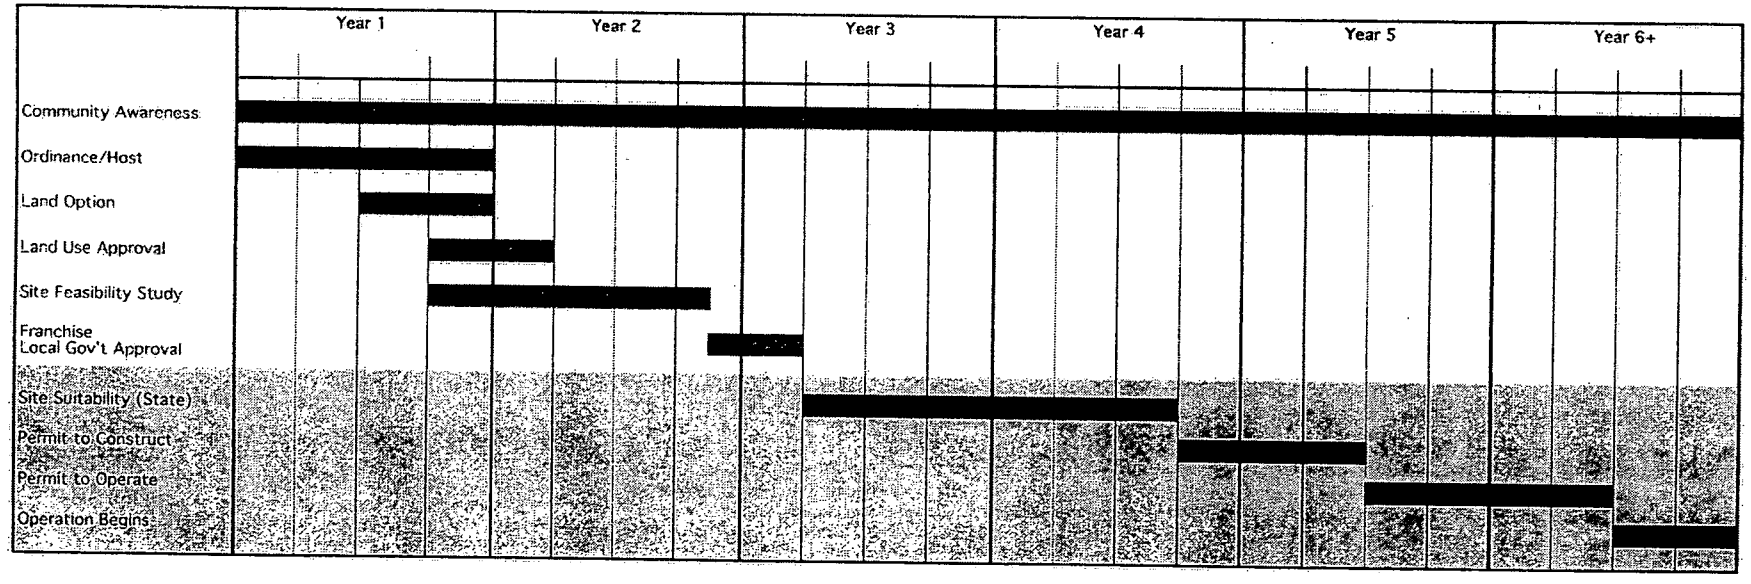
Landfill Safety

- The new modern Subtitle D Landfill is safe
- In the US, no modern Subtitle D landfill has been required to fund any clean-up costs associated with leaks or failures
- In NC, no base liner leaks have been detected from any of the 42 lined facilities permitted since 1990

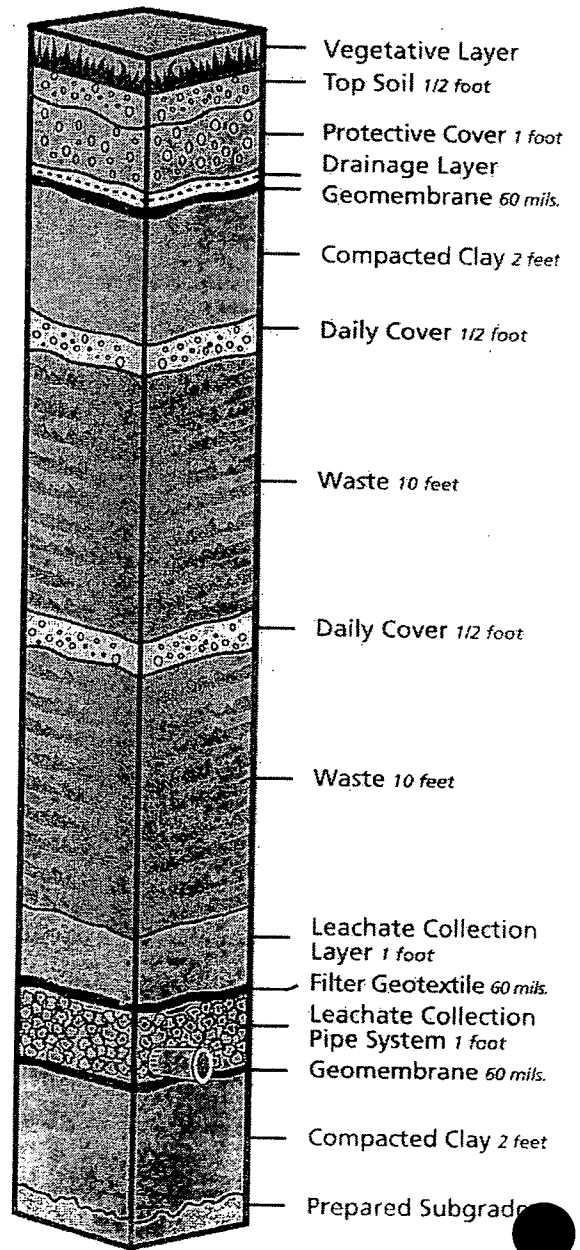
Summary

- Industry is committed to reducing the amount of solid waste going into landfills
- The public controls the current process for locating landfills
- Modern lined landfills are safe

Municipal Solid Waste Landfill Development Timeline Scenario



Typical Modern Landfill Cross Section

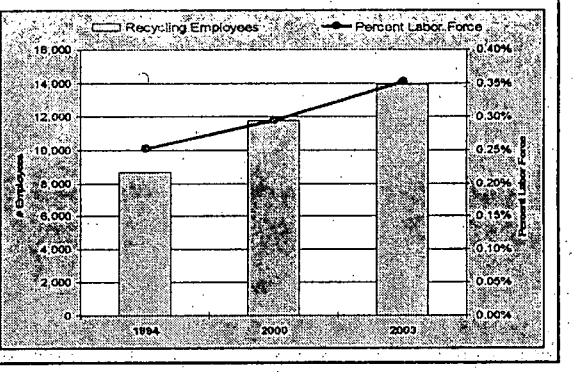


Status of Recycling and Recycling Markets in North Carolina

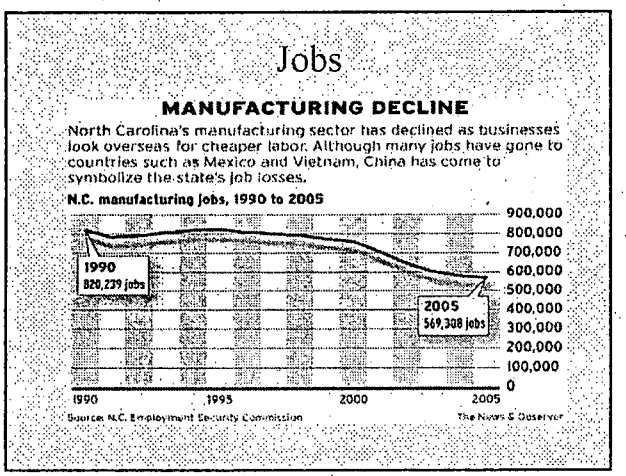
Environmental Review Commission

1/17/2007

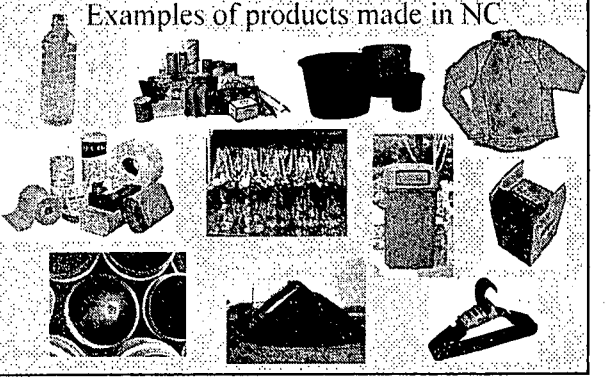
Growth in Recycling Jobs in NC



Jobs



Recycling Essential to NC Manufacturers – Examples of products made in NC



Problem for Economic Growth: Global Warming

- Nicholas Stern, former World Bank chief economist and currently head economist with the British Treasury:

Unabated climate change will cost as much as 20 percent of the global GDP and could lead to an economic upheaval on the scale of the 1930s Depression.

Recycling Markets

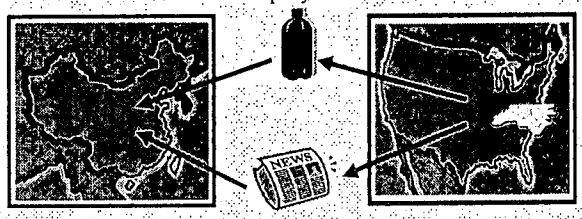
- Demand for recyclable materials is steadily rising.
- Manufacturers relying increasingly on recycled commodities, in the U.S. and around the world.
- The number of recycling companies in North Carolina is growing and able to handle more material.
- Rapid growth in some market areas – e.g., electronics, plastics.
- Slower growth in other areas: e.g., construction waste.

Role of Waste/Recycling in Global Warming

- Landfills account for 37% of human-generated methane emissions - methane 21% more effective at trapping heat than carbon dioxide.
- Recycling reduces greenhouse gases through landfill diversion, and through energy and resource conservation.
- Local government recycling efforts in NC reduce the equivalent greenhouse gas emissions of over 400,000 cars/year.
- Increasing local recycling tonnage by 25% would remove the equivalent of another 100,000 cars

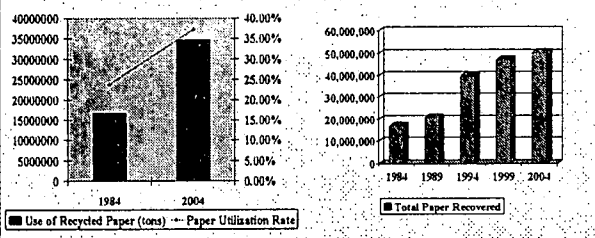
China Consuming More Recyclables

- 37% of recycle PET bottles going to China
- 400 million lbs. per year



- Over 40% of China's imported recovered paper comes from the U.S.
- $100 million in paper exported to China from U.S. ***per month***
- China building 16 million tons of recycled paper capacity by 2010

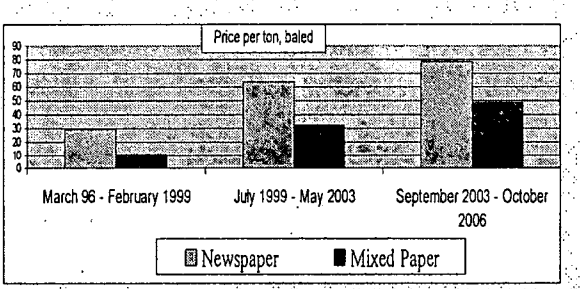
The Remarkable Story of Paper



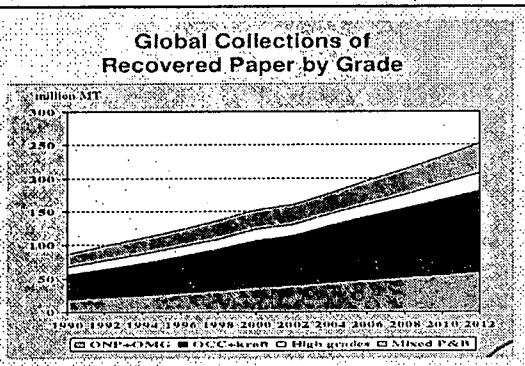
- 78 percent of U.S. paper mills rely on some amount of recycled fiber

Recycling Market Prices since March 1996

Prices per ton received by major processors in NC from mills



Global Collections of Recovered Paper by Grade



Global consumption of recycled paper expected to rise steadily – increase of 25% in next 6 years.

Data courtesy of Moore & Associates

Every year, North Carolina landfills over *1.26 million tons* of recyclable paper

Estimates of disposed tonnage:

Newspaper	123,000
Cardboard	300,000
Magazines	65,000
Office Paper	248,000
Mixed Paper	460,000
Telephone books	18,000
Milk Cartons	16,000
Books	31,000

- Approximate market value of disposed paper: ***$50,000,000/year***

Aluminum

- Aluminum industry has heavy presence in southeast – Novelis, Wise, Alcoa.
- Industry **needs** 20% more material, or 150,000 tons of additional cans - over 6 times what we dispose in NC.
- Market value of what we dispose in NC:

$20 million/year

Electronics

- One of fast growing part of the solid waste stream – approximately 77,000 tons generated per year.
- Some counties running very good electronics collection program – increasing public interest in recycling options.
- Overall, collection programs growing slowly - limited by funding.
- Dell/Goodwill collection program helpful but limited to computers and to western part of state.
- State funding source would accelerate collection dramatically and feed expanding markets.

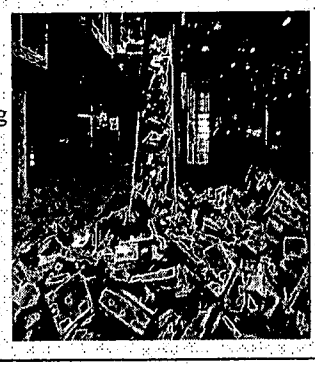
Plastics

- North Carolina home to largest mixed bottle recycling plant in U.S.
- North Carolina hosts the second largest HDPE recycler in the U.S.
- Many other recyclers of post-consumer and post-industrial plastics in North Carolina.
- Plastics recycling involves skilled labor and sophisticated technology, like optical sorting.
- We still throw away 80% of our plastic bottles in North Carolina – market value approx:

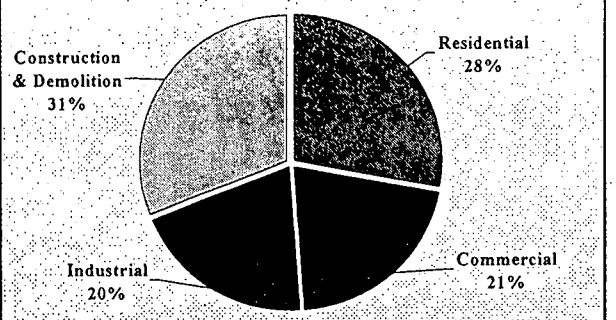
$23 million/year.

Electronics

- Markets for electronics are excellent.
- Over 30 companies in North Carolina collecting and/or processing electronics.
- Investments include new $4 million shredder at GEEP in RTP.
- Recyclers need more material

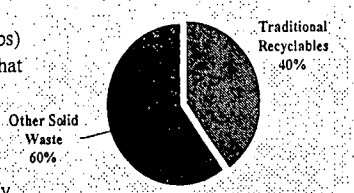


Sources of Waste in NC

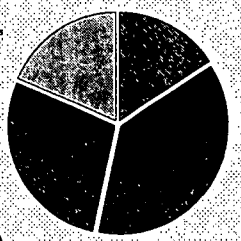


Household Generation

- Estimated tons of solid waste generated per household: .94 (1,880 lbs)
- % of household waste that are recyclables: 40%
- Recyclable lbs. per household: 745
- Average program is only collecting 226 lbs per household served



North Carolina Waste Diversion Potential



Disposables
Diapers, fines and misc. organics, treated lumber, etc.

Traditional recyclables
Paper, bottles & Cans, etc.

Materials with some diversion potential
Furniture, Some C&D, some industrial waste, etc.

High Potential Materials
Wood waste, Food waste, electronics, some C&D, film plastics, etc.

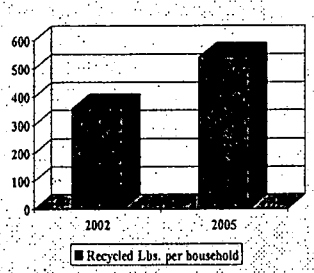
With the right programs, incentives, and funding in place, over half of North Carolina's waste stream is divertable from disposal.

Local Government Recycling Efforts

- City and county programs performing steadily, but most could be improved.
- Improvements needed include:
  - increasing participation
  - collecting a wider range of materials
  - modernizing collection systems
- Local programs need motivation/incentives to improve.

Municipal Success Story: Brevard

- Suspended program in 2003; reinstated in 2004
- 2005 recycling rate of 540 lbs/household – 50% greater than in 2002.
- **$22 per-ton cheaper to recycle than to collect and dispose of solid waste.**

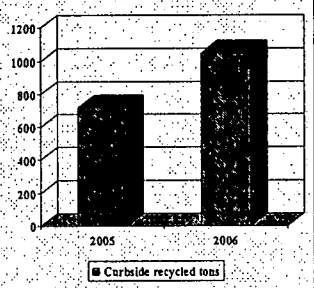


Recycling success in rural NC

- Study completed for Perquimans, Chowan, and Gates (PCG) counties showed ***recycling saves the counties a net $79 per ton.***
- 10 of top 15 recycling counties in NC are rural – Dare, Macon, Swain, Alleghany, Watauga, Craven, McDowell, Iredell, Transylvania, Stokes.
- Access to markets for rural counties has improved.

Success Story: Kernersville

- Program changes in 2005:
  - Added materials
  - Began commingling, using carts
  - Conducted broad public education campaign
- Household recycling tons **increased 45% from 2005 to 2006**



Options for Increasing Recycling in North Carolina

- Enforce the current and pending material disposal bans.
- Enact additional bans if enforcement is improved.
- Increase funding for recycling grants and public education.
- Set and enforce performance standards for local recycling programs.

Options for Increasing Recycling in North Carolina

- Require and/or provide incentives to private haulers to offer recycling services to customers.
- Provide strategically targeted tax credits to increase the diversion of large waste streams, such as food and wood wastes.
- Enact an advanced recycling fee on electronics and establish a comprehensive statewide recovery system.
- Increase the commitment of citizens, governments, businesses, institutions, builders, and industry to recycling.

Recycling Means Business!

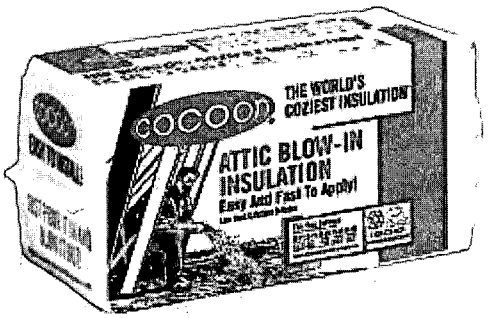
Introduction



The insulation in your attic. A glass pickle jar in your cupboard. The pots your flowers came in. The cardboard box in your storage closet. The detergent bottle in your laundry room. The 1,000-piece puzzle you never completed. The red-dyed mulch you put under your trees. The soft drink bottle in your fridge. The litter in your kitty's box. Just about any piece of metal you touch. The newspaper you read this morning. The carpet under your feet. The tissue in the bathroom. The cereal boxes in the pantry. The wheels that roll your garbage cart. The composted topsoil in your garden.

What do all these things have in common? The journey of these products to your home started in your community's recycling program and North Carolina businesses helped make it happen. An amazing array of companies across the state help turn discarded materials into everyday things, all the while creating jobs for our citizens and investment in our economy. In fact, North Carolina's "recycling economy" is one of the fastest growing job engines in the state. The recycling economy in North Carolina is dynamic and a picture of diversity. It includes:

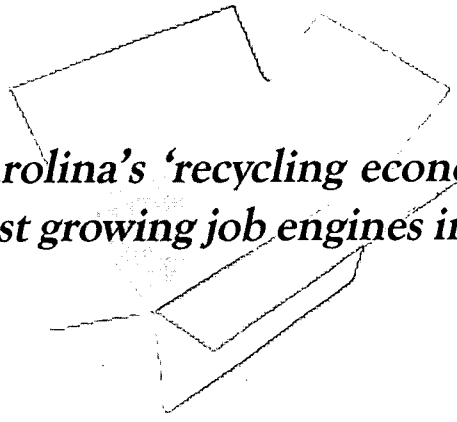
- Fortune 500 firms operating major manufacturing facilities in rural counties.
- A computer recycler bringing life and jobs back to an old textile mill.
- A plastics recycler using sophisticated, patented technologies to sort processed materials.
- A fast-growing compost company providing beneficial soil amendments to farmers in eastern North Carolina.
- A woman-owned collector and processor of commercial recyclables serving Triangle businesses.
- A small, family-owned paper processing business recently passed down to the second generation.
- A manufacturer of fine wood flooring who has integrated recycled materials into a new product line.

How can we help our fellow North Carolinians whose livelihood depends on recycling? The first answer is easy – recycle! These companies need material, and it does them no good if it's in a trash can or Dumpster. Empty bottles and cans, old computers, wooden pallets and discarded office memos buried

Recycling Means Business!

30 feet in a landfill rob our recycling employers of valuable feedstock. Every household, business, industry and government agency in North Carolina can help these companies grow and hire more people by making a commitment to recycle as much material as possible.

North Carolina can also help create and maintain a business climate that supports the success of recycling companies. Local communities and the state can help with policies, programs and incentives that drive materials out of the waste stream and into the hands of recyclers. Some recyclers struggle to compete against relatively low tipping fees to get materials. Access to capital can be improved. Maintaining a strong network of technical, economic development and business planning assistance can give companies a strong foundation for expansion and improvement. A need exists to raise public awareness of the recycling economy. Waste generators, decision-makers and the public should know about the economic development and waste diversion opportunities that recycling companies offer. Ultimately, what many recyclers need most is more supply, and it will take a concerted and broad-based effort to keep materials flowing their way.



"North Carolina's 'recycling economy' is one of the fastest growing job engines in the state."

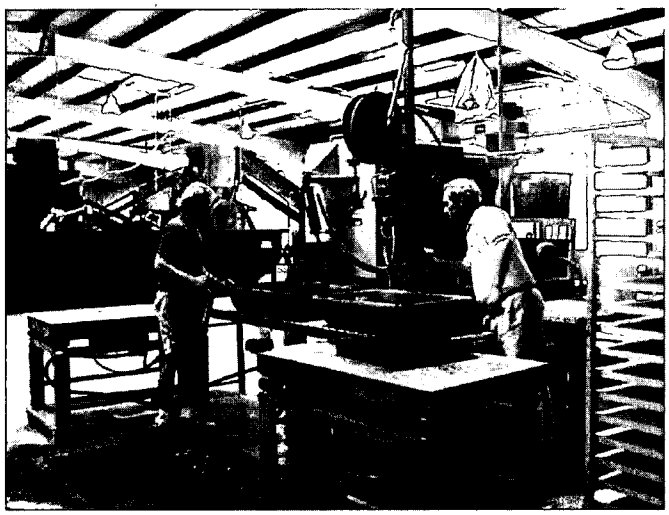
This document provides a snapshot of the many faces of North Carolina's recycling industry. The 42 companies featured here are just a few of the literally hundreds of recycling firms in the state. They demonstrate the idea that protecting the environment and creating jobs can be accomplished together. What's good for the planet can also be good for the economy, and North Carolina's recycling companies are poised to make North Carolina a national leader in making it happen.

Recycling Means Business!

Recycling's Job Impact

The N.C. Division of Pollution Prevention and Environmental Assistance recently conducted a survey to track recycling's impact on jobs and the North Carolina economy. This survey follows up on a similar effort conducted in 1994 and documents the growth of the recycling industry over the past decade. (A copy of the full study can be found at: http://www.p2pays.org/ref/34/33911.pdf.) Some of the findings include:

- Recycling employs approximately 14,000 people across the state.
- In 1994, recycling employed 8,700 people, rising 60 percent in 10 years to reach its current level.
- Recycling jobs as a percentage of the state's total employment has increased 40 percent in 10 years, from 0.25 percent of the total labor force in 1994 to 0.35 percent in 2004.
- Fifty-four percent of the businesses surveyed forecast creating more recycling-related positions in the next two years.
- Recycling employs more people than the bio-tech and agricultural livestock industries in North Carolina.
- The number of companies listed in the state's recycling markets directory has increased from 306 in 1994 to 532 in 2004, a 74 percent increase.
- Recycling companies in North Carolina range from Fortune 500 manufacturers to single proprietary, family-owned businesses, handling hundreds of different types of materials and products. Some of these companies now occupy old textile factories and other industrial plants abandoned by some of the state's more traditional industries.



Elizabeth City Glass employees transform glass bottles into patio pavers and other valuable products.

Recycling Means Business!

Recycling Means Business!

Jackson Paper employee monitors master controls in its recycled paper-making operation.

The recycling industry can be expected to continue its growth in North Carolina, with expansion of existing firms, the advent of new companies and a rising level of employment in this sector. The chief obstacle to growth is access to materials that are currently being thrown away and sent to landfills. Some of the ways that North Carolina can foster the development of its recycling companies include:

- Enhancing the performance of local government recycling programs.
- Increasing the commitment of businesses, industries and the public to recycling.
- Addressing the relatively cheap cost and ease of disposal as a disincentive to recycling.
- Considering local or statewide disposal bans on materials that are needed by the state's recyclers.
- Providing funding to recycling collection efforts through mechanisms such as advanced recycling fees.

Every North Carolinian - at home, work or play - can participate in growing jobs through recycling. Recyclers are in towns and cities all around the state, they're hungry for more material, and if they get it, they can hire more people and increase their investment in our communities.

Recycling employs more than 14,000 North Carolinians and recycling jobs have increased about 60 percent in the last ten years.

Recovering the "Waste Stream"

North Carolina's waste disposal has been on an upward climb. Landfills serving the state received 6.8 million tons in 1991; by 2004 that number was 10.6 million tons, a rise of 56 percent. Some of this upsurge has been fueled by population growth, but the waste stream has also grown on a per capita basis, from 1.01 tons per capita in 1991 to 1.27 tons in 2004.

In using the term "waste stream," however, it is easy to forget that the vast majority of what is disposed is highly usable material. An office memo, a plastic bottle, a cardboard box, a wooden pallet, leftover food, a computer - these are all commodities desired by the growing North Carolina recycling industry and feedstock to supply the rising demand for secondary resources. These resources only become "waste" when we make the mistake of putting them in a garbage can or Dumpster.

"... when materials switch from waste to recycling, businesses grow, money is invested in communities and people find jobs."

What, then, are the major recoverable materials in the disposal stream? Below is a sampling of "wastes" that North Carolina recyclers can easily turn into commodities:

Paper: Newspaper, office paper, cardboard, magazines, chipboard - these are all paper "grades" in growing demand by foreign and domestic paper mills (including five mills here in N.C.). The estimated 1.8 million tons of paper discarded in North Carolina represent tremendous business opportunities for collectors, processors and end users of this material.

Aluminum Cans: Arguably one of the most valuable of all recyclables, and subject to a statewide disposal ban, as much as 25,000 tons of aluminum are still thrown away in North Carolina each year. Market value of the discarded material is approximately $25 million.

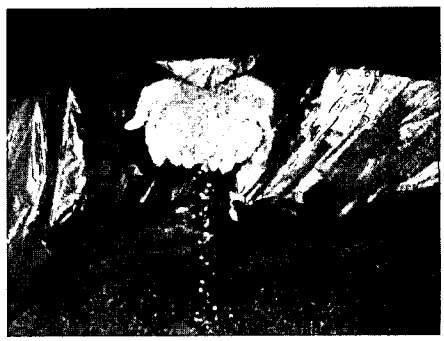
Wallboard: Gypsum discarded from building sites across the state has useful agricultural properties, and can be used as feedstock for compost and animal

Recycling Means Business!

bedding. Three hundred thousand tons of this material await diversion into value-added products in North Carolina.

Food Waste: Almost a million tons of food enters North Carolina landfills annually, but food rescue agencies and composters are starting to make a dent in this disposal. Some of the state's high-profile grocery chains and the North Carolina Farmers Market are among the early leaders in diverting food wastes, working with commercial composters in the Triangle region.

Plastic bottles: Few states are better poised to divert plastic bottles to beneficial use than North Carolina, with a number of nationally prominent processors and end users located in our state. The expanding appetite for recyclable resins by domestic and export markets makes it possible to divert all of the 87,000 tons of plastic bottles discarded in North Carolina each year.



At Envison Plastics, flakes are pelletized according to clients' specifications - like Downy® Blue or Gain® Green.

Wood and Pallets: Arguably the "lowest hanging fruit" of the disposed stream, waste wood and pallets are experiencing a steady, large-scale growth in demand from a wide range of businesses. Pallet repair companies, wood fuel users, composters and wood flooring manufacturers could divert more than 500,000 tons of this material annually.

Electronics: The rapidly expanding use of computers, televisions, cell phones and other gadgets will present a waste diversion challenge to North Carolina. Fortunately, the state already has electronics collection and processing companies ready to handle all the material they can get their hands on, including the 50,000 tons annually generated in North Carolina.

Glass: The use of recycled glass, or cullet, to make new bottles and jars saves glass manufacturers a large amount of energy and improves their profitability. Recovering more glass can help the plants in North Carolina stay competitive, and can feed other smaller businesses making value-added products from cullet.

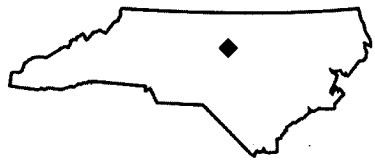
Recycling Means Business!

The waste stream is a potentially rich source of materials that can be put back to work for the North Carolina economy. The bottom line is that when materials switch from waste to recycling, businesses grow, money is invested in communities and people find jobs.

Recycling Means Business!

The Impact of Recycling on North Carolina's Economy

RECYCLING COMPANY PROFILES



Brooks Contractors

Brooks' unique truck design has helped it expand its food collection services.

Judy and Dean Brooks own and operate one of North Carolina's largest state-permitted composting facilities. In 1992, Chatham County's Brooks Contractors began accepting organics on its 30-acre facility to process into a valuable compost product. Brooks started out with only two employees, a couple of customers and a few hundred tons of organics to process. Today, Brooks has a substantial customer base, more than 55,000 tons to process each year, a fleet of trucks, 12 full-time and a few part-time employees.

In the late 1990s, Brooks began offering collection of food waste to grocery stores, restaurants, microbreweries and cafeterias in Orange County. Food collection expanded quickly from 700 tons the first year to more than 24,000 tons from Orange, Wake, Durham and surrounding counties. Brooks has made major contributions to the food collection and composting industry. The company designed a collection truck that provides several functions not found on a typical waste hauling truck. The truck weighs the container before and after dumping its contents into the truck. The truck is also equipped with a high-pressure water system that allows operators to clean out and sanitize each collection container after dumping. This valuable and unique feature has been critical to making the food collection service a success by nearly eliminating odor and fly complaints.

"Brooks has a substantial customer base, more than 55,000 tons to process each year, a fleet of trucks, 12 full-time and a few part-time employees."

In addition to its original compost, Brooks has expanded its product line to include more than eight different products, including topsoils, flower bed mix and other compost blends to meet varied landscaping and agricultural needs.

For more information about Brooks Contractors, contact Judy Brooks at (919) 837-5914, e-mail: brooksco@centernet.net.

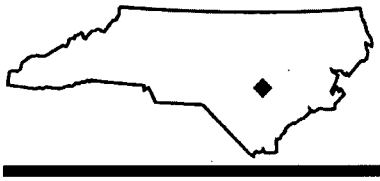
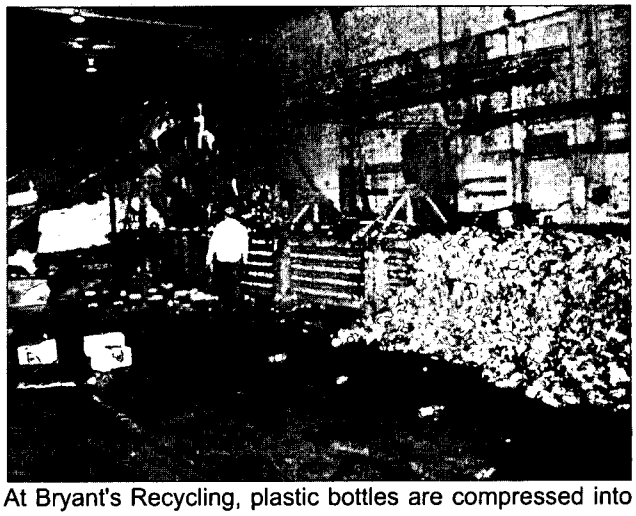
Recycling Means Business!



Bryant's Recycling Inc.

Bryant's Recycling Inc.
Clinton
Sampson County

Bryant's Recycling Inc. is a family-run recycling operation that has been collecting and processing fiber and containers for recycling since 1997. Bryant's Recycling is owned by Fulton Bryant, who along with his sons Daniel and Byron, is focused on the continued growth of the company.



At Bryant's Recycling, plastic bottles are compressed into bales and shipped to market.

Recyclable material is collected from various municipal and industrial customers in the Sandhills region. In addition to on-site collection services and materials processing, Bryant's provides 53-foot trailers for storage and collection.

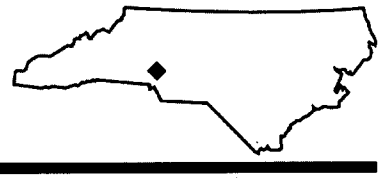
Bryant's Recycling provides collection and processing of cardboard, mixed paper, office paper, newspaper, plastic containers, aluminum and metal cans, and other industrial fiber products such as fiber cores. The company also has the ability to handle other types of material such as plastic film and window glass, as well as provide in-house document destruction.

Bryant's Recycling processes about 8,500 tons per year of material, and employs 17 people at its Clinton facility. With its location in Sampson County, Bryant's Recycling has the ability to provide recycling services and processing in the historically underserved southeast region of North Carolina.

Bryant wants to provide a local market for surrounding county governments and municipalities, which could be a great resource to these communities. Bryant's Recycling is also looking at Raleigh and Fayetteville area commercial customers as targets for growth.

For more information about Bryant's Recycling Inc., contact Daniel Bryant at (919) 590-2200, e-mail: abryantd@earthlink.net.

Recycling Means Business!

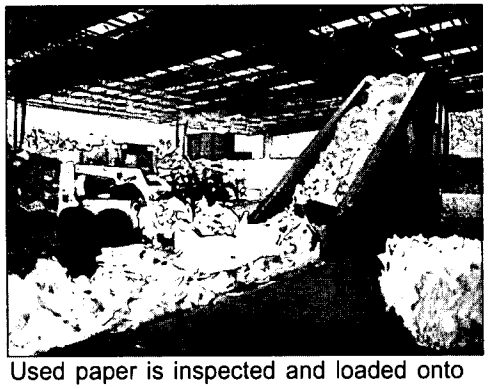


Caraustar

Beginning in 1938 as Carolina Paper Board Corp. with its first plant in Charlotte, Caraustar has become one of the nation's leaders in recycled content packaging. Caraustar ranks number one in recycled paperboard production in the United States, is the second largest producer of tubes, cores and composite containers and in the top 10 of folding carton production. Caraustar has grown over the past 65+ years to become a billion dollar company with 108 facilities worldwide employing more than 5,700 people.

"Caraustar ranks number one in recycled paperboard production in the U.S."

Caraustar operates both a fiber recovery facility and a paperboard mill in Charlotte. Located in close proximity, these two operations employ 125 people. The recovery facility has a throughput of 55,000 tons of fiber per year. Ninety percent of the fiber consumed by the mill is supplied by the nearby recovery facility. Fiber grades include mixed paper, double lined kraft, corrugated cardboard and newspaper. The remaining 10 percent of consumed fiber is returns (boxboard cuttings) from paperboard customers.



Used paper is inspected and loaded onto a conveyor to be baled and shipped to a paperboard mill.

The paperboard mill produces 52,000 to 55,000 tons of 100 percent recycled rigid boxboard and chipboard annually. In addition to the recovery and mill operations, Caraustar has converting, paper tube, container and box plants located across North Carolina.

For more information about Caraustar, contact Jason Garrison at (704) 376-7474 or Jason.garrison@caraustar.com. You can also visit its Web site at: http://www.caraustar.com.

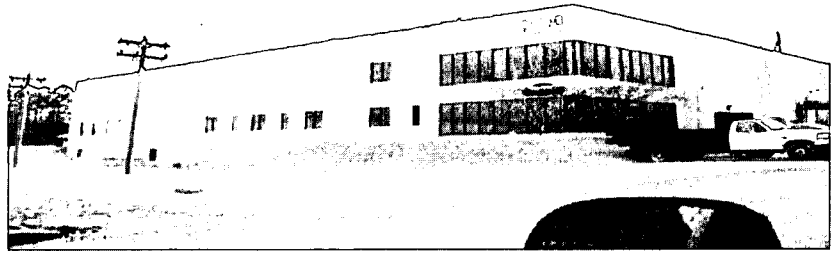
Carolina Materials LLC

Carolina Materials LLC
Belmont
Gaston County

Carolina Materials LLC, formerly known as Texas Encore Materials, relocated from Romulus, Mich., to Belmont in spring 2004. For more than 11 years, Carolina Materials researched and developed a process incorporating recycled tire pieces into new manufactured products. The N.C. facility manufactures extruded sheets made from recycled rubber and plastic resins. The finished sheets are used in automotive, industrial and consumer applications. In the automotive sector, the extruded sheets are used to make a reversible luggage liner in the Ford®Taurus™.

Carolina Materials currently employs 20 people and has used more than 40,000 pounds of recycled tire crumb in its initial start-up year. The company recently purchased two additional sheet extruders, which will increase production four-fold. Carolina Materials expects to employ a total of 100 workers with an average salary of $16 per hour within the next three years. "[The company's] announcement to locate in Gaston County not only provides the state with high quality jobs but demonstrates yet again that job creation and environmental protection can go hand in hand," said Gov. Mike Easley.

> ***"[The company's] announcement to locate in Gaston County not only provides the state with high quality jobs but demonstrates yet again that job creation and environmental protection can go hand in hand."***
> - *Gov. Mike Easley*



Carolina Materials transforms recycled tire pieces into products like reversible luggage liners.

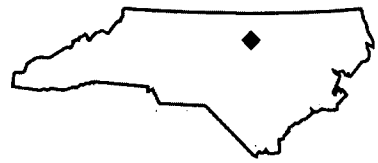
Recycling Means Business!

Clean Green Inc.



High-tech machinery purifies used antifreeze at Clean Green.

Clean Green Inc. is a unique and growing recycling business that processes between 5,000 and 7,000 gallons of antifreeze per week at its plant in eastern Durham. The used antifreeze is purified by a patented filtration system designed by the company's owner, Tim Wilkinson. A longtime Durham car repair shop owner and auto mechanics teacher, Wilkinson saw a need to improve the handling of the hazardous fluid and, in the true entrepreneurial spirit, learned the chemistry involved to create the process necessary to purify antifreeze.

Incorporated in 1997, Clean Green now employs 10 people. It operates five trucks for collecting waste and delivering recycled antifreeze. Subject to the same standards as the virgin product, the recycled antifreeze is available in all major colors and formulations. The company collects used antifreeze from many sources, including the automotive industry, municipalities, N.C. landfills and collection centers and other industries. However, a majority of the used antifreeze is collected from the companies purchasing the reprocessed product. This offers companies a closed-loop system of recycling for their antifreeze needs. Customers save dramatically by purchasing Clean Green's recycled antifreeze, which sells for less than half the price of virgin antifreeze.

Wilkinson has watched the company grow approximately 20 percent each year and is expanding operations to include recycling of used oil filters. Clean Green is now reprocessing more than 300 barrels (45-50 tons) each month of used oil filters. These filters are 100 percent recyclable and contain valuable steel and waste oil used for fuel.

Owner Tim Wilkinson and son, Andrew.

For more information on Clean Green Inc., contact Tim Wilkinson at (919) 596-3500, or cleangreen@verizon.net.

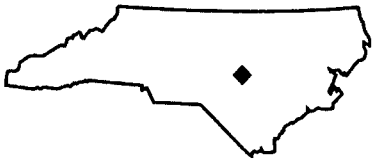
Recycling Means Business!



Cohen and Green Salvage Company Inc.

Cohen and Green Salvage Co. Inc.
Fayetteville
Cumberland County

Recycling Means Business!

Fayetteville is home to Cohen and Green Salvage Company Inc., a metals handler and processor. Established in 1946, this privately-owned company serves the eastern and central part of North Carolina as a market for ferrous and non-ferrous metals. Cohen and Green handles practically every type of metal commodity from aluminum to zinc, including automobiles, electronic/computer equipment, appliances, gold, silver and more. Cohen and Green processes, separates, grades and markets these commodities, utilizing 30 full-time workers.

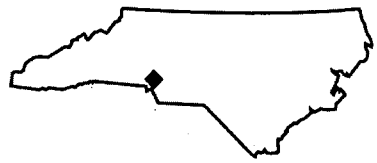
North Carolinians throw away more than $20 million in aluminum cans each year.

The company's president, Michael Green, says that although the metals recycling industry is currently very stable, challenges to the business include transportation costs and complying with an ever-growing list of regulations. "Cohen and Green Salvage and the metals recycling industry as a whole are working to recycle as much metal as possible while complying with environmental regulations," said Green.

Making products from recycled aluminum instead of virgin materials results in a 90 percent energy savings.

For more information about Cohen and Green Salvage Company, call Michael Green at (910) 483-1371, or e-mail: Mgreen6592@aol.com

CompuTel IG LLC



Computer monitors are transported to a staging area and then dismantled for recycling.

CompuTel IG LLC is a family-owned Charlotte-based recycling business started in 1995 by John Rhinehardt. The company collects, processes and markets materials in the emerging area of computer and electronics recycling. CompuTel prides itself on being one of only a handful of electronic recyclers that will accept a complete range of consumer electronics from a wide variety of sources. Those sources range from large generators such as state and local government agencies, international power companies and utilities, school districts and a national asset management company, to local residents who routinely drop-off material at CompuTel's Charlotte location.

In 2003, CompuTel recovered more than 600 tons of electronic equipment that would otherwise have required disposal. Thanks to the purchase of a 24-foot box-body truck, CompuTel anticipates increasing its recovery efforts to more than 750 tons of electronic scrap per year. The purchase of that vehicle was partially financed through grant funding from the N.C. Department of Environment and Natural Resources.

"In 2003, CompuTel recovered more than 600 tons of electronic equipment that would otherwise have required disposal."

John and his son Brett are optimistic about the company's future and project continued growth, based in part on being named as available vendors in the North Carolina Electronic Recycling Services State Term Contract. CompuTel currently employs seven people and, should its growth trend continue, may add three to five jobs over the next year.

For more information about CompuTel, contact Brett Rhinehardt at (704) 376-1116, e-mail: Brett@Computelig.com.

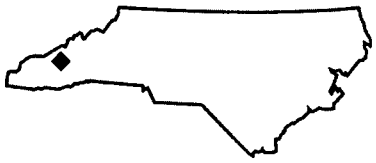
Recycling Means Business!



Curbside Management Inc.

Curbside Management Inc.
Asheville
Buncombe County

Recycling Means Business!

Curbside Management Inc. is a collector-processor of residential and commercial recyclables located in Asheville. A majority of material recovered by Curbside is collected through residential collection programs set up with many of the region's municipalities. Owner David Johnson has combined business savvy with ingenuity to stay competitive against the large waste haulers that compete for municipal contracts in the region.

Curbside recently expanded operations to include a semi-automated material recovery facility. When this facility opened in August 2003, it was able to handle the material collected by Curbside as well as provide an outlet for other recyclers to deliver material for processing. Curbside is currently processing about 6,000 tons per year of recyclable materials that include cardboard, newspaper, office paper, mixed paper, glass and plastic bottles, and metal cans. The collection and processing operations employ 38.

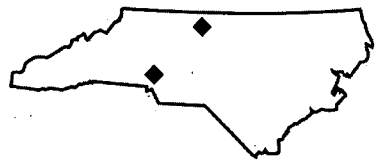
Last week North Carolina trashed enough newspapers to fill nearly three football fields three feet deep.

In addition to providing important processing capacity for this region of the state, the MRF has also allowed Curbside to expand its collection services. Curbside moved forward with plans to expand its commercial recycling operations as well as offer mixed paper recycling to the municipalities it serves. With equipment partially financed through grant funding from the N.C. Department of Environment and Natural Resources, it began rolling out expanded recycling collection services for commercial customers in the city of Asheville.

Curbside's Owner David Johnson.

For more information about Curbside Management Inc. contact David Johnson at (828) 252-2532, e-mail: djohnson@curbie.com. You can also visit the company's Web site at: http://www.curbie.com.

Custom Polymers Inc.



Custom Polymers Inc., a North Carolina-based company with production facilities in Charlotte and Houston, Texas, and sales offices in Durham, Chicago, Ill., and Toronto, Canada, has been in the plastics recycling business since 1996. Partners John Calhoun and Phil Howerton have built a multifaceted business that employs 15 people at its North Carolina locations and handles a vast array of recycled resins, including both commodity and engineering grade materials.

Custom Polymers' sales consist of 80 percent post-industrial materials and 20 percent post-consumer. It sells approximately nine million pounds of plastics per month in the form of scrap, regrind and pellets. The company specializes in the regrinding and reprocessing of industrial plastics, but has recently begun to expand its business by focusing on post-consumer bottles. As part of that growth, a new partnership was formed recently to acquire 50 percent of Blue Ridge Plastics in Eden. Custom Polymer's plant is a washing and grinding facility that processes approximately 1.6 million pounds of post-consumer bottle material per month into clean flake. The company is also very active on the international scene, with two sister companies located in Toluca, Mexico.

> **"Custom Polymer processes approximately 1.6 million pounds of post-consumer plastic bottles each month."**

The United States plastics industry includes 2015 companies with more than 35,000 employees.

For more information about Custom Polymers, contact John Calhoun at (704) 332-6070 or john@custompolymers.com. You can also learn more about the company at its Web site: http://www.custompolymers.com.

Eastern Carolina Vocational Center Inc.

Eastern Carolina Vocational Center Inc.
Greenville
Pitt County

Recycling Means Business!

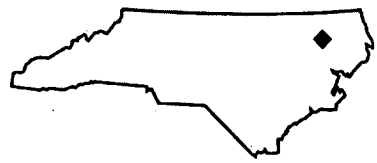
Eastern Carolina Vocational Center Inc. has operated a recycling business in Greenville for more than 25 years as a way to provide jobs for people with disabilities. In 1995, ECVC built a recyclables-processing center otherwise known as a materials recovery facility. ECVC employs 80 people in its recycling operation. Residential and commercial recyclables generated in Pitt and nearby counties are sorted at the MRF and prepared for market. Materials handled include plastic bottles, newsprint, glass containers, steel cans, aluminum cans, cardboard, office paper and mixed paper including paperboard boxes, magazines and phone books. With the exception of glass, all materials are baled and sold in the domestic and foreign markets. ECVC processes 30,200 tons of recyclables each year.

ECVC employees sort incoming recyclables.

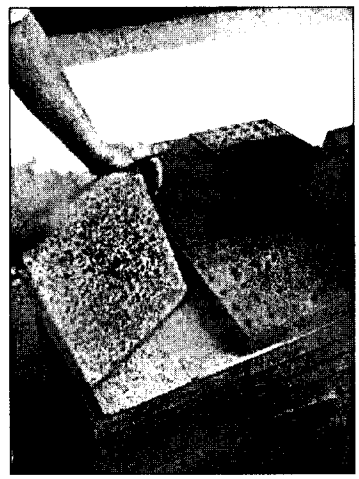
ECVC provides much-needed recycling processing infrastructure to eastern North Carolina. In 2002, ECVC received an award from the National Recycling Coalition for "Outstanding Environmental and Community Leadership." With the help of a N.C. Department of Environment and Natural Resources' grant in 2004, ECVC will be installing equipment to enable processing of cleaner, higher-value recyclables. Revenue generated from the savings will be used to increase the recovery of mixed paper from the region.

For more information about ECVC, contact Doug Bonds at (800) 758-4188, or e-mail dbonds@ecvcinc.com. You can also visit the company's Web site at: http://www.ecvcinc.com.

Elizabeth City Glass Inc.

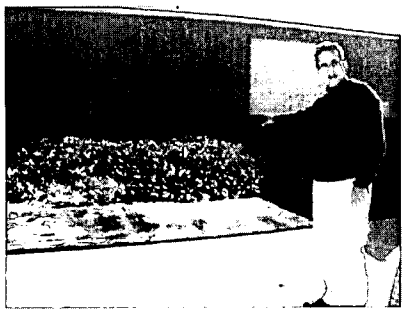


Located in Pasquotank Industrial Park on the north side of Elizabeth City, Elizabeth City Glass Inc. is both a processor and end user of construction glass, Pyrex, ceramics and mixed post-consumer container glass.



ECG's dimpled patio pavers are made from more than 80 percent recycled glass.

After spending three years in the research and development phase, ECG began operation on Jan. 1, 2004, as a full-scale, operational pilot project. The brand-new facility includes a 16,000 square foot building with most operations under roof. Truck scales and an industrial-sized hopper provide the tools for handling feedstock coming into the facility. Material is offloaded directly into the hopper where the materials are transported to the processing equipment inside the facility. Inside the facility, the glass material is crushed, screened and washed. The finished material is used to produce a product line of utilitarian and decorative precast concrete products with 82 percent recycled glass content. Products at the facility include crosswalk tactile warning blocks for the physically challenged (American with Disabilities Act compliant), parking lot wheel stops and patio pavers.



Owner Shawn Lemmond shows the facility's incoming glass feedstock storage area.

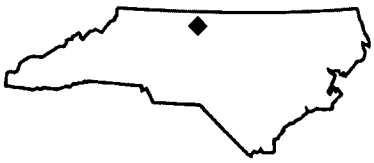
At current production levels, ECG employs four people and is recovering 384 tons per year of glass waste. ECG expects to grow as sales increase in 2005. With few outlets for recovered mixed glass in the northeastern part of the state as well as southeastern Virginia, ECG is providing a much-needed market for this material.

ECG was a recipient of a 2004 N.C. Department of Environment and Natural Resources' grant. As traditional markets for glass container recycling continue to decrease, ECG's research and development may open up other avenues for using glass waste in other types of precast concrete products.

For more information about ECG, contact Shawn Lemmond at (252) 333-1002 or e-mail at ECGCompany@aol.com. You can also visit its Web site at: http://www.glass-recycling.com.

Elizabeth City Glass Inc.
Elizabeth City
Pasquotank County

Recycling Means Business!



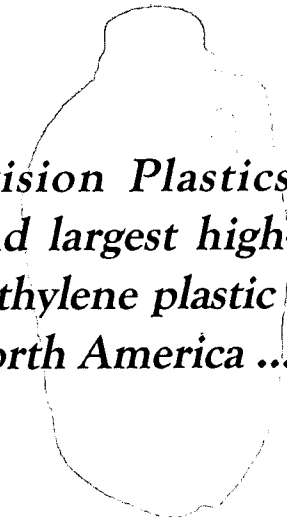
Envision Plastics

Envision Plastics
Reidsville
Rockingham County

Envision Plastics is the second largest high-density polyethylene plastic recycler in North America with plants in Reidsville and Chino, Calif. Envision employs 60 people and processes about four million pounds per month of post-consumer plastics at its North Carolina facility.

At Envison Plastics, flakes are pelletized according to clients' specifications - like Downy® Blue or Gain® Green.

Like other plastics processors, Envision receives baled plastics that are ground into flakes and are then washed and dried. Next, Envision uses state-of-the-art technology that color sorts the flakes into distinct colors specific to clients' specifications such as "Downy® Blue" or "Tide® Red." The flakes are then pelletized and sold to blowmolding companies throughout the United States, including several in North Carolina that manufacture new colored bottles. Although other recyclers hand-sort the plastic flake, Envision is the only company employing an automated color-sort technology.



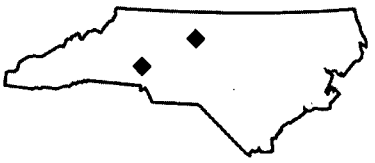
"Envision Plastics is the second largest high-density polyethylene plastic recycler in North America ..."

Envision customers can save money by reducing the amount of colorants they need to add in their manufacturing process. They are also able to use the copolymer HDPE resin found in detergent bottles, as opposed to the homopolymer found in unpigmented milk jugs, to make new detergent bottles. The copolymer resin has demonstrated better environmental stress crack resistance when customers perform "drop tests" on their finished product.

Recycling Means Business!

For more information about Envision Plastics, contact Todd Payne at (336) 342-4749 or e-mail todd@envisonplastics.com.

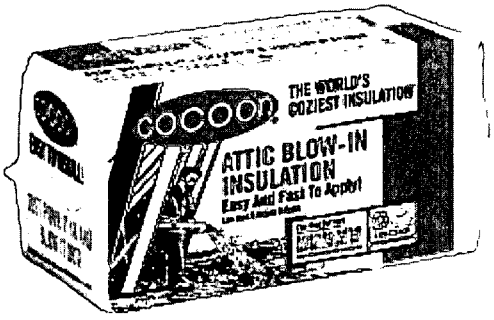
FCR and U.S. GreenFiber



FCR, a subsidiary of Casella Waste Systems, operates recovery facilities and reprocessors in the Southeastern and Midwestern United States. Headquartered in Charlotte, FCR operates recycling facilities there and in Greensboro. Both cities work with FCR as its processing partner for its local recycling programs. The company sorts, processes and markets commingled materials under long-term contracts with municipalities and other authorities.

Together the FCR facilities in North Carolina employ 63 full-time and 12 temporary workers, and process around 97,000 tons of recyclables each year. In addition, FCR's Charlotte facility hosts an education center designed to educate school groups and the public about how FCR's recycling process helps the environment.

Casella Waste Systems is also fifty percent owner of U.S. GreenFiber LLC. Established in 2000, GreenFiber is a producer of Cocoon®, a cellulose insulation with national manufacturing and distribution capability. With an 85 percent recycled content, Cocoon® insulation is used in attics and exterior walls to provide thermal comfort, added fire safety and noise reduction.



U.S. GreenFiber makes Cocoon insulation out of old newspapers.

Old newspapers collected in Charlotte enter FCR's material recovery facility, where they are separated from other recyclables and converted into packaged cellulose insulation at the GreenFiber plant operating within the FCR building. The integrated operation optimizes efficiency by eliminating transportation for the product feedstock. This insulation plant is one of 10 in the country and serves as a model of vertical integration for recyclers and other manufacturers. The 30 employees of Charlotte's GreenFiber manufacturing plant process more than 27,000 tons of newsprint and other papers into the cellulose insulation each year.

For more information about FCR, contact Bill Leonidas at (704) 379-0625, billleonidas@casella.com , or visit its Web site at http://www.casella.com/locations/fcr.

For more information about U.S. GreenFiber, contact John Harkavy at (704) 379-0654, john.harkavy@us-gf.com, or visit its Web site at http://www.greenstone.com.

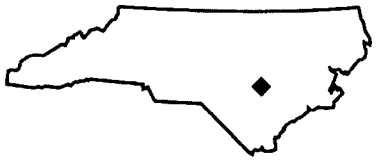
Recycling Means Business!



Filter Specialty

Filter Specialty
Autryville
Sampson County

Charles Jackson established Filter Specialty in Autryville in 1997 to recycle oil filters from automotive, marine and industrial sources. Oil filters have scrap value as metal, and also contain residual oil that can end up leaking and causing contamination problems. Although oil is officially banned from disposal in North Carolina landfills, a large amount is still disposed with oil filters.

Owner Charles Jackson unloads drums of used oil filters for reprocessing at the Autryville facility.

Filter Specialty has grown because of its strong service record and its proven ability to process and market the filters. Its customers include utility companies, school bus garages, government agencies, car dealerships, repair shops and many others. It also provides processing services to other filter collection companies in North Carolina.

North Carolina's more than six million registered motor vehicles generate more than 12 million used oil filters per year.

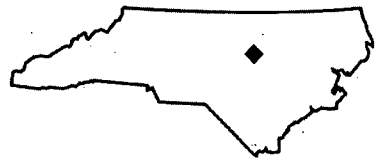
The company handles around 720 tons of filters per year, which it crushes with a machine that extracts residual oils and then creates dense metal briquettes. The metal is sent to steel mills and foundries. The 40,000 to 60,000 gallons of oil recovered annually from the filters and the company's oil recycling service is sent to refiners that manufacture boiler fuel.

All of Filter Specialty's processing is done indoors with the proper permitting and environmental controls. Charles Jackson employs two others in the company, and is in a strong position to grow his business. With the ability to market all the filters and oil it collects, Filter Specialty just needs more supply and more customers.

For more information, contact Filter Specialty at (910) 567-5474 or filterspecialty@intrstar.net. You can also visit the company's Web site at: http://www.filter-specialty.com.

Recycling Means Business!

Food Bank of Central & Eastern N.C.



Food Bank of Central & Eastern N.C.
Raleigh
Wake County

The Food Bank of Central & Eastern North Carolina was founded as the state's first food bank in 1980 as the Community Food Bank. Since then, the Food Bank has expanded services in an attempt to keep pace with a growing demand for emergency food, distributing more than 100 million pounds of food in the process. In 1984, the Food Bank gained affiliation with America's Second Harvest.

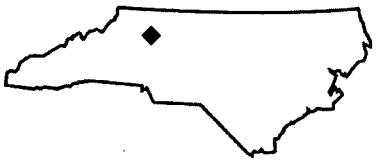
The Food Bank has outgrown its warehouse space three times since partnering with Second Harvest. With a primary facility in Raleigh, the Food Bank also has branch warehouses in Durham, Greenville, Southern Pines and Wilmington. In 1985, the organization distributed nearly 1 million pounds of food to a network of nearly 100 agencies. In 1996, distribution rose to 6.5 million pounds of food to a family of 480 private, emergency feeding programs and sister food banks (one million pounds of which was disaster relief in the wake of Hurricane Fran). Hurricane Floyd devastated eastern North Carolina in 1999, and with it came the Food Bank's largest distribution ever.

Nutritious, non-perishable foodstuffs that would have been sent to a landfill are given a second life through the Food Bank.

The Food Bank distributed 18.8 million pounds of food in fiscal year 1999-2000. Last fiscal year, the Food Bank distributed 26.4 million pounds of food, a 71 percent increase from just five years ago. Today, the Food Bank provides in excess of two million pounds of food every month to 865 nonprofit, community-based, emergency feeding programs (soup kitchens, food pantries, homeless shelters, group homes, day care and after-school centers, and elderly nutrition programs), serving more than 375,000 individuals at risk of hunger in 34 central and eastern North Carolina counties. In spring 2003 the Food Bank received a grant from the N.C. Department of Environment and Natural Resources to help purchase additional sorting equipment and a stacker that made it possible to double its egg distribution capabilities.

For more information about the Food Bank and its programs, please contact Peter Werbicki, acting executive director, at (919) 875-0707, or visit the Web site: http://www.foodbankcenc.org.

Recycling Means Business!



Foothills Sanitation & Recycling

Foothills Sanitation & Recycling
Wilkesboro
Wilkes County

Recycling Means Business!

For the past 15 years, Jeff and Janet Miller have provided excellence in recycling service to the area in and around Wilkes County through their company, Foothills Sanitation & Recycling. The company that began as J&J Recycling has continued to grow over the years despite a near-devastating fire, and the many ups and downs associated with end-market pricing. For the past few years, Foothills Sanitation and Recycling has been in a planning and construction phase for a new sorting facility. The small-scale recovery facility takes in all types of recyclables, sorts the material and markets it to end users and recycling manufacturers. The company currently employs 26, but plans to add another 10 employees once the sorting facility is fully operational. Positive results from the new facility are already evident. Paper recycling production has increased from 12,100 tons to almost 17,000 tons annually with future increases anticipated.

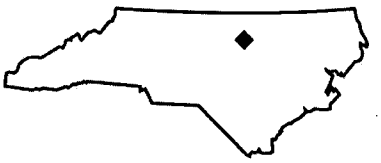
Horizontal balers, like Foothill Sanitation's, are an integral part of many material recovery facilities across the country.

"Paper recycling processing has increased from 12,100 tons to almost 17,000 tons annually with future increases anticipated".

Now that its new sorting facility is online, the company is experiencing a steady increase of tonnage and is looking forward to expanding the list of materials that it handles. Along with an increase of intake of non-ferrous metals, the company is also looking toward the possibility of expansion into the arena of electronics recycling. According to Jeff Miller, the biggest hurdle the company faces is educating the general public about the importance of recycling and how to recycle the right materials.

For more information about Foothills Sanitation & Recycling contact Jeff or Janet Miller at (336) 667-4432, or visit the Web site at: http://www.foothillssanitation.com.

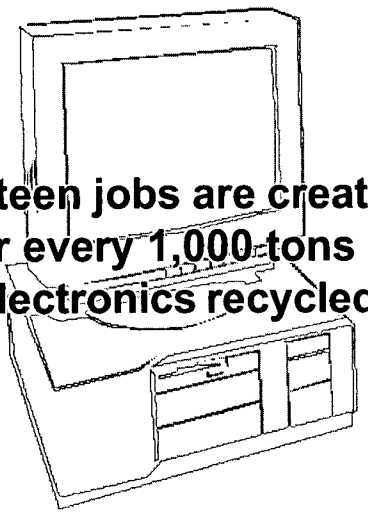
GEEP/ARC



GEEP/ARC
Durham
Durham County

Global Electric Electronic Processing Inc. and Asset Recovery Corporation are two e-waste recyclers located in the same Durham facility. These separate companies work in partnership to provide comprehensive electronics recycling and remarketing services to clients nationwide. Some of their larger clients include: Nortel Networks, Unisys Corporation, Silicon Graphics, ADC Telecommunications and Honeywell International.

GEEP/ARC also have the ability to handle material from community collection events. The companies can provide municipalities and local governments e-waste collection services including event management, transportation and processing.



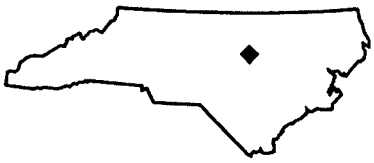
Fifteen jobs are created for every 1,000 tons of electronics recycled.

GEEP/ARC is a vertically-integrated processor of computer and electronic scrap. GEEP de-manufactures the material by carefully dismantling the equipment for reuse and salvage. In addition to standard de-manufacturing capabilities, GEEP's parent company, Cable Recycling Inc., is a final destination for sorted electronic components that can provide shredding, grinding and final sale of commodity-based material streams. This includes the assaying and separation required to extract copper, gold, silver and other metals from cables, circuit boards and metal-containing electronic components. The resulting commodity streams are then sold back into the marketplace.

At the Durham facility, GEEP/ARC employs 25 and recycles about 10,000 tons of electronics per year. This includes material sold at auction, repaired and resold through wholesale markets and Internet sales, and material that is de-manufactured.

For more information about GEEP/ARC, contact Tom Fellows at (919) 544-1443, or e-mail tomfellows@geepinc.com. You can also visit their Web sites at: http://www.cablerecyclinginc.com and http://www.assetrecoverycorp.com.

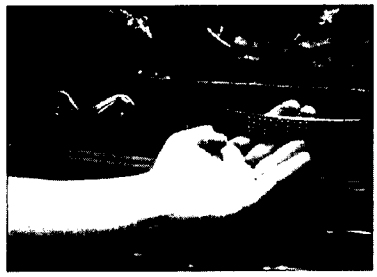
Recycling Means Business!



Habitat ReUse Center

Habitat ReUse Center
Raleigh
Wake County

If you want a bargain on building supplies in Raleigh, visit the Habitat ReUse Center on Alwin Court - just off of Hodges Street. The ReUse Center accepts donations of used or surplus building materials and furniture - everything from windows and doors to lumber, fixtures and cabinets - and sells them to the public at discounted prices to raise funds for Habitat's homebuilding activities.



Customers can find a wide variety of materials at the ReUse Center, including hardware and building supplies.

Habitat for Humanity of Wake County was one of the first in the state to start an affiliate ReUse store. After outgrowing an initial facility, it moved to a bigger warehouse in 2000. Now, with business booming and more materials available than ever before, the ReUse Center may soon expand again.

The Habitat facility diverts materials from disposal by receiving tax-deductible donations from builders, manufacturers, businesses with surplus inventory, retailers, universities and individuals. The center has also reinvigorated its deconstruction program, sending crews to homes slated for demolition to salvage doors, windows, flooring, cabinets and other reusable items.

The ReUse Center has become a popular spot for homeowners to find inexpensive, high-quality building supplies. In the past year alone, sales have grown from $576,292 to $777,855. The "profit" generated helped finance the building of five homes in 2004 by Habitat for Humanity of Wake County.

The Wake ReUse Center is arguably the "flagship" of a growing number of such facilities around North Carolina in Winston-Salem, High Point, Pittsboro, Boone, Burlington, Sanford, Wilmington and Charlotte. Together, these centers are capturing value from the waste stream, putting perfectly good materials and products back to work and raising money for the building mission of Habitat for Humanity.

For more information about the Wake Habitat ReUse Center, call (919) 833-6768, or visit http://www.habitatwake.org/ReuseCenterpage.

Recycling Means Business!

Hartsell Scrap Metal

Hartsell Scrap Metal has operated under the ownership of John Hartsell since 2001. Formerly known as "Hollifield Brothers Used Auto Parts and Scrap Metal," the original company opened its doors in the early 1990s, serving the western North Carolina area. Based in Spruce Pine, the company handles used auto scrap, aluminum and steel cans, copper, white goods, steel industrial machinery and other ferrous and non-ferrous scrap.

In addition to Hartsell, the company employs three people full-time and one part-time. Although recent fuel cost increases have had a negative impact on profits, the overall stability of the metals markets has helped to compensate to make Hartsell Scrap Metals very stable.

The national recycling rate for steel is 64 percent. Making new products from recycled steel vs. virgin materials results in 60 percent energy savings.

Hartsell is looking toward the possible expansion into the electronics scrap market in the future and is considering the purchase of a shredder in order to add additional on-site processing capability.

For more information on Hartsell Scrap Metal, call John Hartsell at (828) 765-5265.

Jackson Paper

Jackson Paper
Sylva
Jackson County

Recycling Means Business!

Jackson Paper is a major independent producer of 100 percent recycled content paper. The company recently developed an engineered recycled paper product designed as alternative poultry bedding. Located in the heart of the mountain town of Sylva, the recycled paper mill employs 132 workers that produce about 300 tons of paper per day from used corrugated cardboard containers. Through its use of more than 96,000 tons of cardboard each year, Jackson Paper serves as a major market for cardboard recycling centers in North Carolina and surrounding states.

Jackson Paper employee monitors master controls in its recycled paper-making operation.

Built in 1928, the facility is a main fixture on Sylva's Main Street. Current owner Timothy Campbell acquired the mill in 1995. Under Campbell's management, Jackson Paper has not only steadily increased production and profit, but has also proven itself as an environmental leader. To minimize waste and maximize product output, the mill utilizes a unique process that binds two trim rolls from the main paper machine into one larger roll of product. In addition, Jackson Paper is one of only a handful of mills in the United States with a closed-loop water system and treatment plant, allowing zero discharge of waste into the nearby stream or municipal sewer. Further reducing N.C.'s waste stream, Jackson Paper also purchases more than 60,000 tons per year of sawdust from area sawmills and furniture makers for steam combustion to produce the energy needed to operate the mill.

Jackson Paper produces almost 300 tons of paper per day from used corrugated coardboard containers.

With its diversified products, experienced management and environmental stewardship, Jackson Paper has a clear and important role to play in North Carolina's economy.

For more information, contact Don Arrington, at (828) 586-5534, e-mail: donarrington@jacksonpaper-nc.com, or visit the company's Web site at: http://www.jacksonpaper-nc.com.

K&K Recycling

K&K Recycling is a family-owned paper processing company in Wilson. The company was started by Kenneth Radford in 1990. When Radford passed away in 2004, his sons Kenneth and Kelly decided to keep the family business going.

K&K focuses on corrugated cardboard, paper tubes and high grade (office) paper, but can handle newsprint, magazines, residential mixed paper and other types of fiber. It receives materials through private haulers and collection contracts with business and industrial customers. K&K also receives some material from local government recycling programs and is interested in getting more. In addition, it processes film plastics (stretch-wrap) generated by local industries.

Almost 80 percent of United States papermills rely on recycled feedstock. In fact, it comprises 37 percent of their supply.

The heart of K&K is its large Mosely baler, which produces bales up to 1,350 pounds for shipment to paper mills. Most of its paper is shipped to manufacturers of corrugated cardboard and other types of paper, but K&K also exports some of its materials through some of its existing paper mill contracts.

K&K processes about 16,000 tons per year, but has the capacity to double that amount. Its markets are strong and it is looking for more customers and additional material. The company currently employs six people and is planning improvements to its facility, including new scales and possibly a commingled processing line.

For more information about K&K, call (252) 237-3010 or e-mail: kkrecycling@earthlink.net.

Kamlar Corporation

Kamlar Corporation
Rocky Mount
Nash County

Since 1966, Rocky Mount's Kamlar Corporation has been producing high-quality mulch products using recycled wood waste. Kamlar uses wooden pallet and crate waste generated in eastern North Carolina as the main feedstock for the production of a variety of mulch products sold commercially throughout the East Coast, Midwest and Canada. Approximately 12,000 tons of wood waste is recycled each year into value-added landscaping products rather than being buried in a landfill. Kamlar employs 35-40 people during peak season and 22 people in the off-season.

Owner Roger Seale in front of discarded pallets that will be ground into mulch.

Kamlar's mulch-making process involves grinding the large wooden pallets and crates into small pieces using a tub grinder. A magnetic separator removes all the nails and metal pieces to ensure a safe product. The small pieces of wood waste are sent through a mechanical screening system for size uniformity and consistency. A variety of the product line is colored red, black or brown using environmentally-friendly, non-toxic dyes. Kamlar's product line includes colorized mulch, shredded mulch, cypress mulch, pine bark and professional products such as nursery mix, soil conditioner and federally-certified playground mulch. Kamlar's products can be found in big box stores such as Home Depot® and Lowes® and other small to medium-sized garden stores.

Kamlar is a strong, growing North Carolina company. With the help of a N.C. Department of Environment and Natural Resources' grant in 2004, Kamlar purchased equipment that will enable it to double the amount of material it is currently producing.

For more information about Kamlar, contact Roger Seale at (252) 443-2576, e-mail Kamlar@earthlink.net. You can also visit the company's Web site at: http://www.kamlar.com/index.htm.

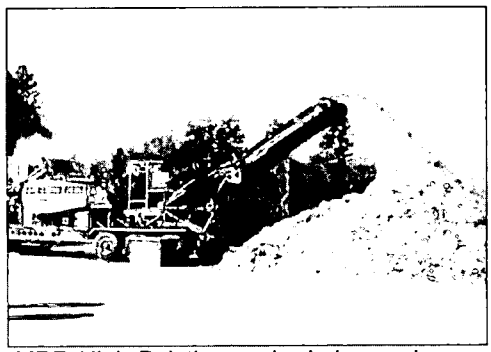
MRR Southern

With increasing generation of construction and demolition debris in North Carolina, one local company - MRR Southern - has positioned itself to capture the value of important recyclables from this portion of the state's waste stream. Partners Norbert Hector, Juan Carroll, D.H. Griffin Sr. and David Griffin Jr. pooled their vast experience in construction, wrecking and demolition to form a new recycling company. MRR Southern opened its first large-scale mixed construction and demolition debris processing facility in south Raleigh in 2000. In 2004, the company opened a second facility in High Point.

MRR Southern Raleigh employees hand-sort construction and demolition debris.



MRR High Point's wood grinder produces fuel for industrial boilers.

Both recycling facilities are multi-million dollar investments in areas targeted for economic development and job creation. The Raleigh facility employs 18 people, while the newer and growing High Point facility employs 15. Materials are recovered from mixed construction and demolition debris using both manual and mechanical separation. Clean wood debris, concrete, brick, cardboard, drywall and soils/fines are separated and sold for a variety of end uses including compost, boiler fuel, road base, poultry bedding, recycled metal, paper and alternative daily landfill cover.

The Raleigh facility processes 85,000 tons of mixed construction and demolition debris per year and recovers about 50 percent of incoming materials. The High Point facility processes almost 74,500 tons per year.

For more information about MRR Southern, contact Chris Roof at (919) 835-3655, e-mail ctroof@dhgc.com.

Editorial Note: Sale of both facilities is pending to WCA Waste Corp. in March 2005. At the time of the announced sale, WCA Waste Corp. indicated it planned to establish a collections company that will operate in conjunction with the material recovery facilities.

Recycling Means Business!

Under the leadership of M. Noel Lyons, McGill-Leprechaun operates two compost manufacturing plants in North Carolina and is one of the largest solid waste composting companies on the East Coast. The company was started in 1991 near Harrells to help manage the growing amount of animal waste generated by the poultry industry. Now, its facilities in Chatham and Sampson Counties process more than 200,000 tons of compost per year. Feedstocks come from a large variety of generators, including industrial plants, municipalities and agricultural operations. The materials handled by McGill include industrial residuals, municipal biosolids, water treatment plant residuals, sheetrock, clean construction wood waste, commercial wood waste (pallets, shipping crates, etc.), food processing waste, grease trap waste, agricultural residuals, animal waste and source-separated organic solid waste (shredded paper, food scraps, waxed cardboard, etc.).

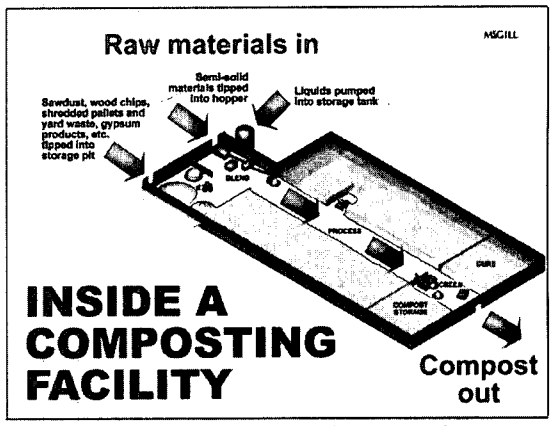

Diagram of McGill's composting operation.

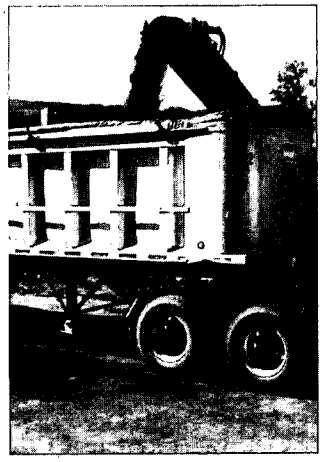
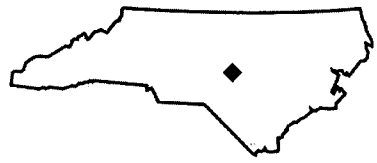


Finished compost is loaded into truck for bulk sale delivery.

With more than 50 employees and $7 million in annual revenue, McGill-Leprechaun is poised to expand its operations to other parts of the state. It found large-scale markets for its finished compost, which is sold in bulk by the cubic yard to retail and wholesale customers throughout the Carolinas. McGill's products have been used effectively to eliminate the use of methyl bromide, an ozone-depleting chemical, in produce and crop production. The company's rapid growth and innovative technology earned McGill-Leprechaun the honor of runner-up for North Carolina Small Business of the Year in 2004.

For more information, contact Lynn Lucas at McGill (910) 532-2539, e-mail: llucas@mcgillcompost.com, or visit the company's Web site at http://www.mcgill-leprechaun.com.

Noble Oil Services Inc.



Noble Oil Services Inc. maintains an oil recovery and processing facility in Sanford. The company collects used oil and antifreeze from about 9,300 customers in North Carolina, South Carolina and Virginia. In 1997, Noble Oil recovered approximately six million gallons of used oil. Through the innovation of the president and CEO, James Noble, it now collects about 25 million gallons of used oil per year and produces various formulations of fuel oil that is sold to companies to supplement their energy needs. This product is used mostly in asphalt plants, paper mills and other industrial facilities. Noble Oil is currently working on the production of a premium fuel blend that can be used in more commercial applications. The company employs about 100 people and serves more than 60,000 collection locations each year.

Noble Oil also accepts used oil filters that are drained and crushed and usually yield about nine gallons of oil per 55-gallon drum of used filters. The collected filters are then transported by the truckload from Noble Oil to a facility that processes the oil filters, re-claims any additional oil and uses the resulting scrap metal to make manhole covers.

Just two gallons of used oil can generate enough electricity to run the average household for almost 24 hours.

Noble Oil is now expanding its services by offering an additional product – ASTM-certified recycled antifreeze. Nobel Oil is promoting product stewardship by collecting used antifreeze for free with the purchase of its recycled antifreeze.

For more information about Noble Oil Services Inc., contact Jim Noble at (919) 774-8180 or jnoble@nobleoil.com, or visit its Web site at: http://www.nobleoil.com.

Nucor Corporation

Nucor Corporation
Charlotte
Mecklenburg County

Nucor Corporation
Cofield
Hertford County

Nucor Corporation is a crown jewel in North Carolina's recycling economy. Nucor is headquartered in Charlotte, and has one of its newest mills in Hertford County, where it produces steel plates for the manufacturing of ships, barges, rail cars and other industrial products.

Aerial view of Nucor's Hertford County recycled steel manufacturing plant.

Nucor is both the largest steelmaker in the United States and the largest recycler in the nation, consuming more than 14 million tons of scrap each year to make everything from steel joists, steel deck, bars, beams, girders and fasteners. Nucor is renowned for its lean corporate structure and for its profitability. The company continues to grow – its $780 million net consolidated earnings for the first nine months of 2004 set a corporate record. The company averages more than $6.2 billion in sales annually.

Almost 69 million tons of steel scrap was recycled in the United States in 2003.
- Steel Recycling Institute

The company employs 9,900 people, including approximately 390 at its Hertford County mill. Most of its production is done at "minimills" using electric arc furnaces designed specifically to consume scrap. It is dependent on the recovery of steel to feed plants in 14 states.

To learn more about Nucor, call Steve Rowlan at (704) 367-8685, or visit its Web site at http://www.nucor.com.

Recycling Means Business!

Oaks Unlimited

Oaks Unlimited has more than 40 years' experience producing high quality hardwood lumber for both domestic and overseas markets. In 2004, Oaks Unlimited president, Joe Pryor, expanded operations to produce a hardwood flooring product made from recycled pallet deck boards.

Dismantled pallets are planed into deck boards.

Located in Waynesville, Oaks Unlimited has worked closely with Waste Reduction Partners in Asheville to develop the flooring production process. Additional equipment purchases and a required building expansion were partially financed through grant funding from the N.C. Department of Environment and Natural Resources.

The "start-up" component of this new venture for Oaks Unlimited has been successful. From June to December 2004, Oaks Unlimited created one full-time position, and requires three additional part-time employees to meet the initial production schedule. As it ramps up to meet demand, production could be doubled using existing equipment and adding more employees.

Owner Joe Pryor displays the recycled pallet boards to be used for the hardwood flooring finished product.
(Photo courtesy of *The Mountainer.*)

Oaks Unlimited has used its experience in the production, marketing and distribution of high-quality lumber to create a business that is designed to fill a niche in the hardwood flooring market. The final product is a three-eights inches thick, solid hardwood flooring that is pre-finished and ready for installation. The rustic flooring is marketed as a "green" product, and more than 250 tons of pallet deck boards are recycled annually in its production. This translates into 120,000 square feet per year of flooring. Increases in waste diversion rates are directly proportional to expanding market demand.

For more information about Oaks Unlimited, contact Joe Pryor at (828) 926-1621, e-mail: jpryor@oaksunlimited.com.

Pallet Resource of N.C. Inc.

Pallet Resource of N.C. Inc.
Lexington
Davidson County

Davidson County's PRNC facility.

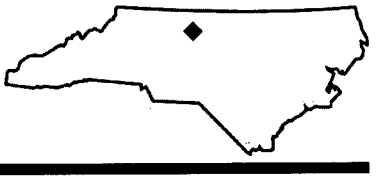
Nestled on a 22-acre site in the northern Davidson County countryside near Lexington, Pallet Resource of N.C. Inc. takes pride in being a full-service provider of environmentally-responsible products for any wooden material-handling need. PRNC currently employs 110 people - 35 of whom are directly associated with recycling - and recovers more than one million pallets per year, or 20,000 tons that would otherwise have required disposal. The company incorporates the environmental philosophy of "Reuse, Repair, Recycle and Renew" into all aspects of its operation.

Since 1985, under the leadership of Neal Grimes, PRNC services the needs of industry throughout central and western North Carolina with newly manufactured pallets, used pallets and reconditioned pallets, in addition to providing a pallet disposal and removal service. To PRNC, however, "disposal" means grinding pallets into a variety of useable wood fiber products. PRNC's two grinders, with the assistance of large magnets that remove nails and other metal fragments, produce uniformly sized, clean wood fiber that is transformed into products ranging from Designer Wood, the company's recycled wood fiber mulch, to Kid Cushion, a loose-fill organic playground surface.

For more information about PRNC, contact Neal Grimes at (336) 731-8338, e-mail: nealgrimes@prnc.com.

Recycling Means Business!

The recycled pallet industry in North Carolina employs more than 3,300 people and produces 36.5 million pallets annually.
-N.C. State University Pallet Recycling Study, May 2004.



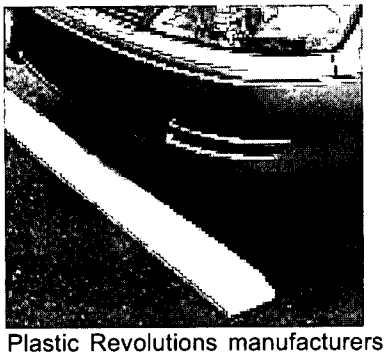
Plastics Revolutions

Reidsville is home to several plastics recycling companies, making the town the virtual "Plastics Recycling Capital of North Carolina." John Hagan is proud to be owner and president of Plastics Revolutions, one of the recycling companies operating successfully there. The company is a processor of post-industrial and post-consumer plastic scrap.

A Plastics Revolutions employee readies the finished product for shipping.

Plastics Revolutions employs 22 people, operates 24 hours a day and processes 2.5 million pounds of plastics each month. The company recycles a variety of discard plastic materials including bottles, pallets, bins, films, floor sweep regrind, pellets, parts, spurs and runners.

Plastics are processed into small flakes. The flakes are sent through a washing process that removes labels, glue, non-compatible plastics, dirt and metal. Cleaned flakes are dried and packaged for sale to manufacturers of plastic products, such as drainage pipe, nursery containers and plastic sheeting.



Plastic Revolutions manufacturers "Safety Stops" from recycled plastic resins.

Plastics Revolutions also manufactures "Safety Stops," a replacement for concrete parking stops. Safety Stops are made of recycled plastic and can be recycled at the end of their lifespan. Safety Stops are also cost-effective as their lightweight construction cuts shipping costs and single-person installation reduces labor expenses.

Contact John Hagan at (336) 349-2800 for further information about Plastics Revolutions. Also visit the Plastics Revolutions Web site at: http://www.plasticrevolutions.com.

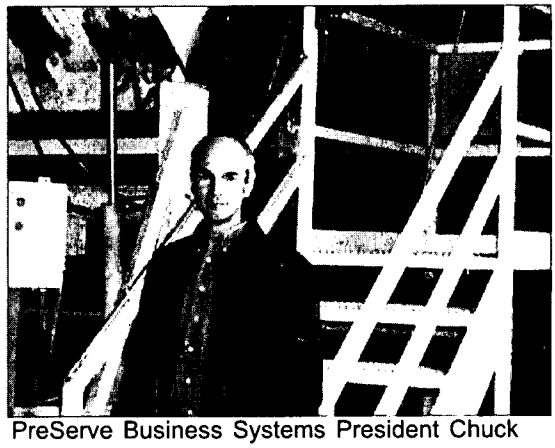
PreServe Business Systems

PreServe Business Systems
Gastonia
Gaston County

PreServe Business Systems diverts an assortment of plastic wastes from landfills by collecting them from a number of North Carolina businesses. It processes the collected materials and markets them to plastic molders and extruders for remanufacturing in North Carolina, the eastern half of the United States and internationally. PreServe's president, Chuck Cooper, has 14 years' experience managing waste plastics in all the commodity grades and most engineered resins. He has established two successful plastic waste processing operations with state-licensed sheltered workshop partners that provide vocational training and jobs to individuals with disabilities and other special needs.



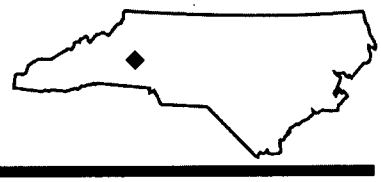
PreServe Business Systems President Chuck Cooper.

Recently, PreServe completed a major equipment upgrade at its Gaston Skills Inc. operation, partially financed through grant funding from the N.C. Department of Environment and Natural Resources. The upgrade will enable the Gastonia facility to process oversized parts such as plastic barrels, pallets and purges from a wide variety of North Carolina businesses such as the Dart Container Corporation plant in Randleman. "PreServe takes both our HIPS and PET scrap purgings and regrind," said Stephen P. Ridgill, plant manager, Dart Container Corporation of N.C. "I look forward to many years of continuing our strong business relationship with the company."

PreServe's Gastonia facility is in its second year of operation and employs between five to 10 Gaston Skills clients, depending on the operations' processing needs. The operation will process approximately 800 tons of plastic scrap this year collected from regional businesses in a wide variety of industries including telecommunications, automotive parts, wire and cable, textiles and furniture.

For more information about PreServe, contact Chuck Cooper at (919) 732-9253, e-mail: preserve@sprynet.com.

Recycling Means Business!

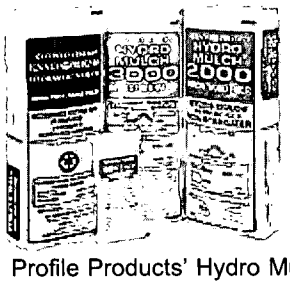


Profile Products

Profile Products
Conover
Catawba County

Profile Products is a name that has become synonymous with soil amendments and erosion control. This company's Conwed Fibers brand was a pioneer in the mulch industry in 1965 as it introduced its line of wood-based hydraulic mulches manufactured at its facility in Conover.

The Conover facility opened its doors in the mid-1960s under the name Conwed Fibers and was purchased in 2001 by Profile Products of Buffalo Grove, Ill. In addition to hydraulic mulches, Profile Products manufactures a number of other mulch and erosion control products such as Flexterra® Flexible Growth Medium™, Seed Aide® Mulching Granules, Futerra® Erosion Control Blanket and more. Currently, the company is testing new products for future expansion of its product line.



Profile Products' Hydro Mulch line is used for a variety of turf applications, promotes faster germination and minimizes sediment and water runoff.

According to Profile's operations manager, Tim Andrews, the company uses about 70,000 tons of waste wood from local industries every year to manufacture hydraulic mulch, and as much as 10,000 tons of discarded paper at its Conover facility. All this is material that would have ended up in landfills, were it not for Profile Products.

Andrews notes that higher transportation costs due to fuel price increases are the "fly in the ointment" in Profile's optimistic business outlook. However, he is quick to point out that the company is thriving and anticipating opportunities for growth in the near future.

The company provides 80 jobs for workers in Catawba County, an area that has been hit particularly hard by furniture plant closings in recent years.

Those interested in finding out more about Profile Products should call Tim Andrews at (828) 327-4165, extension 822, or e-mail tandrews@profileproducts.com. You may logon to http://www.profileproducts.com to visit the Profile Products Web site.

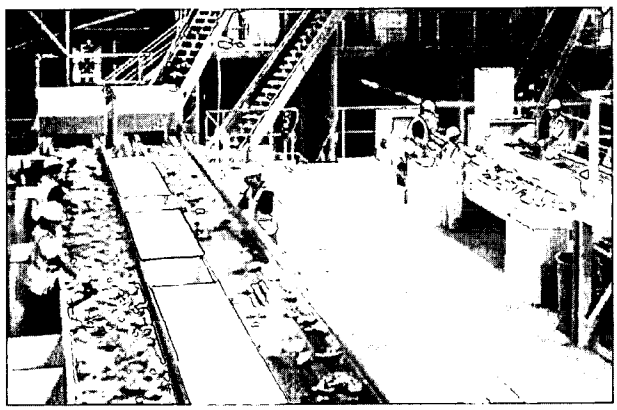
Recycle America Alliance

Recycle America Alliance
Raleigh
Wake County

Recycle America Alliance
Winston-Salem
Forsyth County

If you toss your aluminum can into a recycling bin, it may end up at a Recycle America Alliance plant. As the name suggests, the company operates a large network of recycling facilities across the United States. With facilities in Raleigh and Winston-Salem, Recycle America Alliance currently runs more than 80 recycling plants and provides marketing services for more than 140 locations in the United States and Canada.

Recycle America Alliance was formed as a subsidiary of Waste Management Inc. in January 2003. By combining assets and operations with other key domestic recycling processors and end users, Alliance carries a great deal of marketing clout.



Raleigh RAA employees perform a final manual sort after plastic bottles exit the company's highly automated resin sensors.

Recycle America Alliance uses single-stream processing technology to automate the separation of virtually all types of recyclable materials. State-of-the-art optical-sorting technologies are used in the Raleigh facility to quickly and affordably process commingled materials. Co-located in Raleigh is a facility that separates different colored glass. Likewise, the Raleigh operation employs advanced plastics-processing technologies that enable the company to accept separated or mixed plastics. The unique ability to offer this "no-sort" recycling option allows communities and business to recycle mixed plastic bottles more cost-effectively.

The Raleigh facility employs 145 workers and processes more than 160,000 tons of commingled recyclables each year. While less automated, the Winston-Salem facility has 20 employees that process approximately 36,000 tons of recyclables each year.

For more information about the Raleigh RAA location, contact Kerry Martin at (919) 829-1311 or kfmartin@recycleamerica.com. For more information about the Winston-Salem RAA location, contact Terry Feeney at (336) 631-9439 or tfeeney@wm.com. You can also visit the company's Web site at http://www.recycleamericaalliance.com.

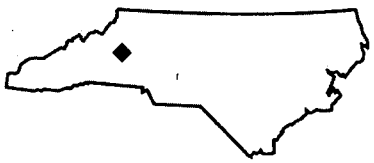
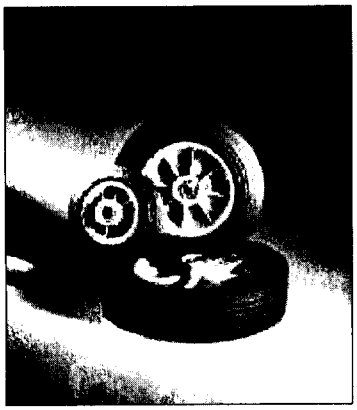
Roll-Tech LLC



Roll-Tech LLC is a unique recycling company in Hickory that manufactures solid rubber tires and wheels using recycled crumb rubber from scrap automobile and truck tires. The company began as a division of Roll-Gom and later, Guitel, a French manufacturer of wheels and casters with solid rubber tires.



Hickory's Roll-Tech Inc. transforms scrap tires collected from across N.C. into rubber wheels and casters.

Roll-Tech was established in 1995 as the result of collaboration between state agencies such as the Recycling Business Assistance Center and the N.C. Department of Commerce, along with the city of Hickory and other local and regional agencies.

The company employs 23 people and manufactures a variety of rubber wheels and casters for uses such as safety wheels for garbage containers, central locked casters for larger garbage containers, wheels for high-pressure cleaners and handling equipment and other heavy-duty applications. Using recovered crumb rubber, the company produces an innovative solid cushion tire that is resilient, highly impact resistant and puncture proof.

According to owner Patrice Bertrand, Roll-Tech has processed the equivalent of more than 20,250 tons of scrap tires since beginning operations in 1995.

For more information about the company, contact Patrice Bertrand at (828) 431-4515 or rolltech@rolltech.net. Visit the Roll-Tech LLC Web site at: http://www.rolltech.net.

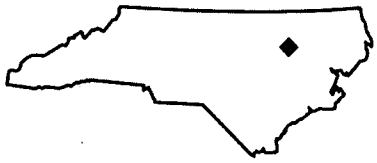
According to the N.C. Division of Waste Management, 9.6 million tires were managed by counties in 2003.

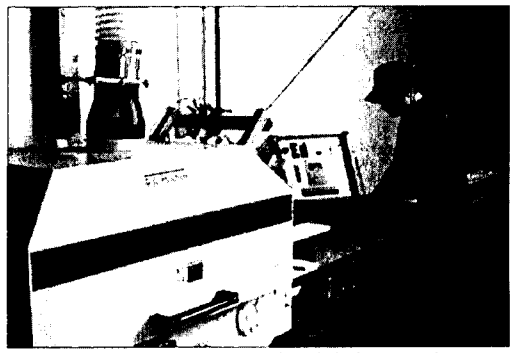
Recycling Means Business!



Scotland Neck Heart Pine Inc.

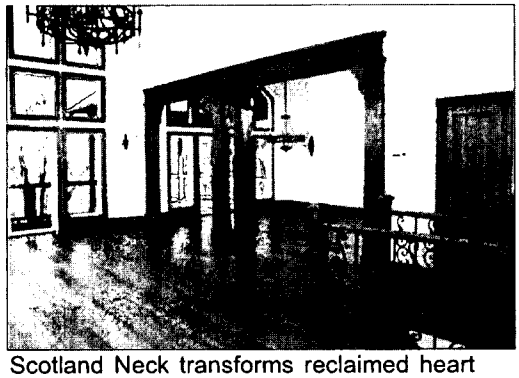
Scotland Neck Heart Pine Inc.
Tarboro
Edgecombe County

From a young age, Hodge Kitchin loved working with his hands, especially woodworking. The heartwood of the Southern Yellow Longleaf Pine that Kitchin observed through various woodworking projects captured his fascination and interest. Interest grew to a personal passion and in 2003, Hodge, along with other craftsmen, formed Scotland Neck Heart Pine Inc.



A specialty saw helps refurbish heart pine lumber collected from antique structures across North Carolina slated for demolition.

Located in Halifax County, Scotland Neck Heart Pine Inc. provides floorings, stair parts, moldings, doors, mantels and custom architectural millwork from reclaimed antique and old growth heart pine. These strong, long and straight timbers yielded excellent decay-resistant beams, which had been used as framing and decking for our young nation's factories and warehouses. In fact, these massive beams were used almost exclusively until the once-abundant supply was nearly exhausted near the end of the 1900s. Its reclaimed antique heart pine is recycled from these large old structures generally built prior to 1900. Scotland Neck also provides deconstruction and demolition of properties which allows them access and control of the old timbers to maintain quality handling.



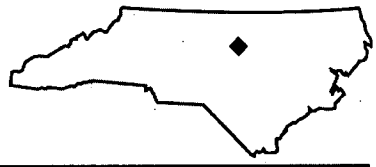
Scotland Neck transforms reclaimed heart pine into custom architectural products.

In the spring of 2004, the N.C. Department of Environment and Natural Resources awarded Scotland Neck a grant to purchase a specialty saw to be used to increase production of its reclaimed lumber. In 2004, Scotland Neck Heart Pine estimates that it has diverted 500 tons or nearly 220,000 cubic yards of waste from entering landfills.

For more information about Scotland Neck Heart Pine, contact Walton Burgyn, vice president, at (800) 826-8117, or visit the company's Web site: http://www.snheartpine.com.

Recycling Means Business!

Shimar Recycling Inc.



Since August 1997, Shimar Recycling Inc. has provided recycling services for offices and other commercial businesses in the Raleigh-Durham area. Meredith Marley, owner of Shimar Recycling, has worked to build the company into a small-business success.

Paper for processing is unloaded from the collection truck into gaylord boxes.

When the Durham-based collector-processor started up, it operated with two employees from the small corner of a parking lot leased from a paper stock dealer. With the help of a Small Business Association loan through Self-Help Credit Union, Shimar purchased a 22,500 square foot building in 2001. The new facility provides much more than shelter from the elements - it fulfills the long-held dream of expansion. Since purchasing the building, Shimar has more than tripled its capacity. Now it can look to expand collections, increase processing and make its overall operations more efficient.

Shimar's collection truck is used to serve businesses all over the Triangle.

Shimar now employs seven people and has recently purchased larger capacity baling equipment, partially financed through grant funding from the N.C. Department of Environment and Natural Resources, making full use of its new facility. The company currently collects and processes 75 tons of fiber plus 20 tons of glass and plastic bottles, and metal cans per month.

Shimar's mission is to provide a professional and affordable recycling collection service for businesses and institutions in the Triangle, with an emphasis on customer satisfaction. To do so, the company will act as its clients' recycling coordinator to help them optimize their recycling systems and maximize the potential benefits of Shimar's services including cost savings and conservation of natural resources.

For more information about Shimar Recycling Inc. contact Meredith Marley at (919) 680-6262 or meredith@shimar.com. You can also visit the company's Web site at: http://www.shimar.com.

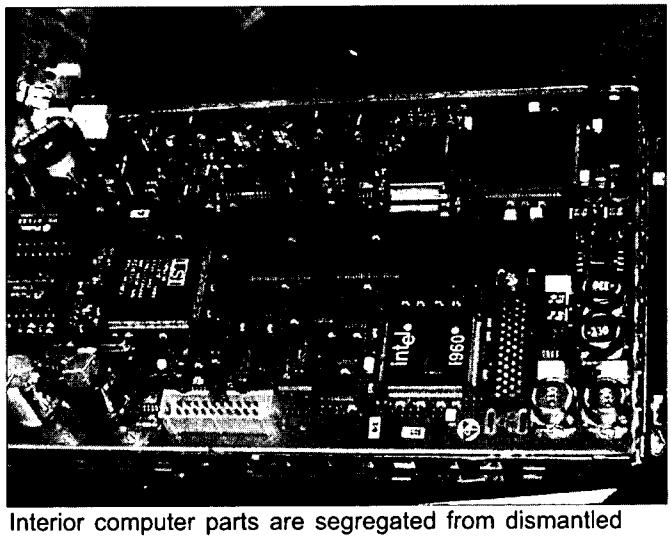
Synergy Recycling LLC

Synergy Recycling LLC
Mayodan
Rockingham County

Synergy Recycling LLC began operations in July 2000 in response to the growing need for proper disposal of electronic products and other materials. Joe Clayton manages operations and applies his experience in all phases of recyclable material processing to the company's continued growth.

Synergy Recycling is based in Mayodan, yet it handles customer needs throughout the eastern United States. Synergy Recycling specializes in providing single-source service in removal of excess and obsolete equipment including mainframe computers, PCs and work stations, monitors, keyboards, printers, circuit boards, telephone equipment, switches, circuit breakers, voltage regulators and other electrical equipment, connectors, cables and wiring.

In 2004, to increase diversion and to provide needed service in the business community, Synergy Recycling purchased a 26-foot box truck with a lift gate to assist with smaller scale "milk-run" type collections. This equipment was partially financed through grant funding from the N.C. Department of Environment and Natural Resources. Synergy Recycling currently employs six people, and handles a wide variety of material from commercial and municipal customers. It collects and processes more than 1,000 tons per year of electronics and other equipment – mostly through asset recovery contracts.



Interior computer parts are segregated from dismantled computers and recycled for high-value heavy metals.

For more information about Synergy Recycling, contact Joe Clayton at (336) 548-7014 or jclayton@synergyrecycling.com. You can also visit the company's Web site at: http://www.synergyrecycling.com.

Recycling Means Business!

TODCO

In 1992, Davidson County established a policy discouraging the disposal of wood at its landfill. With a heavy furniture manufacturing base, the county saw the policy as a way to prolong the life of its landfill. But where was the wood to go? In stepped TODCO.

Owner Todd Warfford set up a wood-waste grinding yard less than a mile from the disposal facility's scale house. TODCO began receiving wood and yard waste materials to be ground into mulch and boiler fuel.

Owner Todd Warfford has operated TODCO since 1992.

Twelve years later, TODCO is processing 16,000 tons of material annually, with capacity to expand to around 20,000 tons. Its chief customers are manufacturers - furniture and other wood-based industries in the Davidson County area. A hauling company Warfford started alongside his wood grinding business brings in some of TODCO's material. TODCO also receives yard waste from municipalities, helping them comply with the state disposal ban on that material.

TODCO's products are mostly boiler fuel, which it sends to large industrial energy users, and different kinds of mulch, including some colorized products. It also supplies bulking agent to a local biosolids composting facility. TODCO is also expanding into the production of bark mulch and nursery mix.

The company employs nine people. Two of its biggest challenges are the costs for generators to bring heavy wood waste material over long distances to TODCO's facility and competition against cheap disposal options. But it continues to grow the mulch side of the business and to diversify its products, which will make it a strong, viable recycler for many years to come.

To learn more about TODCO, call Todd Warfford at (336) 248-2001.

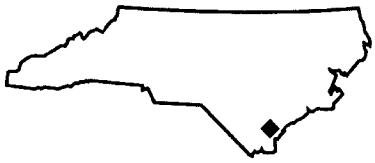
Recycling Means Business!



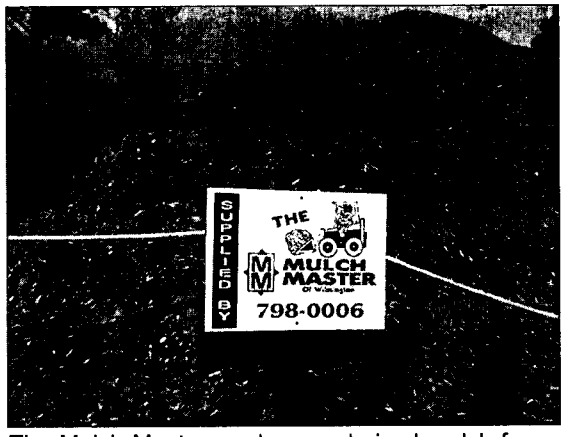
Total Maintenance

Total Maintenance
Wilmington
New Hanover County

In 2001, Joe Van Eron decided to do something about the large amount of wood being collected and sent to landfills as a result of his Wilmington-based construction site clean-up business, Total Maintenance. His first step was to purchase a tub grinder to market mulch and boiler fuel products. The purchase of that equipment was partially financed through grant funding from the N.C. Department of Environment and Natural Resources.

Owner Joe VanEron with the tubgrinder that chips wood debris into mulch and boiler fuel products.

Later, Van Eron purchased a colorizing machine that produces red, brown and black mulch. This led to the establishment of his second company, The Mulch Master of Wilmington. Currently, 15 employees work at Total Maintenance and The Mulch Master collecting, sorting, grinding and colorizing the recovered wood waste. During the first year of operation, approximately 2,250 tons of material was recovered. Today, that amount has increased to 5,000 tons and Van Eron anticipates continued growth in the future. In fact, Van Eron expects to begin recycling approximately 40 tons per week of gypsum drywall in the near future.

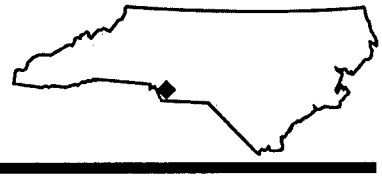


The Mulch Master produces colorized mulch from wood debris.

Recycling Means Business!

For more information about Total Maintenance and The Mulch Master of Wilmington, contact Joe Van Eron at (910) 395-2944, e-mail: JVAN10957@aol.com.

Union Gypsum



When Steve Davis began his Union Gypsum recycling business near Marshville in 1999, he sold ground gypsum in bulk at a discount to local farmers for use as a soil amendment. His product replaced the virgin agricultural gypsum farmers had been purchasing at a premium price. Today, he produces a high value-added product in 40-pound bags called "Funky Chicken." The new product is a magical mixture of poultry litter, recycled gypsum drywall and wood ash that is blended and dried prior to going through a long curing process. Davis also supplies ground recycled gypsum drywall to two large poultry producers as bedding for their poultry houses. The patented gypsum and poultry litter product, which is gathered from the poultry houses at the end of the season, is sold to area farmers for use as a nutrient-rich soil amendment completing the cycle.

Owner Steve Davis stands on a pile of ground recycled drywall.

Union Gypsum's premium organic compost, Funky Chicken, is sold in 40-pound bags.

Union Gypsum's major source of recycled gypsum drywall feedstock is independent clean-up companies that remove gypsum drywall from new construction sites. Davis is in the process of cultivating a relationship with a potentially large source of gypsum drywall – the North Carolina manufactured housing industry. Currently, six people work at Union Gypsum, where they contribute to the recycling of about 5,000 tons a year of gypsum drywall and 50,000 tons a year of poultry litter.

For more information about Union Gypsum, contact Steve Davis at (704) 624-2077.

Approximately 350,000 tons of drywall waste is generated in North Carolina annually.

Wagram Paper Stock

Wagram Paper Stock
Wagram
Scotland County

Established in 1979, Wagram Paper Stock is an independent collector and processor of recyclables located in Wagram, just north of Laurinburg. Located in a rural area of the state, Wagram Paper Stock's market focus is on the collection and baling of corrugated containers and other fiber material from various industrial and commercial customers in the region. It is a contract supplier of recovered fiber to Sonoco Products, an international paper and packaging company headquartered in nearby Hartsville, S.C.

President Tommie Currie has expanded the range of material the company collects from fiber grades only to aluminum and plastic containers recovered through curbside collection from local municipalities. This area of growth will provide Wagram Paper Stock the ability to support rural communities in the region that may lack the volume or have the infrastructure required to get their recyclables to an end market. Wagram Paper Stock has the ability to provide a consolidation point to assist small rural communities in this region with their recycling programs.

160 paper mills in the United States, including many located in the Southeast, exclusively use recovered fiber.

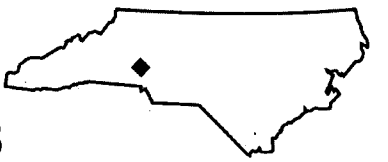
Material recovery facilities like Wagram Paper Stock can provide residential and commercial collection programs with an advantage in getting their material to market. Municipalities, as well as private haulers, can usually gain collection efficiencies and increase diversion in the regions where access to such facilities is available. The continued development of the infrastructure for primary processing represented by forward-thinking companies like Wagram Paper Stock can greatly improve the economic effect of recycling in the state.

Wagram Paper Stock is locally owned and operated, employs 17 people and collects 14,400 tons per year of recyclable materials.

For more information about Wagram Paperstock, contact Tommie Currie at (910) 369-2211.

Recycling Means Business!

Wallace Farms Soil Products

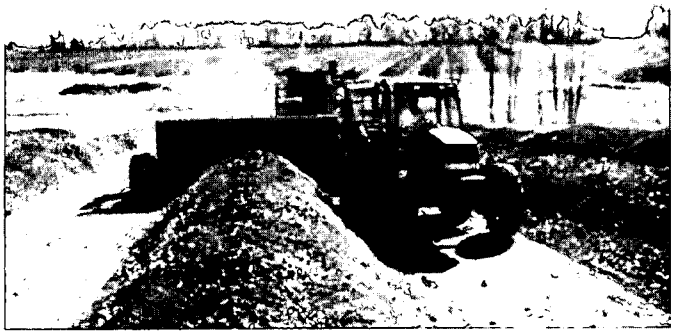


Huntersville's Wallace Farms Soil Products began operation in the early 1940s as one of the largest dairy farms in North Carolina. In 1990, the family-owned and operated business decided to diversify by leasing out its dairy facilities, and creating a soil processing and composting operation.

Wallace Farms has been making high-quality compost since 1990.

Because of increasing environmental concerns and regulations governing animal waste, the Wallace family set out to develop an environmentally friendly method of managing the dairy manure. Aerobic composting proved to be the logical solution, originating one of the few "real" composted cow manures available today. Wallace Farm Soil Products has since developed a high-quality line of soil and compost products, including blended topsoil, composted cow manure, compost-plus, potting soil and play sand.

With 22 employees, Wallace Farm Soil Products receives approximately 60,000 tons of organic waste a year and is one of the largest compost and packaging facilities in the state. The farm reaches out to other farms and industries to divert organic waste materials such as animal manures, food waste, wood waste and yard waste from landfills.



At Wallace Farms, rows of organic debris are turned by a windrow turner to produce high-quality compost.

For more information, contact Eric Wallace at (704) 875-2975, or visit the company's Web site at http://www.wallacefarmproducts.com.

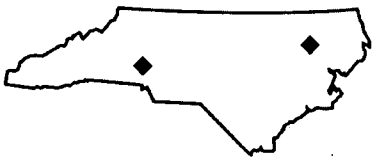
Recycling Means Business!



Weyerhaeuser Company

Weyerhaeuser Company
Plymouth
Washington County

Weyerhaeuser Company
Charlotte
Mecklenburg County

Weyerhaeuser Company is an international forest products company with annual sales of $19.9 billion. Weyerhaeuser was founded in 1900 and currently employs about 55,000 people in 18 countries. Its diverse business includes nearly every aspect of the forest products industry, from growing and harvesting trees to producing pulp, paper, packaging and building products.

Weyerhaeuser

Here in North Carolina, Weyerhaeuser has established a range of facilities that includes nearly all aspects of its forest product operations. These facilities include pulp and paper mills in Plymouth and New Bern, lumber mills and managed forests in various parts of the state, and box plants and a fiber recovery and recycling facility in Charlotte.

"The Plymouth mill employs just under 2,000 people, and in addition to making the 100 percent recycled content linerboard, also produces 1,300 tons per day of fine printing and writing papers."

The Charlotte recovery facility employs 16 people and processes 84,000 tons per year of mostly fiber material. It also brokers an additional 18,000 tons of baled material that does not need processing. A majority of the cardboard that passes through this facility ends up as feedstock for the Plymouth containerboard plant.

The Plymouth facility uses 100 percent recycled fiber from old corrugated containers to produce 930 tons per day of linerboard (the outside portion of corrugated containers). The Plymouth mill employs just under 2,000 people, and in addition to making the 100 percent recycled content linerboard, also produces 1,300 tons per day of fine printing and writing papers.

For more information about Weyerhaeuser, contact Ginny Santorine at (804) 739-6736, e-mail: ginny.santorine@weyerhaeuser.com. You can also visit the company's Web site at: http://www.weyerhaeuser.com.

Recycling Means Business!

N.C. Recycling Business Assistance Providers

A number of organizations provide a wide variety of technical and business development assistance to North Carolina-based recycling businesses. Some provide assistance specifically to members of the recycling industry, while others provide general business development assistance to a wider range of clients. These organizations include:

Recycling-Specific Service Providers

N.C. Recycling Business Assistance Center

The N.C. Recycling Business Assistance Center is a partnership of the North Carolina Department of Environment and Natural Resources' Division of Pollution Prevention and Environmental Assistance and the North Carolina Department of Commerce. Its mission is to promote environmentally sound economic development through the reuse and remanufacture of recyclable materials. To achieve this objective, RBAC:

NORTH CAROLINA RECYCLING BUSINESS ASSISTANCE CENTER

- Provides technical assistance to recycling businesses with sourcing, processing and remanufacturing secondary materials and marketing their end products.
- Provides business development assistance by identifying funding sources, participates in the N.C. Recycling Business Loan Fund and funding demonstration projects.
- Develops policies that address the barriers to collecting, processing, remanufacturing and reusing secondary materials.
- Promotes to potential customers the need to purchase products with recycled content.
- Promotes the need to develop, transfer and apply technologies that will increase the use of recycled materials.
- Promotes partnerships among government and industry to stimulate and facilitate the recovery and reuse of secondary materials.
- Fosters the development of a supply infrastructure that is capable of providing industry with clean, readily usable and available raw materials.
- Promotes waste prevention and reuse within both the public and private sectors to reduce business costs and the consumption of virgin materials.

For more information about RBAC, contact Matt Ewadinger, RBAC manager, at (919) 715-6504, or matt.ewadinger@ncmail.net, or visit the RBAC Web site at http://www.p2pays.org/rbac.

Recycling Means Business!

Recycling Means Business!

Self-Help Credit Union

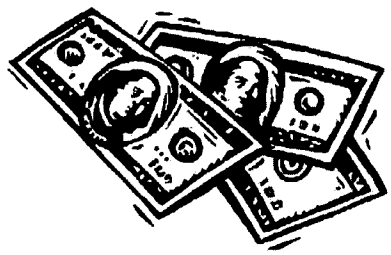
SELF HELP
CREATING OWNERSHIP AND ECONOMIC OPPORTUNITY

Self-Help, North Carolina's community development banking group, administers the N.C. Recycling Business Loan Fund. The loan fund nurtures fledgling businesses until they become bankable and graduate to full-service private sector financing.

Why is there a dedicated Recycling Business Loan Fund? Banks are sometime reluctant to fund start-ups or companies in untested sectors. While venture capital is designed to take on higher levels of risk, those firms often want only very large deals and those with some form of management participation. The Recycling Business Loan Fund is designed to fill the gap between bank loans and venture capital.

What types of loans are available? The loans are structured as market-rate debt, and can be used for working capital, inventory, equipment and real estate purchases. Initial interest-only periods may be available, where appropriate. The staff at Self-Help is well skilled at tapping existing Small Business Administration funding pools and guarantee programs to help with the approval of riskier loans. Self-Help often uses SBA 504 and 7(A) guarantees in its underwriting.

Self-Help has had significant experience lending to the recycling business community. In the past 12 years, Self-Help has lent more than $3 million to 20 recycling companies in North Carolina, including loans to companies that provide a wide variety of recycling services. Those services range from collection and processing to end-use products of diverse materials such as paper, scrap metal, construction and demolition debris, plastics and wood. Loan deals have ranged from $10,000 to more than $1 million (with an average loan size of $75,000) and have leveraged an additional $2 million.



For more information about the Recycling Business Loan Fund, contact Fred Broadwell, environmental finance coordinator at (919) 956-4490, or fred@self-help.org, or visit the Self-Help Web site at http://www.self-help.org.

Carolina Recycling Association

The Carolina Recycling Association is one of the largest state-based recycling associations in the United States, serving North and South Carolina since 1989. CRA represents more than 400 members (individuals, small businesses, multinational corporations, state government agencies and local governments) who are committed to reducing waste, promoting recycling and buying recycled.

Its mission is to conserve resources by advancing waste reduction and recycling throughout the Carolinas. CRA seeks to accomplish this mission in three ways:

- Networking: create ample opportunities for members to make valuable contacts with colleagues at events and through membership resources.
- Educating: sponsor workshops, training courses and tours, host the largest regional recycling conference in the country and produce informative publications.
- Advocating: support legislation that positively affects solid waste policies and advances states' waste reduction and recycling.

CRA is governed by a 13-member board of directors and has a staff of one part-time and two full-time employees. For more information about CRA contact Kerry Krumsiek, executive director, at (919) 545-9050, or kerryk@cra-recycle.org, or visit the CRA Web site at http://www.cra-recycle.org.

N.C. Department of Transportation's Recycled Products and Solid Waste Utilization Task Force

The N.C. Department of Transportation established the Recycled Products and Solid Waste Utilization Task Force in September 1992 to encourage the development of the state's recycling industry by promoting the successful development of markets for recycled goods. The mission of the task force is to provide leadership and expertise in the selection and recommended use of recycled materials to reduce waste and preserve natural resources. This mission is accomplished through research, demonstration projects, bid procedures and specifications that encourage contractors to develop and utilize recycled products.

Recycling Means Business!

Since its inception, the task force has been instrumental in including a wide variety of recycled materials in DOT projects. Those materials include scrap tires, fly ash, processed silica, plastics, land clearing and demolition debris, yard waste, poultry litter, municipal sludges, recycled glass, shingles, aluminum, recycled concrete and recycled asphalt.

For more information about the task force, contact DOT's Division of Highways at (919) 250-4128, or visit the Web site at http://www.doh.dot.state.nc.us/sitemap.html and click on "Recycling Information."

General Business Assistance Providers

N.C. Department of Commerce

The Department of Commerce, the state's leading agency for economic, community and workforce development, has been a cooperative partner since the inception of RBAC. A RBAC staff person has worked with the DOC office as a RBAC/DOC liaison since 1995.

The mission of the Department of Commerce is to improve the economic well-being and quality of life for all North Carolinians. The department's strategic plan focuses on three goals to further this mission:

- Keeping North Carolina competitive for high-value, technologically competitive industries and companies by actively recruiting and encouraging their expansion in the state.
- Increasing economic opportunities for North Carolina in a global economy by ensuring that North Carolina is recognized throughout the world as a highly attractive location for growing businesses, for the high quality of its products and for its appeal as a location for tourism, film and sports development.
- Improving economic opportunities for all North Carolinians through programs targeted to people and places not currently enjoying economic prosperity.

For more information about DOC and DOC/RBAC connection contact Matt Ewadinger at (919) 715-6504, or matt.ewadinger@ncmail.net. Visit the DOC Web site at http://www.commerce.state.nc.us.

Recycling Means Business!

N.C. Small Business & Technology Development Center

The Small Business & Technology Development Center's mission is to support the growth and development of North Carolina's economy by encouraging entrepreneurship, assisting in the creation and expansion of small businesses and facilitating technology development and transfer for small businesses. As part of the RBAC/SBTDC partnership, SBTDC offers scholarships to North Carolina-based recycling companies for two of its highly acclaimed small business training programs. Scholarships for SBTDC's "NxLeveL Entrepreneurial Training Program" and "SymmeTree Change Management Course" are held at various statewide locations throughout the year. Contact Dan Blankenship at (919) 715-7272 or (800) 258-0862, or dblankenship@sbtdc.org for more information. Visit SBTDC's Web site at http://www.sbtdc.org.

N.C. Department of Environment and Natural Resources' Customer Service Center

The Customer Service Center for the Department of Environment and Natural Resources is a single source of information for all of the Department's programs. Through its "1-STOP" permit assistance program, the CSC helps customers determine what environmental permits they need for a particular project as well as permit decision timelines. The CSC's "Small Business Ombudsman/Assistance Program" helps small businesses understand and comply with environmental requirements and resolve environmental problems. The 10-person staff is headquartered in Raleigh with express permitting and 1-STOP permit offices in Mooresville, Washington and Wilmington. For more information about CSC contact Edythe McKinney, director/small business ombudsman at (877) 623-6748, or edythe.mckinney@ncmail.net, or visit the CSC Web site at http://www.envhelp.org.

Waste Reduction Partners

Waste Reduction Partners, a team of highly-experienced volunteer engineers, architects and scientists, provides western N.C. businesses and industries with no-cost waste and energy reduction assessments and technical assistance. The WRP's mission is to work for a sustainable

Recycling Means Business!

economy, healthy environment, and a better quality of life by helping businesses, industries, institutions and government entities in the western part of the state reduce waste and utilize natural resources efficiently.

As part of its recycling business development efforts, WRP is leading a public/private partnership to demonstrate and commercialize a process to make wood flooring from waste pallets. The project goal is to produce 50,000 square feet of high-quality flooring in the first two years. In North Carolina more than 300,000 tons of pallet waste are sent to landfills annually.

WRP is administered by the Land-of-Sky Regional Council and works in special partnership with the North Carolina Division of Pollution Prevention and Environmental Assistance. Other partners include the Regional Water Authority of Asheville, Buncombe and Henderson, the Environmental Protection Agency and the USDA's Rural Utility Services. For more information about WRP, contact Terry Albrecht, program director, at (828) 251-6622, or wrp@landofsky.org, or visit the WRP Web site at http://www.landofsky.org/wrp.

SJF Ventures

SJF Ventures

SJF Ventures is a venture capital fund that finances and assists expansion stage companies in the clean technologies, business services and consumer products sectors. These companies achieve rapid growth and a competitive advantage through proprietary business models, quality management, high-performing entry-level workforces and environmental efficiencies. SJF Ventures provides equity financing from $500,000 to $5 million, solo or in syndicates, to companies with annual sales of $500,000 to $20 million. SJF Advisory Services, an allied nonprofit organization, provides entrepreneurial, workforce and sustainability assistance services to SJF prospect and portfolio companies.

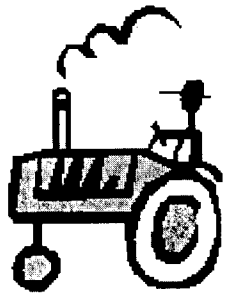
For more information about SJF Ventures, contact Rick Larson, managing director, at (919) 530-1177, or rlarson@sjfund.com, or visit the SJF Ventures Web site at http://www.sjfund.com.

Recycling Means Business!

N.C. Agricultural Finance Authority

The N.C. Agricultural Finance Authority provides financing to farmers and agribusinesses engaged in the processing and manufacturing of agricultural products, and agribusinesses that provide value-added processing or support

for other facets of agriculture such as composting and manure management. For more information about the N.C. Agricultural Finance Authority, contact Dr. Frank Bordeaux at (919) 790-3949, or frank.bordeaux@ncmail.net, or visit the National Council of State Agricultural Finance Programs Web site at http://www.stateagfinance.com/northcarolina.html.



N.C. Rural Economic Development Center and its Institute for Rural Entrepreneurship

The mission of the North Carolina Rural Economic Development Center is to develop, promote and implement sound economic strategies to improve the quality of life for rural North Carolinians. The center serves the state's 85 rural counties, with a special focus on individuals with low-to-moderate incomes and communities with limited resources. Created in 1987, the Rural Center operates a multi-faceted program that includes conducting research into rural issues; advocating for policy and program innovations; and building the productive capacity of rural leaders, entrepreneurs and community organizations. The Rural Center is a private, nonprofit organization, funded by both public and private sources and led by a 50-member board of directors.

The Institute for Rural Entrepreneurship was established in October 2003 to stimulate and support the development of micro, small and medium-size enterprises in North Carolina's 85 rural counties. The institute is housed within the Rural Center and draws from a range of resources to serve the needs of rural entrepreneurs, community and economic leaders, and state policy makers. The goals of the Institute for Rural Entrepreneurship have been developed by the Rural Center in collaboration with state business leaders and public officials. They are to:

- Support self-employment as an important source of jobs and income in rural North Carolina.
- Support development of entrepreneurial companies - new and existing - that can grow and generate jobs and wealth in rural communities.
- Support rural communities as they celebrate and build support systems for entrepreneurship.
- Support overall improvement in the health and vitality of the small business community in rural areas.

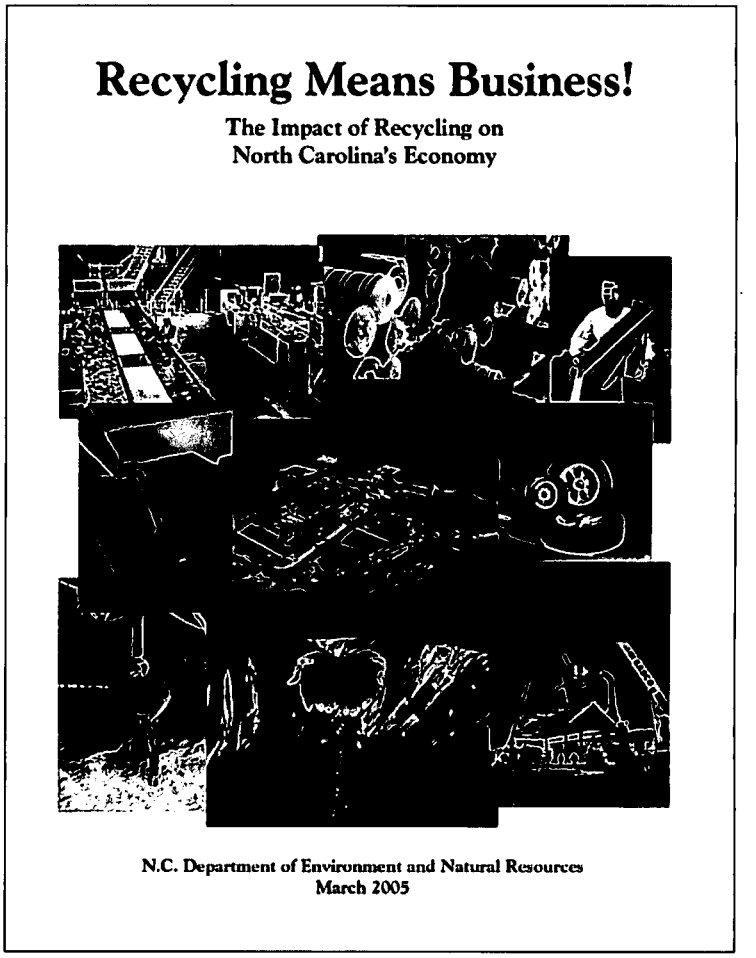
Foreword

In 2004, the N.C. Division of Pollution Prevention and Environmental Assistance produced a document entitled *Recycling Means Business! The Impact of Recycling on North Carolina's Economy* (shown here), highlighting more than 40 North Carolina businesses that process recycled materials, from sorting to manufacturing new products. These companies range in size from Nucor, a large steel manufacturer with more than 11,500 employees, to Elizabeth City Glass, a glass processor and manufacturer currently employing four people. A number of manufacturers process recyclables from start to finish. Others buy materials such as plastic from other businesses that perform one or more of a variety of industrial activities including: sorting, shredding, chipping, cleaning and pelletizing the materials.



One thing that these and the other recycling businesses listed in the state's recycling markets directory (http://www.p2pays.org/DMRM/start.aspx) have in common is their important contributions to North Carolina's economy. While other manufacturing sector jobs have declined over the past decade, recycling jobs in the state have increased 60 percent from 8,700 in 1994 to 14,000 in 2004. In addition, a number of these companies now occupy old textile factories and other industrial plants abandoned by some of the state's more traditional industries.

While *Recycling Means Business!* showcased a cross-section of recycling operations, *Made in North Carolina: Recycled-Content Products Help Fuel the State's Economy*, highlights a number of companies that are manufacturing recycled-content products. Some of those products, like paper and metal, have been made with recycled-content materials for decades, while others, like nursery containers and blow-molded plastic bottles, are only recently being made with recycled-content materials. Regardless of how long these companies have been using recycled materials, manufacturers will increasingly rely on recycled feedstock to produce a wide variety of products.

Introduction

Manufacturing – the process of making value-added products – has long been one of the pillars of North Carolina's economy. But recently that pillar has seemed to crumble in the face of global competition. As documented by the N.C. Employment Security Commission and Raleigh's *The News & Observer*, manufacturing jobs in the state have declined from 820,000 in 1990 to 569,000 in 2005.* This rapid decline is unsettling and it begs the question: how can manufacturing be kept alive in North Carolina?

"Our state's recycled product companies are doing their part to retain manufacturing jobs in North Carolina and the United States."

One of the answers comes from a surprising source: recycling. Long understood as a way to "keep stuff out of the landfill," recycling is first and foremost a process that captures discarded commodities for use in manufacturing. Manufacturing relies on access to materials and any company making any kind of product needs to bring in reliable and appropriate feedstocks for processing. Increasingly, manufacturers around the world are relying on recovered commodities as a supply source, and that's true here in North Carolina as well.

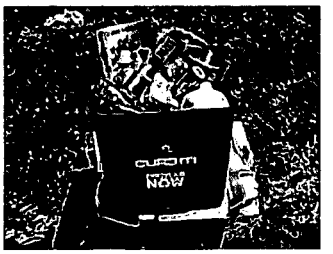
The companies profiled in this document are actively ensuring that manufacturing stays a part of North Carolina's economic future. They make a range of products from traditional everyday paper, plastic bottles and flowerpots, to relatively new items such as trash cans and polyester yarn. You probably use one of these products every week if not every day, unaware it was made from the materials placed in the curbside or office recycling bin. The items these manufacturers are producing have great utility, are high quality and can even be things of beauty, like flooring made from recovered heart pine boards.

Our state's recycled product companies are doing their part to retain manufacturing jobs in North Carolina and the United States. They are operating profitable businesses giving people the products they want. They are in step with a global trend to use "secondary" or recovered materials that meet or exceed quality and specification standards. In short, recycled products manufacturing is a success story in North Carolina and one that can help rebuild that central pillar of our economy.

How can we increase that success? The simple answer is: recycle. Households, businesses, churches, construction companies, nonprofit agencies, schools, institutions, industries and individuals across North Carolina can help make both recycling and manufacturing succeed by recognizing that some things are not trash, but the building blocks for a thriving economy. Why would you throw all that away?

*"China aims to innovate, compete for tech jobs," *The News & Observer*, Sept. 18, 2006.

What Is Buying Recycled And Why Does It Matter?

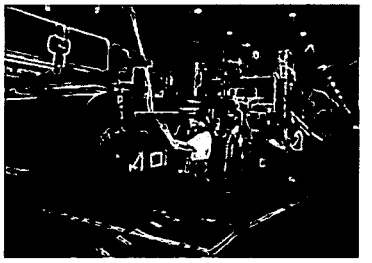


You know the three Rs – reduce, reuse, recycle. You're familiar with the "chasing arrows" image that tells you if something is recyclable or made of recycled materials. But, can you list the process those arrows represent? The truth is, placing materials in the recycling bin rather than throwing them in the trash is only the first step.

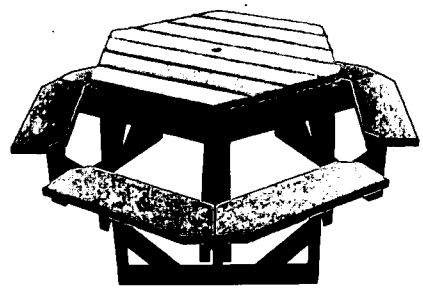
As you can see from the recycling bin in the photo above, curbside recycling programs can be extensive, accepting Nos. 1 and 2 plastic bottles and jars, glass containers, magazines and catalogs, newspapers, cardboard, spiral paper cans, steel cans, telephone books, aluminum cans, junk mail, mixed paper and gift wrap.

Materials collected for recycling are sorted (as workers are doing in the photo on the right), cleaned, processed and sold to companies to use in manufacturing new products. Remanufacture is the second action in the recycling loop, as shown at a mill in the photo below. Not only does the simple act of recycling save space in landfills but it also creates much-needed feedstock for the manufacturing sector.

To complete the "loop" the final step requires consumers to purchase and use recycled content products, such as the ones shown above left. By purchasing recycled products, you are helping to create long-term stable markets for recyclable material collected. The more a recycled-content product is purchased, the more competition improves, the more resources we save and the less waste and pollution we produce. If that doesn't sound convincing, then remember, it is also creates jobs!



Buying Recycled Products



Recycled-content products have a lesser or reduced effect on human health and the environment when compared with competing products that serve the same purpose. They often have the added benefit of being more durable, such as a picnic table made from plastic lumber. It is low maintenance, will last much longer than a wooden table and it's made from recycled materials!

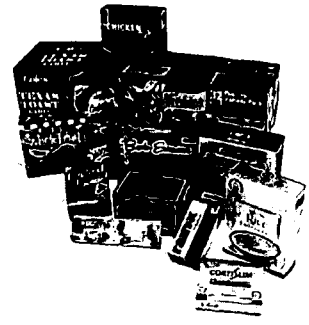
Purchasing recycled products is like casting a vote. Requesting more recycled-content products in the marketplace shows manufacturers that consumers care about the way products are made. Many people become good environmental stewards through recycling efforts and have joined the campaign by participating at home and at work. But to complete the full circle, you should begin purchasing products that are made of the materials we recycle.

What to look for

When shopping at your local grocery, hardware and multipurpose stores, look for the recycling symbol(s).

Arrows superimposed on a dark background indicate that the product is made with recycled material.

Arrows superimposed on a white or light background indicate the product can be recycled after it's used.

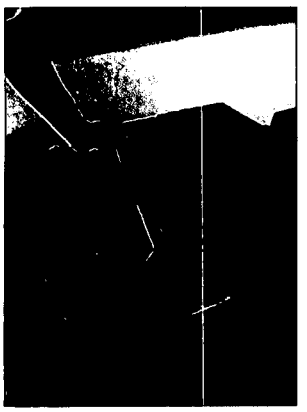


But don't just rely on symbols. Read product labels like you would food nutrition labels. The use of the recycling logo is not regulated by law. If the label says only "recycle" or "recyclable," it may contain no recycled content. To ensure you are buying a product made from recycled materials check the label for words that indicate the product is made from recycled materials. Make sure you're getting exactly what you're looking for in your purchases.

Recycled Product Examples

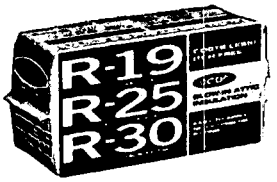
The following is a list of EPA's Comprehensive Procurement Guidelines product categories, along with some examples (http://www.epa.gov/cpg/).

- *Construction Products*: building insulation, carpet and carpet cushion, cement, concrete, paint, floor tiles, pavers (shown at top of p. 5), roofing materials, shower and restroom dividers/partitions



- *Landscaping Products*: compost, garden and soaker hoses, plastic lumber landscaping timbers and posts
- *Non-paper Office Products*: binders, clipboards, folders, clip portfolios, furniture, recycling containers and waste receptacles, plastic desktop accessories, plastic envelopes, plastic trash bags and toner cartridges
- *Paper and Paper Products*: commercial/industrial sanitary tissue products, miscellaneous papers, newsprint, paperboard and packaging products, printing and writing papers
- *Park and Recreation Products*: park benches and picnic tables, plastic fencing, playground equipment, playground surfaces and running tracks
- *Transportation Products*: parking stops (shown at right), traffic barricades and traffic cones
- *Vehicular Products*: engine coolants, rebuilt vehicular parts, re-refined lubricating oils and retread tires
- *Miscellaneous Products*: awards, plaques, bike racks, industrial drums, mats, pallets and signage

For some purchases, consumers are making a conscious decision to buy the more environmentally-friendly product. Many times we're not even aware that what we're buying has recycled content.

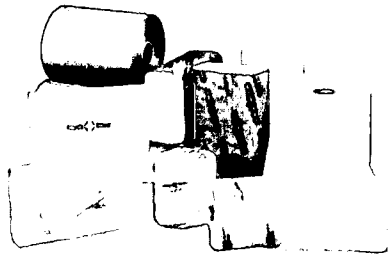


For example, steel is not only one of the most highly-utilized material in manufacturing, it is also the most recycled commodity. Three-quarters of all steel recycled in America is actually made back into a new product—anything from a can to a car. Insulation manufacturers also commonly use recycled materials in their product. Fiber glass insulation, traditionally made with sand, is increasingly made with recycled glass, and cellulose insulation is made from a variety of recycled paper categories including newsprint, food boxes and phone books.

These unconscious purchases, many highlighted in the following pages, include both plastic and glass bottles, cereal boxes, pipes, flower pots, coat hangers, furniture and upholstery.

Where to Buy Green Products?

You can find recycled-content products at stores across the country for office supplies, building materials and yard supplies. Some examples include plastic lumber at home improvement

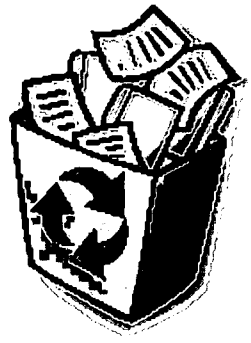


stores and a wide variety of paper packaging that contain healthcare, food and household products. Everything you ever wanted to know about recycled-content products and other environmentally preferable products can be found on the N.C. Division of Pollution Prevention and Environmental Assistance's EPP Web site at http://www.p2pays.org/epp/.

If you have trouble finding recycled-content products or other environmentally-friendly products, consider filling out a comment card and dropping it into the customer comment boxes where you shop. Local stores want to carry products their customers are looking for - perhaps they are not aware that these products are available or that it could help their environmental image. Businesses need to know what is important to their customers, so help keep them informed.

Create an Incentive

Whether you work in a government office or in the private sector, it's a good idea to create a policy with your purchasing initiatives. Work with upper management and procurement professionals to gain buy-in and create the policy document. Because everyone is involved in purchasing decisions, educate the entire staff on the new purchasing procedures. Contractors need to be made aware of the policy so they, too, can try to purchase more sustainable products and conduct their service in the most sustainable way.



The federal government, as well as many states (including North Carolina), have instituted "buy recycled" or "green purchasing" programs. These programs establish a secure commitment to buying products made with recycled products. Consumers benefit from these programs because the purchasing power of the government drives change in the marketplace and creates competition that eventually drives down cost. This opens the door for industries to begin using more recyclables to manufacture products.

Box stores are developing sustainability policies that include various efforts, from carrying more environmentally-friendly products and making more sustainable products to developing product stewardship programs. Policies are being developed to encourage suppliers to improve everything from packaging materials to manufacturing more recycled content products.

Reduce, reuse, recycle and be a conscious consumer! Visit http://www.p2pays.org/epp for more information.

Energy Savings And Recycling: Making The Connection

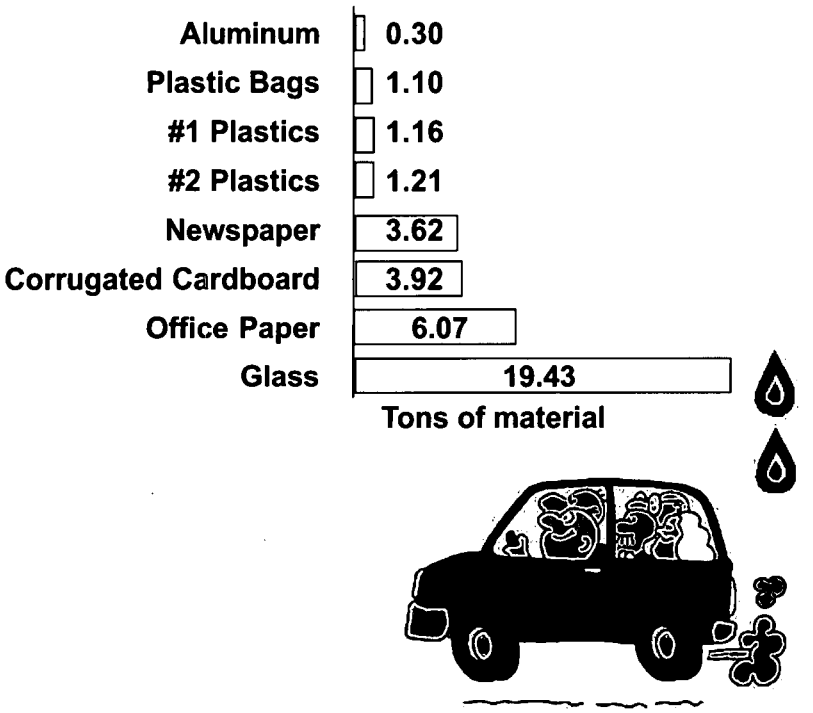
As energy costs continue to rise, it's a good time to revisit the energy savings associated with recycling. Products that enter the waste stream have impacts on energy use at each stage of their life cycle. These stages include: the acquisition of raw materials, the manufacture of raw materials into products, product use by consumers and product disposal.

"A 4.4 percent increase in recycling rates would have the same effect as removing 27 million passenger cars from the roadway each year."

Recycling saves energy. Manufacturing goods from recycled materials typically requires less energy than producing goods from virgin materials. When a product is made with recycled materials, less energy is needed to extract, transport and process raw materials and to manufacture the product. When energy demand decreases, fewer fossil fuels are burned and less carbon dioxide is emitted into the atmosphere.

Energy savings are determined by comparing the difference between manufacturing a product using virgin inputs and manufacturing a product using recycled inputs. For example, recycling aluminum cans results in significant energy savings per ton. These savings reflect the nature of aluminum production; manufacturing aluminum from virgin inputs is energy intensive whereas relatively little energy is required to manufacture cans from recycled aluminum.

Tons required of each material to equal the energy savings of taking one car off the road per year



If the United States recycling rate were to increase from the current 30.6 percent recovery scenario to 35 percent by 2008, energy savings would increase to an estimated 1,720 Trillion Btu – an amount equivalent to the consumption of 13.7 billion gallons of gasoline. A 4.4 percent increase in recycling rates would have the same effect as removing 27 million passenger cars from the roadway each year.*

*"Waste Management and Energy Savings: Benefits by the Numbers," Anne Choate, Luaren Pederson and Jeremy Scharfenberg, ICF Consulting and Henry Ferland, U.S. EPA; Sept. 4, 2005.

Other Benefits To Manufacturers Using Recycled Feedstock

Recycled-content products are manufactured to meet the same specifications as virgin products. Manufacturers realize the same benefits using recycled materials as consumers do when purchasing recycled-content products. They help their communities conserve energy and landfill space, create markets for recyclables the community generates, create jobs and build the economy.

North Carolina offers a few incentives to companies in the recycling industry. Businesses can apply for a tax exemption on equipment and facilities used exclusively for recycling and resource recovery. The N.C. Division of Waste Management manages the Tax Certification Program. North Carolina also offers grants to businesses involved in recycling from collection of materials to processing and manufacturing products, as well as grants to communities to help develop and expand local recycling initiatives. See the RBAC Web site for additional information: http://www.p2pays.org/rbac/financing.html.

Products Made
Beanbag chairs

Process Description
Post-industrial scrap plastics are brought in by truckload and ground into a flake material. Plastic flake is filled into sewn beanbags and bags are sealed.

Product Facts
Artist Colony's soft goods are created using recovered foam products and plastic beads. Post-industrial scrap plastic foam materials are processed into chips that become the filler in beanbag chairs. Artist Colony's beanbag chairs come in a variety of shapes and colors.

Where to Buy
Beanbag chairs are sold at department stores, retail furniture stores, catalog retail and e-marketed under the Artist Colony brand.

Other Information
Artist Colony, which has been selling beanbag chairs to furniture outlets since 1980, has found that using recycled feedstocks gives it a financial advantage in the marketplace.

Cascades Tissue Group

Rockingham

Products Made
Bathroom tissue, paper towels, paper hand towels, facial tissue and paper napkins

Process Description
From feedstock to final product, it all happens at this facility. Sorted office paper is sent through a de-inking process to make de-inked pulp. This pulp is used to make paper. The finished paper is converted into many different tissue products that are packaged and distributed around the country.

Product Facts
All products produced by Cascades Tissue Group contain 100 percent recycled content. The company is a major supplier of private-label products for major chains and drugstores. Also, its brands for the commercial and industrial markets can be found in North Carolina. These innovative lines are offered under various brand names such as "New Horizon," "North River," "Decor" and "Perkins."

Products Made
3"-48" HDPE corrugated plastic pipes

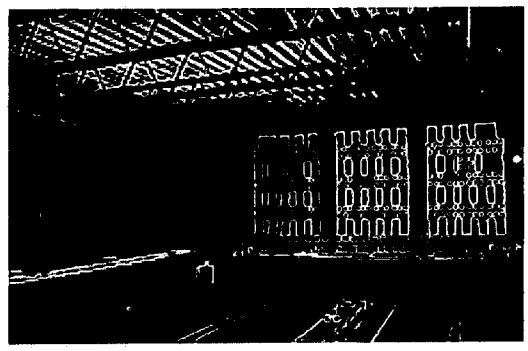
Product Facts
Pipes can be made with up to 100 percent recycled HDPE content. Product applications include: road culverts, parking lot detention-retention drains, landfill drains, industrial wastewater systems, golf course landscape drains, sewer composting and septic sewers.

Where to Buy
CPP direct sells to departments of transportation, building contractors, wholesalers, independent building supply companies and hardware stores east of the Mississippi, from New Jersey to Florida.

Other Information
The company operates the largest corrugated plastic pipe manufacturing plant under one roof on the eastern seaboard.

Cunningham Brick Company Inc.

Lexington



Products Made
Building brick and brick nuggets

Process Description
Material is blended with clay and shaped into bricks. Bricks are fired in a kiln. Whole bricks are sold directly to consumers, contractors and building supply vendors. Off-spec and broken pieces of brick are converted to brick nuggets and bagged for sale to consumers and the commercial landscaping market.

Product Facts
Cunningham Bricks come in a variety of sizes, including modular, engineer, queen, closure, utility and norman sizes. They are also available in a number of colors and specialized shapes.

Where to Buy
Bricks can be purchased directly from the manufacturer. Brick landscaping nuggets may be purchased from approved landscaping vendors. Brick products are distributed to 37 states and Canada. Cunningham Brick Company Inc. also sells through "big-box" home improvement stores. Bricks are sold under the Cunningham brand name.

Products Made
Precision-milled tongue and groove flooring

Process Description
Heartwood Pine purchases the salvaged wood beams and decking from demolition companies, sorts by quality, de-nails (removes any metal contamination) and processes the wood into top-quality flooring. The flooring is marketed and sold to builders and homeowners for both new construction and remodeling projects.

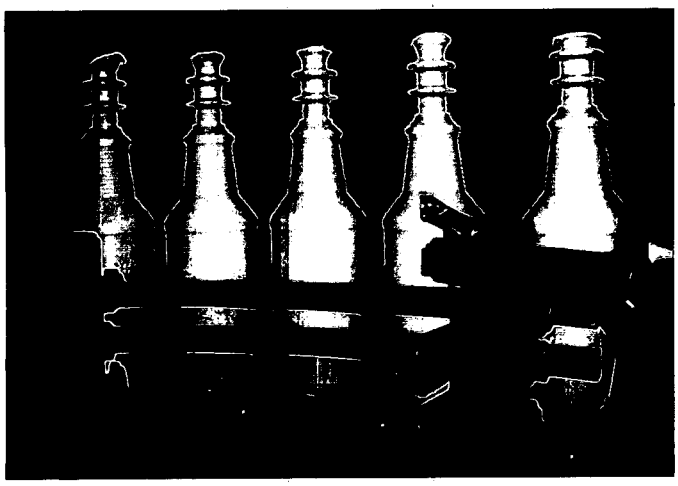
Product Facts
Wood beams, decking and timber are salvaged from textile mills being dismantled or demolished. The company specializes in 100-plus-year-old heartwood pine and produces 100 percent-recycled content tongue and groove flooring.

Where to Buy
Heartwood Pine's flooring can be purchased directly at the showroom in Pittsboro, or through the company's Web page (www.heartwoodpine.com). The company also advertises in *Fine Home Building* magazine.

Other Information
Heartwood Pine received a grant from N.C. DPPEA in 2005 to purchase and install a band saw giving it the capability to increase the amount of material reclaimed and reduce waste.

Intertech Corporation

Greensboro



Products Made
Blow-molded plastic bottles, sizes 1.5 ounces to 160 ounces. Bottles from 16 ounces to 64 ounces may contain post-consumer resin.

Process Description
Intertech purchases post-consumer resin recycled from milk and water bottles. The PCR is blended with virgin resin and then blow-molded into a variety of high quality plastic containers.

Product Facts
Additional products/services include container decoration by screen printing, labeling and sleeving, and container and mold design/construction.

Where to Buy
Products can be purchased through the company's Web page (www.intertechcorp.com).

Other Information
Intertech also manufactures Funballs, HyGenie ball washing systems and GigglePlay Gazebos (ball pools) for children's play.

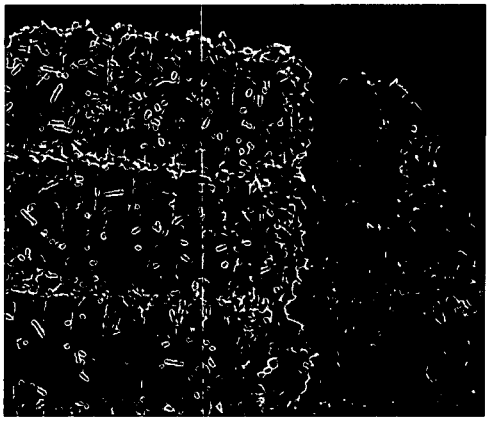
Bath tissue and towels

Process Description
Sorted office paper is sent through a de-inking process to make de-inked pulp. This pulp is used to make paper. The finished paper is converted into many different tissue products.

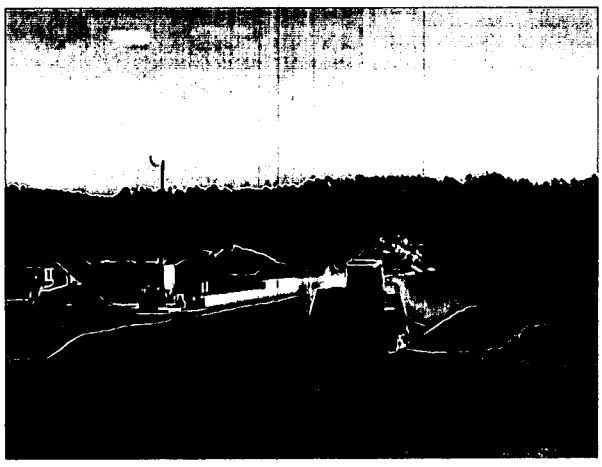
Product Facts
All products produced by Laurel Hill Paper Company are 100 percent recycled content. Sales are about $1.5 million per month. Products include bath tissue, center pull towels and jumbo roll tissue.

Where to Buy
Institutional sales only; products can be found in interstate rest areas and prisons. Call Glen Duncan, marketing manager, (910) 997-4526 for purchasing information.



Novozymes North America Inc.

Franklinton



Products Made
Nature's GREEN-RELEAF compost, colored designer mulch and specialty compost blends

Process Description
Recycled feedstocks are dropped off for a fee. Nitrogen rich enzyme residuals are a byproduct from the production of Novozymes' food grade enzymes. Pallets are ground, colored and marketed as designer mulch. Other manufactured wood byproducts are ground to size for compost production. Wood waste, sawdust and ground yard trimmings are mixed with food waste and deactivated enzyme residuals. The mix is processed into high-quality compost by using the turned windrow method of composting. The process takes a minimum of 90 days from start to a cured finished compost product.

Product Facts
The compost is tested by U.S. Compost Council Seal of Testing Assurance Program.

Where to Buy
All of Nature's GREEN-RELEAF products can be purchased in bulk at the facility or through distributors listed at www.naturesgreenreleaf.com/Distributors.htm.

Products Made
Glass bottles and containers

Process Description
Used glass arrives by both truck and rail. After being remelted, recycled glass bottles are trucked to various customers. Bottlers add product, label and market to the consumer.

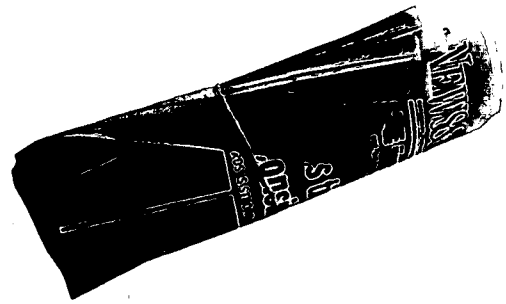
Product Facts
The Lexington plant produces only beverage containers. The 2.5-3.0 million containers made per day in the plant contain 40 to 50 percent recycled glass and are commonly used for juices, sodas, teas, beer, wine and spirits. Approximately 50 percent of the glass containers made worldwide are manufactured by O-I or its licensees.

Where to Buy
The company's clients range from global multinationals to smaller, regional partners. Common retail items found in grocery and convenience stores are bottled with O-I glass containers.

Other Information
A Fortune 500 company, O-I is one of the world's leading manufacturers of glass packaging products with operations in North America, South America, Europe, Australia and Asia. With more than 30,000 employees worldwide, the company contributes more than $1 billion annually to national, state and local economies through its purchase of goods and services from U.S. businesses. O-I is an active supporter of the Keep America Beautiful Foundation and the National Recycling Coalition.

Precision Fibers

Ronda



FAST FACTS

Material Recycled
Newspaper

Tons Recycled Per Year
5,000

Employees 27

Established 1994

Products Made
Hydro-seeding mulch, additive for asphalt

Process Description
Loose newspaper is fed onto a conveyor and into a hammermill. The paper is milled into a loose fiber. The loose fiber material is then sent through a cuber. This is the process that forms the fiber into the cube shape that gets packaged. The final product is then packaged and stacked onto pallets. The hydro-mulch product is trucked directly to hydroseeders and paving locations for application purposes.

Product Facts
All products produced by Precision Fibers are 100 percent recycled content.

Where to Buy
Products can be purchased factory direct or through distributors. Call the company for details. Precision Fibers does not compete with its distributors, so if the project is in an area that a distributor services, the customer will be directed to that distributor.

Hangers, plastic feet and legs for furniture

Process Description
Repelletized plastic resin is mixed with virgin resin and melted. The melted material is then injected into a mold to make various plastic products.

Product Facts
Fifty to 100 percent recycled plastic is used for products that are black in color. Products that are any other color use 25 to 50 percent recycled plastic.

Where to Buy
Coat hangers sold at Wal-Mart under the Wal-Mart brand name—Mainstays. Technimark produces plastic feet and legs for furniture that is sold as one of the Klaussner Furniture brand names.

Other Information
Technimark Inc. is a subsidiary of Klaussner Furniture.

Toter Inc.

Statesville

Products Made
Waste collection and material handling carts and containers

Process Description
Toter Inc. purchases virgin and post-consumer resin material that is extruded to produce rotationally molded waste collection and material handling carts and containers. Toter also reprocesses all scrap material that is generated from the production process.

Product Facts
Toter Inc. is the leading manufacturer of waste collection carts in the United States. Made of 25–75 percent recycled content, Toter carts have been used at municipalities throughout the country, including Charlotte and Winston-Salem. Toter products can also be found at stadiums, arenas and convention centers such as Raleigh's RBC Center.

Where to Buy
Toter carts are sold direct to the consumer at Lowe's Home Improvement stores. Contact the company for information about government, institutional or business orders.

Post-industrial fiber waste and post-consumer plastic soda bottles

Employees 1,065

Established 1971

Products Made
100 percent recycled polyester yarn

Process Description
Waste generated in the polyester-manufacturing process is combined with plastics such as recycled two-liter soda and water bottles. Unifi's Yadkinville facility grinds it into a chip, extrudes, texturizes and forms it into yarn.

Product Facts
The end product, Repreve®, is then used in fabrics suitable for a number of end uses, including contract and home upholstery, and automotive and apparel fabrics. Malden Mills' new line of eco-friendly performance Polartec® fabrics is designed using Unifi's Repreve® yarn.

Where to Buy
Many new styles of Polartec® fabrics are now available using recycled content, including Polartec® Power Dry®, Polartec® Thermal Pro® and Polartec® Wind Pro®. Check your local and online sports stores for brands made with these fabrics.

Other Information
Unifi is headquartered in Greensboro and has additional manufacturing facilities in Yadkinville, Madison, Reidsville and Stoneville. International manufacturing facilities are located in Latin America, Brazil and China. Unifi employs approximately 1,065 in Yadkinville, 2,500 in North Carolina and 3,500 worldwide.

N.C. Recycling Business Assistance Providers

Recycling-Specific Service Providers

A number of organizations provide a wide variety of technical and business development assistance to North Carolina-based recycling businesses.

Self-Help Credit Union

Self-Help, North Carolina's community development banking group, administers the N.C. Recycling Business Loan Fund. The loan fund nurtures fledgling businesses until they become bankable and graduate to full-service private sector financing. The loans are structured as market-rate debt, and can be used for working capital, inventory, equipment and real estate purchases.

Definitions

Biosolids – nutrient-rich organic materials resulting from the treatment of domestic sewage in a treatment facility. When treated and processed, these residuals can be recycled and applied as fertilizer to improve and maintain productive soils and stimulate plant growth.

Blow-Molded – a manufacturing process by which hollow plastic parts are formed. This method is used to make items such as commercial drums and bottles.

Card Stock – a rigid paper used for postcards, manual covers or table tents. Also known as cover paper.

Computer Printout or Greenbar – a high-grade paper almost entirely made of uncoated chemical pulp, although some ground wood is used.

Environmentally Preferable Products – products that have a lesser or reduced effect on human health and the environment when compared with competing products that serve the same purpose. The product or service comparison may consider raw materials acquisition, production, manufacturing, packaging, distribution, reuse, operation, maintenance or disposal.

Fiber Drum – cylindrical shipping containers made of heavy paper or fiberboard.

Folding Carton – paper product storage and shipping packages of various designs that are delivered ready-to-use in flat form and are first squared up or erected by the user.

Hammermill – a machine with a high-speed rotor equipped with large hammers for pulverizing material into smaller sizes.

High Density Polyethylene – a plastic used to make bottles for milk, juice, water and laundry products.

Kraft Paper – strong paper used for wrapping and to make grocery bags and large envelopes.

Linear Low Density Polyethylene – higher tensile strength and higher impact and puncture resistance than low density polyethylene. It is used for plastic bags and sheets (where it allows using lower thickness than comparable LDPE), plastic wrap, pouches, toys, lids, pipes, buckets and containers, covering of cables, geomembranes and flexible tubing.

Mixed Paper – the term "mixed paper" is used as an inclusive, "catch all" or "what's left over" category for a wide variety of recovered paper blends including slick advertising inserts, envelopes and other things with gummy surfaces.

Medium Density Fiberboard – a composite wood product similar to particleboard. It's made out of wood waste fibers glued together with resin, heat and pressure. MDF is appropriate for many applications, from cabinetry to molding, because it is smooth, uniform and will not warp.

Newspaper or Newsprint – a lightweight paper, made mainly from mechanical wood pulp, engineered to be bright and opaque for the good print contrast needed by newspapers.

Old Corrugated Cardboard – a box, in its most common form, is manufactured from containerboard, layers of linerboard and one layer of medium. The layers are combined on a corrugator, a machine that presses corrugations into the medium and laminates a layer of linerboard to each side. The sheets are folded, printed and glued or stapled to make a finished box.

Old Magazines – consists of coated magazines, catalogs and similar printed materials.

Paperboard – one of the two subdivisions of paper. The distinction is not great, but paperboard is heavier in basis weight, thicker and more rigid than paper. All sheets 12 points (0.012 inch) or more in thickness are classified as paperboard.

Paper Tubes – consists of paper cores made from either chipboard and/or linerboard, single or multiple plies.

Particle Board – an engineered wood product manufactured from wood particles, such as wood

chips, sawmill shavings or even sawdust, and a synthetic resin or other suitable binder, which is pressed and extruded.

Polyethylene – largest volume plastic manufactured. It is used for packaging films; trash, garment, grocery and shopping bags; molded housewares; toys; containers; pipe; drums; gasoline tanks; coatings and many other products.

Polypropylene –a plastic that has an excellent chemical resistance, is strong and has the lowest density of the plastics used in packaging. It has a high melting point, making it ideal for hot-fill liquids. In film form it may or may not be oriented (stretched). Polypropylene is found in everything from flexible and rigid packaging to fibers and large molded parts for automotive and consumer products.

Polystyrene – is a very versatile plastic that can be rigid or foamed. General purpose polystyrene is clear, hard and brittle. It has a relatively low melting point. Typical applications include protective packaging, containers, lids, cups, bottles, trays and tumblers.

Polyurethane – an extremely versatile plastic in terms of the forms in which it is available: flexible or rigid foams, rubbers, coatings, adhesives and sealants. Polyurethane's major and best known form, however, is a foamed or "cellular" material. Flexible foams are used in furniture, cushioning, carpet underlay, bedding, packaging, textiles and automotive seating and safety padding. Rigid foams are used in building insulation and are found in refrigerators, trucks, boats (for flotation) and in the construction of furniture components.

Post-consumer Material – refers to a material or finished product that has served its intended use and has been discarded for disposal or recovery, having completed its life as a consumer item.

Post-industrial Material – recovered industrial and manufacturing materials that are diverted from municipal solid waste for the purpose of collection, recycling and disposition.

Recycled Content – materials that have been recovered from the solid waste stream, either during the manufacturing process (post-industrial) or after consumer use (post-consumer).

Rotational Molding – consists of a mold mounted on a machine capable of rotating on two axes simultaneously. Solid or liquid resin is placed within the mold and heat is applied. Rotation distributes the plastic into a uniform coating on the inside of the mold until the plastic part cools and sets. This process is used to make hollow configurations and is a relatively simple concept since heat is used to melt and fuse a plastic resin inside a closed mold without using pressure. Common rotationally molded products include shipping drums, storage tanks and some consumer furniture and toys.

Sorted Office Paper – consists of paper, as typically generated by offices, containing primarily white and colored groundwood-free paper, free of unbleached fiber.

Virgin Material – a material that has not been processed or used before.

White Office – consists of paper, as typically generated by offices, containing primarily white groundwood-free paper, free of unbleached fiber.

Yard Trimmings – grass clippings, shrub prunings, leaves, tree branches and other discarded material from yards and gardens.

Blazing a Paper Trail in China

By DAVID BARBOZA

HONG KONG — Just five years ago, Zhang Yin and her husband were driving around the United States in a used Dodge minivan begging garbage dumps to give them their scrap paper.

She and her husband, who was trained as a dentist, had formed a company in the 1990s to collect paper for recycling and ship it to China. It was a step up from life back in Hong Kong, where she had opened a paper trading company with $3,800 to cash in on China's chronic paper shortages.

"I remember what a man in the business told me back then," Ms. Zhang said. "He said, 'Wastepaper is like a forest. Paper recycles itself, generation after generation.' "

Ms. Zhang took that memory all the way to the bank. As a result of her entrepreneurship, Zhang Yin (pronounced Jang Yeen) is now among the richest women anywhere in the world, including Oprah Winfrey, Martha Stewart and eBay's chief executive, Meg Whitman. Her personal wealth is estimated at $1.5 billion or more, with members of her family worth billions more.

Her companies take heaps of waste paper from the United States and Europe, ship it to China and recycle it into corrugated cardboard, which is then used for boxes that are packed with toys, electronics and furniture that is stamped "Made in China" and often shipped right back across the ocean to American consumers.

After the boxes are thrown away, the cycle starts all over again.

Late last year, Forbes magazine named Ms. Zhang the wealthiest woman in China. She may even be the richest self-made woman in the world, challenging a handful of others, like Giuliana Benetton, who started the clothing company with her brothers, and Rosalia Mera, who co-founded Zara, the Spanish clothing retailer, with her former husband.

Most of the world's richest women inherited their wealth: from the Walton women of Wal-Mart fame to the daughters of the men who created Mars candy bars, L'Oréal cosmetics and BMW.

But not Ms. Zhang. A petite 49-year-old woman with a cherubic smile and a fancy for diamonds, she started out from a modest background, the daughter of a military officer. Now she dominates the world's paper trade through her giant companies, one centered in Dongguan just outside Hong Kong and the other based in Los Angeles.

"She's a visionary," says Herman Woo, an analyst at BNP Paribas, which helped her paper company list shares in Hong Kong. "She doesn't mind putting a lot of money in at the beginning, to build the company."

That company, Nine Dragons Paper, is now China's biggest papermaker. The company raised nearly $50 million when it went public here last March with the help of Merrill Lynch.

Since then, shares of Nine Dragons have quadrupled, giving the company a market value of over $5 billion. (The Zhang family controls 72 percent of the company, which makes it one of the richest families in China.)

Ms. Zhang's smaller, Los Angeles-based venture, America Chung Nam, is also one of the world's biggest paper trading companies, with ties to recycling yards in New York, Chicago and California.

No other American company sends so much material to China, in as many containers, as America Chung Nam, which was named the top American exporter to China by volume for the fifth consecutive year in 2005, the most recent ranking, according to Piers Global Intelligence, which tracks import and export data.

Now, with the paper industry shifting to China, where labor and land are cheaper, Ms. Zhang and Nine Dragons are vowing to take on the world's global paper giants, like International Paper, Weyerhaeuser and Smurfit Stone.

"My goal is to make Nine Dragons, in three to five years, the leader in containerboards," Ms. Zhang says emphatically in a short interview in her glistening Hong Kong office. "My desire has always been to be the leader in an industry."

In person, Ms. Zhang is filled with nervous energy and hearty laughs. But she rarely grants interviews, and when she does, they are brief and controlled by an army of handlers.

Ms. Zhang is cagey about how she made her fortune. In a society known for close ties and hidden deals between government officials and business leaders, she says simply, "I'm an honest businesswoman."

Ms. Zhang was the oldest of eight children born into a military family from northern Heilongjiang Province, near the Russian border. During the brutal Cultural Revolution, which began in 1966, her father was sent to prison, like millions of others who were branded "counterrevolutionaries" or "capitalist roaders."

When the Cultural Revolution came to a close in 1976, her father was released from prison and "rehabilitated." She went to work as an accountant.

After China's economic reforms got under way in the early 1980s, she moved to the southern coastal city of Shenzhen, one of the first areas in China allowed to experiment with capitalism. There she started working for a foreign-Chinese joint venture paper trading company.

In 1985, she ventured to Hong Kong, which was then still a British colony.

Ng Weiting, who was her partner in Hong Kong in the 1980s, says Ms. Zhang was driven and tough and had figured out how to get the best performance out of her workers.

"When her employees asked for a pay raise, she would grant it if it was reasonable," he recalled. "But when her employees made mistakes, she would criticize them severely. She made it clear when to reward and when to punish."

Analysts say Ms. Zhang's ebullient personality made her a great saleswoman and a sharp deal maker.

There were occasional threats from competitors, yet being a woman was not a problem, she says. "Actually, I didn't find it difficult," she says. "I found men respected me."

After Hong Kong's paper market proved too small for her ambitions, she moved to Los Angeles in 1990 and married for the second time, to Liu Ming Chung, who was born in Taiwan, grew up in Brazil and is fluent in English.

Together, they formed America Chung Nam. At the time, China's fast-growing economy faced shortages of raw materials, and the country began looking overseas for scrap metal and used paper. Zhang Yin was an early mover, one of the first to sell scrap paper to China.

China's own paper products are poor quality, often made from grass, bamboo or rice stalks, leaving it at a disadvantage against waste paper derived from wood pulp, the source of most paper made in the United States and Europe.

America Chung Nam quickly made deals with American scrap yards and began shipping huge containers of paper back to China. The demand grew so fast that in 1995, Ms. Zhang (who also goes by her Hong Kong name, Cheung Yan) returned to China to found Nine Dragons, opening her first papermaking facility in Dongguan. Mr. Liu now serves at chief executive; Ms. Zhang is chairwoman.

A decade later, the company has 11 giant papermaking machines, 5,300 employees, $1 billion in annual revenue and a huge facility under construction in the country's other booming export hub, the Yangtze River Delta area near Shanghai. Reported profits last year rose a whopping 349 percent to $175 million.

Nine Dragons is now one of the world's fastest growing paper companies, and yet the company says it cannot keep up with demand for containerboard, the material used to make boxes, because of the booming growth in China's economy and exports.

Foreign paper companies have been slow to build a sizable manufacturing base in China. Analysts doubt they will catch up any time soon. And Chinese manufacturers have advantages. They burn cheap coal rather than clean but expensive natural gas. And they are capitalizing on less expensive labor and the newest machinery, while papermakers in the United States and Europe are often using less efficient machines from the 1970s and 1980s.

"It's very difficult for U.S. companies to get into this business now," says Mr. Woo at BNP Paribas. "I heard five or six years ago they looked at opportunities but they didn't do anything."

"Right now," Mr. Woo adds, "the largest globally is Smurfit Stone. Weyerhaeuser is No. 2. By 2008, Nine Dragons could be No. 1."

Analysts have been nearly unanimous in their praise of Ms. Zhang, though she came under some criticism for appointing her 25-year-old son as a nonexecutive member of the Nine Dragons board of directors.

But Ms. Zhang vigorously defends the appointment, saying her son is qualified and Nine Dragons is, after all, a family company. She has a second son in high school. And her younger brother, Zhang Chang Fei, is the company's deputy chief executive, worth an estimated $900 million, according to Forbes.

Ms. Zhang jumped to No. 5 this year in the Forbes ranking of the wealthiest people in China, from No. 107 last year, largely because of the huge public stock listing.

She hasn't lost her ambition, though. Sometimes called the queen of trash, she doesn't disown the title. But, she said, "Some day, I'd like to be known as the queen of containerboards."

North Carolina's Strategic Plan for Biofuels Leadership

A STRATEGIC PLAN FOR NORTH CAROLINA'S BIOFUELS INDUSTRY

INTERIM STATUS REPORT

GUIDING PREMISES

Strategies and thinking about North Carolina's biofuels endeavor must be shaped over coming years by seven key premises:

1) Strong and sustained state policy is required to shape outcomes and leadership.
2) The endeavor requires long-term commitment by varied parties – institutional and government, public and private, state and federal.
3) Advanced science and technology, and in particular biotechnology, will be key to success, outcomes, and leadership.
4) All involved parties and steps in the movement from science and research to production, distribution, and use must be addressed comprehensively.
5) Particular local and regional capabilities must be identified and addressed.
6) Responsibility for coordination, assistance, and policy implementation over time must be positioned in a single entity.
7) Activities and outcomes must work for agricultural and rural benefit(s).

NORTH CAROLINA'S STRATEGIC PLAN FOR BIOFUELS LEADERSHIP

THE BIOFUELS IMPERATIVE

Development and application of biofuels from varied sources will be increasingly significant to North Carolina's economy, consumers, and agriculture. As a result, state leaders and organizations share the recognition that attention to biofuels must be a matter of state policy, addressed cooperatively and comprehensively by varied parties statewide. Coming years will impel new sources of fuels, and North Carolina is remarkably well positioned to shape science, biotechnology, agricultural resources, and policies into a position of national biofuels leadership.

The recognition triggered a June 2006 Biofuels Summit at the North Carolina Biotechnology Center. Catalyzed by Senator Charlie Albertson and Representative Dewey Hill, the event brought together fourteen institutional leaders for a first ever targeted discussion of the imperative for informed, future-directed state planning and policy.

Reflecting this imperative, the General Assembly in its 2006 session passed Senate Bill 2051: State Energy Use/Energy Assistance, which in Part III calls for development of a Biofuels Industry Strategic Plan.

Four parties are designated in the legislation as the co-convening Work Group for this Plan: the College of Agriculture and Life Sciences at North Carolina State University, the School of Agriculture and Environmental Sciences at North Carolina Agricultural and Technical State University, the North Carolina Biotechnology Center, and the North Carolina Rural Economic Development Center.

In addition, the legislation calls for involvement of twelve other institutions and organizations as well as other appropriate entities. These parties were constituted in September 2006 as the Project Steering Committee.

The Steering Committee serves actively as focal point for gathering information and testimony, as a functional working group in its key meetings, as strategic respondent, and as partner to the Project Co-conveners in shaping the final report, *North Carolina's Strategic Plan for Biofuels Leadership*. This initial report is being submitted to the Environmental Review Commission by January 15, 2007, with a final report to be submitted by April 1, 2007.

PROJECT GOAL

The *Strategic Plan* synthesizes and conveys the best thinking of individuals and institutions statewide around a central question: *What policies, resources, and partnerships are required for North Carolina's long-term leadership in, and gain from, the emerging biofuels sector?*

Ideas, experience, and recommendations are sought from diverse parties, to shape thinking for both the initial framework and final *Strategic Plan.*

PROJECT CO-CONVENERS

Steven Burke	North Carolina Biotechnology Center
Billy Ray Hall	North Carolina Rural Economic Development Center
Ghasem Shahbazi, PhD	North Carolina A&T State University
Secretary E. Norris Tolson	North Carolina Department of Revenue
Johnny C. Wynne, PhD	North Carolina State University

PROJECT STEERING COMMITTEE

Senior designated representatives from more than 30 key vantage points are actively engaged with the Committee:

- Appalachian State University
- Department of Administration
- Department of Agriculture and Consumer Services
- Department of Commerce
- Department of Environment and Natural Resources
- Department of Revenue
- Department of Transportation
- Farm Bureau Federation
- Golden LEAF Foundation
- Lotus Engineering
- North Carolina Advanced Vehicle Research Center
- North Carolina Forestry Association
- North Carolina Agribusiness Council
- North Carolina Agricultural and Technical State University
- North Carolina Biomass Council
- North Carolina Biosciences Organization
- North Carolina Biotechnology Center
- North Carolina Community College System
- North Carolina Rural Economic Development Center
- North Carolina Solar Center
- North Carolina Soybean Producers Association
- North Carolina State Grange
- North Carolina State University
- North Carolina Sustainable Energy Association
- Novozymes, Inc.
- Office of the Lieutenant Governor
- Office of Science and Technology, Department of Commerce
- Piedmont Biofuels
- State Energy Office, Department of Administration
- United States Army, Fort Bragg
- University of North Carolina

PROJECT TIME LINE

2006	
June	**Biofuels Summit** - Catalyzed by Senator Charlie Albertson and Representative Dewey Hill, the event brought together fourteen institutional leaders for a first- ever targeted discussion of the imperative for informed, future-directed state planning and policy.
August	**Senate Bill 2051** – The General Assembly in its 2006 session passed *Senate Bill 2051: State Energy Use/Energy Assistance*; Part III of the bill calls for development of a Biofuels Industry Strategic Plan
October 17	**First Steering Committee Meeting** - Steering Committee members and varied statewide parties met. Presentations and discussion revealed a range of ideas, imperatives, and activities on which to build.
October – December	**Submitted Recommendations** – Steering Committee members and engaged parties submitted more than 130 ideas, clear needs, competitive long-term thinking, and realistic strategies required for North Carolina's economic and societal gain from biofuels in the coming years. Submitted content yielded an initial draft document.
December 14	**Second Steering Committee Meeting** – The Steering Committee met to shape an initial framework for the *Strategic Plan*. Smaller work groups were established to focus on content areas deemed essential for an effective strategic plan.
December 15 – January 15, 2007	**Interim Report** – The Co-Conveners prepared an interim report on the development and status of the strategic plan, including preliminary findings, recommendations, and legislative proposals to the Environmental Review Commission for evaluation beginning January 15, 2007.
2007	
January – February	**Work Groups** – Work groups will meet to finalize recommendations, findings, and legislative proposals organized around seven guiding premises and five broad strategic categories
February	**Third Steering Committee Meeting** – Date to be determined. Committee members and engaged parties will review recommendations, findings, and proposals submitted by the work groups.
February – March	**Final Synthesis** – Steering committee members and engaged parties—under the leadership of the five co-conveners—will synthesize submitted content into the final strategic plan for presentation to the Environmental Review Commission.
April 1	**Final Report** - The Biofuels Industry Strategic Plan Work Group will submit a final report on the development of the strategic plan to the Environmental Review Commission no later than 1 April 2007.

STRATEGIES: ORGANIZATIONAL LEADERSHIP

Strategies in organizational leadership will focus on a central coordinating entity, institution, or agency as required to chart the next years of biofuels development and strategy. Proposals and recommendations will explore a designated authority within the state that has the budget and political endorsement needed to implement a bold, imaginative, and comprehensive alternative fuel industry plan.

STRATEGIES: MARKET TRANSFORMATION

Market Transformation strategies will identify and promote policies that will eliminate market barriers and increase opportunities for expanding a biofuels market and industry in North Carolina. Market transformation proposals will identify ways in which North Carolina can move toward fuel and energy independence while maintaining the highest levels of environmental stewardship.

STRATEGIES: SCIENCE, RESEARCH, DEVELOPMENT, FEEDSTOCKS, AND BIOMASS

Well thought-out strategies are needed for the scientific research and development of feedstocks and biomass. An economic analysis is needed to identify the best potential feedstocks that could be utilized for biofuels production in North Carolina. The costs and timetables for completion and implementation—with due attention to biotechnology—are critical elements in fostering a biofuels industry in North Carolina. Strategies will focus on an advanced and chronological look at how to grow and use crops:

- *Short-Term – Use existing feedstocks and biomass;*
- *Mid-Term – Modify and improve existing feedstocks and biomass; and*
- *Long-Term – Develop new feedstocks and biomass.*

STRATEGIES: PRODUCTION AND DISTRIBUTION

Production and distribution recommendations will focus on strategies to ensure biofuels in North Carolina are produced and supplied safely and reliably. Proposals will address full-scale distribution infrastructure, retail availability, upgrade and strengthening of production and supply systems, and work force training needs.

STRATEGIES: CULTURE AND EDUCATION

Strategies and proposals will focus on comprehensive public relations and education initiatives that will create public awareness and understanding of the benefits of a biofuels industry and alternative energy use in North Carolina. Biofuels public education is needed to induce lasting changes in consumer behavior and in the marketplace. Moreover, due attention must be paid to cultural imperatives to adopt needed changes in behaviors (i.e. growers, distributors, existing users of crops, consumers).

SL2006-206

GENERAL ASSEMBLY OF NORTH CAROLINA

SESSION 2005

SESSION LAW 2006-206
SENATE BILL 2051

AN ACT TO REDUCE ENERGY, FUEL, AND WATER CONSUMPTION IN THE STATE THROUGH: (1) DEVELOPMENT OF A PLAN TO INCREASE THE AVAILABILITY AND USE OF ALTERNATIVE FUELS IN STATE-OWNED VEHICLE FLEETS; (2) PROVISION OF ENERGY ASSISTANCE TO LOW-INCOME PERSONS; (3) DEVELOPMENT OF A STRATEGIC PLAN TO EXPAND THE BIOFUELS INDUSTRY IN NORTH CAROLINA; AND (4) STUDY MECHANISMS TO IMPROVE ENERGY AND WATER CONSERVATION IN STATE-OWNED FACILITIES.

The General Assembly of North Carolina enacts:

... PART III. DEVELOP BIOFUELS INDUSTRY STRATEGIC PLAN

SECTION 3.1. There is established the Biofuels Industry Strategic Plan Work Group. The purpose of the Work Group is to develop a strategic plan for expansion of biofuels as an industry in North Carolina. The Work Group shall include representatives of the College of Agriculture and Life Sciences at North Carolina State University, the School of Agriculture and Environmental Sciences at North Carolina Agricultural and Technical State University, the North Carolina Biotechnology Center, and the Rural Economic Development Center, Inc. In developing this strategic plan, the Work Group shall delineate the increasing role of biotechnology in the development of biofuels and may consult with all of the following:

(1) The Department of Administration.
(2) The Department of Agriculture and Consumer Services.
(3) The Department of Commerce.
(4) The Department of Environment and Natural Resources.
(5) The Department of Transportation.
(6) The University of North Carolina System.
(7) The Community College System.
(8) The North Carolina Solar Center at North Carolina State University.
(9) The North Carolina Farm Bureau Federation.
(10) The North Carolina State Grange.
(11) The North Carolina Agribusiness Council.
(12) The North Carolina Forestry Association.
(13) Representatives of private industry that are engaged in biotechnology and the biofuels industry.
(14) Any other entity that the Biofuels Industry Strategic Plan Work Group deems appropriate, particularly entities that are engaged in biotechnology and the biofuels industry.

SECTION 3.2. The Biofuels Industry Strategic Plan Work Group shall submit an interim report on the development of the strategic plan, including any preliminary findings, recommendations, and legislative proposals, to the Environmental Review Commission no later than 15 January 2007. The Biofuels Industry Strategic Plan Work Group shall submit a final report on the development of the strategic plan, including any findings, recommendations, and legislative proposals, to the Environmental Review Commission no later than 1 April 2007.

N.C. Wastewater Discharge Elimination Program

2006 Annual Report to the North Carolina General Assembly

November 2006

North Carolina Department of Environment and Natural Resources
Division of Environmental Health
On-site Water Protection Section

Program Description

The North Carolina Wastewater Discharge Elimination (WaDE) Program operates under the On-site Water Protection Section of DENR's Division of Environmental Health. The WaDE Program was established pursuant to S.L. 1996-18es2, Section 27.26, to identify and eliminate discharges from straight pipes and failing septic systems to land surfaces and streams. Funds currently appropriated by the N.C. General Assembly support two staff to address the straight pipe and failing septic system issues in North Carolina. Additional financial support has been secured through grants from the N.C. Clean Water Management Trust Fund (CWMTF) and the U.S. Environmental Protection Agency (EPA) 319 Non-point Source Program. Strong collaboration with local and regional agencies as well as the public, the media and environmental groups is the hallmark of the WaDE program and the key to its successes thus far.

Program Goals

Based in Asheville, the program serves 26 western North Carolina counties. The primary goals of the WaDE Program are to survey watersheds, identify straight pipes and failing septic systems in these watersheds and act as a conduit for limited financial assistance to aid property owners in correcting their wastewater violations.

Collaborative efforts with the Division of Water Quality and the Public Water Supply Section of the Division of Environmental Health aid in prioritizing survey work in watersheds with impaired water quality. WaDE's surveyors work along streams used as public water supplies and for recreational purposes, which are important to the economic vitality of the region, and survey along EPA-identified or potential environmentally-impaired streams.

Information about failing systems identified by WaDE in its survey work is forwarded to the local health department in the county where the survey is occurring. These local health departments take this information and use it to issue permits to the property owners to eliminate straight pipes or repair their failing septic systems. The program also identifies, and at times channels, sources of financial assistance for low-income homeowners in need of septic system repairs. This financial assistance is in the form of grants and deferred loans, provided by CWMTF, which are distributed by WaDE through regional councils of government or local non-profit community action agencies. The WaDE Program also provides public health and environmental education to homeowners and other stakeholders at the household, community, county, regional, state and federal levels related to on-site wastewater issues.

Program Accomplishments (1997-2006)

During the first four years of the WaDE Program the WaDE staff assisted four independent county surveys in Watauga/Alleghany/Ashe Health District, Jackson County, Madison County and Avery/Mitchell/Yancey Health District. The independent county projects were funded by the CWMTF, N.C. Department of Commerce's Division of Community Assistance (DCA), Appalachian Regional Commission and N.C. Rural Communities Assistance Project (RCAP).

In 1998 the WaDE team also directed their own survey project in Buncombe County on the Ivy Watershed in collaboration with the Buncombe County Health Center, the Town of Weaverville and Land of Sky Council of Government. With participating agency input from the first four years and the experience gained from the Ivy Watershed Project, the WaDE team proposed an improved model for achieving the goals of the program. This model was approved and funded in 2002 for three years by the CWMTF ($1.2 million over three years) and the EPA 319 Non-point Source Program ($500,000 over three years). This new funding enabled the WaDE Program to add seven full-time and two temporary surveyors to the original two-person staff. WaDE surveyors assisted homeowners who self-report

problems with their on-site wastewater systems, giving homeowners substantial time to resolve the problem.

Since January 2002, using CWMTF and EPA grant funds, survey projects have been conducted in approximately 17 areas across western North Carolina. During this time, approximately 11,336 homes have been visited as a result of WaDE Program efforts, identifying about 1,335 violations in these survey areas. The rates of identifying failing septic systems and repairing these failing systems have increased. Currently, nearly 40 percent of all violations identified since 2002 have been corrected with many repair permits having been issued and awaiting system installation. Table 1 contains the WaDE Program statistics for January 2002 through September 2006.

Table 1. January 2002 – September 2006

Results	
Total Homes Visited	11,336
Completed Surveys	6,945
Violations	1,335*
Violations Corrected	
Repairs Completed	526*

*These totals include data from the referral program.

Of the 526 repairs completed, 171 of them received financial assistance via the WaDE Program. To date, WaDE and CWMTF grants provided financial assistance to 79 of these households totaling $193,027 and averaging a cost of $2,443 per repair. The remaining 92 of the 171 households received financial assistance through three separate projects funded by CWMTF and the Division of Community Assistance - Community Development Block Grant, totaling $245,240 and averaging a cost of $2,665 per repair. These repairs are environmentally significant.

The WaDE Program continues to provide financial assistance for septic system repairs in participating survey areas throughout western North Carolina. Financial assistance is being provided through collaboration with CWMTF, U.S. Department of Agriculture's Rural Development Program and regional councils of government. In addition to direct assistance in survey areas, the WaDE Program works to annually identify and update other possible sources of financial assistance for septic system upgrades or repairs in all North Carolina counties.

The WaDE Program also provides public education on related public health concerns and environmental issues. This information has been offered to the public through public service announcements, public community meetings in survey areas, door-to-door visits by trained WaDE surveyors, local news paper articles, teachers' guides and videos for school children, outreach to the N.C. Real Estate Commission on property disclosure requirements, and slide show presentations geared toward local, state and national audiences.

2005-2006 Program Highlights

Survey Work

For the reporting period October 2005 through September 2006, the WaDE Program actively surveyed in three western North Carolina counties. Survey and referral program efforts are shown in Tables 2 and 3.

Surveys conducted by the WaDE Program were reduced this year for two primary reasons. First, the Program's new three-year grant was awarded in 2006, so surveys halted while counties were establishing new contracts with the Program. The surveying that did take place within the last year was funded by the original Clean Water Management Trust Fund grant to the program, and it expired in May of 2006. Follow-up surveying from previous survey projects continued throughout the year while the new contracts were being developed. The new three-year grant began in May 2006, and new surveying is anticipated to resume in January of 2007. Secondly, WaDE surveyors attended Centralized Intern Training to become environmental health specialists, which took them out of the field for several months this summer and resulted in fewer surveys completed. As environmental health specialists, surveyors can issue septic repair permits as they survey, thereby reducing delays in getting violations corrected and repair permits issued by the health department.

Survey projects resulted in almost 1,200 homes visited. Homeowner surveys were completed on 538 of these homes, revealing approximately 120 violations (22 percent violation rate) for failing systems or straight pipes. Repairs have been successfully completed on an additional 58 failing systems and straight-pipes during the past year. The addition of a contract part-time environmental health specialist who issues septic system repair permits positively affected the pace of repairs during the last half of the reporting period.

Table 2. Twelve-Month WaDE Survey Statistics

Results	
Total Homes Visited by WaDE	1,148
Homeowner Surveys Completed	538
Violations Identified	119
Violations Corrected	
Repairs Completed	58

The WaDE Program works to distribute CWMTF money through a referral program in which residents are either referred to the health department or self-report problematic systems. After 75 percent of the identified violations in any WaDE-surveyed watershed are repaired, the Program uses CWMTF funding to assist property owners in other parts of the county with financing septic system repairs. The referral program also provides financial initiatives to local health departments to issue repair permits. Participation in this program over the past year is shown in Table 3.

Table 3. Twelve-Month WaDE Referral Program Statistics

Homeowners Participating in WaDE Referral Program	8
Repairs Completed	4

The number of referrals was dramatically reduced this year as a result of local health department staff turnover in Buncombe County – a county that typically issues numerous referrals to the WaDE Program. The WaDE staff became environmental health specialists this year, so now the staff can issue septic repair permits as they survey, thereby reducing delays in getting violations corrected and repair permits issued by the health department.

A New Grant

In 2005 the WaDE Program applied for a second CWMTF grant totaling $1.5 million for continued surveys and financial assistance in western North Carolina. The CWMTF staff was able to find additional funding for the WaDE Program as a statewide project through May 2009. However, the CWMTF has expressed a reluctance to continue to fund the existing survey staff positions beyond the time of this current contract. Therefore, the division will begin to look at alternate sources of funding for these positions.

Database Improvements

The WaDE program uses a centralized database to collect and record data, track progress of violation corrections and provide information for reporting of survey progress. The WaDE Program evaluated the options for providing the best possible service associated with database management and decided to move the database to the Asheville Regional Office. This transition greatly enhances the capabilities, security and reliability of the WaDE database.

The GIS component houses geographic data such as watershed and road information that is gathered at the beginning of a survey project. It is then used to identify roads serving populated areas of watersheds to be surveyed. This information is mapped and given to local health departments and other DENR agencies like the Division of Water Quality and DEH Public Water Supply Section to help select appropriate areas for septic system survey projects. When problematic or failing septic systems are identified during surveys, the information is GIS-mapped and given to the local health departments. Visually displaying the locations of homes with failing septic systems and straight-pipes allows for repair options to be better analyzed and the most cost-effective approach to be determined.

Future Goals and Needs

Based on the 1990 and 2000 U.S. Census data, approximately one half of the state's wastewater infrastructure is reliant on on-site wastewater disposal systems. Although the WaDE Program is performing well within its mandate and scope, considering future improvements and addressing challenges enable this program to reach its full potential in assisting residents of the state.

Additional funding Based on the need and use of on-site wastewater systems, the WaDE Program has submitted a request for additional funding to expand the program statewide. The WaDE Program routinely documents violation rates of 15 percent to 30 percent from its door-to-door surveys. Using an even more conservative failure rate of 10 percent, it is expected that approximately 175,000 failing septic systems in North Carolina would be identified. Last year, local health departments issued approximately 7,700 septic repair permits – only 4 percent of the estimated total of malfunctioning systems in North Carolina. The local health departments do not have the staff to actively survey areas in their counties and act mainly upon complaints about the problem septic system from neighbors. The vast majority of septic systems in need of repair across the state are still in use but remain unidentified. Making WaDE a statewide program for identifying failing systems and providing and distributing grants and low-interest loans to eligible homeowners in need of septic repair would enable the removal of up to 42 million gallons per day of partially treated wastewater from North Carolina's streams and rivers. This would provide safer and healthier wastewater treatment options for many residents beyond the timeframe of the current funding. The expanded program could work with local governments, regional councils of governments and local housing rehabilitation agencies to identify potential sources of financial assistance.

ENVIRONMENTAL REVIEW COMMISSION

JANUARY 23, 2007

MINUTES

For Membership List and Statutory Authority,

See ERC minutes of October 9, 2006

NCDENR
North Carolina Department of Environment and Natural Resources

Michael F. Easley, Governor

William G. Ross Jr., Secretary

February 19, 2007

The Honorable Charles A. Albertson
625 Legislative Office Building

The Honorable Daniel G. Clodfelter
408 Legislative Office Building

BY HAND DELIVERY

The Honorable Pryor Gibson
419-A Legislative Office Building

Gentlemen:

Enclosed is a summary of the Department's specific recommendations for improved management of sanitary landfills in North Carolina. These recommendations provide additional detail, but closely follow the general outline of landfill recommendations previously presented to the Environmental Review Commission. The Department has also provided draft language for these recommendations to the Environmental Review Commission's counsel, George Givens.

In both the summary and the bill draft, there is a placeholder for recommendations related to the landfill franchise statute. The Department is continuing to work on the franchise recommendation in consultation with Mr. Richard Whisnant at UNC's School of Government. The Department wants to be sure that any proposal for amendment of the franchise statute maintains an appropriate role for both local government and the State with respect to landfill siting decisions.

I look forward to working with you to improve the landfill permitting process. If you have questions about the specific recommendations, I would encourage you to contact either Assistant Secretary Robin Smith at 715-4141 or the Director of the Division of

1601 Mail Service Center, Raleigh, North Carolina 27699-1601

Waste Management, Dexter Matthews, at 508-8414.

Sincerely,

William G. Ross, Jr.
Secretary

Cc: Senator Marc Basnight
Rep. Joe Hackney
Dexter R. Matthews, Division of Waste Management
George Givens, ERC Counsel
Dorothy M. Waugaman, Commission Clerk

February 19, 2007
DENR

SUMMARY OF LANDFILL RECOMMENDATIONS

1. Specify how a landfill applicant must demonstrate financial qualifications to construct and operate the landfill.

The applicant should provide cost estimates for: performing environmental studies; acquiring the site; designing the landfill; constructing and operating the landfill; and financial assurance required for corrective action and closure of the landfill. To show financial qualification, the applicant should submit an audited, certified, financial statement and identify sufficient assets to cover the estimated costs. Where assets of a parent, subsidiary, affiliate or joint venturer are offered in support of the financial qualifications of the applicant, then that party must be listed as an owner/operator on the facility permit.

2. Expand financial assurance requirements.

Require that the landfill operator provide financial assurance to cover possible corrective action (in the event of a leak from the landfill, for example). This would be in addition to the financial assurance currently required for the cost of closing the landfill and providing post-closure case. The minimum amount of financial assurance for corrective action should be $3 million. Financial assurance for corrective action should apply to both new and existing facilities. For new facilities, the financial assurance would be required before permit issuance.

3. Strengthen environmental compliance review of potential landfill operators.

Expand the scope of the existing environmental compliance review to include any past environmental violation (not just those related to solid waste) and a larger group of people associated with the permit applicant. For example, the environmental compliance review would be broadened to cover a person who holds a minority interest in the entity applying for a landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

4. Broaden the definition of "owner or operator".

Include in the definition of "owner or operator" any person who has a financial or equitable interest in the entity that has applied for the landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

5. Clarify solid waste enforcement provisions.

Amend the statute sections that authorize injunctive relief and civil penalties for solid waste violations to expressly allow the use of those enforcement remedies in response to a violation of a permit issued by the Department or an order issued by the Commission for Health Services. Increase the maximum civil penalty allowed for a solid waste or hazardous waste violation. Authorize the Department to recover the costs of investigating a violation.

6. Require notice to the Department of any significant change in the structure or assets of the business entity that holds a landfill permit.

The Department should be notified within 30 days of any significant change in the structure of the business entity that owns or operates the landfill facility; the identity of any person or business entity previously identified as an owner or operator of the facility pursuant to G.S. 130A-309.27(a)(1); or in the financial assets identified in the financial qualification of the owner or operator. A change is significant if it could effect the financial qualifications of the permit holder or result in a change in the identity of the owners or operators for purposes of either financial qualification or environmental compliance review. When the Department receives notice of a change, it can require a new environmental compliance or financial qualification review.

7. Set standards for safe transportation of solid waste by railway or barge.

Containers used to transport solid waste should be leak-tested and covered. Records of leak testing should be retained at the permitted solid waste facility for 3 years. It would be a violation to allow liquid to enter a container of solid waste or to allow solid waste, liquids or odors to escape from a container.

8. Require a traffic study for larger solid waste facilities.

Require that applications for solid waste management facilities proposed to handle more than 100,000 tons of waste per year include a study of the traffic impacts of the facility. The results of the study would be considered in the permit decision.

9. Authorize local landfill liaisons.

Authorize a local government with planning authority over a sanitary landfill that has a service area of greater than a 100-mile radius to designate a landfill liaison. The liaison would be a certified landfill manager, but would not direct the operation of the landfill. The landfill liaison would have authority to enter the landfill facility at reasonable times and inspect the landfill operation for purposes of: ensuring that the facility meets all local requirements; identifying and notifying the Department of potential violations; and identifying and notifying the Department of potentially hazardous conditions.

10. Require the permittee to employ an independent quality assurance engineer to oversee construction of the landfill.

The permittee should employ a licensed engineer who is independent of both the landfill owner and any person engaged in the design or construction of the landfill to inspect during construction. The project engineer would be responsible for certifying that construction of the solid waste management facility units, leachate handling facilities and landfill appurtenances conforms to the plan approved by the Department, the permit to construct, and the rules adopted by the Commission.

11. Establish minimum standards for new landfills and for landfill expansions onto previously unpermitted property.

Minimum standards for new landfills and for landfill expansion onto property that was not included within the scope of a previous permit would include:

a. double liners and a leachate collection system for municipal solid waste landfills;
b. composite liners for construction and demolition landfills;
c. a minimum separation of 5 feet between the bottom elevation of the waste (or the liner system, if the landfill has a liner) and seasonal high groundwater and bedrock;
d. a 200-foot buffer between the waste boundary and streams or wetlands (unless no feasible alternative location is available that would comply with the buffer requirement); and
e. a prohibition against siting landfill units in the 100-year floodplain or in area reclaimed from the floodplain.

12. Establish new standards for construction of lined sanitary landfill units permitted on or after the effective date of the bill

Specific standards for leachate collection systems and liners would include:

a. leachate collections systems should be designed to maintain a head of less than one foot during leachate recirculation.
b. the leachate collection system should be designed to return the head to one foot or less within 72 hours based on a 25 year-24 hour design storm falling on an empty cell.
c. geomembrane base liner systems must be tested for leaks and damage.
d. leachate collection lines should be designed and constructed to allow for remote camera inspection and cleaning. Lines should be cleaned and remotely inspected annually.
e. all pipes used to carry leachate should be constructed with dual containment outside of the lined disposal unit.
f. new units and lateral expansions should be constructed without pipe penetrations of the bottom liner, whether for leachate, stormwater or gas.

13. Direct the Commission for Health Services to review landfill rules and adopt new rules necessary to protect public health and the environment.

Rules adopted by the Commission should:

a. establish standards for the collection, control and utilization or destruction of landfill gasses at municipal solid waste landfills;
b. establish standards for the construction, operation, and maintenance of bioreactor landfills;
c. establish criteria for development of bird and wildlife management plans; and
d. incorporate measures necessary to minimize impacts to natural, historic and cultural resources, including but not limited to wetlands, critical fisheries habitat, parks, recreation areas, cultural and historic sites, and potential water supplies.

14 Require that all sanitary landfills have a waste screening plan to ensure that the facility is in compliance with waste bans.

15 Require an environmental study of very large landfills and landfills with an extended service area.

The existing exemption from the N.C. Environmental Policy Act for landfills owned and operated by local governments should be removed for facilities that receive more than 300,000 tons of waste per year; have a total disposal capacity of more than 15 million cubic yards of solid waste; or have a service area of more than 100 miles in radius. An environmental study should also be required for privately-constructed landfills that will exceed one of more of those thresholds. The environmental document would need to meet the standards for an environmental impact statement under the N.C. Environmental Policy Act and rules adopted by the Department of Administration to implement the act. The documents would also be subject to the same public notice and a public hearing would be required.

16. Change landfill franchise authority to differentiate between landfills that provide local service and those that have large regional or multi-state service areas.

The Department is still working on the specific recommendation to alter local government franchise authority.

17. Add a new statute section setting out the grounds for denial of a landfill permit.

The statute should authorize the Department to deny a landfill permit if it finds one of the following:

(a) Construction or operation of the landfill would violate water quality standards for groundwater or surface waters;

(b) The landfill would jeopardize a renewable resource of more than local concern, such as watersheds or aquifers that are sources of public water supply.
(c) Construction or operation of the landfill would damage fragile or historic areas or areas containing environmental or natural resources of more than local significance. Examples of these areas would include national or State parks or forests; wilderness areas; historic sites; recreation areas; segments of the natural and scenic rivers system; wildlife refuges, preserves and management areas; areas that provide habitat for threatened or endangered species; primary nursery areas and critical fisheries habitat designated by the Marine Fisheries Commission; and Outstanding Resource Waters designated by the Environmental Management Commission.
(d) Construction or operation of the facility would jeopardize public rights to access or use public trust waters.
(e) The facility will be located in a natural hazard area, such as an area subject to excessive seismic activity, that would increase the risk to public health or safety.
(f) The proposed facility would be inconsistent with statutory standards or rules adopted by the Commission for Health Services.
(g) The proposed facility would be inconsistent with ordinances adopted by the local government that has planning jurisdiction over the site of the proposed facility.
(h) There is a practicable alternative to be proposed landfill that would have less adverse impact on public resources.
(i) Construction of the landfill would contribute to cumulative effects that would damage a natural, historic, or cultural resource protected under the statute.

18. Establish permit fees for solid waste facilities. A copy of the proposed fee schedule is attached. Fee revenue would be used to support the solid waste regulatory program.

19. Establish a state-wide surcharge on disposal of solid waste at $2 per ton. The surcharge would apply to municipal solid waste and to construction and demolition waste that is either disposed of at a permitted solid waste facility or moves through a permitted transfer station en route to a disposal facility outside the State. The surcharge would be used to pay for cleanup of orphan landfills and other orphan inactive hazardous waste sites; provide state matching funds for remediation, monitoring and maintenance of Superfund sites in North Carolina; provide funds to local government for redevelopment of contaminated sites; and provide funds for administration of contracts to cleanup orphan landfills and inactive hazardous waste sites.

DRAFT
DENR
Feb. 19 2007

PROPOSED PERMIT FEES FOR SOLID WASTE MANAGEMENT FACILITIES

"**§ 130A-293.1. Fees applicable to permits for solid waste management facilities.**

(a) It is the intent of the General Assembly that the fees collected pursuant to this section shall be used to support the Department's solid waste management program.

(b) The Solid Waste Management Account is established as a non-reverting account within the Department. All fees collected under this section shall be credited to the Account and shall be used for personnel and other resources necessary to do any one or more of the following:

(1) Provide a high level of professional review of permit applications for solid waste landfills and other solid waste management facilities;

(2) Provide timely review of permit applications;

(3) Improve monitoring of solid waste management facilities;

(4) Increase compliance activities related to solid waste management facilities; and

(5) Review and update rules governing the construction and operation of solid waste landfills to recognizing advances in technology and research to better protect public health and the environment.

(c) Applicants for permits shall pay an application fee according to the following schedule:

(1) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$25,000

(2) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$15,000

(3) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(4) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $50,000

(5) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $30,000

(6) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Modification - $3,000

(7) Construction and Demolition Landfill accepting less than 100,000 tons/year of solid wasteNew Permit-$15,000

(8) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(9) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(10) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $30,000

(11) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $18,500

(12) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Modification - $2,500

(13) Industrial Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$15,000

(14) Industrial Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(15) Industrial Landfill accepting less than 100,000 tons/year of solid waste Modification - $1,500

(16) Industrial Landfill accepting 100,000 tons/year or more of solid waste New Permit - $30,000

(17) Industrial Landfill accepting 100,000 tons/year or more of solid waste Amendment - $18,500

(18) Industrial Landfill accepting 100,000 tons/year or more of solid waste Modification - $2,500

(19) Tire Monofill New Permit - $1,750

(20) Tire Monofill Amendment - $1,250

(21) Tire Monofill Modification - $500

(22) Treatment and Processing New Permit - $1,750

(23) Treatment and Processing Amendment $1,250

(24) Treatment and Processing Modification $500

(25) Transfer Stations New Permit - $5,000

(26) Transfer Stations Amendment - $3,000

(27) Transfer Station Modification - $500

(28) Incinerator New Permit - $1,750

(29) Incinerator Amendment - $1,250

(30) Incinerator Modification - $500

(31) Large Compost Facility New Permit - $1,750

(32) Large Compost Facility Amendment - $1,250

(33) Large Compost Facility Modification - $500

(34) Land Clearing and Inert New Permit - $1,000

(35) Land Clearing and Inert Amendment - $500

(36) Land Clearing and Inert Modification -$250

(d) The application permit fee under this section shall be paid upon submission of the permit application.

(e) A permitted solid waste management facility shall pay an annual permit fee on or before August 1 of each year according to the following schedule:

1. Municipal Solid Waste Landfill $3,500
2. Post Closure Municipal Solid Waste Landfill $1,000
3. Construction and Demolition Landfill $2,750
4. Post Closure Construction and Demolition Landfill $500
5. Industrial Landfill $2750
6.. Post Closure Industrial Landfill $500
7. Transfer Station $750
8. Treatment and Processing Facility $500
9. Tire Monofill $500
10. Incinerators $500

11. Large Compost Facility $500
12. Land Clearing and Inert Debris Landfill $500

(f) As used in this section, the following definitions apply:

(1) 'New permit' means all of the following:

a. An application for a new solid waste management facility not previously permitted by the Department. It includes one site suitability review, the initial permit to construct and one permit to operate the constructed portion of a phase included in the permit to construct.

b. An application that proposes to expand the boundary of a permitted waste management facility for the purpose of expanding the permitted activity.

c. Any application that includes a proposed expansion to the boundary of a waste disposal unit within an existing permitted solid waste management facility.

d. An application for a substantial amendment to a solid waste permit, as defined in G.S. 130A 294(b1).

(2) 'Permit amendment' means all of the following:

a. An application for a permit to construct and one permit to operate for the second and subsequent phases of landfill development depicted in the approved facility plan for an existing solid waste management permit.

b. An application for a renewal or a permit review every five years after issuance of the existing solid waste management facility permit, as required by rule.

c. Any application that proposes a change in ownership or corporate structure of a permitted solid waste management facility

(3) 'Permit modification' means all of the following:

a. an application for any change to the plans approved in the existing permit for a solid waste management facility that does not constitute a 'permit amendment' or a 'new permit'."

b. a second or subsequent permit to operate for a constructed portion of a phase included in the permit to construct.

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
23 January 2007

The Environmental Review Commission (ERC) met on Tuesday 23 January 2007 at 9:30 a.m. in Room 1228 of the Legislative Building. Senator Albertson presided.

The following members were present: Senators Albertson, Bingham, Dorsett, Kinnaird and Weinstein; and Representatives Gibson, Hackney, Harrell, Harrison, Justice, and Warren. Mr. George Givens, Commission Counsel; Jeffrey Hudson, Assistant Commission Counsel; Jennifer McGinnis, Assistant Commission Counsel; Susan Iddings, Assistant Commission Counsel; Jennifer Mundt, Commission Analyst; Mary Watson, Acting Commission Clerk; and Dot Waugaman, Commission Clerk; were also present.

On 3 January 2007, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. Copies of the agenda for the meeting and visitor registration sheets are included in the attachments as **Exhibits B** and **C**.

Senator Albertson called the meeting to order. He then asked Mr. George Givens to present his report and explain the agenda items. Mr. Givens pointed out that there were two packets of reports with an explanation memorandum from Ms. Jennifer Mundt dated 23 January 2007 at their desks (see **Exhibit D**). The first package of reports includes a Report on the Feasibility and Desirability of Acquiring Land and Establishing a State Park at Cabin Lake, dated 15 January 2007 (see **Exhibit D-1**); and a report submitted by Mr. Peter Anderson, Executive Director of the Center for Competitive Waste Industry, titled, "Day of Reckoning: Protecting California Taxpayers from the Looming Landfill Crisis" (see **Exhibit D-2**). Mr. Anderson presented on behalf of the International Brotherhood of Teamsters on the liabilities associated with existing and proposed landfills at the ERC meeting on 13 December 2006. The other memorandum, also from Ms. Mundt, dated 23 January 2007, attached a copy of the written public comments on the La Capra Associates, Inc. study (see **Exhibit E**). An updated copy of "Status of Reports to the ERC Required by Law (see **Exhibit F**) was also made available. Other reports submitted are attached to specific agenda items and will be identified below. Mr. Givens commented that the day's agenda would focus on parks, recreation and land conservation, but will also include other important items, some of which were carried over from the December and earlier January meeting.

Senator Albertson introduced Mr. Phil Baddour, Chair of the Board of Trustees, Clean Water Management Trust Fund (CWMTF), to speak about the annual report on the implementation of the Trust Fund, projects and awarded grants (see **Exhibit G** for a copy of the report). He introduced Mr. D. G. Martin, who has assumed the position of interim director of the CWMTF Board. Mr. Baddour stated a primary goal of the Board of Trustees is to take a close look at ways to improve grant review criteria. He suggested integrating the Trust Fund's existing criteria with the common criteria set forth in the Session Law adopted in 2005. The Board endorsed his recommendation that more weight be given to good water quality applications from economically distressed local communities.

Senator Albertson introduced Mr. Richard Rogers, Assistant Secretary for Natural Resources, DENR, to speak about the Conservation Easement Program and progress for preserving 1 million acres of natural land by the end of 2009 (see **Exhibit H** for a copy of his PowerPoint presentation, **Exhibit I** for a copy of the Annual Million Acre Report, and **Exhibit J** for a copy of the Annual Report of the Conservation Easement Program). He commented that the state is at a critical point where the conservation challenges need to be faced head on and a strategic plan developed. He said private land conservation across the state is not being maximized.

In 2006 the Department took on establishing a stewardship program to include an ecosystem enhancement program for easements being used to mitigate Department of Transportation highway projects. There are 75 properties being monitored in partnership with land trust communities through contracts. The cost of the program is being determined. Money from the projects is put in an endowment to allow DENR to finance a property monitoring program.

Another area is the Conservation Tax Credit (CTC) Program. The program has also provided several easement properties across the state that need to be monitored. DENR staff is now determining the status of the properties, specifically who is responsible for monitoring and assuring that the appropriate conservation benefits are being realized for the state. The CTC Program is going to hire a stewardship analyst to manage the program.

The Conservation Grant Fund (CGF) allows DENR to set up various funds (an endowment fund an interest bearing account, and an operating account) to be used in a multitude of ways. Interest on the endowment fund is being used to monitor the easements. It is also being used in conjunction with the Military Support Act, passed in 2005 and funded in 2006 for $1 million. Almost one-third of the $1 million has been allocated for use on and around military bases. The funds cannot be used to purchase land, but the Fund does allow payment for transaction, survey, and other costs associated with the purchase of land.

The CTC program has been in existence since 1983. Because of the cap on donations for tax credit for individuals and businesses, a lot of excess value goes into the program, thereby reducing the amount paid for the properties. The costs have averaged about $600 per acre. Over 154,000 acres of land have been conserved through the program. Mr. Rogers brought three legislative recommendations to the Commission: (1) corporate donations (pass through entities and increase incentives to donate), (2) clarify the language of "other conservation purposes", and (3) define a property appraisal method.

Mr. Rogers ended his presentation with a request for funding for supporting conservation to sustain and keep the network of natural systems together for economic, natural resource, and quality of life benefits.

Senator Albertson introduced Mr. Lewis Ledford, Director, Division of Parks and Recreation, DENR to present the annual report on the Parks and Recreation Trust Fund (see **Exhibit K** for a copy of his PowerPoint presentation, **Exhibit L** for a copy of the Parks and Recreation Trust Fund Program Overview and Annual Report, and **Exhibit M** for a commemorative brochure celebrating 90 years of stewardship of the North Carolina State Parks).

Senator Albertson then introduced Ms. Lisa Riegel, Executive Director, Natural Heritage Trust Fund, to present the semi-annual report on acquisitions made with funds from the Natural Heritage Trust Fund (see **Exhibit N** for a copy of her PowerPoint presentation, and **Exhibit O** for a copy of the annual report). The Fund receives income from 25% of the state's portion of the Deed Stamp Tax, $15.00 per plate from additional fees for personalized license plates, and interest. The money can be and is used to leverage other money from the state, from the federal government, and from private sources.

Senator Albertson introduced Representative Lucy Allen, Co-Chair of the Land and Water Conservation Commission, to present a report on the work of the Commission and recommendations based on the findings of the report (see **Exhibit P** for a copy of the Executive Summary and **Exhibit Q** for a copy of the Media Coverage Clip Book, 5 September 2006 through 17 January 2007). In addition to the meetings held in Raleigh, the Commission met in three venues across the state: Asheville (280 attended, 65 people spoke); Greenville (275 attended, 45 people spoke); and Greensboro (290 attended, 79 people spoke).

Representative Gibson asked what the Commission heard concerning the bond pool—schools, transportation, water and sewer, and conservation. Representative Allen replied that the Commission focused on conservation because it is more intangible than other bond possibilities. There was great support for land and water conservation, but there was a lot of debate about who would pay for it.

Representative Harrison asked about when the ERC would hear about the Farmland Preservation Fund. Mr. Givens replied that he would check the status of a report and let members know. (Later in the meeting, Mr. Givens asked Senator Albertson to recognize Ms. Joy Hicks of the Fiscal Research Division to tell the members the status of the report. Ms. Hicks stated that the Agriculture Development and Farmland Preservation Trust Fund annual report does not come to the ERC. It goes to the Joint Committee on Governmental Operations Subcommittee on Natural and Economic Resources. Mr. Givens added that Mr. Maximillian Merrill of the Department of Agriculture is responsible for the report. Mr. Merrill advised that a report will be forthcoming soon. Mr. Givens said he will draft legislation to add to the reporting requirement that the report will come to the ERC.

Senator Albertson introduced Ms. Suzanne Klimek, Director of Operations, Ecosystem Enhancement Program (EEP), DENR, to present the annual report on the Implementation of the Ecosystem

Enhancement Program and use of the Ecosystem Enhancement Fund, including an inventory of property and easements (see **Exhibit R** for a copy of the PowerPoint presentation and **Exhibit S** for a copy of the 2005-2006 Annual Report of the program). Ms. Klimek commented that the EEP is an example of environmental streamlining that is a model for the nation. The work of the program is compensatory mitigation, basically restoration to offset unavoidable impacts to aquatic resources. Mitigation is required because of provisions the federal Clean Water Act.

The EEP started with a three-way memorandum of agreement between DENR, DOT, and the Army Corps of Engineers. Since the beginning of the program, no DOT projects have been delayed because of compensatory mitigation, in contrast to the situation prior to the establishment of the program where 40 percent of DOT's road projects were delayed because compensatory mitigation was not in place. All work of the EEP is outsourced. Staff members work with environmental consulting firms, private mitigation bankers, government agencies, non-government organizations, and universities to plan restorations so the mitigation provides the most benefit. They design and construct the restoration projects, acquire the land in association with all the projects, and monitor the projects over a five-year period to make sure the mitigations meet their success criteria.

The EEP has to provide compensatory mitigation within the same watershed as the environmental impact. They work closely with state and federal agencies on a daily basis. One way is through their Program Assessment and Consistency Group, made up of Division of Water Quality, Division of Coastal Management, EPA, Army Corps of Engineers, US Fish and Wildlife Commission, among others. The liaison council made up of environmental consulting firms, mitigation providers, land trusts, non-government land associations to inform the Group of what they are doing and to engage them in understanding what is going on with the program. The EEP reports to the Board of Transportation and the Department of Transportation, because they manage a large sum of money on their behalf. The most important interaction they have is the Annual Report to the ERC.

Because the EEP consolidates all requirements they have to meet, not only for the Department of Transportation but also for private entities across the state and for managing the Nutrient Offset Program and the Buffer Mitigation Program, and they work strategically to meet requirements across the state to maximize environmental and economic efficiency. To do that, they evaluate customer needs in terms of mitigation that has to be in place to complete their projects. They also evaluate environmental needs on a watershed approach. They look at where in the land space it make the most sense to apply the restoration dollars.

The DOT's needs have been falling off annually, approximately 30 percent, due to two things. The first is the Transportation Improvement Program is not as active because of their funding issues. They are also doing a better job of determining what the environmental impacts are going to be. There is also a slight reduction in participants of the traditional in lieu fee program, but the buffer and nutrient offset programs are continuing to increase in activity.

They do review the cost of delivering the restoration annually. This includes the cost of acquiring the land, designing projects and constructing the projects. Those costs are increasing. Therefore they are engaged in a rule revision process to update the schedule of fees for compensatory mitigation. They last looked at their costs in 2003, and increased the stream fee at that time. They now have more data on costs than they have ever had, helping them to determine a figure that can be backed up with data. The data shows they can justify distinction across the state in terms of urban, rural and coastal environments. Costs are higher in urban and coastal areas because land values are increasing. They also want to set fees to reflect the actual costs being incurred. The process is underway, and the public comment is open until February 15.

The regulatory entities are interested in whether or not the program is complying with the permit requirements they have taken on as they relate to compensatory mitigation, and are they meeting their goal of advancing mitigation ahead of the impact as established in the tri-party memorandum of agreement. Their currently managed assets (1,471,107 linear feet) are more than the required amount through 2008 (1,379,553 linear feet), demonstrating they are advancing mitigation, and the compliance with what they have in the system is very high. They have had similar success with wetland assets. Buffer and nutrient offset mitigation programs are also highly compliant with required mitigation.

Representative Gibson asked about mitigation during the removal of dams. Ms. Klimek said EEP has had good results from the projects they have supported. They are asking the Army Corps of Engineers for consensus on guidance on how to go about removing the dams. Ms. Klimek also commented that the EEP has more data on project cost now than they ever have had in the past, which allows fee schedules to be set more accurately.

Senator Albertson introduced Mr. Bruce Nicholson, Brownfields Program Manager, Division of Waste Management, DENR, to report on the effectiveness of the Brownfields Property Reuse Act (see **Exhibit T** for a copy of the annual report). The program has facilitated almost $2 billion in committed private investment in brownfields in North Carolina. Lenders who had previously turned down requests for loans for such projects are now advising developers of the brownfields properties. The program is part of the landscape for cleanup of environmental problems. The program promotes more sustainability and property redevelopment. It recycles and reuses infill properties and counters the continued sprawl into green spaces. Because of the popularity of the program and the leveling off of federal funds, the program will use the statutory authority for imposing fees, probably an additional $3,000 for each applicant. For most developers, the fee would be nominal. With the additional resources provided through the fee, more staff could be hired, and the program of cleanup and redevelopment of environmentally impacted properties would continue to meet the challenges of its success.

Senator Albertson introduced Ms. Robin Smith, Assistant Secretary for Environment, DENR, to speak on the report of the findings and recommendations of the Governor's Hazardous Materials Task Force (see **Exhibit U** for a copy of the report). The Task Force was set up to respond to the questions that arose as a result of the explosion at Environmental Quality Company (EQ), a hazardous waste facility in Wake County.

Ms. Smith reported on the results of environmental tests done in the surrounding community to the Committee. She said air quality monitoring staff was on site within a few hours after the fire. They began taking air quality data the following morning as soon as they were cleared by the first responders to get close enough to the site to set up their equipment. Water quality staff was on site the following morning to begin monitoring surface water in the vicinity of the fire to insure that contaminants were not reaching the streams in the vicinity. No significant water or air quality violations were found in either of the monitoring efforts. The first responders set up berms around the fire site so that stormwater runoff was not leaving the site and contaminating surface waters. Rain helped air quality. In the following weeks DENR did screen some homes and businesses in the community surrounding the site, because there was a great deal of concern about the possibility of contamination. DENR developed a cooperative program with the Department of Health and Human Services (DHHS) and took samples at 39 sites in the community. Exterior and interior wipe samples were taken as well as soil samples. Most of the homes that were tested had interior mercury vapor testing. All mercury vapor testing came back negative. The interior wipe sampling basically all came back negative. One high lead level appeared to be associated with lead based paint in the house, not with the fire and explosion. The soil and exterior wipe sampling picked up a variety of heavy metals and other constituents, which could be explained by naturally occurring events.

There were a couple of hot spots for arsenic that appeared to be related to arsenic sources on the site. Old pressure treated wood decking is a known source of arsenic. The same was true for the one site where a higher than average mercury level was found. It appeared to be the result of contamination from an automobile repair and maintenance facility. They found no contamination that could be attributed to the fire and explosion. Virtually everything found was within naturally occurring levels. The full report on the off-site screening around the Apex facility is on the DENR website. The offsite screening in the Apex case cost the state approximately $170,000.

Ms. Smith then reviewed the recommendations from the Task Force (see **Exhibit U**).

Representative Harrison asked if the Task Force discussed the disclosure of hazardous situations in real estate transactions. Ms. Smith replied she did not recall that the subject came up during the Task Force meetings. She added that the Task Force moved in the direction of requiring the facility operator or the permit applicant (for a new facility) to notify property owners directly, not to get involved in property transfers.

Representative Justice asked if it would be too much of a burden on local fire departments to have them involved in containing hazardous waste problems without having the information they need. Ms. Smith replied that all sites have at least one annual inspection by the fire department. She added that the Task

Force specifically recommended that there be a review of the State Building Code and the way that it addresses labeling of hazardous materials, so that fire personnel who conduct the inspections would be able to tell more easily what is in the storage container and what its properties are. The Building Code Council has been asked to look at container labeling to see if there needs to be different labeling requirements. DENR is also routinely sharing their inspection reports of the facilities with the local fire officials. The Task Force suggested they also send them copies of compliance orders so the local fire officials will have a record of the deficiencies found during DENR inspections.

Representative Gibson asked if the business representatives on the Task Force had any concern about the proprietary nature of some of the information that they would be required to put in the public domain. Ms. Smith replied that the information they would need to share would not be proprietary in nature. What is needed is to know what materials are on site and what the characteristics of those materials are.

The meeting adjourned at 12:25 p.m.

Representative Pryor Gibson, Co-Chair

Senator Charlie Albertson, Co-Chair, Presiding

Dot Waugaman, Commission Assistant

Notice of Planning Meeting
Schedule of Future Meetings
Meetings of Interested Parties (605 Working Groups)
Additional Information

COMMISSION MEETING:

The Environmental Review Commission (Commission) will meet at 9:30 a.m. Wednesday 17 January 2007 in Room 544 of the Legislative Office Building in Raleigh.

At this meeting, the Commission will continue studies for which the Commission is responsible, hear reports from State agencies, discuss topics to be considered at future meetings, and attend to other matters. Listed below are potential agenda topics for this meeting and for future meetings. More specific information regarding the agenda for the 17 January meeting of the Commission will be developed at the staff planning meeting discussed below.

STUDIES

1) Issues related to solid waste management (S.L. 2006-244, Sec.4)

2) Issues related to the nutrient offset payment program with regard to the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen; whether nutrient offset payments should be authorized for additional nutrients, including phosphorus; and whether the nutrient offset program should be expanded to other areas of the State (S.L. 2006-215, Sec. 2)

3) The merger of the organization and functions of the Ecosystem Enhancement Program and the Clean Water Management Trust Fund with the Joint Legislative Transportation Oversight Committee (S.L. 2006-248, Sec. 16)

REPORTS *(Report due dates are indicated in parentheses)*

General/Miscellaneous:

4) Annual report on the evaluation and adjustment of the boundaries of the area served by each Metropolitan Planning Organization (G.S. 136-202(d)) *(1 November)*

5) Annual report on the mercury minimization plan prepared by the Department of Environment and Natural Resources (G.S. 130A-310.57) *(1 November)*

6) Quarterly report on the activities of the Environmental Management Commission (G.S. 143B-282(b)) *(15 January)*

7) Interim Report by the Biofuels Energy Strategic Plan Work Group on the Development of the Strategic Plan (S.L. 2006-206, Sec. 3.2) *(15 January 2007)*

Air Quality:

8) Interim Report on the Costs and Benefits of Reducing Oxides of Nitrogen, Particulate Matter, and Other Greenhouse Gases from Motor Vehicles (S.L. 2006-248, Sec. 43) *(15 January 2007)*

Hazardous Waste Management:

9) Annual report on the Effectiveness of the Brownfields Property Reuse Act (G.S. 130A-310.40) *(1 October)*

10) Report on the findings and recommendations of the Governor's Hazardous Waste Task Force

Land Resources:

11) Annual report on implementation of the Sedimentation Pollution Control Act of 1973 (G.S. 113A-67) *(1 October)*

Parks and Recreation:

12) Parks and Recreation Trust Fund Annual Report, Fiscal Year 2005-2006 (G.S. 113-44.15(c)) *(1 October)*

13) Report on the Conservation Easement Program and inventory of all conservation easements held by the Department of Environmental and Natural Resources (G.S. 113A-235(c), S.L. 2004-124, Sec. 2.2) *(1 October)*

14) Report on acquisitions made with funds from the Natural Heritage Trust Fund (G.S. 113-77.9(e)) *(Semi-annually, within 30 days of revision)*

15) Annual report on the State's progress made towards Preserving One Million Acres of farmland, open space, and conservation lands (G.S. 113A-241(c), S.L. 2004-195, Sec. 2.3) *(1 October)*

16) Report on the Feasibility and Desirability of Acquiring Land and Establishing a State Park at Cabin Lake (S.L. 2006-138, Sec. 3) *(15 January 2007)*

Solid Waste Management:

17) Solid Waste Management Annual Report (G.S. 130A-309.12(c), G.S. 130A-309.06(c)(8), G.S. 130A-309.63(e), G.S. 130A-309.06(c)(10), G.S. 130A-309.85, G.S. 130A-309.06(c)(11), G.S. 130A-309.06(c)(12), 136-28.8(g), G.S. 130A-309.06(c)(13), 143-58.2(f)) *(15 January)*

18) An evaluation of the recycling industry, the markets for recycled materials, the recycling of polystyrene, and the success of State, local, and private industry efforts to enhance the markets for these materials. (G.S. 130A-309.06(c)(6)) *(15 January)*

Water Quality:

19) Annual report on the Wastewater Discharge Elimination Program (S.L. 2001-452, Sec. 2.9) *(15 October)*

20) Implementation of the Clean Water Management Trust Fund; projects and awarded grants. (G.S. 113-145.6A(a) and S.L. 2002-148, Sec. 3) *(1 December)*

21) Implementation of the Ecosystem Enhancement Program and use of the Ecosystem Enhancement Fund, including inventory of property and easements. (G.S. 143-214.13) *(1 November)*

22) Follow-up discussion of the report on the evaluation of the training and qualification requirements for approval as an animal waste management systems technical specialist (S.L. 2006-38, Sec. 2) *(15 November 2006)*

Water Quantity:

23) Annual report by the Catawba/Wateree River Basin Advisory Commission and the Yadkin/Pee Dee River Basin Advisory Commission (G.S. 77-117) *(1 October)*

PLANNING MEETING:

To facilitate development of the agendas for the 17 and 23 January meetings of the Commission, to plan for subsequent meetings of the Commission, and to receive input from interested persons regarding the work of the Commission, the Commission Counsel will hold an informal planning meeting at **10:00 a.m. on Monday 8 January 2007 in Room 605 of the Legislative Office Building**. Persons who wish to participate in the development of the agenda for meetings of the Commission, or who are interested in any matter before the Commission, are invited to attend.

SCHEDULE OF FUTURE MEETINGS:

The Environmental Review Commission is scheduled to meet at 9:30 a.m. on Tuesday 23 January 2007 in Room 1228 of the Legislative Building. It may be necessary to reschedule this meeting.

The Commission may also meet once the General Assembly is in session (G.S. 120-70.44). When the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representative as provided by G.S. 143-318.12(b) and will be distributed by email. The Commission will resume a regular schedule of monthly meetings following adjournment of the 2007 Session of the General Assembly.

MEETINGS OF INTERESTED PARTIES (605 WORKING GROUPS):

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

Underground Storage Tank Working Group
10:00 a.m. Friday 26 January 2007 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, you may contact the Commission Counsel or other Commission staff at (919) 733-2578.

AGENDA
9:30 a.m. Tuesday 23 January 2007
Room 1228 Legislative Building
Raleigh, North Carolina

1. Call to order
   Senator Charles W. Albertson, Presiding

2. Introductory remarks by Cochairs *(5 minutes)*
   Senator Charles W. Albertson
   Senator Daniel G. Clodfelter
   Representative Pryor A. Gibson

3. Report to the Commission and explanation of agenda items *(10 minutes)*
   George F. Givens, Commission Counsel

4. Annual report on the implementation of the Clean Water Management Trust Fund; projects and awarded grants (G.S. 113A-257) *(15 minutes)*
   Philip A. Baddour, Chair of the Board of Trustees
   Clean Water Management Trust Fund

5. Discussion of issues related to parks, recreation, and land conservation *(Total time: 55 minutes)*

   Discussion of conservation planning for North Carolina including the Conservation Easement Program and progress made towards preserving one million acres of farmland, open space, and conservation lands (G.S. 113A-235(c), S.L. 2004-195, Sec. 2.2; G.S. 113A-241(c), S.L. 2004-195, Sec. 2.3) *(20 minutes)*
   Richard E. Rogers, Assistant Secretary for Natural Resources
   Department of Environmental and Natural Resources (DENR)

Annual report on the Parks and Recreation Trust Fund, Fiscal Year 2005-2006 (G.S. 113-44.15(c)) *(10 minutes)*
Lewis R. Ledford, Director
Division of Parks and Recreation, DENR

Semi-annual report on acquisitions made with funds from the Natural Heritage Trust Fund (G.S. 113-77.9(e)) *(10 minutes)*
Lisa D. Riegel, Executive Director
National Heritage Trust Fund

Report and recommendations of the Land and Water Conservation Study Commission (S.L. 2006-223) *(15 minutes)*
Representative Lucy T. Allen, Cochair
Land and Water Conservation Commission

6. Annual report on the Implementation of the Ecosystem Enhancement Program and use of the Ecosystem Enhancement Fund, including inventory of property and easements (*20 minutes*)
Suzanne H. Klimek, Director of Operations
Ecosystem Enhancement Program, DENR

7. Report on the effectiveness of the Brownfields Property Reuse Act (G.S. 130A-310.40) *(20 minutes)*
Bruce I. Nicholson, Brownfields Program Manager
Division of Waste Management, DENR

8. Report on the findings and recommendations of the Governor's Hazardous Materials Task Force (*30 minutes).* The text of the full report is available on line at: http://www.enr.state.nc.us/docs/HazardousWasteTaskforceReport.pdf
Robin W. Smith, Assistant Secretary for Environment
DENR

10. Commission discussion and announcements

11. Adjourn

SCHEDULE OF FUTURE MEETINGS:

The Commission will likely meet one or more times while the General Assembly is in session (G.S. 120-70.44). When the Commission meets while the General Assembly is in session, written notice will not be mailed to persons on the mailing list. Rather, notice will be given at a session of the Senate and House of Representatives as provided by G.S. 143-318.12(b) and will be distributed by email, if possible. The Commission will resume a regular schedule of monthly meetings following adjournment of the 2007 Session of the General Assembly.

OTHER MEETINGS:

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

Underground Storage Tank Working Group

10:00a.m. Friday 26 January 2007 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

Persons having questions about the Commission meeting or other matters related to the Commission may contact Commission Counsel or other Commission staff at (919) 733-2578.

MEMORANDUM

To: Members of the Environmental Review Commission
From: Jennifer Mundt, Commission Analyst
Re: Reports to the Commission

The following report has been submitted by the Department of Environment and Natural Resources (DENR) to the Environmental Review Commission (Commission) since the last reports distribution on 17 January 2007. This report is designated as a read only and is attached to this memorandum:

1. Report on the feasibility and desirability of acquiring land and establishing a State Park at Cabin Lake. 15 January 2007. Authority: S.L. 2006-138, Sec. 3.

The following report has been submitted by Peter N. Anderson, Executive Director of the Center for Competitive Waste Industry who presented on behalf of the International Brotherhood of Teamsters on the liabilities associated with existing and proposed landfills at the Commission's meeting on 13 December 2006:

1. Day of Reckoning: Protecting California Taxpayers from the Looming Landfill Crisis. 2004.

The following report has been submitted by the Clean Water Management Trust Fund to the Commission and will be distributed in connection with ***Agenda Item # 4***:

1. Annual report on the implementation of the Clean Water Management Trust Fund. 1 December. Statutory Authority: G.S. 113A-257.

The following reports have been submitted by Department of Environment and Natural Resources (DENR) to the Environmental Review Commission and will be distributed in connection with today's Agenda Items as noted below:

1. Annual report on the Conservation Easement Program and inventory of all conservation easements held by DENR. 1 October. Statutory Authority: G.S. 113A-235(c), S.L. 2004-195, Sec. 2.2. ***Agenda Item #5***

2. Annual report on the State's progress made towards preserving one million acres of farmland, open space, and conservation lands. 1 October. Statutory Authority: G.S. 113A-241(c), S.L. 2004-195, Sec. 2.3. ***Agenda Item #5***

3. Annual report on the Parks and Recreation Trust Fund, Fiscal Year 2005-2006. 1 October. Statutory Authority: G.S. 113-44.15(c). ***Agenda Item #5***

4. Semi-annual report on acquisitions made with funds from the Natural Heritage Trust Fund Statutory Authority: G.S. 113-77.9(e). ***Agenda Item #5***

5. Annual report by DENR on the implementation of the Ecosystem Enhancement Program and use of the Ecosystem Enhancement Fund. 1 November 2006. Statutory Authority: G.S. 143-214.13. ***Agenda Item #6***

6. Annual Report by DENR on the Effectiveness of the Brownfield Property Reuse Act. 1 October 2006. Statutory Authority: G.S. 130A-310.40. ***Agenda Item #7***

7. Report on the findings and recommendations of the Governor's Hazardous Materials Task Force. ***Agenda Item #8***

Please contact George Givens, Jeff Hudson, Jennifer McGinnis, or Jennifer Mundt at (919) 733-2578 if you have any questions or comments.

FEASIBILITY AND DESIRABILITY OF ESTABLISHING A STATE PARK AT CABIN LAKE

N.C. Division of Parks and Recreation
January 2007

INTRODUCTION

In 2006, the NC General Assembly directed the N.C. Division of Parks and Recreation to study the feasibility and desirability of acquiring land and establishing a state park at Cabin Lake in Duplin County. Cabin Lake is currently owned and operated by Duplin County as a county park. N.C. Division of Parks and Recreation staff visited the site, reviewed relevant data and files, and interviewed the director and staff of the Duplin County Department of Parks and Recreation. A biologist from the N.C. Natural Heritage Program visited the site to evaluate the significance of its natural resources.

LOCATION

Cabin Lake is a 194-acre county park located in the eastern part of Duplin County, about five miles northwest of Beulaville along NC 111. The park was established on a 64-acre impoundment of Cabin Creek, a tributary of Limestone Creek, which in turn flows into the Northeast Cape Fear River.

Duplin County is in the southeastern coastal plain of North Carolina. At about 819 square miles, it is the 9th largest county in North Carolina. The 2005 population was 52,141. The county has 10 incorporated municipalities. Major economic sectors in Duplin County are agriculture, livestock, textiles, and manufacturing. James Sprunt Community College is located in Kenansville, the county seat.

According to the N.C. Department of Commerce, travel expenditures in Duplin County are estimated to be approximately $31.8 million, generating $1 million in local taxes and supporting 200 jobs. Tourist attractions include historic homes, four National Register Historic Districts, museums, farms open to visitors, including Glenwood Farms, and the Duplin Winery, which offers daily public tours. Accommodations include several hotels and inns, and three campgrounds – Cabin Lake County Park and two private campgrounds: Lake Leamon, located near Wallace and offering picnicking, swimming, boating, and full hookup campsites; and Maxwell Mill Park, located near Pink Hill and offering a fishing lake, swimming pool, boat rentals, and full hookup campsites.

Most of Duplin County is within Cape Fear River Subbasin 03-06-22. The Northeast Cape Fear River flows south through the county. Major tributaries include Goshen Swamp, Grove Creek, and Stockinghead Creek, flowing from the west, and Limestone and Muddy Creeks, flowing from the east. Cabin Creek is a tributary of Limestone Creek. It is about four miles long, and is classified by the N.C. Division of Water quality as B Swamp, which means the water is used for body-contact recreation, as well as fishing, boating, agriculture, and aquatic life. The swamp classification means the stream has naturally occurring low velocity, low pH, and low dissolved oxygen.

HISTORY

Cabin Lake and its associated park were constructed as part of a watershed improvement project begun in the late 1960s. Sponsored by the Duplin County Soil and Water Conservation District, the Duplin County Board of Commissioners, and the Duplin Development Commission, the project was intended to improve drainage, to prevent erosion and flooding, to improve water supply, and to provide recreation. The project included channel restoration (clearing and snagging) in Limestone Creek, channel excavation and drainage on the laterals, a land treatment program for local landowners, and purchase of land and construction of a recreation lake.

In 1969, a special election was called by the Duplin County Commissioners to determine whether to levy a special "watershed improvement tax" of 10 cents per hundred dollars of valuation. The funds would be used for prevention of floodwater and sediment damage and for "development and maintenance of water resources." The measure passed overwhelmingly, with 1135 votes for and 324 against. By supplementing its tax money with federal and state funding, the county was able to leverage its funds and maximize the return on its investment.

Engineering for the project began in 1972, and a public meeting was held in 1975 to update the public on the plans and schedule for the work. An environmental inventory was conducted by the N.C. Wildlife Resources Commission in 1976, and a Preliminary Investigation Report was prepared in 1977. A second public meeting was held in 1978 to present the Preliminary Investigation Report to the public. Approximately 70 landowners attended, and only one voted against the project.

Over 800 easements were secured from affected landowners to allow work on their properties, and work on the first phase of the project began in 1982. The last phase of the project was the 194-acre park. The 64-acre lake was completed in 1994, and the public facilities were completed in 1998.

CURRENT USE

In 1995, Duplin County was awarded a grant of $49,707 from the N.C. Parks and Recreation Trust Fund (PARTF) for the development of facilities at Cabin Lake County Park. Facilities constructed at the park include a small entrance station/office, individual RV and tent campsites, two group camping sites, picnic tables and an 8-table picnic shelter, canoe and paddle boat rentals, a boat launch, two playgrounds, a swim beach and bathhouse, two fishing piers, and associated parking and restrooms. A well-maintained, 2 ½-mile hiking trail circles the lake. The trail is used as a running track by the nearby high school.

The park is open Thursday through Sunday year round, and the admission fee is $3. The park operating budget is approximately $165,000 per year, which is about 75 percent of the $219,000 budget of the Duplin County Parks and Recreation Department. There are no other county parks, but two athletic fields are leased to provide ballfields for local teams.

The park's facilities are attractive to group users who rent the group campsites and the picnic shelter. Appendix A shows group reservations at the park since 2004.

NATURAL HERITAGE SIGNIFICANCE

Cabin Creek County Park was surveyed by a biologist from the N.C. Natural Heritage Program to identify significant natural heritage values. The vegetation community of the

lake shoreline was found to be in an early succession stage due to its young age. Upland slopes adjacent to the lake have been altered by past timber management. There are a few acres along the east shore where young-mature beech (*Fagus grandifolia*) and oaks (*Quercus alba, Q. falcate, Q. nigra*) are scattered among very small regenerating trees. The larger trees are up to 1.5 feet in diameter at breast height, but the habitat is dominated by small trees with diameters only 2-7 inches across. In time, this area may produce a mosaic of maturing mesic and dry-mesic hardwood forests.

In summary, the biologist identified no habitat of natural heritage significance at the park. However, he noted that any future botanical survey of the site should look for the very rare Raven's seedbox (*Ludwigia ravenii*) along the shore. This plant was found about 0.8 mile to the west of the reservoir in 1957.

STATE PARK SYSTEM CRITERIA

The State Parks Act states that the state parks system shall consist of representative examples of North Carolina's unique biological, geological, archeological, recreational, and scenic resources. New state park system units shall be added by an act of the General Assembly and shall address the needs described in the Systemwide Plan. All additions shall be accompanied by adequate appropriations for land acquisition, development, and operations. Addition of new units to the State Parks System should focus on preserving sites of statewide significance and on ensuring that representative examples of the state's resources are protected.

While expansion of the system is important, new parks must be selected carefully to ensure that they contribute to fulfilling the purposes of the system and that they justify the considerable public investment in acquisition and long term management. The Division has developed criteria for evaluating proposed new units to the state parks system. The evaluation criteria are divided into minimum and measured criteria.

The minimum criteria are used for initial evaluation of proposed park sites. The four basic criteria are:

- Statewide significance of the site's resource themes;
- Size (sufficient acreage to protect principal resources and to provide appropriate facilities with minimal impacts to principal resources);
- Absence of incompatible features (through roads, intrusive development, incompatible vistas and air, water and noise pollution threats); and
- Public access free of limitations inhibiting management and public use

Sites which do not meet these minimum criteria are removed from consideration. If a site meets the minimum criteria requirements, it is then evaluated using measured criteria, which include:

- Number of high priority resources;

- Rarity of natural resources;
- Threat to natural resources;
- Degree of threat / urgency of acquisition;
- Presence of rare and endangered species;
- Interconnection of the site with other protected areas;
- Presence of superlatives (one of a kind, biggest or best example);
- Demand for state parks system units that are staffed and open to the public; and
- Suitability for providing high quality recreation

SUITABILITY OF CABIN LAKE

Statewide significance - A proposed new unit of the state parks system must contain a high quality example of a natural resource (biological, geological, archeological, recreational, or scenic) of statewide significance. In this context, statewide significance means one of the best examples of its kind in the state, or likely to attract visitors from other regions of the state. A biologist from the N.C. Natural Heritage Program found no natural heritage resources of statewide significance at Cabin Lake Park. While the park is scenic and has high quality recreational amenities, these qualities were judged not to be of statewide significance.

Size - A proposed addition to the state parks system must have sufficient acreage to protect the principle resources. Areas proposed as state parks or state recreation areas should have a minimum of 400 acres. Cabin Lake contains less than 200 acres and has little potential to be significantly enlarged. State natural areas may contain less than 400 acres, but they do not contain extensive recreational facilities. Cabin Lake is not suitable as a state natural area.

Absence of incompatible features - A new state park should be relatively unspoiled and should not contain incompatible features such as roads that cannot be closed; intrusive development; significant threats to air or water quality that cannot be controlled; sources of excessive noise that cannot be controlled; and incompatible vistas. Cabin Lake Park is attractive and does not contain substantial incompatible features.

Public access - A new state park should have adequate public access and should be free from limitations, such as zoning or deed restrictions, that would inhibit management of public use. Cabin Lake County Park meets this criterion.

A site proposed for addition to the state parks system must meet all of the above minimum criteria to be eligible for further consideration. Cabin Lake County Park meets some but not all of the criteria, and so it was determined to be unsuitable as an addition to the State Parks System. Because the site did not meet the minimum criteria, the measured criteria were not applied.

Development of the park is essentially complete, so the cost of developing a state park on the site would be low. However, this advantage does not outweigh the lack of statewide significance and the insufficient size.

CONCLUSIONS

Cabin Lake County Park is an attractive, well-maintained park with a variety of recreational facilities. It is popular for group use activities. However, the natural and recreational resources of the site were determined not to be of statewide significance, and at 194 acres the park does not meet the minimum acreage guideline for a state park. Therefore, the establishment of a state park at Cabin Lake is not recommended.

Cabin Lake was found to be more typically suited for operation as a local park. The park is an asset to the county's economy and quality of life. The park has a long history of public support going back to the special watershed election of 1969, and the county has done a good job in designing, constructing, and operating the park. The county has made a substantial investment in the park, and has received considerable federal and state funds to support the project.

Zip code data on group users is not available, but according to park staff a large proportion of group users are from outside the county. It is likely they contribute to the county economy through purchases of groceries and gasoline, in addition to the rental fees they pay to the park for the use of the facilities. The park also provides accommodations for visitors to other county attractions such as the Duplin Winery and Glenwood Farms, and can play an important role in the county's efforts to attract tourism and business.

The park is very popular with group users and in the long term, rental demand could probably support another picnic shelter and more group camping. This would also allow the park to remain open to the general public at the same time a large group is renting facilities. Additional acreage would probably be needed to expand the facilities. An indoor area for classrooms and displays would make the park more useful for local school groups and community college classes.

The park is still fairly new and would benefit from more public awareness and promotion. More and better signs and increased exposure in county publications and websites would make people more aware of the park. It would also be beneficial for the park to install a traffic counter to better assess visitation.

WASTE INDUSTRY

December 6, 2004

Ms. Resa Dimino, Board Chairperson
Grassroots Recycling Network
210 N. Basset Street
Madison, Wisconsin 53703

Dear Ms. Dimino:

The Center for a Competitive Waste Industry is pleased to provide you with the report that you commissioned for the California Integrated Waste Management Board evaluating the adequacy of landfill financial assurance, *Day of Reckoning – Protecting California Taxpayers from the Looming Landfill Crisis.*

On the one hand, we found California has among the most comprehensive set of regulations for post-closure financial assurance relative to any other state in the U.S., or in Europe.

On the other hand, we also found that the manner in which financial assurance is presently structured in California, as elsewhere, only addresses a small sliver of the probable risks — risks that will rise dramatically in the years following closure. Consequently, in the future, states will face billions of dollars in exposure from impending landfill failures for which they essentially have no protection.

Current amounts designated for financial assurance can be less than $^{1}/_{100}^{th}$ of the exposure to the states at all but small, remote, or arid sites. Moreover, separate from the wholly inadequate amounts, the assurance mechanisms include ones that are inappropriate and, in all respects, do not extend to the period after the defined end of post-closure care when the risks are greatest. Thus, current procedures are effectively useless to protect taxpayers.

For that reason, we retained insurance experts to help us develop an entirely new and market-based approach geared to address the unique probabilistic occurrence of the risks that extend after care is ended. If pursued, we believe that the state, its taxpayers and the large corporations that use municipal landfills, can be protected from the enormous surprise costs that will almost certainly arise.

We have enjoyed working on this project, and stand ready to provide any further assistance that you or the California Integrated Waste Management Board may require.

THE CENTER *for a* COMPETITIVE
WASTE INDUSTRY

Executive Summary

This report is in response to the request by the Integrated Waste Management Board for public comment on how long the landfill 30 year post-closure period and financial assurance should extend and which assurance mechanisms should be favored.

We explain why, instead of tinkering around the edges in this way, the urgent need now is to completely overhaul California's financial assurance regulations for privately owned landfills. For municipalities that own landfills, the need for fundamental reform is less pressing because, when the future problems arise, they will presumably be around to respond and have the capability to tax.

Essentially, everyone has been focusing on the wrong questions, whether it be lengthening the period of care or tightening the mechanisms for showing assurance to pay for what has been called care.

In fact, there is no extended post-closure period that would protect the environment, because long term care only serves to prolong isolation of the waste load from infiltration by rain and runoff for a while. Since the decomposition that produces leachate and landfill gas only proceeds when water is present, and since it is only a matter of time after post-closure care ends and before the untended cover degrades, the instigation of major uncontrolled releases is just temporarily kept at bay. But that surcease will last only so long as the cover is maintained – no matter how long that time is extended. Then, whenever care finally stops, the latent hazards will reassert themselves.

Furthermore, while indeed some of the mechanisms are grossly inadequate to provide assurance, the job of reforming them, while necessary at some level, completely obscures the real point. That is the magnitude of the risks at major sites could be in the order of one hundred times greater than contemplated in the current regulations. Tallying the costs at all the sites together, the final price tag for the state of California to clean up today's landfills may be in the order of $26.4 billion.

Because of that, and because the risks of future corrective actions and third party injuries are not only great, but also probabilistic and highly variable in their occurrence, most of the current mechanisms, which attempt to provide assurance for minor, predictable and periodic maintenance costs, are essentially useless when viewed against that wider pallet.

Only insurance coverage for major risks that extends beyond the end of post-closure holds the promise to meet the challenge. Also, that coverage must be sufficient to truly remediate the site so that it no longer is a threat to the environment, rather than the merely palliative measures. That is all most Superfund efforts are limited to.

In addition, significant changes are needed in the existing assurance structures for the routine maintenance that is intended to be covered. One of the mechanisms does not, in fact, add any real assurance as do third-party and trust instruments. That is the so-called financial means test that rests assurance on the corporation's own balance sheet, which is, in essence, no more than a 50 year IOU.

Also, trust funds and third party instruments should be adapted to provide assurance for care in perpetuity, because maintenance will be required for many years, or decades, beyond the defined 30 years of post-closure.

Less critical but of importance, trusts would be stronger were the payments into the fund front-ended, and the third party mechanisms would be enhanced were the state's right to collect made automatic in the event the policy is canceled.

Alternative recommendations put forward in a waste industry report, in which the post-closure period is ended when certain tests find that leachate and gas releases are below levels of concern, are flawed. Even if the observed discharges at the end of post-closure is within limits, the real problem lies out beyond the end of that period.

The Board is urged to act decisively and with all deliberate speed, because the State is the middle of a financial crisis and the short time remaining to rectify the rule's flaws is rapidly passing. Failure to utilize the market place by insuring against these enormous risks in order to overcome the inherent limitations of regulations will almost certainly short circuit the State's progress on its painful path to fiscal recovery. ☞

Introduction

The Coalition to Protect States from Long-Term Landfill Liabilities presents this analysis and recommendations in response to the question asked by the California Integrated Waste Management Board. That question, which recapitulates the way we have all looked at this issue in the past, is how long the post-closure period and financial assurance for municipal solid waste landfills should last.

As we delved into the matter, we found that this manner of parsing the issue fails to grapple with the inherent failing of today's liner-based landfills. For that reason, we have taken the liberty of rearranging our response to provide an answer that, we believe, will better help the Board understand the deeper issues. What we learned from our top-to-bottom review is that there is a need to devise an entirely new assurance mechanism that can grapple with major site failures, which are probabilistic in their occurrence and will probably arise after whatever post-closure period is specified.

What follows is divided into four sections. In the first, we look back in time to the period when EPA's federal landfill regulations were first developed to demonstrate why asking for advice on revising the length of the post-closure is the *wrong question*.

See page 5

In the second, we show where California's current financial assurance *rules are inadequate* to protect the state from billions of dollars in liabilities.

See page 37

In the third, our *recommendations* are provided to stave off a financial crisis for the state.

See page 89

Lastly, the *proposal by the waste industry* is evaluated and shown to have no probative value for regulatory purposes.

See page 117

We stand ready to further assist the Board in any way we can to help insure that California, its municipalities and other states, are protected from the responsibility for the massive long-term landfill liabilities. ☞

Chapter I

The Wrong Question

The major question put by the California Integrated Waste Management Board's notice is how long the post-closure period ought to be extended.

Landfills are more likely to fail after the 30 year post-closure ends, and therefore there is no period that can be adequate.

Currently, of course, the defined post-closure period in California, during which financial assurance is required, is 30 years, recapitulating the length of time specified by federal rule. Before turning to the reasons why any length of time, nonetheless 30 years, is unsupportable, the SIDEBAR provides a short trip back in time to the derivation of the three decade time frame.[1]

That history illuminates the misapplication of key facts and the lack of technical grounding for this, as with so much else, in today's landfill regulations. Indeed, a decade later, EPA officials interviewed by its Inspector General finally conceded "that the 30-year time frame was *not based on specific scientific criteria or research studies*."[2]

But, apart from the fallacious basis for pegging post-closure care at 30 years – with its inference that no problems can arise after that time – the focus on how long the post-closure period should be extended fails to confront the real question.

Fallacious Basis for 30-Year Rule

Before the current generation of *dry tomb landfills*, with liners and gas and liquids removal systems, there were *sanitary landfills* that, before WWII, began replacing open dumps. Sanitary landfills were limited to covering each day's wastes with a soil cover to discourage vermin and other disease vectors and to reduce odors, followed by a few feet of permeable soil on top when the site closed.

But, nothing was done to prevent infiltration of rainfall so that the groundwater and air would not be polluted by the hazardous gases and leachate produced when that moisture causes the garbage to rot. For this reason, the trash in that saturated environment very quickly underwent rapid fermentation – something which does not occur in dry tomb designs with their elaborate barriers that keep the site dry for a time until the liners degrade.

In these sanitary landfills – which have nothing to do with today's dry tomb sites where the waste is kept dry, albeit only until the barriers degrade after 30 years – people observed that fermentation dwindled after about 20 to 50 years. From that experience that is inapplicable to today's facilities, 30 years was incorrectly selected as the time that a dry tomb site would be largely stabilized.

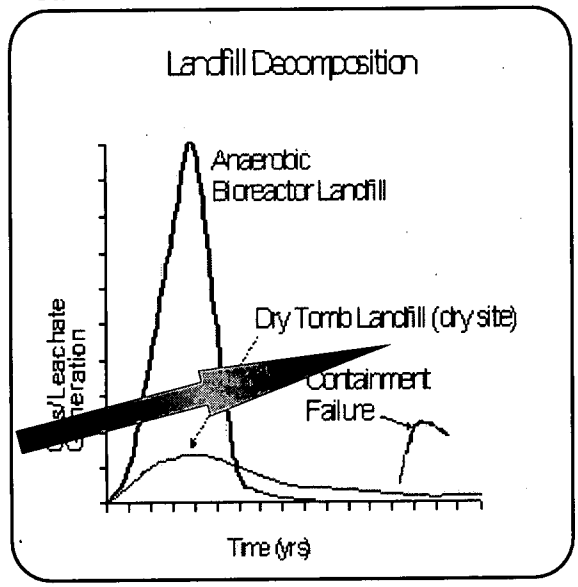
2 U.S. Environmental Protection Agency Inspector General, *RCRA: RCRA Financial Assurance for Closure and Post-Closure* (No. 2001-P-007, March 28 , 2001), at p. 31 (emphasis added).

To grasp the key issues that have lain beneath the surface, the profound implications of the staff's presentation to the Board in November of 2003 that opened this proceeding need to be incorporated into the answer to the question the Agency has asked.[3]

Staff Post-Closure Maintenance Slide No. 8



Staff's Slide No. 8 from its presentation to the Board (reproduced in the graphic along side) presciently shows that "containment failure" can occur *after* the post-closure period ends. More recently, the Staff later amplified its views in its most recent report to the Board:

> "However, the initial term of 30 years for P[ost] C[losure] M[aintenance] is unlikely to resolve all the environmental issues related to a closed landfill in California. Since Subtitle D was promulgated, research shows that certain wastes in some landfills stabilize in a short period of time and that, at those landfills, the potential to impact the environment may only last for a short portion of the conventional 30-year PCM period. On the other hand, some landfills may remain a threat to the environment for longer than 30 years. For example, stakeholders have reported to Board staff that landfill gas control systems have had to be installed at landfills that had not operated for up to 60 years. Dry tomb landfills (favored by Subtitle D and 27 CCR) indefinitely suspend and/or retard the decomposition process such that a breach in containment (e.g. extreme climate or earthquake event or inappropriate land use, or simply failure of equipment or containment barriers) could trigger uncontrolled production and release of landfill gas and leachate, and public contact with waste. *The state of the science thus indicates that municipal solid waste landfills will in many cases pose a significant threat to the environment well beyond the conventional 30-year PCM period.*" [4]

---

3 Staff *Post-Closure Maintenance Presentation* to CIWMB Permit and Enforcement Committee (November 3, 2003), Power Point Slide No. 18.

4 CIWMB, Discussion Paper Regarding Postclosure Maintenance Beyond the Initial 30 Years and Financial Assurance Demonstrations (December 6, 2004) (emphasis added). On-line at: http://www.ciwmb.ca.gov/Agendas/agenda.asp?RecID=1015&Year=2004&Comm=PEN&Month=12.

What this implies is that the overarching problem arises *after* financial assurance has ended and jurisdiction for post-closure care has largely lapsed – and please note the irony in this statement – that is the case no matter how long care is extended. That creates a profound impediment to constructing a workable system of protecting taxpayers from long-term landfill liabilities.[5]

...no matter how long the period of care is extended, it will be insufficient...assurance must run longer than the period of care

Because of this inherent fallacy, the answer to the Board's question is regardless of how long the period of care is prolonged, it will be insufficient. To work, assurance to provide funds after care ends, which is when the problems are most likely to arise, must run longer than the period of care. Although an assertion that later problems will be worse than earlier ones may appear counter-intuitive at first blush, this ought not be considered controversial. As will be documented later, the EPA, the Inspector General, other states and the leading engineers in the landfill industry also acknowledge the essential point that the failures of greatest concern are most likely to arise after the post-closure period is over and care ends.[6]

Therefore, in order to address the underlying issues, we need to look beyond those elaborate engineered systems and the artificial time constructs surrounding them. That is why the Board's question needs to be restated if the State of California and its municipalities are to protect themselves from the enormous long-term landfill liabilities. For there are billions of dollars in liability for cleaning up and compensating damages at many of the 279 open and 116 closed Class III landfills that will inevitably be abandoned by their owners, most likely before their containment fails.

After laying out the factual basis for this quandary in this section, and explaining the inherent limitations of current assurance mechanisms in the next,[7] the section that follows puts forward a solution that extends current assurance mechanisms to meet these widely unrecognized challenges.[8]

---

5 The distinction between the time that *financial assurance* is provided and that over which *legal liability* attaches is critical to understand. Although the regulations in California purport to impose liability in perpetuity, without the funds to pay for future problems, there would be no practical way to enforce the rule.

7 *See* page 37.

8 *See* page 89.

The Fallacy of Subtitle D Rules

The statement that long term liabilities could run into the tens of billions of dollars may sound like groundless rhetoric to those schooled on repeated claims that modern landfills are state-of-the-art facilities guaranteed to protect the environment. But, although once only the province of environmental, not landfill, experts, a new widely shared consensus of the two disciplines is emerging. Today, both join in the conclusion that, in fact, the very foundations and latticework of the Subtitle D rules are fatally flawed.

...the very foundations and latticework of the Subtitle D rules are fatally flawed.

Claims that the Subtitle D rules would protect the environment have never been erected on technical facts, but rather were only girded by political expediency. In order to understand why this is the case, please permit a slight detour to the origins that led to the current landfill designs and the infirmities that followed. Those designs just delayed and did not prevent pollution, as a recounting of the regulation's history shows.

History of Limitations of Current Rule

Our household and commercial garbage includes major volumes of decomposable matter, such as unrecycled paper, food scraps and uncomposted yard trimmings, which EPA estimates to be about two-thirds of the landfilled waste stream, as shown in FIGURE 2.[9]

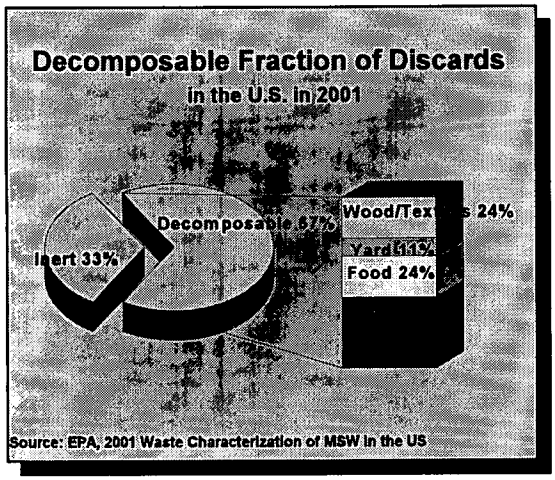

FIGURE 2

These things that rot are the source of much of the problem of safely managing wastes in the ground. For after trash is discarded in a landfill, the conditions are created in which micro-organisms grow and sustain decomposition of the organic fraction. That process keeps the site biologically active producing effluents and emissions that are a significant challenge to control.[10]

Along with the microbes, which are always a part of garbage, and heat, the critical limiting condition for bioactivity is moisture. Some moisture is entrained in the incoming waste, but is soon largely consumed. That leaves precipitation, which enters the site freely before it is capped, as the chief contributor of moisture in non-arid areas. Afterwards, rain and runoff

only infiltrates in very minor amounts through defects in manufacture or installation of the cover. But later, major volumes will percolate through breaches that are inevitable with the passage of time, at least for all those who do not consider the idea of perpetual care to be realistic.[11]

When liquids continue to be present – or when precipitation later reenters the site – leachate is formed that drains out of the waste load, carrying with it toxic substances such as vinyl chloride, benzene and toluene which are ubiquitous in household and commercial trash. There, at the bottom of the landfill, the dangerous effluent is poised to leak through any breaches in the liner into the underlying water table, which all too often connects to our drinking water supplies.[12]

Obviously, if hazardous leachate forms, it must be isolated before it reaches our drinking water supplies in order to protect public health and the environment. That is what Congress intended to require in the Hazardous and Solid Waste Amendments of 1984 (HSWA) when it enacted comprehensive amendments to the original Resource Conservation and Recovery Act (RCRA) of 1975, and which govern federal waste policy today.[13]

Note that, as amended, RCRA set a particularly high standard for environmental protection, one that was not significantly undercut, as is the Clean Air Act Amendments (CAAA), by competing demands to diminish the environmental protections in order to give greater recognition to cost considerations. RCRA mandated the federal rules creating minimum standards for the states were supposed to insure that "at a minimum ... there is *no reasonable probability of adverse effects* on health or the environment from disposal of solid waste."[14]

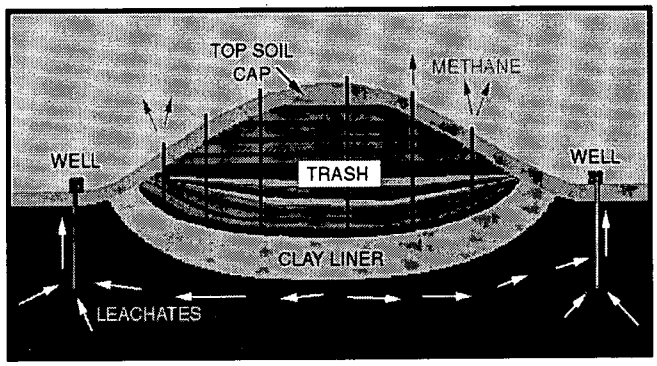
12 Lan ier Hickman, Jr. *Principles of Integrated Solid Waste Management* (Amer. Academy of Env. Eng. 19, 99) at pp. 411-412. Also, methane gas is generated, in addition to leachate, in the anaerobic, or oxygen starved, conditions deep inside landfills that carries moisture entrained in the trash or is infiltrated with rainfall or runoff. Methane transports many of those volatile organic compounds into the atmosphere, and, by itself, the gas is also a greenhouse gas with 21 times the warming potential of CO_2. This is a matter of equal importance, but is not dealt with here only to keep the length of this report manageable.

13 42 U.S.C. §§6901-6992.

14 42 U.S.C §6944(a) (italics added).

To achieve these objectives, EPA proposed regulations in 1988, and promulgated them in 1991, based upon principles of isolating the dangerous waste load. The rule's effectiveness depends upon the practical feasibility of perpetual care.[15] Along with piping and pumps to extract liquids and gas, the rules required composite liners on the top, bottom and sides of landfills in order to keep precipitation from entering into and the leachate from leaking out of the facility.[16] It further provided for post-closure care, requiring the landfill owner to be responsible for maintaining the site for 30 years after it is closed.[17]



Schematic drawing of barrier systems in modern landfill
Credit: University of Michigan

The rule did not, on the other hand, give consideration to preventing leachate and gas from forming in the first place by banning organics from land disposal — similar to what it did by banning large volume hazardous wastes in 1991,[18] and more directly what Europe wound up moving toward by ordering dramatic reductions of organics in landfills beginning in 1999.[19]

EPA's regulations were said to "entomb" the waste, isolating it from the environment in perpetuity.[20] However, on examination that was probably one of the worst strategies to have deployed because no barrier structures constructed by man or woman last forever, and the very idea of perpetual care by human institutions in some sort of garbage priesthood is dubious at best.

[Entombment] was probably one of the worst strategies because no barrier structures last forever, and the very idea of perpetual care by human institutions is dubious at best

20 42 U.S.C. §§6901-6992 and 40 C.F.R §258.40. California P.R.C. §43020 and 27 C.R.R. §17406.

As EPA's technical staff repeatedly warned in the decade of the 1980's leading up to the promulgation of Subtitle D in 1991, even composite liners "will ultimately fail" within decades after the agency's post-closure care requirements have expired,[21] "and when they do, "leachate will migrate out of the facility."[22] Yet, the EPA staff recognized, the duration of a landfill's hazardous loadings that needs to be isolated may be "many thousands of years,"[23] long after the time when discharges will occur.

What we have actually accomplished with liner systems is only to postpone – not prevent – pollution, and to possibly the very worst time, when the responsible parties have left the scene, the assurance funds have expired, the remediation systems are no longer functional, the costs to correct the problem are substantially greater than would have been required to prevent them, and the states, cities and taxpayers are left with the multi-billion dollar costs of cleaning it all up. Then, decomposition will resume as infiltration reignites a whole second wave of leachate and gas generation. But, now that will be happening at the very time when the active and passive barriers and capture systems have been breached or fallen into disrepair, as well as at a time when monitoring is no longer ongoing and maintenance will not occur until a gross exhibition of environmental impact attracts attention.

...liner systems only postpone – and do not prevent – pollution, and to possibly the very worst time

Recent anecdotal studies, while not rigorous, provide some suggestion of just how brief a reprieve liners really provide. A survey conducted in 2001 by the EPA's Inspector General found that landfill covers began experiencing demonstrable failures before the nominal post-closure period had expired. After cover failure, rainfall will begin to re-infiltrate the waste load making it dangerously biologically active all over again.[24]

(continued...)

Even if we momentarily put out of mind what happens after the end of post-closure, the maintenance of the cover during that period is not a simple matter. Patching small tears in those thin, one-sixteenth inch plastic liners before they propagate into big ones is not easy. Nor, for that matter, is finding breaks buried and hidden under the vegetation and several feet of dirt that tops the cover to stabilize the site from erosion.[25] In any event, repairs are never as effective as the original installation, even with the best of intentions. When the end is in sight for a private operator's legal liability at a site that has not produced revenues in years, those intentions may not always be the very best.

If the monitoring systems were really able to provide sufficient advance notice of liner failure to avert major damage while the landfill owner was still on the scene, there might be some cold comfort in procrastinating further. However, that last avenue for justifying delay is foreclosed because of yet another defect in Subtitle D's rules. The wells

---

[24] (...continued)
"In our sample," the Inspector General reported, "we found several examples of [cover] barriers failing during the first 30 years. Most of the states in our sample reported animal or weather-related damage at their sites. Repairs were required at one facility after wild pigs rooting in the near surface soil caused erosion of the landfill cap. In another state, black bears have been a problem. We found other examples of landfill caps eroding, damage to caps due to animal burrows, and a drainage channel being destroyed after heavy downpours. Other sites needed maintenance due to vegetation growth. Additionally, unexpected events other than natural erosion occurred at other sites which required maintenance activities. For example, at one site an automobile drove through the fence surrounding the facility, destroying the leachate treatment system. Another landfill site required repairs after children dug under a fence into a landfill site in order to skateboard on an old truck ramp."

Most important to note is that fact that this study just recorded instances where there was a visible manifestation of breaches at the surface, excluding tears in the synthetic liner beneath the topsoil occurring from other causes not apparent from above, such as from subsidence, roots or faulty installation, which may not provide visible clues. For more, *see* NOTE 25 below.

[25] 40 C.F.R. §60.753(d) and §60.755(c) are the EPA standards for detecting gas leakages, commonly referred to as the "sniff test," which may be argued, would disclose the location of any leak holes in the geomembrane. But, the type of monitoring protocol in EPA's landfill air rule is based on placing flux boxes at approximate equal distances from each other about 100' apart in a grid across the surface looking for methane 500 ppm above background rather than optical scanning of the entire surface. That protocol can only perform the job of showing where defects exist in the cover if the emissions are diffused fairly equally across the surface of the landfill within reasonably defined variability. In fact, this is not the case for capped landfill cells in which most gas leakages are high flux emissions through occasional tears or breaks in the geomembrane.

Thus, as an example, if there were one hot spot per acre, and 10 across a 100 acre landfill, the probability of detecting those 10 hot spots in a year, using a Poisson Distribution, would be 2.4×10^{-38}, which is a decimal point followed by 38 zeros and then 2. Consequently, the required monitoring will be effectively useless at detecting all of the problems that would show where repairs are needed, except by chance, even if the rule is seriously adhered to during post-closure and not undertaken without purposeful intent to manipulate the results. Lastly, the rule permits termination of gas control and testing when reported emission rates of non-methane organic compounds decline below 55 tons per year, 40 C.F.R. §60.752(b)(2)(v)(C), something that may be achieved before the end of the post-closure period with well maintained caps or in arid areas. For a further discussion of the "sniff test," *see* NOTE 9 on page 123.

used to detect contamination are spaced about 200' from each other — too far apart to detect most finger-like plumes escaping through small breaches in the synthetic liners in modern landfills under most soil conditions.[26]

Even were such an unlikely detection achievable, the time that the alarm would be raised would be too late. In the composite liner, two-feet of clay is required to underlie the flexible membrane and be designed to retard seepage for approximately 25 years following a tear in the plastic sheet.[27]

Furthermore, depending upon the type of aquifer, the leachate may take decades more after escaping the torn synthetic liner to course through the unsaturated zone, and from there to groundwater layer to finally reach the periphery about 150 meters away where the monitoring wells are arrayed. That is to say, we would almost never be aware that the landfill is leaking for as many as 50 or probably more years even though a pathway to contaminated drinking water has been irretrievably opened up.[28] And, even then, by that time the cost of remediation for thousands of sites across the country will be a massive expense.

---

26 40 C.F.R. §258.51. This monitoring system might have worked in the pre-Subtitle D era of unlined landfills that relied upon "natural attenuation" when these monitoring regimens were first developed. For leaks from unlined landfill produce very large, generalized plumes that will be detected by almost any deployment of wells. However, neither unlined, nor clay-only liners, are any longer considered an adequate barrier to the migration of leachate from the landfill into the groundwater.

Current standards require composite plastic/clay liners, and plastic sheets tend to shear in at a single location. Consequently, the plume from a small tear will tend to be very narrow and finger like in shape. A typical two-foot long tear or rip would be expected in a sand aquifer system to spread laterally to only about ten feet within 150 meters of the source where wells are typically arrayed. The probability of such a tendril-shaped leak through a composite liner being detected when the leak reaches the perimeter where the wells are located, when those wells are 200 or more feet apart and have a detection radius of perhaps 1-foot, is an exceedingly low probability event. J. Cherry, "Groundwater Monitoring: Some Deficiencies and Opportunities," Hazardous Waste Site Investigations: Towards Better Decisions, *Proc. 10th ORNL Life Sciences Symposium*, Gatlinburg, TN, May 1990.

Other landfills may be underlaid with soils that have low hydraulic conductivity, which resists easy passage of liquids through it, and that may cause some wider dispersion of the plume by the point of compliance. But, even in those types of soils, leachate will often tend to follow preferred paths of flow in channels through the denser earth, thereby overriding its general resistance to flow. At other times, in an effort to maximize air space at economically attractive near-in sites without room to expand, the landfill footprint is close to the property line, in which case there can be an insufficient distance traversed to the monitoring wells for dispersal to have occurred.

27 40 C.F.R. §258.40(b). The clay is to have a hydraulic conductivity of 10^{-7} cm/sec., which, using Darcey's law, equates to 25 years for liquids to seep through the clay part of the composite liner, unless the clay directly under a break in the overlying flexible membrane has become desiccated or suffered cracking.

28 G. Fred Lee. "A Groundwater Protection Strategy for Lined Landfills," 28 *Environmental Science & Technology* 584 (1994). H.. Haitjema, "Ground Water Hydraulics Considerations Regarding Landfills," 27 *Water Res. Bull.* 791-796 (1991).

The last time when California can still have time to act to protect against the environmental liabilities, which are likely to occur after the end of post-closure, is while the landfill is still operating. After the facility is closed and no longer producing revenue, the regulators' leverage is so attenuated to be unequal to the task. Moreover, even were the owner were somehow inclined to comply against its financial interest, the cumulative costs would exceed its capacity to do so.[29]

...the last time when California can still have time to act to protect against environmental liabilities after the end of post-closure is while the landfill is still operating

Time is Late for Correcting Assurance Problems

However, even if a landfill is currently operating, that does not mean major new costs can readily be imposed upon the owner to correct inadequate assurance regulations. The nearer the date when the landfill is expected to close, the fewer the years to amortize any such new costs. With less years to spread the cost, the greater will be the additional cost per ton to generate the desired reserves, and our examination shows California is already on the brink of being unable to realistically correct its course.

TABLE 1 is a sensitivity analysis that shows for different add-on assurance liabilities how the cost per ton increases the closer retirement approaches (Years 1 to 15), as well as for more aggressive corrections to the assurance amount to reflect the sorts of costs being incurred under the Superfund program ($1, $5, $10, $25 and $50 million).[30]

Impact of Amortizing Financial Assurance on the Cost per Ton from Late-Life Assurance Requirements

Late Assurance Cost	When the Years of Operation Remaining to Closure Are														
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
$1 million	$0.35	$0.36	$0.38	$0.40	$0.42	$0.45	$0.48	$0.52	$0.58	$0.65	$0.75	$0.91	$1.16	$1.68	$3.2
$5 million	$1.75	$1.82	$1.90	$1.99	$2.10	$2.24	$2.40	$2.61	$2.88	$3.24	$3.76	$4.53	$5.82	$8.41	$16.2
$10 million	$3.50	$3.64	$3.80	$3.98	$4.20	$4.47	$4.80	$5.22	$5.76	$6.49	$7.51	$9.06	$11.64	$16.82	$32.4
$25 million	$8.76	$9.10	$9.49	$9.95	$10.51	$11.18	$12.01	$13.05	$14.41	$16.22	$18.78	$22.64	$29.10	$42.06	$81.0
$50 million	$17.52	$18.19	$18.98	$19.90	$21.01	$22.35	$24.01	$26.10	$28.81	$32.45	$37.57	$45.29	$58.21	$84.12	$162

TABLE 1

Thus, if the additional cost to provide improved assurance were, illustratively, $5 million (second row), the per ton cost would be $1.75/ton (second column) if instituted at the

---

29 *See, e.g.*, page 79.

30 The assumptions used in constructing this amortization table are that the after-tax cost of money is 8% per year, the operating life of the landfill is 15 years, and all the garbage in the landfill when closed will total 5 million tons. Later, the report explains the reasons why actual costs to remediate mega MSW landfills will vastly exceed the experience under Superfund, which is what was used in this table.

time waste was first received, but $16.20/ton were the new requirements not imposed until the last year of the site's life (last column).

If one plots this data on a graph, something becomes immediately apparent that is very important for decision-makers to recognize. FIGURE 3 shows that there is an inflection point for each of the curves beginning at about 10 years after waste emplacement – five years before the end of life for a 15-year site. At about that time, the steady increases in annual amortization expense per ton dramatically takes a sharp turn upwards hyperbolically.

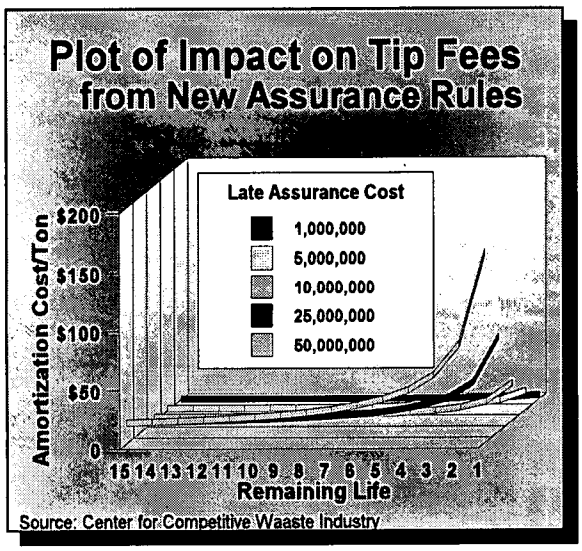

FIGURE 3

Any attempt to impose new and costly requirements at any time on the private sector will be resisted vigorously. This graph shows how that resistence will reach a political flashpoint among owners of landfills in those last 5 years of the facilities' projected lives.

Among the myriad complications that might arise is the case where two trash companies are competing in a market, each with their own landfill. But one site has just opened and the other is close at its end-of-life. The tipping fee of the one about to close would, therefore, become double the first's, and hence would effectively be put out of business under almost any set of conditions. Either the owner could attempt to stay open to collect revenues to fund a trust, but have no customers from whom to collect, or he or she would just walk away.

In order to use this information to assess how many years the Board has to act, we need to know how many years remain until California's landfills are expected to close. The histogram in FIGURE 4 shows the distribution of the State's landfills by the time remaining before the end of the site's permitted life.[31]

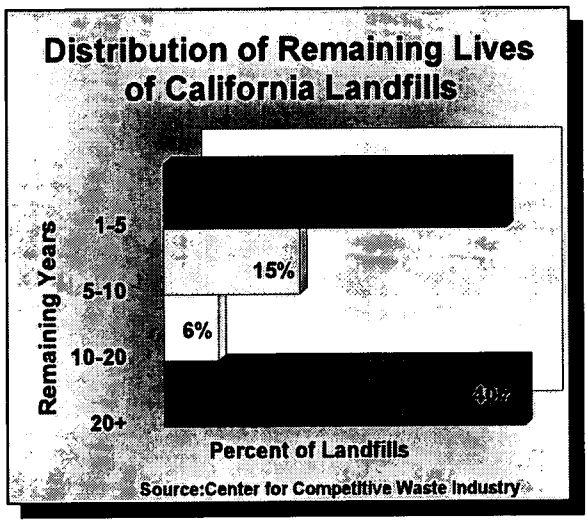

FIGURE 4

Thirty-eight percent of the sites are currently within five years of their permit's end, which looms so close that, as TABLE 1 showed, we may expect to see costly new requirements met with the fiercest resistence and threats to walk away. Fifteen percent are five to 10 years from retirement. That is on the border-line in which there might be the political practicality to impose essential corrections to current practices, with some further latitude with the 6% with 10 to 20 years.

Forty percent have permits that extend their lives more than 20 years. Only if all of the sites had more than 20 years remaining life would there be little imperative for the State to act quickly to remedy today's law. But, in fact, more than half do not offer that latitude to California.

Take-Away Lessons

The first lesson is that because additional barriers only further delay, but do not prevent, the time when the barriers will ultimately fail, doing anything more of that sort – including improved or extended post-closure maintenance – will only prolong, and therefore also fail to resolve, the inherent problem.

...extended post-closure maintenance will only prolong, and therefore also fail to resolve, the inherent problem

Today's short-sighted approach recapitulates the very same out-of-*sight* tactic that sullies the last hundred-year history of waste management. For millennia before that, the citizenry threw their garbage out the window into the streets to be eaten by roaming bands of pigs and picked up by scavengers. All the while they prided themselves as being above their prehistoric ancestors who dropped their rubbish on the floor. As the modern era dawned with new attitudes

---

31 Calculated from the comprehensive CIWMB landfill data base of open landfills receiving municipal solid waste and accepting more than 50 tons per day. The data base does not show which landfills are likely to receive permits to expand further on the existing site, nor which of those are vertical expansions that might delay the time when closure occurs. The latter could effect the distribution of remaining lives such that a larger fraction would have more years remaining before closure.

towards sanitation in the last century, progress was then claimed because the offal was hauled to smoldering open dumps out just beyond the city walls.[32]

Now the contemporary rendition of our past behavior is more elaborate. In the twenty-first century, the construction of garbage pits are bolstered by limited engineered systems to shift problems out-in-*time*. But, at heart, the two are the same thing. Both constitute a relentless refusal to resolve the threats that landfilling creates as a political expedient in order to avoid acknowledging the true cost of wasting — and, as a consequence, the full economic potential of diversion.

Whether moved in time or in place, all of them serve only to transpose the problem. So, no longer are we heaping garbage over the city walls to get the unsightly refuse off of the streets.[33] But, instead, we are conveying the inevitable injuries that the liners only temporarily hold in check, like a perverse form of disinheritance, from our children to our grandchildren.

...there is no more time to postpone addressing the myriad failings of current landfill rules if California is to protect itself from billions in liabilities.

The other lesson is that there is no more time to postpone addressing the myriad failings of current landfill rules if California is to protect itself from billions in liabilities. Already almost half of the landfills are so near to closure that the practical options are limited for them. The time to act is now. Either that or be responsible for leaving the State with bail-out costs so large they could force the State from its current financial crisis into a irretrievable downward spiral.

Industry Concedes Problem

Assertions about the fallibility of dry tomb landfills, once branded by some in the landfill industry as fighting words, are today no longer controversial. They have, through the passage of time and the weight of the evidence, become the new conventional wisdom.

The early warnings from EPA's technical staff discussed on page 11, were most recently reinforced from an investigation and field study conducted by the agency's Inspector General –

Garrick Louis, "A historical context of municipal solid waste management in the United States,"22 *Waste Management & Research* 306, 310 (2004).

33 Melosi, *supra*, at p. 14.

"EPA officials have stated that based on current data and scientific prediction, the release of contaminants may eventually occur, even with the application of best available land disposal technology. There is concern that *these barriers will merely postpone the inevitable release of contaminants until after the 30-year liability has expired.* As previously stated, some sites contain materials which are highly resistant to decomposition or which remain toxic forever. There have been several studies to determine the expected life span of landfill liners, and opinions on this issue vary widely. The bottom line is that not even the manufacturers claim that their liners will last forever."[34]

What began as an underlying concern among EPA's technical experts in the years before the final compromises were made in those Subtitle D rules, has in more recent years been increasingly recognized by many of the states charged with implementing those regulations. The testimony of the staff of the California waste board cited on page 6 are not the only warning flags to have been raised by state regulators. Washington state's Department of Ecology has similarly said:

"The extent to which today's landfills adequately protect human health and the environment is a subject of debate, however. Requirements that govern siting, operation, closure, and post-closure are stringent and extensive. While the newest landfills are state-of-the-art facilities, they are far from benign in their impacts. Landfills may still affect the air, land, and water but to a significantly lesser degree than before today's standards went into effect. As waste decomposes in landfills, methane and other hazardous gases are generated. Methane is a greenhouse gas concern because its impact is twenty-three times that of carbon dioxide (EIA). Leachate from decomposing matter in landfills can contain hazardous constituents. If landfill liners and/or leachate collections systems fail, then groundwater and surface-water pollution can occur. No liners are engineered to be 100 percent impenetrable or to last forever without some sort of failure. In fact, US EPA officials have stated that problems can occur more than thirty years after closure of a landfill, pointing out that 'even the best liner and leachate collection system will ultimately fail due to natural deterioration.'"[35]

In addition, the Wisconsin Department of Natural Resources has also pointed to the same inherent flaw in dry tomb designs for landfills:

"... the responsibility of responding to long-term problems at dry-tomb landfills will fall on future generations, and the funding requirements could quite likely fall on state and local governments." – John Skinner

"The problem with dry tomb landfills is that the organic wastes in them remain largely undecomposed. They represent a continuing and large potential source of methane gas, as well as a potential source of groundwater pollutants. The essentially perpetual management of these problems represents a long-term financial liability to the waste management industry, and potentially to the state, if public monies have to be used to clean up future problems."[36]

Furthermore, in the last three years, many in the landfill industry have conceded these basic facts, as well. The Executive Director of the Solid Waste Association of North America (SWANA), John Skinner previously headed EPA's Office of Solid Waste where he had a major role in drafting Subtitle D. Dr. Skinner has recently written:

"The problem with the dry-tomb approach to landfill design is that it leaves the waste in an active state for a very long period of time. If in the future there is a breach in the cap or a break in the liner and liquids enter the landfill, degradation would start and leachate and gas would be generated. Therefore, dry-tomb landfills need to be monitored and maintained for very long periods of time (some say perpetually), and someone needs to be responsible for stepping in and taking corrective action when a problem is detected. The federal Subtitle D rules require only 30 years of post-closure monitoring by the landfill operator, however, and do not require the operator to set aside funds for future corrective action. Given the many difficulties of ensuring and funding perpetual care by the landfill operator, *the responsibility of responding to long-term problems at dry-tomb landfills will fall on future generations, and the funding requirements could* ***quite likely fall on state and local governments.***"[37]

Dr. Skinner's predecessor at SWANA, Lanier Hickmanexpressed the same view more forcefully:

---

36 Testimony of Suzanne Bangert, Director Wisconsin Department of Natural Resources Bureau of Waste Management Before the Assembly Committee on Natural Resources on Clearing House Rule 04-077 (April 27, 2005).

37 John Skinner, "Composting and Bioreactors," *MSW Management* (July/August 2001), at p. 16 (emphasis added).

"Currently many policymakers view F[inancial] A[ssurance] for landfills from the perspective, 'If it ain't broke, don't fix it.' However, *the question is not 'if' there will be future landfill problems, but 'when.'* Since FA requirements are the last line of defense before the public winds up with the costs for corrective action, it is critical that an FA mechanism be able to guarantee coverage of expected landfill costs."[38]

"... the question is not 'if' there will be future landfill problems, but 'when.'" – Lanier Hickman

Or another from environmental scientists in industry –

"...The dry containment method of operating a landfill has been described as long-term storage of waste rather than waste treatment or waste disposal, and does have some significant drawbacks. There will always be pockets of moisture within waste, and *it is generally accepted that all lining and capping systems will eventually leak so rain and/or groundwater will eventually enter the site.* Thus, the decomposition of the organic fraction of the waste will eventually occur, with resulting emissions of landfill gas and leachate. Since pipes and pumps buried within the waste eventually clog up and fail, there will be less chance of collecting and treating these emissions if they occur in the distant future."[39]

Or from one of the premier landfill engineers –

"The containment provided by these landfills offers environmental protection initially; however, at some point *beyond the 30-year [postclosure] period, there may be partial failure(s)* of the containment lining system (underlying and overlying the waste). The primary environmental issue associated with partial containment system failure and moisture infiltration is the potential associated increase in gas and leachate production and the resulting impact of uncontrolled leachate and/or landfill gas releases to the environment. The nature and magnitude of the releases exiting the landfill and their resulting impacts are directly related to the amounts of organic waste not yet decomposed."[40]

40 John Pacey, *et. al., The Bioreactor Landfill - An Innovation in Solid Waste Management*, Monograph (2001), at p. 2 (emphasis added).

And from another landfill engineer–

"The driving force behind the use of reactive landfill technologies arises from market concerns and community expectations that conventional landfills are no longer practical and profitable as a means of disposal for MSW."[41]

Waste Age, the waste industry trade magazine, opined as well that:

"[I]n the next few years, some facilities closed in the past will be nearing the end of the 30-year period for which closure and post-closure costs were calculated. What then? The contamination may still exist, but the financial assurance coverage will have been calculated on the assumption that costs would extend for only 30 years. If the owner/operator disappears from the scene at that point, the financial assurance designed as a backstop may be inadequate to ensure continued care. Regulators are concerned about this."[42]

There simply is no longer any tenable basis to defend Subtitle D's liner-based regulatory scheme on technical grounds. Any basis for the rule must be found elsewhere.

Political Not Technical

Why, then, did the political appointees in EPA adopt liner-based regulations in 1991, when they were fully informed by their own technical staff at the time that engineered barriers will eventually fail? That question was answered by the EPA Inspector General a decade later in 2001. Extensive interviews with the agency's technical staff established that *the reason was political, not technical*–

"Landfill design requirements and post-closure maintenance for both Subtitle C and Subtitle D facilities are expected to prevent leakage in the short term; however, their long-term effectiveness in controlling releases of contaminants is unknown. EPA and others have stated that it is likely that some disposal facilities will leak at some period after they close. ...

42 Jeffery Bromme, "Avoiding a Financial Crisis," *Waste Age*, May 2005, at p. 28.

"However, some who commented were concerned that an extended time frame would place an economic burden on smaller businesses. Therefore, EPA officials *acknowledge the lack of criteria or scientific basis* for establishing the 30-year post-closure time frame. ... EPA made the decision to establish the time frame at 30 years, seemingly *based on a compromise of these competing interests*. EPA officials we spoke to agreed that the 30-year time frame was *not based on specific scientific criteria or research studies*."[43]

That is to say, in confidential interviews protected from repercussions, the agency's staff essentially informed the Inspector General that the Subtitle D regulations were politically compromised and never were supported with any technical basis to insure that "there is *no reasonable probability of adverse effects* on health or the environment..."[44]

Rather, according to EPA, flawed liner rules were deliberately adopted to keep the costs of compliance down, allegedly to reduce the "economic burden on smaller businesses."[45] But, the facts do not support such a defense.

Weak Rules Are Not Justified to Protect Small Operators

Even this extralegal economic defense appears to mask the real underlying basis for knowingly writing rules that neither protect the environment nor meet the statutory requirements of RCRA. An examination of the record simply does not support a claim that the rules sidestepped essential environmental measures in order to reduce the "economic burden on small businesses," or, for that matter, the consumer.

The regulations did directly exempt or otherwise provided looser standards for the smallest landfills,[46] and offered a cheap exit strategy to encourage the small and mid-sized unlined landfills whose owners were expected to, and did, accept that offer to close down with limited liability.[47]

---

43 U.S. Environmental Protection Agency Inspector General, *RCRA: RCRA Financial Assurance for Closure and Post-Closure* (No. 2001-P-007) (March 28, 2001), at p. 31 (emphasis added).

47 40 C.F.R. §258.1(d)(1).

But, most telling, elsewhere EPA specifically admitted that its intent was not to protect the small landfill owner, but rather to encourage large regional landfills, and, apart from rural areas with few people, to force those small landfills to shut down:

> "[W]ith respect to small MSWLFs [EPA's intent] was that the move to greater regionalization, in order to benefit from the economies of scale, would be a secondary benefit of the [rule].[48]

This was at a time when the only large privately owned landfill in the country was an 800 acre facility owned by Browning Ferris (BFI) near Poland, Ohio, and two publicly owned landfills, Fresh Kills in New York City and Puente Hills in Los Angeles.

Nor is there any perceptible financial burden on the customer from stronger standards. For a typical household, doubling disposal costs to avoid these long term problems would equate to the price of one cup of coffee per household per month.[49] That would seem to be a small price that most would gladly pay to protect the water that their children, and their children, will drink.

Even if RCRA permitted compromising essential protections to lessen the "economic burden on small businesses" – which it does not – the rules do not appear to have been weakened for that reason. There seemed to be a very different purpose, at least in the minds of the large waste firms who successfully lobbied the agency for modifications in the rules in order to achieve their narrow interests. That was to push off the problem to the future when they were no longer libel, at the expense of the public, which will have to pay for the costly clean up.

A graphic example is the fact that the originally proposed rules provided for two phases of post-closure care, the first was a 30-year period of focused maintenance and a second, and longer, period to follow afterwards.[50] Three years later when the final rule was promulgated, the second phase after 30-years, which is necessary to provide care over the extended period that the site was known to remain a threat to the environment, was eliminated.[51]

---

48 56 FEDERAL REGISTER 50989 (October 9, 1991)

49 A typical household discards approximately one ton of garbage each year. The cost of adequate regulations may be benchmarked against a mixed waste processing system, such as the Bedminster model that stabilizes the incoming waste so that only inert residue is landfilled, and which costs out at about $60/ton. Doubling fees from California's current $32/ton, Leone Young, "Learning the ABCs of Solid Waste," *Resource Recycling* (November 2003), at p. 11, to $60 per ton, equates to a little more than $2 per household per month.

50 Proposed 40 C.F.R. §258.31. 53 FEDERAL REGISTER 33345 (August 30, 1988).

51 40 C.F.R. §258.61. 56 FEDERAL REGISTER 51011 and 51094 (October 9, 1991).

Liner Rules Protect Monopoly Not Groundwater

A short detour to understand how and why political forces led to a distortion of the regulatory process in order to achieve market advantage, rather than environmental protection, is necessary to, by learning from history, not be doomed to repeat it here. For, the primary economic interest protected by the decision to adopt the fatally compromised landfill rules was not the small operator, nor, for that matter, the smaller municipalities. Rather, the ones who reaped the greatest benefits were the national waste firms.

...there is an almost certain probability those adverse effects will eventually happen

These are the very large garbage companies that came into being by first rolling up thousands of small operators, privatizing once publicly-owned operations and later by merging with other consolidators. Key to their strategy, at the same time they also combined (or "vertically integrated") collection operations in each market with their own landfills to form what they called "hub and spokes." The "Big Three" companies today include Waste Management, Inc., Allied Waste Industries (which also operates in some markets as Browning Ferris Industries), and Republic Services, together with $19.3 billion in annual revenues.[52]

A short digression is essential into the way the modern waste industry evolved in order to understand the strategic needs of the Big Three that led EPA to promulgate landfill rules it knew were in violation of the controlling statute. Rules that the agency was aware not only failed to insure that "there is *no reasonable probability of adverse effects* on health or the environment,"[53] but, more to the point, that there *is* an almost certain probability those adverse effects will eventually happen in a significant number of cases.

To exist and thrive, these companies had to achieve pricing power, which is the ability to charge more than the price that would exist in a free market. That was necessary because creating a national company out of thousands of local haulers incurred major costs. These included premiums paid to close so many deals, the expenses and confusion involved in integrating diverse companies, overheads to oversee far flung operations, attenuated lines of control and the loss of entrepreneurial spirit at the local level. Unless there were substantial efficiencies garnered by virtue of the acquisitions, prices had to exceed market rates in order to offset all of these losses. Also, they had to produce the kinds of out-sized earnings sufficient to satisfy the same investors who financed the buying

53 42 U.S.C §6944(a) (emphasis added).

spree to roll up the smaller players in the market. Otherwise Wall Street would cash out and leave the firms ripe for a takeover that would break them up.[54]

Yet, the long march over three decades to consolidate the fragmented waste industry into national companies never made economic sense in a truly free market because garbage hauling was inherently a low-tech, local business with few barriers to entry and no grand economies of scale past the local level. At the very beginning of the era of consolidation there were some efficiencies gained from merging the fragmented market of very small, two or three truck haulers. However, those scale efficiencies were largely exhausted before the consolidators expanded past the metropolitan level.[55]

This was a matter of some pressing importance, because, by the close of the 1980s, the industry's ability to raise prices by collusion and intimidation had faltered in the face of disclosure, litigation and publicity.[56] Succeeding attempts in the early nineties to paper over the fact of low performance with serial acquisitions, which make analysis of a company's fundamentals impossible, and Enron-style bookkeeping were quickly exposed, as well.[57]

Regulation of landfills, as Waste Management, Inc.'s founder, Mr. Dean Buntruck, was among the first to appreciate, had by the 1990s become the best vehicle to achieve the anti-competitive pricing power necessary to justify the continued existence of national waste companies.[58]

Because disposal is a bottleneck in the garbage industry, once landfill dominance is achieved in a geographic area, any independent hauler attempting to slash rates in order to break into a market could be price squeezed through discriminatory tip fees at the disposal site when his or her garbage trucks drove up to offload.[59] But, for that to happen, first some way to shutter (or force the sale of) the thousands of public and small private landfills across the country would have to be found, and barriers to entry into disposal had to be created through regulatory burdens. Otherwise, the new entrant would be able to evade the cartel's vice-like control over disposal.[60]

Regulation of landfills had become the best vehicle to achieve the anti-competitive pricing power necessary to justify the continued existence of national waste companies

Since the strategy of the national waste firms is based on gaining market power through control over landfills, the contours of EPA's disposal rules wind up being fundamental to industry's ability to charge monopoly disposal fees without fear of new competition.[61]

Landfills, and, more so, the rules that govern their design, are the keys to the temple.[62]

The fact that disposal is a bottleneck in the waste industry is a necessary but not a sufficient condition to that end. In the absence of limitations on new landfill construction, new players would enter the market and build enough landfills to meet all the demand. But, carefully crafted environmental rules, Mr. Buntrock saw, could create near-insurmountable barriers to new entry into the market for landfills to close the vice around any hauling competition outside of the cartel.

However, to disfigure regulation, from a tool to protect the environment into an accessory to quash competition, required a delicate balancing act. In order to distort public policy to private ends in this way, government requirements needed to be sufficiently expensive and protracted to force the small competing landfills out of business and to discourage new players. Subtitle D rules did that by requiring multi-million dollar

62 Peter Anderson, "Keys to the Temple," *Solid Waste Digest* (EXECUTIVE REVIEW 2004).

investments too great for most of the small owners and towns, thereby slashing the number of landfills from 7,683 to 3,581 in the early years of the nineties.[63]

On the other hand, those requirements could not be so expensive that landfills become more costly than the alternatives to disposal that compete with it. Examples of alternatives to landfills include expanded diversion efforts, waste-to-energy plants and conversion technologies, all of which would conceivably be competitive with landfills were they not subsidized by inadequate regulations.

An analogy shows that this is a rather significant constraint. After the Second Arab Oil Embargo in 1979, the oil companies soon discovered that their new found pricing power came from selling scarcity, not a product or service. However, notwithstanding the fact that the cartel could make oil scarce, competition from outside the industry can give consumers alternatives to oil to meet their energy needs. Gas lines had created panic in the spot markets and higher profits soon followed. But the run ups at the pump also provoked quantum leaps in energy conservation and switching to natural gas. That threatened the oil industry's ability to sustain premium, instead of commodity, prices. This is the reason, ever since, OPEC has carefully refrained from fully exploiting its short term monopoly power in order to avoid instigating major conservation or fuel shifting in response.[64]

In fact, that very sort of distorted regulatory tacking of landfill rules closely mimics much of what is necessary to happen for the industry to accumulate market power. EPA itself observed that its rules would lead to a shift to larger landfills, whose sheer size and licensing requirements create major barriers to entry,[65] although presumably it felt that larger size landfills were necessary to marshal adequate resources to safely operate a disposal facility.[66]

65 *See* page 22.

66 Undoubtedly, EPA believes that the megafills will exhibit superior environment performance, and that fact is what motivated their bias to larger landfills. There are two problems with what EPA says.

First, the Agency's comment in the Federal Register confuses the acknowledged problems of maintaining the substantial investments in dollars and expertise required to build and operate engineered sites for *small* landfills, with the absence of any such similar invidious showing for *mid* size facilities. Indeed, because there has not been adequate validation of the basic safety systems when extended for such out-sized facilities, and because there are many serious concerns when scaling up about escalating complications, and because the implications of a catastrophic sidewall failure at a sites several hundreds of feet high and extending over hundreds of acres is so portentous, we really do not have a technical basis for comparing the long-term risks of megafills (400 feet high) vs. moderate sized landfills (100 feet high).

(continued...)

What is clear is that the requirement for substantial investment in the underlying infrastructure of a landfill in order to *delay* pollution soon economically forced the shift to mega-fills due to their lower costs per ton. Mega-fills are landfills that dramatically swelled in size to become approximately one-hundred times larger than the volume of a typical site in the pre-Subtitle D era.

However, while front-end capital investments were increasing due to regulation, that is not the same as per-ton costs that the customer sees. With these mega-fills three, four, five or six times higher than before, *unit* costs actually wound up being driven down from more than $30 to often less than $20 per ton. That was because so much more material was encased between each acre of the expensive liners and leachate collection pipes on the bottom and final cover and header lines at the top.[67] TABLE 2 illustrates the enormous scale efficiencies achievable by enlarging a landfill to its maximum reach once a

---

66 (...continued)
Second, EPA may have also confused the *lower unit costs* that larger landfills will provide with questions about *safety*, even though the two elements are distinct. In fact, there has never been any rigorous engineering analysis to validate whether the engineered landfill's design components could simply be scaled up to reach megafill proportions without untoward side effects to the environment. A longer discussion of this issue can be found at page 123.

67 56 FEDERAL REGISTER 50989 (October 9, 1991). Chartwell, *Solid Waste Digest* (1991-2002) Chartwell reports gate prices that are approximately one-third more than discounted prices). EPA justified its intent by claiming that the result would be to better protect the environment, as the displaced smaller landfills had too few resources and were too poorly managed to properly do the job. However, as this report makes clear, regardless of how poorly the small sites were maintained, the megafills did not really protect the environment either. At best, they just did a better job of delaying the onset of groundwater contamination, and their sheer size did so at the further expense of creating whole new risks in the form of catastrophic site failure.

On the other hand, to give the EPA its due, certainly one could agree that they achieved a major incremental advance in 1991-1993 by forcing a shift from open dumps to some level of engineered facilities in an era when there were, variously, 10,000 to 20,000 open dumps across America. Politically, they would be entitled to rebut, it may not have been possible at that time to do more.

However, even were that granted, this is the year 2003, twelve years after the Subtitle D rules were issued. No matter what the correct reading of the politics in 1988-1991, responsible officials would have informed decision-makers and stakeholders that the liner approach was only an intermediate strategy and that work needed to proceed with dispatch for a long term resolution.

site has been environmentally permitted and the local community has been accommodated with host fees.[68]

Incremental Capital Cost to Build Larger Landfills							
	Width (Feet)	Length (Feet)	Height (Feet)	Volume (Cu.Yds.)	Acres	Capital Cost (Total)	Capital Cost (per ton)
Small	600	1,200	100	888,889	16	$9,896,907	$1.73
Medium	1,200	2,400	200	7,111,111	66	$39,587,629	$0.87
Large	2,000	4,000	333	32,921,811	183	$109,965,636	$0.52

Source: Center for Competitive Waste Industry

TABLE 2

However, most tragic were the ultimate consequences of EPA's efforts to drastically trim regulations in an attempt to keep disposal costs low. For they may not have fully understood that *cost* is something very different from *price*. We can see this palpably from looking at how the leading national consolidator reacted at the first indications of market power.

In 1999, USA Waste merged with Waste Management, Inc., and simultaneously acquired the major regional waste company in the northeast, Eastern Environmental, which they believed gave them dominance in many of that region's markets. Just days after the U.S. Department of Justice approved the Eastern acquisition,[69] the new Waste Management announced "eye-popping spot market price hikes" averaging 89% on an unweighted basis.[70]

Although subsequent events later showed that they did not have the market power that they thought they did, and many of the increases were later rescinded, the episode is very important for regulators. It revealed that the true intent of the waste consolidators is not to protect the consumer by keeping landfill *costs* artificially low with rules that are

---

68 The assumptions for the TABLE are: Sideslope: 4:1; Capital cost/acre: $600,000; Term: 15 years; and Cost of money: 8%. Capital costs include land acquisition, composite liner, final cover, leachate collection system, gas collection system, and associated share of monitoring wells, compactors and scale house.

demonstrably inadequate. Rather, the intent seems more likely to have been crafted to reserve leeway to add monopoly premiums on top of a fair return without, in the process, pricing themselves out of the market to recycling or incinerators. To do that, they must have the cooperation of the regulatory community.

Thus, the other lesson from this history is that any attempt to temper landfill *costs* by improperly constraining necessary environmental regulations will eventually result in dramatically higher *prices* anyway. Consumers are likely to eventually wind up paying as much as or more than they would have with bonafide rules. But, instead of the price premium going to make a down payment on a safer environment for their children, it will have gone for a lavish lifestyle for the executives and supercharged capital gains for stockholders who bought into the pollution sector early.

...any attempt to temper landfill costs by improperly constraining necessary environmental regulations will eventually result in dramatically higher prices anyway

Waste Management, Inc., and the industry group who prepared a financial assurance report that is discussed later,[71] are asking regulators to deliberately ignore Subtitle D's known fallacy and to shift the cost responsibility due to inevitable liner failures in the future after the post-closure period ends from the landfill owners to the states.

Such cost shifting will reduce the present value of lifetime landfill costs away from the site's owner. It will also improve the quality of earnings reported by Wall Street analysts, who have become concerned about the financial uncertainty of the trash companies' exposure to prolonged post-closure periods.[72] But, some extensive naivete would seem to be required to expect that those savings will be reflected in lower prices to the consumer as the waste consolidators' market dominance over landfills grows. And, most certainly, even if, for the sake of argument, it were – which it will not – the long-term liabilities will later fall to the taxpayer and dwarf any short-term savings.

The Alternatives Considered Have Been Skewed

Similarly, also anathema to the national waste firms' business strategy was any regulatory structure that followed Europe's conclusion that rotting garbage cannot be managed in the ground. The European Commission shifted its fundamental approach from the discredited *design-based containment model* (liner-based landfills) to *operational restrictions* (banning organic material, along with hazardous waste, from land disposal that are the source of the insoluble problems). A strategy based upon banning organics from land disposal could divert that fraction of the waste stream away from ever arriving at the landfill. But organics constitute 60% of their present inflows.[73] Were they suddenly diverted under a ban, the supply of disposal airspace would dramatically overrun demand, and the monopoly value of landfill domination would effectively become worthless.[74]

Undoubtedly, that is why the waste industry's analysts have stated that –

""Recycling is a competitive threat to disposal, the primary business of publicly traded solid waste companies.... *[R]ecycling has long been the enemy of the solid waste industry, stealing volumes otherwise headed for landfills.* ...[L]ess recycling should lead to accelerating disposal volumes, which in turn should lead to pricing leverage for landfill operators. Primary beneficiaries of such a trend, in our view would be highly vertically integrated waste companies like Waste Management and Allied Waste..."[75]

"[R]ecycling has long been the enemy of the solid waste industry, stealing volumes otherwise headed for landfills." – Waste industry analysts

Understanding the Achilles heel of the coming garbage cartel raises disturbing inferences about EPA's myopia now that no one can any longer ignore the undeniable fact that its earlier entombment strategy was fatally flawed. Policy, law and best practices all would seem to impel the Agency to at least consider non-landfill solutions to the problem of managing organic and hazardous materials.

The Agency's own integrated waste hierarchy states that the preferential order of managing solid waste is reduce, reuse, recycle, compost, waste-to-energy, and only last

landfilling.[76] This would suggest that priority would now be given to correcting the flaw in its Subtitle D rules by source separating the troublesome organic fraction from the trash that cannot be recycled by first composting, and second energy conversion technologies (CTs). Last might be pretreatment to stabilize a mixed waste stream before the stabilized residual is deposited in the ground.

Similarly, whatever outcome is ultimately selected, the National Environmental Policy Act (NEPA) compels agencies to at least give full consideration to a full spectrum of alternatives when taking major action significantly affecting the environment.[77]

Moreover, the fact that Europe did complete a comprehensive investigation, concluded that organics cannot be safely managed in the ground, and ordered 65% reductions in of land disposal organic materials by 2015, gives further weight behind the operational alternative of banning organics from land disposal.[78]

However, contrary to its own policies, its statutory mandate, and what is being done in much the rest of the developed world, EPA ignored the expanded composting-conversion technology-pretreatment options because of a preoccupation with a very different landfill-based approach.

In the late 1990s as these problems with EPA's Subtitle D rules became inescapable, Waste Management, Inc., proposed to the Agency its alternative approach for resolving the long term threats of dry tomb landfills. As the next generation landfill, it argued for a wet-cell design, known as "bioreactors." In a bioreactor, instead of attempting to keep the landfill dry by blocking rainfall out, massive amounts of liquids are deliberately added in an attempt to accelerate decomposition and better stabilize the site before it is closed, in theory, reducing those long term concerns.[79]

The unique problems that bioreactors raise are several, but are before the Board's Permit and Enforcement Committee in another proceeding and are beyond the focus of this docket. Suffice it to say briefly that, among many other things, the concept of essentially liquefying landfills, which are typically manmade mountains 200-300 or more feet high and contained by little more than a two-foot berm and plastic tarp, has raised

major concerns, especially in view of the major side wall failures that have occurred during testing.[80]

Regulators in many states and within EPA are worried about site stability and catastrophic sidewall failure inasmuch as this has already occurred on several occasions during tests. Further added to this disturbing mix is the fact that, EPA appears to be accepting Waste Management's insistence that the rules should be compromised in a transparent ploy to keep costs below its competition from diversion and conversion.[81]

---

80 V. L. Wilson, et. al., "Avoiding the Slippery Slope," *Waste Age* (Feb 2001), at p. 43. Letter from Montgomery Watson to WI DNR, dated Sept. 22, 2000, re Metro Landfill in Franklin, WI. The National Recycling Coalition has submitted a comprehensive compendium of major bioreactor problems in a letter to EPA dated February 1, 2002, in *Re Project XL Site-Specific Rulemaking for Implementing Waste Treatment Systems at Two Virginia Landfills*, Docket No. F-2001-WVLP-FFFFF – RIN 2090-AA30.

81 For examples of industry statements that demonstrate the intent to specify design elements so that costs would not be increased, *see, e.g.*, William Fisher, "Down in the Dumps: Where Do We Go From Here?: Waste Management Overview," *Raymond James Equity Research* (April 17, 2000): "[T]he area of leachate recirculation and related bioreactor landfills represents a technology-based initiative that is getting dramatically increased attention within the landfill industry and holds enormous potential to improve landfill profits, with limited incremental investments." *See, also*, Prentis Shaw, "Bioreactor Landfills: But Does It Save Money," *Waste Age* (July 2000), at 16. "Proponents add that the cost of the basic piping and pumps for recirculating leachate and accelerated gas extraction will be offset by recirculating instead of treating leachate and by recovering 50% of the airspace through higher final densities so that "bioreactors landfills save money in the long-term."

For a specific example, *see,* Gary Hater, *Economics of Eight Scenarios for Landfill Bioreactors as Compared to a Base Case Subtitle D Landfill* (WASTETECH 2001) (Feb. 13, 2001), at p. 10. This study by Waste Management's bioreactor expert analyzes the effect of further limitations on the steepness of the side slope of the landfill, which is one of the critical safety factors used to stabilize these manmade mountains, that independent regulators might impose on bioreactors. EPA rules for dry tomb landfills restrict side slopes to a ratio of 3:1 (horizontal to vertical). However, several states have found from observation that 3:1 is too steep to reliably stabilize, and instead require a 4:1 side slope at dry tomb landfills in which, for the short to mid term, the waste mass is in fact very dry and stable. Most objective observers would conclude that when a landfill's site stability will be significantly compromised by doubling and tripling liquid additions, the very first thing that would at least be evaluated is the need to decrease the steepness of the side slope to 4:1. After all, there is already a major body of professional engineering opinion that 4:1 slope limitations are even required in dry tomb landfills. Yet formal requests to EPA to add 4:1 side slopes to the research agenda have been rejected. Mr. Hater's study suggests the reason:

> "[T]hese are some of the benefits and risks [of bioreactors] that have been intentionally excluded ... Change in slope construction from 3:1 to as much as 4:1 and the resulting loss of airspace."

This carefully couched language suggests that the imposition of a 4:1 side slope would doom bioreactor economics, which it would. Shallower sidewalls mean less volume of waste overlying the same footprint. The difference equates to a 25% loss in the overlying air space and an increase in the per ton charge in about the same proportion, which is greater than the net 20% volumetric gain from accelerating decomposition. Because the shallower sidewall ratio needed to lessen the chance of catastrophic collapse causes volume losses that make the design uneconomic, the safety measure has been excluded from consideration.

(continued...)

The only thing that need be taken note of here is the fact that EPA chose to ignore its integrated waste policy, violate the environmental impact statement (EIS) law and ignore the actions of other leaders in the developed world by focusing all of its energies on advancing bioreactors without any consideration of the constructive non-landfill alternatives. Apart from whatever the ultimate resolution should be, EPA improperly refuses to even consider the environmental alternatives. Most would expect that ought to be uppermost in the mind of an agency that is predominately operating under technical, not political, criteria.

Three years after it was sent, EPA continues to refuse to even respond to a detailed letter from the legal counsel for the National Recycling Coalition formally requesting an environmental impact statement and alternative's analysis.[82] One does not need to know the answer as to whether, ultimately, bioreactors are a good or a bad idea. Bioreactors on-the-cheap raise such serious concerns of their own that major alternatives with higher priority ought to at least be given consideration when the Board comes to find a solution to the problem that is practical and will work through its investigation of post-closure care.

The Real Issue

No matter what the political influences have been in the past that overrode the technical facts, state regulators now need to part ways with the actions in Washington, which create the impression that political considerations dominate the decisions. While EPA will not itself be financially responsible for the costs its inappropriate actions are expected to engneder, the states will, along with municipalities and some of the largest corporations with the deepest pockets that used the landfill.[83] The critical juncture in time has arrived when what was once a long term problem off over the horizon is beginning to come around the bend into view.

---

81 (...continued)
Moreover, prior to the advent of bioreactors, landfills with high moisture content, in this case due to the presence of paper mill sludges, have been required to reduce side slopes to not just 4:1, but 6:1. §NR504.09(2)(h), Wis. Admin. Code. Needless to say, not only is no investigation being given to 4:1, but also not to 6:1 side slopes because of the cost implications.

82 Letter dated October 4, 2000, from Clifford Case to EPA, in its Bioreactor Proceeding, Docket No. F-2000-ALPA-FFFFF.

83 Many of America's largest companies may have thought they had evaded Superfund's joint-and-severally legal thicket by moving their industrial hazardous wastes to their own controlled sites and only tangentially using MSW landfills for non-process wastes. But, so far they have failed to recognize that, even though they themselves are no longer landfilling hazardous wastes at MSW sites, small generators and households are, and eventually, that will result in the states having to run costly clean up projects when the barrier systems ultimately fail. With limited budgets, states will be under enormous financial pressures to litigate with any other potentially responsible parties with deep pockets.

One by one, landfills will be orphaned to the States. As the cover layers protecting these orphaned landfills begin to deteriorate, major environmental incursions can be expected to occur in non-arid regions. That will cause the sites to fail, after which those that threat aquifers will presumably be added to the Superfund queue, just as had negligently been apportioned with the thousands of open dumps shuttered by the Subtitle D rules.[84]

The price tag for remediation can be in the tens of millions of dollars just for palliative care at each failing landfill, and hundreds of millions to excavate and stabilize urban sites that are not in abandoned mines, tens of billions in aggregate for California,[85] and the bill will be laid at the feet of California, not EPA, whose Superfund chest is empty, leaving the cost to the taxpayers, not the polluters.[86]

Today's system of financial assurance is broken and cannot be salvaged by tinkering around the margins with slightly longer post-closure care periods, by hoping that later case-by-case reviews will resolve things, or by enhancing segregation of assurance funds.

Thus, the correct question has little to do with the past manner this debate has been framed, which has focused on maximizing the flexibility for the landfill owners to both reduce their costs and optimize their opportunity to shift the inevitable costs to the state. Instead, now that the problem looms immediately in view, the Board should look to new mechanisms that will first innoculate the state from the impending costs of failing landfills, and then restructure the going-forward operating requirements for MSW landfills to insure that this predicament is not repeated in the future.

Today's system of financial assurance is broken and cannot be salvaged by tinkering around the margins

---

84 40 C.F.R. §258.1(d). The open dumps prohibited by section 4005 of RCRA, variously estimated to be 10,000 to 20,000 in number, were only required to install a final cover over the site. No maintenance was required of the cover, nor, saliently, was any monitoring mandated. Whatever the actual motivation, the effect was only to briefly delay the consequences for leaving unaddressed thousands of garbage pits known to be a threat to health and the environment for others when these sites wind their way onto the Superfund queue after damage to drinking water supplies has already occurred, the public has been harmed and the cost to remediate the situation will be prohibitively costly.

85 *See* page 41.

86 Government Accounting Office, *Superfund Program: Current Status and Future Fiscal Challenges* (GAO-03-850, September 2, 2003), at p. 3: "The balance of the Superfund trust fund available for future appropriations has decreased significantly since 1996, while additional hazardous waste sites continue to be placed on the NPL. The Superfund trust fund revenues from taxes, cost recoveries, interest, fines, and penalties have decreased from more than $2 billion in fiscal year 1995, the year the taxing authority expired, to less than $370 million in fiscal year 2002 when presented in constant 2002 dollars." See, also, Office of the Inspector General, *Congressional Request on Funding Needs for Non-Federal Superfund Sites* (Report 2004-P-00001, January 7, 2004, at p. 4.

States and municipalities that wish to protect themselves from major financial liabilities, instead of bailing out one small industry at the expense of all the others, need to split themselves off from Washington's long years of regulatory abdication and march to their own drummer. ☞

Chapter 2

Inadequacies of the Current Rules

Current assurance rules only cover costs to mow the lawn – with almost nothing for corrective action – and also permit mechanisms that provide neither cash nor third party guarantees

This chapter asks whether California's existing post-closure rules effectively protect the State from the costs of failing landfills. That question begins with an evaluation with how well the current code is written. After reviewing the Board's current rules for providing assurance that long-term post-closure care will be undertaken, the cost items that are missing from the assurance list are discussed, as well as the fatal deficiencies in the mechanisms to provide assurance themselves. This is followed by a proposal to fill in the gaping holes in the Integrated Waste Management Board's rules.

No doubt the themes that follow will be startling for those who have come to believe that there is a functioning mechanism to protect against landfill's long-term liabilities. But, just as is shown below, in 1990, before EPA had even finalized its assurance rules on which California's are based, the Government Accountability Office (GAO) had exposed the major limitations of EPA's parallel rules for hazardous waste sites, which had been adopted earlier:

"Owners/operators are liable for any postclosure costs that may occur. However, few funding assurances exist for postclosure liabilities. EPA only requires funding assurances for maintenance and monitoring costs for 30 years after closure and corrective action costs once a problem is identified. No financial assurances exist for potential but unknown corrective action, off-site damages, or other liabilities that may occur after the established postclosure period."[1]

Unfortunately, neither criticism by the GAO nor its Inspector General have had any apparent effect on EPA to reform its procedures.

California's Current Post-Closure Care and Assurance Rules

California's fabric of regulations for protecting the environment after landfills end their operating lives is erected on a three-legged stool requiring landfill owners to do the following:

- *Closure.* Properly close the site at the end of its operating life, including a final cover to minimize infiltration of rainfall;[2]

- *Post-Closure Care.* Maintain and monitor the site after closure, albeit to a lesser degree than during operation, for at least 30 years following the time it closed (and possibly longer);[3] and

- *Financial Assurance.* Use one of eight mechanisms that appear to, but often do not actually, provide financial assurance that there will be the necessary funds for some, but not all, maintenance for the first 30 years after closure, so the State can complete these tasks in the event the owner fails to do so.[4]

As compared with other states, the three chapters in the California code through which post-closure care and financial assurance weaves are very detailed, showing the greater attention the Board's staff has devoted to the issue.[5] Certainly, they are robust in comparison to many other states and to the legislative anticipation at the time of

---

2 27 C.C.R. §§21769 - 21820.

3 27 C.C.R. §§21769 - 21780 and §§21825 -21890.

4 27 C.C.R. §§22200 - 22222.

5 27 C.C.R. CHAPS. 3, 4 and 6, at §§20950 - 22254.

enactment, when long-term problems were seen as too distant and far off in the future to register in the political calculus.

Then, the focus was more on providing landfill owners with flexibility, which translates into enabling them to transfer liability to the public. But, that necessarily implies shortchanging essential protections needed to insure that the State does not wind up responsible for cleaning up hundreds of leaking landfills.[6]

Now, as the leading edge of a massive landfill bailout begins to converge with the State's unprecedented fiscal meltdown, California simply cannot afford a failure of the regulatory process that leaves tens of billions of dollars of costs on the taxpayer.

To help frame the following analysis, TABLE 3 lists the five discrete types of costs that can be created by a landfill following closure, which financial assurances are intended to address. They are described in more detail in the following section.

Types of Post-Closure Landfill Costs
(filled in boxes indicate when occurs, checks indicate if presently covered in CA, "x"'s indicate if not presently covered)

Types of Costs	When-	
	Post-Closure	After 30 Year Post-Closure
Minor maintenance costs	✔	
Major maintenance costs	✗	
Corrective action to remediate known pollution	✔	✔
Corrective action to remediate foreseeable pollution	✔	✔
Third-party claims for bodily injury and property damage	✗	✗

NOTE: California statutes permit coverage of reasonably foreseeable corrective actions that are not known, but that authority has not yet been seriously exercised. California rules go beyond EPA minimum standards and require third party insurance during landfill operation, but not afterwards.

TABLE 3

The Costs Not Covered by the Rule

When viewed in relation to the full spectrum of probable post-closure liabilities, California's post-closure assurance rules protect the State from only a very small part of the total financial exposure that failing landfills pose. Before turning to the adequacy of

---

6 P.R.C. §§43500 to 43510.

assurances for the items that are covered, here is a list of the major items that are not even included in financial assurance at all:

Understatement of Included Costs for Post-Closure Care

With the states hard pressed to seriously audit self-determined estimates by landfill owners with a self-interest in under reporting, significant costs can be expected to be omitted or grossly underestimated. Region IV of EPA found that 89 of 100 facilities submitting landfill cost estimates in their review underestimated closure costs and thus posted inadequate levels of assurance. The total amount of the underestimates was $450 million for those 89 sites,[7] and the EPA Inspector General found from its review that this is a matter of significant concern.[8]

Expensive Maintenance for Post-Closure Care

The definition of maintenance is limited to routine, minor items, such as lawn mowing, leachate treatment and occasional monitoring.[9] It excludes major, non-routine maintenance expenses that almost certainly can be expected before the end of 10-20 years of operation and 30 or more years of post-closure care. Examples are the need to replace the key final cover as it degrades that may happen every 20 or 30 years and cost approximately $20 - $40 million to replace at major landfills each time.[10] Another is to repair the mission-critical leachate collection lines and associated drainage systems that will likely become clogged and, at large landfills, can cost millions of dollars to fix *per line* when the clean out head is no longer able to clear the pipe. Although there has been very little discussion about the need to protect the states from the distinct possibility of higher maintenance costs than currently booked for public assurance, internally, the landfill industry is moving to protect themselves from these future costs.[11]

---

7 Inspector General, *supra,* at p. 46.

8 Inspector General, *supra*, at p. 45.

9 27 C.C.R. §21840(c).

10 Final cover installation costs approximately $120,000 per acre and the footprint for large landfills occupies hundreds of acres. Depending upon how much clay might be recovered during replacement, the costs might be reduced somewhat. A figure of $100,000/acre would appear to be a fair composite cost. While the entire cover is not necessarily degraded by the time the warrantee expires, for example, it will be difficult to identify which parts have because the cover is overlain by dirt and vegetation. Even those sections of the cover which have not yet failed, can be expected to deteriorate soon afterwards, and that will tend to make it uneconomic to patch the known trouble spots.

11 Richard Peluso and Rodney Taylor, "How to Own a Landfill (and Sleep at Night)," *Waste Age* (November 2003), at p. 43.

Corrective Action

No protection is provided as a companion to the assurances for post-closure care to cover the major costs for corrective action during that period (or, for that matter, during operation). This includes actions to eliminate groundwater contamination from leaking landfills and to restore the site to a condition where it no longer poses a discernable threat to the environment (unless they are already known or, in the case of California, are reasonably foreseeable).[12]

Some have been aware of this fact that the major post-closure costs to address a major site failure, such as those dealt with under Superfund, have not been generally included in assurance programs.[13] But, few have appreciated the far greater issue that Superfund's efforts only touch the surface of what will have to be done to remediate failing landfills in the future.

There is no reliable data base of Superfund costs, but, what data there is suggests that it has spent about $25 million on landfills on the National Priority List. Note, however, that Superfund's experience provides a grossly inadequate basis for estimating these costs because most of its efforts have not really remediated the sites, as most people understand the term.

EPA adopted generic guidance that remediation of MSW landfills is only required to include the bare minimum of short term expedients, which it characterizes as "containment," having rejected true treatment as "impractical."

In 1991, EPA adopted generic guidance for what remediation should consist of at Superfund landfill sites. Essentially, the guidance states that remediation of MSW landfills is only required to include the bare minimum of short term expedients, which it characterizes as "containment," having rejected true treatment as "impractical."[14]

---

12 27 C.C.R. §§22220 - 22222.

13 Although California's rules go beyond known to reasonably foreseeable corrective action, as shown later, the actual amounts posted are wholly inadequate for serious remedies to a failing site.

14 U.S.E.P.A., *Conducting Remedial Investigations/Feasibility Studies for CERCLA Municipal Landfill Sites* (EPA/540/P-91/001, February 1991) (emphasis added). The report attempts to qualify its general authorization for containment-only in certain instances:

> "The NCP also contains an expectation that treatment should be considered for identifiable areas of highly toxic and/or mobile material (hot spots) that pos potential principal threats. Treatment of hot spots within a landfill will therefore be considered and evaluated."

However, the guidance also states that it is not necessary to characterize the waste body, and, therefore, the very instrument that might discern that sort of localized high risk situation before it becomes acute is

(continued...)

In application, this containment approach consists largely of capping and fencing, and sometimes relief wells, slurry walls and bottled water. These limited measures are only designed to slow down for the short-term the rate of biological activity, which is what generates and transports the releases of toxic leachate, hazardous air pollutants and greenhouse gases into the environment, and temporarily deflect some of the worst uncontrolled releases.

But, containment does not restore the site to a state where it no longer poses a threat to human health or the environment, absent the continued intervention of active and passive barriers and collection systems that will have to be continuously monitored and maintained for the centuries long time span that the releases are capable of occurring.[15] Today, we still can observe leachate being produced in landfills dating back to the Roman Empire.[16]

When the containment efforts themselves fail, as they inevitably will in the absence of institutional structures, nonetheless funding for perpetual care, the only defense for containment is the claim that the pollutants that are released into the environment will be attenuated from dilution, degradation and, underground, adsorption.

However, attenuation does not pertain to the global impacts of climate change from methane and does not protect people who live in proximity to the site from the uncontrolled emissions of hazardous air pollutants and from contaminated drinking water, unless it is sourced from a different aquifer.

Essentially, EPA's only substantive justification for authorizing minimal actions to address failed MSW landfills is the unsupported claim that they are "to a lesser extent hazardous" than licensed hazardous waste sites, and therefore only pose a "low-level threat rather than a principle threat." Its further defense is that remediation is "impractical" because of its enormous cost is only relevant if the affected public will not demand it.

But, that reliance does not hold up on examination. The constituents of MSW landfills can be a serious concern, and the catastrophic failure modes that EPA did not consider are so direct and significant the affected public is not likely to accept the use of palliative efforts.

MSW Landfill Constituents are a Serious Concern. The leachate characteristics at MSW facilities, while less in concentration, are not entirely dissimilar to

---

14 (...continued)
deliberately not applied.

15 *See* NOTE 23 on page 11.

16 Allan Freeze and John Cherry, *Groundwater* (Prentice-Hall, 1979), at p. 437.

licensed hazardous waste sites. At the future time when the problems occur, their remediation will not be significantly less necessary.

First, many of the major engineered licensed landfills are not exclusively municipal waste facilities. Actually, they are often linked at the hip with old, pre-Subtitle D co-disposal sites that accepted hazardous industrial along with municipal wastes. In many cases there simply is no "bright line" between so-called modern and sanitary municipal landfills and old, discredited and leaking industrial dumps.

This often happened as an outgrowth of the waste industry's efforts to gain market power with the "hub and spoke" strategy of combining hauling with disposal assets in each geographic market. To do that, when the consolidators entered each new market, they sought to quickly purchase an existing landfill that could be more quickly re-licensed as an MSW facility than pursue environmentally qualifying a new site that could be bogged down in hearings for years.

Second, the definitions in Subtitle D rules refers to "municipal" and "sanitary" wastes, but any inference that the garbage is benign would be inaccurate. In fact, because of the small generator and household waste exemptions – and also possibly including some of the large number of variances for industrial process wastes and low-level radioactive waste – many currently recognized toxic substances continue to be a part of municipal waste discarded in Subtitle D landfills.[17]

Indeed, the actual field data examined by the EPA in 1991 as part of its Subtitle D rule process actually did "not reveal significant differences in the number of toxic constituents and their concentrations in the leachate" between sanitary and hazardous waste streams.[18] While more recent measurements suggest that today there may be somewhat different concentrations, and for some constituents, lesser concentrations, in 1991 when the Agency provided its presumptive remedy guidance, it did so in the face of its own data that concluded toxic constituents of municipal waste were not in fact less than legally defined hazardous waste.

Third, many new chemicals that wind up in the municipal waste stream, such as bromated fire retardants, which are not currently listed as hazardous today, appear

---

17 40 C.F.R. §§261.4 - 261.5.

18 56 FED. REG. 196, at pp. 50982-50984 (October 9, 1991).

destined to be enumerated in the future, even though they are of the same class as many recognized toxics today.[19] Perchlorate is another.[20]

Fourth, entirely new categories of chemical compounds, which are not presently recognized as legally hazardous, appear to be a threat to human health, such as health and pharmaceutical and personal care products (PPCP) that are not regulated for disposal. These do not currently meet the tests for "priority pollutants" as being "persistent, bioaccumulative, toxic (PBT) or "persistent organic pollutants" (POP), but that distinction is based upon an arbitrary categorization.[21] In general, over time standards tend to become stricter, bringing more compounds within our recognition as being dangerous to our health.

Fifth, the present leachate measurements used to correlate with estimates of latent hazardous waste constituents in the landfills probably do not significantly capture the all of the toxic loadings presently entrained in the casings and screens of durables like computers and television screens and in some packaging. Ultimately, however, the little research which there is suggests the significant possibility that these hazardous compounds and heavy metals will leach, or the integrity of those casings will physically deteriorate, and the additives and metals will be able to migrate into the environment under the right conditions.[22] By definition, current leachate measurements fail to provide any reliable estimate of those types of hazardous effluents in the future, even though they would seem to be a significant feature in the future.

Sixth, this list shows that the issue of how much less toxics there are in municipal versus licensed hazardous waste landfills winds up being a question of *degree* and not *kind*. That in turn, bears significantly on whether it will be politically possible to keep

putting temporary band-aids over the problem, instead of permanently resolving the problem.

Whether, on the one hand, the pollutant is just salt that makes the water taste bad along with a little benzene that might cause cancer in a few, or, on the other hand, significant benzene levels that conclusively will cause cancer in many, remedial efforts will be demanded in populated areas.

Moreover, if history is any guide, when these problems are most likely to arise, the future generations at that time will probably be more intolerant of contaminated water supplies than those today. While the health impacts from a failure to act to prevent groundwater contamination may be worse for a licensed hazardous waste landfill than for a municipal landfill, in the future either is likely to elicit a public response that demands resolution, which, as EPA notes, will not be demonstrably different from hazardous waste repairs. Thus, the costs of addressing the problem cannot reasonably be assumed substantially less for a MSW landfill than at a legally defined hazardous waste landfill.

Catastrophic Failure Modes Ignored. EPA's contemplation of what is necessary to respond to a failing landfill focus on a belief that the releases will not be significant and addressable with minor repairs.

The Agency's presumptive remedy guidance does not appear to consider catastrophic site failure, which could, like the impending failure of a large dam above a nearby town, peremptorily demand sizable repairs rather than be amenable to patch ups. Yet, major site failures appear to be an credible outcome for many landfills because critical components of the landfills' safety features necessary to keep the wastes isolated will not be maintained for the period of time required, while the sheer mass of the waste sites have increased logarithmically.

Key to understanding why this is the case the role that is supposed to be played by another critical component of today's engineered landfills, which is less well known than the liners, and that is the leachate collection system (LCS). As has been discussed, by rule the operation of the LCS, as well as cap maintenance and replacement, is scheduled to end 30 years after closure, assuming that these items remain effective even that long.[23] The critical importance of the final covers' integrity to long term site performance is sometimes recognized, but, less often is the LCS.

Sealing the bottom is a good thing to do in the sense that it may help reduce the chance of leachate seeping directly into the underlying groundwater. But, when the cap on top ultimately degrades, the whole idea of using barriers to isolate the waste load falters unless there is an additional system to remove the leachate that drains to the bottom,

---

[23] 27 C.C.R. §21900. There also are very small amounts denominated for those acknowledged foreseeable corrective actions. See p. 91

which otherwise will accumulate and threaten the integrity of the liner and the stability of the site. That is the purpose of the LCS's perforated pipes arrayed across the liner, and it is mission critical to landfill safety.

Although the Board nominally retains the power to extend maintenance for these two key components, there will probably be no assurance funds available for that purpose after the end of post-closure care, making any hypothesized extension of care after 30 years a Pyrrhic accomplishment. Also, under current requirements, even if there were funds still on hand, they would just be sufficient for lawn mowing, leachate treatment and sampling. There never are any funds under the current rules to replace final covers or repair clogged collection lines even during those 30 years of care, nonetheless thereafter.[24] Moreover, with the new generation of landfills today, which are several hundred feet high, the liner and collection system are under so many tens of millions of tons of garbage, that, as a practical matter, they have become inaccessible and unrepairable notwithstanding any conceivable amount of money that could be mustered for the purpose.

In any event, there is not likely to be way to circumvent the absence of any assurance funds by compelling the original owners to perform the task of cap maintenance, nonetheless for massively expensive repairs at the bottom of the landfill, all for a site which has not produced any revenue for a generation. That is not even realistic for a company which, somehow, has remained in business, and obviously impossible for the majority that are no longer in existence.

Even if the Board, or more likely its successor agency, were to be have oversight over maintenance for hundreds of closed sites and were aware of the need for repairing failing caps, the costs would be in excess of $100,000 per acre, or billions of dollars for all the state's landfills.[25] Without assurance funds set aside for this purpose, there is no reasonable basis to assume that it will happen, even if the prerequisite institutional memory existed to do so.

Therefore, as EPA's technical staff has repeatedly stated, the cap will "eventually fail."[26] When it does, as incursions of rainfall, runoff or snow melt in non-arid sites increase through cracks and tears in the cap, localized decomposition and settlement may be expected to cause cascading failures. In some places, water will pond in the resulting dips and degrade the underlying liner components, and in others the plastic sheet will rip and the clay, crack.

---

24 *See* page 39.

25 For a more detailed discussion, *see* page 128.

26 See note 21.

With the leachate collection systems out of operation, perched water tables and hydraulic head buildup on the bottom liner inside the landfill will become inevitable, unless the liner has deteriorated to the point where the leachate leaks into the aquifer more quickly than moisture intrudes from above, a highly undesirable outcome of its own.

If not, and leachate accumulates, there does not appear to be any reasonable probability that the leachate collection systems could be reactivated to remove it. Keeping these systems functioning is a challenge while they are being actively maintained and annually cleaned out. After years of stagnant drainage and disuse, the lines and drainage beds will more likely have become clogged and no longer operable were an attempt made to restart them.

From that point, unfortunately, engineering protocols do not exist to predict how the failure mechanisms will unravel, because precious little attention has been given to this overriding problem in the future. In addition, the fact that EPA has embraced the industry's push to mega-fills to 100 times their former size exacerbates all these concerns to a very significant degree, because there is no long term historical experience with such large sites to validate the engineering equations. Factor of safety analyses rely on too many assumptions, many of which are not known, to be useful for predictive purposes for any landfill, nonetheless of a mega-sized landfill, to analyze the geophysical performance of a stressed heterogeneous waste mass.

For all of these reasons, there is no way to anticipate precisely what will happen after liquids re-enter the site.

The industry hopes that the manner in which the failures will evince themselves will be minor and manageable. This is largely grounded in the fact that, although most of today's landfills are manmade mountains above grade, the base is typically dug about 30-50 feet into the ground. One could initially contemplate that the dug in side walls will keep the site stabilized so long as the hydraulic buildup does not exceed that height, and when it does,
the damage will there a "bathtub effect," as EPA has sometimes referred to it as, in which leachate spills over the sides. Presumably, were this to happen, whoever is responsible for the landfill, which as years go by would inevitably be the state, would seek to minimize their costs by drilling relief wells and constructing slurry walls to temporarily stem the overflows.

Whether that least cost approach would satisfy the technical and political needs at the time in the event that is all that happens, is not known. In any event, EPA's vision of the worst case event would actually be the least of the complications that may be anticipated. The full effects would entail dramatically greater costs, because there not be any early warning bathtub effect with leachate spilling out the toe where the sides of the landfill ties into the base, and the impacts could be so much greater than side seeps.

Among the complications are the possibility of a major landslide in which a significant part of the landfill mass becomes detached or slides off its base. For, not only is it very unlikely that infiltrating liquids will be drained out by the LCS, but also, especially in mega-sized landfills, the infiltrating liquids may remain largely perched above the below-grade base. For not only do the landfill operators use repeated passes with compactors, which weigh more than 100,000 pounds, to bring average densities greater than 1,600 pounds per cubic yard (and more than 2,200 lbs./cu.yd. at the lower depths), but also, the overlying and overpacked waste burdens hundreds of feet high are likely to compress the bottom levels to near impermeable conditions through time through settlement.[27] Furthermore, far above grade in the waste mass will be intervening layers of heterogeneous, low permeable material that will create either mounded leachate pools or perched water tables, likely to move laterally to the sides.

The more liquids are present throughout the waste mass, and especially so above grade, the lower the friction that keeps pieces of wastes next to each other from sliding by each other. That is the key condition that can reduce the shear strength, which is needed to counterbalance those forces, and threaten landfill stability.

In addition to decreases in the shear resistence, perched water tables above the bottom level will create expanding pockets of gas generation. When that happens near the exterior side walls, this phenomenon has been observed to physically lift and punch out the membrane on top, destabilizing the side walls. Presumably, other presently little understand phenomenon will occur as well.

With tens and sometimes hundreds of millions of tons of garbage held back in manmade mountains as much as 1,000 feet high by little more than a few feet of a compacted dirt berm and plastic tarp on the side walls, the consequences can pose an extreme threat to human life, as well as to environmental resources.

For these reasons, the possibility of catastrophic site failure exists along with the bathtub effect. When the possibility of major sideslope failures looms over bathtub effects at a megafill, and the site is located near developed areas, the physical threats become so substantial that palliative efforts such as cap repairs and relief wells would not seem likely to be publicly acceptable.

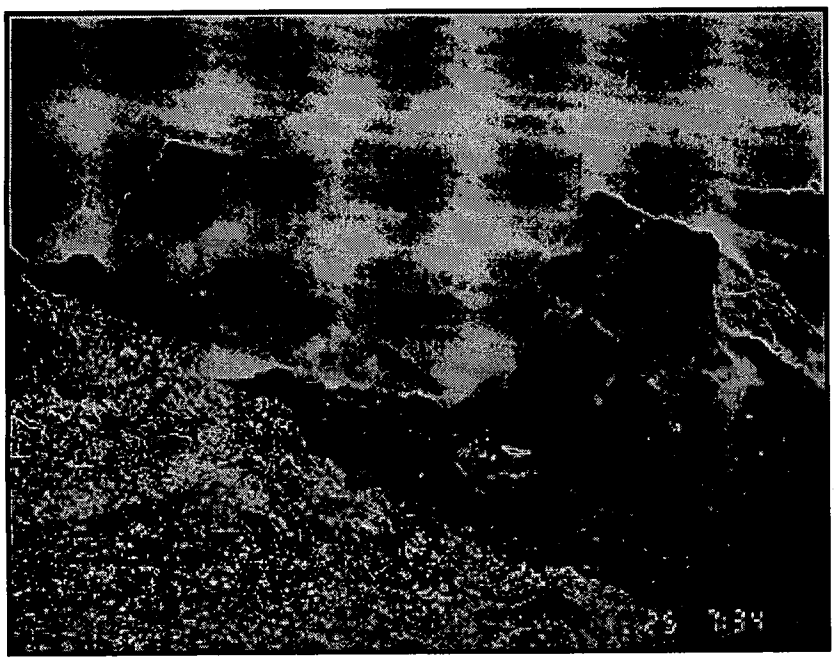
This is not an academic concern. Major landfill collapses are far more common than is publicly understood, but only because those that occurred to date have either been on the enclosed interior working areas of the site, or in uninhabited areas. But, that good fortune is only a matter of luck, not due to some sort of safety feature in today's landfill designs.



Rumpke landfill near Cincinnati collapses causing fire
Photo by Cheryl Allen

The most notorious example of a catastrophic landfill collapse in the U.S. occurred without warning in 1996 at the Rumpke landfill near Cincinnati. The photo along side shows the sheered face of the interior side wall that, without warning, catastrophically collapsed and burst into flames in March of that year.[28]

In the Rumpke case, the particular collapse occurred on one of the interior walls of the landfill. But, there is no reason to believe a future collapse will not occur on the exterior side wall, affecting whatever development surrounds the site.

The dimensions of these types of threats to tomorrow's subdivisions and malls that will surround today's landfills needs to be described to be fully grasped, as was recounted in *Waste News* –

> "Jim King remembers running, fast, as 20 acres of landfill collapsed behind him. Larry Stone, despite years of service as a police officer and firefighter, is unashamed to say the destruction overwhelmed even him.
>
> "And Dan Flannery figured he was the best equipped in the firm to help fix the problem – so he did just that.

---

28 B. O. Schmucker, "Forensic Analysis of the 9 March 1996 Landslide at the Rumpke Sanitary Landfill," Proceedings 12th Annual Geosynthetic Research Institute Conference (1998), at p. 75. While the Rumpke failure involved an interior collapse and was not, itself, due to long term problems, but improper practices in expanding a cell, the episode is relevant to the consequences of any number of types of events in closed landfills that can lead to the same result, such as a failing cover and clogged or inoperable leachate collection lines, that undermine site stability.

"March 9, 1996, was a watershed date in the history of the Rumpke Sanitary landfill, 12 miles northwest of Cincinnati in Colerain Township.

"That's the day a massive portion of the landfill – known to locals as Mount Rumpke – collapsed as employees literally ran for their lives.

"The collapse, which lasted only a minute or so, has taken more than a year and a half to fix and has cost Rumpke Inc. millions in destroyed equipment, lost disposal capacity and repair costs.

"'That brought me to my knees. I can't explain the energy that I felt when I saw the 992s crumpled up,' said Stone, general manager for Rumpke's Ohio operations. The 992s are massive front-end loaders with tires taller than the men who drive them.

"Two of the huge machines were near the bottom of the hill, and the force of the slide catapulted one on top of the other.

"That brought me to my knees. I can't explain the energy that I felt when I saw the 992s [compactors] crumpled up" – Rumpke general

"'When I got there, it was a tad overwhelming,' said Stone, the former cop and fireman.

"For King, landfill operations manager, instinct kicked in as he and about seven other workers ran for cover when the hill collapsed that Saturday morning. 'As I was running down the hill, I was hollering,' he said. 'I told everybody, Run for their lives.'

"'Cracks were coming underneath my feet. It was like an earthquake.'

"They had no idea where or when the landslide would stop. 'When we ran over that hill, we didn't know if it would come out to us. We just kept on running," King said.

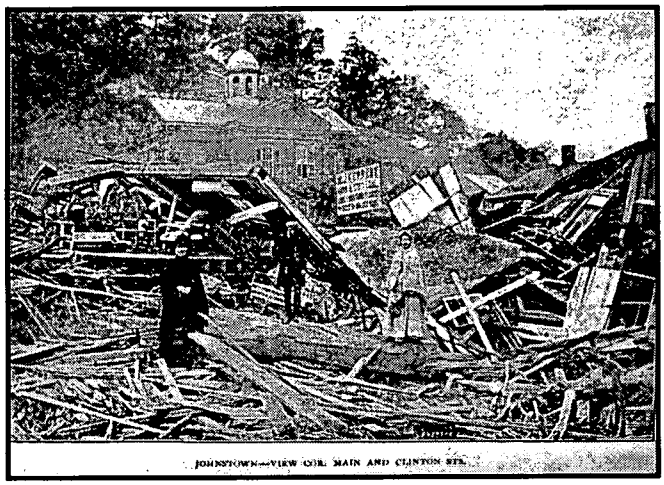
"Craig Wells was one of those workers on the run.

"Wells was the only employee near the base of the hill, pumping water out of a new cell being built. Then, the earth moved.

"'I thought it was pretty much over with at that point. It was pretty severe,' he said.

"Wells ran to a nearby truck and started to drive away. But the truck got stuck, and the trash rumbled closer and closer.

"'I figured if I was going to get it, I was getting it on the run,' Wells said. 'I thought I was going to get buried.'



The aftermath of the Johnstown Flood – corner Main and Clinton Streets.

> "Wells outran the slide, but a wave of earth and debris lifted his truck like a surfboard.
>
> "About 20 acres ultimately collapsed into another 13 acres on the side of the landfill's massive hill. . . ."[29]

As noted, EPA has attempted to bound the consequences from these sorts of failure mechanisms as a "bathtub effect." But these recent failures, most prominently as at the Rumpke landfill, or the even more serious one near Manila the following year, illustrates that the sheer physical devastation of a full-fledged site failure at a mega-fill might more properly reassemble the far more dramatic mechanisms of a dam collapse, such as the 1889 Johnstown disaster that killed 2,200 people,[30] than a relatively benign "bathtub" overflowing its sides and requiring some mopping up.

In the Philippines case, at the Payatas landfill outside Manila, "residents recounted hearing a thunder-like burst just before the wall of garbage, looming over the town like a volcano, fell....then burst into flames.[31]

California, too, has not been exempt from experiencing these sorts of site failures, albeit not as spectacular as Rumpke, most recently at the Keller Canyon landfill in 1997. Before that, in 1978, the Acme landfill experienced a failure in Contra Costa County.[32]

(continued...)

The only sites immune to a collapse at those built in old mine sites, such as the Eagle Mountain landfill in Riverside County, and those like the Mesquite Landfill in Imperial County sited in deserts without perceptible precipitation.

For remote landfills, conceivably there may be some who would argue that it would be politically possible and economically desirable to let massive landslides happen, imprudent though that may, in fact, be. But, that cannot be the basis for calculating future liabilities today. By the time failures are expected in today's lined landfills, most of the sites will be surrounded by the once distant cities, which in many instances will have sprawled out around them (*see* photo along side of the subdivisions adjoining the Richland Creek Road Landfill near Atlanta), just as has already happened to many of the pre-Subtitle D generation of landfills. [33]

Nearly 200 houses were sold in 15 months in the Little Mill Farm subdivision outside Atlanta next to the Richland Creek Road Landfill

Indeed, many major urban landfills, such as the Sunshine Canyon landfill in Los Angeles, were actually originally located in population centers to minimize haul costs, without thought to the long-term consequences of contaminating drinking supplies for millions of people, nonetheless of catastrophic landslides.

Moreover, the confluence between landslides and affected populations has come very close to already happening in the U.S. Although the Rumpke disaster, large though it was, involved a collapse inside the landfill that did not threaten neighbors, three years later a catastrophe, which would have engulfed major commercial businesses, was only narrowly averted.

---

32 (...continued)
Landslides also have been reported in other parts of the country at the Metro, Meadowlands, Payatas and Paxton landfills from design flaws, operator error, deliberate imprudent shortcuts, or unusual weather conditions.

33 Marc Rogoff, et al., "Urban Infilling Impacts on Solid Waste Facilities," *MSW Management* (Elements 2006), at p. 10. Deepa Patel, "Homes to go between landfills," *Atlanta Journal-Constitution* (July 18, 2004). James Hagerty, "Luxury Home for Sale: 6 Bdrms, Dumpster Vu," *Wall Street Journal* (August 5, 2004).

In 1999, while undergoing remediation efforts, the abandoned, 170 foot high Paxton II Landfill in southeast Chicago was observed with unstable slopes that threatened to release 300,000 cubic yards of garbage onto the businesses along Stony Island Avenue below, also closing Interstate Highway 94. Extensive coverage of the possible "garbalanche," forced the state to appropriate funds to install a new cap and leachate collection pumps and replanted the side slopes with new vegetative cover that has so far staved off the feared collapse.[34]

What specific steps would be demanded if someone ten, 20 or thirty years from now were to observe side-seeps from a long-closed 500 foot high landfill containing a hundred million tons of garbage, surrounded by thousands of homes and stores, is not known.

But, even if advance warnings were given, the distinct probability that a significant part of the entire site would have to be excavated and stabilized, before being redeposited somewhere else, appears to be within the realm of possibility. For, environmental sensibilities, including unwillingness to ignore risks to public health or to accept palliative responses to risks, have consistently heightened over time. Should there be no warning, as is often the case, the expense of stabilizing and reburying a mountain of trash, which has already collapsed, will be unavoidable.

As shown on TABLE 4, the costs to excavate, stabilize and re-bury the part a failing landfill needed to re-stabilize the waste body could be between $72 and $86 per ton – or hundreds of millions of dollars for a modern landfill.[35] And that is before contemplating the third party damages.

34 Illinois Environmental Protection Agency, *Superfund Listing: Report on Paxton Landfill* (LPC #03160000033) (2004). Sarah Downey, "State Tryng to Keep Landfill from Sliding Towering Dump Could Slip Into Neighborhood," *Chicago Tribune* (Mar 14 '99). Megan O'Matz, Workers Set to Take on 170-Foot Tall Waste Heap," *Chicago Tribune* (Mar 16 '99).

35 Excavation and haul costs from the Minnesota closed landfill remediation program. Stabilization costs based upon bare-bones mechanical-biological treatment (MBT) being deployed in Europe to comply with the European Commission's 1999 Landfill Directive which ordered the phase out of land disposal by 2015. Assumptions applied to the reported $50/ton processing cost were: organic fraction, 60%; volume remaining after MBT, 70%; tip fee at new site, $20/ton, at existing site using same base, $15/ton.

Estimated Cost to Excavate and Stabilize Failing Landfill ($/Ton)	
Cost to Excavate	$ 1.50
MBT Stabilization	$ 50.00
Hauling - Low	$ 10.00
Hauling - High	$ 20.00
Re-Disposal@Exist Site	$ 10.50
Re-Disposal@New Site	$ 14.00
Total - Low	$ 72.00
Total - High	$ 85.50

Source: Center for Competitive Waste Industry

TABLE 4

The largest part of the cost is stabilization, about which some may raise questions. Under Superfund, after all, the most extensive clean ups of landfills have involved digging up the contaminated site and reburying it in a newer lined landfill.

But, modern megafills contain more than 100 times the volume of material as most of the sites dealt with under CERCLA. By itself, when we are contemplating what to do with 50 to 100 million tons of garbage in a failed site, the sheer volume precludes the option of moving that large a load to another facility, because none would be large enough to receive it. There would also be the question of why go to the expense of excavating and reburying all that waste in another facility designed with the same flaws as the one that had just failed.

For these reasons, if site failures arise in large sites as issues of concern, true remediation will almost certainly include stabilization, but, we have broken down the cost elements in the event one believes otherwise. There certainly exists the possibility that efforts to address a failing site, which has suffered significant liquid intrusions before the problem was observed, may be addressed with relief wells, surrey walls and other palliative measures. But, especially with the large megafills, and the likelihood of greater environmental sensitivities in the future than today, a hypothesized low-cost scenario doe not appear to be a high probability.

Personal Injury

Compensatory claims for personal injury and property damage to those who live in proximity to the sites from the effects of leakages are covered only in California by limited assurances, and even there only while the landfill is operating.

However, these costs are not covered at all following closure of the site, and even during operation, are capped at $1 million per occurrence at a site and $5 million for all sites owned by an operator in the state.[36]

Since coverage is not provided for occurrences in the decades following closure, much less after post-closure, there is no protection at all for the very time when injuries and physical damages are most likely to be observed, apart from the wholly inadequate $1 million cap. This could be hundreds of millions of dollars at the worst sites, and multiples more if putative damages are awarded.

Also, if the few epidemiological studies that have been done, all of which suggest a link between routine emissions and adverse health impacts,[37] are borne out in further testing, almost all sites may involve personal injury claims that would also swamp the per-site caps.

Maintenance and Environmental Impacts After Post-Closure

No coverage is provided for either routine or non-routine and expensive maintenance and all of the other environmental costs listed above after the 30 year, post-closure period is ended (or after any additional years required by administrative action during which the cover is maintained).[38]

To summarize, in addition to failing to reach past the post-closure period when problems are most expected, financial assurance does not presently cover the following types of long term landfill costs: non-routine care, palliative or remedial corrective action, or third party injuries, each of which are very expensive. *See* TABLE 5.

38 27 C.C.R. §21900.

Types of Long Term Landfill Risks Not Covered by Existing Financial Assurance	
Type of Risk	**Description**
Non-Routine Care	Replacing the final cover repeatedly, unclogging leachate collection lines
Palliative Corrective Action (current Superfund practice)	One replacement of the cap, relief wells, slurry walls, bottled water, fencing
Remedial Correction Action*	Excavating, pretreating and then reburying the stabilized waste load
Third Party Injuries	Personal injury and property losses

TABLE 5

* California is unique in having a provision requiring coverage of "reasonably foreseeable" corrective action, which could be utilized to correct this omission here. Unfortunately, with current postings for this item varying between $162,000 and $3.8 million, the requirement has yet to be meaningfully applied.

To put all this in perspective, a typical large landfill might cost $50-$100 million to build, and generate something more than about $200-800 million in revenues over its operating life. Its financial assurance funds might be calibrated at $100,000 to $200,000 annually over more than 30 years, to total $3 to $6 million by the time the site is closed.

Yet, after the post-closure period ends, a large landfill, not located in an arid or remote region, also may be expected to leave as its legacy costs to the State the risks for the expense of a full-fledged remediation effort as well as damage awards. In serious cases, that could easily be several hundred million dollars over and above the minor maintenance costs that are covered.

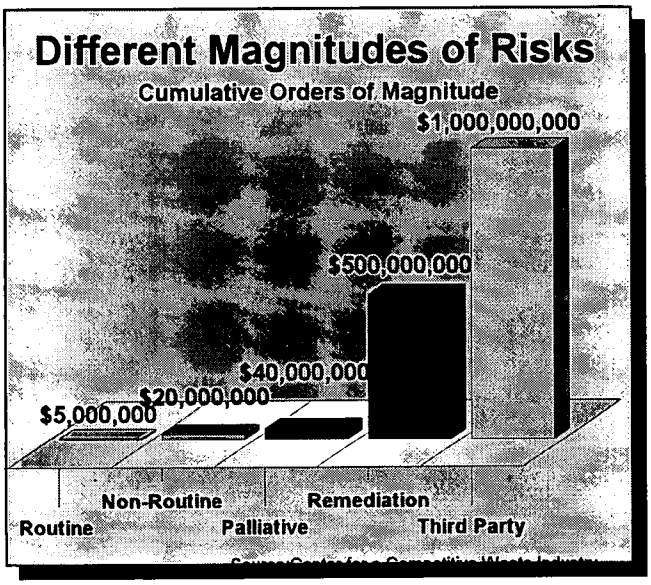

FIGURE 5

Thus, the final bill at such a site could be one hundred times what has ostensibly been set aside for long-term care, and approach or exceed the total of its 15 to 20 years of revenues.

While current assurance amounts for routine care approximate $5 million, just non-routine care, which definitely will be required, will easily exceed $20 million, and palliative corrective action might raise that to more than $50 million. But, true corrective action at a megafill could be $500 million and third party injuries in populated locals might double that. FIGURE 5 shows approximate estimates of the range of cumulative costs for the long term risks posed by landfills.[39]

But, FIGURE 5 just reflects the relative magnitude of costs at a single, major site under these alternative definitions for recognizing costs. The ultimate bill under current rules that will eventually fall to the State needs to reflect the totality from among all of the highly variable site costs.

Detailed engineering studies to project the liabilities of site failure at each of the 240 landfills in California has not yet been done. But, the preceding discussion suggests that a conservative first order proxy is that the bulk of costs at all of the sites probably is very unlikely to lies anywhere less than somewhere between $20 million to $200 million. That could be statistically represented as the standard deviation around the mean where 68% of long-term, site specific costs will fall if they are normally distributed. Under that assumption, the final costs for the state of California to clean up its landfills would well be in the order of $26.4 billion. Yet the cumulative amounts for which assurance is currently provided, or more

[T]he final costs for the state of California to clean up the landfills would well be in the order of $26.4

39 The values shown are not engineering studies, but rather are only intended to reflect the relative orders of magnitude of the different types of costs that may be incurred in the case of a major site failure at a megafill in an populated area.

often denoted without any cash balances or guarantees, probably is little more than $1 billion. If a more pessimistic set of assumptions are used and the standard deviation around the mean is $50 to $500 million, than the expected costs would be $66 billion.

Whether the assurances for the small part of the total long term costs that are covered by post-closure care requirements have real value to protect the State from regulatory failure is discussed next.

The Fatal Flaw in Financial Assurance for Minor Costs

As explained in the preceding section, most of the risks from long term landfill liabilities are not even addressed by current financial assurance procedures. With regard to the small part that is, the Integrated Waste Management Board's rules permit financial assurance to be demonstrated by a wide variety of financial instruments that largely mirror those enumerated in EPA's rules, with several key enhancements that deserve mention.

Before turning to the details of each in the next part of this chapter, the major overarching concern to emphasize has nothing to do with the usual debate in these matters as to the unique particulars of each. For example, are letters of credit as good as segregated trust funds, or are financial means tests as bad as captive insurance? All of that, while of no small importance in their own realm, is peripheral to the crux of the matter in the wider context.

For, as discussed in the prior chapter, none of these mechanisms reach the essential flaw in their common denominator. That is, regardless of the rigor of the assurance mechanism, any fund will be dismantled too soon. The problem transcends any attempt to be overcome by longer post-closure periods, and tweaking them will not repair that fundamental problem.[40]

What undercuts the entire regulatory structure currently used to provide assurance — no matter what mechanism is polished and selected — is, again, the fact that landfills are most likely to eventually leak after care finally ends. That will create the major costs after the end of the legally defined period of financial responsibility, probably sometime shortly after the minimum 30-year post-closure proof period ends, financial assurance is drawn down, and care is terminated.

Therefore, at the very point when the big ticket cost items will likely come due, the financial assurance chest will be bare, making the rigor of the assurance mechanism immaterial. So not only do these rules fail to cover landfills' real costs during the period when some assurance is provided, but also, nothing is left by the time the major items are most likely to arise.

---

40 *See* prior discussion beginning at page 8.

Reading this, many will be tempted to conclude that the structural defect can be cured if only we were to extend the post-closure period beyond the minimum 30 years. That is, unfortunately, most assuredly not the case.

California's assurance rule already reserves the power to extend the minimum 30-year post-closure period on a case-by-case basis,[41] and does so more assertively than EPA's.[42] While the Subtitle D rules only permits the 30-year period to be extended if the state finds that "the lengthened period is necessary to protect human health and the environment"[43] – putting the burden of proof on the state – the Board's rule seems intended to shift the burden to the landfill owner to prove that the "landfill no longer poses a threat to the public health and safety and the environment."[44] Also, California's code makes no provision for shortening the post-closure period to less than the "*minimum* period of 30 years,"[45] as does the EPA's.[46]

There are four fatal problems in any attempt to resolve the problem with the hope of possibly extending the post-closure after the minimum thirty years have elapsed: the lack of legal authority, the interminability of the problem, the lack of funds to do so, and institutional limitations.

Difficulty of Legal Authority

First, especially for those states following the EPA model, there does not appear to be a legal basis at that point in time to extend the care period. At the end of the 30-year post-closure period, the data will probably appear to show, *incorrectly*, that the site is stabilized and safe, leading to an unjustified response to release the site from the maintenance requirements. As the EPA Inspector General has properly explained, this is a fundamentally flawed approach—

> "The [Landfill Groundwater Rule] is broad enough to allow extensions of post-closure care for potential problems. However, the regulation implies that there should be indications from leachate or groundwater monitoring that the facility may present a risk to human health and the environment. Although there may be no releases or indications of release at a landfill for

46 40 C.F.R. §258.61(b)(1).

the first 30 years of post-closure, there may be a potential for releases of hazardous waste in later years."[47]

That is to say, after a careful analysis of all of the issues surrounding financial assurance, including in-depth field surveys, the Inspector General put her finger on the same fundamental infirmity with this whole process that we highlight in this report.[48] In a properly maintained site in which the integrity of the final cover is carefully managed, by the time 30 years have passed following closure, the waste load ought to be "bone dry."[49] Leachate quality measured in the sump pumps at the end of the leachate collection lines, and gas in the well heads, will have shown a record of steady improvement to the point where only the barest traces of hazardous or noxious constituents may remain.

This historic trend, which is the only hard piece of evidence that will exist at that time, will seem to show that the site has stabilized and is no longer a threat to the environment — regardless of the fact that the tests do not have any predictive of the future. In fact, they almost certainly belie the inevitable failures to come.

From that earlier discussion, and the admonishments from the Inspector General, there is little room for doubt that these temporal surface measurements will mask the real underlying problem. That is, much of the remaining undecomposed organic matter and hazardous constituents that were a part of the incoming waste effectively remains in suspended animation. Waiting patiently, the latent carbon potential sleeps until the day when the cap fails and rainfall reenters the site, reawakening leachate and gas generation all over again.

For all we know, since EPA has rejected requests that it statistically study the proportion of carbon content remaining after closure compared to when the waste first arrives,[50] the second wave of leachate generation may be greater than what was experienced during the time the site was operated.[51]

---

50 67 FEDERAL REGISTER 47312 (July 18, 2002).

51 Indeed, a comparison of subsidence in dry tomb to bioreactor landfills suggests that less than half of the eventual decomposition will have occurred in a dry tomb landfill prior to closure. Christopher Campman and Alfred Yates, "Bioreactor Landfills: An Idea Whose Time Has Come," *MSW Management* (Sept/Oct. 2002), at TABLE 1.

Thus, when the time comes, the Board, or maybe a successor agency with a new cast of board members and staff that probably have lost the requisite institutional memory of what originally happened, will be handed a request from a waste company.

That company will not have received any revenue from the site for 30 years, and most likely will be a successor company. Just as Dow-Carbide has disclaimed any responsibility for the continuing environmental disaster at Bophal, it will loudly disclaim any knowledge or interest in what its predecessor, Union Carbide, did decades before, and stoutly and repeatedly hammer home the fact that all of the leachate tests show that the site is no longer a threat.[52] An unbounded excess of optimism would have to be summoned to anticipate a rigorous regulatory response at that future date about events that began so long before.

In any event, even if fully focused on the matter to overcome intense lobbying, for states with rules using the EPA model there does not appear to be a legal basis, at the time just before care has ended, to make an evidentiary finding that the lengthened period is necessary to protect human health and the environment.

For the California formulation that puts the burden to show no harm on the landfill owner, a determined board would be in a position to reject a petition to end assurance because of the inherent difficulty proving a negative. The real question is whether the agency will have the determination to do so when the argument is made, and accompanied by political pressure, to accept the numerous tests showing dramatic reductions in test results of constituents of concern.

Problem Only Delayed to After Care Ends

Second, and for a far more important reason, extending the care period would only prolong the problem further out in time. Eventually, that will finally reach a point when the process and its participants collapse of exhaustion and capitulate, or more likely – like the 100-year-old sewers under the streets of the City of New York that no one can any longer find – everyone forgets about the whole morass, or where the old landfill even is, as it fades under the sands of history. So, instead of the failure occurring, illustratively, in year 32, two years after care normally would end, it would happen in year 42, two years after a hypothetical 10 year extension, *ad infinitum* — but, eventually, the failure would still happen.

---

52 Francis X. Donnelly, "Dow-Carbide merger assailed: Dissidents claim Carbide holds back on Bhopal liability" (*Detroit News*, May 12, 2000).

Lack of Funds

Third, for the sake of argument, imagine that the Board somehow did extend the time for an additional 10 years beyond the initial post-closure care period when the 30 years were over. Apart from the fact that the timing of the failure would, at best, just be prolonged a bit longer, there would be no funds to pay for the costs of the extended care. By the time 30 years following closure have passed, there would not be any opportunity to spread the attendant costs over the long past users of the facility. The site will not have produced any revenues for decades with which the then current owner (who almost certainly will be a successor to the original operator) could fund the obligation. Also, as the Inspector General noted:

> "When it eventually becomes necessary to conduct longer term monitoring and maintenance for these landfills, financial assurance funds may not be available for extended post-closure care if the company responsible for the landfill no longer has sufficient funds or has gone of business."[53]

That is to say, any attempt by the Board, or its successor, to later correct the fact that care will be required past 30 years could well run into the problem that, by that future point in time, the landfill owner will almost certainly not have sufficient resources to undertake the responsibilities for yet another decade, including corrective action as well as maintenance, that would follow from extending post-closure care.

Frailty of Human Institutions

Fourth, human institutions become increasingly frail when called upon to endure for protracted periods of time, such as to manage a vital, decades' long program that demands concerted action extending so many years into the future.[54] Any strategy that relies upon such engaged long term regulatory involvement is highly questionable.

Many of the Mechanisms are Inadequate on Their Own Terms

As noted above, none of the mechanisms assure necessary funds for anything in the relevant long-term after the post-closure care period during which proof of financial assurance is required. Nor do they do so for any corrective action — palliative or substantive — at any time that is not already known, nor for compensation for personal injury to the landfill's neighbors in the long run. They do not even do so for maintenance expenses that are major rather than minor in amount. Moreover, many of the mechanisms

---

53 Inspector General, *supra*, at p. 29.

54 Rodd LaPorte, "Assuring Institutional Constancy: Requisite for Managing Long-Lived Hazards," *Public Administration Review* (November 1996).

also fail to provide adequate assurance for the minor maintenance items that they purport to cover.

Of those mechanisms permitted by the Board, we focus on those available to private companies, excluding those restricted to public entities because they operate so differently. The public sector generally exhibits a higher degree than the private sector of financial and environmental responsibility that bespeaks their role as public servants. Capping their differences is the fact that local governments can raise taxes to meet their obligations after the landfill is no longer revenue producing, while the private sector has no means to reliably fund major projects that no longer generate revenue in the absence of some pre funding mechanism.

Six general mechanisms are deemed permissible for privately owned Class II landfills.[55] TABLE 6 lists them, along with the section of the administrative code in which they are found and the number of landfills using that mechanism,[56] along with the parallel national data.[57] They provide a variety of financial tools some think will increase the probability that there will be funds available to undertake minor maintenance over the closed site should the owner fail to do so, but only for the defined post-closure period, after which the rules provide that the funds shall be released.[58]

TABLE 6

The EPA, its Inspector General, the Government Accounting Office, and many states, California among them,[59] have strived to quantify or compare the relative risks that post-closure care might not be completed from among the different mechanisms that aim to protect the state from nonperformance of minor maintenance for the first 30-years following closure of landfills.

Essentially, the criteria seek to articulate different ways to measure whether sufficient assurance is provided by each mechanism. "Sufficient" will mean different things to different people. But, presumably, there can be a general agreement that "sufficient" means that there is an insignificant probability of the funds for post-closure care not being available when needed from the landfill's owner, trusts maintained by it for that purpose, or third parties with whom it has contracted to provide a second layer of support for that care.

This matter is crucial because extremely large expenses will be incurred after the landfill closed and, although the site is potentially capable of later generating massive amounts of dangerous leachate in that time, it will no longer be generating any revenues. Absent reserves built up over the operating life of the facility for those future costs, the

---

59 63 FEDERAL REGISTER 17706 (April 10, 1998); Inspector General, *supra*; Government Accounting Office, *Hazardous Waste: Funding of Postclosure Liabilities Remains Uncertain* (June 1999) (GAO/RCED-90-64).

question remains as to how the post operating costs will be paid for, especially when, as noted, those costs can rise to equal the entire stream of revenues.

The criteria in TABLE 7, which we would recommend, partly recapitulates those earlier efforts The first four items, which focus on the broader issues, are ours. EPA's formal list of criteria for approving provisions for financial assurance in state plans is legal verbiage that has little utility for making a real world evaluation.[60]

[60] 40 C.F.R. §258.74(l)(1) to (4).

Criteria for Evaluating the Risk of Different Means of Attempting to Provide Financial Assurance	
Versatility to meet unexpected costs during post-closure	Since the major costs will be for corrective action and damage awards, the assurance should both contemplate these costs and also be sufficient to encompass very costly outlyers.
Longevity to meet unexpected costs after post-closure	Also, since the likelihood is that the greatest expenses will occur after the end of the post-closure period, the mechanism needs to extend its protection to that time as well.
Cancellation replacement	For those mechanisms that depend upon a third-party, there needs to be a way to attract a new provider in the case where the prior one cancels before the end of the post-closure period because the landfill owner no longer has adequate collateral, and that deterioration makes it difficult to find anyone else willing to replace the expiring policy.
Accessibility	All mechanisms should be easily accessible by the State in the event needed without the prospect of protracted litigation, and definitely ought to be accessible outside of bankruptcy litigation, the outcome of which is always impossible to predict.
Independence of third-party	Absent a trust fund, the more assurance derives from contingent payments by a third-party, the greater the need for independence from the landfill owner, because independence decreases the probability that both entities will be facing financial distress at the same time.
Financial strength of third-party	Similarly, the more that the third-party is financially strong and has diversified the risk from widespread landfill failures, the less likely that it will be unable to provide the assurance payout when called upon to do so.
Difficulty of administration	Administrative resources for future concerns are not likely to be extensive, so the mechanism should be as transparent as possible in order that agency staff can easily rely verify and monitor the mechanism.
Premature Closure	If the assurance mechanism builds up to its full value over the expected life of the landfill.
Adjust to price changes	The cost of maintenance, corrective action and damages can be expected to increase over time and the size of the fund should change with it as automatically as possible.

TABLE 7

When these criteria are objectively applied to the stock list of assurance mechanisms, there is no question but that several fail the test, even for the limited purpose of providing sufficient assurance that routine, minor maintenance costs will be covered.

Captive insurance

To its credit, the Integrated Waste Management Board and its staff previously undertook a major effort to evaluate the efficacy of pure captive insurance companies (whose sole assets are those of the landfill owner or its parent). By rejecting those that cannot be assigned to a successor company, the Board effectively rejected them as a class, because, essentially, they provide no additional assurance beyond the company's existing resources.[61]

Unfortunately, in no small measure because of shortcomings in the current statutes,[62] the Board leaned heavily for its decision on one of the lesser deficiencies with captive insurance policies – that inability to be transferred to a successor landfill owner – as a technical violation of EPA's minimum insurance standards.

That explanation could come to complicate the Board's efforts later if it placed too much emphasis on the statute's limiting provisions, and not enough on its flexibility to protect the State.

Financial means and corporate guarantee

The financial means test (and its close relation, the corporate guarantee) purport to provide assurance based upon the reported financial strength of the landfill owner today. Of all the tests EPA has permitted to show assurance, it is the only one that has none of the normal mechanisms for doing so — it has neither involvement of third parties nor the creation of a segregated trust, the foundation upon which financial assurance is normally constructed.

Those omissions are of great significance because, by diversifying the risk, third parties provide an additional layer of assurance that there will be someone who is financially capable of and contractually required to meet the landfill owner's long-term obligations should the owner later become financially unable to do so. Trusts, of course, provide an additional layer of protection by actually setting aside the required funds.

What is especially anomalous about the financial means test is that the purpose of financial assurance is to provide just such an additional layer of protection in the event of

61 CIWMB Policy Statement Update on Financial Assurance (September 11, 2001). CIWMB Board Meeting of September 11, 2001, Agenda Item 6, Amending Standards for Acceptance of Insurance for Financial Assurance. This view is widely supported outside the private landfill industry. *See, e.g.* Inspector General, *supra*, at p. 26; Kate Goff, "When a Guarantee is No Guarantee," *MSW Management* (May/June 1999), at p. 44; James Boyd, *Financial Assurance for Environmental Obligations* (University College of London, 2001), at pp. 16 and 46; Minnesota Pollution Control Agency, *Financial Assurance Report to the Legislative Commission on Waste Management* (November 1, 1993), at p. 2.

62 P.R.C. §42601(b); §43601.5.

nonperformance of the operator's maintenance functions. This putative test, on other hand, provides nothing above the assets of the company itself, which were always there before assurance requirements were imposed. All that it does is tell us which landfill owner is currently a major company today, and since that has little to no meaning for the company's status decades from now, the mechanism does not afford any significant ability to predict its utility in the future when called upon.

Note, too, that the aberrant financial means test was neither required nor suggested by Congress in its 1984 Hazardous and Solid Waste Amendments to RCRA,[63] nor was it a part of EPA's original assurance rules when Subtitle D regulations were promulgated in 1991(although it was under consideration).[64] A subject of very heated controversy when proposed afterwards, the test was only added in 1998, seven years later.[65]

The purpose of this late addition to its financial assurance rules, EPA stated, was "to increase flexibility" and "provide regulatory relief by establishing additional, less costly mechanisms for owners and operators to comply with existing financial assurance requirements."[66] "Today's rule," EPA averred, "adds a financial test that allows a less costly means of providing financial assurance to entities financially capable of covering the costs themselves, through self-insurance, or relying on a guarantor that meets the financial test."[67]

EPA's claims that flexibility did not come at the expense of protection for the states did not convince anyone outside of the major waste firms who were the new rule's beneficiaries. Mr. Lanier Hickman was the long time director of SWANA and a vigorous advocate of modern engineered landfills. Even in retirement, he has taken on the role of watching over their development in order to prevent abuses that would ultimately undermine the whole approach. As EPA moved to adopt this rule change, he reacted with total dismay --

> "Between this action [for publicly owned facilities] and the [pending] net-worth provisions for privately owned landfills, the country has eliminated the guarantee that financial resources will be there should they be needed...*The net-worth provision for the private sector is not worth the paper that identifies the net worth pledge.* Companies come and go, subsidiaries close when the landfill is filled; the money will not be

65 63 FEDERAL REGISTER 17706 (April 10, 1998).

66 63 FEDERAL REGISTER 17706 (April 10, 1998).

67 63 FEDERAL REGISTER 17715 (April 10, 1998).

there...*[T]he public has been terribly violated* – today, and more importantly, one or two generations from now."[68]

The month after the rule change appeared in the Federal Register, *MSW Management* magazine, the trade organ for the municipal landfill industry, editorialized –

> "In it, EPA develops its rational for the action, taking pride in reducing costs involved in the issuance of third-party assurance instruments by an estimated $68 million per year. Pegging the total potential liability for closure and post-closure care costs at $6.8 billion [not counting the costs of corrective action or damages for personal injury] – you may feel a twitch in your gizzards at what appear to be remarkably low estimates given the cost of recent environmental restoration projects – the agency adds a few novel twists to the notion of 'assurance.' These appear to allow larger landfill-owners to substitute creative accounting practices for rock-ribbed guarantees that real reserves will be there if ever needed. As we've all just recently seen, some larger landfill-owners have demonstrated a real talent when it comes to creative accounting practices, and those with a strong sense of humor will appreciate the timing of EPA's high regard for accounting ethics given those recent revelations. Perhaps renaming the agency WSPA (Wall Street Protection Agency) makes senses. ...
>
> "In this, along with a great many other burdens of our overextended lifestyle, *we seem hell-bent on passing down the costs of proper stewardship to our heirs....*
>
> "When Subtitle D was proposed, it seemed that EPA was doing just that [not ignoring the long term costs of landfilling], but now one has to wonder. *When we allow politics to enjoy equal footing with principle, we're asking for trouble.*"[69]

An exhaustive academic study of financial assurance prepared for the University College of London concluded that financial means did not provide sufficient assurance due to its lack of identifiable and discrete assets in case of need, compounded by multiple complications limiting the regulator's capability to supervise, and the inability of financial reports to anticipate sudden changes in financial condition –

> "The problem with self-demonstration and guarantees, in a nutshell, is that there exists no financial instrument dedicated to environmental obligations....[I]t involves no specific financial asset to which a regulator

---

68 Lanier Smith, "No Guarantee," *Waste News* (January 20, 1997).

69 John Trotti, "Editors Comments: Landfill Financial Responsibility: Whose Interests Are We Protecting Now?", *MSW Management* (May/June 1998), at p. 6 (emphasis added). *See also*, Rob Arner & Cristine Leavitt, "Dump Now, Pay Later? Landfill Financial Assurance Mechanisms Are Burying the True Costs," *MSW Management* (December 1999).

can lay claim in the event obligations are not performed. The assets claimed by a self-demonstrating firm are much more ephemeral. Assets are not specifically dedicated to assurance in a legally binding way and must therefore be sought in competition with other creditors, if those assets are in place and have value at all once obligations come due."[70]

Essentially, then, the absence of a supporting third-party or an independent trust in the financial means' mechanism leaves the same self-insurance that the Board rejected when the construct was dressed up as captive insurance, albeit now is limited to large, and *reportedly* financially healthy, companies.

The reasons why self-insurance has no basis for inclusion in landfill financial assurance standards include the following:

- Conflict of interest;
- Bankruptcy is the ultimate test;
- Reported financial statements cannot be relied upon;
- The states neither have the capability, nor are given the information, to meaningfully evaluate the company's underlying condition and be able to assess the validity of the initial financial claims;
- Initial showings of financial strength have no bearing on a company's condition 50 years from now;
- Relative improvement by larger firms is not the same as sufficient improvement to protect the states;
- Even if the companies do survive for decades hence, and their financial situation does not deteriorate, they could not afford to undertake care;
- There is no evidence that regulators will have advance warning of impending financial distress to create a meaningful "trigger" to go secure alternative assurance;
- A financially stressed company is not likely to be able to secure alternative assurance; and

---

70 *Op cit*, Boyd, at pp. 47 to 50.

- Once a firm becomes insolvent, in the absence of a segregated fund, the state has no special claim to attach the company's remaining assets in bankruptcy court.

This is why the rule change unleashed a firestorm of criticism from within the landfill industry as well as without. Because the federal corporate means test preceded the States' MSW assurance rules on the subject, a review of EPA's actions needs to be added to the analysis.

Conflict of Interest. Before reaching the issue of whether any financial test today can anticipate a firm's financial condition decades into the future, there are immediate tensions which this mechanism creates that undermine proper care in the post-closure period. When a financial test is used, the state creates a strong economic incentive for the landfill owner to short change maintenance. This is because, under this mechanism, any funds not spent on upkeep at a closed landfill – which is no longer revenue producing – flows through to the company's bottom line, increasing its profitability.

Bankruptcy. The end of the line that each financial assurance mechanism must ultimately address is whether those assurances are reliably able to come through a bankruptcy proceeding intact. Where will the long term liabilities stand in the eyes of the Master in Bankruptcy?

As the experiences of Dow Corning's breast implant litigation and the long line of companies entwined in the asbestos imbroglio demonstrate, environmental clean up costs and damage awards can well be among the many items that are a "dischargable claim" under bankruptcy laws. Only the erection of a well-constructed trust fund or bond instrument has a reliable prospect of surviving under the police and regulatory power exception.[71]

All of these factors make clear that there was no technical basis for adding net worth tests to the list of acceptable means of demonstrating financial assurance. The rule's elaborate edifice of reported working capital and net worth, cash flow, bond ratings, letters from chief financial officers and certified public accountants are largely worthless for establishing the sufficiency of assurance needed by the State. It meets none of the criteria that one would look to in order to gauge whether the assurance is sufficient to protect the .

Were the landfill owner's financial health to decline precipitously, as is not uncommon especially over such long time periods, and were the Board somehow to become aware of the fact before its terminal stages, there would be no realistic ability at

---

[71] 11 U.S.C. §362(b)(4). Richard Epling, "Impact of Environmental Law on Bankruptcy Cases," 26 WAKE FOREST L.R. 69 (1991).

that late date to find some other mechanism to replace it. The time to set aside a sinking fund would probably have passed. The competing demands to make payroll and keep the doors open on any working capital would almost certainly trump the need for funding a substitute form of assurance, as the firm tottered on bankruptcy and would force the unsecured long-term care fund to the back of the line in bankruptcy court. And, of course, there would be no third party to lean on or trust fund to clutch on to.

Adding financial means as an approved mechanism did violence to the most fundamental tenets of assuring coverage of long-term liabilities. The matter lies outside the range of reasonableness, within which reasonable men and women might legitimately disagree.

All that the financial means test does is lower the true cost of landfilling and create an additional regulatory barrier to entry that invidiously works against new entrants into the market for disposal, as many commenters on the proposed rule argued to EPA.[72] The large waste firms, who appear strategically working to form a cartel, will not have to put up millions in cash or weaken their balance sheet to cover post-closure care. But, the new company on the block will have to come with cold hard cash or reduce its leverage to borrow. As had happened in the original enactment of Subtitle D, environmental protection had become confused with cartelization.

Financial Statements Are Unreliable. But, most troubling with corporate tests is their reliance on the self-reported financial condition of the landfill owner, along with the financial officers and certified public accountants who prepare the books. In fact, earnings reports and balance sheets can and are subject to gross misstatements that may belie net worth, ratios and other claims of financial vigor.

Some may excuse EPA's obviously misplaced reliance on reported earnings, because they feel that this problem did not become apparent until the collapse of Enron in 2002, four years after EPA promulgated its corporate financial assurance amendments.

The Enron debacle, which unfolded in late 2001 and crested as 2002 began, demonstrated that reported financial results have no necessary relationship to reality. They turned out to be meaningless because the boards of directors, who often received lucrative personal consulting business, did not want to know what was going on; the prestigious Big-Five accounting firms chose to look the other way because they were more interested

---

72 63 FEDERAL REGISTER 17717 to 17719 (April 10, 1998). In response, EPA conducted an analysis that it concluded, showed that this was not a concern because even third party financial assurance costs for large landfills was very small. USEPA, *Subtitle C and D Corporate Financial Test Analysis Issue Paper: Market Effects of the Financial Test* (Background Documents for April 10, 1998 Federal Register Publication). The Agency did not explain why, if this were an accurate depiction of the issue, the large waste companies expended so many resources, first to convince EPA to adopt the corporate test over a storm of criticism, and, second, subsequently to be permitted to use captive insurance companies, which are not true third parties.

in high margin consulting fees than audits; the financial analysts were clueless; the country's largest and most hallowed banks turned out to be more interested in investment banking profits than abstaining from giving their imprimatur to transactions it knew to be fraudulent, and the Securities and Exchange Commission – the regulators themselves – had not even reviewed Enron's books for years before the collapse.[73]

But, any claim that this critique of EPA's financial assurance amendments to its rules in 1998 stems from Monday morning quarter backing is dispelled by a closer look at earlier accounting scandals – scandals among the premier waste management company, for whose benefit the net worth tests were especially crafted.

In 1997, the Securities and Exchange Commission (SEC) began an investigation of the books of Waste Management, which had an earlier brush with accounting irregularities in 1994, and which is only one using financial means tests in California. In February of 1998, that investigation led to a $3.54 billion pretax write down for the years 1992 to 1997, effectively wiping out most of the earnings over that period. At the time, that was the largest accounting restatement in U.S. history.[74]

One would have thought that, in June of 1998, any responsible agency, acting on the basis of the facts, would have held up the promulgation of rules when it read the extensive reports of Waste Management's massive bookkeeping derelictions. After all, the entire foundation of the Agency's pending rule was premised on the accuracy of reported statements. But, overwhelming, undisputed facts undermining the value of reported values seemed to have no effect on the Agency.

Nor did EPA seem to take notice of the near complete financial meltdown that occurred the following year on the morning following the July 4th weekend when even worse financial malfeasance surfaced.

Two months earlier on May 24, 1999, it should be mentioned, Mari Bari with Deutsche Bank, the most respected analyst in this industry group, not content to regurgitate management claims like most of the rest, finished her own independent review of Waste Management's books. Nonetheless, the astute and diligent Ms. Bari concluded

74 Jonathan Weil, "Waste Management Suit by SEC Zings Anderson," *Wall Street Journal* (March 27, 2002).

that "WMI's fundamentals [are] attractive and [we] believe that the stock [then, slightly off its $60 high, at $54] is still cheap."[75]

Even one month before in the closing days of June, "[g]lowing financial forecasts, reaffirmed by [COO] Proto ... lent strong supporting evidence of the vast potential promise for WMI's future. Investor confidence, buoyed by analysts' ratings, soared."[76]

Then came July 6th. *Waste News* asked rhetorically:

"How could that happen?

"That's the foremost question on the lips of analysts and investors who last week exacted a stiff price for Waste Management Inc.'s shocking announcement it would fall $250 million short of second-quarter revenue projections.

"The troubling news about the industry kingpin came out of the blue and sparked a 'bloodbath,' in the words of one analyst. Waste Management shares plunged $19.63 to close July 7 at $33.94, a 37 percent drop.

"As investors rushed to get out – more than 70 million shares traded – the company's value fell nearly $12 billion in one day. Waste Management's nightmare dragged down share prices of all its competitors as well, with Allied Waste Industries Inc. tumbling more than $2.81 and Waste Connections Inc. dipping $2.25.[77]

Bad though that was, things went from bad to worse:

"On July 13, a week after the initial tremor rocked the company, Proto admitted the company had been too aggressive with its projections. But he denied there were any systemic problems eroding WMI's performance and said he was confident that revised but still heady growth assumptions were attainable.

"By the end of the month, however, a second warning of lowered earnings cut another $5.50 off the stock price in a day. Proto said the company would conduct a comprehensive review of operations to root out

77 Bob Brown, "WMI Takes Nosedive: Company Promises Details of Drop in August," *Waste News* (July 12, 1999).

the trouble. In addition, the board voted to sell up to $2 billion in assets to shore up shaky finances."[78]

At the end of months reviewing the books by 1,160 outside auditors at the cost of $3 million a day, $1.4 billion was written off the books, and that was on in addition to the $3.54 billion write down from the year before.[79]

All that was followed by a lawsuit brought against Waste Management and its auditor, Arthur Andersen, by the SEC charging six former waste company executives of securities fraud, alleging that they concocted "a systemic scheme to falsify earnings and other measures of financial performance." According to the *Wall Street Journal*, the SEC spokesperson said '[o]ur complaint describes one of the most egregious accounting frauds we have ever seen.'"[80]

Further adding to the available evidence of the times, this was recapitulated during the same period of time by another waste company specializing in hazardous waste, Safety-Kleen, whose bankruptcy is described later. The former chief financial officer and the former chief executive officer of the hazardous-waste disposal company were ordered by the SEC to pay fines for their role in a massive accounting fraud by materially overstating the company's revenue and earnings in financial reports and press releases in order to meet Wall Street's earnings projections. Between 1999 and the beginning of 2000, they improperly adjusted their earnings by $265.9 million, a boost of 83.1%.[81]

Through it all, EPA did not appear to evince any concern in the final financial assurance rules it adopted for the inherent problems relying on company books. Along with a cascading tide of massive bookkeeping scandals at Sunbeam, Rite-Aid, Cendant, Adelphia Communications, Xerox, Enron, Tyco, WorldCom, HealthSouth Corp. and, most recently, Parmalat — Waste Management's serial propensity to falsify its financial statements and misrepresent its earnings and balance sheet were all, apparently, ignored by EPA.

The Agency continued rules to accept what the facts show to be undue risks of misstatements in reported balance sheets. Although the EPA would not itself suffer were their indifference to these major risks to lead to a financial meltdown, the states, along

with municipalities and the largest corporations who use the landfills, would be left to raise taxpayers in order to cover the attendant costs.

States Capabilities and Access. Even if the state regulators had ready and reliable access to the data purporting to show an applicant's net worth, there are serious questions whether they would be able detect accounting misstatements, and access to underlying information to verify the claims. For any landfill owner (including parent companies) with landfills outside California, the State's task is further complicated because, in order to verify the reported financial ratios and net worth, regulators must have accurate and current data each year on all of the other landfills as to their future liability and how (or if) those liabilities, and any other associated liabilities, have been accounted for to subtract from the assets.[82]

Compounding the problem, a key provision of the EPA rule significantly eliminates for the states their concerns whether they have the very substantial expertise in accounting and finance, intimate knowledge of the company's operations across the country, and a detailed understanding of the financials unique to this industry. For EPA also made it unlikely that the state regulators would ever see the supporting documents to review.

A subsection of the federal self-insurance provision provides that financial claims are not even required to be submitted to the state permitting authority, nonetheless require that the state independently review the self-interested claims. That point is at such marked variance to sound regulatory principles that it deserves to be repeated and emphasized:

> **The EPA's rule provides that the permitting state authority should normally never even see, nevertheless review, the purported claims, which allegedly support financial means.**

All that is required under the federal rule is for the landfill owner to maintain a copy of its claim in its files, and notify the state only once when the claim is first made that copies of the backup documents are in the owner's files.[83]

---

82 *Op cit*, Boyd, at pp. 48 to 49.

83 40 C.F.R. §258.74(e)(2)(vi). This does not appear to be due to inadvertence inasmuch as the policy is repeated later in EPA rule-making over records concerning even more worrisome hazardous waste disposal. *See, e.g.*, EPA Docket F-2001-SPRF-FFFFF - Hazardous Waste Management System; Standardized Permit; Corrective Action; and Financial Responsibility for RCRA Hazardous Waste Management Facilities. There would appear to be a deliberate policy to both make it substantially more difficult for the staff of the state regulatory agency to independently evaluate the naked representations in the operator's filing, and also to prevent the affected public from having access to regulatory documents of potentially great importance to their welfare. On the other hand, California's rules do require the operator to submit the supporting material to the Board. 27 C.C.R. §22246(h).

Major concerns exist about the decision to allow the financial test as an approved assurance mechanism in and of itself. But, this particular provision, which acts to remove any process for the states to assess a landfill owner's financial means, would seem to eliminate any basis to claim that this test provides any substantive assurance of anything.[84]

Nominally, states that do not override federal rule may, on some occasions, get access to some of those documents. However, that is only *if* the state can prove, without access to those documents to do so, that because of changing circumstances the owner may "no longer meet the [rule's] requirements." At the point at which the landfill owner's financial predicament has become so widely known that the state has become aware of it from published reports would almost always be after it is too late to repair the problem.

To a similar effect, no provision is made for states to challenge the first posting when it receives notice that the landfill owner has put it financials on file in its office. Needless to say, the public, which will later be asked to pay higher taxes for to bail out the private landfill owner, can never see the records absent the state's choosing to subpoena them.[85]

Fortunately, at least the practice in California is to require the submission of all of the underlying documents used to support a claim of financial means.

---

84 An examination of the details of how EPA interpreted the highly questionable financial means test only raise more disturbing questions. Another example is an interpretation of the financial test rule that the agency issued for Subtitle C facilities in 1997.

Even though the Securities and Exchange Commission required public corporations to recognize future liabilities on their balance sheets in their annual reports, EPA said it will permit landfill owners to "adjust" their reporting to delay recognition of certain known future liabilities in the statement of the firm's financial strength. These adjusted statements, which omit major future costs, could then be used to excuse the company from being required to post cash or to contract with third parties to insure that the post-closure maintenance is done. Memorandum from Elizabeth Cotsworth to RCRA Policy Advisors, re Obsolete Language in the Financial Test for Subtitle C Treatment Storage and Disposal Facilities, dated February 27, 1997:

> "[I]n reporting for 'post retirement benefits other than pensions' (e.g. health benefits for retirees), FASB Statement 106 allows either an immediate or deferred recognition of these benefits as liabilities. Since either method is allowable under generally accepted accounting principles for financial reports, EPA will allow companies to use the immediate recognition method for their financial reporting to the SEC and the delayed method for purposes of the financial test."

The issue here is whether a private company that looks financially strong today will also be sufficiently vigorous 40, 50 or 60 years in the future to continue making substantial outlays, which although necessary to protect the environment, are non-revenue producing for the firm.

This technical sounding memorandum makes the entirely untenable assertion that a showing of a firm's financial strength necessary to provide that extraordinary assurance can ignore major future costs that it will have to cover at the same time in the future.

85 40 C.F.R. §258.74(e)(2)(vi).

Ignores Long Term. EPA has largely defended the overlying rational for the financial means test based upon analyses showing that small firms fail more frequently than larger ones.[86] However, its supporting analysis looks at short term correlations and does not even purport to predict a firm's financial vitality *as much as 50 years or more in the future*, which is the time period the landfill owner is supposed to be liable for maintenance and remediation (when a 15 to 20 year operating life is added to a 30-year post-closure period).

In the longer term that pertains here, any such short-term correlations between size and business failures become immaterial as technological and social changes undermine once vaunted positions in the market. During such a long time frame, industrial giants which once had double and triple A bond ratings like the once redoubtable Penn Central Railroad, Bethlehem Steel and Pan American Airlines have gone bankrupt due to technical change. Today, AT&T's debt, once at the apex of financial security, is rated junk bond status and only a fire sale acquisition stands between it and bankruptcy. Or, reminiscent of what may the future may bode for the landfill industry, the bankruptcies of Dow Corning and Johns Manville were largely due to a failure to anticipate the size of environmental liabilities that attach to their product or service. In the last 22 years, there have been 21 bankruptcies involving companies with more than $10 billion and as much as $103 billion in assets before their filing.[87]

Moreover, all of that just concerns the difficulty predicting how the winds of change can upend once great megaliths of the economy. Separately at issue is the inherent difficulty inferring financial strength from reported results due to fraudulent books that is discussed later.

Essentially, then, there is only way to rely upon the present volume of assets of the landfill operator to anticipate its future financial vitality. That is in the hypothetical case in which the regulator is informed of the firm's declining economic well-being in time to find and to secure replacement assurance from someone else. Yet, as noted, warning flags were not raised in advance of many historic bankruptcies, and third-party instruments are normally only issued when the risks are adequately collateralized, something a distressed company at that future time will not have.

Even Healthy Firms Could Not Afford Care. In aggregate, the costs of care during the post-closure period are so large that even landfill companies that remain financially healthy for such extended time frames will probably not be able to afford to make the required outlays if they relied on the financial test instead of setting aside the necessary funds while the site was still operating.

---

86 63 FEDERAL REGISTER 17714 to 17718 (April 10, 1998).

87 BankruptcyData.com, *The Largest Bankruptcies 1980-Present* (2002).

What is missing is the fact that indices of corporate size and profitability underpinning EPA's financial test fail to fully contemplate the fact that waste firms that are larger also will tend to have many more landfills — each with their long-term landfill liabilities. While some, but not all, of the tests attempt to screen for that fact, they must fail because each severely undercounts the magnitude of those liabilities.

Putting aside the larger concern that the enormous costs of corrective action and third party injuries are not considered, and also ignoring the concern whether landfills in other states are properly tallied, major and incontrovertible maintenance liabilities are not counted as a deduction from assets, because only minor and not inevitable major maintenance costs are accounted for. As discussed earlier, that could run nine times more than the incidently lawn mowing type of costs that are recognized.[88]

FIGURE 6 provides a graphic example of the difference between the major liabilities for more complete maintenance (but not corrective action) to the cash that a large landfill company might have to pay after the site is closed. Waste Management's net income and free cash flow is compared to the annual routine and non-routine costs of post-closure care for its stable of landfills.

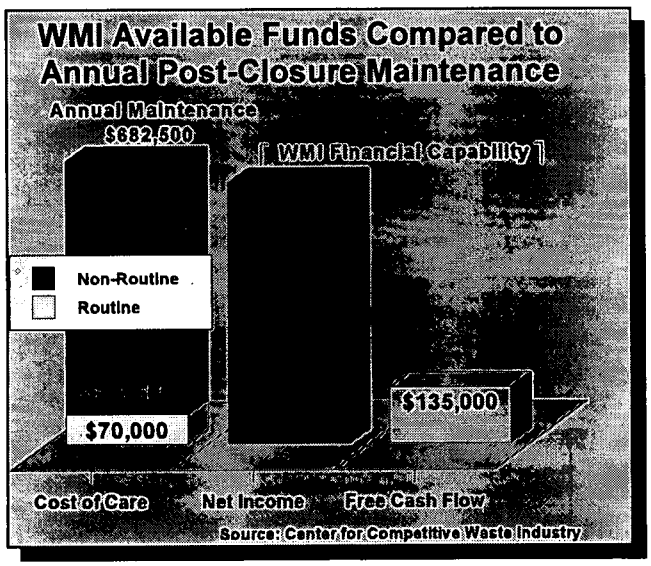

FIGURE 6

The annualized cost of cap replacement every 20 years is used as a surrogate for the constellation of maintenance activities that will be required to maintain the site above and beyond lawn mowing and well sampling. It is, please note, a conservative one, omitting, for example, the enormous costs of repairing clogged leachate collection lines when obstructions can be cleared with clean out heads, and which is likely to be a recurring problem over time.

Because these post-closure costs are not related to any revenue producing activity, there does not appear to be a realistic opportunity to finance these annually recurring expenses. Not only is its earnings stream insufficient, but, in reality, the only available long term funding source for post-closure care is the firm's free cash flow, not its net income that includes non-cash items, such as depreciation. In the example shown in this chart, the average annual maintenance costs, $685,000 per year – conservatively stated – will be

88 *See* page 40.

more than five times greater than Waste Management's cash flow, $135,000 — before considering the corrective action or third party injuries.[89]

Relative Improvement Is Not Sufficient. Before turning to whether the regulator is likely to receive timely warning of decline, the very predicate of EPA's justification of self-insurance also completely fails to address a more fundamental question. That is whether a large firm's current financial girth – by itself and apart from the irrelevant question of whether that affords *relatively more* assurance than a firm with less weight that the agency purported to test – provides *sufficient* assurance that the State will not be left to pay for private costs. Inasmuch as very few companies, regardless of how strong they may appear today, can be expected to be sufficiently healthy 50 years in the future to pay massive sums to remediate retired and nonrevenue producing assets, any such claim would be fatuous.

Regulators Unlikely to Receive Time Warning of Financial Decline. In any event, the record is replete with instances in which the regulators either did not receive timely notice of changing financial circumstances, or were unable to find a replacement assurance mechanism when it did.

A study of 673 bankruptcies between 1996 and 2001 by Bloomberg found that 363 companies' last filed financial statements – 54% – contained no cautions by the auditor in the months before bankruptcy.[90]

In Dow Corning's case, the company went from an AA bond rating into bankruptcy in one year brought upon by the breast implant litigation costs. None of that, however, had inhibited Dow from submitting a claim of financial means based upon accounting gimmicks just before this happened. Its RCRA site was left without adequate coverage for closure and post-closure costs.[91]

In the case of Safety-Kleen, the company was in a weakened financial condition when it received notice in 2000 that its surety company, Frontier Insurance, had been removed by the U.S. Treasury from its approved list (Treasury approval of sureties is required by EPA's rule).

---

89 Waste Management data is from its Form 10-K (2003), at pp. 4, 47 and 48. The annual report only indicates that the company had 284 landfills in 2003 that it owned or operated. Not shown is what proportion of that total are those for which it has financial responsibility, nor the closed landfills, nor new landfills that will be built in the future. We assumed that in the future there would be 350 landfills that WMI would be responsible for providing post-closure care. Cap replacement costs were described earlier in note 10.

90 Stephen Taub, "Teetering on the Brink – But No Audit Warning," *CFO.com* (April 25, 2002).

91 *Op cit*, Boyd, at p. 48.

The Treasury list, however, was only intended for qualifying completion insurance/bonds for road building contracts over the next six months, not over decades. It was never intended for the purpose of long term viability, and EPA could not have been unaware of that when it chose it, nor that there are institutions which do look out over the short term.

The insurance rating agencies are the institutions which evaluate the long term health of insurance companies, and those rated A and above can be expected to have set aside reserves that are generally understood to be adequate for long term health using sound underwriting principles.

Without any other explanation for EPA's odd choice for ratings, there cannot but be a concern that it chose to not to use the appropriate mechanism because of pressure from the landfill companies who wanted to minimize their costs by being allowed to buy very low cost plans from companies that could not necessarily be expected to make good were things to go wrong.

The result was to permit landfill sureties which were little different from the insolvent savings & loans in the early 1980s, which kept themselves afloat by offering unaffordably high, but federally insured, interest on brokered CDs in a desperate effort to continue enticing depositors that was no more than a Ponzi scheme.

Frontier offered low ball premiums to attract customers, knowing it could not afford to pay out on major claims, and their financial ratings reflected this fact.

Safety-Kleen, in turn, had selected it because Frontier was the only surety that would give it a bond when it did not have adequate collateral to secure coverage from a surety which would have the ability to pay out if required to do so. Once delisted, the hazardous waste company found itself without coverage and with a balance sheet too weak to secure a replacement policy. In short order, an investigation found that its books had not properly accounted for such things as long term liabilities, resulting in overstating earnings by $534 million in the prior two years.

The EPA had structured its rule in a way that permitted hopelessly weak sureties to qualify, and therefore failed to take cognizance of the analogous laws of physics that like particles attract each other. Weak sureties, with their low premiums and anemic requirements for collateral, attract weak companies which are seeking a bond, and that creates a fatal lack of independence between the two, with a high likelihood of the surety's failure causing the failure of the insured.

There should have been no surprise, then, had the EPA crash tested its rule, in which case it would have seen that both the surety and the landfill owner could fail at the

same time.[92] The two failure events were linked, rather than being independent of each other, as is necessary for third party guarantees to add assurance.

Worse than the company's predicament was the one facing the EPA. When a company is a going concern, a regulator's threat to shut down its disposal facilities, from which it generates significant cash flow, might well be a credible warning. However, when the company's viability is degraded, and the firm is tottering on bankruptcy, which Safety-Kleen did enter shortly thereafter, what tools does the regulator have? EPA tried issuing a series of deadlines for the company to come into compliance, but to no effect.[93]

In the end, Safety-Kleen, sheltered by the bankruptcy court, only offered pennies on the dollar to communities that hosted its hazardous waste landfills for the legacy costs it orphaned to the taxpayer, and only then if they agreed to release the company of all future claims. At its Sumpter County hazardous waste landfill near Lake Marion, South Carolina, Safety-Kleen offered the municipality $49 million, most of which was allocated for continuing care, while projections indicate the taxpayers will be liable for $133 million in clean up costs if there is a major leak, by some state estimates, and over a billion dollars according to others.

Tragically, this could have been avoided. Twelve years earlier, after meeting privately with the company, the appointed board for the state's Department of Health and Environmental Control had ignored internal studies and its own staff's recommendations, which urged imposition of a $133 million cash bond, and instead permitted a unsecured corporate guarantee.

Because of the political influence which the company had exerted, it was able to force the state to accept that deal, against its wishes."[94]

California's Predicament. Sixteen percent of California's Class III landfills in number (not size) use either the financial means test, or its close variant, the corporate guarantee,[95] which the Board incorporated into the California standard, in response to the

TABLE 8

Perhaps because the enabling statute was thought to partly constrain its ability to presumptively exclude any mechanism permitted by EPA, the Board appears to have attempted to deal with the inherent fallacies of net worth tests with a strategy of strengthening the weak trigger mechanism in the federal rule. The California trigger requires an annual filing by the landfill owner of its audited financial condition. If there is a weakened showing, the rule requires the filing to be accompanied by a demonstration of an alternative form of assurance.[98] But, even though the staff in California, unlike many other states, is receiving these reports, the trigger remains wholly ineffectual as an attempt to repair the gaping holes in the means test.

As before, the fact that the company books cannot be relied upon to establish the true financial health of the firm at a given point in time, and the further fact that financial collapse can occur in the space of months, is just the beginning of the problem. Again, by the time the Board becomes informed of serious questions about the earlier financial reports and is in a position to act, there almost certainly will be no way left to establish a new assurance mechanism to replace it.

Moreover, as to some of the other problems with the attempted repair, it only requires the landfill owner to make subsequent filings of any change in circumstances 90

98 27 C.C.R. §22246(h).

days following the end of its fiscal year (which in the Waste Management case described above was nine months later), after which the Agency will take several months to issue a notice of deficiency, followed by another 60 days for "the operator [to] obtain alternate coverage," and, if the company cannot, another 10 days to notify the Board of the failure.[99]

As we have seen, in the real world, there is a distinct possibility that not only can a drastic change in financial condition occur suddenly, as opposed to a gradual deterioration over time as the rule envisions, but also third party guarantors are not in the business of providing assurance for shaky businesses. For that reason, the waste company cannot be expected to secure alternative assurances when it has entered a time when even the Board has become aware of there being financial deterioration.

What practical recourse will the Board have at that time when it is no longer dealing with a going concern or when the dispute is whether to fully prepay into a fund to maintain a nonrevenue producing asset? When payments to pension funds are suspended, where in line will the Master in Bankruptcy place the State's interest in distant, and seemingly non-critical, problems? The answer is probably none and toward the rear, as the Safety-Kleen bankruptcy graphically demonstrated.

Nor is it likely that a bottom-fisher, vulture or a turnaround artist that acquires the distressed company with landfill assets would also include in its offer to purchase the shuttered disposal facilities and the unknown liabilities attached to them, which is precisely why banks do not foreclose on mortgages of buildings overlying brownfields.

The Board's long journey towards a rational financial assurance program that can truly protect California from billions in budgetary demands during its fiscal crisis must begin with the urgent and pressing need to eliminate the financial means test. Although the Board formally acted against most captive insurance companies due to their lack of assignability, its action was underscored by a serious concern about the lack of assurance provided by self-insurance. The exact same basis for its concerns over captive insurance apply to the financial means test, yet another form of self-insurance.

How to do that in the face of the statutory admonition to not exclude the use of any mechanism permitted under federal law[100] is dealt with as part of the next section of this report.[101]

Letters of Credit, Surety Bonds & Insurance v. Trust Funds

The five basic remaining types of approved mechanisms for assurance can be divided into two groups, those that depend upon third parties to add further assurance, and those that resort to segregated trust funds.

Third Party Approaches. Letters of credit, insurance and surety bonds are all mechanisms that increase the level of assurance by involving a third party, which contractually agrees to step in if the landfill owner fails to perform minor and routine post-closure maintenance. They provide assurance by diversifying the risk of nonperformance beyond the resources of the landfill owner because, if there is true independence, the probability of non-performance by the landfill owner will not affect the probability of default by the other party. Both parties to the contract are, therefore, unlikely to be financially in distress at the same time. Also, financial institutions, which are often the third parties, may have greater insulation from some of the economic vicissitudes that impact other businesses.

Segregated Fund Approaches. Trust funds, on the other hand, provide additional assurance by segregating the entirety of the funds required for long-term care by the time the site is anticipated to close. Assurance comes from the fact that, at the time non-performance occurs, the cash is physically present without any need to be concerned about the status of another, third-party to be able to provide the necessary funds at that time.

Comparison Between the Two Approaches. The main distinguishing features between these legitimate forms of assurance turns on differences in protection against premature shutdown, misestimation of the cost of care, and the accessibility of the funds.

Essentially, the great strength of the three third-party mechanisms (surety bonds, letters of credit and insurance) over segregated instruments (trusts funds) is that the full amount specified for closure and minor post-closure maintenance is Day One coverage. On the day when the landfill first receives waste, the owner must begin paying premiums that provide the defined coverage.

On the other hand, segregated mechanisms slowly accumulate the full amount over the anticipated operating life of the landfill. Thus, if the site is forced to close earlier than expected, there may not be sufficient funds to cover the planned expenditures on long-term care.

As for the segregated approaches, their strength is the assuredness that, if called upon, the funds will be there for the state to access, regardless of the financial turbulence

the landfill owner is experiencing or the possibility of simultaneous economic stress of the third party or its preference to litigate rather than to pay out on the policy.

On the other hand, the third-party approaches have a back-end weakness. Were the operator to experience financial stress and cause the surety, insurance company or bank to conclude the risks of continuing the policy have become too great in light of changes in the landfill owners' ability to collateralize the coverage, they could prospectively cancel the policy. There are buffers intended to protect against that eventuality, but they are not foolproof.

The rule provides that any policy must include a provision that insures that a 120-day warning is given prior to the effective date of any cancellation notice. During that time, the intent is that, first, the landfill owner would find replacement coverage. Alternatively, was that not possible, the state has the legal right to cash out of the policy's coverage and place the monies into a stand-by trust fund to insure that minor maintenance expenses are covered.

However, as to the first, a replacement policy would seem unlikely if the original third party determined that the owner's financials had declined.[102] As to the second, there is the nontrivial risk that the state could fail to exercise its right to lay claim to the assurance funds before the rule's mandated three-month advance notice has passed.[103]

In addition, some have raised questions whether some third-parties may refuse to pay all or part of a state's claims in the event there is non-performance without the specter of costly and protracted litigation.

Lastly, both the segregated approach as well as most of the third-party mechanisms fail to provide protection against the risk that the landfill owner significantly underestimated the cost of routine care, as he or she has a self-interest in doing, and as the Inspector General found is occurring.[104] Among the three third-party mechanisms, only insurance has the practical capability of providing protection against underestimation to the extent that the maximum coverage of the base policy and any umbrella for any exceedances is not less than the amount of the final costs for the state to undertake completion of maintenance responsibilities.

Since premium costs typically reflect a probabilistic assessment of the policy being exercised, and, if so, of how much the claim may be, insurance will tend to offer substantially lower costs to provide more conservative margins of protection above the bare bones estimates of future costs of care than other mechanisms. Those other

---

102 *See* NOTE 26 on page 82.

104 Inspector General, *supra*, at pp. 45-46.

mechanisms will also tend to require collateral in the amount of the face value of the coverage.

Reasonable people will disagree about which mechanism is preferred for minor long-term maintenance expense, because they both have roughly comparable degrees of strengths and weaknesses. But that is not to say that either has yet to be sufficiently fleshed out to truly protect the interests of the state in not bearing the costs of massive cleanups for orphaned landfills.

In the next section, we will make proposals on how to patch up the holes in surety bonds and letters of credit.[105]

Early Trust Fund Withdrawals Would be Too Risky

The Board's notice also asks whether, and under what conditions, the operator should, in the future, be permitted to draw down trust funds as post-closure care proceeds and the anticipated future demands decline.

If there is no reasonable chance that the actual costs that will be incurred after closure may exceed the amount specified in the Post-Closure Maintenance Plan, and if there is no possibility that the Board may need to extend the minimum 30-year post-closure period, then there could be a basis for permitting early draw-downs, as is the current practice.

However, neither hypothetical assumption is correct. As noted earlier,[106] the current scope of maintenance plans is limited to minor items, and excludes major maintenance, such as replacing the final cover and repairing clogged leachate collection lines that will almost certainly be required.

Equally salient is the fact that the Board's rule, which purports to give it the right to extend the post-closure period beyond 30 years, is effectively meaningless unless there are assurance funds available at that time to continue care. Extending the care period to 40 or 50 years, for example, would be an exercise in futility were the former site operator defunct in the absence of segregated funds available to the state to, itself, render that care. Moroever, as shown earlier, even a financially viable large landfill company does not have the cash flow to pay the aggregated costs of its many holdings for non-revenue producing purposes.[107]

---

105 *See* page 110.

106 *See* page 40.

107 27 C.C.R. §21900(a). *See* page 79.

Therefore, the rules should be amended to deny premature draw downs from landfill operator's financial assurance mechanism until at least the end of the post closure period, if not the site reaching final storage quality. ☞

Chapter 3

The Correct Answer

The market, in the form of insurance, should be used to determine long term landfill risk and protect

As presently phrased, the answer to the Board's question is that extending the post-closure period will not prevent landfill's long term problems from becoming an obligation of the State and its municipalities. But, saying that, and nothing more, does little to constructively advance the ball down the field, and so let us move onto the basic principles learned from this rather lengthy analysis.

The focus of the existing rule is on providing assurance that the *hundreds of millions* of dollars of *maintenance* costs for closed landfills do not devolve into a liability of California's taxpayers. However, we now know that the far more critical issue is how to develop new mechanisms that will insure that the *billions* of dollars in *environmental* liabilities do not wind up as an obligation of the State.

For that reason, this chapter first addresses the environmental issues and makes a key proposal to protect the State that differs significantly from the existing assurance structures. After that, recommendations are also made on how to modify the existing assurance provisions to better afford protection with regard to those lesser maintenance issues.

Protecting States Against Long-Term Environmental Liabilities

What has too long been missing from the financial assurance debate is recognition of the fact that most of the licensed dry tomb landfills will probably pollute after the end of the post-closure period.[1] Costs in just California could be in the tens of billions of dollars – none of which is covered by any of the mechanisms in place as they are currently applied.[2]

---

1 Although there are also concerns about the magnitude and severity of uncontrolled landfill gas emissions during operation, those views are not uncontroverted, as are, to large measure, the ones surrounding groundwater contamination. To simplify discussion here, but not concede the air issue, this report is confined to a discussion of groundwater contamination.

2 Approximately, 70% of the 240 landfills subject to financial assurance are in non-arid areas, and Superfund cleanups of sites with greater hazardous constituents may cost about $25 million a site for containment.

(continued...)

Those environmental liabilities that will follow post-closure are not just critical to address because of their greater magnitude than the relatively minor maintenance costs during post-closure. Even more of a factor is that only a small proportion of post-closure responsibilities are expected to be abandoned. On the other hand, since the largest environmental failures will tend to become manifest only after the owners' liabilities have lapsed, virtually all of the *post* post-closure environmental problems will be orphans of the State by definition.

Uncovered Long-Term Costs

There are three types of environmental landfill liabilities for which the State needs to be protected: corrective action to remediate, not just contain, pollution by landfills; injuries to third-parties by pollution from landfills during post-closure or afterwards; and major maintenance expenses during post-closure.

Corrective Action. Current federal and state rules notably fail to address the probability that most of the licensed and engineered, dry tomb landfills will leak after the end of the post-closure period. The EPA rule only speaks to corrective action of environmental failures for "known" situations, i.e. leakages that have already been detected.[3] Since the federal regulations relieve the landfill owner of any further responsibility, including that for financial assurance, after about 30 years, and since most liner failures will not become "known" in that strict sense until after the end of the post-closure period,[4] the current federal financial assurance structure does not address the major liability facing the states.

One of the Bush Administration's stated policy objectives has been to devolve regulation to the states.[5] Whatever the pros and cons of that agenda, less publicized has been its companion policy to also devolve to the states the liabilities from industrial pollution that deregulation permits to continue. Devolving liability to the states violates the very intent of financial assurance.

---

2 (...continued)
Although it may be the case that the hazardous constituents of a municipal landfill may be less than for a hazardous landfill, the repair costs will not likely be substantially different in terms of relative magnitudes because the groundwater is contaminated either way.

3 40 C.F.R. §258.73(a).

4 *See* page 8.

Mark Hertsgaard, "Trashing the Environment," *The Nation* (January 16, 2003). Todd Wilkinson, "Eyes on Washington, The Environmental Guide," *The Amicus Journal*,(Spring 2001).

To its credit, California's rule goes beyond the federal minimum and also requires assurance for corrective action that is "reasonably foreseeable."[6] At this time, only the state's Water Boards have acted to implement this provision, and, for that reason, only attempts to apply it for damages related to impairment of the state's waters. TABLE 9 shows the amounts presently posted for foreseeable corrective action among the state's 25 largest privately owned landfills for which data is available.

Amounts Designated for Corrective Action at Largest Private Landfills in California
2003

Landfill	Permitted Capacity (Cu.yd.)	Corrective Action		
		Mechanism	Cost	Cost/Yd
Chiquita Canyon	45,889,550	Insurance	$489,192	$0.01
Altamont	58,900,000	Surety Bond	$722,766	$0.01
Otay Annex	59,857,199	Letter of Credit	$183,000	$0.003
Sycamore	27,947,234	Surety Bond	$162,000	$0.01
Simi Valley	43,500,000	Surety Bond	$551,551	$0.01
Bradley West	38,600,000	Surety Bond	$3,799,210	$0.10
Durham Road	19,271,000	Surety Bond	$903,023	$0.05
WM Lancaster	22,645,000	Surety Bond	$551,560	$0.02
Antelope Valley	6,480,000	Surety Bond	$421,303	$0.07
Kettleman Hills	4,200,000	Surety Bond	$330,365	$0.08
Ostrom Road	41,822,300	Trust Fund	$1,536,720	$0.04
Quadalupe	16,500,000	Surety Bond	$288,631	$0.02
Cold Canyon	8,773,339	Letter of Credit	$396,000	$0.05
			Average	$0.04
			Stand. Dev.	$0.03
			Coef.of Var.	86%
			Lowest	$0.003
			Highest	$0.08

SOURCE: CENTER FOR COMPETITIVE WASTE INDUSTRY

TABLE 9

As indicated in the table, the amounts posted for reasonably foreseeable corrective action range from $162,000 at the Sycamore landfill to $3.8 million at Bradley West, with an average value of $795,025. Converting the indicated costs to a per cubic yard figure to normalize for the different size facilities shows a range of one-third of a cent per yard to 8¢/yd.

The amounts currently recorded for reasonably foreseeable corrective action are both too small to even cover non-routine maintenance, such as just the first of many $10-plus million cap replacements, nonetheless corrective action for containment or, needless

6 27 C.C.R. §22221(a).

to say, true remediation. In addition, the large variation among those landfills, in which reported values for foreseeable corrective action is so large, there does not appear to have been consistent regulatory guidance or review on the subject to the permitees to insure compliance with the intent of the rule in practice.

All corrective action, properly defined, whether known or occurring during or after the post-closure proof period, should be covered for remediation.

Third-Party Injuries. The other major long-term environmental landfill liability claims would be from third-parties for personal injury and property damages in the event pollutants escape from the landfill or there is catastrophic site failure. Because either environmental excursions or site failures will tend to occur before the incipient failures leading to those events are detected, funds will be needed both to make those injured whole as well as to recover site stability. Costs related to preventive actions, such as replacing a cap or installing relief wells are not as likely to be involved.

Unlike the federal law, California code requires landfill owners to provide coverage for third party injuries. However, similar to federal hazardous waste statutes, that requirement ends when the site is closed — precisely when the coverage is most likely to be needed.

Coverage for personal injury and property damage should be extended as long as can be provided after closure, and appropriate assurance mechanisms need to be adapted to increase the probability that landfill neighbors will not be left exposed at the very time when injuries are most likely. More about how to do that through insurance is discussed later.

Major Maintenance. Things like replacement of caps and clogged leachate collection lines do not come within the ambit of current itemized maintenance costs, even though they can incur major expenses. They are not currently considered as routine and predictable, but they very likely involve measures that will be needed during the post-closure period to prevent leakages.

One means to do so would be a perpetual care fund accumulated as a sinking fund over the site's life for things that are relatively predictable such as the recurring need to replace the final cover at regular intervals over the centuries that the waste load remains a potential threat. Clogged lines are less predictable, but at the very least they should be flushed, cleaned and tested annually to lessen the occurrence rate of serious jams blockages that cannot be removed with major surgury.

New Times Demand Action

In the 1990s, financial assurance rule-making focused on optimizing "flexibility" for the landfill owners.[7] However, in practice, that seemed too often to translate into minimizing their costs and maximizing their opportunities to shift risks to the public. Today, times have drastically changed and reached a critical turning point.

Now is the time that action is compelled because most now recognize that most of the dry tomb landfills will, in the words of EPA, "ultimately fail."

Now is also the time because, with each passing day, more of today's landfills come too close to the end of their operating lives to be readily absorb new and costly assurance requirements and to amortize makeup dollars at an affordable level.

Lastly, now is the time because, at the end of 2003, California had a $14 billion debt and another $4 billion structural deficit. The costs of bailing out landfills, if the Board fails to act in the near future, will ultimately translate into even more cutbacks in aids to local government, health and welfare and education services and other critical needs for the citizens of California.

Very interestingly, while the appropriate response is contested, there is a wide consensus between the public sector and the private waste industry that now is the time that there should be resolution about how the endpoint of post-closure care will be determined. The Inspector General has advised that:

> "The consequence of not addressing the problem of postclosure care may be that the state or federal government will be left with the financial burden of addressing any remaining post-closure care necessary at these facilities. It is important to assess the need for additional post-closure care while the facility is in an economic position to fund additional postclosure care. Rather than passing the problem of postclosure care on to future generations, the problem should be addressed now, and solutions implemented for each landfill long before the end of the 30-year period ..."[8]

The waste industry financial assurance paper discussed later reaches that same conclusion.[9] Their report states:

---

7 63 FEDERAL REGISTER 17708 (April 10, 1998).

8 Inspector General, *supra*, at p. 43.

9 *See* page 117.

"Defining the end of post-closure care is currently a topic of great interest within the solid waste community. It is important to address this subject sooner rather than later because, if the period is lengthened, as much time as possible will be needed to accrue the requisite funds, and a large number of pre-Subtitle D landfills are passing the end of post-closure care."[10]

Obviously, this report is only one of a long line of such documents questioning the foundation of today's financial assurance structures as a fitting vehicle to provide the states with full protection against major long-term landfill liabilities. Because the day of reckoning from those years of accommodation is rapidly approaching, the debate has recently shifted to where the law demands it should be. That is to eliminate the public's risk rather than the operators' risk, because pollution delayed will otherwise ultimately wind up as a government obligation, which will result in higher taxes and lawsuits seeking deep pocketed potentially responsible corporate parties.

Moreover, some concerned state regulators, seeing a fiscal crisis coming around the corner, have, commendably, already attempted to resolve the transparent shortcomings of current financial assurance rules, but within the limits of the tools currently in use.

These proposed regulations have usually conceptualized a new perpetual care mechanism to supplement existing instruments. An example of this process is what is used for long term cemetery care. The Wisconsin Department of Natural Resources conducted a study that compared the cost of a traditional proof of financial responsibility period for post-closure maintenance to a perpetual proof period. Annual payments into a trust fund over an assumed 15-year site life would increase from $178,000 to $330,000 per year. In addition, they added an entirely hypothetical $10 million proof of financial responsibility for corrective action that would be also be funded through annual payments during the 15-year site life. This would require annual payments to a trust fund of $480,000. So, the combined additional payments into trust funds would be $632,000/year. For a five million-ton landfill, this would equate to $1.89/ton in the case where the cost is spread over a 15-year life.[11]

But, those earnest efforts to address the problem, while commendable, do not reach to the heart of the problem. To understand why, an understanding is necessary of the difference between *assurance* and *insurance*. Without an understanding of that basic construct, a solution that matches the appropriate mechanism with the distinct problems landfills pose will elude our grasp.

10 Jeremy Morris, *et al.*, "Performance-Based System for Post-Closure Care at MSW Landfills — A New Approach to the Current 30-Year Time-Based System of Subtitle D" (2003), at p. 3.

11 Dennis Mack, *Evaluation of Proposed Financial Assurance Enhancements* (WI Department of Natural Resources, 2003). Assumptions included: inflation, 2%/yr., interest, 4%/yr., site life, 15 years. The comparison was between perpetual care and the 40 year post-closure period used in Wisconsin, not the EPA 30 year period.

Assurance v. Insurance

There are twin aspects of long-term landfill liabilities that are very distinct. One type is the routine and relatively predictable items, such as minor maintenance costs that occur within the post-closure period, which is what the financial assurance rules most directly seek to address.

The other type is a major release of pollutants, which would have adverse impacts on the environment and public health, and have a significant probability of occurrence at some unpredictable time in the future, to widely varying extents.

For the first type of liability, namely the relatively predictable maintenance items (trusts, surety bonds and letters of credit), all can be appropriate mechanisms for assuring the State that it will not be left with the costs of undertaking long term maintenance where the operator fails to do so – but only if their structures are reinforced, as is described later.[12]

However, all of them have several limitations if an attempt is made to apply these mechanisms to the latter type of environmental liability. The first and debilitating problem that the usual assurance mechanisms cannot address is, again, their lack of long arms to reach failures that occur *after* the end of the legally defined post-closure period, which is the very time when most of the releases will probably occur.

The second problem stems from the probabilistic nature of these environmental concerns. We know that in non arid areas there will be containment failures that reignite uncontrolled biological activity and pollute the environment at some point in the lives of most of us reading this report. We just do not know precisely when or the precise (or even approximate) clean up costs at each site.[13] Yet, the traditional mechanisms all rely upon defining a coverage period as if we can predict the time within which it will occur.

The third is that, once there is an environmental failure, the extent of the costs for corrective action and personal injury will vary widely, perhaps between $10 million and $500 million at a site when most outliers are counted. If third party injuries are included, as they should be, the final tab could double the top end of the range.

Where any given landfill's cleanup costs will fall within that range is something that is uniquely site specific. Its final place in that cost range will depend upon such things as the quality of the barriers and the collection system, the rigor of the maintenance

---

12 *See* page 110.

13 There will also be pollution from landfills in arid areas, albeit the scant rainfall and depth to groundwater will probably delay their impacts longer into the future, beyond the point that society is likely to acknowledge them.

program, the depth to groundwater, the source of local drinking water, and the distance to and size of adjoining populations now and in the future.

Unlike national insurance companies with years of experience, the states neither retain insurance actuaries, nor do they have the wide-ranging commercial data base for the entire country, which is necessary to make reliable actuarial computations. In these circumstances, the states are no in a position to set the assurance amount without either, conservatively, grossly overcharging some or, recklessly, undercharging others.[14]

Finally, the environmental liabilities are not easy to define. Not only, as noted, are they probabilistic rather than fixed, but also, any attempt to specify them is highly susceptible to political pressures. In an administrative proceeding to determine a finite value would be met by a hailstorm of highly paid experts attesting to the small probabilities that they believe exist for major problems. The affected public would be unlikely to afford to participate in an evidentiary level. Outgunned, most state departments would wind up in such a perverted fact-finding process with a low ball result, which would have been driven by those with a direct self-interest in freighting all risks that they are responsible for onto the public.

For all of these reasons, none of the standard instruments in use for landfill financial assurance can efficiently protect the states from the near-certainty of environmental liabilities, albeit in an unknown amount and at an uncertain time. Fortunately, there is something that fits the bill, and that is insurance which is explained in the next part of this chapter.

Insurance Is a Market Based Solution for Corrective Action and Third-Party Injuries

Of all those that have been considered, insurance is the only mechanism for financial assurance that approaches meeting all of the peculiar requirements necessary to protect the state and its taxpayers from long term landfill liabilities.

Insurance has many advantages over the other instruments, but current policies, as they are presently constructed, do not yet meet all the necessary requirements, and there some impediments to the their being crafted for landfill's needs. Yet, nonetheless, the state is in a position to create a new market for insurers so that they could meet those needs by recombining existing terms.

---

[14] For a further discussion, *see, op cit,* Boyd, at p. 15.

Advantages

Insurance is well positioned to protect the state against long-term landfill risks because its structure is suited to the nature of the risks, insurance is already involved with landfills, its mechanism is economically efficient, and its application avoids conflicts of interests.

The Structure of Insurance Is Suited to the Nature of the Risks. Insurance is our economy's long-standing and time-tested mechanism for addressing the probabilistic nature of pollution, including that from landfill failures on third parties and the potentially costly corrective actions that will follow. It provides a mechanism specifically crafted to protect the insured from the economic risks when the overall long-term frequency to those in an identifiable group is predictable, but its occurrence to anyone at any given time is not. By grouping people with a similar risk in a pool, the cost to protect against that risk can be shared, lowering its price to each member of the pool.

Homeowners, for example, know that in any year some houses will burn down, understandably wish to be protected from that risk, and, obviously do not want to set aside the full cost of rebuilding when there is only a very small possibility of its happening to them that year. Insurance fits the bill for most of us, costing a few hundred dollars a year to insure a several hundred thousand dollar house, protecting us fully in the case where it is our house that burns.

So long as the incidence, magnitude of costs and time of occurrence from landfill failures vary from site to site, and there is a rational way to make actuarial predictions, insurance will tend to be less costly than other assurance mechanisms. This is in contrast with post-closure costs that either are constant (i.e. cover maintenance) or largely predictable (i.e. periodic cover replacement) for which, since the probabilities are 1, insurance holds no advantages.

Insurance is Already Engaged Insuring Landfills. Indeed, the insurance industry is already heavily involved in writing policies for injury to third parties at hazardous waste landfills during their operating lives.[15] AIG, XL/ECS and Zurich are companies that have long insured the hazardous waste disposal industry, and, after some unexpected losses during the early eighties, by 1992 were making a comfortable profit from underwriting those risks.

Although not mandated by rule, like hazardous waste sites many MSW landfill owners also insured for third-party damages during the operating life of the sites.[16] In

---

15 40 C.F.R. §265.147.

16 These policies establish an important precedent, although, in this particular application, the concern that has been raised as to these policies is whether the insured promises to make good to the insurer on any

(continued...)

California, of course, the landfill rules are stricter than in most other states and require insurance for third party damages. But, none presently extends coverage after closure, nonetheless after post-closure, and that is a telling limitation with these policies because that is when claims are most likely to occur. Nonetheless, the principle and experience history, albeit limited, is an important precedent to extend it out in time to when it will really be needed.

Note, though, that the policies state regulators often see used in the post-closure period, and which are labeled as insurance, are not are not real insurance instruments. True insurance provides protection against risks that have a probability of less than 1, and only pay out to the policy holder when a covered event occurs for the eligible costs up to the policy limit.

On the other hand, the particular type of insurance that some landfill owners use after closure is not real insurance even though it is provided by insurance companies. These policies distribute funds each year following closure for the projected costs of periodic and routine care over the next 30 years, and for which the probability of its occurring is 1. Referred to as *finite risk* policies, their purpose is not to insure against risk, but rather to provide an annuity matched to future costs in a way that achieves other objectives. An example might be to gain tax advantages, because payments into a trust fund, were the owner to establish his or her own annuity-like instrument, are not tax deductible, but disbursements to pay insurance premiums, as an expense of doing business, are.

Insurance Is Economically Efficient. Insurance is the only mechanism that provides full coverage for premiums for less than the amount of the coverage, because the gains from spreading risk dwarves the transaction costs of providing a policy. Any other attempt to use trust or bond instruments in sufficient amount to cover the worst case, so that the State does bear the costs of private mistakes, would be far more expensive for the landfill owners to purchase. The larger the pool that the state can create by regulation, the lower the costs of coverage tend to be.

Insurance Does Not Suffer Conflicts of Interest. Insurance also overcomes the crippling infirmity of the current system that, effectively, largely relies upon the party with an overwhelming self-interest in understating the risk to define the amount of assurance needed. Imagine for a moment an assurance proceeding to attempt to establish a perpetual care fund that would bring corrective action under the financial assurance umbrella.

---

16 (...continued)
claims that arise. In that case, the insurance companies are pricing the policies to a greater extent based upon the balance sheet of the landfill owner and the risk of its not being able to make repayment rather than the risk involved. As such, these types of premiums are not a measure of risk, even for the short-term during the landfill's operating life.

The hearing would be inundated by the landfill owner's hired experts stoutly declaiming, in direct proportion to the size of the fees they charge, the attenuated nature of the risk involved, but without backing up their opinion with their own money. Against that, the public's unfunded voice would be muted, and the agency's staff would be under political pressure to accommodate in the political theater without sufficient regard to the technical merits.

Even were these political pressures removed from the equation, the fact that the risks are probabilistic make it impractical to address with an administratively determined point estimate. When remediation costs might as easily be $25 million and $250 million, some facilities would be asked to provide assurance for ten times more than will wind up being necessary, and that would be extremely difficult to impose.

With the insurance mechanism, the matter could be moved, in the spirit of the times, from a regulatory to a market-based environment. It would be handed over to a third-party in the marketplace, which has decades of expertise in risk assessment, and which puts its own money at risk behind its conclusions. Moreover, because it will be liable for underestimation, that third-party would tend to share the same interest as the States in not under-assessing the magnitudes of the risks involved.

Balancing that, so long as two or more insurance companies offer the desired type of policy, competitive market forces would dampen any tendency to overestimation. Finally, with probabilistic risks, insurance is the least-cost mechanism for providing assurance because the risks are spread among the members of the pool.

Even for those vigorously opposed to the government intervening in the market place in order to correct its imperfections, insurance is now seen as playing a vital market-based role in protecting society. Most recently, the Bush Administration has been reported as embracing insurance as a market-based mechanism for driving chemical and other facilities to take greater precautions against terrorism:

> "Homeland Security officials in the Bush administration are considering ways to use the insurance industry as a free-market-friendly vehicle to drive chemical facilities, food companies, utilities, and other businesses to take greater precautions against terrorist attacks without heavy-handed new regulations."[17]

That is not to say, however, that insurance does not have problems that need to be addressed before this type of mechanism can work appropriately for landfill liabiilties.

Disadvantages

---

17 Charlie Savage, "US sees insurers as possible tool in terror fight," *Boston Globe* (February 22, 2005).

On the other hand, insurance, especially as it is presently offered, is not a panacea. Fully understanding its limitations is necessary in order to construct new forms that will most closely meet the objective to protect the state from the enormous long-term landfill liabilities.

There are four potential problems insuring against these landfill risks under current insurance practices. Fortunately, each can be surmounted so that insurance, with all of its inherent advantages can be utilized in this context.

The September 10th Problem. Except for occurrence-based policies that are normally no longer written extending more than 5 years, environmental insurance are usually for a 1, 2 or 3 year term, with the premiums and coverage related to what, and what transpires, in that year the premium is paid. This is what is typically done, for example, with the current environmental liability policies required for hazardous waste landfills.

But, that would not meet the needs here as we have described them, because the real risks arise only long after the site is closed and, especially following the end of post-closure care. As annual policies, the premiums need only reflect the slight risks expected over the next twelve months, and can be oblivious to the very real and significant risks in the future. This is especially the case when there is scant hard data about the long-term consequences of entombment because insufficient time has occurred to date.

When policies are reissued annually to continue coverage for the risk of a future event that has not yet occurred, the insurance industry will be tempted to discount that uncertainty in the future, believing that it has a safety net. The underwriters may perceive that they can increase premiums in succeeding years to recover the payout in the event a worst case event were to later materialize. A recent example is insurance for the risk of a terrorist attack, which on September 10, 2001 was essentially calculated at or close to zero, notwithstanding several reports warning of the risk. Only after the wake up call on September 11th were very expensive riders needed to cover a showplace building in a major city.[18]

Thus, the question is whether an insurance instrument can be constructed that telescopes recognition of the long term risks into today's annual premiums by insurers who otherwise may not assess this type of difficult-to-determine future risk, in which the incidence of those risks increases over time.

To understand this issue for assessing risks, there are two general types. First is the risk of a person crashing into another car while driving, which, all other things being equal, is the same this year as it will be in the future. On the other hand, there is the risk that a person will die in a year, which is very small for a person in his or her youth, but

---

18 S. Roy Woodall, Jr., *Terrorism Insurance in the Post September 11 Marketplace* (Congressional Research Service, December 7, 2001).

then later in life increases significantly.

Landfill liabilities are more like life insurance than auto insurance, in that the probability of failure increases over time and rises appreciably after the end of the care period. Further complicating things, like the risk of a major terrorist attack in the United States, accidents that have not yet occurred are difficult to recognize. Yet, unless the initial premiums for landfill liabilities reflect that future uptick for dramatically higher risks 50 years from now, the funds will never have been collected while the site was operating to pay for the cost of coverage in the critical years after post-closure.

The Medium Probability/High Cost Event Problem. The insurance industry has long been accustomed to marketing policies for risks that have a low probability of occurring, but experience a high loss when they do. An example would be the risk of someone's house burning down. Because the probabilities are low, the cost of the premium can also be small even though the entire house may have to be replaced. This makes these policies easy to market to the consumer.

When the probability of a high cost event is no longer low, however, and the probability becomes 25% instead of 1%, for example, then the premiums need to be larger, and they become less marketable. For this reason, insurance companies have not historically been interested in products such as this.

But, that inhibition only applies to products that customers have a choice whether to purchase. Were the state to require insurance as a condition for operating a landfill, then a market will have been created that is not dependent upon a low price, and the commercial reason for this lack of interest in medium/high risk events will no longer exist. That means, a necessary component of landfill insurance for corrective action in the long term will depend upon state action to make the market.

Long Reach Provisions Have Limitations. Two generally understood insurance instruments – claims made with very long extended discovery of claims provisions (or long tail), and occurrence policies – are generally thought of when attempting to cover long term risks. But, in addition to their limited availability, their terms do not sufficiently cover the type of claims that are more likely to arise from landfill failures.

Occurrence policies extend their coverage past the end of the term of the insurance during which premiums are paid, theoretically for an unlimited period of time after the last premium was paid, as long as the injury originally began, even if it did not then become cognizable, during the time the insurance was in effect.

Claims-made policies, on the other hand, are usually written to only insure against claims made within the term of the policy. However, extended discovery and completed operations provisions can be added to cover risks that may not become evident until after

the end of the life of the policy, or of the period when premiums are paid. These can extend coverage for a specified number of years beyond the last premium paid for occurrences at the site.

In any event, the restriction to injuries that began during the term of the policy undermines their applicability to landfill injuries. To be covered, the injury must arise from an event that can be shown to have occurred while the insurance was in force, such as from injuries with a long latency period like mesothelioma, a rare cancer that typically did not become apparent until decades after workers were exposed to asbestos. With current landfill designs, the breach of the barrier systems that leads to a release of pollutants – nonetheless the additional time to migrate through the soil into drinking water supplies before people are first exposed – is not likely to occur until decades later after the site has been closed.

Moreover, the insurance industry rarely issues policies with this sort of long tail for more than 5 years because of unexpected payouts that have arisen and the tax complications they create.

Tax Complications. Not only have insurance companies experienced too many unexpected payouts with some of these long tail policies, but also the uncertainty of whether they will at some undefined time in the future leaves prolonged exposure to those risk subtracting from reported profitability. Regardless of how well hindsight later ultimately shows that an insurance company has estimated the probabilities of a future occurrence, accounting rules require that the insurance company's net income be determined at the end of each year based on what is known at that time.

Insurance with a very long policy term, unfortunately, leaves unresolved potential liabilities on the balance sheet of the insurance company for an indefinite period. In assessing profitability, investors do not give any credit for the company's estimation of the profitability that a claim will only be made in a small number of cases.

Consequently, insurance companies cannot be expected to offer long term liability occurrence policies regardless of how large a market the state creates through regulations.

New Combination of Existing Provisions

The insurance industry does not presently have off-the-shelf products to offer the sorts of policies that would protect the states from the environmental failures after the end of post-closure described earlier.[19] However, the needed coverage can be assembled from policy terms that are commonly in use today, but grouped together in a new way.

---

[19] *See* page 16.

Two generally understood insurance instruments – claims made with very long extended discovery of claims provisions (or long tail), and occurrence policies – were considered. But neither provides adequate assurance for long-term landfill failures and both are largely unavailable anymore.

Claims-made policies are usually written to only insure against claims made within the term of the policy. Occurrence policies, by definition, extend their coverage past the end of the term of the insurance, theoretically for an unlimited period of time, as long as the injury originally began, even if it did not then become cognizable, during the time the insurance was in effect.

However, extended discovery and completed operations provisions can be added to claims made policies in order to cover risks that may not become evident until after the end of the life of the policy, or of the period when premiums are paid. These can extend coverage for a specified number of years beyond the last premium paid for occurrences at the site, and effectively make this variation on a claims made resemble an occurrence policy.

For obvious reasons, too many expensive payouts has meant that occurrence policies are no longer written for the environmental liability of landfills because of the open-ended period of liability. Long-tail policies may still be found, but they substantially limit the number of years for the extended period to usually less than five years and that makes them inapplicable to the long stretches of time over which landfills risks arise.

Attempts to get insurers to write longer policy terms are not likely to be fruitful because of the uncertainty that the prolonged exposure creates in the reported profitability to their investors. Regardless of how well hindsight later ultimately shows that an insurance company has estimated the probabilities of a future occurrence, accounting rules require that the insurance company's net income be determined at the end of each year based on what is known at that time.

Insurance with a very long policy term, unfortunately, leaves unresolved potential liabilities on the balance sheet of the insurance company for an indefinite period. In assessing profitability, investors do not give any credit for the company's estimation of the probability that a claim will only be made in a small number of cases. The entire potential liability is seen as subtracting from their earned returns. For these reasons, these policies are not common, and, when available, do not extend much more than five years from the current year – not, as needed here, the 20 or more years after the landfill closes 15 years from now.

In any event, the basis for either instrument undermines its utility for the landfill case. To be covered, the injury must arise from an event that can be shown to have occurred while the insurance was in force, such as from injuries with a long latency period like mesothelioma, a rare cancer that typically did not become apparent until decades after

workers were exposed to asbestos. With current landfill designs, the breach of the barrier systems that leads to a release of pollutants – nonetheless the additional time to migrate through the soil into drinking water supplies before people are first exposed – is not likely to occur until decades later after the site has been closed.

However, there is one tool that can work to protect the State from the potential for environmental liabilities at landfills into the future. After considerable analysis with assistance of insurance experts, we believe that the best insurance vehicle for this situation is, first, a multi-year five year, claims-made policy that will be cancelled and rewritten on an annual basis as a matter of right for extended periods of time in order to reach the coverage time frames involved with landfill failures.

Second, the requirement for this type of insurance policy on each site should be combined with a segregated future insurance premium fund that has built-up to a sufficient amount at closure to pay the annual premiums into the future in the likely event that eventually the current landfill owner departs the scene and is unable to pay the premiums for the insurance renewals .

Third, added to that policy should be an incidence reporting coverage trigger as opposed to a claims made and reported coverage trigger. The incident reporting trigger is intended to insure that the premiums paid today fully incorporate the long term risks of any individual insured site based on the extensive data the insurance industry has accumulated on landfill claims in the past twenty years.

Insurance coverage has to be provided over an extended period of time, which far exceeds the present 30-year post-closure period. Annual policies are available for environmental liabilities, of course, and on occasion three or even five year policies are sometimes offered. To extend the coverage out further in time, policies currently exist for closure and long term care insurance that provide the insured with the guaranteed right to repeatedly renew the policy at the end of its term. These same provisions could be incorporated for this liability insurance policy.

Perpetual Care Fund for Future Premiums. A potential deficiency in the claims made type of insurance is that coverage only lasts for as long as premiums continue to be paid. Also, the insurance company may raise premiums in future periods based upon general inflation and/or adverse loss experience across all of the insured landfills.

By itself, then, this leaves two problems: the first is how to insure premiums get paid long after the waste company no longer exists, and the second, how to do so in the face of possible fee hikes.

To insure that premiums continue to be paid, reserve funds to pay for recurring premium charges can be established at the time of closure from funds that accumulate over the operating life of the landfill. The size of these funds at closure can be calculated to

reach a sufficient size so the earnings on the fund are larger than required for the annual future premium payments while continuing to have enough left over to continue generating adequate earnings for this purpose forever. The formula also needs to reflects expected changes in price levels.[20]

September 12th Premiums. This calculation may not on its own contemplate significant bump ups in premiums due to later adverse experience, as what happened in the terrorism case. That is where incidence reporting feature of the insurance policy design comes in.

In incident reporting, the filing of an incident report during the term while the insurance policy is in force would trigger coverage for a claim at any point in the future when a actual claim is finally made. Also, the definition of "incidence" could be specified to include events that are expected to lead to a covered claim under the policy.

An incident reporting provision in an environmental liability policy would almost certainly force the underwriters to evaluate the long term risks of a site and incorporate them in their current premiums. By requiring this insurance, the long term risks of a site will be captured in the ongoing costs of the insurance during its site life in a competitive insurance market. If a site has low risk, the premiums will be lower and high risk sites will either pay higher premiums or be considered to be uninsurable. Making open market insurance a requirement for permiting is also a way for regulators to screen out high risk sites based on the loss experience of the insurance industry.

Encouraging the insurer in this way to recognize the long-term risks beyond the 5 year term of the current policy is key. For only if this is done can the State know how much to collect each year the landfill is operating in order to accumulate reserves adequate to recurringly pay the premium over time. Were premiums instead set on a "September 10th" basis, the insurer would, undoubtedly, at a later date dramatically increase the premium, which the reserves would be inadequate to pay, and the policy wind up be cancelled.

Importantly, because of the way accounting rules work for the insurance industry, the incident reports would not be reflected as a liability in the insurance company's financial statements.

Components of EEILI Policy. Other aspects of this proposed vehicle would include limiting insurance to those companies with an A.M. Best rating of "A+" or better, and reinsurance.

---

20 This is similar to the calculations done by cemeteries that offer perpetual care of grave sites. It is calculated as:

$$\text{Periodic Outlay} \times \frac{1}{\text{Interest\%} - \text{Inflation\%}}$$

For lack of an existing name, we call this combination of insurance features "Extended Environmental Impairment Landfill Insurance" (EEILI). Its features are summarized in TABLE 10

Features of Extended Environmental Impairment Landfill Insurance
Claims-made policy including –
✓Five year term
✓To provide extended coverage, policy cancelled and renewed each year for another five year term
✓Incidence reporting
✓Coverage for environmental impair.
Insurance protection including –
✓A.M.Best "A+" or better
✓ Reinsurance
Perpetual premium payment fund at closure

TABLE 10

Included at the end of this report as ATTACHMENT A is an Insurance Note by two experts in insurance that discusses these issues and concludes that there is no theoretical problem in insuring these risks and doing so past the end of the post-closure period, but there are no policies written that do all of these things. They add that there is a reasonable likelihood that developing these policies would be achievable, but only if, after careful study, the states created a market by mandating such coverage.[21]

Ideally, these policies would be renewable forever and have very high limits of several hundred million dollars. However, ideal coverage is not likely to be available in the market, and an in-depth insurance study by experts in the field would be necessary to assess what is the maximum coverage available from the smallest acceptable number of companies willing to offer it.

The Board should commission a study the full extent that dependable insurance policies could be purchased that would meet the needs of protecting the state and its citizens from the costs over the long term before the site is stabilized for remedial corrective action and third party bodily injury and property damages. TABLE 11 shows the

[21] *See* page 141.

major questions that the study should address.

Insurance Questions to Resolve
✔What government mandates are necessary to create a market for extended environmental impairment landfill insurance
✔Whether the program operation can be improved by grouping all landfill policies in the State together
✔The maximum coverage that could be available
✔The possibility for different maximum coverages at different sites that exhibit significantly different risk profiles
✔The longest term available for a renewing policies
✔The policy language that would minimize the opportunities for an insurance company to disclaim coverage

TABLE 11

The Risks of Insurance Failure Are Manageable. In theory, insurance most closely matches the requirements of protecting states against the long term liabilities from catastrophic landfill failures in the future. At the same time, whenever a third party is used to protect against risks, the possibility must be considered of that counter party failing at the same time as the landfill company is unable to perform its post-closure duties.

This concern is the reason why the third party is usually required be truly independent of the landfill company. In this way, the diversity of circumstances effecting the two will tend to reduce the chance of failure by both from a common event at the same time. That underlies the objections to captive insurance companies whose financial well-being is closely interconnected to the landfill owner, making the possibility of a common failure likely.

In addition to diversification of risk, there are a number of specific measures that can be utilized to further reduce the risks of an insurance company failure affecting the state's coverage, because insurance companies can go bankrupt, too, as demonstrated by the Frontier experience discussed earlier, although that technically involved a surety, not an insurance company.[22]

The insurance rating agencies are what evaluates the long term health of insurance

22 *See* page 80.

companies, and we know that those rated A and above have set aside reserves that are generally understood to be adequate for long term health using sound underwriting principles.

So, first, the rules need to be changed to restrict insurance to those with A and above ratings. But, also, insurance risk should be diversified as well by requiring both pooling of insurance and reinsurance mechanisms, which, in combination, make the risk of insurance default extremely low.

The risk of even carefully devised insurance will not be zero. But, nothing has a zero risk, not even lock boxes, which can come up short because the site failure occurs prior to the lock box being filled over the anticipated operating life of the facility that never was completed. Furthermore, interest rates used to calculate the required amortization can be lower than projected, or unexpectedly high inflation can cause the costs of remediation to far exceed what was anticipated. Also, a municipality or the state could raid the lock box during a budget crisis if control over the instrument is not under the auspices of a truly independent third party.[23]

Proto-Insurance Alternatives. In addition, there are other non-traditional proto- insurance mechanisms for protecting against risk, as the financial markets have become increasingly efficient in the past several decades in first monetizing risks and then using securitization, or at other times complicated hedging techniques, to provide instruments that closely resemble the sort of protection from risks that was once provided only by insurance companies.

Over the last ten years, in particular, new approaches to financing risk have been developed that offer alternatives to the conventional use of insurance contracts. These include:

- Catastrophe-linked bonds (covering both single locations and entire portfolios - for earthquake and/or windstorm risk) ;

- Catastrophe-linked swaps (where e.g. the losses arising from a portfolio of windstorm risk are exchanged for those arising from a portfolio of earthquake risk);

- Catastrophe basis swaps (where instrument payout depends on value of actual losses incurred for a particular peril by a single insurer or reinsurer vs. value of an index which aggregates the loss experience of multiple insurers or reinsurers)

---

23 Earlier this year, the city of Tucson, Arizona "raided its landfill closure fund of $18 million and added it to the general fund balance" in order to shore up its bond rating. "Refuse Funds Rescued Tucson," *Solid Waste Report* (December 10, 2004) , at p. 241.

•Contingent surplus notes (derivative that pays investors U.S. Treasury rates or a share of an insurer's surplus, depending on whether certain contingencies arise)

•Catastrophe equity puts (Insurer or reinsurer has right to sell equity at a pre-negotiated rate if a specified catastrophe occurs)

• Loss-sensitive convertible debt (coupon is not paid if if losses or loss ratio exceeds a specified threshold)

• Residual value derivatives (Instrument pays issuer if aggregate value obtained on lease resales falls a specified amount below expected value)

• Life insurance securitization (Long-term cash flows which have low expense load are used to fund short-term cash flows which have high expense load);

Because the financial markets offer capacity over 1000 times that of the insurance market, they represent a potentially attractive way to finance "difficult" risks. The study group that we propose to follow up on this report should look carefully at such alternative risk financing methods, along with more conventional approaches including traditional insurance, the use of insurer pools and government-sponsored insurers, for different layers of coverage. In this way, the most efficient mechanism can be crafted to protect California's tax payers at the least cost.

Legal Authority. The authority to pursue the future corrective action part of this issue lies in the salient difference between the federal rules and California's. Although EPA limits financial assurance to corrective actions that are "known," California's adds "or are reasonably foreseeable."[24] Now that most recognize that all liner-based landfills will, in the words of EPA, "ultimately fail",[25] the eventual need for corrective action is reasonably foreseeable and a new program of corrective action insurance is required along with the existing maintenance assurance.

Nothing in the restrictive language of the statutes precludes this. While the law requires the Board to permit the use of any mechanism for financial assurance for minor *maintenance* (subject to conditions), that specification does not extend to assurances for reasonably foreseeable *corrective actions*. For the provision only applies its requirement to permit all mechanisms approved by EPA to matters dealing with "evidence of financial *ability*." "Financial ability," in turn, is defined as that which "provide[s] for closure and

---

24 27 C.C.R. §22221(a).

25 *See* page 11.

postclosure *maintenance*,"[26] there is no statutory impediment to limiting financial assurance for corrective action to insurance mechanisms if that is what is necessary to protect the State.

With regard to personal injury and property damages (or "operating liability"), the statutes require financial assurance for "claims resulting from the operations of the disposal facility which occur before closure."[27] While the law's *exclusio* principles makes the matter not entirely free from ambiguity, the fact that the ingredients for subsequent uncontrolled releases in the form of organic and hazardous wastes are all present before closure would seem to permit the Board to proceed to achieve the overall objectives of the Act. To be certain of the political acceptability of this position, the draft rules can highlight the issue along with the Board's interpretation, and invite legislative intervention if it believes the agency misunderstands the statute's intent.

Improving Existing Rules for Minor Maintenance

With all that said about the failure of conventional financial assurance mechanisms to address reasonably foreseeable corrective action, most continue to have vitality for routine minor maintenance during the delimited post-closure period. However, for the reasons set forth in the last chapter, one mechanism does not, and that is the financial means test. It should be repealed or, if a state's statutes do not permit that, at the very least, these corporate IOUs should be substantially conditioned.

The segregated funds, on the one hand, and third party instruments such as surety bonds and letters of credit, on the other, together continue to have vitality for routine, minor maintenance. Whether the first is preferable to the other is a difficult question to answer. Segregating cash obviously, on the surface, seems to provide more certitude because there does not appear to be any need to be concerned with the probabilities of both parties to the contract suffering financial duress at the same time.

At the present time, the simultaneous failure of the insurance company and the insured in the Frontier/Safety-Kleen case is freshest in observers' minds. For the moment, that probably will tend to bias contemporary opinions towards trust funds. If nothing else, the case raised the question of whether each counterparty's financial health is truly as independent of the other as originally thought, which is the basis for attributing greater assurance through diversification of risk when a third-party countersigns the long-term care obligation. In that case, the failure of the insurer appears to have been, at least partially, a contributory cause of the collapse of the insured.[28]

---

26 P.R.C. §43601(b) and §43600(b) (emphases added).

27 P.R.C. §44040.

28 *See* page 82 and NOTE 92.

However, the certitude associated with trusts is not consummated until the fund builds up to its full amount in equal amortization payments paid-in each year throughout the *expected* operating life of the landfill. There is a non-trivial chance that a landfill may be required to be shut down for regulatory reasons prior to the time it was anticipated to close, such as has recently happened in regard to the major Pottstown and Live Oak landfills, outside Philadelphia, Pennsylvania and Atlanta, Georgia, respectively.[29] Indeed, that also happened to a landfill that used a trust fund mechanism in California at the Yuba Sutter disposal area landfill, which was closed by the Regional Water Quality Control Board before the fund was complete.[30]

Also, premature closure may happen independently for financial reasons, or in combination with regulatory complications. Moreover, if landfill critics are correct about systemic failings of their design and operation,[31] a significant number of landfills might wind up shuttered unexpectedly at one time, creating very sizable financial burdens for the states.

Were segregated funds widely required, and were Pottstown and Live Oak a bellwether of a future trend that reaches a critical mass and culminates in cascading closures, there would be massive occurrences of unfunded trust funds at the same time.

Nonetheless, whether one concludes that trust or third-party assurance mechanisms are preferable in concept, as currently articulated, they each have shortcomings that require minor modifications to repair.

Finally, none of these mechanisms currently extend assurance for the maintenance costs that will continue far past the end of the defined post-closure plan. As is done to assure funds to maintain cemetery plots for eternity, perpetual care funds for maintenance of the landfill should be established. A lump sum set at closure that is sufficient, accounting for interest earning additions and maintenance cost withdrawals, to balance out and preserve the principle.

Condition Financial Means

By rights, the financial means test and corporate guarantee should be repealed outright. Contrary to the very intent of financial assurance, they offer no additional protection apart from their limitation to larger companies, which offers especially small comfort in the era of Enron's collapse.

29 Dawn Fallik, "State orders owners of landfill in Pottstown to close the site," *Philadelphia Inquirer* (December 4, 2003); Eric Stirgis, "Landfill closing affirmed," *Atlanta Journal-Constitution* (December 9, 2003).

30 Response to RecycleWorlds' FOIA Request from Garth Adams, dated January 13, 2004.

31 *See* page 8*ff.*

However, the laws that the Board operates under do permit compliance with financial assurance rules under any mechanism permitted under EPA's rules,[32] which includes the financial means test and corporate guarantee.[33]

On the other hand, the purpose of that part of the statutes is to provide for "the long term protection of air, water, and land from pollution due to the disposal of solid waste [which] is best achieved by requiring financial assurances of the closure and post-closure maintenance of solid waste landfills."[34]

More to the point, the same provision that bars "exclud[ing] the use of any mechanism permitted under federal law," also specifically adds that, at the same time as it approves the test, "the board may [also] adopt regulations that reasonably condition the use of one or more of these mechanisms to ensure adequate protection of public health and safety and the environment."[35]

Clearly, the fatal infirmities of the financial means test, which has led to its near universal condemnation, demands the adoption of conditions, without which the financial means test would fail, as the statute also requires, to "ensure adequate protection of public health and safety and the environment." Only by doing so can the Board harmonize these two otherwise inconsistent provisions.

The condition for any landfill owner using financial means should be a requirement that the company's balance sheet be backstopped with the other legitimate forms of assurance, trusts, surety bonds, letters of credit or insurance to cover the possibility that the company may fail to perform minor maintenance during post-closure due to either false or incomplete representations in its financial reports or significant changes in the market that erodes its former financial strength. That is to say, the purpose of requiring a second tier of assurance is only to cover the risks that the financial means test coverage fails.

The industry might be heard to complain that this would essentially negate its legal right to choose financial means. But, for one thing, the statute requires the Board to condition any instrument where it is necessary to protect the environment, and for another, the landfill owner is free to select insurance as its backstop. While surety bonds and letters of credit would effectively require the owner to fully collateralize the face amount of the risk, insurance companies quantify those probabilities and spread the risk among those in the same pool. In that way, the cost of a backstop insurance premium would be

---

32 P.R.C. §43601(a).

33 40 C.F.R. §258.74(e) and (g).

34 P.R.C. §43500.

35 P.R.C. §43601

the price that the market assigns to the risk of nonperformance.

If the private landfill industry's representations are correct and there are no serious risks, then that fact will be reflected in very low premiums, and the substance of the complaint evaporates. Only in the case where the market has determined that those representations are not true would the premium would be expensive. But, if that is the case, that is precisely the type of situation that the Legislature has demanded the Waste Board protect the State from.

This would seem to be squarely in the boundaries and intent of the laws. However, were there any serious question, again the Board could prepare such a rule amendment in draft and send a copy to the legislature substantially before its final adoption to invite the Legislature, should they disagree, to amend the statute to bar such an action.

Reform Trust Funds

Segregated trusts do not become fully funded until the originally projected closure date, leaving a possible funding hole when the operator fills the site faster than specified in the permit application or in the case when regulators order the shutdown of the site because it threatens public health or the environment.

Pre-funding the trust at the onset of landfill operations would, obviously, be the ideal remedy to fix this problem. However, setting aside such a large a sum before any revenues have been received, or borrowing the funds to do so, might be argued to be too onerous a burden on the landfill owner, especially for a new entrant into the market. If a reasonable compromise is sought, one possibility would be to use any of several standard techniques for accelerating depreciation, such as sum-of-the-years-digits (SOYD), in order to advance the time when most of the funds will have been set aside in the event there is premature closure. TABLE 12 illustrates how the current pay-in schedule compares to that accelerated basis.

Percent Unfunded in Trust Fund After Each Year		
End of Year	Straight Line	Sum of Years Digits
1	93%	88%
2	87%	76%
3	80%	65%
4	73%	55%
5	67%	46%
6	60%	38%
7	53%	30%
8	47%	23%
9	40%	18%
10	33%	13%
11	27%	8%
12	20%	5%
13	13%	3%
14	7%	1%
15	0%	0%

Source: Center for Competitive Waste Industry

TABLE 12

Essentially, after half of the scheduled 15-year site life, the current system would only have set aside half of the necessary funds, while SOYD would have set aside about three-quarters of the total.

Correct Third-Party Mechanism

The third-party mechanisms, including sureties, letters of credit and insurance, have a weak link that very well could turn out to be a very serious one. In the event of cancellation, the state must affirmatively act to cash out the policy before the three-month notice period expires or possibly wind up being responsible to care for the site during post-closure.

Third-party policies should be changed so that, upon the issuance of a 120-day cancellation notice, the state is deemed to have automatically exercised its right during that period to claim the funds on the 120th day, unless, before the end of that time, it affirmatively decides not to do so.

That change in the legal meaning that follows from inaction is essential because there is a very serious risk that the state will, for innumerable reasons, fail to act in the 120-day period, even though it would intend to. Issuance by default has long been discredited as a regulatory procedure because, historically, it has led to unintended

approvals occurring due to the passage of time, rather than regulatory intention.[36]

Add Perpetual Care for Maintenance After Post-Closure

None of the existing mechanisms, which are only intended to provide assurance for the expense of minor maintenance until the defined post-closure period ends, presently extends any assurance for after that time, even though care will essentially be required forever.

Although the current statutes may not provide the authority to do so, to correct for this omission, the amount of a trust fund at closure would need to be calculated using a perpetual care calculation, which is to be sufficient, after netting each year's inflation adjusted earnings on and withdrawals from the fund, to retain the necessary principle amount in order to pay the cost of care in perpetuity.

Alternatively, sometimes consideration is given to the use of the finite-risk form of insurance and other third party mechanisms, instead of trust funds, because they have tax advantages. If this is done, prior to closure, a fund should be accumulated sufficient to pay the premiums forever.

To do this, the following simplified equation can be used to approximate the size of the fund whose earnings will be sufficient to pay the expected annual outlays, after accounting for inflation, while leaving the principle intact.

$$Perpetual\,Care = Initial\,Payment_{future\,dollars} \times \frac{1}{Interest - Inflation}$$

EQUATION 1

The initial payment is the amount anticipated will be required to be spent on care in the first year following closure, after accounting for inflation in the years before the site is closed.

[36] See, e.g., 40 C.F.R. §70.8(e). *Virginia v. Browner* (4th Cir. 1996), 80 F.3d 869, 874.

Chapter 4

The Industry Proposal is Not Relevant

Taking measurements shortly after closure, while the cap is maintained, disguises the major problems almost certain to follow in the future

A consortium of landfill companies, consultants and engineers have submitted a report to the Board, financed by Waste Management, and organized by the waste industry's Environmental Research and Education Foundation (EREF), coordinated by GeoSyntec, and dealing with financial assurance (the "Waste Industry Paper"). Among the listed authors are officials from Waste Management, Inc., the private waste industry trade association, consultants with extensive client lists of landfill companies, and two professors.[1]

In this chapter, we evaluate the report to determine whether it has any use by states in setting their post-closure care and financial assurance requirements.

The stated purpose of the Waste Industry Paper is "to present a performance-based system for evaluating post-closure care at MSW landfills." Essentially, the report lays out the authors' view that, first, the length of post-closure care is a site specific issue, and, second, taking certain measurements will establish when long term care can be reduced and/or terminated.

As to the first point, the fact of site diversity is certainly not in dispute – *so long as it not meant to imply that, at the end of 30 years, we have the tools to conduct a site specific analysis that can provide a valid technical basis to determine that facility's threat to the environment after the end of post-closure care or that a site can be considered stabilized before the second wave.* As to the second, and as to the authors' bona fides to make that determination, they ignore the salient facts, and, consequently, their paper is not useful for decision-making by the Board.

---

[1] Jeremy Morris, *et al.*, "Performance-Based System for Post-Closure Care at MSW Landfills — A New Approach to the Current 30-Year Time-Based System of Subtitle D" (the "Waste Industry Paper") (2003). On-line at: http://www.erefdn.org/rpts_summary_ordrs/PostClosureCareInterimRept.pdf.

For one thing, the whole idea of taking measurements at the end of the post-closure period in order to predict environmental threats decades later after the cap is breached is technically invalid. That is precisely when leachate generation is at its lowest point. For another, the prism through which the authors filter the facts to reach their conclusions does not reflect the direct interests of the State.

The Proposed Procedure Is Technically Invalid

In place of a relatively fixed 30 year post-closure period, the Waste Industry Paper posits a new structure for post-closure care which it terms the Evaluation of Post-Closure Care Model. The purpose of the model is said to be "to enable regulators to make confident decisions on maintaining, extending, reducing, or modifying the current 30-year post-closure period."[2]

To help make those decisions, the model proposes taking measurements of the quantity and quality of the leachate in the collection system, gas management, groundwater monitoring wells and cap maintenance toward the end of the base-level 30 year post-closure period and sets "trigger points" for exceedances that would require either additional maintenance or remediation.

But, their proposal ignores the fundamental quandary that liner-based landfills must confront. The barriers, and their maintenance, only delay environmental threats until after the time the site is no longer cared for. Unfortunately, the better the job of maintaining the site – which is what these measurements chronicle – the more severe will be the environmental threats that will be transferred to the future after care ends. For good site maintenance quickly drives moisture out of the load after closure to conditions that are so dry they contain less moisture than in a piece of lumber, or as Bill Rathje often says, "bone dry."[3]

In that state, and until the landfill cover degrades to let rain reenter the site resuming decomposition, there will be very little biological activity to generate leachate and landfill gas. The whole premise of the Waste Industry Paper is that these deceptively low readings expected at the end of post-closure mean the site has stabilized and is no longer a threat to the environment. But that is not true. The reality is that such a clean bill of health is a mirage that masks the looming cover failure and second wave of leachate and gas generation.

Further ironies abound in the waste industry position, which rewards the sites with the tightest seal. If the site has been kept dry, then less of the organic portion of the trash

3 U.S. Environmental Protection Agency, *Anthropogenic Methane Emissions in the United States: Estimates for 1990* (Report to Congress, April 1993) (EPA 430-R-93-003), at pp. 4-4 to 4-8. William Rathje, *Rubbish!: The Archaeology of Garbage* (HarperCollins NY 1st ed.)(1992), at p. 115.

will have rotted prior to closure, with the resulting leachate being collected and treated. But, after post-closure ends, the amount of the decomposable fraction, which carries over to threaten the future, will be that much greater.

Moreover, the longer the post-closure period is extended, the more certain there will be no responsible parties or functioning pumps or monitoring systems to respond when the barriers ultimately fail and the site is flooded.

The truth of this rebuttal is found in the conclusions of the EPA and its Inspector General. Twenty-five years ago, when EPA issued its proposed Subtitle regulations, it noted–

> "[E]ven the best liner and leachate collection system will ultimately fail due to natural deterioration, and recent improvements in MSWLF containment technologies suggest that releases may be delayed by many decades at some landfills. For this reason, the Agency is concerned that while corrective action may have already been triggered at many facilities, *30 years may be insufficient to detect releases at other landfills.*"[4]

Even more on point is the EPA Inspector General's conclusion that this is a fundamentally flawed approach. To repeat her previous citation —

> "The [Landfill Groundwater Rule] is broad enough to allow extensions of post-closure care for potential problems. However, the regulation implies that there should be indications from leachate or groundwater monitoring that the facility may present a risk to human health and the environment. *Although there may be no releases or indications of release at a landfill for the first 30 years of post-closure, there may be a potential for releases of hazardous waste in later years.*"[5]

But, not only do the Inspector General's conclusions demonstrate that the industry paper is invalid, GeoSyntec, the same consulting company that now puts this proposal forward, recognized the same thing. In a lengthy report focusing on liner performance that GeoSyntec and two others prepared for the EPA, they found:

> "After closure of such a landfill, the final cover system (which will typically contain a [geomembrane] to satisfy present-day federal regulations) will essentially eliminate infiltration into the landfilled waste. Consequently, over time, leachate and gas generation will progressively decrease and eventually cease. A nominal stabilization of waste (i.e., partial conversion of the decomposable organic constituents and leaching or fixation of hazardous waste constituents) will probably occur by the end of the post-closure period, although this process will be

4 53 FEDERAL REGISTER 168, at pp. 33344-33345 (August 30, 1988) (emphasis added).

5 Inspector General, *supra*, at p. 33 (emphasis added).

incomplete due to a deficit of moisture in the landfill. ... The waste will retain a latent capacity to generate leachate and gas and release pollutants should moisture be reintroduced into the landfill in the future. The goal with this strategy is to prevent a reoccurrence of leachate or gas generation in the future. This goal can be achieved through perpetual maintenance of the final cover system. ...

"[However, a]fter the post-closure period, requirements for ongoing maintenance and monitoring are suspended ... consistent with current regulations that prescribe a minimum post-closure period of 30 years. For this strategy to be effective in the long term, events that occur after the end of the post-closure period must not result in unacceptable groundwater or air pollution. These events may include degradation of the final cover system, renewed leachate and gas generation, accumulation of leachate and gas in the unit, and, eventually, migration of these waste by-products from the unit. An assessment of the eventual impacts requires evaluation of: (i) the potential for long-term degradation of the final cover system; (ii) water infiltration through the final cover system in its long-term condition; (iii) leachate and gas generation resulting from the water infiltration; (iv) the potential for long-term degradation of the liner system; (v) gas migration through the final cover system in its' long-term condition and leachate and gas migration through the liner system in its' long-term condition; and (vi) impacts to groundwater resulting from the leachate and gas migration and impacts to air resulting from gas migration.

"Potential groundwater impacts associated with this type of strategy depend on a variety of factors. Any impacts may be acceptable if long-term contaminant migration rates are low and/or if the landfill is located in a favorable hydrogeologic setting. Conversely, if anticipated contaminant migration rates are high and the landfill is in a vulnerable hydrogeologic setting, the long-term consequences of this strategy may not be acceptable. In the future, when regulators and design engineers assess the need to extend the post-closure period of a particular landfill beyond the 30-year regulatory minimum, they will need to perform an assessment of the type described in the preceding paragraph. The authors recommend that, for new landfills, this assessment process be included at the initial design stage, within the framework of a long-term management strategy."[6]

To pull out the essence of this lengthy and guarded exposition for clarity: at the time the post-closure period ends — which is when the industry paper proposes to test for future threats — leachate will have "ceased" yet "[t]he waste will retain a latent capacity to generate leachate and gas and release pollutants should moisture be

G-4.) This report can be found on-line at: http:/www.epa.gov/ORD/NRMRL/Pubs/600R02099/600R02099.pdf.

reintroduced into the landfill in the future."

In the end, were the private waste industry's plan adopted, those landfills which have been well constructed, operated and maintained will probably be permitted to reduce their post-closure period to substantially less than 30 years – which, presumably, is the very point of this exercise. Indeed, their tables, which show leachate flow rates trending to negligible levels by nine years after closure suggest that, in application, their conclusions will lead to an attempt to end post-closure care after 10 years following closure.[7]

On the other hand, those which have not maintained their sites might be required to extend post-closure to more than 30 years in order to have time to repair the landfill cover so that the tests, which essentially measure reactions only when water infiltrates through inadequately maintained covers, can be passed.

But, in either case, the problem is not solved. Rather, once again, pollution is only shifted to after the end of post-closure – whenever that occurs. And, if the problem is not solved but only shifted in time, the landfill, which by that time may be leaking, will wind up as an orphan of the State.

Therefore, whatever use that the private waste industry chooses to make of the model, the proposal is not relevant for the State of California's concerns.

The Proposers' Viewpoint Does Not Reflect California's Interests

There is another set of issues with regard to this report separate from the disconnect between the proposal and reality. That relates to the extent to which the drafters' opinions can be relied upon to implement the model were it adopted.

The authors of the Waste Industry Paper have years of expertise in landfills. No one would question their credentials. However, when choosing what questions to ask, which facts to acknowledge, what weight to accord competing claims and what conclusions to draw, everyone views these controversial issues about landfill safety through the unique lens that reflects the lives that they have lived and, even more so, the amalgam of interests they represent, including by those that employ or contract with them.

That is an entirely proper and appropriate thing in our society. No one can question everyone's right to make a living in a profession of their choosing, and, in

7 Environmental Research & Educational Foundation, *Performance-Based System for Post-Closure Care at MSW Landfills: A Procedure for Long-Term Stewardship Under RCRA Subtitle D* at the Wisconsin Department of Wisconsin Department of Natural Resources Natural Resources (March 11, 2004), at FIGURE 3.

drawing his or her conclusions, to sift the facts through a strainer that reflects those interests. But acknowledging that right of the individual does not, on the other hand, mean every expert's opinion can be relied upon by regulators merely because of the breadth of his or her credentials.

In the case now before the Board, several of the authors of the report are employed by Waste Management, Inc., and the waste industry trade association. They have a legitimate self-interest in minimizing regulatory costs on their industry and shifting to the public as much as they can of the risks that flow from their choices. For that, they cannot be properly criticized. But, neither can they complain if the Board asserts the competing interests of the public and the State.

For the trash industry's interest is not the same as anyone else's, and certainly not of the State of California, which in a zero sum game with the large waste companies over who will bear the palpable long term risks after landfill closure. And, this concern over the objectivity of the reports' authors is not limited to the obvious self-interested landfill companies and their trade representatives.

The concern extends to the independent consultants and academes who also penned this report and, notwithstanding their elaborate depictions of models and the modules within the models, also choose to ignore the overriding problem of liner-based landfills that vitiate the very underpinnings of those models. Any hope that their influence might leaven the more obvious self interest of the landfill industry is clouded by that omission on the face of their document. It is also shown by their past record.

As a case in point, one of the paper's authors is employed by GeoSyntec, a major landfill consultant. GeoSyntec has been subcontracted by the Board to undertake a Landfill Facility Compliance Study that is supposed to provide a comprehensive picture of MSW landfill environmental performance in California.

Yet, their study design intended to discern environmental problems was largely limited to listing currently observed code violations at operating and recently closed landfills and comparing the number of reported violations to the various performance characteristics of landfills. However, the major problems are most likely to occur in the future, not in the present where the analysis focuses.

When a tear, rupture or hole appears in the plastic liner, the two feet of underlying clay is rated to retard seepage for approximately 25 years (unless the clay is cracked directly under the break). Depending upon hydrological conditions, the escaping leachate may take 20-100 years to reach the periphery where the monitoring wells are arrayed, but are so far apart, the tendril-like plume is almost to certain to pass between them undetected. By the time we become aware of a major problem, the aquifer will almost certainly have been intractably contaminated, but that will not be for decades

hence.[8]

Landfill gas emissions, too, are unlikely to be cited for rule violations, inasmuch as no direct monitoring of gas emissions is even required and the indirect tests are meaningless.[9]

Consequently, the snapshot Geosyntec is taking of infractions recorded today is exceedingly unlikely to provide a glimpse of the big picture.

The thing that is really being assessed is the difference in observed short-term leakage of leachate at unlined compared to lined landfills, and as regards lined landfills only, the quality controls used during construction of those landfills and the rigor of enforcement. That may tell us something that would further support the decision that was made more than twenty years ago to reject natural attenuation and require liners, but nothing about whether the barrier systems resolve the problem over long time frames. Criteria that might uncover systemic problems in the overall liner-based philosophy itself decades in the future has been omitted, even in the face of the fact that Subtitle D is largely discredited.

Thus, when GeoSyntec was petitioned by the National Recycling Coalition to add

---

8 *See* NOTE 26 on page 13 for a detailed description of these issues.

9 The Landfill Air Rule is found at 40 C.F.R. Part 60 Subpart WWW, and contains no provisions that require direct monitoring of gas emission rates or volumes because the gas is released across the landfill face that may exceed 100 acres, not through a smokestack.

There is a requirement that the surface concentration of methane above the landfill's face not exceed 500 parts per million, which is sometimes called the "500 ppm" or the "sniff" test. This measurement is to be taken quarterly, every 98 feet along the perimeter of the landfill and in a serpentine grid pattern across the collection area during typical weather conditions. 40 C.F.R. §60.753(d) and §60.755(c). The test does not, however, have any technical validity for the following reasons:

(1) There is no established relationship between the 500-ppm concentration limit and anything other than odor control. Five hundred parts per million is essentially an operational standard – like the maintenance of negative pressure and oxygen/nitrogen infiltration provisions. It is only intended to approximate the release level of a gas system that is as well managed as it can be within severe cost constraints. But, that engineering approach never asks whether a well maintained system using current design parameters achieves the legally mandated protection of public health and the environment.

(2) The measurement methodology is structured to only detect diffused emissions such as might occur in a clay-only cap, and it will not detect emissions at landfills with a composite landfill that includes a synthetic geomembrane in which uncontrolled releases are funneled through localized hot spots. Using Poisson probability analysis, in a hundred acre landfill with 10 hot spots, the probability of detecting just one of those 10 hot spots in a year using EPA's protocols would be 0.0522%, or one in 2,000. The probability of detecting all 10 of them would be 2.4×10^{-38}.

(3) The particular monitoring protocols in the rule are so easily manipulated as to thoroughly undermine the rule's effectiveness. 40 C.F.R. §60.755(c). A prominent example would be by taking readings on days with high barometric pressure that suppresses gas releases.

data fields for factors that might illuminate the problems that will occur in the future, the consulting firm refused.[10] A good example that illustrates the type issues in contention relates to the leachate collection system (LCS), which is mission critical for the safety of the site.

The LCS's job is to collect and remove the liquids that drain to the bottom of the landfill in order to prevent their pooling that would threaten liner integrity, site stability and the so-called "bathtub effect."[11] Unfortunately, the collection pipes and their overlying drainage beds are prone to clogging, which can cripple their functionality. Also, as the size of landfills increases, the weight of the overburden becomes greater, the distance to conduct repairs longer, and the length of the collection pipes must increase proportionately. That longer length compounds the drainage problem because the pipes are installed in 12-20 foot segments. Over a quarter mile run, that may require laying more than 100 segments. So many segments are difficult to set in a straight line that can be readily cleaned, and that many junctures are created that may, over time, become unglued.

A continuing threat to the ability of these systems to remove excess liquids is the problem of clogged pipes from microbial action and clog materials such as sand in the drainage beds, exacerbated by organic matter and calcium concentrations from the waste load.[12] That is why annual clean outs is so critical for maintaining performance through post-closure. One of the indices of impending problems in this critical component of these systems is the record of the annual clean outs of the collection pipes. Those records will show whether there was an inability of the clean-out head to transverse the entire length of the pipe due to blockages.[13]

And, indeed, this is not an infrequent occurrence that can be ignored. When the Wisconsin Department of Natural Resources undertook an informal survey of LCS performance in the state, it found 62 collection lines at 14 landfills had been reported to the agency as too clogged to permit the passage of the clean-out head, and many of those were constructed to modern pipe standards.[14]

Unfortunately, there was insufficient political support that would have permitted a technical follow up to determine whether there had been an increase in the hydraulic head over the liner in order to properly assess the severity of the (continued...)

Evidence of clogged lines is one way to discern whether serious problems may lie down the road. But GeoSyntec has rejected looking at the issue. Instead, it acts as if the Board's interest in evaluating landfill performance could be assuaged by focusing solely on factors that have almost no chance of disclosing the kinds of future problems of major concern and by excluding such bellwether criteria like LCS performance that have some chance of uncovering the possibility of future problems.

Another example is found in the lack of objectivity that mark the work of Prof. Morton Barlaz, a coauthor of the Waste Industry Paper and one of the principals of EPA's Life Cycle Management Study, which compares competing alternatives to managing discards. Among many other matters of concern, when Prof. Barlaz quantified the ability of the bottom liner to prevent leakages, he proposed a "leachate collection efficiency of 99.8%" for the long term over centuries.[15] This, even though, as noted, EPA's technical staff, the agency's waste office director in charge of writing the Subtitle D rules, and a wide spectrum of those within the landfill industry anticipate that the liners will fail while the landfill continues to represent a threat to the environment.[16]

In a meeting with the National Recycling Coalition, he defended his assumption that liners would perform perfectly for such a long time based upon studies of leak rates from hazardous waste landfills. Under RCRA's Subtitle C, hazardous waste landfills are required to have a double composite liner system, with leak detection in between, that makes it possible to take measurements over the short-term time frame during which the cover is rigorously being maintained. But, by definition that analysis contained no data of use to predict long term performance after maintenance of the cover ceases 30 years following closure.

For the sake of argument, let us ignore all these reasons why the basis for the industry proposal is unsound and assume for the moment that their plan is adopted in order to anticipate what is likely to happen. Then, even if the proposed post-closure testing finds excess leachate concentrations, their predispositions create further issues on how the results will be interpreted. Those biases make it difficult to exclude the possibility that these practitioners will reinterpret the results and find mitigating circumstances that obviate the need to act.

They may be expected to fall back on theories of natural drainage through gravel beds to purportedly sidestep the need to repair clogged leachate collection lines, and natural attenuation when leakages finally become apparent to avoid a Superfund cleanup.

14 (...continued)
problem.

15 U.S. Environmental Protection Agency, *Life Cycle Process Model Documentation: Calculation of the Cost and Life Cycle Inventory for Waste Disposal in Traditional, Bioreactor and Ash Landfills* (1999), at Part 7.2.1, p. 3.

16 *See* page 11.

But, these are concepts that were discredited twenty years ago, are not permissible under Subtitle D during operation, and hence, ought not be allowed afterwards.[17]

The Ultimate Test for the Validity of This Proposal is Simple

Fortuitously, telling concessions recently proffered by Prof. Barlaz during a debate over his proposal make the final assessment of its validity by the Board simple, and reduce it to a matter of policy that requires no specialized technical knowledge.

Prof. Barlaz was confronted with the fact that, at the time he believes declining leachate flow rates may justify ending scheduled care, he has no data to show that the site will not leak later should the cap fail because substantial volumes of organic wastes remain. Therefore, he was asked, wasn't his argument dependent on the cap being maintained "forever" to insure that rainfall never reenters the waste load. For, when the cap "ultimately fails," as EPA repeatedly has said it eventually will, and moisture reenters the site, there will a second wave of major uncontrolled releases as a function of that volume of decomposable material remaining in the waste.

Revealingly, he did not deny the fact that, were the cap to fail later, he had no basis to assure the landfill would not then be a potential threat to people and the environment. Instead, he rested his case on a claim that the cap would be maintained for the indefinite future — but, most notably, by the states, not by the landfill owners. He did not, as one may imagine, explain the significant implications of how this hand-off would work. Let us elaborate on what that might entail, because almost no one else will see the wisdom in such an idea.

Landfill Owners Would Shift the Burden of Care to the State

To defend the fact that he does not have any data on the amount of the decomposable fraction remaining after closure — at the same time he maintains that no

---

17 *See* 40 C.F.R. §258.40(a) and (b), which are the sections in EPA's Subtitle D regulations that require both a composite liner and an active leachate collection system, thereby ending the prior regulatory era that relied upon natural attenuation sites without engineered barriers. Even though natural attention was no longer permitted in the design of landfills after the promulgation of the Subtitle D regulations in 1991, EPA came under intense pressure from the landfill industry to accept natural attenuation as an appropriate corrective action to respond to engineered landfills that later failed, threatening public health or the environment. Environmental Protection Agency, *Symposium on Natural Attenuation of Ground Water* (EPA/600/R-94/162, September 1994). Concerned about hostile public reaction that it was leaving polluters "off the hook," Guy A. Tomassoni, "The U.S. EPA Regulatory Perspective: Natural Attenuation as a Remedial Option for Contaminated Ground Water, *Symposium*, but unable to completely reject the proposal in all situations, the Agency's final directive on the subject clearly disfavored the practice and sought to impose substantial procedural obstacles to its being relied upon without a substantial active treatment counterpart. Environmental Protection Agency, *Use of Monitored Natural Attenuation at Superfund and Underground Storage Tank Sites*, (RCRA Directive Number 9200.4-17P, Ap 21 '99).

measurements need to be taken as a precondition before ending post-closure care to demonstrate that there is no substantial latent bioactivity — he made a telling admission:

> "You asked if the site will no longer be cap dependent. That's a pretty tall order...I don't in my mind see us working to a situation where we are not cap dependent...If [uncontrolled releases later] did occur, I think we have to go right back to the fact that the cap failed.
>
> "If the cap failed, and if *you* do what we said to do in the Cap Module, you'd go in and fix the cap.
>
> "Now if you don't believe that *society* has the mechanism to insure that you go back and fix the cap, I personally can't address that. That's a regulatory matter."[18]

What Prof. Barlaz appears to be telling the states is two things, and the validity of the industry approach is completely dependent upon them:

① The final cover is monitored and maintained far beyond 30 years, and, in fact, in perpetuity, and

② The responsibility for perpetual care and all of the attendant costs will be undertaken by the states (assuming that is what he intends to imply when he indicates that "[y]ou" and "society" will undertake care), but in any event not the owners of the landfills.[19]

Under the landfill industry model, then, in practice sometime following 10 years after a landfill closes when leachate flows are expected to be negligible, any of the minor assurance funds that are still posted would be returned to the owner.[20] The state would then effectively assume responsibility by default for both monitoring the sites and repairing, and periodically replacing, the final covers on all of the closed landfills, as well

---

18 Presentation by Prof. Mort Barlaz before the Wisconsin Department of Natural Resources' Landfill Stability Subcommittee of the Leachate Collection System Technical Advisory Committee, on March 1, 2004, in Madison, Wisconsin (emphasis added). A video tape of the proceeding prepared by the agency.

19 On consideration, once Prof. Barlaz was forced to acknowledge the fact that a landfill remains a potential threat nearly forever, he really had no choice but to make the assumption that society (or the state) would assume these perpetual care responsibilities. For there would not appear to be any credible basis to assert that corporations can be expected to have an existence that extends for hundreds of years.

20 Or alternatively, depending upon what financial mechanism was used, the associated liability recorded on the books of those using the financial test would be removed, or premiums paid to third party guarantors would be terminated.

as raising the funds for the substantial costs.[21]

That is to say, closed landfills and their final covers do not take care of themselves. Active maintenance is essential and that would, truly, be an monumental task, as costly as it would be difficult.

Perpetual Periodic Cap Replacement Would Cost $55 Billion

If, for the moment we just look at replacing covers after the end of their typical warrantee period of 20 years,[22] and, put aside the cost of maintenance in between replacement, the costs to do so would be very substantial.

While the cost for cap replacement is site specific, typical costs are approximately $120,000 per acre.[23] Landfills in California, for which the Board has data, average 318 acres per site.[24] California currently has 240 landfills under financial assurance.[25] If, as a working number, 300 closed landfills were to become the responsibility of the state, approximately fifteen landfills would require cap replacement each year, essentially forever, at an aggregate cost each year in today's dollars of $572.4 million.

When an expenditure for some purpose is required to be recurringly made over a number of years, the cost in a single year does not adequately value its true magnitude, because the future stream of continuing payouts are not accounted for. A better measure of its cost in this case is considered to be the value today of all those future years'

---

21 To be clear, the Industry Proposal does not explicitly make the statement that the landfill owners' legal responsibility will terminate in as little as 10 years after closure. But, that would appear to be the only result of a process that purports to establishes a basis — deliberately erected on palpably invalid principles — for finding that a well maintained site closed only 10 years is no longer a threat to the environment. It is the only result because, other than for poorly maintained sites, the opposite interpretation would not result in any change in the status quo, other than less frequent monitoring, a very minor cost item.

22 Inspector General, *RCRA Financial Assurance for Closure and Post-Closure, supra*, at p. 31.

25 CIWMB, SWIS Data Base.

outlays, something that is referred to as its "present value." The present value today of the stream of all the annual costs in the future of periodically replacing the caps, were it realistic to accomplish and it achieved its intended purpose, would be $55.6 billion.[26]

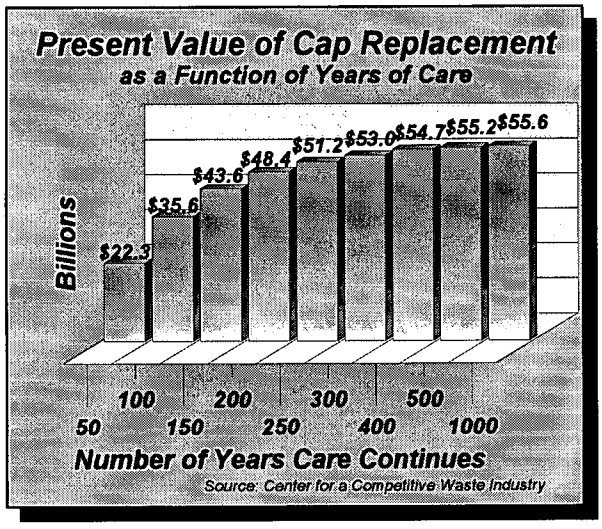

FIGURE 7

FIGURE 7 shows how the present value stream of that level of expenses varies with the length of time the responsibility is performed. It indicates that the value today of all those future expenditures begins to plateau at about $50 billion after 200 years, and hyperbolically reaches its zenith at around $56 billion after a thousand years of care. This would be 86% of the $64,878,701 in revenues that California raised through all its taxes in the most recent fiscal year.

However, while disturbing enough by itself, this hypothetical exercise begs the more significant questions in five ways.

The Legislature and Governor Would Have to Agree to Raise Taxes

First off, the proposal assumes that the Legislature and Governor would be willing to raise the necessary taxes by even one dollar, nonetheless a half-billion dollars each and every year, essentially forever. Worse yet, the political pain entailed in raising taxes to that extent would not go to things that public officials like to claim credit for in order to offset the calumny they would receive from irate citizens for the new levies.

The significant tax increase would not, for example, reduce class size in the critical lower grades from 20 to 16 students, nor would it provide health care for 40,000 families below the poverty line, nor relieve congestion in east L.A., nor would it provide a 5% reduction in corporate taxes to improve business climate.

Instead, the hard fought tax increase would be used to pay for the costs of managing the sites abandoned primarily by three companies in the private sector, which had earned substantial profits from them during the units' operating lives. This would seem to do violence to the very tenets of our free market system, which is erected on the principle that prices are fairly allocated when beneficiaries of a good or service pay the attendant costs, as well as to people's basic sense of fairness. A high probability cannot be attached to such a tax increase being enacted.

[26] This calculation assumes a long term inflation rate of 3% and a discount rate of 6% for the present value.

Without the necessary funds from the Legislature, the Waste Board or its successor agencies would be unable to do anything to maintain the sites.

The State Will Need Institutional Memory and Resources for Centuries

The so-called "cap module," which Prof. Barlaz looks to for resolving these major problems, also assumes that the state will have the institutional capacity to perform such a task for that length of time, even if funding were not an impediment.

In this regard, there must be a distinction made between the presumed vitality of the states as an organizing principle of government in the U.S. for a substantially longer time than private corporations – which many would agree with – and the ability of their administrative agencies to continuously monitor and remediate several hundred sites spread across the state for centuries, through changes in administrations, parties in power, bureaucratic retirements, administrative reorganizations, economic vicissitudes, tax revolts, earthquakes, global warming and other environmental catastrophes, and any number of other epoch changing events – which most would question.

Therefore, even if the will and capacity on the part of the state were present today, there is no reasonable basis to assume that would be perpetuated for such a long period of time, five times as long as the entire history of California to date.

Annual Maintenance Needed as well as Cap Replacement

Although some manufacturers warrantee geomembranes for 20 years, that does not, in any way, necessarily mean that one can reliably wait for two decades before involving oneself in maintaining the cap to last even that long. Warrantees do not generally extend to damage from improper installation or burrowing animals, intruding roots, subsidence that either causes ponding at the surface, rips the plastic sheet or breaks the seal around the sagging gas well heads, or any other event that punctures the liner. In the absence of an aggressive maintenance program, that can occur at any time between the times when the entire cap is replaced.[27]

---

27 A standard warranty exclusion states:

> "This Warranty is effective from installation and is for a period of 20 years for 60 mil HDPE when installed for normal uses and services for which it is designed and manufacturer, in any customary weather which may be encountered and which is not customarily considered to be in the nature of an Act of God, casualty or catastrophe, such as but not limited to earthquake, flood, piercing hail or tornado. Normal use and services excludes, among other things but without limitation, the exposure of the liner to chemicals known to be harmful to the liner, mechanical abuse by machinery, equipment or people or excessive pressure or stress from any source."
>
> "...
>
> "In no event shall liability exceed the amount of the sale price of the material...and under no

(continued...)

In fact, then, if the caps are not replaced for 20 years, there must be a monitoring regimen to detect and then patch any intermittent tears or ruptures of the thin liner no thicker than a credit card laid and seamed together over hundreds of acres during the years between replacement. Otherwise, the liquid intrusions will rekindle another wave of leachate and gas generation, as a function of the remaining organic fraction.

Moreover, one or two such minor intrusions of liquids will probably not remain localized. Seemingly minor leakages at one location will tend to cascade catastrophically, because the process of decomposition will cause voids below that will lead to settlement at the surface over that spot. As the ground under the thin liner settles, additional and larger breaks in the barrier will probably follow letting in even more rainfall, causing successive rounds of cascading failures that soon will reach major proportions.

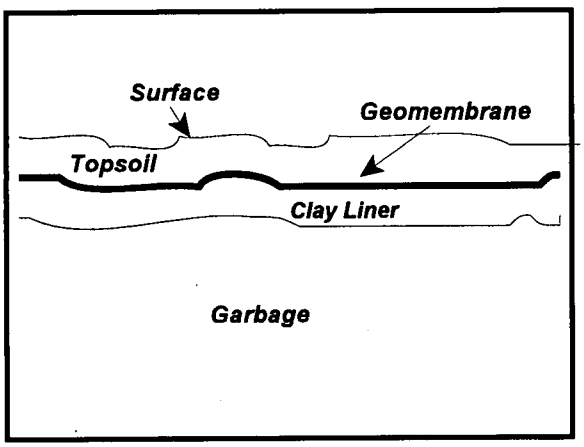
For these reasons, absent such a continuous and aggressive maintenance protocol, again across hundreds of landfills each and every year for centuries, the periodic cap replacement program, even if it were feasible, would be of little utility.

Cap Maintenance is Extremely Difficult and Ineffective

Even the best run maintenance program runs into the problem that there is no easy way to detect early ruptures in the geomembrane.

One part of cap maintenance is mowing the lawn to clip trees whose roots might puncture the liner, and also replacing and regrading topsoil lost to erosion. But, the other part is the detection of potential problems in the underlying barrier layers before they become serious and hard to address. This is something that is difficult to do.

For the key low-permeable synthetic geomembrane is buried under two feet of dirt (*see* schematic along side), which is used to check erosion and absorb infiltration. Then, beneath the geomembrane are two or more feet of clay that, if not desiccated or cracked, delays the movement of liquids in or gas out of the landfill, and together with the plastic sheet, makes up the



Cross section of landfill cover

27 (...continued)
circumstances shall there be any liability for incidental or consequential damages..."

composite liner.[28]

Thus, whether at any point in time there is degradation of the barrier layer, two feet below, and not visible from, the surface, is not something that is possible to observe directly, other than distressed vegetation and settlement. There are more reliable indirect indices of cap tears that are beginning to emerge, but they are not yet demonstrated nor are they easy to apply. An example is the development of infra-red scanning techniques to identify high flux points of methane emissions across the surface, because landfill gases tend to rapidly escape where there are small tears in the cover.[29] Others are under development.

But, these all tend to be costly, time consuming, labor intensive, sophisticated, subject to interpretation and complex. Multiply that by the more than 100,000 acres of aggregate landfill cover in California, and subdivide that total among the 300 different sites where these sorts of complicated tests need to be done, each year, for hundreds of years, and the enormity of the task becomes apparent, and, in the end, highly improbable to accomplish, especially on a timely basis.

At the point at which initial infiltration has caused settlement, indentations and bowls will begin to be visible at the surface in the event someone does a comprehensive survey of the survey over those extensive areas. But, even then, the question remains: by that point in time, will the problem has progressed to the point that the forces leading to major site failures may have already been put in motion.

Perpetual Care is Impractical, and Therefore, Far More Costly Remediation Will Be Required

If, because of all these obstacles, the State is today acknowledges it is either unwilling or unable to provide effective maintenance of the cover at least each year between periodic cap replacements over the next thousand years, then a whole set of far more costly consequences arise that dwarf even the major expense involved in cap replacement, and raise fundamental questions about the reasonableness of the theoretical modules in the Waste Industry Paper. Even if the State does not acknowledge this limitation, public institutions are unable to endure for those extended periods of time.

The key safety feature in a landfill intended to address the problem when liquids eventually infiltrate the cover is the leachate collection system (LCS). During operation, and ostensibly extending through the legally circumscribed 30-year post-closure care

---

28 40 C.F.R. §258.60(a).

29 Stephen Piccot, *et al.*, "Field Assessment of a New Method for Estimating Emission Rates from Volume Sources Using Open-Path FTIR Spectroscopy," 46 JOURNAL OF THE AIR & WASTE MANAGEMENT ASSOCIATION 159 (February 1996). Also, a careful inspection of vegetation to identify brown spots, which might be due to methane leakages, is better than nothing, but is not a comprehensive solution.

period, the system's perforated pipes, arrayed in gravel drainage beds over the bottom liner, remove liquids that have entered through tears in the cover and drain to the bottom of the landfill. Because liquids trigger decomposition that creates and mobilizes pollutants, and also threatens site stability, the LCS is mission critical to the safe management of the site (*see* page 51) .

But, after postclosure care, the LCS is scheduled to be removed from service and will no longer be operational.[30] Moreover, there are many serious concerns, which we described previously, whether the systems will still be functional in any case, even if someone were to desire to resume its operation after the 30-year care period has ended.

This means a that a cover liner, once it becomes slightly damaged, and is followed by early infiltration, can all too quickly run out of control, at which point in time the original safety systems will not be available to intercede. If this likely event occurs, then the costs that will be incurred could well be those necessary to remediate the site and reimburse third parties for damages to them. For a mega-fill in a populated area with normal rainfall, this could well run into the hundreds of millions of dollars – per site – as the earlier discussion pointed out.[31]

These, then, are the very significant concerns that are ignored when Prof. Barlaz conveniently dismisses considering the feasibility of assigning to the states the enormous custodial responsibilities of insuring the integrity of the final covers at thousands of landfills for hundreds of years –

> "Now if you don't believe that *society* has the mechanism to insure that you go back and fix the cap," he told the Wisconsin DNR, "I personally can't address that. That's a regulatory matter."

•

For these reasons, the model should not be used, and if, nonetheless, it were, it ought not be applied by people such as the authors of this report, who have so resolutely resisted objective recognition of facts contrary to their preconceived views. ☞

---

30 40 C.F.R. §258.72-258.74. Under the California rules, 27 C.C.R. §21900(a), as a technical matter the landfill owner has the burden of proof at the end of the 30 year care period to show that the site no longer poses a threat to the environment before he or she may terminate care. Although the fact that this stronger provision was promulgated is a good thing, it does it provide a means of insuring that funds are re-upped for the task. Also, by itself, the rule is no guarantee that it will be enforced when the time comes in the face of aggressive lobbying to look the other way. Nor, for that matter, is there any means today to know whether the current owner of the site will even be in existence 40 or 50 years from now, nevertheless have the financial wherewithal to make major financial expenditures out into the future with regard to a site that closed decades earlier, and hasn't produced any revenues in decades..

31 *See* page 41.

Conclusion

To protect its taxpayers, California's financial assurance rules for landfills urgently need to be overhauled, and at the earliest possible time.

While the State's regulations are comprehensive as far as they go, they do not reach the fundamental problem with financial assurance rules throughout the United States . That is their failure to address the implications of the fact that liners only delay and do not prevent pollution. This means that most landfills will leak and require major corrective action in the future, probably after the end of the post-closure period.

Not only is it critical to address this omission if California is to be protected from untold billions of dollars in costs to remediate hundreds of orphaned landfills, but also, a new mechanism is needed to address high risk, probabilistic events like liner failures, rather than predictable and periodic maintenance costs.

In this report, we suggest that insurance is the appropriate mechanism for this sort of risk and urge the Waste Board to commission a study to evaluate its feasibility.

We also point to lapses in the current regulations directed at providing assurance for those routine maintenance expenses. The financial means test badly needs to be backstopped by insurance. Less critical, but important, if third party policies are canceled, the state should automatically cash out of those policies, and the pay-ins to trust funds should be front-ended.

With California in the midst of one of its worst fiscal crises in its history, with the enormity of costs facing the State as today's landfills close only to leak afterwards, and with the time very short to amortize the expense of new assurance requirements as many of the state's landfills approach the last half of their operating lives, action is needed at the earliest possible time.

Furthermore, the Board needs to put its finger in the dike to prevent the perpetuation of these problems stemming from the current flawed operational standards for our landfills. In the future over the remainder of this decade, as Europe and parts of Canada are doing, land disposal of decomposables should be phased out.

The ramifications of inaction are too high to delay. ❑

(A summation of our specific recommendations are set forth in Attachment B.)

Epilogue

The final lesson for California from South Carolina's financial crisis over Safety-Kleen's abandoned Pinewood landfill

"Some of these things you just want to put out of your mind," Richard Jabbour reflected recently, recalling the financial fallout from the Pinewood landfill near the shores of South Carolina's Lake Marion, which is the state's largest reservoir, over two aquifers, which provides drinking water to the state's coastal plain. "This," he exclaimed, "is one of them."

Jabbour was referring ruefully to a vote he had cast in 1995, which eliminated monetary protection the state had established the year before to insulate its taxpayers from the landfill's long-term liabilities. Over the next few years, he had slowly awakened to the realization that Pinewood had become a financial albatross around the state's neck because of that decision he had made to ignore the technical facts and acquiesce to political pressure.

Back in 1977, an old clay pit began a new life as a kitty litter mine, and, a year later was converted into a loosely regulated hazardous waste dump. Thereupon, the landfill went through a dizzying succession of different owners. First there was SCA, and then Laidlaw, which later morphed into Safety-Kleen.

By 1985, regulators had come to realize that the landfill's liners would eventually fail, threatening the water supply for tens of thousands of people. Eventually, they later projected, a major cleanup would be necessary that could cost as much as $1 billion.

[South Carolina] projected a major cleanup would be necessary that could cost as much as $1 billion.

After a series of confounding twists and turns, in 1994, the Board of the Department of Health and Environmental Control (DHEC) had required Laidlaw to post a $133 million cash bond before expanding the hazardous waste dump. But only the first $14.5 million installment was ever paid when the company's political machine was wheeled into action.

During the year that followed, Laidlaw spent $250,000 lobbying the Legislature, generating the political pressure to steam roll over the Department's technical decision.

When the DHEC Board sat down to revisit the issue the following year, three new and more compliant members had been appointed, and they decided to let the operator, itself, determine how to provide financial assurance. To no one's surprise, the company offered up a corporate IOU, which had no more value than its dubious balance sheet. But, there was – everyone was assured – no need for concern. After all, this was a strong $2 billion company.

But, as spring gave way to the summer of 2000, things came unglued. Safety-Kleen, the site's last owner, ominously decamped its offices from Columbus to Delaware, and, thereupon, filed for bankruptcy. Then, this year, it offered South Carolina a take-it-or-leave-it annuity allegedly worth $49 million for the long term costs of maintaining the site and. In the exceedingly unlikely event anything was left over, that would be no more than a *de minimus* down payment on the possibly billion dollar cost to clean up Pinewood. Even that pittance was contingent on their being legally relieved of responsibility for all future liabilities.

"We felt surely they would never go bankrupt," remembered Roger Leaks, who had been one of those new Board members appointed to remove the bonding requirement. "Maybe," he now wonders, "we should have held out for cash."

"The costs could be astronomical," fretted Sandra Molander, another former state environmental board member. "I'm sure there's not enough money there," she said.

But, by then, the horse was out of the barn. In the end, South Carolina realized it had little choice but to sign the release in order to get any cash. At that point, the state with license plates that say "Beautiful Places," and which prides itself on the benefits of being business-friendly, recognized they had been diddled, boxed in by political machinations into accepting a billion dollar liability for chump change.

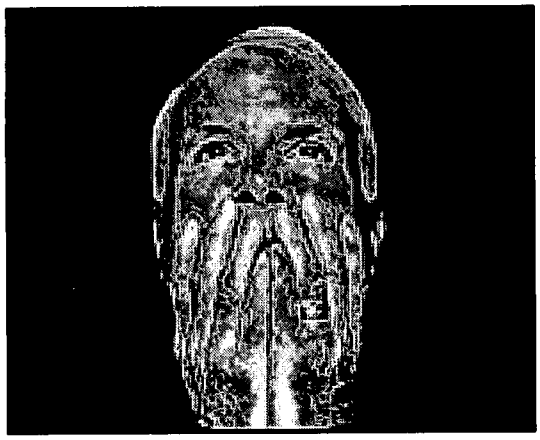
Lake Marion stands as a poster child, teaching the rest of us how trading away protection from long-term landfill liabilities for political crumbs has been a monumental mistake..

Although Pinewood hasn't failed yet, a fuse has been lit because the site's toxic brew festers behind barriers doomed to eventually degrade. Someday, in the not to distant future, that ticking time bomb will detonate a massive tax increase to pay for the cleanup.

Lake Marion stands as a poster child, informing the rest of us how trading away protection from long-term landfill liabilities for political crumbs has been a monumental blunder.

❖

In the career of many in public life, there comes along one trial by fire that, by its enormous stakes, transcends the political adage, to get along, go along. Like the trillion dollar S&L debacle a generation before, now landfills' future risks exemplify those cases, made exceptional by their sheer magnitude, which must be carved out from the customary way politics is practiced in America.



***"I fear the [Keating 5] episode probably will be on my tombstone."* – John McCain**

For most of us, we can, and we do, learn from history. And, by doing so now, we will not come to suffer the same fate as John McCain and Alan Cranston, both good men, honorable men, who slipped up once following Charles Keating's siren song nearly 20 years ago. Now, they expect to have that mistake on their tombstone as the legacy for which they will be remembered, rather than for all the good works they had championed over the course of their lives.

Past generations of regulators had the luxury of passing the buck to the next, but those days are now gone. Today is the day of reckoning, and this generation of regulators has – to paraphrase Roosevelt during those earlier times when the S&L's faced their first crisis – a rendevous with destiny.

The time for you to act is now.* ❐

---

* The Lake Marion story has been extensively chronicled by *The State*'s reporter, Sammy Fretwell. The background and quotations described in this Epilogue were largely excerpted from his article "Landfill deal threatens S.C. lake, taxpayers," published on June 13, 2004. The McCain quote in the photo caption is from his autobiography, John McCain, *Worth Fighting For* (Random House, 2003), at p. 204. Notably, as McCain wrestled with a bout of cancer that made him confront his mortality, he rued that "twelve years after [the conclusion of the Keating Five scandal] I still wince about it and find that—

"if I do not repress the meaning, its recollection still provokes a vague but real feeling that I had lost something very important, something that was lost in pursuit of gratifying ambitions, mine and others', and that I might never possess again as assiduously as I once had."

NOTE BY INSURANCE EXPERTS ON THE FEASIBILITY OF INSURING FOR CORRECTIVE ACTION AND THIRD PARTY INJURIES AFTER THE END OF THE POST-CLOSURE PERIOD

The purpose of this note is to discuss the feasibility of providing reliable insurance coverage for the risks of corrective action and third party claims from pollution by municipal solid waste landfills during the operation, closure and after the end of the post closure period if the responsible party is unable or unwilling to do so.

The authors of this discussion are Prof. Daniel Anderson, CPCU and Leslie P. Schultz Professor of Risk Management and Insurance at the University of Wisconsin-Madison, and David Dybdahl, CPCU. Our vitæ are attached.

In our opinion:

1. A two billion dollar annual revenue, environmental insurance market has for over twenty years offered insurance products to cover precisely the risks for corrective action and third party damages associated with the operation, closure and long term care of landfills. These policies can insure the sites out to 30 year time frames but are usually written for periods shorter than five years.

2. As a theoretical question, it should be possible to estimate the risks associated with landfills sufficiently to underwrite insurance policies that provide environmental insurance coverage that extends beyond the end of the post-closure period.

3. Although there are currently active insurance markets for corrective action and third party damages during operation, closure and post-closure, as a practical matter, the insurance industry does not presently offer policies today that would provide coverage following the end of post-closure period.

4. There are, however, current examples of insurance and various financial markets being utilized to fund corrective action during closure and post-closure of very large hazardous waste sites in the United States, for coverage periods greater than 30 years. One such site has long term care funding for perpetuity. Insurance models already exist to address the risk of reopeners of landfill after the RCRA post closure period expires. These existing financial models could be modified to address the long term funding needs of landfills for perpetual care for corrective action and third-party damages.

5. Based on past experience with hazardous waste sites we believe that it is possible with the support of regulators to underwrite the risks of perpetual care. But several issues need to be resolved before a definitive conclusion can be reached as to the feasibility and probability of doing so.

6. There is a risk that any individual insurance company providing insurance protection over an extended period of time decades into the future could become insolvent before the premiums it collected for the risks of corrective action and third party damages during the operating period of the landfill can be utilized to pay for the perpetual care of the site. Therefore a form of long-term insolvency protection must be built into the perpetual care funding model. We believe that this can be done through a multi layer backstop consisting of:

   a. Limiting eligible insurers to those rated by rating agencies such as A. M. Best as A+ as the first line of defense.

   b. Adding reinsurance as an additional line of defense against insurance company failure over such extended periods of time.

   d. Creating a state insurer insolvency fund to add a final line of defense.

5. One of the major policy considerations in assessing the prospects for eliciting a market for environmental insurance is whether California or the federal government would require by statute or rule that all landfill operators licensed by the State must do so in order to create an adequate risk pool and demand for the insurance policies. Without that underpinning, the prospects of the successful development of a perpetual care insurance market would not be favorable. Whether the Board, the Legislature and/or the Governor consider whether the post-closure risks are sufficiently great as to enact or promulgate such a policy to insulate the State from substantial costs that could in worst case circumstances run into the billions of dollars is something that we cannot comment on.

6. Among the factual questions that will need to be investigated before firm decisions can be reached as to whether to impose new insurance requirements of this type are the following:

   a. The ability to estimate the range of costs of corrective action and third party damages (including the price of defense), and the ability to rank individual landfills by their site specific risk.

   b. The extent that uncertainty increases with longer periods of time that coverage is extended.

c. The likelihood of receiving favorable tax treatment of loss reserves.

d. The feasibility of voluntary participation by the insurance industry.

e. Potential financial models to create perpetual care insurance policies

7. Were a comprehensive study of these issues conducted, we believe that the Board would in a posture to determine whether the insurance industry would offer the sought after coverage in the event the State required it, and the range of possible prices that might be charged.

Attachment B
SUMMARY OF RECOMMENDATIONS

The following recommendations are made in this report. The Integrated Waste Management Board should –

1. Make a determination that:

   a. There is a risk of substantial liability for the incidence of major maintenance expenses, corrective action and third-party damages from municipal solid waste landfills after they are closed;

   b. This risk extends past the end of the defined post-closure period; and

   c. Current financial assurance mechanisms do not protect against either current or future environmental risks or routine care after the end of the post closure period.

2. Commission a study to determine whether Extended Environmental Impairment Landfill Insurance can protect the State of California from these liabilities.

3. Amend the existing financial assurance rules for minor maintenance expenses to, preferably, require the accelerated accumulation of a perpetual care fund for minor and major maintenance costs during the operating life of the site, or in the alternative:

   a. Retain the full value of the assurance funds in the mechanism until the end of the post-closure period because there is a significant probability that unanticipated maintenance expenses will arise.

   b. Require that payments into trust funds be accelerated using a mechanism such as sum-of-the-years digits.

   c. Require that, if a surety bond and letter of credit is cancelled, the State shall be assumed to have exercised its right to claim the funds under the mechanism on the 120th day following notice of cancellation unless the State affirmative acts to forego its right to do so prior to that time.

   d. Restrict the use of the financial means test by conditioning its use upon insurance.

4. Reject the predicate in the Waste Industry Paper that the length of the period of time when post-closure care is required can be determined by measurements taken prior to time that the final cover is likely to have failed.

5. Phase out the land disposal of decomposable matter to less than 50% by weight in any new cell or lateral or vertical expansion of an existing landfill or new landfill after 2005; 40%; after 2006; 30% after 2007; 20% after 2008; 10% after 2009; and 5% after 2010.

Notice Announcing the Availability of an Analysis of a Renewable Portfolio Standard for the State of North Carolina and Request for Public Comments
December 13, 2006

FILED
DEC 15 2006
Clerk's Office
N.C. Utilities Commission

On January 24, 2006, the Environmental Review Commission (ERC) of the North Carolina General Assembly adopted a motion requesting the North Carolina Utilities Commission (Commission) to undertake a study of the potential costs and benefits of enacting a renewable energy portfolio standard (RPS) in this State. The process proposed to and adopted by the ERC requires the Commission to issue a request for proposals (RFP) and to ultimately contract with an experienced consultant to perform the study under the direction and guidance of the Commission.

After evaluating the responses to the RFP, the Commission engaged La Capra Associates to perform the analysis requested by the ERC. On December 13, 2006, the Commission and La Capra presented the results of the study to the ERC.

The Commission is soliciting written comments on the report from the public to be provided to the ERC. Any written comments should be signed and mailed to the Chief Clerk, North Carolina Utilities Commission, 4325 Mail Service Center, Raleigh, North Carolina 27699-4325 or hand delivered to 430 North Salisbury Street, Fifth Floor, Raleigh, North Carolina 27603. The Commission will accept such comments through January 19, 2007.

The following documents are now available on the Commission's web site: http://www.ncuc.net/rps/rps.htm.

RE: Comments Regarding "Analysis of a Renewable Portfolio Standard for the State of North Carolina" performed by La Capra & Associates

Dear Ms. Vance:

Pursuant to the North Carolina Utilities Commission's notice requesting comments on the study and report "Analysis of a Renewable Portfolio Standard for the State of North Carolina" performed by La Capra & Associates, Carolina Power & Light Company, d/b/a Progress Energy Carolinas, Inc. hereby submits its comments in that regard.

Very truly yours,

BEFORE THE NORTH CAROLINA UTILITIES COMMISSION

In the Matter of:	)	
	)	
Request of the North Carolina Sustainable Energy Association for Appropriate Proceedings to Determine the Potential for Energy Efficiency Resources to Meet the Demand for Electricity in North Carolina	)	**COMMENTS OF PROGRESS ENERGY CAROLINAS, INC.**

Pursuant to the North Carolina Utilities Commission's ("the Commission") notice requesting comments on the study and report "Analysis of a Renewable Portfolio Standard for the State of North Carolina" performed by La Capra & Associates, Carolina Power & Light Company, d/b/a Progress Energy Carolinas, Inc. ("PEC") submits its comments in that regard.

First, the La Capra Renewable Portfolio Standard (RPS) study provides useful input into the public policy deliberations concerning consideration of policies promoting renewable energy resources in North Carolina. PEC commends the Commission for the process employed to conduct the study, including creation of the RPS Advisory Group.

As acknowledged by La Capra, their analysis was not performed using sophisticated and comprehensive utility planning models similar to those routinely used by utilities in integrated resource planning. Also, due to budget and time constraints, La Capra used simplifying assumptions and aggregate data in the analysis. These methods produce results that may be reasonable indicators of relative costs, but the results are not precise. Similarly, the analysis of energy efficiency programs utilized screening criteria

and methods different from the analysis usually employed and accepted in regulatory proceedings, including integrated resource planning proceedings, in North Carolina. Their analysis did not evaluate the potential impact on electric rates paid by consumers using methods routinely accepted in North Carolina. Nonetheless, the results are useful in evaluating the scenarios examined by La Capra.

As explained in the report, there are a host of other details to be considered as the State considers the question of whether or not to adopt a RPS, and these issues require careful attention.

The La Capra RPS Study concludes that "North Carolina should *[emphasis added]* have sufficient renewable resources within the State to support a 5% RPS..." within a 10-year period. The study also concludes that "The State would have difficulty meeting a more aggressive 10% RPS with only renewable resources located within North Carolina. A 10% RPS focused solely on generation supply would only be achievable by the inclusion of larger hydroelectric generation and the development of wind in both the western part of the State and in off-shore locations." The report does conclude however, that "Inclusion of energy efficiency as an eligible RPS resource in addition to larger hydroelectric generation and wind in the western part of the State would enable the State to achieve a 10% RPS..." The report finds that adoption of a RPS will increase the costs of meeting the electricity needs of North Carolina consumers, and result in increased rates when compared to the current utilities' resource plans, which rely more on conventional, less-costly generation sources. Based upon the assumptions and analytical methods used, the study finds that certain RPS scenarios including energy efficiency and significant reliance on wind generation in the mountains, along with the inclusion of

larger hydroelectric generators results in a savings to customers. However, these assumptions may well be impractical and therefore the conclusion very uncertain, as explained in the report.

PEC's studies have consistently concluded that the vast majority of renewable energy resources and those DSM/energy efficiency programs that fail the rate impact measure test will cause electricity rates to be higher than would otherwise be the case. As a result, with minor exceptions, PEC has not relied upon such resources to meet its service obligations.

Whether it is in the public interest for the State to require the use of these higher cost resources to meet the electricity needs of North Carolina is a public policy issue that is to be determined by the General Assembly after weighing the qualitative and quantitative benefits of such resources against their impact on the state's electricity rates. As simply a tool to be used by the State to implement such an energy policy, PEC requests that it be assured of timely recovery of all costs incurred in meeting such requirements, if they are imposed.

Importantly, there are several critical assumptions underlying and supporting the La Capra conclusions regarding availability and cost of renewable resources and energy efficiency programs that may be unrealistic. These assumptions include:

- The ability to site and build several hundred MW of wind generators in the eastern part of the State, under the 5% scenario. It is currently unclear what issues and challenges may have to be addressed to site and build these generators.

- A 10% RPS would require between 900 to 2,300 MW of off-shore wind. At 3 MW per turbine, that means building up to 767 wind turbines off the coast of North Carolina. Numerous challenges would have to be solved to make the off-shore wind practical and economic. The report notes that a 10% RPS is likely impractical if it depends on this off-shore wind.
- The report also explains that if off-shore wind is impractical, then a 10% RPS requirement can only be achieved by reliance upon the inclusion of energy efficiency programs, larger hydroelectric generators, and development of wind in the western part of the state. But one of the obstacles to development of wind in that part of the State is the Mountain Ridge Protection Act of 1983, which adds substantial uncertainty to large-scale wind development in the mountains. The report notes that until the Ridge Law is clarified, some of the most cost-effective renewable resources are stymied. That leaves no identified resources to meet the 10% RPS scenario, rendering it impractical, even if energy efficiency and large hydro are included.

While the report states that adoption of a RPS can mitigate the need for some baseload capacity, depending on the scenario, it goes on to explain that additional intermediate (combined cycle) generation will be required. In addition, Mr. Jonathan Winer, lead consultant and one of the authors of the report, has explained that even if a

RPS were adopted, the coal and nuclear plants currently being planned by the utilities would still be needed.

PEC agrees with the report that there are a host of other details that require careful consideration regarding the question of adoption of a RPS. These issues and details include, but are not limited to:

- Development and implementation of a mechanism, such as an annual adjustment clause, to provide the utilities with timely recovery of all costs associated with meeting the RPS requirements.
- Development and inclusion of sufficiently flexible mechanisms to minimize compliance costs, such as provisions for the purchase of Renewable Energy Certificates (RECs) and for making alternative compliance payments.
- As demonstrated by the La Capra analysis, meeting a RPS would be challenging in North Carolina. Any consideration of a RPS should include a broad definition of qualifying renewables to enable achievement of the RPS targets and provide opportunities for a wide and diverse array of technologies to meet the requirements as cost-effectively as possible.

PEC appreciates the opportunity to submit these comments, and looks forward to continuing participation in discussion of these issues.

Respectfully submitted this 19th day of January, 2007.

Notice Announcing the Availability of an Analysis of a Renewable Portfolio Standard for the State of North Carolina and Request for Public Comment	)	**COMMENTS OF DUKE ENERGY CAROLINAS**

Pursuant to the North Carolina Utilities Commission's (the "Commission") Request for Public Comments, dated December 13, 2006, on the study and report entitled, "Analysis of a Renewable Portfolio Standard for the State of North Carolina," performed by La Capra & Associates (the "La Capra RPS Study"), Duke Energy Carolinas, LLC ("Duke Energy Carolinas" or the "Company") is pleased to provide these comments.

Duke Energy Carolinas recognizes the growing interest of the public, our customers, our shareholders and our legislators in planning for a reliable and responsible energy supply now and in the future. As the La Capra RPS Study discusses, renewable energy resources and energy efficiency initiatives are important components of that vision. Duke Energy Carolinas commends the North Carolina Utilities Commission (NCUC) for engaging La Capra Associates to further explore these public policy issues.

Duke Energy Carolinas believes the La Capra RPS Study is a valuable starting point in evaluating the impacts of a Renewable Portfolio Standard ("RPS") for North Carolina. However, the La Capra analysis, as they acknowledge, does not use comprehensive utility planning models similar in scope and detail to those used by Duke and other utilities in developing their integrated resource plans. Instead La Capra relied on simplifying assumptions and aggregate data in its analysis. Duke believes that more detailed analysis is necessary including detailed market potential studies for our service territory in order to identify and develop new cost-effective

energy efficiency products and services for Duke customers. A detailed analysis should also evaluate the potential impact on electric rates paid by customers for these products.

Duke Energy Carolinas agrees that increased energy efficiency and renewable generation are important parts of our future energy portfolio. However, the La Capra study recognizes that even with the 5% or 10% RPS, at least 3000 megawatts of baseload generation will be needed by 2017 (see Table 13). The La Capra 5% RPS scenarios all contain 500 additional MW of intermediate conventional generation and two of the three 10% scenarios add 840 MW of additional conventional peaking generation than the utility portfolio. In other words, all La Capra scenarios appear to require additional conventional generation in amounts comparable to Duke's current plans. This point was publicly acknowledged by Mr. Jonathan Winer, lead consultant and one of the authors of the report.

The La Capra RPS Study focuses primarily on (i) whether North Carolina has the physical resources to support an RPS, and (ii) the economic impact of adopting an RPS. In particular, the study finds that existing eligible RPS resources (including energy efficiency) in North Carolina combined with greater hydroelectric generation and wind energy would enable the State to achieve a 10% RPS. Duke Energy Carolinas believes the assumptions underlying this conclusion do not adequately account for the availability and costs associated with developing such resources. In particular, the Company believes that identification of eligible RPS resources should include consideration of technological, regulatory, economic and public support issues that are not sufficiently explored in the La Capra Study. For example, development of wind energy projects, which is a key component of the La Capra RPS Study, is likely to encounter siting obstacles due to the limitations of existing North Carolina law, as well as potential public resistance. The La Capra Study does not address how these and other challenges might be overcome.

The La Capra RPS Study also finds that implementation of an RPS will increase the costs of meeting the electricity demands of North Carolina consumers. Duke Energy Carolinas' own studies and experience with renewable energy resources support this conclusion. It is ultimately a public policy issue as to whether the benefits of energy efficiency and RPS outweigh the cost impact on electricity rates in the state and how they should be implemented.

If an RPS or energy efficiency requirement is adopted for North Carolina, and Duke Energy Carolinas and other utilities are required to make investment in energy efficiency and renewable generation in response to such a requirement, Duke Energy Carolinas requests that a mechanism be put in place to provide utilities with timely recovery of costs incurred to meet the requirements. Also, to protect customers from unexpected rate increases, several program options should be explored. Included in these options to be explored should be a cap on rate impacts and provisions to allow for a reduction in the RPS or efficiency targets if unexpected increases in rates occur. Further, a market for trading renewable energy credits should be designed and explored for integration with other markets.

Finally, Duke Energy Carolinas believes energy resource selection, planning and financing issues are interrelated and must be assessed together in order to provide North Carolina consumers with the lowest-cost, most reliable generation portfolio. For this reason, Duke Energy Carolinas encourages the development of consistent energy policies that discuss customer rate impacts, changes in reliability, other generation sources, cost-recovery, and long-term system planning impacts, such as generation, transmission, and distribution, concurrently with the adoption of an RPS.

Duke Energy Carolinas appreciates the opportunity to submit these comments and looks forward to working with all stakeholders to continue the evaluation of these very important issues.

Re: Comments of Dominion North Carolina Power on Renewable Portfolio Standards Study

Dear Commissioners:

Virginia Electric and Power Company d/b/a Dominion North Carolina Power ("Dominion" or the "Company") submits these comments, as requested by the North Carolina Utilities Commission ("Commission") on December 13, 2006, upon the *Analysis of a Renewable Portfolio Standard for the State of North Carolina*, La Capra Associates, December 2006 ("La Capra Report") and *A Study of the Feasibility of Energy Efficiency as an Eligible Resource as Part of a Renewable Portfolio Standard of the State of North Carolina,* GDS Associates, Inc., December 2006 ("GDS Report," together with the La Capra Report, the "RPS Study").

INTRODUCTION

Dominion appreciates the opportunity to comment upon the RPS Study. The issues surrounding renewable energy portfolio standards ("RPS"), including energy efficiency measures, are important issues to be examined in the provision of electric energy in North Carolina. Dominion serves over 114,000 retail customers in its North Carolina service territory in the Northeast portion of the State, including portions of the Outer Banks. As a public utility in North Carolina, Dominion is committed to ensuring that the people and businesses of North Carolina have access to the electric energy that is provided in a reliable manner at just and reasonable rates. Dominion is also committed to minimizing the impact to the environment while carrying out its public utility responsibilities.

Dominion believes that the RPS Study is a good first step in outlining the issues that need to be confronted in analyzing renewable portfolio standards, including energy efficiency. The Company does not believe, however, that the RPS Study is sufficiently developed so as to be relied upon by policy makers for the purposes of crafting a

renewable portfolio standard in North Carolina. As will be discussed below, the RPS Study makes a number of assumptions to support its conclusions, does not fully evaluate significant issues and does not address the need to ensure the availability of electric energy at reasonable rates by requiring adequate cost recovery for any potential RPS or energy efficiency measures. This being said, the Company intends to work with interested parties towards workable incentives for renewable energy in North Carolina.

COMMENTS

The RPS Study lacks sufficient analysis of the rate impact on customers and does not address the issue of cost recovery.

The RPS Study does not provide sufficient analysis of the total rate impact of a RPS and associated energy efficiency measures. On page vii of the La Capra Report, the admission is made that: "These cost comparisons do not include all costs that may be incurred by either renewable generation, energy efficiency, or conventional generation, such as system operation costs or regional transmission upgrades that are highly site and resource specific." These costs can be significant and cannot be ignored as incidental. The failure to make a complete economic analysis makes the RPS Study incomplete. Policy makers need complete information in order to make an accurate cost/benefit analysis when considering the establishment of renewable portfolio standards.

It is telling that the La Capra Report recognizes that current avoided costs may not make a RPS cost-effective. One of the solutions to this problem proposed in the La Capra Report is to set the RPS standard high enough to force "demand" driven prices. [1] What is not sufficiently analyzed in this study is the impact on ratepayers who will be forced to pay higher rates to cover these costs.

The GDS Report states that a third party administrator would need to provide $409 million in incentives (in today's dollars) over twenty years to achieve the energy efficiency savings component of a RPS.[2] Moreover, this is with the assumption that the incentives would cover only 50% of such incremental costs.[3] Presumably these funds ultimately would come from ratepayers. In addition, if $409 million only represents 50% of the incremental costs, then ratepayers would shoulder the burden of spending the additional $409 million, as well, meaning the real cost to appears to be over $800 million.

Finally, both the La Capra Report and the GDS Report do not address utility cost recovery for items such as administrative costs and the impact that these measures will have on a utility's volume of sales, including the associated impact on earnings. A thorough customer rate impact analysis cannot occur without a complete understanding

[1] La Capra Report at 86.
[2] GDS Report at 1-4, 8.
[3] *Id.*

of all costs. The Company believes that to be effective any potential RPS, with or without an energy efficiency component, must address full cost recovery for suppliers.

The recommendations within the RPS Study do not allow for out-of-state renewable energy to count towards any potential RPS.

Dominion is concerned that the study did not evaluate the benefits to North Carolina of allowing out-of-state renewable energy to count toward any potential RPS. Such allowance is very common nationally. Indeed, 17 of the 22 states with such standards allow renewable energy purchases from neighboring states and/or regions to count toward their goal. There may be instances where development or purchase of renewable resources may be completed more cost effectively outside of North Carolina. In this scenario, ratepayers would pay less for renewable energy if the energy were developed in or purchased from a neighboring region. North Carolina's citizens could still benefit from any resulting air quality improvements. Allowing out-of-state renewable resources to count toward an RPS is particularly important for Dominion. With most of our generation in another state, much of our opportunity to build and operate renewables exists outside of North Carolina.

In addition, Dominion's membership in PJM places the company in a unique position. PJM is a regional transmission organization.[4] Through its membership in PJM, the Company's North Carolina retail customers enjoy numerous benefits such as enhanced reliability, optimized system planning, improved resource adequacy, short-term operational pricing signals and access to additional generation capacity. Membership in PJM provides access to renewable energy which could be at a lower cost to Dominion's customers than if imported from other parts of North Carolina. To limit our ability to provide cost effective renewable energy to our customers in North Carolina could substantially increase Dominion's North Carolina customers' costs.

Providing access to other markets helps provide the economic incentives to utilize renewable energy sources. In addition, in the nonrenewable fuel market, namely coal, imports from out of the state are allowed. By restricting the renewable market at its infancy, while the other fuel markets are not similarly restricted, may actually create a disincentive for the utilization of renewable energy. Dominion would encourage a broader, more expansive approach to imports thereby allowing for more opportunities for the renewable market to develop.

[4] Dominion sought and received regulatory approval to join PJM from the Federal Energy Regulatory Commission ("FERC"), the Virginia State Corporation Commission and the North Carolina Utilities Commission ("NCUC" or "Commission"). On April 19, 2005, the NCUC issued its approval for Dominion North Carolina Power to join PJM under several conditions. With approval by the regulating entities, Dominion integrated operation of its transmission facilities into PJM on May 1, 2005.

The RPS Study falsely assumes that renewable resources built in North Carolina will be exclusively dedicated towards any future statewide RPS goal

The RPS Study seems to assume that any developed renewable resources will be utilized exclusively in North Carolina, thereby ignoring the possible economic benefits that might be realized from the resources in other nearby markets, such as PJM. A recent example of this situation can be found by Craven County Wood-Energy Limited Partnership ("CCWE") which is currently selling into this market. CCWE sells 48 MW of renewable energy to DTE Energy, which markets the power in the PJM market. Power is delivered over a 230 kV interconnection and is transmitted to the PJM market through the Progress Energy Transmission system. In short, any future RPS goals should be set with the realization that generators using renewable resources in the state may pursue economic gains in the wholesale market and outside of the state as opposed to selling its capacity and energy within North Carolina.

The RPS Study does not sufficiently analyze transportation and interconnection costs.

Dominion does not believe that the RPS Study takes into sufficient consideration the costs associated with transporting renewable power supplies. Before any cost/ benefits of renewable portfolio standards can be made, there should be a full analysis of all of the RPS costs, not just parts of them.

For example, the RPS Study failed to provide a complete, detailed economic assessment of the costs of wind and biomass generation. By not providing a complete analysis of all of the costs involved in providing wind and biomass generation, the RPS Study necessarily understates the financial costs to providing such renewable energy. One of the most significant costs involves providing wind farms with access to electric transmission facilities. If transmission facilities are not nearby, building such transmission lines to deliver the wind farm's power can be extremely costly. These construction costs are in addition to the siting and permitting costs for the wind farm and transmission lines and the potential need to acquire land for the transmission facilities. It should also be noted that many wind farms rely on federal tax incentives which are subject to political and fiscal considerations of Congress. In fact, the RPS Study states that without the federal tax credit, the incremental cost of this form of RPS may be 40% higher.[5] Without this tax incentive, a wind project's financial viability may be questionable.

In regard to biomass generation, the costs of biomass in the RPS Study were not adjusted to account for the cost of transportation, the variability of different materials in different regions, or the costs of retrofitting any existing generation facility to

[5] La Capra Report at xv.

accommodate biomass in its daily operations. The installed costs vary for different power plants, so the total cost of biomass is not an average cost, but rather a cumulative cost and as such may be much higher than anticipated. For example, the cost of piping landfill gas to any plant for use in combustion is highly sensitive to distance. Thus, just because the gas is available, does not make it economical to utilize.

The Constitutional issues raised in the La Capra report are not addressed.

On page 87, the La Capra Report states that: "An explicit exclusion of out-of-state resources may raise questions under the Commerce Clause of the Constitution." Dominion believes that such a significant issue should be explored more thoroughly, particularly as the report to date has excluded the use of renewable imports. In short, a constitutional issue of this magnitude should have been reviewed in greater detail in the report.

A tracking system must be established to measure the effectiveness of RPS.

In order to measure the effectiveness of a RPS, a tracking system is necessary. For example, in PJM the Generation Attribute Tracking System ("GATS") provides supply information on the fuel source, emissions, as well as other generation characteristics. These systems require resources and take considerable time to develop. The functional design of GATS was developed through considerable deliberation of the PJM GATS Working Group. This stakeholder group began meeting in late 2001. It was comprised of representatives from various state agencies in the PJM region (such as state public utility commissions, state environmental protection offices, state energy offices and consumer advocates) as well as PJM market participants, environmental advocates, other PJM stakeholders and PJM staff. Failing to capture the costs of developing and maintaining these systems fails to reflect the total costs and technical abilities needed to accomplish a RPS in North Carolina. Such a system is particularly important if there are incentives and disincentives applied in achieving certain levels of RPS.

Complexities surrounding a "Program Administrator" must be examined.

Throughout the RPS Study there are references to a "program administrator" for energy efficiency initiatives. It should be noted that the value of a third party administrator is currently being examined by the North Carolina Utilities Commission.[6] The issues involved in utilizing a third party administrator, its funding, and its authority are complex. Dominion does not think such issues should have been merely assumed in the RPS Study.

[6] Docket No. E-100, Sub 110.

Impact on Jobs and Economic Development

The impact of RPS on jobs and economic development in North Carolina could be profound. As North Carolina competes in a global marketplace and against other states for jobs, even seemingly small increases in marginal costs can cause jobs to be outsourced overseas or make North Carolina unattractive for new job producing facilities. Whether it is a manufacturing facility or a customer call center, small changes in energy costs can impact the bottom line of a business. Dominion believes that further study of the impact of electric rates needs to be performed before mandated RPS targets are made. It should also be noted that the laws of supply and demand will also apply to renewable energy. RPS targets could cause the cost of renewable fuels, generation, and transmission to increase significantly over current projections.

The RPS Study unnecessarily limits biomass co-firing to wood residue only.

Dominion favors a broad definition of eligible fuels in a renewable portfolio standard to encourage deployment of a wide range of environmentally beneficial sources and technologies. Dominion is concerned that the RPS Study did not evaluate the benefits to North Carolina of co-firing with fuels other than wood residue. There may be instances where other environmentally beneficial waste products (e.g., tobacco waste, washed peanut hulls, pre-consumer waste paper, and agricultural waste) may be cost-effectively co-fired.

The RPS Study Ignores Dominion's membership in PJM, which provides unique opportunities for demand-side benefits to its customers

With Dominion's integration into PJM, including the associated operating and planning benefits therein, the Company has the opportunity to participate in a market that functionally assesses the economic value of demand-side initiatives. Access to PJM pricing expands the tariff-based DSM pricing opportunities for Dominion customers. The Company believes that offering dynamic pricing tariffs that can better reflect the varying costs of electricity production, combined with the public and private market offering new products, services and standards to customers, will help yield conservation and energy efficiency in North Carolina.

The RPS Study does not take into account the unique circumstance of Dominion, with its membership in PJM, in its analysis of renewable portfolio standards and energy efficiency. Dominion believes that this omission makes the Study incomplete. Dominion believes it is important to ensure that the benefits that North Carolina customers receives from PJM are not negatively affected by any future RPS on conservation-related programs as contemplated by the RPS Study.

CONCLUSION

Dominion appreciates the opportunity to offer these comments. Dominion does not oppose the appropriate utilization of renewable energy and energy efficiency programs so long as any such programs provide sufficient incentives for the development of a robust renewable energy market, are not unduly restrictive, and provide for full cost recovery for suppliers. These comments are offered in the spirit of helping policy makers understand the shortcomings in the RPS Study so that they can seek additional information to assist in their decision making

Sincerely,

Vishwa B. Link

Re: ***Comments of North Carolina Electric Membership Corporation Regarding the* Analysis of a Renewable Portfolio Standard for the State of North Carolina**

Dear Ms. Vance:

The North Carolina cooperatives applaud the ERC for directing the NCUC to conduct an independent study of a potential renewable portfolio standard (RPS) in North Carolina. It is vitally important for policy makers to have an independent assessment to consider as they deliberate such an important issue. The consultants who were selected to conduct this study are industry recognized leaders in this field. We also appreciate the opportunity to participate in the process through the RPS Advisory Group.

The North Carolina cooperatives have long supported responsible stewardship of the environment. We recognize the growing importance of energy independence for our national security. Therefore, the cooperatives consider renewable energy as an important component of a balanced energy supply strategy. This is particularly true for cooperatives, as many renewable technologies, such as biomass and wind, are predominately located in rural areas.

The cooperatives also believe that energy efficiency and other demand-side management (DSM) programs play an important role in reducing the need for future generation, and continue to actively promote energy efficiency among their consumers through education, rebates and other programs.

As consumer-owned businesses, the North Carolina cooperatives operate "at-cost" and must immediately pass on increased costs directly to the consumer. Our service territories include some of the most economically depressed in the state. Many of these consumers simply cannot afford even a small increase in utility costs. Clearly, we are very concerned that any discussions of possible mandates for renewables or energy efficiency adequately consider the impact to the end-use consumer who will ultimately foot the bill.

On its surface, the RPS study presents a relatively favorable view of the potential impact of an RPS. NCEMC does not intend to debate the methodology or results of the study. However, a number of the study's findings should be carefully scrutinized by policymakers as a potential RPS is deliberated.

- The study correctly concludes that there are a limited number of viable renewable technologies in North Carolina. In fact, while some states have proposed an RPS as high as 20%, only a 5% RPS is achievable in NC without inclusion of energy efficiency or non-conventional renewables.
- The study concludes that a 5% RPS would only result in a 1% increase in rates. However, this amounts to $750 million dollars additional cost to NC consumers. A 10% RPS would cost consumers $2.7 billion in additional costs. These are significant costs by any measure, and the impact of adding these costs to the consumers electric bill should be given due consideration.
- The study concludes that inclusion of energy efficiency would enable the state to achieve a 10% RPS with an overall cost reduction. It is important to note that the energy efficiency analysis was a simplified screening analysis, based on published studies, not a detailed, NC-specific study. While NCEMC supports allowing utilities the flexibility to use energy efficiency to meet a portion of a proposed RPS, we believe a more detailed study of the benefits of energy efficiency measures should be conducted before decisions are made. In particular, the studies should consider the different impacts of energy efficiency measures in rural and urban areas, and the extent to which benefits of energy efficiency are already captured in existing programs.
- The energy efficiency analysis assumes that efficiency programs will be administered by a program manager, with a 50% incentive level for participants. Structuring a program of this type and determining the proper funding mechanism is a significant undertaking in itself, and should not be taken lightly.
- The study shows that the cost of renewables is significantly higher than the utilities' avoided cost. With the exception of landfill methane (Figure 3) the cost of renewables is higher than new conventional coal. These findings are consistent with our experience, in which renewable developers have demanded prices two to three times what we currently pay for base load power. With the availability of renewables very limited, we are concerned that a mandated RPS will take away any incentive for developers to price their projects competitively, pushing prices even higher.

- The study indicates that nearly half of the practical renewable resource potential would come from on-shore wind projects (Table ES-1). The issues associated with siting wind projects in sensitive mountain and coastal areas must be dealt with if the renewable targets cited in the report are to be realized.
- The study also assumes a practical potential for hydro development of 425 MW (Table ES-1) at a total of 93 sites (Table 5). Again, we are concerned that the practicality of realizing this potential development must be questioned in light of historical opposition to hydro development for environmental and other reasons.
- While the study focuses on incremental renewable energy, the report notes that the state already has over 2,000 MW of renewables in place. It is important that utilities be given proper credit in any proposed standard for renewables already in place.

In summary, NCEMC supports inclusion of renewable energy and energy efficiency programs as part of a balanced and responsible energy strategy. However, the results of the RPS study show that such a strategy is not without significant costs to the consumer and presents a number of significant implementation issues. It is essential that policy makers consider the ultimate costs of any proposed mandate, and ensure that if a mandate is enacted, it be structured to minimize the impact on the rate-paying public.

Should you have any questions, please do not hesitate to contact me at 919.875.3032.

RE: Public Comments on NCUC's "Analysis of a Renewable Portfolio Standard for the State of North Carolina"

The North Carolina Sustainable Energy Association ("NCSEA") appreciates this opportunity to comment and commends the North Carolina Utilities Commission for their leadership in commissioning this non-biased study of the costs, benefits and economic potential of a Renewable Portfolio Standard for the state of North Carolina ("RPS Study"), which also incorporated the economic potential of a small subset of the low-cost energy efficiency measures currently available. The RPS Study is an energy modeling effort. Thus, when drawing policy conclusions, decision-makers must not only assess the specific results of the report, but also consider the model's sensitivities and omissions. It is NCSEA's intention to highlight several of these areas.

1. Energy efficiency is a low-cost resource, and the model should account for scenarios that include efficiency implementation measures greater than 2.5 percent of projected retail sales.

NCSEA has dedicated substantial effort to highlighting the importance of energy efficiency (e.g., reference intervener submissions in docket no. E-100, Sub 103). The RPS Study did not contradict our prior evidence. Rather, it highlighted energy efficiency's critical role in the State's electricity future (i.e., its ability to reduce rates or neutralize rate impacts). Therefore, NCSEA believes that the RPS Study results combined with prior energy efficiency data and material submitted to the Commission warrants an investigation of the La Capra model's sensitivity to increased energy efficiency measure implementation beyond 2.5 percent. The RPS Study results signify that increased energy efficiency will produce favorable results from the La Capra model – one reason to suggest that portfolio standards greater than 10 percent are not out of reach.

2. The model's results should be considered within the construct of more specific North Carolina data when applicable. Residential solar hot water systems are one example.

Residential Solar Hot Water Example

Data cited by GDS in Appendix A, page 84, came from the American Council for an Energy Efficient Economy ("ACEEE") book, *Consumer Guide to Home Energy Savings*, 8th ed., 2003. The cost of a solar hot water system yielding 3,442 kWh annually was listed at $2,500. Using their assumed discount rate of 10 percent and inflation rate of 2.5 percent (Appendix E) in the standard formula for installment loans, the result is an annual payment of $294. Dividing this by 3,442 kWh yields their quoted value of $0.085 per kWh.

A commercially available solar hot water system of the same capacity in North Carolina has a levelized cost of $0.043 per kWh, making full use of current tax credits and using more realistic financing assumptions. We'll go through the assumptions and calculations in detail:

> Southern Energy Management of Cary installs a two panel system designed for a family of four for $4,500. Discount rate is 3% real and loan finance rate is 5% real, corresponding to (approximately) 5.5% and 7.5% nominal respectively with an inflation rate of 2.5%. Federal tax credit is 30% and state tax credit is 35% with a cap of $1,400. Federal tax rate is 30%. The service life and financing term are each 25 years.
>
> Results are shown in the table. Assuming the loan is financed through a home mortgage or home equity loan whose interest can be taken as an itemized deduction on the Federal tax return, the reduction in taxes has a present value of $387, further lowering the effective system cost. Since that benefit materializes over time, it is considered to be equivalent to a loan from the home owner to himself at the discount rate, paid back in installments of $22.22 a year. The result is an annual total payment of $148.73 with an energy yield of 3442 kWh, or $0.043 per kWh.

Characteristics of our North Carolina based model vs. the ACEEE system are:

(1) Higher gross system cost;
(2) Inclusion of current state and federal tax credits;
(3) Federal and state tax deduction of interest cost;
(4) Longer system life; and
(5) Lower discount and interest rates.

Characteristic number five deserves comment.

> A discount rate is the implied rate of return of an investment with a comparable degree of risk to the one under consideration. In the case of a solar hot water system, energy generation is highly predictable, with virtually no volatility. An investment of comparable degree of risk is a U.S. Treasury note, with historic nominal yields in the 5-6% range and inflation averaging about 2.5%. Thus, a realistic real discount rate for low-risk investments is approximately 3%. Indeed, the Federal Energy Management Program and Office of Management and Budget specify discount rates of approximately 3% in life-cycle cost analysis of energy efficiency projects. Interest rates for loans can vary considerably, of course, but home mortgage rates have been as low as 5% in recent years and remain below 7% nominal in most areas of the U.S. Thus, 7.5% nominal seems considerably closer to current norms than the 10% assumed in the GDS analysis.

NCSEA recognizes that the purpose of the GDS study was to demonstrate that cost-effective energy efficiency savings equal to 2.5 percent of electricity use were obtainable. However, it seems likely that this study will be relied upon extensively for energy resource planning in North Carolina for some time to come. The RPS Study's objective was easily met without including solar hot water. Since solar hot water comprised one quarter of the total technical potential for energy savings in the residential sector (Table 5-2), it represents a measure well worth *serious*

consideration in energy efficiency programs in North Carolina. Solar hot water should be seriously considered due to the dramatic impact it could have in lowering energy demand cost-effectively.

Residential Solar Hot Water System in North Carolina

Assumptions:	Discount (real)	3.00%	Loan interest (real)	5.00%	
	Fed. Tax rate	30%	State tax rate	n/a	
	Fed. Tax credit	30%	State tax credit	35%	($1,400 max)
	Service /finance life	25	Annual energy saved	3442	kWh

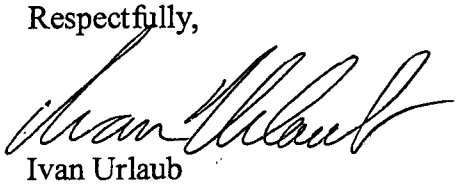
System cost - gross	$4,500.00	
Federal tax credit		-$1,350.00
State tax credit		-$1,400.00
Fed tax on state tax credit		$420.00
Interest deduction on Fed tax (present value)		-$387.00
Credits	-$2,717.00	
System cost - net	$1,783.00	
Annual payments:		
Loan		$126.51
Interest deduction on Fed tax2		$22.22
Total	$148.73	
Cost of energy (annual payment/energy)		$0.043

3. A Renewable and Efficiency Portfolio Standard should promote resource diversity and provide benefits to all consumers. Combined heat and power (CHP) generation should be included in any standard.

According to material published by the North Carolina Solar Center, "CHP generation can be used for building space conditioning, district heating and cooling and agricultural or industrial processes". CHP can provide significant cost savings to industrial and commercial users – stakeholders who should also gain from the benefits of renewable energy and energy efficiency. These benefits can include reduced sensitivity to fuel price fluctuations as a result of CHP's higher fuel efficiency, significant cost savings, and it can serve as primary power, standby, or peak shaving. In short, ignoring CHP ignores a Renewable and Efficiency Portfolio Standard's purpose – to promote diverse fuel resources, provide and support in-state economic development, and reduce environmental impacts of electricity generation.

In summary, North Carolina is now well positioned to act on its own opportunity to encourage the economic and social benefits of renewable energy and energy efficiency. In fact, it can do more. It can be the Southeast's regional leader in energy policy as no other Southeastern states have made the noteworthy commitment to a Renewable Policy Standard. In addition, the RPS Study incorporates the benefits of energy efficiency and identifies the need for a Renewable *and Efficiency* Portfolio Standard – an important recognition of energy efficiency as a low cost resource. Thus, NCSEA supports a North Carolina Renewable and Efficiency Portfolio Standard.

Respectfully,



Ivan Urlaub
Executive & Policy Director

Reference: Analysis of Renewable Portfolio Standard for the State of North Carolina and Request for Public Comments

Dear Sir:

Both the GDS Associates **A Study of the Feasibility of Energy Efficiency as an Eligible Resource as Part of a Renewable Portfolio Standard for the State of North Carolina** and La Capra Associates **Analysis of a Renewable Portfolio Standard for the State of North Carolina** appear to contain computational problems in their assessments of the economic suitability of two solar energy technologies for inclusion in RPS legislation. My comments follow.

Clerk mail
Watson

I. Solar Tax Incentives. As of this date, the Federal 30% income tax credit has been extended through the end of 2008, and it looks like the new Congress may extend the Federal tax incentives through 2017. The excellent solar energy resources cited by La Capra and the combination of Federal and North Carolina solar tax incentives in the commercial and industrial sectors mean that North Carolina has one of the best solar energy investment environments of all of the states, including those states like California, New Jersey, and New York that offer solar rebates instead of tax incentives. These solar tax incentives buy down the net capital costs of commercial solar energy systems by around 80% when the owners can use their tax liabilities this way. The Solar Energy Industries Association (SEIA) has concluded that the North Carolina investor-owed utilities can apply tax incentives on solar energy equipment that they own and operate with the permission of the NCUC.

The tax incentives that are presently available for commercial solar energy systems are the Federal 30% Investment Tax Credit (with no limits), the Federal 5-year MACRS (accelerated depreciation), the North Carolina 35% tax credit (with a $2.5M limit per project), and a North Carolina 10-year straight line depreciation. For the residential market, there are the Federal 30% income tax credit to a limit of $2000 and the North Carolina 35% income tax credit to a limit of $1400 on a solar hot water system. It is unclear if La Capra and GDS have correctly applied all of these tax incentives to their analyses of solar energy technologies. The only references to solar energy tax incentives are on pages 37 and 39 of the La Capra report, and they are incomplete as written. The GDS report fails to even mention solar tax credits.

I request the Utilities Commission staff require La Capra and GDS to re-examine any computations in the study that can include solar tax incentives to reduce the levelized costs of electricity generated or displaced, and to insure that these incentives are properly factored into their computations.

II. Analysis of a Renewable Portfolio Standard for the State of North Carolina.

La Capra fails to include solar PV as an acceptable renewable energy technology because the computed levelized costs of $0.20/kWh to $0.35/kWh are too high. (See Figure 3 on page 8 and Table 8 on page 42). Levelized cost is defined on page 97 of the Study as "A single cost (often stated as a rate per kWh or MWh) that would produce the same economic outcome as a series of varying costs over the economic life of an investment." Yet it is unclear from the statements on page 41 and Table 8 what actual methodology was used to compute the levelized costs other than 20 years is assumed to be the economic life of a system. On page 36, the assumed installed costs of PV range from $8,000/kW (large commercial systems) to $12,000/kW (small residential systems), and the annual PV production varies from 1665 kWh/kW-yr to 1706 kWh/kW-yr. Using these data, the computed costs of $0.20/kWh to $0.35/kWh appear to be simply installed costs divided by 20 years of total PV electricity production. These don't appear to take into account all solar tax credits and the changing value of money over 20 years.

It is unclear how La Capra computes levelized costs. Several years ago, the staff of Duke Engineering and Services (DE&S), a subsidiary of Duke Energy, developed an Excel spreadsheet calculator that uses the NPV function to compute a single cost of a commercial solar energy system where the various tax incentives are applied over different time periods with discount rate as an input to estimate the change in the value of money over time. (This follows the La Capra definition of a levelized cost.) For example, the Federal 30% ITC is taken in the first year, the 5-year MACRS schedule is over 6 years, the North Carolina tax credit is taken over 5 years, and the North Carolina straight line depreciation schedule is over 10 years. NC tax credits are treated as income for Federal tax purposes. For a large commercial solar PV installation at $8000/kW with a 5% discount rate, this calculator produces a system present value cost of $1516/kW, which is 19% of the capital costs. This suggests that instead of a levelized cost of $0.20/kWh, the cost should be closer to $0.072/kWh when all commercial tax incentives are included in the calculations.

It is noted that La Capra computed wind power levelized costs of $0.055/kWh to $0.105/kWh on Table 8 page 42 with production tax credits included, and La Capra includes wind as an economically viable technology for RPS legislation. Therefore, it must be concluded that if La Capra were to compute levelized costs for solar PV by including all applicable tax incentives, large commercial PV systems could also be included as viable for a North Carolina RPS. The impact of including solar PV in RPS legislation can be illustrated by the following example: were commercial building rooftops with a total area equal to the land area surrounding the Shearon-Harris nuclear power plant used for solar PV systems, around 3200 MW could be installed.

I request the Utilities Commission require La Capra to re-evaluate solar PV by recalculating the levelized cost of electricity in a way that includes all applicable solar tax incentives, and to make a solar PV resource assessment.

III. A Study of the Feasibility of Energy Efficiency as an Eligible Resource as Part of a Renewable Portfolio Standard for the State of North Carolina.

In its evaluation of an acceptable energy efficiency measure to be included in an RPS, GDS has established an arbitrary electricity levelized cost savings of $0.05/kWh. Levelized cost per lifetime kWh saved is defined in the report as the annual cost of an installment loan payment over the life of the energy efficiency measure divided by the annual kWh savings. (This differs from the La Capra definition of a levelized cost.)

For residential solar hot water (SHW) systems, Table 5-4 on page 38 of the report lists the levelized cost as $0.085/kWh. Appendix E lists an assumed discount rate of 10% (nominal) with inflation of 2.5%, and page 84 of the report lists the cost of a residential SHW system as $2500, an annual electricity savings of 3442 kWh, and a 20-year lifetime. This information is credited to a 2003 ACEEE publication. It is unclear how GDS arrived at their stated levelized costs other than they computed the annual premium of a 20-year loan and divided it by the annual energy production of the SHW system. Because the computed residential levelized cost is greater than $0.050/kWh, solar hot water was rejected as a measure to be included in the RPS. Were the calculation less than $0.050/kWh, Table 5-2 on page 36 shows that this measure could save approximately 25% of all considered measures by 2017.

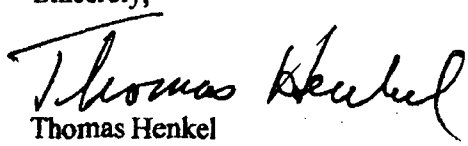
Because GDS used residential solar hot water system incremental costs from a 2003 publication and failed to mention tax credits in their report, it is doubtful that they included the 2006 appropriate solar tax incentives. For a capital cost of $2500, the DE&S calculator, while incorporating the applicable solar tax credits, produces a present value cost of $1186 at a 10% discount rate, which is 47% of the incremental capital cost. Therefore, with tax incentives included, the levelized cost calculation should produce a value of approximately 47% of $0.085/kWh or about $0.043/kWh.

I also question if a 10% discount rate is reasonable for an investment in a reliable energy system at today's price of money.

I request the Utilities Commission require GDS to re-evaluate the residential solar hot water energy efficiency measure by recalculating the levelized cost of energy saved and insuring that all appropriate tax incentives are included.

Thank you for considering my comments. I will be happy to respond to any questions the Commission staff may have about my analyses.

Sincerely,



Thomas Henkel

Comments on the "Analysis of a Renewable Portfolio Standard for the State of North Carolina"

I would like to commend La Capra Associates and the North Carolina Utilities Commission on a thorough and realistic assessment of renewable energy opportunities and costs and the subsequent impact to North Carolina ratepayers.

That being said, I do have one correction and several comments to make. Having served over 10 years as plant manager at Craven County Wood Energy, a 50 mw biomass electrical generating facility in New Bern (referenced in the report), and now responsible for operations at four such facilities nation wide and some 150 mw of biomass generating capacity, I believe I am qualified to offer some practical comments.

The correction I need to point out is the fuel cost listed for "Wood Block 1" New Biomass plants on Appendix F Operating Cost Assumptions (page 118). This cost is shown as $2.05/mmbtu, but to be consistent with the $40/dry ton cost shown on Appendix F Fuel Cost Assumptions (page 116), the correct number is $2.35/mmbtu (a dry ton of wood typically has about 17 mmbtu available). This number is correctly shown in Section 3.2 of the report. The $2.94/mmbtu cost shown for "Wood Block 2" New Biomass correctly corresponds to the $50/dry ton shown on the Fuel Cost Assumptions.

That being said, the extremely low and even negative fuel costs (-$0.40 to +$0.19) shown for co-firing biomass on these same pages is misleading and leads one to the conclusion that co-firing biomass is an order of magnitude cheaper than other renewables. The same should be said of Table 8 on page 42, which explains in a footnote that the fuel costs shown for co-firing actually represent only the incremental cost above coal. I therefore recommend that any comparison of costs of the different generating technologies show the full cost of electricity generated from co-firing biomass.

It is unclear to me how and if this is factored into the utility rate impact modeling. Since co-firing biomass displaces coal, the full cost of the biomass must be factored in and not just the differential above coal costs.

The report does a good job in pointing out that co-firing does not help toward needed capacity additions. The report states that this is factored into the economic model.

Another unfair comparison is that biomass generating facilities are modeled using an economic life of only 20 years whereas coal and nuclear generation is allowed an economic life of 40 years resulting in a lower levelized cost. These are purely commercial assumptions and have nothing to do with the relative potential technical longevity of these facilities. A wood waste fired power plant is very similar to a coal plant in its basic steam cycle technology, and it has a comparable if not longer life due to its relative simplicity. An example of this can be seen in many operating power houses in aging pulp and paper mills today.

My final point is that it is imperative that any RPS introduced include existing resources. Biomass resources have become competitive markets, and if new biomass generation comes on line at a premium to existing generation it has an unfair economic advantage in competing for the same biomass resources. The report does accurately show the higher costs of new biomass compared with today's market, but it is inevitable that new generation will compete for the cheapest resources available and market prices will increase for all generators. By excluding existing generators the RPS could therefore have a negative affect by adding new renewable generation but losing existing, resulting in a small or negative net capacity change.

Re: Analysis of a Renewable Portfolio Standard for the State of North Carolina and Request for Public Comment

Dear Ms. Vance:

Please find CIGFUR's comments in accordance with the Commission's solicitation for public comments regarding the Report issued to the ERC by the Commission and La Capra.

Please let us know if you have any questions.

Sincerely,

BAILEY & DIXON, L.L.P.

CIGFUR's Comments on the
Analysis of A Renewable Portfolio Standard for the State of North Carolina
Prepared by La Capra Associates, Inc. – December 2006

Introduction

The following comments are submitted by the Carolina Industrial Group for Fair Utility Rates (CIGFUR)[1]. CIGFUR members are vitally interested in the continued availability of an adequate supply of reliable electric power at the lowest reasonable rates to ratepayers in North Carolina and, consequently, wish to be involved in any consideration of a renewable portfolio standard (RPS) for the State. CIGFUR does not oppose expansion of utility-owned capacity, purchased capacity (including capacity based on renewable energy), or demand-side management (DSM) provided it can be demonstrated that the alternative selected results in least cost rates to ratepayers without subsidies or undue discrimination.

The *Analysis of A Renewable Portfolio Standard for the State Of North Carolina* (Report) provides a first analysis of an RPS for the State and appears to be a good, initial effort in this complex and dynamic area of inquiry. Due to the complexity of this subject matter and the uncertainty associated with a forecast of variables affecting the future, certain assumptions were required in an attempt to model the variables associated with this undertaking. Therefore, it should be recognized that, while the Report may be a best-efforts attempt to gain insight into the impact of future variables and uncertainties, the future is always subject to change as more information becomes known and measurable.

Conflicts with Existing Ratemaking Principles

CIGFUR is concerned by any proposal to change the present regulatory system in order to provide a subsidy or preferential treatment for renewable energy in connection with implementation of an RPS. For example, the North Carolina Utilities Commission (NCUC or

[1]The CIGFUR groups, CIGFUR I, II and III, are associations of large, industrial purchasers of power in North Carolina from the three investor-owned electric utilities operating in the State.

Commission) has established the avoided cost rates paid by North Carolina utilities for power purchased from qualifying facilities by keeping ratepayers indifferent to whether power is supplied from utility-owned generation or non-utility generation. The Report states:

> Existing average avoided cost[44] rates (4 to 6 cents per kWh) for wholesale energy including capacity paid to Qualifying Facilities under PURPA are insufficient for new renewables to be built in the State. Avoided costs are calculated based on marginal power costs, which reflect the weighted cost of generating electricity on the margin, and the capacity cost associated with new combustion turbines. However, the avoided cost calculation does not take into account the full cost of new baseload generation. Furthermore, many of the existing non-utility owned generators' long-term contracts are expiring, and those projects are facing lower avoided cost rates for the energy today, risking potential closure of the facilities. Others are considering wheeling the energy into PJM and selling the energy out-of-state where wholesale prices are higher and there is potential opportunity to participate in other states' RPS programs.
>
> [44]"Avoided cost" is defined in the Federal Public Utility Regulatory Policies Act of 1978 (PURPA) as "the cost to the electric utility of the electric energy which, but for the purchase from such cogenerator or small power producer, such utility would generate or purchase from another source." 16 U.S.C. § 824a-3. The avoided cost is designed to produce no rate impact to customers and reflects the marginal cost of generating electricity, but does not necessarily reflect the all-in cost of building baseload generation." Report, p. 7.

The Report also states that some of the renewable generation for the RPS does not provide capacity value.[2] To the extent capacity is not supplied when capacity is required, the value of the power is significantly reduced and reliability becomes an issue. Energy supplied at off-peak times may produce a burden on utilities and ratepayers, rather than a benefit. These issues need to be analyzed fully prior to any change in the North Carolina method of regulation of electric service.

Another significant area of concern is associated with long-standing integrated resource planning criteria. Currently, utilities are required to present IRPs to address comprehensively their plans for future capacity, purchased capacity or demand-side management to provide reliable service to ratepayers on a least cost basis. This process has served North Carolina well over many years and should not be abandoned or changed substantially without full and adequate consideration of all ramifications. The least cost standard is a fundamental regulatory

[2]Report, page 59.

principle that should not be abandoned. Utilities and ratepayers need to know that the ground rules for fair, efficient least cost ratemaking without discrimination have not changed and will not change. If the IRP process and least cost standard are abrogated, more problems will be created than solved.

Some North Carolina industries produce energy from wood products or chemical processes that are extremely efficient and conserve the State's resources. However, the avoided cost rates established by the Commission do not currently provide for the economic sale of that efficient energy to utilities. It would be unreasonably discriminatory to set a different, higher level of avoided cost rates for new participants in order to establish an RPS for North Carolina. This would allow new participants to take advantage of the higher avoided cost rates at the expense of existing ratepayers who offer more efficient sources of energy. There is no doubt that the increased cost would be passed through to ratepayers as stated on page 41 of the Report:

> "The output of the non-utility-owned projects is assumed to be sold to utilities under long-term power purchase agreements (PPA) for a fixed price that is equivalent to a levelized cost which allows the owner to earn a market return on investment. The cost for the PPAs will be passed through to ratepayers."

Phantom Taxes or Subsidies Should Not be Allowed

A subsidy forced on ratepayers by higher avoided cost rates, abandonment of the least cost criterion or a rate increase caused by a Public Benefits Fund is in actuality a new, "phantom" tax levied on North Carolina citizens. A new tax should not be levied on North Carolina citizens through a process before the NCUC. New taxes should be levied only by the General Assembly. Public benefit funds or payments for purchased power above avoided cost, are equivalent to taxes and should not be called anything else.

Additional Costs Associated with a RPS

The Report does not review analyze costs imposed by the necessary expansion to the transmission grid or substations that will be required by certain renewable projects such as offshore windmills. The cost and operating problems associated with offshore windmills or other renewable energy projects should not be minimized. For example, transmission lines are difficult to construct in many geographic areas and may meet resistance from North Carolina property owners.

The costs and problems associated with renewable energy projects must be taken into account before any new action is taken to promote them. For example, energy that is contingent on wind may not be available when needed and cannot be counted on for meeting peak load requirements of North Carolina ratepayers. Reliability may be strained, and additional utility generation may be required for system reliability in addition to the renewable energy. These issues must be considered and evaluated prior to establishment of a mandatory RPS requirement.

Existing Clean Air Requirements

Utilities in North Carolina have the responsibility of meeting very strict clean air requirements under the Clean Smokestacks law (2001 N.C. Sess. Laws 2002-4). A significant amount of capital is being invested to produce clean energy from existing North Carolina generation. Since North Carolina is "ahead of the curve" with respect to clean energy from existing fossil-fueled plants, it may not be necessary for North Carolina to rely on renewable energy for environmental reasons to the same extent required by other states with plants that are not already required to be environmentally friendly. Is it reasonable for North Carolina ratepayers to fund extremely clean fossil-fueled plants and in addition subsidize renewable energy in an attempt to stay "ahead of the curve" with respect to clean generating technology.

Energy Efficiency is Not Renewable Generation

Section 5 of the Report considers energy efficiency as a method of reducing the rate impact of an RPS. Energy efficiency is always a consideration for manufacturing industries located in North Carolina. Energy efficiency is also mandated through standards in the manufacture of appliances and in building codes. Energy efficiency is separate and apart from generating electricity using other than fossil-fueled sources. Energy efficiency will stand on its own and should not be used to mask the increased cost that may be associated with an RPS. Energy efficiency can be pursued without renewable generation that must be subsidized because it is not the least cost option.

Job Impacts

Section 7.1 of the Report considers non-energy related benefits on an RPS including job gains and losses. A model was used to derive this information, and, obviously, many assumptions were required for this forecast. The Report projects that new jobs may be created from a requirement to obtain power from renewable sources and that jobs may be lost from increased prices that would burden existing North Carolina companies. The Report also considers that certain renewable equipment is not manufactured in North Carolina. Indeed, industries in North Carolina are already subject to global competition and may be forced to cease operations or locate elsewhere due to increased costs. CIGFUR does not believe that new jobs should be weighed against old jobs as a basis for a mandatory requirement for new forms of generation. The least cost standard is the fairest way to proceed with cost-based rates for all ratepayers. Introduction of a subsidized, more costly form of energy with a netting of new jobs versus old jobs should not be considered as a basis for establishing an RPS standard. A phantom tax that subsidizes new sources of power may result in new jobs but would be indifferent to the fact industries paying the subsidy will likely lose jobs. North Carolina residents

who work in the North Carolina manufacturing industries should not be forced to subsidize a new industry that may cause the loss of their jobs.

Respectfully submitted, January 19, 2007.

OFFICIAL COPY

Dear Commissioners:

The North Carolina Farm Bureau Federation appreciates this opportunity to provide comments regarding the North Carolina Utilities Commission's "Analysis of a Renewable Portfolio Standard for the State of North Carolina" (RPS Study).

Agriculture is North Carolina's number one industry, accounting for $68 billion in annual economic activity. We are the state's largest farm organization and, with 500,000 member families, among the state's largest organizations. North Carolina Farm Bureau supports the utilization of renewable energy and energy efficiency and commends the North Carolina Utilities Commission and the Environmental Review Commission for authorizing this study. We recognize that renewable resources and efficiencies are essential components of balanced energy supply and energy independence. Farmers are in a position to benefit greatly from the utilization of agricultural biomass, animal manure, poultry litter, forest biomass, and wind power. However, we are cognizant of the possible negative impacts of a mandated RPS and an unbalanced energy efficiency program in North Carolina.

North Carolina Farm Bureau is deeply concerned about the negative impact of rising energy costs on North Carolina's farm families, rural citizens and agribusinesses. These costs are jeopardizing our state's rural economy and squeezing the budgets of hard working citizens. As you know, North Carolina has recently enjoyed low electricity costs compared to other regions of the United States. The RPS Study predicts a rise in electricity rates for nearly all evaluated RPS scenarios. This RPS rate increase, though small, would be added to the anticipated rate increases due to new baseload construction. Farmers and rural citizens cannot afford rising electricity rates to be compounded with the already rising oil and natural gas prices. Farmers do not have the ability to pass on these increased production costs. Clearly, the state must identify and develop local sources of renewable energy, but at a cost that does not threaten the rural economy.

North Carolina Farm Bureau supports utilities using energy efficiency as a flexible tool to meet increasing demand. The RPS study proposes an energy efficiency program paying for 50% of the efficiency measures through a central administrator. The energy efficiency analysis was completed based on a review of published reports and not a detailed, North Carolina specific analysis. In the analysis, agriculture is considered within the industrial sector with no agricultural specific efficiency measures evaluated. We are concerned that a statewide energy efficiency program will disproportionably tax the agricultural sector with little to no qualifiable energy efficiency measures available. In this case, North Carolina farmers will shoulder their part of the program cost but realize very little of the benefit.

North Carolina's farmers and agribusinesses, like the rest of the state's consumers, are dependent on imported energy feedstock to keep their operations in business. It is critical that North Carolina continue to implement sound energy policy that provides reliable and affordable electricity. Part of that sound energy policy includes expanding the utilization of our abundant renewable resources. North Carolina Farm Bureau encourages the increased use of renewable resources as a part of the growing energy portfolio. We believe that voluntary, incentive based, market driven approaches provide for a proper balance between renewable energy, energy efficiency, and affordable electricity. North Carolina Farm Bureau supports the utilization of renewable energy and energy efficiency and look forward to our involvement in the development of sound energy policy.

Again, thank you for allowing us the opportunity to comment on the "Analysis of a Renewable Portfolio Standard for the State of North Carolina".

Sincerely,

Subject: Renewable Portfolio Standard for North Carolina

Dear Ms. Vance:
Attached are 40 copies of the comments of Andrew C. Givens concerning a Renewable Portfolio Standard and energy efficiency measures for North Carolina.

Sincerely,

Andrew C. Givens

Andrew C. Givens

Comments to the North Carolina Utilities Commission

Regarding

Establishment of a Renewal Portfolio Standard for Electric Generation In North Carolina

Submitted by:
Andrew C. Givens[1]
Cardinal Energy Service, Inc
Raleigh, NC

January 19, 2007

The Environmental Review Commission and the North Carolina Utilities Commission should be applauded for examining the issues related to a Renewable Portfolio Standard (RPS) and energy efficiency measures for North Carolina. The reports of the La Capra Team provide important background information for discussion and further consideration of these issues.

The pattern of overall energy consumption in this country is significantly higher than is necessary or appropriate to maintain and continue to improve our standard of living. As a result of our energy consumption we have degraded our environment, risked our health through polluted air, reduced our national wealth and impacted the value of the US dollar by massive spending on foreign fossil fuel resources, become energy dependent upon remote oil-rich countries around the world, and become politically and militarily weaker. There is a better way and we should work to find and implement it.

Some of these issues relate more to our oil use than to electricity generation and consumption in North Carolina. However, the prices of energy resources are linked in the market, and as oil prices rise, the cost of energy substitutes such as coal and gas trend upward. In addition, our addiction to careless energy consumption is broad, and a change in our consumption will require an overall increased awareness of energy cost and a rational dialogue to find a more satisfactory approach toward meeting our future energy needs.

---

[1] Andrew Givens is an energy and utility consultant with over 25 years experience and has been directly involved in the renewable energy industry in North Carolina for over seven years. During this time he has worked with landfill gas developers, hydro operators and developers, hog waste project developers, and has analyzed the availability of renewable energy in North Carolina including hydro, landfill gas, animal waste, wind and solar energy development. In addition, he was directly involved in the initial development of the NC GreenPower program which supports the development of renewable generation across the state of North Carolina. The comments and positions expressed in this document are the personal and professional positions of Andrew Givens as a concerned resident of North Carolina, and are not sponsored or on behalf of any other party or organization.

Based on the information discussed below, North Carolina should adopt a program with its primary focus being energy efficiency with intermediate term support for the development of renewable resources and cleanup of utility fossil generation. Energy efficiency will lead to an overall reduction in the consumption of resources now and into the future. It will stimulate the development of new energy efficiency technologies. It will reduce the total carbon released into the air. It will reduce the need for new infrastructure such as power plant sites and transmission lines. A Renewable Portfolio Standard (RPS) based primarily on development of new renewable resources will be putting our eggs in a basket which has a higher resource cost than even the existing electric generation mix and has the potential to be a long term financial burden to the electric customers of North Carolina.

In fact, electric generation from many renewable resources in North Carolina is not resource efficient, as discussed below. In order for these resources to be developed, income tax credits, federal production tax credits, NC GreenPower support payments and other sources typically are needed. While these support programs may make the development feasible for a developer, this does not change the fact that most of these forms of generation require more resources and cost more than conventional generation. The development and operation of many renewable resources consumes significantly more capital, labor, equipment, and fuel resources to produce a kWh of electricity than with the current production scheme. By imposing a long term requirement to develop and utilize renewable resources without regard to the total resource cost, we are choosing the more resource intensive option.

Some renewable energy technologies are at the early stages of their development and may become resource efficient after an initial growth period. A properly structured Renewable Portfolio Standard (RPS) could be an appropriate mechanism to facilitate development of the initial renewable electric generation to help these industries reach an efficient scale. However, such an RPS must provide that the technologies eventually meet the competitive challenges, and that the long term development be based on resource competition, without support.

Again, we should not reject the development of the renewable generation strategies, but it is important to clearly understand the high cost of these generation technologies and the limited potential for them in North Carolina. We should move ahead on a sustainable basis and this requires that we develop a strategy which is based on the total resource efficiency principles. This requires a reduction of energy use through improved energy efficiency, and by requiring utilities to reduce emissions.

A closer examination of the La Capra report and consideration of specific development issues in North Carolina shows the difficulties with a reliance on major renewable electric generation.

1. The potential for hydro generation of 66 – 425 MW may be overstated. The stakeholder process leading to the formation of the NC GreenPower program addressed the development of hydro generation and showed the depth of controversy regarding existing and new hydro generation. At that time, existing hydro generation was not wholeheartedly supported, and there was severe opposition to new impoundments for hydro generation. It was clear that any new hydro generation which would be included in

the program would have to meet the Low Impact Hydro standards. It will be difficult to meet these standards in the development of potential sites in North Carolina.

The redevelopment of hydro generation sites in the early 1980s, following the federal PURPA law of 1978, led to the review of most, if not all, hydro sites in the state and the redevelopment of many viable sites. These operators have struggled to maintain feasibility of these sites over the last 20 years. There are few developable sites available which do not have serious environmental, operational, or financial issues limiting their development.

Some of the potential hydro sites listed on the INL database used by La Capra have already been developed and are among those in operation. Others sites on the INL list have serious issues related to development, or are rated at a significantly higher capacity than can be expected. While the INL database may be one of the best national databases available for a generalized analysis, it has lead to an overstatement of the actual available resource in North Carolina. Realistically, it is difficult to see more than 20 MW of additional small hydro generation developed in North Carolina.

2. The wind resource was shown to be about 26% to 42% (500-1,500 MW) of the practical potential renewable resource. The availability of the feasible wind resource may be overstated, based on the following factors:

   a. Wind generation is a seasonal resource which cannot be dispatched by a utility and cannot be counted on by the utility to serve specific peak loads. For this reason, the utility must provide other generation resources during low-wind periods and may not be able to significantly reduce the generation capacity required to meet the system load during peak times. On the other hand, wind generation could provide energy during periods of favorable wind, and offset the consumption of fossil fuel at some other plants.

      While the La Capra report reflects this seasonality of the wind resource, it can be easy to over estimate the resource value until the seasonality is worked into the integrated resource plan of the utility. For this reason, it may not be accurate to sum a projected capacity figure for wind generation with other seasonal resources such as hydro and solar, which may typically generate during other parts of the year.

   b. Based on the wind resource maps, the on-shore wind resource in eastern North Carolina is primarily located in areas of Hyde and Carteret Counties and within Albemarle and Pamlico Sounds. La Capra recognized that the development of wind farms typically requires some addition of transmission facilities to get the wind power to the grid, and included a generic cost for these transmission facilities. The specific sites in eastern North Carolina are particularly remote from the major transmission facilities. At most of these sites, lengthy transmission lines would be required, particularly in Hyde County and locations in the sounds. There are major issues related to construction in wetlands, waterfowl habitat, and

military aviation. This would be an even greater issue if the wind resource were to include a loop connection to the grid, as would be normal for a major generating resource.

c. The development of the wind resource in the mountains appears to be dependent on the legislation or litigation regarding the current "Ridge Laws." La Capra points out that the development would only involve approximately 100 miles, or 5% of the ridgelines above 3000 feet. While this may be true, these are, for the most part, the highest and most prominent 100 miles of ridges in the western part of the state. The resource is located primarily in five areas; 1) north of Boone, 2) Grandfather Mountain area, 3) Mount Mitchell area, 4) Mount Pisgah area, and 5) the Great Smoky Mountains. The Blue Ridge Parkway runs along or near many of these ridges. While the people of North Carolina may find wind turbines to be acceptable in these locations, it is clear that they will have a major impact on the mountain views.

d. The impact of the wind generation also includes the access and clearing of the sites for construction and operation. Particularly in the mountains, the construction and long term maintenance of access roads may be a significant cost and will have an environmental impact.

e. While some polls of people near potential wind farms show an acceptance of these developments, experience in some areas after generation has been added is mixed, and in some cases further development has been halted as a result.

f. The success of the wind industry in other states reflects the fact that other states, particularly the west coast states, certain mountain and plains states have a much greater wind resource than does North Carolina. The wind generation may be feasible in those states because of the significant federal production tax credits and the state mandates, rather than because they were resource efficient projects.

Based on the coastal or mountain locations and the transmission issues, a reasonable estimate of the development cost of wind generation in North Carolina would be at or above the high end of the cost data shown in the La Capra report. That is 9.1¢ per kWh. When looking at the total resource cost of putting a kWh of wind power on the gird, including the PTC and income tax credits, the cost may be 12¢ to 15¢ per kWh. While incentives may lead to the development of 10 MW to as much as 50 MW of wind generation may be developed in some coastal areas, it is not prudent to anticipate more wind generation to be developed in the state.

3. The biomass resource is shown to be approximately 35% to 50% (953 – 1239 MW) of the practical potential renewable resource in North Carolina. This is certainly a resource which can be effectively utilized for electric generation, particularly for co-firing at existing coal plants. The La Capra report points this out and discussed the need to address the related fuel supply, environmental, and regulatory issues.

A significant limitation of the biomass resource comes from the increase price of the fuel once the industry grows and a market develops for what once was waste. Experience in other locations has shown that as foresters and farmers see the wood waste or crop waste as a byproduct to be sold, the market develops and suppliers seek the highest price for their product. La Capra referred to this and to the importance of locating plants at a sufficient distance from each other to reduce this impact. However, plants must locate where there is access to the transmission grid and transportation. As the industry grows, there may well be an overlap of fuel supply areas and escalating prices. If the wood and agricultural waste generation industry does develop, this competition for fuel resources may quickly cap the feasible level of generation.

Most of the job creation related to the renewable power industry as discussed by La Capra is in the area of biomass generation. As shown in Figure 26 on page 72 of the report, most of these jobs are related to providing the fuel for the biomass facilities. Much of this employment is presumed to be the gleaning of wood residue from timbering sites and transportation of the fuel to plants. While many of the rural areas which would host these generation facilities can use the boost in employment which this would bring, we must recognize that these are not high paying jobs and not the jobs which the state has been promoting elsewhere.

4. Landfill gas generation appears to be the most developable renewable resource, with a number of projects in North Carolina in operation for 5 years or more. In many situations, however, the most efficient use of the gas has been direct use by large users rather than for the generation of electricity. This direct use avoids the energy losses inherent in electric generation and delivery to the grid. Where the site specific circumstances call for it, however, the utilities should be receptive to the electricity entering the grid. Recognizing the current mix of direct use and generation facilities, and the regulations regarding control of landfill methane, it is more reasonable to expect 50 MW of generation from landfill gas.

   North Carolina has an ample supply of animal and poultry waste and the generation of electricity would serve several goals. Researchers have been searching for the appropriate digestion, combustion, gasification, or other disposal technologies and have had some success. Some of these technologies include electric generation. Typically, the farm based generation facilities would produce less electricity than is used on the farm. While centralized facilities have been discussed, they have faced issues such as transportation cost and biosecurity hazards. While it is appropriate to be optimistic that new disposal methods will be found, it is unclear that any significant generation will be put on the grid through these technologies.

   With regard to solar energy, solar thermal heating and passive solar heating continue to be effective systems in many cases. The installed cost of photovoltaic panels, including the electronics, remains very high on a per kWh basis. The industry continues to improve the efficiency of the cells and works toward reducing the delivered cost of the panels. However, the longstanding hope that solar electric power will be competitive with utility

generation remains in the distance, in part because of the specialized electronics, battery storage, and labor intensive nature of many of the installations. To facilitate the continued development of this hopeful technology, it may be reasonable to support solar technology through programs such as NC GreenPower. La Capra showed little photovoltaic energy involved in the RPS.

Elimination of all energy subsidies to allow the market work – The competitive market is the basic structure in our economy for the allocation of resources and for the determination of what is consumed and what is produced. While it is far from being a perfect allocator of resources, it proves to be an effective reflection of the preferences of the American consumers' willingness to spend their wealth as long as the market is not manipulated by other forces. The existence of subsidies to different energy sources and to energy producers tends to understate the resources used in providing the energy to the customer. This has distorted the consumption patterns, typically encouraging our increased consumption.

The effective market requires that the customer see the full resource requirements in the price. This should include the value of the environmental impacts which they cause. A mismatch between the resources required and the cost to the customer thwarts the effective market mechanisms and should be eliminated. Examples of this include the direct and indirect federal support to fossil fuel industries, sub market oil and gas leases, use of excessive depreciation periods, and tax advantages not related to the energy production and service role of the suppliers.

Many of the energy subsidies are the result of federal action and the State of North Carolina may not be able to directly change them. However, we should eliminate those subsidies where we can and encourage the federal government to do so. We should also be cautious about implementing any long term support programs which artificially support the development of less resource efficient energy alternatives.

Impact on the customer - Establishing a RPS, income tax credits, Production Tax Credits or other mechanisms may make certain renewable energy projects feasible for development, but the programs do not make these generation projects more economically feasible or resource efficient. These programs work for the developer because the customer to pays for a portion of the project directly through electric rates, and the taxpayers pay the rest through the government programs. In fact the customer/tax payer pays for all of the resources used but, only sees a part of the resource cost.

How much does he see? According to the La Capra report the electric rates may increase by about 1% with the 5% renewable energy RPS. Today this is in the neighborhood of $90,000,000 to $100,000,000 per year. In addition to this direct increase, taxpayers may pay that much again in tax relief for the developers. The total cost may be well above $150,000,000. This is not instead of the currently anticipated cost of power, but in addition to the currently anticipated cost of power. This could be a major burden on the people on North Carolina. This should be imposed on the people of North Carolina only if programs to clean up the utility emissions or to produce energy efficiency are more expensive or ineffective.

Energy Efficiency Needs to be the Focus - Energy efficiency is the only substantive way to reduce the carbon emissions, cut the need for new utility infrastructure, and cut our dependence upon foreign energy resources, and develop high paying long lasting jobs. Achieving energy efficiency is a complex task which requires a wide variety of programs. One cannot show off a new plant for not producing energy. One cannot count the kWh's which were not consumed. Energy efficiency cannot be achieved through a single program or contract. It has to involve committed leadership together with a broad package of consumer programs and state regulations.

One of the strongest reasons for adopting the energy efficiency route is shown in the La Capra report. The report shows that by meeting only ¼ of the 5% RPS with energy efficiency measures will lead to an absolute reduction in the electric rates after the initial installation period. Meeting or exceeding the 5% level with energy efficiency should further reduce the power cost, with a direct benefit to the customers. The economy of the state will provide a strong incentive for job growth throughout the state.

The GDS report provides a solid array of energy efficiency programs. Likewise, the State Energy Office has years of experience encouraging the adoption of these programs in the state and within the state government. These efforts are largely based on the Energy Star program by DOE which have helped improve the energy efficiency of the housing stock, commercial buildings, and state facilities. These steps will produce energy savings for years to come where they have been undertaken.

To reach a more effective level of energy efficiency will require 1) technical advances, 2) regulatory action, and 3) leadership. Following the oil shocks of the 1970s, technical advances for appliances, lighting, building controls, motors, and HVAC systems were developed and have entered the market. These advances have helped to moderate the growth in energy use and show the way for more energy efficient measures in the future. Further technical advances are achievable and it is in the interest of the people of North Carolina to support and encourage these steps.

During the last 30 years many regulatory steps have been taken to improve energy efficiency, including implementation of improved building codes, better appliance standards, and mandated energy efficiency in government buildings. These steps should be strengthened as appropriate.

While it is a complex issue, the state should also consider modifying the regulation of electric and gas utilities to allow them to earn a return on their successful energy efficiency activities. These companies have a unique understanding of energy production, energy markets, and customer behavior. While they have earned a return on assets to produce and sell energy in the past, the regulatory scheme could be modified to channel their current position in the market to sell energy efficiency. In addition, the market could be revised to allow additional third party operators to "sell" energy efficiency in the state. This is an area which others states have also considered, and North Carolina should further develop such a solution.

Possibly the most important action which the state can take toward energy efficiency is to provide the high level leadership toward an energy efficient ethic. The State Energy Office has been involved extensive in programs and working for their implementation by those already interested and involved. They may be well positioned to play a major role in this task. However, in order to have a significant impact on the energy awareness of the broad population it will be necessary to involve the highest elected and appointed officials.

Conclusion: It is very important to review and consider renewable generation alternatives both now and in the future. The La Capra report has done a good job of identifying these resources. However, a realistic look at the development of these resources in North Carolina specifically leads to the conclusion that no more than 200 to 300 MW renewable generation can be developed in North Carolina, even with the support of a Renewable Portfolio Standard.

In determining the appropriateness of an RPS it is important to establish a yardstick of total resource efficiency prior to committing the ratepayer's money over the long run. While many improvements have been made to the renewable generation technologies over the last 10 years, most of the renewable resources available in North Carolina are expected require higher electric rates, even with significant government incentives.

On the other hand, energy efficiency measures offer to reduce the customer's bills, to reduce the utility infrastructure and to provide many of the benefits of renewable generation. The North Carolina Legislature and the Utilities Commission should focus on energy efficiency measures and emissions regulations to address the concerns at hand.

Comments by the **Southern Alliance for Clean Energy** to the North Carolina Utilities Commission on the Analysis of a Renewable Portfolio Standard for the State of North Carolina: January 19, 2007

FILED

Clerk's Office
N.C. Utilities Commission

We are pleased that the North Carolina Utilities Commission (NCUC) has commissioned the Analysis of a Renewable Portfolio Standard by La Capra Associates. The Southern Alliance for Clean Energy (SACE) supports the requirement for a Renewable Portfolio Standard in North Carolina to provide energy security through diversifying the state's energy mix, increasing rural economic development and providing greater environmental protection.

After review of the study, we believe that the study underestimates the potential for both renewable energy and energy efficiency. We believe the study used a lower cost of future generation than what is being seen in the North Carolina market. Using the incorrect lower cost numbers of new generation, the study fails to show the full extent that renewables and energy efficiency can provide in economic benefits. In addition, the report did not give economic value to the current and potential reductions in emissions from renewable energy and energy efficiency. These economic values could be significant as nitrogen and sulfur emissions continue to increase. To add to these escalating costs is the strong likelihood of carbon regulation that will have a significant impact on utility cost in the future.

We believe the potential use of cost effective renewable energy is also underestimated because La Capra Associates was directed to use a more restrictive screen for qualifying wood resources, which was used in the NC GreenPower program. SACE participated in the NC GreenPower stakeholder process that established the restrictive screen used for qualifying wood resources. SACE supported the restrictive screen in NC GreenPower because customers are asked to pay a higher price voluntarily, therefore should get a more "premium" product, i.e. more wind or solar. With a mandate, we would fully expect that a broader definition of wood resources be used, but still with a focus on sustainable forest and agriculture practices. The result would be more biomass at a lower cost than what the study indicates.

After reviewing the GDS Associates study "A Study of the Feasibility of Energy Efficiency as an Eligible Resource as Part of a Renewable Portfolio Standard for the State of North Carolina," we have identified certain aspects of the study that would tend to indicate that the results are conservative. Primarily, these comments are focused on the determination of the achievable potential and the avoided cost.

For the residential sector, GDS estimated that the achievable potential is approximately half of the technical potential, that is, 20.4% of 2017 residential sector electricity sales. After determining what was achievable, GDS determined the "achievable cost-effective" potential. Generally, we would expect a study to determine the "economic" potential after determining the technical potential. In determining the economic potential one

study shows 0% maximum achievable potential and 0% achievable potential (Table 1-7), but in fact the study shows a 5.1% potential. As another example, we could not find the information showing a maximum achievable cost-effective potential of 4.9% and 4.8% in the residential and commercial sectors in the study for Wisconsin as GDS asserts. Even if one accepts the average of cost-effective achievable potential in the commercial sector as accurate, North Carolina's cost-effective achievable potential would effectively be limited by the avoided costs in other states and the politics of energy efficiency in other states.

The industrial sector potential in the present study relies even more heavily upon the averages of estimates in potential studies done in other states and utility service territories and we would reiterate the same concerns for this sector. To be clear, we find GDS' methodology in determining the technical potential in all these sectors to be generally sound. It is the reliance on other studies to identify the achievable and cost-effective achievable potential that concerns us.

RE: Public Comments on NCUC's "Analysis of a Renewable Portfolio Standard for the State of North Carolina"

Please find the following public comments of the signatories of this letter to the North Carolina Utilities Commission in response to the December 2006 report "Analysis of a Renewable Portfolio Standard for the State of North Carolina" conducted by La Capra Associates, GDS Associates and Sustainable Energy Advantage, LLC and commissioned by the NC Utilities Commission at the request of the legislative Environmental Review Commission.

We commend the North Carolina Utilities Commission for their leadership in commissioning this non-biased study of the costs, benefits and economic potential of a Renewable Portfolio Standard for the state of North Carolina ("RPS Study"), which also incorporated the economic potential of a small subset of the low-cost energy efficiency measures currently available.

At this time, 20 states and Washington, D.C. have implemented Renewable Portfolio Standard requirements. As each of these states advances in their respective implementations, their progress is a sign that (1) technical and non-technical concerns surrounding renewable energy electric generation and energy efficiency measures can be constructively resolved through collaborative rulemaking, (2) Renewable Portfolio Standards as a policy tool are succeeding (i.e., states are not racing to repeal their respective statutes), and (3) in fact, several states have increased their Renewable Portfolio Standards requirement in response to early compliance by electric utilities and/or ratepayer support for more aggressive growth and development of renewable energy resources and industries.

North Carolina is now well positioned to act on its own opportunity to encourage the economic and social benefits of renewable energy and energy efficiency. In fact, North Carolina can do more and do it better. North Carolina can be the Southeast's regional leader in energy policy as no other Southeastern states have made the noteworthy commitment to a Renewable Portfolio Standard. In addition, the NC Utilities Commission's RPS Study incorporates the benefits of energy efficiency and identifies the need for a Renewable *and Efficiency* Portfolio Standard – an important recognition of energy efficiency as a low cost resource. Thus, the signatories to this letter support a Renewable and Efficiency Portfolio Standard.

When considered as a whole, the RPS Study provides sufficient information and evidence for the state legislature to have confidence in a decision to create a mandatory Renewable and Efficiency Portfolio Standard for the state of North Carolina. The study was broad in scope, used conservative assumptions that likely underestimate the amount of renewable energy and energy efficiency that could feasibly be developed and implemented in North Carolina, engaged a broad range of stakeholders, and demonstrated clear benefits – both economic and social – of a Renewable and Efficiency Portfolio Standard in North Carolina. The subsequent comments

highlight the RPS Study's positive conclusions and stress additional items that should be considered when reflecting on its results.

1. Reliability is not sacrificed when the State's renewable energy resources are utilized.

Interruptions in the supply of electricity to customers can be caused by disturbances in the power system's generation, transmission, or distribution components. Interruptions can also be caused by the unavailability of adequate resources to supply the utilities' electricity customers. The RPS Study addresses reliability – specifically focusing attention on the economic analysis of the power system's generation component and resource availability.

Contrary to historical opinion, the RPS Study results show that relative to the modeled Utilities Portfolio set forth in their combined 2006 Integrated Resource Plans, the RPS Study's Alternative RPS portfolio ("Renewable and Efficiency Portfolio Standard") - a resource portfolio comprised of conventional generation and an established standard that includes in-state renewable energy resources and comprehensive energy efficiency measures – can also:

(1) Achieve the capacity requirement necessary to ensure reliability;
(2) Meet, and in most years, exceed the projected energy needs; and
(3) **Offset the need for over 1,800 MW of baseload generation – coal and nuclear** (RPS Study, page 57).

Furthermore, this result is calculated within the constraints of the conservative model assumption that "intermittent" resources such as wind and hydropower will not contribute to the State's capacity requirements. Other states' experiences challenge this assumption as renewable energy generation is demonstrating that these resources have an inherent capacity value.

2. A Renewable and Efficiency Portfolio Standard has a positive impact on the State's economy.

The RPS Study illustrates that, due to the utilization of North Carolina fuel resources and more labor intensive electric generation technologies, a ten percent Renewable and Efficiency Portfolio Standard can create a net increase of approximately 2,700 jobs per year for twenty years. Not only does the Renewable and Efficiency Portfolio Standard create more jobs relative to the business-as-usual Utility Portfolio, it also strengthens the State's labor market – the result of a neutral rate impact due to reductions in energy demand. Total energy expenditures will not necessarily increase, which translates into an in-state economic market that attracts business and supports economic growth. Again, the RPS Study provides strong evidence that a Renewable and Efficiency Portfolio Standard will actually stimulate economic growth.

In addition to the fact that the Renewable and Efficiency Portfolio Standard's economic benefit remains primarily within North Carolina, it creates an opportunity for benefits to be spread throughout the State. The La Capra analysis indicates that the highest return job-related benefit comes from the installation of solar technologies, anaerobic digesters, and the development of biomass generation facilities that source their fuel from within North Carolina. A review of the RPS Study's resource supply assessment shows that such *economic development would not be*

isolated to specific State counties or regions. The wealth can be spread throughout the State - not only in job-related benefits but increased property tax revenue as well.

3. <u>The RPS Study's model inputs over-estimate the cost of renewable energy and under-estimate the cost of conventional generation technologies.</u>

The RPS Study significantly under-estimates the future cost of a new coal-fired power plant for baseload and intermediate load power generation. It is highly likely that the actual rate impacts of a State Renewable and Efficiency Portfolio Standard of 10 or possibly 20 percent will be lower than the projected Utilities Portfolio. This is due to two current developments that show no signal of reversing:

(1) Currently operating coal and nuclear facilities are now subject to increased operation costs as a result of increasing prices for all conventional electric generation fuels – prices that the La Capra study refers to as "dramatic increases." We submit these are more than just dramatic price increases – they are fundamental changes in the fuel resource market that are already occurring (i.e., the price floor for power generation fuels has risen). Pressures on fuel markets are significant. One such pressure is the proposed construction of over 90 new coal generation facilities nationwide, which are leading utilities to secure new Central Appalachian Coal (CAP) and Northern Appalachian Coal (NAC) fuel contracts such as Duke's recent purchase of NAC. A second such pressure is transportation costs necessary to import conventional fuels from other states and foreign countries. Reflected in increased rail rates, the capacity of our country's rail infrastructure is stressed and will only be alleviated with substantial future investments that represent a significant cost. A cost that will, at least in part, be passed on to ratepayers.

(2) The most recent industry experiences reveal significant cost overruns for proposed coal and nuclear power facility construction. To date, over 100 new coal power and 19 new nuclear power facilities are proposed nationwide. Repeatedly, electric utilities and contractors are raising their cost estimates for these proposed facilities due to the rising and unpredictable costs of materials, design considerations, fuel waste management, and shortage of construction labor.

For example, Duke Energy recently increased their capital and construction labor cost estimate for their proposed Cliffside power plant by 50 percent, up from $2 billion to more than $3 billion, which is not reflected in the RPS study. With further analysis, it is our belief that that this cost increase alone could be enough to neutralize a significant portion of any potential rate increase from a 10 percent Renewable and Efficiency Portfolio Standard that is 7.5 percent renewable energy and 2.5 percent energy efficiency as modeled in the RPS Study's Scenario III. One needs to look no further than the RPS Study's sensitivity analysis to see that capital costs can substantially impact the costs and benefits modeled in the RPS Study. Although many renewable generation resources have higher capital costs per megawatt associated with capital equipment relative to conventional generation, they are much more flexible in terms of size and typical development and construction time frames. Thus, capital risk associated with

conventional power sources can be alleviated if the State relies less on the financial success of a few, large-sized conventional projects.

The RPS Study also over-estimates costs for renewable energy sources. Nationwide, the cost of renewable energy technologies has steadily declined for 30 years, and the RPS Study sets overstated cost assumptions that do not fully account for these trends and observed North Carolina business conditions. As an example, the RPS Study estimates the 2007 levelized cost of solar photovoltaic power to be approximately 20 cents per kWh for commercial systems and 35 cents per kWh for residential systems. However, current NC GreenPower data reveals that companies are offering to sell both commercial and residential solar photovoltaic power in the range of 14 cents and 18 cents per kWh respectively – a strong indicator that the modeled 20 and 35 cents per kWh is overstated.

4. A Renewable and Efficiency Portfolio Standard is the State's best opportunity to improve North Carolina's utility industry in an approach that addresses the causes of global climate change.

As stated in the RPS Study, it is clear that a Renewable and Efficiency Portfolio Standard will diversify the State's resource mix. A Renewable and Efficiency Portfolio Standard can alleviate the potential risk of increased costs associated with carbon dioxide emissions from fossil-based generation. Such a policy would reduce the forthcoming carbon dioxide cost that our electric utilities - and by connection their customers and shareholders – will face in the future with a utility portfolio that is already heavily weighted in coal and projected to increase.

The RPS Study concludes that a 10 percent Renewable and Efficiency Portfolio Standard can reduce carbon emissions that are causing global climate change by over 13.6 million tons of carbon dioxide equivalent per year. Duke Energy, the North Carolina Utilities Commission and North Carolina General Assembly are aware that federal regulation of carbon emissions is imminent in the next five years, and State action to curb carbon emissions from the electric utility sector is a possibility. These bodies are also aware that if approved, Duke Energy's proposed 1,600 MW Cliffside coal power plant will annually emit 11 million tons of carbon.

In summary it is our assessment that through a collaborative approach, which utilized conservative input metrics for cost and other variables, this RPS Study has shown with confidence that Investor Owned Utilities can deliver low-cost, reliable baseload power by adopting a 10 percent Renewable and Efficiency Portfolio Standard. In fact, it is our position that a 20 percent standard is not unattainable. Rather, it should be the gold standard.

A required Renewable and Efficiency Portfolio Standard satisfies the North Carolina Utilities Commission's mandate while delivering greater job creation, economic, environmental, and public health benefits that collectively advance our State's economic growth. As the RPS Study demonstrates, a diversified utility portfolio of conventional fuel sources, renewable energy resources and energy efficiency promotes a level of growth that is greater than the results shown if we choose a utility portfolio that relies on the electric utilities business-as-usual approach to our state's future economic advancement.

N.C. Utilities Commission

Dear Utility Commission Members:

I am writing to offer my comments regarding the technical report presented to you in December 2006 titled "*Analysis of a Renewable Portfolio Standard for the State of North Carolina.*" First and foremost, the Utilities Commission should be commended for its foresight in requesting this study. As the report states, the economic and environmental opportunities afforded by energy efficiency standards and renewable energy options are significant and should be fully explored by state policymakers.

However, my support for the report's conclusions is contingent on the implementation of measures to protect the beauty of North Carolina's mountain and coastal resources. Efforts to comply with future RPS standards must not be met at a significant cost to some of our state's most beautiful and valuable resources. I am particularly concerned with the report's "expanded renewables" option that would necessitate a "clarification" of the Mountain Ridge Protection Act to allow for "utility-scale" wind turbines on North Carolina's highest mountain ridges. And although at-sea wind energy generation shows great promise, near-shore coastal siting of wind turbines should be scrutinized for similar aesthetic and environmental reasons.

Many of the renewable energy options presented by the report are straightforward and appear non-controversial constituting what is often termed "low hanging fruit." These include biomass options that convert waste to energy from landfill gas, wood residue and animal waste. A good example is the plan to build an ethanol plant in Robeson County powered by methane gas from the county's landfill – a plan that will allow the county to keep carbon credits that could be sold to industries required to reduce greenhouse gas emissions.

Other very promising biomass options include energy generation from crop-based materials such as corn starver and wheat straw. These options are particularly attractive to the agricultural community in that they could offset some of the negative impacts resulting from years of declining production from tobacco and other farm products.

According to the report, biomass options, combined with small hydro and some wind power (presumably from small turbines or eastern wind), would enable North Carolina to support a 5% RPS "with a relatively small impact on retail electricity rates." If energy efficiency standards are added, the 5% goal is more readily achievable with a dramatic

reduction in cost. I strongly believe that the Utilities Commission should adopt a 5% RPS coupled with meaningful energy efficiency standards. I do not support a 10% RPS in that it would necessitate the large-scale development of utility-scale wind turbines on North Carolina's mountain ridges. The remainder of comments are specific to the Mountain Ridge Protection Act.

The Mountain Ridge Protection Act of 1983

It was the development of the Sugar Top condominium in 1982 that united landowners, responsible developers, environmentalists, and local and state politicians to press for the passage of North Carolina's Mountain Ridge Protection Act. One of the primary objectives of the Act, which became law in 1983, is to protect the natural beauty of the state's mountains. To achieve this objective, the law limits the height of structures on high mountain ridges to 40 feet. There are exceptions for "structures of a relatively slender nature and minor vertical projections of a parent building, including chimneys, flagpoles, flues, spires, steeples, belfries, cupolas, antennas, poles, wires and *windmills*." Regarding the exception for windmills, the state's Attorney General has stated that the legislative intent in 1983 was to exclude the traditional, solitary farm windmill which has long been used in rural communities. He believes the Ridge Law must apply to wind facilities with their multiple large towers with stroboscopic lighting, stretching for miles along one of the state's most valuable resources – our scenic mountain ridges. For anyone doubting the wisdom of the Attorney General's 2002 decision, take note of the enormous controversy and multiple lawsuits in two of our neighboring states – Virginia and West Virginia. Unlike North Carolina, neither state has a law to protect scenic mountain resources the result of which has been a blossoming of organizations to address concerns of unregulated wind energy development. Some of these groups are listed below with websites.

Today's modern wind turbines stand between 300 and 400 feet. This is approximately three times the height of the 10-story SugarTop Condominium in Avery County. It was the development of SugarTop in 1982 that united landowners, responsible developers, environmentalists, and local and state politicians to press for passage of North Carolina's Mountain Ridge Protection Act.

Today's wind turbines are larger than the "experimental" wind turbine that was erected on Howard's Knob in Watauga County in the 1980s and to be effective, they must come in multiples. Even if one could argue that the "windmill exclusion" in the Ridge Law was inserted to accommodate the Howard's Knob project, it is a huge stretch to say that the exclusion should extend to multiple wind turbines that could possibly occupy hundreds of miles of North Carolina's beautiful ridgelines.

Over the last four decades, great effort has been devoted to preserving the beauty of North Carolina's mountains. In addition to the Ridge Law, there was the 1970s fight to prevent the damming of the New River – a dam that would have flooded hundreds of miles of beautiful mountain valleys and drowned one of the world's oldest and most scenic rivers. Back then, very much like today, the nation was focused on energy. In the

aftermath of the Arab Oil Embargo of 1973, the promise of renewable hydroelectric power was a strong draw and the New River Valley was a candidate. One of the arguments against the dam was that *energy conservation* was not considered as an alternative to the project. The dam was ultimately stopped, and in 1976 the beautiful New River was classified a Wild and Scenic River - a designation that helps insure it will remain a national treasure. Surely our mountain ridges deserve the respect as our mountain river valleys.

And one cannot forget the efforts the late Hugh Morton, one of North Carolina's great voices in land stewardship. As a businessman, Mr. Morton clearly understood the vital link between the physical beauty of North Carolina's mountains and the region's economic development. When the National Park Service wanted to extend the Blue Ridge Parkway he fought hard – not against Parkway itself but against extending the road in a manner that would forever scar the beauty of the mountain he so deeply loved. The result was the construction of one of the most magnificent sections of the Blue Ridge Parkway with minimal intrusion to the environment and natural beauty of Grandfather Mountain. The Parkway and Grandfather Mountain continue to draw thousands of annual visitors, a testament to Mr. Morton's wisdom

The potential magnitude of "utility-scale" wind development in North Carolina's mountains can be discerned from comments by Dr. Dennis Scanlin, Department of Technology at Appalachian State University. Dr. Scanlin estimates 1,000 miles of mountain ridges in the state (approx 150,000 acres) have good "utility-scale" wind resources. With the exception of the Ridge Law and a local ordinance in Watauga County, there is little regulatory control over the placement of "utility-scale" turbines. Without regulatory control, property owners, tourism related businesses, city and county governments and some environmental organizations would be left scrambling to respond.

No one should deny the benefits of wind energy – it is renewable, relatively pollution free and a largely untapped source of electricity. Small-scale wind turbines (residential and business installations) are already up and running in North Carolina, including at least one generator in Ashe County. In Buncombe County, a residential property owner recently installed a system that not only generates power for the residence, but is designed to deliver excess electricity back to the utility company through North Carolina's GreenPower program.

Unlike "utility-scale" systems, small wind systems usually don't require expensive utility system upgrades or the acquisition (often by condemnation) of miles of private property for high voltage utility line corridor. And sites for small systems are plentiful in western North Carolina. Dr. Scanlin estimates that there is 5 times more land on lower elevation mountain ridges, relative to high ridges, where smaller turbines will work well. This is a huge energy resource that can be tapped without violating the beauty of our state's highest peaks.

Finally, utility-scale wind would only make a small dent in meeting North Carolina's energy needs. By some estimates, a complete "build-out" of available mountain ridges in

North Carolina might result in meeting 6% of our energy needs (the 30% of the time when wind blows sufficiently to produce electricity in western NC). In a state that has an electrical energy growth of 2% annually, any benefit from utility-scale wind could be erased in 2-3 years. It's just not worth the trade-off particularly when there remains untapped potential in small wind and other renewables.

Dear Sir or Madame:

We are writing to urge you to implement the 5% renewable energy standard recently recommended in the La Capra Consultants report. North Carolina is lagging behind the more than 20 states that now require utilities to use renewable energy. As homeowners in Raleigh, we do not want to see construction of any more nuclear or coal plants - the time to begin a serious switch-over to renewable energy is now!

An Appalachian State University study says "Wind power is an excellent option for North Carolina homes, farms, businesses, schools, and utilities interested in producing clean, independent electricity (www.wind.appstate.edu)." We all breathe the same air, and we all have a responsibility to help take care of our environment. A modest rate increase, and intelligent investment from our state utilities, is a price we're all willing to pay for cleaner air and a healthier place to live.

Sincerely Yours,

Rachel Niketopoulos & Caudill

Reference: Analysis of Renewable Portfolio Standard for the State of North Carolina and Request for Public Comments

I appreciate the major accomplishment represented by bringing together a mountain of data into a coherent picture. In many cases, it was necessary to use generic data to simplify this task.

With time to assess these results and think about how to make them more specific to North Carolina, I have been able to develop some alternate views that yield results we think the Commission may find helpful in its deliberations. My comments specifically relate to the analysis of solar hot water systems as an energy efficiency measures.

Such was the case in the GDS analysis of residential solar hot water systems as an energy efficiency measure. Data cited by GDS in Appendix A, page 84, came from the American Council for an Energy Efficient Economy (ACEEE) book, *Consumer Guide to Home Energy Savings*, 8th ed., 2003. Cost of a solar hot water system yielding 3442 kWh annually was listed at $2500. Using their assumed discount rate of 10% and inflation rate of 2.5% (Appendix E) in the standard formula for installment loans, the result is an annual payment of $294. Dividing this by 3442 kWh yields their quoted value of $0.085 per kWh.

A commercially available solar hot water system of the same capacity in North Carolina has a levelized cost of $0.043 per kWh, making full use of current tax credits and using more realistic financing assumptions. I'll go through the assumptions and calculations in detail:

Southern Energy Management of Cary installs a two panel system designed for a family of four for $4,500. Discount rate is 3% real and loan finance rate is 5% real, corresponding to (approximately) 5.5% and 7.5% nominal respectively with an inflation rate of 2.5%. Federal tax credit is 30% and state tax credit is 35% with a cap of $1,400. Federal tax rate is 30%. The service life and financing term are each 25 years.

Results are shown in the table. Assuming the loan is financed through a home mortgage or home equity loan whose interest can be taken as an itemized deduction on the Federal tax return, the reduction in taxes has a present value of $387, further lowering the effective system cost, shown as installments of $22.22 a year. The result is an annual total payment of $148.73 with an energy yield of 3442 kWh, or $0.043 per kWh.

Characteristics of our N.C.-based model vs. the ACEEE system are: higher gross system cost; the inclusion of current state and federal tax credits; federal and state tax deduction of interest cost; longer system life; and lower discount and interest rates. The latter deserves comment.

A discount rate is the implied rate of return of an investment with a comparable degree of risk to the one under consideration. In the case of a solar hot water system, energy generation is highly predictable, with virtually no volatility. An investment of comparable degree of risk is a U.S. Treasury note, with historic nominal yields in the 5-6% range and inflation averaging about 2.5%. Thus, a realistic real discount rate for low-risk investments is approximately 3%. Indeed, the Federal Energy Management Program and Office of Management and Budget specify discount rates of approximately 3% in life-cycle cost analysis of energy efficiency projects. Interest rates for loans can vary considerably, of course, but home mortgage rates have been as low as 5% in recent years and remain below 7% nominal in most areas of the U.S. Thus, 7.5% nominal seems considerably closer to current norms than the 10% assumed in the GDS analysis.

We recognize that the purpose of the GDS study was to demonstrate that cost-effective energy efficiency savings of 2.5% of electricity use were obtainable and that this objective was easily met without including solar hot water. However, it seems likely that this study will be relied upon extensively for energy resource planning in North Carolina for some time to come. Since solar hot water comprised one quarter of the total technical potential for energy savings in the residential sector (Table 5-2), it represents a measure well worth serious consideration in energy efficiency programs in North Carolina for the dramatic impact it could have in lowering energy demand cost-effectively.

Table. Residential Solar Hot Water System in North Carolina

Assumptions:	Discount (real)	3.00%	Loan interest (real)	5.00%	
	Fed. Tax rate	30%	State tax rate	n/a	
	Fed. Tax credit	30%	State tax credit	35%	($1400 max)
	Service /finance life	25	Annual energy saved	3442	kWh

System cost - gross	$4,500.00	
Federal tax credit		-$1,350.00
State tax credit		-$1,400.00
Fed tax on state tax credit		$420.00
Interest deduction on Fed tax (present value)		-$387.00
Credits	-$2,717.00	
System cost - net	$1,783.00	
Annual payments:		
Loan		$126.51
Interest deduction on Fed tax2		$22.22
Total	$148.73	
Cost of energy (ann'l payment/energy)		$0.043

To Whom it May Concern:

We are writing to express our strong feelings about saying YES to implementing a 5% renewable power standard in North Carolina. Actually, 5% isn't enough, but we have to start somewhere. North Carolina is behind 22 states that already require this minimum standard. As citizens of Raleigh and the Earth, we care deeply about our environment and it's future.

The Department of Energy has shown that a national standard would actually save money by reducing the use of natural gas in power plants. That would reduce the price that all consumers pay for natural gas, making up for the higher cost of renewable power. We are totally opposed to building a nuclear power plant in Raleigh. There is no need when we have endless amounts of wind and solar power available all the time. We need to stop polluting our atmosphere- the more pollution we have in the air, the more CO2 that gets trapped in our atmosphere, and the more our temperatures change drastically. Snow in Raleigh, hurricanes in England, summer-like days in Chicago in December; let's do what we can to make an impact now.

Sincerely,

Tracy Golaszewski

Chief Clerk, North Carolina Utilities Commission
4325 Mail Service Center, Raleigh,
North Carolina 27699-4325

MSC RPS

Dear Sir or Madam:

I would like to encourage the implementation of a Renewable Portfolio Standard for North Carolina as a way to improve the sustainable generation and conservation of energy. Both energy efficiency and renewable generation will provide more jobs as well as an improved environment. Global warming is a problem that must be addressed my many means and this is one that will help North Carolina be in a better position in the future for energy consumers and for employment opportunities as well as for our environmental well being.

Sincerely,

Boone Guyton

RE: Report on a renewable portfolio standard for NC

Dear Ms. Vance:

I want to express my gratitude for this opportunity to provide comments on the renewable portfolio standard (RPS) report. These comments are mine alone and do not necessarily reflect the views of the John Locke Foundation.

I. Process

Before getting into the substance of the report and issues involving an RPS, I would like to discuss the process that was involved in developing the report.

The Utilities Commission formed an RPS advisory group without public notice. These individuals were invited to serve without giving other interested parties the same opportunity to serve. In addition, the meetings of this advisory group have not been open to the public. To this day, there are still no records for any of the meetings (including minutes, agendas, etc).

This process may have violated the state's open meetings law. A key question is whether this advisory body constitutes a "public body." As listed under § 143-318.10, this body appears to meet the requirements of a "public body" and be subject to the open meetings law: the individuals were appointed to this body and they were authorized to exercise an advisory function.[1]

At a minimum, even if the law does not apply, the process was precisely the type of closed-door policymaking that has undermined the public's confidence in state government and hurts the credibility of this report.

---

[1] See N.C. Gen. Stat. § 143-318.10 at http://www.ncga.state.nc.us/EnactedLegislation/Statutes/HTML/BySection/Chapter_143/GS_143-318.10.html

II. Overview

A renewable portfolio standard is a requirement that utilities provide a certain percentage of electricity through renewable means of energy as opposed to fossil fuels, such as coal and natural gas. North Carolinians already have the option of voluntarily supporting renewable energy sources through NC GreenPower. As seen with this program, North Carolinians have very little demand for renewable energy.

An RPS also would impose very high costs to consumers, presumably for environmental reasons. However, renewable energy sources, especially wind power, are themselves serious threats to the environment. For an "objective" report, it is very concerning that little space, if any, was dedicated to discussing the well-known environmental problems of renewable sources.

III. Lack of Support for an RPS

If policymakers want to see if the public would support an RPS, they do not need to look any further than the limited support for NC GreenPower. Individuals and businesses can contribute money to help generate energy through renewable sources. As in other states, citizens have chosen not to support renewable sources of energy. According to NC GreenPower, "Excepting large scale hydroelectric power, less than 1% of our current power supply comes from renewable resources."[2]

In fact, as stated in the report, "the NCGP [NC GreenPower] program thus far has been able to provide 0.011% of the State's energy needs." Average participation rates nationally, according to the report, "have remained steady at just more than 1% of customers." This also does not mean that 1% of energy comes from renewable sources. It only means that 1% of customers participate to some extent in these programs (footnote 41 in the report seems to clarify this point).

The very reason for an RPS is to force consumers to support renewable energy because voluntary programs do not work. For those policymakers that respect consumers and their choices, an RPS never would be an option.

IV. The High Cost of an RPS

The report acknowledges that an RPS that requires 5% of electricity to be generated through renewable sources (a 5% RPS) will increase rates for consumers. A 10% RPS will increase the costs even more. The report however tries to offset these high costs by pushing energy efficiency programs. To be clear, using renewable sources would not save money—it would cost more money for consumers. It is only through energy efficiency programs that these high costs allegedly can be offset.

---

[2] See NC GreenPower FAQ web page at http://www.ncgreenpower.org/about/faqs.html

The report tries to make a 5% RPS and 10% RPS look like it is all coming from renewable sources. However, 25% of the RPS would be coming from alleged energy efficiency savings. This means that a 5% RPS is really a 3.75% RPS and a 10% RPS is really a 7.5% RPS. Energy efficiency is not a renewable source of energy. Without taking into consideration energy efficiency, any RPS would drastically increase rates. Common sense tells us that if the sources of energy cost more, then the rates will increase.

These energy efficiency programs are the same failed demand-side management programs that have existed in North Carolina for decades. Consumers already have funded these programs through buried and hidden charges in their electricity rates.

Demand-side management programs, which are designed to reduce demand for electricity, have failed for numerous reasons. Some of these reasons, as listed in the State Energy Office's "State Energy Plan," include "the cost of peak power plants, such as gas turbines, has become so low that they are less expensive than reductions in peak demand for DSM [demand-side management] programs." In other words, it costs less to generate electricity than to fund these programs. Another reason is "some DSM programs were not able to provide the peak demand savings projected." Finally, "utilities sought to lower their costs in order to increase their competitive edge."[3]

This final reason is very important. If North Carolina is going to have a deregulated and competitive electricity marketplace, it would not work with myriad programs designed to reduce demand for electricity. A utility would not want to enter a new market if they have to reduce demand for their product. A utility never would be able to achieve any type of competitive edge.

Somehow, the report estimates that these programs will reduce electric energy use 14% by 2017. There is ample history in North Carolina to determine whether this is a realistic number—it is highly unlikely that the state has ever come close to 14%. The report acknowledges, "North Carolina would need to undertake an *extraordinary* effort to achieve this level of savings."

Consumers and Subsidies

The report does not recognize that North Carolinians already are paying for renewable sources in addition to higher rates. There is the federal production tax credit that provides 50% of the cost of production for renewable sources of energy. These credits are mentioned in the report, but it does not mention the fact that North Carolinians, like other citizens of the country, pay for that credit. There also is a separate federal tax credit for solar power that is 30%.

In addition, North Carolina has its own subsidy for renewable sources. There is a state tax credit that offers 35% of the cost of installing renewable energy systems. Both the

---

[3] North Carolina State Energy Plan at p. 24.

state and federal subsidies are costs to taxpayers. If these subsidies somehow disappeared, then the rates that have been projected in the report would be drastically higher. In fact, the federal production tax credit has regularly expired in the past, with Congress eventually renewing the credit.

V. The Environmental Costs of an RPS

It is quite amazing that the report does not discuss most of the tremendous environmental problems with an RPS. For example, wind power uses up an incredible amount of land. Coal uses only 1,950 acres for a 1,000 megawatt power plant. Nuclear power uses even less land—it uses 1,700 acres. Wind uses an astounding 192,000 acres. This is about 100 times more land needed for wind than coal and nuclear.[4]

"Wind farms" are the worst enemy of birds. Even the Sierra Club has called them "the Cuisinarts of the air."[5] Some environmental groups have tried to at least minimize the damage of wind farms. The Center for Biological Diversity, for example, filed a lawsuit against the owners and operators of the Altamont Pass (CA) wind farm to try and reduce the number of bird deaths. At this site alone, about 1,000 birds a year are killed, including birds that are endangered.[6]

The North Carolina Attorney General in a February 4, 2002 letter to the Tennessee Valley Authority argued against a wind farm based not only on the North Carolina Mountain Ridge Protection Act but also the aesthetic problems associated with wind farms:

> The EA [the environmental assessment for a proposed windfarm] itself concludes that 'construction and operation of the [Stone Mountain] windfarm facilities would permanently alter the visual landscape character resulting in a significant [adverse] visual impact [in Watauga County, North Carolina],' and 'would create substantial visual discord and adverse contrast while reducing scenic attractiveness and tranquility.'[7]

Other renewable sources also have environmental problems. Solar energy takes up a massive amount of land. Biomass, as the report points out, creates problems with air pollution. "From an environmental standpoint, combustion of biomass leads to many of

the same kinds of emissions as the combustion of fossil fuels, including air pollutants, greenhouse gases, and solid wastes (ash)."

VI. Economic Harms

The report argues that an RPS will lead to more jobs and increased property tax revenues. Forcing consumers to subsidize an industry will not create more jobs. It simply creates different jobs and drives up the cost of labor for existing employers. It takes money from consumers that can be used for other and more productive purposes, and shifts it to a favored industry.

As it relates to property taxes, the report does not discuss the problems wind farms could have on the values of neighboring properties. It also does not consider the possibility that the land would be used for more productive purposes.

Here are just a few other critical economic problems that do not seem to be considered in the report:

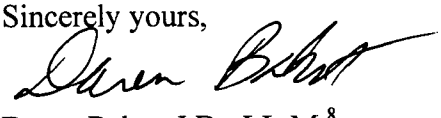
- Firms that have to pay higher rates may move out of the state.
- Firms that would otherwise move into the state would be dissuaded from coming to North Carolina.
- Wind farms would be located on the coast and in the mountains, both prime tourism locations. The impact on tourism could be significant.

VII. Conclusion

An RPS would be bad for North Carolina. *Forcing* consumers to pay for inefficient, environmentally-unfriendly, and costly sources of energy is a bad policy option. An RPS is simply a corporate subsidy program for energy sources that do not have the necessary demand or viability to succeed on their own. In the future this may change, but this is the current reality. Wishing this away by taking money out of the hands of consumers at best would not work, and at worst is an unethical use of the state's power.

Thank you again for this opportunity to provide this comment.

Sincerely yours,



Daren Bakst, J.D., LL.M.[8]
Legal and Regulatory Policy Analyst

One North Carolina Naturally

Introduction

The Board of Trustees of the Clean Water Management Trust Fund (CWMTF) is writing to thank the members of the General Assembly of North Carolina for your continuing strong support for investments in clean water and to make our annual report to the General Assembly and the public pursuant to GS 113A-257.

The Board is also writing to report to the General Assembly on management and stewardship of conservation easements pursuant to Section 6.22 of Session Law 2005-276.

Thanks to the General Assembly, North Carolina continued to make progress in protecting and restoring water quality in calendar year 2006.

Background

The 1996 General Assembly created the Clean Water Management Trust Fund (CWMTF) (Chapter 113A Article 18 (GS 113A-251 et seq.)), "to clean up pollution in the State's surface waters and to protect and conserve those waters that are not yet polluted."

The CWMTF "shall be used to help finance projects that specifically address water pollution problems and focus on upgrading surface waters, eliminating pollution, and protecting and conserving unpolluted surface waters, including urban drinking water supplies" and "to build a network of riparian buffers and greenways for environmental, educational, and recreational benefit."

The CWMTF's non-regulatory, incentive-based programs complement North Carolina's environmental regulatory and educational programs and help ensure both a strong economy and healthy environment.

The CWMTF is an independent agency housed for administrative purposes in the Department of Environment and Natural Resources (DENR.) A 21-member board of trustees establishes criteria, allocates funds, reviews applications, approves grants, and hires the executive director. Seven members are appointed by the Governor; seven by the General Assembly upon the recommendation of the President Pro Tempore of the Senate; and seven by the General Assembly upon the recommendation of the Speaker of the House. An advisory council composed of the Commissioner of Agriculture, Chair of the Wildlife Resources Commission, Secretary of DENR, and Secretary of Commerce or their designees advises the board of trustees.

Local governments, state agencies, and nonprofit conservation organizations, such as land trusts, may apply for grants. The next deadline for applications is March 1, 2007.

Moneys from CWMTF may be used to acquire conservation easements or land in fee simple to preserve riparian buffers, wetlands, floodplains, and greenways; to restore riparian buffers, streams, and wetlands; to repair failing wastewater collection and treatment systems; to eliminate failing septic tanks and straight pipes; to prevent, reduce, collect and treat stormwater pollution; to plan water quality projects; and for

administration and staff. The board works through three principal committees: acquisitions, infrastructure/wastewater, and restoration/stormwater.

CWMTF application forms for grants, grant evaluation guidelines, enabling legislation, lists of the board of trustees, staff directory, news releases, and other reports and documents are available at www.cwmtf.net.

The executive director, two deputy directors, contracts and real estate acquisition manager, administrative officer, public information officer, and executive assistant are based in the central office in Raleigh. Five field representatives cover the coast, piedmont and mountain regions of the state. A part-time water quality advisor is home based.

The Board of Trustees adopted an annual administrative budget of up to $1,975,000 for fiscal year 2006-2007 at its September 2006 meeting. The Board increased the budget to $2,075,000 at its October 2006 meeting. The Board approved new positions for a wastewater project manager, stormwater project manager, paralegal, stewardship coordinator, and receptionist at its September 2006 meeting. The wastewater project manager and stormwater project manager will probably be hired in the first quarter of 2007.

In 2006, The Board of Trustees met ten times - in Lake Lure, Tabor City, Lexington, Lake Logan in Haywood County, Wallace, Mt. Airy, Washington, and four times in Raleigh. In 2007, the Board plans to meet at least six times in Currituck or Dare Counties, McDowell County, Alamance County, and Raleigh.

Progress and Challenges

The CWMTF continued to make strides in reaching performance targets outlined in the state's Progress Board 2001 report entitled ***North Carolina 20/20***. Designed to significantly improve water quality throughout the state by the year 2020, the targets included increasing the percentage of water bodies fully supporting their uses, ensuring that 100 percent of all North Carolinians have access to clean and safe drinking water, protecting and improving water quality to ensure the continued viability of the state's fisheries.[1] Projects funded by CWMTF in 2006 are in one form or another linked to almost all of these targets.

In the last year, CWMTF also continued to help the state achieve its goal of preserving a million acres of open space, as set out in GS 113A-240, assisted Governor Easley implement his One North Carolina Naturally initiative, and further protected the State's military bases from encroachment brought on by incompatible development.

The Numbers

In almost all the areas cited by the North Carolina 20/20 report, CWMTF grants are playing a role in reaching those performance targets. Here are some examples:

[1] North Carolina 20/20: A Report About the Future of North Carolina; N.C. Progress Board, December 2001

- The CWMTF and its partners have helped protect 4,277 miles of riparian buffers and preserve 391,805 acres of land, thereby ensuring streams, rivers, lakes, and shellfishing waters will be able to support their uses for drinking water, recreation, fisheries and other uses. CWMTF has invested over $395,500,000 in land and water conservation.
- The CWMTF has funded 117 riparian buffer, stream and wetland restoration projects totaling over $79,300,000 to help maintain and preserve these important ecosystems.
- CWMTF acquisition and restoration grants have been used to protect shellfishing waters, to help restore waters in areas closed to shellfishing, to restore oyster reefs and other fisheries habitat, and to provide public access to public waters.
- The CWMTF has assisted local governments with 171 wastewater improvement projects, investing over $170,400,000 to reduce discharges and more effectively treat wastewater so that fewer nutrients and other pollutants enter our rivers.
- CWMTF grants have funded 57 stormwater management projects totaling over $43,300,000 to reduce pollution from urban runoff and decrease flooding.

Since 1996 the CWMTF Board of Trustees has approved 945 grants for a total of more than $711,500,000. CWMTF grants have leveraged at least $1,143,000,000 or 161% in private and other public funds.[2]

New Leadership at CWMTF

After five and a half years of service, Robert D. Howard resigned as Chairman of the Board of Trustees on December 1, 2006. Governor Mike Easley appointed Philip A. Baddour, Jr., as Chairman of the Board on December 6, 2006.

Bill Holman, CWMTF's executive director for six and a half years, resigned effective December 27, 2006 to become a Visiting Scholar at the Nicholas Institute for Environmental Policy Solutions at Duke University. The Board hired D.G. Martin on January 7, 2007 as interim executive director. The board will hire a search firm to assist it in hiring a new executive director.

2006 Summary of Projects

During calendar year 2006, The CWMTF Board of Trustees and staff reviewed a total of 299 applications requesting over $411,500,000, including 24 requests for mini-grants and donated easement grants.

During the spring grant cycle (2006A Cycle), 162 applications requesting $251,100,000 in the spring of 2006 were reviewed. 137 applications requesting more than $160,400,000 in the fall of 2006 (2006B Cycle) also were reviewed by staff and trustees.

[2] See Appendix A: Summary of Funded Projects 1997-2006

Thanks to appropriations from the General Assembly and to the closing out of old grants the Board of CWMTF approved 97 water quality grants totaling over $59,700,000 through August 2006 (2006A Cycle) and approved 81 grants totaling over $56,000,000 between September and November 2006 (2006B Cycle). A total of 178 projects for $115,800,000 were approved for funding in calendar year 2006.

Five of those approved grants provided $7,518,000 to help finance clean water/military protection projects involving Marine Corps Air Station Cherry Point's Piney Island Bombing Range in Carteret County, Marine Corps Camp Lejeune/New River and US Army Fort Bragg/Pope Air Force Base. The Board committed $2,270,000 of its remaining special indebtedness authorized by Session Law 2004-179, Finance Vital Projects (HB 1264), to help protect Piney Island.

2006 Highlights

In 2006, the CWMTF Board continued to approve a diverse mix of projects: 47percent of its grants funded acquisition projects; 32 percent funded infrastructure/wastewater grants; 19 percent funded restoration/stormwater efforts; and the remainder funded planning and mini-grants.

Key projects for the year included:

International Paper Company Lands: In 2006, The Nature Conservancy (TNC) purchased 76,711 acres of riparian buffers, wetlands, floodplains and uplands in the Chowan, Roanoke, and Upper Tar River Basins and in the Juniper Creek/Green Swamp of Brunswick and Columbus Counties from International Paper Company at a cost of almost $80,000,000 in 2006. The TNC/IP purchase is one of the largest land and water conservation deals in NC history.

TNC, WRC and State Parks requested over $46,000,000 from CWMTF to acquire these lands for game lands and state parks. The Board approved about $16,300,000 at its August and November meetings (2006A-017, 2006A-019, 2006A-022, & 2006A-027). The Parks & Recreation Trust Fund (PARTF) committed over $1,100,000, and Natural Heritage Trust Fund (NHTF), over $3,600,000 in October to match CWMTF funds. The State Treasurer also sold some timber bonds for WRC authorized by the 2006 General Assembly to match CWMTF funds. The Board will consider additional grants to acquire the TNC/IP lands over the next two years.

Hickory Nut Gorge State Park: CWMTF provided two grants to expand the new Hickory Nut Gorge State Park in Rutherford County: $2,309,000 to help acquire the 301-acre McCraw/Worlds Edge II tract (2006A-002) and $1,600,000 to help acquire the 996-acre Chimney Rock Park (2006B-017).

Alligator River: CWMTF continued its effort to help protect the ecosystem around this valuable river and estuary in Hyde and Tyrrell Counties. Another key piece of the puzzle was protected with a $1,700,000 grant to WRC to begin acquisition of the 8467-acre GMS tract (2003A-032) in Tyrrell County.

Lake Rhodhiss: CWMTF has also worked for years with WRC, Foothills Conservancy and Crescent Resources to protect the confluence of the Johns and Catawba Rivers and the impaired waters of Lake Rhodhiss in Burke County. In 2006, CWMTF provided $4,266,000 to expand game lands by 2248 acres (2006A-013).

Blue Ridge Parkway: CWMTF helped the Conservation Trust of North Carolina (CTNC) protect both Big Crabtree Creek and the Blue Ridge Parkway in McDowell County with a $132,000 grant (2006A-011).

Pigeon River: Haywood County is working with the Towns of Canton and Clyde to buy out properties in the Pigeon River floodplain and to establish a greenway between the two towns. CWMTF provided $1,000,000 to begin the acquisition effort (2006A-014).

Mill Creek: In 2006, CWMTF provided $357,000 to match $457,000 in Civil War Preservation Trust Funds to help protect both Mill Creek and the Bentonville Battlefield in Johnston County (2006B-005).

Watershed Protection: CWMTF continued its partnership with local governments to protect "abandoned" WS-I water supply watersheds for future drinking water sources and public use by providing a grant of $3,580,000 to the Town of Sylva to acquire a conservation easement on its 1088-acre Fisher Creek watershed in the Plott Balsam Mountains (2006A-043). Sylva is donating half the value of the land.

In 2006, CWMTF continued to work with local governments to protect drinking water supplies by providing $1,189,000 to Orange Water & Sewer Authority (OWASA). The funds will be used to protect 74 acres in the University Lake watershed (2006B-027). In addition, CWMTF also provided a number of grants to support the Upper Neuse Clean Water Initiative to help protect Falls Lake and other reservoirs.

Regional Wastewater Improvements: CWMTF provided $2,000,000 to help Elkin, Jonesville and Ronda – three towns in three counties – convert to a regional wastewater collection and treatment system (2006A-509).

The Town of Bolton in Columbus County received $1,989,000 to improve wastewater treatment and connect to Whiteville (2006A-601).

A grant of $2,500,000 to Harnett County will help it to partner with Fort Bragg in a regional wastewater system and will remove failing septic systems (2006A-512). Marion will use $2,500,000 in CWMTF funds to remove a discharge from the Catawba River and to improve its wastewater treatment plant (2006B-512).

Wilson will use a $1,323,000 grant to pump treated wastewater to local industries for process water use (2006A-535).

Seaboard received $500,000 to address leaky sewer lines (2006A-527). Lumberton will use $246,000 to connect homes with failing septic tanks on Merrill Road to its wastewater system (2006A-604). CWMTF provided assistance to many other small towns.

Stormwater Management: With the help of a $2,647,000 CWMTF grant, Fayetteville's Public Works Commission will improve protection of Glenville Lake, one of the City's drinking water supplies (2006A-701).

CWMTF also formed two unique partnerships with two other State agencies to improve and demonstrate the importance of stormwater collection and treatment at the North Carolina Zoological Park in Randolph County (2006A-709) and North Carolina Museum of Art in Wake County (2006A-707).

Stream and Wetlands Restoration: Durham Soil & Water Conservation District will restore a section of Lick Creek in the Falls Lake watershed with a $539,000 CWMTF grant (2006A-402).

Goldsboro has launched an ambitious plan to restore Stoney Creek, a tributary of the Neuse River. CWMTF provided over $2,000,000 to help (2006A-403).

Mecklenburg County will continue to implement its plan to restore Little Sugar Creek and McAlpine Creek with $1,000,000 and $845,000 CWMTF grants, respectively (2006A-404 & 2006A-405).

The North Carolina Coastal Federation continues one of the largest wetland restoration projects in North America at North River Farms in Carteret County. CWMTF provided $532,000 for the effort (2006B-402).

Washington County wants to plan for the growth coming to its beautiful Albemarle Sound waterfront. CWMTF provided $100,000 (2006B-816). CTNC is working with community development corporations to plan for park protection and stormwater management in affordable housing developments. CWMTF provided $135,000 for the project (2006B-806).

Farm and Ranchland Protection: CWMTF provides matching funds for Federal Farm and Ranchland Protection Program Funds (FRPP). CWMTF provided $716,000 to the Conservation Trust for NC (CTNC) to match federal funds to protect the 513-acre Averette Farm on the Tar River in Granville County (2006A-008) and $612,000 to protect the 199-acre Slagle Farm on Cartoogechaye Creek in Macon County (2006B-012).

Conservation Reserve Enhancement Program (CREP): CWMTF continued its partnership with the North Carolina Division of Soil & Water Conservation (DSWC) in providing $6,506,000 for most of the State's match for the federal Conservation Reserve Enhancement Program **(CREP)** (2006B-404). CWMTF is pleased with the improvements that DSWC has made to CREP.

2006 Legislative Action

None of CWMTF's achievements in 2006, or in the last decade would have been possible without the support of the North Carolina legislature.

The General Assembly continued its strong support for protecting and restoring water quality in 2006. Session Law 2005-276, Current Operations and Capital Improvements Act of 2005 (SB 622) appropriated $100,000,000 in recurring funds to CWMTF in each year of the biennium.

The General Assembly also appropriated $575,000 in recurring funds and $425,000 in non-recurring funds to the DSWC to expand CREP to other river basins. CWMTF appreciates appropriations from the General Fund for this expansion. The General Assembly appropriated $3,160,852 in non-recurring funds to DENR to match federal funds for the Clean Water State Revolving Loan Fund.

The General Assembly fully funded CWMTF partners - the Parks and Recreation and Natural Heritage Trust funds - for fiscal year 2006-2007. The General Assembly also appropriated $15,000,000 to assist the North Carolina Division of Parks and Recreation with the purchase of lands at the new Hickory Nut Gorge State Park in Rutherford County.

SL 2006-231 (SB 1621), WRC Special Indebtedness, by Senator David Hoyle, will provide up to $20,000,000 to help the Wildlife Resources Commission match CWMTF funds to help acquire game lands from International Paper.

In other legislative action, Representative Pryor Gibson introduced HB 2208, CWMTF Amendments, to enable the Board of Trustees of CWMTF to consider both CWMTF's clean water criteria and the common criteria established by Session Law 2005-474, Clarify Clean Water Funding. SL 2005-474 (HB 1095) applies common criteria and limits for grants for drinking water, wastewater treatment and stormwater projects funded by the Department of Environment and Natural Resources (DENR) and CWMTF. HB 2208 was enacted as Session Law 2006-178.

Representative Gibson also introduced HB 2164, Sanitary District Powers. HB 2164 was enacted as SL 2006-214. It provides sanitary districts with the same authority to require mandatory hookups for water and wastewater service as other units of local government have.

SB 1566, Stormwater Management 2006, by Senator Dan Clodfelter, was enacted as SL 2006-246.

SL 2006-201 (HB 1843), State Government Ethics Act of 2006 applies to CWMTF and other executive branch agencies.

2007 Legislative Issues

CWMTF appreciates the General Assembly's appropriation of $100,000,000 in recurring funds for CWMTF in fiscal year 2006-2007 and will work to justify continued funding at this or an increased level during each year of the 2007-2009 biennium, to address the more than $17 billion of needs to protect and restore water quality in North Carolina.

CWMTF also appreciates the General Assembly's dedicated appropriations of state deed excise stamp tax and personalized license plate revenues to our partners at the Natural Heritage Trust Fund (NHTF) and Parks & Recreation Trust Fund (PARTF).

CWMTF has provided State funds to match Federal Farm and Ranchland Protection Program (FRPP) and Federal Forest Legacy (FFL) funds for several years. Because the CWMTF standard easement is quite different from the required FRPP and FFL easement, appropriations to the NC Agricultural Development and Farmland Preservation Fund in the NC Department of Agriculture may be a better fit for protecting working lands than CWMTF. However the Board and staff of CWMTF remain committed to providing funds to match available federal farmland and forestland protection funds for projects which provide clean water benefits.

At its December 21, 2006 meeting, the Board unanimously endorsed the Chairman's recommendation to direct the Board's Grant Criteria Committee to improve CWMTF's grant review criteria, to integrate CWMTF's existing criteria with the common criteria set out in Session Law 2005-454, and to give more weight to good water quality applications from economically distressed local governments. The Board is committed to following the direction of the General Assembly set out in GS 113A-254(a1) to give priority to applications for wastewater collection system projects and wastewater treatment works projects that serve economically distressed local government units. The Board may seek additional clarification and guidance in this endeavor.

The 2006 General Assembly authorized a study of merging CWMTF and the Ecosystem Enhancement Program. The Joint Transportation Oversight Commission and the Environmental Review Commission approved a request for proposals at their November meetings. Proposals were due on December 22, 2006. A study of the merger is scheduled for completion in June 2007. Both CWMTF and EEP were established in 1996. GS 113A-254(c) currently prohibits CWMTF from funding compensatory mitigation. The Board will review the pros and cons of such a proposal and may have a recommendation on it following its review. CWMTF will fully cooperate with the General Assembly and its consultants in the consideration of this question.

At its March 12-13, 2006 meeting in Lexington, the Board of CWMTF adopted a resolution endorsing the Land for Tomorrow Initiative to increase funding for land and water conservation and historic preservation by $200,000,000 per year for five years.

During 2006, the Board of CWMTF also adopted a resolution endorsing an additional $1,000,000,000 Clean Water Bond over five years for investments in drinking water, wastewater, and stormwater.

The Board of CWMTF is also interested in working with the General Assembly to explore whether acquisition of the International Paper lands in Eastern NC, Duke Power lands on the Catawba River, Alcoa and Progress Energy lands on the Yadkin/Pee Dee River, and military base buffers might be financed with one-time appropriations and with special indebtedness similar to SL 2004-179, Finance Vital Projects (HB 1264). CWMTF, Natural Heritage Trust Fund, and Parks & Recreation Trust Fund have committed all of the $45,000,000 in funds authorized for park and game land expansions and military protection projects in 2004.

CWMTF supports additional General Fund appropriations to operate and expand the Division of Soil & Water Conservation's Conservation Reserve Enhancement Program (CREP).

The moratorium that the General Assembly first enacted on new and expanded lagoon and spray field swine waste treatment systems in 1997 is due to expire in September 2007. CWMTF would welcome guidance from the General Assembly on what role, if any, CWMTF should play in funding the conversion of swine waste systems to new technology.

CWMTF uses maps of streams and wetlands to review and score applications for funding, set priorities and to determine water quality benefits. CWMTF supports and would benefit from implementation of the "Plan to Improve the Mapping and Digital Representation of Surface Waters in North Carolina" adopted by the Geographic Information Coordinating Council (GICC) in January 2005. The 2005 General Assembly funded phase I of the plan in SL 2005-1, the Hurricane Recovery Act of 2005. Additional appropriations to fund phase 2 and other phases to improve stream maps statewide would benefit CWMTF.

North Carolina's Conservation Income Tax Credit Program encourages many landowners to sell or donate conservation easements or to sell their land at bargain prices. This stretches and leverages the funds that CWMTF and the other conservation trust funds provide. The NC Department of Environment and Natural Resources may recommend expansion and improvement of this important incentive in 2007.

Valuation of conservation easements for ad valorem taxation varies by county. Landowners in some counties may face increased property taxes after they donate or sell their development, timber or other usage rights. CWMTF supports legislation that would enable owners of property in the agricultural or forestry present use tax classification to remain taxed at that rate after they donate or sell conservation easements.

Major landowners continue to sell large tracts of conservation property. International Paper sold more than 600,000 acres in North Carolina in 2006.

Duke Energy/Crescent Resources has agreed to make some lands available for conservation as part of the Catawba/Wateree FERC agreement. Alcoa and Progress Energy will probably agree to make some lands available for conservation as part of the

expected Yadkin/Pee Dee FERC agreement. The combined existing resources of CWMTF and our partners at Natural Heritage Trust Fund, Parks & Recreation Trust Fund, and the Wildlife Resources Commission will not be able to respond to all these potential opportunities without more funds. CWMTF would support one-time appropriations to help respond to these once in a generation opportunities.

Stewardship of Conservation Easements

Section 6.22 of SL 2005-276 directed CWMTF to study the management and stewardship of conservation easements and report its findings to the Environmental Review Commission.

CWMTF has provided funds to land trusts to monitor and steward approximately 173 conservation easements since 1997. The Board has expressed concerns about whether this is the best way to insure proper stewardship of permanent conservation easements held by the State. The Board has also expressed concerns about whether CWMTF stewardship funds are being managed professionally, whether CWMTF stewardship funds are restricted to stewardship activities and are properly audited and reported to CWMTF, and whether CWMTF easements are being monitored and reported on annually.

In 2006 the Board voted to create a CWMTF stewardship program with funds managed by an endowment held by a third party. In September the Board authorized a stewardship coordinator position to manage CWMTF's stewardship program. CWMTF plans to fill the position in 2007.

Since 2004 CWMTF contracts have included language stating that stewardship funds will not be paid to grantees until the Board adopts a final policy on stewardship. CWMTF has funded 109 projects, including 33 new projects in 2006, for which stewardship funds will be needed and that have not been paid. CWMTF is holding these funds until the stewardship endowment fund is established.

- North Carolina's Changing Landscape
- Conservation Planning

Million Acres Report 2006

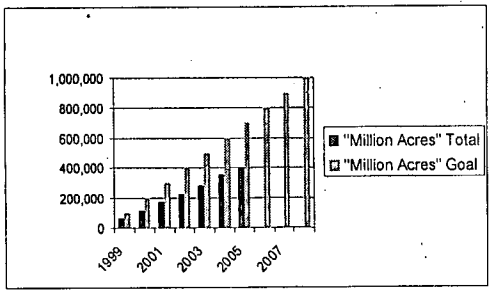
Program Overview

- General Assembly establishes Million Acres Initiative in 1999
  - Requires permanent conservation measures
  - 10 years allowed to acquire additional million acres 1999 - 2009.

The Numbers

- 2005 Acre total 53,431 acres
- Total since January 1999 405,521 acres

Progress Toward Million Acre Goal



CONSERVATION EASEMENT PROGRAM ANNUAL REPORT 2006

ARTICLE 16
Conservation Easement Program

- Conservation Easement Program, 113A-230
- Conservation Tax Credit Program, 113A-231
- Conservation Grant Fund, 113A-232

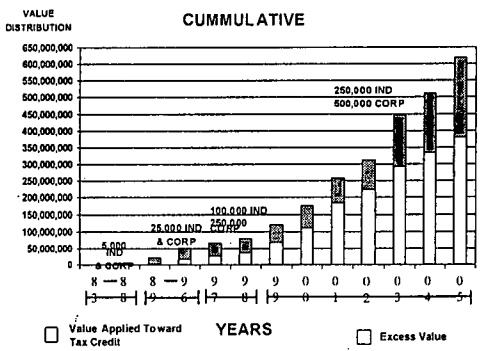
CONSERVATION EASEMENT PROGRAM 2006

- DENR Stewardship Program
  - Conservation Resource Enhancement Program (EEP)
  - Stewardship Analyst

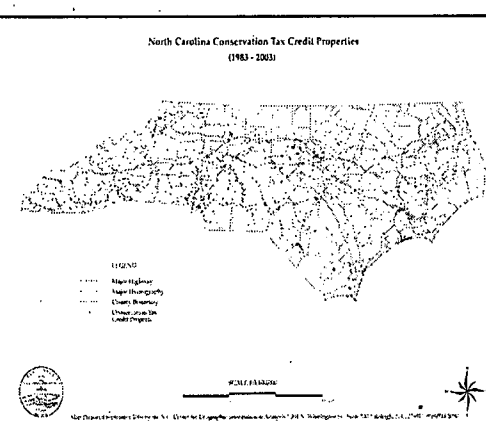
Conservation Grant Fund 2006

- Senate Bill 1117 - Military Support Act

NCCTC PROGRAM STATISTICS



Effective Date 8/15/06



Recommendations
2007 Legislature

- Corporate Donations
  - Pass Through Entities
  - Incentive To Donate
- Other Conservation Purposes Clarified
- Property Appraisal method defined

North Carolina's Changing Landscape

- Population Growth
  - Loss of critical farm and forest lands
  - Loss of habitat
  - Degraded surface waters
  - Reduced Air Quality
  - Land values increasing
  - Loss of our Rural Heritage

Conservation Planning....

- Provides the ability to view the network of natural system that will sustain us now and into the future.
- Provides the state the ability to take multiple plans from state agencies, local governments and NGOs.
- Provides mechanism to keep track of conservation

DENR

- DENR Reorganization Focus
  - Integrate natural resource programs
  - Focus effort on coordinating conservation Green Infrastructure
    - Landscape planner
  - Working Lands Conservation
  - Placed Based Economic Development
  - Coastal Habitat Protection

Recommendations
2007 Legislature

- Corporate Donations
  - Pass Through Entities
  - Incentive To Donate
- Other Conservation Purposes Clarified
- Property Appraisal method defined

North Carolina's Changing Landscape

- Population Growth
  - Loss of critical farm and forest lands
  - Loss of habitat
  - Degraded surface waters
  - Reduced Air Quality
  - Land values increasing
  - Loss of our Rural Heritage

Conservation Planning….

- Provides the ability to view the network of natural system that will sustain us now and into the future.
- Provides the state the ability to take multiple plans from state agencies, local governments and NGOs.
- Provides mechanism to keep track of conservation

DENR

- DENR Reorganization Focus
  - Integrate natural resource programs
  - Focus effort on coordinating conservation Green Infrastructure
    - Landscape planner
  - Working Lands Conservation
  - Placed Based Economic Development
  - Coastal Habitat Protection

MEMORANDUM

TO: Senator Charlie Albertson
Senator Daniel Clodfelter
Representative Pryor Gibson

FROM: Secretary William G. Ross

SUBJECT: Annual Million Acre Report

G.S. 113A-241(c) requires the Department of Environment and Natural Resources to report to the Governor on the state's progress toward attaining the goal of preserving one million acres by the end of 2009. Attached is this year's report. If you have any questions, please contact Richard Rogers in the Office of Conservation and Community Affairs. Richard can be reached at Richard.Rogers@ncmail.net or 715-4152.

2006 Annual Report
NC Million Acre Initiative

Presented to the Governor of North Carolina and the Environmental Review Commission of the North Carolina General Assembly

Sept. 1, 2006

By the North Carolina Department of Environment and Natural Resources
Office of Conservation and Community Affairs

The Latest Numbers

At the end of the seventh full year of the North Carolina Million Acre Initiative (Jan. 1, 1999 – Dec. 31, 2005), private and public land protection partners across the state have permanently protected an additional **405,521** "Million Acre" acres. These partners reported adding **53,431** of those acres during the 2005 calendar year. This is a decrease in the rate of land protection in North Carolina from the previous year.

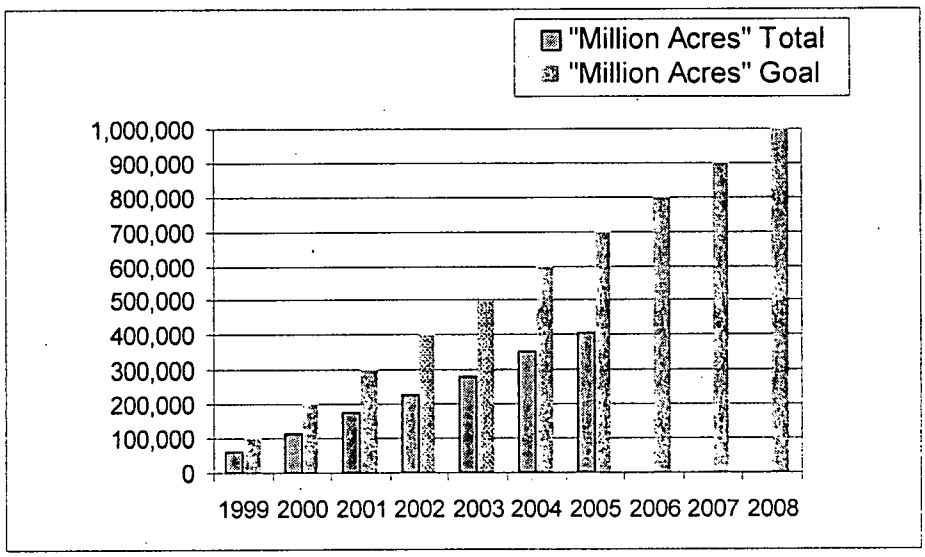
The Clean Water Management Trust Fund (CWMTF), Natural Heritage Trust Fund (NHTF) and Parks and Recreation Trust Fund (PARTF) merit special mention in the Million Acres report, as their contribution to conservation is for the most part not shown in the Million Acres report. This is because the credit for acres gained generally goes to the state agencies, local governments and local land trusts with which the Trust Funds work. For example, since 1996, CWMTF and its partners have helped protect 3,612 miles of riparian buffers and helped preserve 317,529 acres of land. Demand for conservation funding is increasing, as shown by the trend in Clean Water Management Trust Fund applications, which in 2005 set new records in both the numbers of requests (237) and the amount requested ($252 million). The CWMTF was able to award a total of $112 million to 159 projects in calendar year 2005. Similarly, NHTF awarded $28 million in 2005, to help protect 19,469 acres. Since 1987, NHTF has funded protection of 228,949 acres of public lands, held by state agencies and open to the public.

The table at the end of this report describes in detail the number of acres protected by sector (state government, local government, etc.), by program and by time period. To avoid confusion, only official reports of new acquisitions (from surveys, interviews and questionnaires) make it into the final total. Estimations for non-respondents are not included.

The lands protected in 2005 represent important natural areas for habitat, recreation opportunities, working forests, and riparian buffers to maintain water quality and protect floodplains, among others. However, the amount of land protected each year is insufficient to meet the goal of permanently protecting an additional million acres by Dec. 31, 2009 (G.S. 113A-240 and 241). In fact, at its current pace, our land protection efforts do not even match

the rate at which open space is being lost in the state, which currently amounts to about 100,000 acres per year. The primary barrier is the availability of public and private funding for new protection projects. If we intend to meet the Million Acre goal by the end of 2009, more money for land protection must be found. The graphic below illustrates progress toward the Million Acre goal.

Table 1: Progress toward our goal of one million acres of permanently protected open space



One landmark reached in 2005 was the culmination of a five-year agreement establishing a framework for a partnership between DENR, the North Carolina Coastal Land Trust, The Nature Conservancy, and Weyerhaeuser. The terms of the agreement, a Memorandum of Understanding, established standards for corporate management activity during the five-year period, ensuring that the ecological value of specific natural areas owned by Weyerhaeuser would not be compromised while protection was being negotiated. In addition, Weyerhaeuser offered a right-of-first-refusal option to acquire the areas targeted for conservation, if they were earmarked for sale. DENR's Natural Heritage Program identified 7,804 acres of significant natural areas when it conducted inventories of Weyerhaeuser properties in 1998 and 1999. The inventories also provided a critical scientific assessment of the biological value of lands under consideration. The partners saw the agreement as a landmark in cooperative conservation, giving them a chance to work together over a period of years to identify, plan for, and protect the land. Included in the

land protected as a result of the MOU was over 2,585 acres along Swift Creek and the Neuse River at the Weyerhaeuser Company's Cool Springs and Neuse River Floodplain Tracts in Craven County between Vanceboro and New Bern, where the North Carolina Coastal Land Trust established permanent conservation easements. Together these tracts protect over 9.0 miles of frontage along the Neuse River and Swift Creek.

While this project shows the effort and length of time potentially required to conserve the most important lands, it also demonstrates the conservation benefits. In addition to the natural areas conserved through this collaboration, including longleaf pine and swamp forest habitats, much of the Cool Springs Tract itself is presently managed by the Weyerhaeuser Company as a working forest and as a regional environmental education facility. The Coastal Land Trust worked several years to raise almost $3 million in public grants to purchase conservation easements on the Cool Springs Tract. Funding for this project was provided by the North Carolina Clean Water Management Trust Fund, the North Carolina Attorney General's Environmental Enhancement Grant, and the U.S. Department of Agriculture's Forest Legacy Program. As an indication of its commitment to conservation, Weyerhaeuser Company donated a conservation easement on the nearby 927-acre Neuse Floodplain Tract.

The Program

In addition to working to increase the rate at which land is being protected in North Carolina, the Million Acre Initiative continues to work towards making information about land protection tools and techniques more broadly available, and to encourage conservation planning. The Million Acre Initiative, as part of the One North Carolina Naturally program, and with other partners, continues to slowly but steadily increase awareness among North Carolinians about the need for additional land conservation to protect our valuable natural ecosystems.

The Office of Conservation and Community Affairs has demonstrated its commitment to working lands by assigning a staff position to coordinate and implement working lands protection. The coordinator, based in the Piedmont, will work statewide. Projects already

underway include Soil & Water Conservation and Forestry Information Day events; increasing working lands activity for Districts by assisting with Voluntary Agricultural Districts; encouraging the development of county Agriculture Protection Plans; and working with partners to develop criteria to help identify priority farmlands for conservation.

In the coming months the Million Acre Initiative and the One NC Naturally program will work to implement recommendations from local public input. The One North Carolina Naturally Program continues to work with regions to determine appropriate next steps and to develop implementation strategies for the various regional plans. Specific projects will vary depending on the needs within each region, but in addition to the working lands coordinator mentioned above, the Office of Conservation and Community Affairs has assigned a coordinator for resource-based economic development based in the Mountain region, and another coordinator based in the Coastal region to implement and coordinate the Coastal Habitat Protection Plans (CHPPs).

The Million Acre Initiative itself has identified potential focus areas for reaching the goal in a manner that maximizes benefit to biodiversity conservation. Within the N.C. Natural Heritage Program 'Macrosites' are approximately 3 million acres of unprotected land – areas that contribute to ecosystem function for clusters of natural areas and/or managed conservation lands. These areas include undeveloped and little-degraded lands, as well as farmland and working forests that buffer natural areas and connect habitats. This approach helps focus protection of open space, without specifically targeting one million acres of private land. While the Million Acre Initiative has been working to identify targeted areas for conservation, other planning efforts are underway, including the One North Carolina Naturally initiative and the Wildlife Action Plan.

Looking Ahead

The 53,431 acres permanently protected in 2005 was a disappointingly small step forward, in some respects, and it looks as though 2006 will also be a tough year for new land protection

projects. The limits in North Carolina's conservation funding remain a challenge. The General Assembly did not include any substantial additional funding for land acquisition in 2005. The 2006 Capital Improvements budget earmarked $15 million for Hickorynut Gorge State Park -- the only land conservation project specified in the budget. The money for Hickorynut Gorge is a good start, as is fully funding the North Carolina Clean Water Management Trust Fund, but with little federal money available, the burden for land protection falls squarely within the State.

In regard to current federal disposition toward conservation lands, one event that occurred in early 2006 demonstrated that the public has strong commitment to land conservation. The President's 2007 Budget for the U.S. Forest Service included a legislative proposal that would sell more than 300,000 acres of National Forest – lands considered 'protected" by most – to continue a federal program that supplements payments to rural schools in heavily forested counties. Almost 10,000 acres were identified for sale in North Carolina, but public outcry prompted Congress to reject the proposed sale. Governor Mike Easley also expressed strong opposition to the sale, writing to the U.S. Department of Agriculture and noting that the proposal came just as the state is working on a long-term strategy to preserve a million acres statewide by 2009. The U.S. Department of Agriculture has indicated that this proposal may return next year, and the State will have to be dedicated to both adding new lands, and remaining vigilant about lands already protected.

As noted in last year's report, it will be difficult to meet the Million Acre goal without a working lands component that helps to maintain local production of agriculture and forest products. Of particular interest would be a dedicated source of funding for conservation of North Carolina's farms and forest lands. There have been numerous suggestions for ways to generate funding, and it is time to examine some of these suggestions more closely.

In building momentum for additional conservation funding, the Land for Tomorrow Coalition was successful in catalyzing Senate Bill 1122, the "Land and Water Conservation Study." This act creates the Land and Water Conservation Study Commission to evaluate current sources of conservation funding, collect information on tools to protect land and water, draft a report

summarizing research and making recommendations, hold public meetings and present to the General Assembly and the Environmental Review Commission on or before Feb. 1, 2007.

Beautiful landscapes, mild climate and hospitable people draw new residents to our State, as does the strong and diverse economy. To be honest, most of us probably take these landscapes for granted. However, North Carolina's population is projected to increase 50% over the next 25 years. At the current rate of development, 4 million new residents will translate to 8 million acres developed. While we can't say for certain how much land will be permanently altered in the next 25 years, it is safe to say that much of the development is likely to occur on lands that currently have forests or farms – destroying open spaces around larger urban areas. In order to ensure the ecological health of North Carolina, we need to not only step up the rate of land protection, but to identify which lands should be conserved, and which lands are best suited for development to accommodate our new residents. As development pressures intensify and land prices increase, so does the importance of protecting our high priority conservation areas, be they wildlife habitats, areas for passive recreation or water quality protection, or places that supply us with food and fiber. Some of the prioritization could be achieved by combining information from sources such as the Wildlife Action Plan, proposed greenways and trails, Significant Natural Heritage Areas, identified priority agriculture and forestry lands, the Land for Tomorrow Coalition five-year plan, Coastal Habitat Protection Plans, buffers for military bases, Million Acre Initiative, ecological 'connectors'/wildlife corridors, etc. into a green infrastructure plan for the One North Carolina Naturally initiative.

The concept of green infrastructure represents an interconnected green space network designed for its natural resource values and for associated benefits to human populations, and such a comprehensive conservation plan can help us see how individual green spaces and working landscapes across North Carolina fit together into an essential network for ecological and public health. The term was coined to elevate the attention of the areas that provide our natural life-support system to the same level as "Gray Infrastructure." What if our local and state government decision-makers put as much effort into planning and protection of green infrastructure as they do into the planning and upkeep of roads, sewer lines, and buildings? With the anticipated influx of new residents, and the importance of open space for the natural

environment and public health, this idea should be given serious consideration. The green infrastructure approach can also emphasize the economic value of protecting natural lands to better communicate this viewpoint to public officials.

Understanding the interrelationships among the priority areas for conservation will help us target our protection efforts so that we maximize the cost effectiveness and the natural protection value of our investment, and improve North Carolina's quality of life. As tens of thousands of acres each year are permanently altered from their existing natural condition for new development, increased awareness about the importance of setting aside some portion of our critical and unique lands is essential. A combination of planning and coordination at the local, regional and state level, with adequate funding incentives to implement the plans, is crucial. The partners listed in the attached summary table will no doubt continue their efforts, and the One North Carolina Naturally program will look for ways to expand land conservation efforts, and make the future greener for our state.

CONSERVATION EASEMENT PROGRAM

ANNUAL REPORT

TO THE

ENVIRONMENTAL REVIEW COMMISSION

November 1, 2006

Pursuant to NC G.S. 113A-235(c), the Department of Environment and Natural Resources reports to the Environmental Review Commission each year on the implementation of Article 16, the Conservation Easement Program. This Article, 113A-230 through 113A-235, includes enabling legislation for a program for conservation easement promotion/education, conservation tax credit promotion/education and quality assurance of conserved lands, and enabling legislation for a conservation grant fund. The following reports on these programs.

NC Department of Environment and Natural Resources

THE YEAR IN SUMMARY

Over the past year significant progress has been made in the development and integration of the programs within Article 16.

Conservation Easement Stewardship. The use of conservation easements continues to grow, although the rate of growth has slowed. The department (DENR) began stewardship of some of its conservation easements this year, and plans to expand its activities for stewardship oversight incrementally.

Conservation Tax Credit Program. The number of acres and estimated value of donations of interests in real property donated for conservation purposes remains stable, but has not grown in several years. Over the last year, applications for certification have been approved for the conservation of 15,000 acres, which brings the total conserved acreage to 154,000 for the duration of the program. Also, last year the tax credit facilitated bargain sales to the state at prices $46.7 million below appraised market value.

Conservation Grant Fund. Two of this conservation tool's grants programs received funds for the first time this year. The Military Support Act will make grants from a one-time appropriation for transaction costs associated with the buffering of military training areas with compatible land uses, and annual stewardship monitoring grants began on conservation easements held by the Ecosystem Enhancement Program.

ANNUAL PROGRAM UPDATE

Conservation Easement Program 113A-230. Having been established in 1997, this program is administered as part of the NC Conservation Tax Credit Program (NCCTC). The Conservation Easement (CE) program is intended to use promotion, education, and quality assurance to increase the use of conservation easements as a tool to accomplish conservation goals, such as the Million Acre Initiative. A graph (Attachment A) of NCCTC Program Statistics shows the increasing use of conservation easements through this program, due primarily to the growing acceptance of CEs within the farming and forestry communities. Further, CEs are a key element of the Clean Water Management Trust Fund, Ecosystem Enhancement Program, and Conservation Reserve Enhancement Program as the mechanism for water quality protection in most transactions. Also, CEs are held by programs such as State Parks, Coastal Reserves, and Forest Legacy as a tool for accomplishing their missions.

In 2005 the Department began taking the first steps toward funding conservation easement quality assurance related activity. With the increasing number of CEs generated through the Clean Water Management Trust Fund, Ecosystem Enhancement Program, Conservation Reserve Enhancement Program, and other programs, comes a growing responsibility for monitoring and effective management of their conservation values. This was begun in 2006 as a centralized receipts-based program supported by

any agency prepared to make payments into the Conservation Grant Fund Endowment to cover administrative/management costs. The intent is to expand this Stewardship Program incrementally until all conservation easements held by the State are assured proper monitoring and management of their public purposes and values.
At this writing, two agencies have contracted to participate in the Stewardship Program: the Ecosystem Enhancement Program, and the Conservation Reserve Enhancement Program. Beginning in 2007 two additional stewardship monitoring expansions will be pursued: (1) All DENR agencies that hold CEs received through the NCCTC Program will submit annual stewardship monitoring reports, and (2) all private nonprofit land trusts will be asked to confirm their stewardship monitoring of CEs received through the NCCTC Program.

To accomplish optimum use of conservation easements by private landowners and to realize their related economic advantages, the program needs to provide more than superficial information and guidance. While a more substantial and in-depth outreach program could greatly increase the use of conservation easements, as seen on the referenced graph after 1997, it will also require more attention to the costs and complexities of conservation easement drafting and stewardship. By combining the CE Program with the NCCTC Program, the Department operates a limited CE Program (promotion and education), yet the conservation benefits of CEs cannot be optimized without attention to existing administrative constraints.

Conservation Tax Credit Program 113A-231. The State's Conservation Tax Credit was established in 1983 and this Department's role was passive, to respond to donor's applications for certification of their gifts of interests in real property for conservation purposes. In 1997 the Department received the authorization to begin a non-regulatory program of education/promotion to increase the use of conservation tax credits. Over the last ten months NCCTC/CE presentations were made at workshops organized by other groups for landowners and land related professionals, and the NCCTC display was sent to other workshops or conferences.

Graphs (Attachments B & C) of NCCTC Program Statistics show the acreage and estimated value of donations over the duration of the program. Cumulatively, more than 154,000 acres valued in excess of $617 million has been donated. A table (Attachment D) of donations by County shows that there have been donations in eighty-eight of the State's counties.

Over the duration of Conservation Tax Credit use, it has leveraged the donation of $230 million of excess value that was above the amount that could be used to create the maximum credit allowed (Attachments E, F, & G).

Further, when used in conjunction with bargain sales, the conservation Tax Credit (Attachments H & I) can yield substantial savings for conservation trust funds, local governments, and nonprofit organizations purchasing land. For example, in 2005 alone, the gift portion of bargain sales to the State that qualified for the Conservation Tax Credit allowed the acquisition of conservation lands by the state at a price $46.7 million below

appraised market value. Over the duration of the program, all grantees have saved more than $131 million through bargain sales facilitated by the tax credit incentive.

The Department has the statutory responsibility to protect real property and interests in real property conserved in perpetuity by State incentive programs. Fulfillment of this responsibility will require monitoring of these properties to assure that their conservation purposes are not jeopardized. The new but limited stewardship monitoring (quality assurance) program discussed under Conservation Easement Program, above, needs to be expanded incrementally to all conserved properties (both CE and fee simple). The current absence of permanent, full time staff and line item budget prohibit implementation of these activities to further protect the public's conservation assets.

The increasing benefits from the Conservation Tax Credit Program have been derived mostly from increases in the maximum tax credit allowed. Nevertheless, steadily increasing land values reduce the incentive offered by the Conservation Tax Credit over time. Therefore, the maximum credit allowed must increase periodically to retain the program's effectiveness.

The Conservation Tax Credit is currently applied against State income taxes. Yet, there are landowners that cannot use this conservation incentive because they are required to pay other types of taxes. Consideration might be directed toward broadening the types of taxes to which the credit can be applied.

A more substantial and in depth outreach program could greatly increase donations of real property for conservation purposes from the use of conservation tax credits. To date the Department has provided minimum support for this function while the Conservation Tax Credit Program has operated in a limited fashion in the absence of permanent, full time staff or line item operating budget. This is a continuing limitation on the program's potential success.

Conservation Grant Fund 113A-232. Established in 1997, it was intended to stimulate the use of conservation easements, to improve the capacity of private nonprofit land trusts and agencies to successfully accomplish conservation projects, to better equip real estate related professionals to pursue opportunities for conservation, to increase private landowner participation in land and water conservation, and to provide an opportunity to leverage private or other public monies for the stewardship of conservation easements. To date the Department has not received an appropriation to actualize the complete menu of Conservation Grant Fund activities and address the structural weaknesses it was intended to correct.

In 2005, actions were taken to start up two of the Conservation Grant Fund's functions. (1) The General Assembly approved one-time funding in the amount of $1,000,000 for the transaction cost function. This will be directed to the conservation of land that buffers military bases and training areas with compatible land uses. These Military Support Act funds became available in July of 2006, and the first grant cycle will be completed by the end of the year. It appears that approximately $316,000 will be

expended in the first cycle on five projects. Grant cycles will continue until available funds are expended. This program is explained in more detail in (Attachment J). (2) The Department began the process of creating a centralized program that assures proper quality assurance (monitoring and management) of the conservation easements held by its agencies, as part of the stewardship cost function. The Stewardship Program became operational in 2006 as a receipts based operation involving the Ecosystem Enhancement Program and the Conservation Reserve Enhancement Program. An administrative position for this program has been approved, will be funded out of receipts, and will be filled in 2007. Further Stewardship Program expansion involves DENR agencies and private nonprofit land trusts being asked to report their annual stewardship monitoring of CEs received through the NCCTC Program beginning in 2007, at no cost to the Conservation Grant Fund. Until a continuing source of funding can be secured, additional expansion of this program of conservation quality assurance in perpetuity will be constrained.

RESULTS FROM 2006 LEGISLATIVE SESSION

SB 521 carried over from the 2005 Session. While it was not ratified, it was supplanted by Session Law 2006-66, Section 24A.4.(a)(2) which required the Revenue Laws Study Committee to review: "The effectiveness of the tax credit for certain real property donations" and report to the 2007 General Assembly. DENR and the Department of Revenue (DOR) are preparing recommendations for several minor amendments to clarify administrative issues related to the jointly administered NCCTC Program.

RECOMMENDATIONS FOR SUBSTANTIVE LEGISLATION IN 2007

As a result of the ongoing Revenue Laws Study Committee Review, it appears that three topics will be the focus of attention for possible NCCTC amendments.

(1) **NCCTC For Partnerships (Pass Through Entities).** A recent amendment to Department of Revenue (DOR) statutes, governing the way all pass through entities may claim tax credits, deferred its effect on the NCCTC until 1/1/2005 and that has since been extended until 1/1/2006 and then 1/1/2007. At that time, partnerships and other pass through entities will be limited to a maximum allowed credit of $250,000 for donations under the NCCTC, regardless of the value of the donated interests in real property. This has the potential to be a significant disincentive on the scale of donations and gift portion of bargain sales. Under consideration to address this loss of incentive is allowing pass through entities to claim the same maximum allowed credit ($500,000) as other corporations, with each pass through recipient limited to the maximum individual NCCTC of ($250,000) or portion thereof, would partially address the loss of incentive to the NCCTC. The effective date of such amendment should be 1/1/2007.

(2) **Qualifying Conservation Purposes**. Under current law, the qualifying conservation purposes include the catch-all phrase, "other similar land conservation purposes." Differences in the statutory construction of this phrase developed between DENR and DOR. Under consideration to address

this discrepancy is elimination of this phrase and substituting six new, specific conservation purposes: forestland or farmland conservation, watershed protection, conservation of natural areas as that term is defined in G.S. 113A-164.3(3), conservation of natural or scenic river areas as those terms are used in G.S. 113A-34, conservation of predominantly natural parkland, or historic landscape conservation.

(3) **Appraised Value**. Concerns regarding the accuracy of the stated fair market value of donated property have also risen. Current law does not require any specific documentation, other than a certification by DENR of a proper conservation purpose. The DOR has reported problems associated with taxpayer use of restricted appraisal reports to establish the fair market value of the donation. Restricted appraisal reports are reports done specifically for one person and contain little or no information relied upon by the appraiser to formulate the property's value. Under consideration to address this issue is requiring a taxpayer claiming the credit to submit as support for the credit either a self-contained or a summary appraisal report, which are two types of reports defined by Standards rule 2-2 of the Uniform Standards of Professional Appraisal Practice and required to have certain information included supporting the valuation determination. A taxpayer may elect, for fee simple donations of property only, to use the county's appraised value of the property as adjusted by the sales assessment ratio.

OTHER TOPICS FOR CONSIDERATION

Through management of the NCCTC Program and observation of evolving approaches to conservation through incentives, a number of topics may deserve consideration. The following could improve administration of the NCCTC and/or the incentive offered by the state for donation of interests in real property for conservation purposes.

(A) **Reports.** Since its inception, Fiscal Notes for proposed amendments to the NCCTC have been problematic because of the limited available data. DOR and DENR have previously agreed to several achievable data items that could be reported annually. This includes the: (1) number of taxpayers that claimed a credit, and (2) total cost to the General Fund of the credits claimed. This is useful information in its own right and is worth pursuing. Nevertheless, it would be greatly enhanced by knowing the difference between the total value of credit available, and the total value actually used to offset tax liability. This information would provide a depth of insight needed for ongoing refinement of the NCCTC.

(B) **Corporate Incentive To Donate**. Since its creation in 1983, the NCCTC has only been applied against income taxes. With the sunset provision for how corporate passthrough entities claim tax credit, some of the incentive for conservation donations will be eliminated. One approach for regaining the breadth of NCCTC applicability would be to allow the credit to be used against Franchise Tax and Gross Premium Tax. This would appeal to corporate landowners that may be otherwise constrained from

considering the donation of real property for conservation purposes, because they are not required to pay income taxes or they have limited income tax liability.

(C) **NCCTC Refundability.** The NCCTC was created as an incentive for landowners to donate interests in real property for conservation purposes. While the concept has been very successful and has been emulated in other states, there is still a category of landowner that finds little incentive in the program. "Land-rich and cash-poor" landowners [typically owners of working landscapes such as farms and forests] receive disproportionately low return from their conservation donation for a tax credit. Several states with more recent conservation tax credit programs have addressed this issue by authorizing "transferability" for their tax credits, but this involves a considerable administrative workload. The issue could be addressed more simply through "refundability," where those donors with larger income tax liabilities will have the option of electing a credit, while those donors with lower income tax liabilities will have the option of electing a partial refund. As proposed, a 50% refund of any remaining credit amount would be authorized after the second year of carry forward (third year including the year of donation). In this way, land-rich and cash-poor landowners would have more incentive to donate interests in real property for conservation purposes. If enacted, it would be three years before any refunds were paid.

(D) **Index Credit Cap.** Since its establishment in 1983, the maximum credit allowed for the NCCTC has been raised three times (1989, 1997, and 1999). Further requests for increases are inevitable as increasing property values decrease the incentive provided by the NCCTC. These dynamics can be addressed by indexing the credit cap. The incentive to donate would then be stabilized relative to land value, and repetitive legislated increases would be avoided. As proposed, an increase equal to 75% of the Consumer Price Index (CPI) would be calculated from the last year of credit cap increase, with the cap increasing incrementally in the year following a cumulative increase of $25,000 for individuals and $50,000 for corporations. If previously enacted: since the last credit cap increase occurred in 1999, the index threshold would have been passed in 2004, would have been announced in 2005, and 2006 would be the year an automatic indexed increase took effect. Thus, a credit cap increase is due, to avoid a loss of incentive for voluntary donations of interests in real property for conservation purposes. In the absence of indexing authority, an increase in existing credit caps to $275,000 for individuals and $550,000 for corporations is timely.

(E) **Charitable Purpose Flexibility.** To be eligible for a NCCTC, the donated land must yield one or more of the required public conservation purposes. Nevertheless, minor parts of donated tracts may not contribute to the conservation purpose and may not be allowed to be converted to another purpose without conflict with the tax credit statues. While it would be inappropriate to allow wholesale or unsupervised conversion of

conservation properties to other uses, there may be justification to consider allowing small parts that do not contribute to conservation purposes to be converted to another charitable purpose under a specific process of checks and balances administered by the NCCTC Program. This flexibility would be consistent with the concept of providing incentives for community based charitable activity, while allowing compatible but diverse land uses, without jeopardizing the public conservation benefits required by the NCCTC.

MILITARY SUPPORT ACT PROGRAM

Transaction Cost Reimbursement for Buffering Military Training Areas with Compatible Land Uses

In its 2005 session the NC Legislature ratified the "Soldier, Sailor, Marine, Airmen, and Guardsman Support Act". Within this Act were numerous provisions to address the needs of military personnel stationed in this state, as well as the relationship between critical military training areas and surrounding private/public lands. The one provision that established the foundation for a competitive grants program to buffer military training areas reads as follows.

> **SECTION 1A.2** There is appropriated from the General Fund to the Conservation Grant Fund established under G.S. 113A-232 for the 2006-2007 fiscal year the sum of one million dollars ($1,000,000). Funds distributed to the Conservation Grant Fund under this section must be used for compatible land use and conservation easement type acquisitions of land adjacent to military bases and flyways.
> **SECTION 1A.3** This part becomes effective July 1, 2006.

The Department of Environment and Natural Resources (DENR) is responsible for administration of the Conservation Grant Fund and will be responsible for the conduct of this program. The appropriation has been allocated to the Conservation Grant Fund's transaction costs reimbursement functions [G.S. 113A-233(a) and (b)], and will be expended for that purpose. While this is but one of the functions authorized for the Conservation Grant Fund, it most closely reflects the intent of the Act to acquire land or interest in land adjacent to military bases and beneath flyways.

The funds provided by this Act are a one-time, rather than a continuing appropriation. Thus, once it is expended this program will be dormant until additional funds are appropriated for this purpose. Nevertheless, whether temporal or permanent, this program must be designed, explained, and operated in an appropriate manner.

- It must accomplish its authorized purpose.
- It must optimize available funding.
- It must optimize continued military training.
- It must optimize public conservation opportunity.

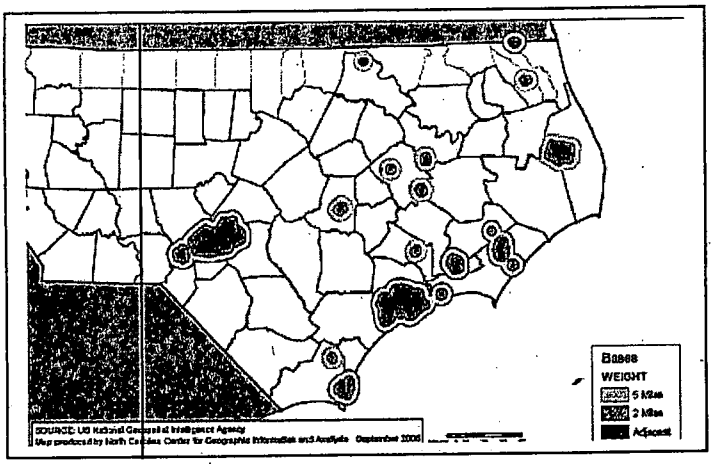
THE PROGRAM

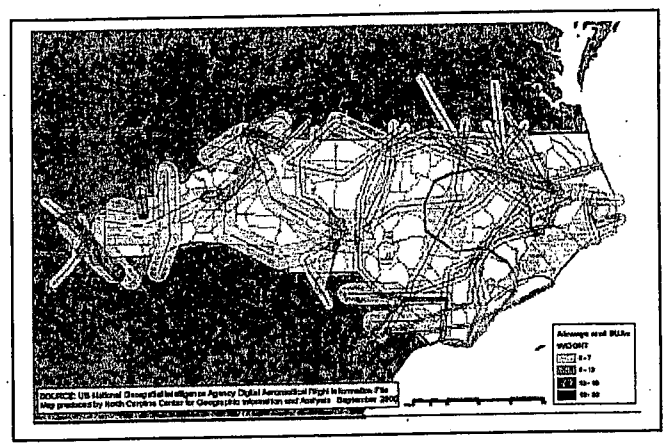
The intent of the operative (above) provision of the Act is to maintain the opportunity for effective military training within the state. The approach for accomplishing this intent is the reimbursement of up to 100% of the transaction cost for acquisition of real property or interests therein to buffer training areas with lands conserved as compatible land uses. [For the purpose of this program the term "compatible land use", as used in the statute and herein, is expected to mean land uses that minimize potential conflicts with military training activities. Since those activities are likely to create noticeable and repetitive noise and vibration and may occasionally cause fires, explosions, or unexpected interaction with trainees; then land uses that minimize human population density would be compatible. Likewise, intensive agricultural husbandry and animal product production is likely to be incompatible, although traditional crops farming and forestry practices are generally compatible. Land conserved for ecological protection or mitigation, and public

recreation use may also be compatible.] To focus this program, the training areas that are eligible for grant funds to accomplish buffering with compatible land uses are as follows.

- Military Bases – includes (Air Force, Army, Coast Guard, Marine Corps, National Guard, and Navy) bases, stations, and installations with resident populations and training areas; as well as outlying landing fields, bombing ranges, and other areas used for training. In specific situations formally used defense sites (FUDS) may be included. (See page 5.)

  Note: Sites identified in **Halifax**, **Pitt**, **Beaufort** and **Pamlico** Counties are military assets that may or may not be active military training facilities. We are currently assessing the status of these sites and will adjust our "weighting tool" accordingly.





- Military Airways – includes Federal Aviation Administration designated and charted restricted areas, military operations areas, alert areas, and military training routes. (See page 6.)

The program requires an application in order to initiate a grant request. The application is in a specified format and provides the information required to differentiate among sites, as well as for optimum distribution of program grants. A weighting system developed for the program will be used along with other available information to assist decision makers in ranking grant approvals.

APPLICANTS

The Military Support Act Program is being administered through the Conservation Grant Fund. Eligibility to apply for a grant is established by its enabling legislation, as follows.

> 113A-232 (c1) Grant Eligibility. – State conservation land management agencies, local government conservation land management agencies, and private nonprofit land trust organizations are eligible to receive grants from the Conservation Grant Fund. Private nonprofit land trust organizations must be qualified pursuant to G.S. 105-130.34 and G.S. 105-151.12 and must be certified under section 501(c)(3) of the Internal Revenue Code.

THE APPLICATION

The first formal step in the process of seeking a grant to assist with transaction costs, related to the buffering of military training areas with compatible land uses, begins with the application. While its format is comprehensive, responses need not be encyclopedic. Maps, tables, and lists should be used instead of text whenever possible. Brevity is appreciated. Its intent is to efficiently collect information that will allow decision makers to distinguish among opportunities. (See pages 7-9.)

There are numerous activities associated with transactions involving interests in real property. Most, but not all activities are eligible for grant reimbursement. (See list) Individually these costs may be deminimus to extreme, depending upon the characteristics of the property and conservation approach involved. The application includes a specific form for documenting projected and actual costs associated with transaction activities. In order to optimize available funding and program purpose, the Department of Environment and Natural Resources will exercise its discretion in determining the level of reimbursement that can be made available for any application.

WEIGHTING PROPOSED SITES

Information provided through the application process will be used to determine where and how available grant funds may be used for transaction costs. Part of application preparation and review includes a site specific weighting process. A GIS driven program has been developed to assist in the application weighting process. It incorporates consideration of a site's proximity to military bases and airways as a mechanism for suggesting its importance as a training area buffer. This weighting tool also accommodates the generation of cumulative weighting values where sites may buffer multiple training areas. (Link http://204.211.135.120/cwland_viewer/viewer.htm) (User Guide link http://204.211.135.120/CWLAND_viewer/ArcIMS_Help/User%20Guide%20for%.)

Applicants should access the weighting tool and the instructions for its use. Familiarity with use of this tool will enable potential applicants to assess the relative importance of various sites. This will, in turn, support the targeting of projects to properties with both high potential for training area buffering and the conservation benefit of compatible land use.

The weighting tool specifically addresses a site's proximity to military training areas as one consideration in the application weighting process. Another part of the process involves the compatibility of the proposed buffer land use, and the significance of the involved property for conservation for ecological and environmental reasons. This information is requested through the application format, and DENR staff will consider the data submitted. Thus, part of the application review is quantifiable through the GIS program, and part is objective. The final decision on grants will reflect a balancing of these two aspects of the application in an effort to accomplish the operative provisions of the Act, set out earlier in this program description.

APPLICATION REVIEW AND RANKING

The DENR will establish a review committee to screen all applications submitted for a grants cycle, and recommend an appropriate ranking based upon the information provided by the applicant and other available sources. The review committee will be comprised of individuals from agencies with expertise in resource conservation. Consideration will be given to: (1) buffering potential resulting from adjacency to training areas, (2) compatibility of the proposed future land uses, (3) existing and/or proposed conservation benefits of the site, and (4) optimizing use of available funds; as grant opportunities are assessed, compared, and contrasted.

The review committee will rank the applications submitted for a grants cycle, and forward the results to the DENR Secretary. In the process, reviewers shall rely upon the purpose and intent of the authorizing statute, information provided in the applications, other publicly available information and their best professional judgements to develop rankings. The Secretary will make the final decision and announce the grant awards.

GRANT CYCLES

This program will observe an open application process and will accept applications for transaction cost grants at any time. Grants will be made on the basis of two cycles per year. The applications deadlines will be October 15 and April 15 with award decisions being made within 45 days of the application deadlines of each year when funds are available.

GRANT AMOUNTS

The DENR will monitor the amount of available funding and the pattern of grants requested in the first and following cycles of applications. Thereafter, grant management conditions will be announced at the beginning of each new cycle. These conditions may involve, but are not limited to: (1) a cap on the maximum allowable grant, and/or (2) the discretion to approve less than the requested transaction cost amounts on a case by case basis. For the purpose of preparing grant applications for the current grant cycle, the maximum allowable grant will be $85,000.

CONTRACTS AND REIMBURSEMENTS

Grants of state funds are made under contract. The DENR will facilitate the grant process between the recipient and State. The maximum grant amount will be set by the contract. Amounts paid for projected costs may vary from the amounts requested in applications, but the maximum grant amount may not change.

Military Support Act Program grants are made on a contract and reimbursement basis. Copies of invoice and payment documents must accompany requests for reimbursement. The grant contract will establish the detailed requirements of the process.

APPLICATION REVIEW PROCEDURE

1. Confirm that application is complete. (If every topic has a response, the application review can continue.)

2. Is the conservation use proposed a suitably compatible land use? (If considered compatible, then continue.)

3. Is the property under option? (Separate those under option as first priority, from those that are not.)

4. Confirm proximity with military base(s) and GIS program score. (Rank those with base proximity only.)

5. Confirm proximity with military airspace(s) and GIS program score. (Rank those with airspace proximity only.)

6. Compile applications with both base and airspace proximity and add scores. (Rank those with both base and airspace proximity.)

7. Confirm species on site.

8. Confirm proximity to public conservation lands.

9. Confirm proximity to designated conservation features.

10. Document transaction's cost/benefit ratio.

* Items #1-#6 and #10 will be completed by Program Administrator.
* Items #7-#9 will be confirmed by DENR agencies with expertise.

The application evaluations identified above will be presented to the Review Committee, to be assessed, compared, and contrasted. The relative importance of each category of information to fulfilling the statutory purpose of the grant will be discussed, established, and consistently applied to the final ranking of all applications.

PARTF Grants for Local Governments Basic Facts

- Maximum Grant Amount - $500,000
- Local governments match the PARTF grant dollar-for-dollar.
- The value of donated property can be used as the local match.

PARTF Grants for Local Governments Important Dates

- Applications are due January 31
- The Parks and Recreation Authority selects grant recipients in May and July

Evaluating Applications - PARTF Scoring System Criteria

- Planning the project
- Involving the public
- Acquiring land
- Applicant's ability to operate and maintain the project
- Quality of the park site
- Number of recreational facilities provided

Selecting Grant Recipients:
Other Factors Considered

- Distributing grant awards across the state
- Population of the applicant
- Administration of previous grants
- The applicant's justification for the project

PARTF Grant Requests and Awards 2006

Applications

- 86 applications received proposing $80 million in land acquisition and recreational facilities
- $27 million in grant requests
- $53 million in local matching funds committed

Grants Awarded

- 55 grants awarded to projects totaling $44 million
- $17.7 million in PARTF funds awarded
- $26.7 million in local matching funds leveraged

PARTF Grants for Local Governments
1997-2006

Applications Received

- 874 applications received
- $150 million in grant requests
- $270 million in local funds pledged to match PARTF grant funds

Grants Awarded

- 487 grants awarded
- $92 million in grant awards
- $156 million in local matching funds leveraged by grants ($1.70 in local funds are spent to match each $1.00 in grant funds)

Requests from Local Governments Continue to Increase

- Elk Knob State Park / Long Hope Valley – about 1,200 acres

Growth of the State Parks System

- The state parks system is experiencing record levels of attendance.
- Additional land and facilities are needed at most state parks; protecting important natural resources.
- Over 40 potential park units have been identified by the New Parks for a New Century initiative.
- On-going repairs and renovations are needed to insure high quality experiences for park visitors.

Size of the State Parks System

- Land Acquisition Opportunities:
  - 43,700 acres at existing state parks for $176 million
  - 113,000 acres at new state parks for $454 million

Capital Needs of the State Parks System

- Capital Improvement Needs:
  - $334 million at existing state parks
  - Estimates for facilities at new parks will be based on park master plans

. . . to protect North Carolina's natural diversity;
. . . to provide and promote outdoor recreation opportunities throughout North Carolina; and
. . . to exemplify and encourage good stewardship of North Carolina's natural resources for all citizens and visitors.

1.0 Introduction

The North Carolina General Assembly established the North Carolina Parks and Recreation Trust Fund (PARTF) on July 16, 1994. The General Assembly made an initial appropriation of $1 million to the PARTF to fund improvements in state parks, to fund grants for local governments and to increase public access to the state's beaches. In 1995, the General Assembly dedicated funds from the excise stamp tax to the trust fund starting in FY 1996-97. The Parks and Recreation Authority, an eleven-member board, was also created to allocate funds from the PARTF to projects in state parks and to grants for local governments.

The excise tax is the primary funding source for the PARTF. The tax is levied on each "deed, instrument, or writing by which interest in real property is conveyed to another person." The tax is levied at the rate of one dollar on each $500 of the interest or property conveyed. Each county remits one-half of the proceeds, less the county's allowance for administrative expenses, to the state. Effective July 1996, the General Assembly (G.S. 105-228.30) stipulated that part of the state's share would be allocated to the PARTF. Of the funds remitted, the Department of Revenue credits 75% to the Parks and Recreation Trust Fund and 25% to the Natural Heritage Trust Fund.

Pursuant to G.S. 113-44.15, the money from the Parks and Recreation Trust Fund is to be allocated as follows:

(1) Sixty-five percent (65%) for the State Parks System for capital projects, repairs and renovations of facilities and to acquire land.

(2) Thirty percent (30%) to provide grants to local governments on a dollar-for-dollar basis to create or improve parks and recreational projects.

(3) Five percent (5%) for the Coastal and Estuarine Water Beach Access Program.

(4) No more than three percent (3%) may be used by the Department of Environment and Natural Resources (DENR) for the operating expenses associated with managing capital improvements projects, acquiring land, and administering the grants program for local governments.

2.0 North Carolina Parks and Recreation Authority

The North Carolina Parks and Recreation Authority, an 11-member board that oversees the Parks and Recreation Trust Fund, was created by the General Assembly with the Authority's powers and duties becoming effective July 1, 1996. The Governor appoints three members, including the chairperson. The General Assembly appoints four members upon the recommendation of the President Pro Tempore of the Senate. The General Assembly appoints four members upon the recommendation of the Speaker of the House.

The Authority is charged with six powers and duties:1) to receive public and private donations and funds for deposit into the trust fund; 2) to allocate funds for land acquisition; 3) to allocate funds for capital projects; 4) to solicit financial and material support; 5) to develop effective support for parks and recreation; 6) and to advise the Secretary of DENR on any matter he may refer to the body.

Members are appointed for three-year terms and may serve no more than two consecutive three-year terms. After serving two consecutive three-year terms, a member is not eligible for appointment to the Authority for at least one year after the expiration of the member's last term. The Parks and Recreation Authority held four meetings during fiscal year 2005-2006.

The 2005-2006 Parks and Recreation Authority members are:

3.0 Parks and Recreation Trust Fund Summary

The Parks and Recreation Trust Fund (PARTF) is housed within the Division of Parks and Recreation, which operates the North Carolina State Parks System. The Parks and Recreation Authority allocates PARTF revenue to the state parks capital improvement and land acquisition projects. This board also selects the recipients of the grants to local governments to create or improve parks and recreational projects. The Division of Parks and Recreation, under Lewis Ledford, Division Director, develops priorities for the state parks system and recommends projects for the board's approval. Once the board has allocated the PARTF funds, the Division manages the projects for state parks and for the grants program.

The Division of Parks and Recreation transfers 5% of PARTF revenue to the Division of Division of Coastal Management (DCM) for the Coastal and Estuarine Water Beach Access Program. The Division of Coastal Management, under the direction of Charles Jones, administers these funds and offers matching grants to local governments throughout the 20 coastal counties.

Table 3-1 shows the revenues received into the Parks and Recreation Trust Fund and the allocation of revenues by program for fiscal year 2005-2006.

Table 3-1
Parks and Recreation Trust Fund (PARTF)
Distribution of Revenues
Fiscal Year 2005-06

Item	Subtotal	Total
Public Beach and Coastal Waterfront Access Program		$ 2,877,772
Local Governments Matching Grants Program		$ 17,035,688
State Parks System		$ 36,910,656

Contract with NCSU Recreation Resources Service	$ 256,483	
Division of Parks & Recreation staff and Authority members	$ 474,840	
2005-2006 PARTF Revenues		$ 57,555,438

4.0 Grants Program for Local Governments

4.1 *Program Description*

The Parks and Recreation Trust Fund (PARTF) program provides dollar-for-dollar grants to local governments. All counties, incorporated municipalities and public authorities (as defined in N.C.G.S. 159-7) are eligible for funding. Two or more local governments may apply jointly. Recipients can acquire land to use for public recreation or to protect the natural or scenic resources of the property. Recipients can also use a grant to build or renovate recreational and support facilities. All facilities must serve the general public.

In September, the Division of Parks and Recreation (DPR) mails a description of the PARTF program and a schedule to local governmental officials and parks and recreation directors. A local government can request a maximum grant amount of $500,000 in PARTF assistance with its grant application. The approved value of land that is donated to a local governmental unit or public authority may be applied to the 50% matching requirement.

The DPR provides assistance to local governments in several ways. In October, the PARTF staff conducts a workshop where local governments can learn about the program and how to complete an application. The workshop is presented simultaneously at University of North Carolina video conference sites. The DPR has a contract with the Recreation Resources Service (RRS) at North Carolina State University. The staff of RRS can provide technical assistance to local governments who request help in planning projects and preparing grant applications. RRS has six consultants in regional offices across the state.

The members of the Parks and Recreation Authority select which applicants will receive a grant. The factors considered by the Authority as it selects recipients include, but are not limited to, the criteria contained in the PARTF scoring system, the population of the applicant, the geographic distribution of projects across the state, the presence or absence of other funding sources and compliance with prior grant agreements.

Applications are due January 31. The Parks and Recreation Authority meets in May to select recipients from PARTF revenues received for the first three-quarters of the fiscal year. The Authority meets in early July to select grant recipients from PARTF revenues received during the fourth quarter of the fiscal year.

4.2 *Description of Applications and Grants*

The PARTF revenues for grants to local governments for fiscal year 2005-2006 were $17,035,688. Eighty-six units of local government submitted PARTF applications requesting a total of $27.2 million in PARTF assistance. The Authority awarded 55 grants for $17,731,116. The difference between the amount awarded and the fiscal year revenues is $695,428. The additional funds are $43,612 FY2004-05 unspent PARTF administrative allotment, and $651,816 is from various cancelled projects or reductions in the scope of work or projects completed under budget.

Table 4-1 on the following page is a list of the projects approved for fiscal year 2005-2006. The table is organized alphabetically by recipient.

4.3 *Geographic Distribution of Grants*

The members of the Parks and Recreation Authority consider the geographic distribution of funds across the state as one of the factors used in selecting grant recipients. After ten funding cycles, the Authority has awarded over $90 million in PARTF grants to 487 projects in 99 counties across North Carolina. Figure 4-1 (page 7) are maps showing the distribution of PARTF grants by county across North Carolina from 1995-2006.

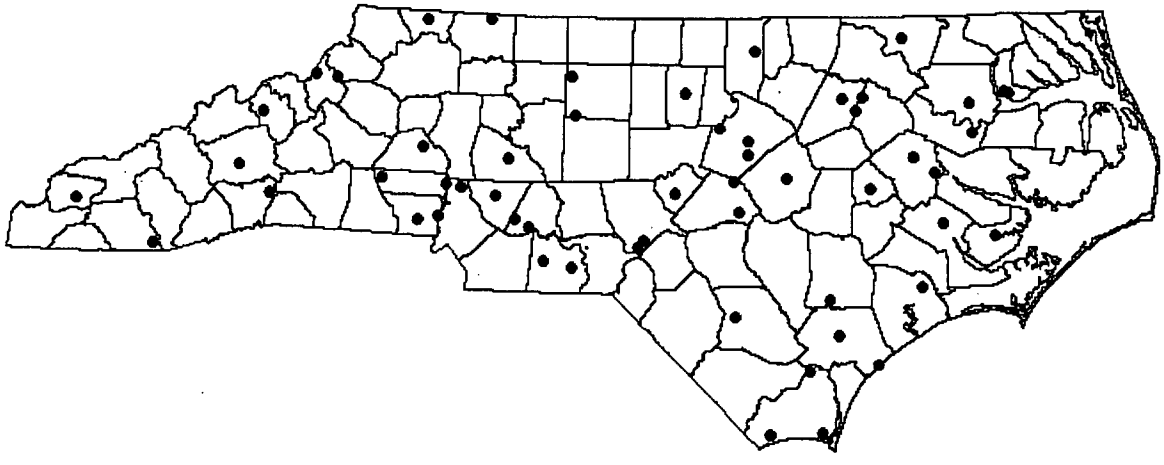
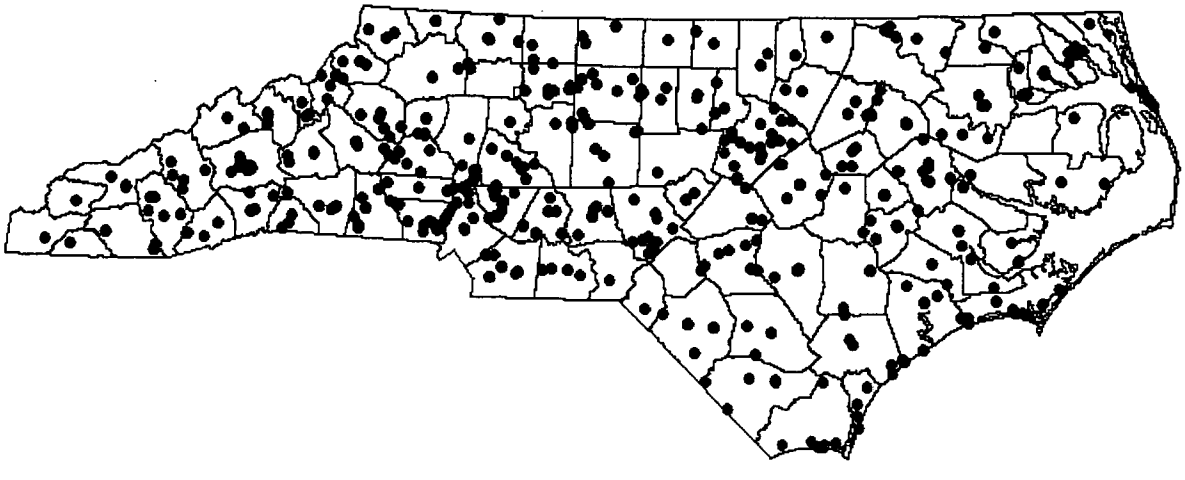
Parks and Recreation Trust Fund
Grant Awards
2006



Parks and Recreation Trust Fund
Projects 1995 - 2006



5.0 State Parks Program

5.1 *Land Acquisition*

For fiscal year 2005-2006, the Parks and Recreation Authority approved $20,609,956 for land acquisition projects in the state parks system (Table 5-1). These projects will help address the need for additional acreage at 15 state parks. The difference between the amount awarded and the fiscal year revenues is $556,093. The additional funds are $84,270 from projects from fiscal year 2001-02 (Merchants Millpond State Park), $377,823 from fiscal year 2002-03 (Crowders Mountain, Jones Lake, and Raven Rock state parks), and $94,000 from fiscal years 2004-05 (Gorges and Lake Norman state parks) that did not occur because the Division could not reach an agreement with the landowners.

It will cost an estimated $176 million to purchase the 43,752 acres needed to complete all of the current state park units. Additionally, through its "New Parks for a New Century" initiative, the Division of Parks and Recreation has identified over 40 sites across the state that could be added as potential state park units. These areas are some of the most treasured and threatened natural resources in North Carolina and have been identified as high priority acquisitions to the state parks system. Purchasing these new units would require an estimated $454 million to acquire 113,625 acres.

Table 5-1
North Carolina Parks and Recreation Trust Fund
Land Acquisition Projects Approved for FY 2005–06

Unit	Acres	Project Description	Cost
Bullhead Mountain State Natural Area	90	Ridgeline tract and access to the site	$ 500,000
Crowders Mountain State Park	1	Lot and house along Sparrow Springs Road	$ 100,000
Elk Knob State Natural Area	235	Tracts at The Peak for resource protection and access	$ 1,200,000
Eno River State Park	25	River corridor tracts at Cabes Ford	$ 600,000
Hanging Rock State Park	175	Ridgeline tracts at Moore's Wall/Knob and Huckleberry Ridge tract	$ 500,000
Hickory Nut Gorge State Park	570	World's Edge area tracts and Dingle tract	$ 7,800,000

Unit	Acres	Project Description	Cost
Hickory Nut Gorge State Park	48	Tract at Round Top Mountain	$ 1,815,036
Lake Waccamaw State Park	778	Tracts at Big Creek and the Lake Compartment tract	$ 2,000,000
Lower Haw River State Natural Area	132	River corridor tracts upstream of current state ownership	$ 1,000,000
Lumber River State Park	200	River front tracts near Fair Bluff	$ 200,000
Morrow Mountain State Park	80	Mountain Creek tracts	$ 800,000
Mount Jefferson State Natural Area	25	Tracts on the slopes of Mt. Jefferson	$ 200,000
Mount Mitchell State Park	54	Ridgeline tracts	$ 400,000
New River State Park	230	River corridor tracts	$ 2,800,000
Occoneechee Mountain State Natural Area	66	Ridgeline tract containing Panther's Den area	$ 450,000
Pettigrew State Park	1	Tract at existing office - maintenance area with house and workshop	$ 245,000
Total	**2,710**		**$20,609,956**

5.2 *Construction and Renovation*

During fiscal year 2005-2006, the Parks and Recreation Authority approved state park construction and renovation projects totaling $16,151,526 (Table 5-3). With PARTF funds, the Division continues to address a lengthy backlog of construction and renovation projects in the state parks system. However, approximately $335.4 million is required to meet all of the needs for new construction and renovation for state parks.

Table 5-2
North Carolina Parks and Recreation Trust Fund
Capital Improvement Projects for Fiscal Year 2005-06

Park	Project Name	Amount
Fort Macon State Park	Coastal Environmental Education Center	$ 5,998,189
Hammocks Beach State Park	Maintenance Dredging of Cow Channel	$ 400,000
Hammocks Beach State Park	Paving of Bear Island Walkway - Additional Funds	$ 125,000
Haw River State Park	Maintenance Improvements - Brown's Summit Environmental Education Center	$ 636,500
Kerr Lake State Recreation Area	Nutbush Boat Ramp Development	$ 2,067,070
Lumber River State Park	Chalk Banks Water Line Extension	$ 150,000
Mayo River State Park	Interim Facilities	$ 1,035,446
Morrow Mountain State Park	Ranger Residence	$ 300,000
Morrow Mountain State Park	Replacement of Underground Electrical Lines& Transformers - Additional Funds	$ 750,000
Morrow Mountain State Park	Park-wide Building Renovations - Additional Funds	$ 125,000
Mount Mitchell State Park	Viewing Platform - Additional Funds	$ 200,000
Pilot Mountain State Park	Pinnacle Improvements - Additional Funds	$ 500,000
Raven Rock State Park	Visitor Center & Picnic Area Expansion	$ 588,950

Park	Project Name	Amount
South Mountains State Park	Master Plan/Aerial Photography	$ 145,000
South Mountains State Park	Dam Repair at Broughton Lake - Additional Funds	$ 330,000
Stone Mountain State Park	Loop Trail/Big Sandy Trail Improvements and Trailhead	$ 110,100
Park System	Construction Reserve	$ 840,271
Park System	Demolition Fund	$ 150,000
Park System	Major Maintenance Funds	$ 1,200,000
Park System	Trail Maintenance Funds	$ 500,000
	Total	**$ 16,151,526**

5.3 *Special Financing for Projects in State Parks*

The General Assembly passed House Bill 1264 in July 2004. Governor Easley signed the bill on August 5, 2004. The law authorizes the State to use special indebtedness, commonly referred to as "certificates of participation", or COPS, to finance land acquisitions for conservation purposes. The law also authorized the use of COPS to finance health and education projects in the University of North Carolina system and for youth development centers.

Specifically, the law authorizes the State to issue or incur special indebtedness to finance the acquisition of property for three programs:

- The Parks and Recreation Trust Fund - to buy land and build park facilities for the State Parks System;
- The Natural Heritage Trust Fund - to acquire land that represents the ecological diversity of the state and land for state parks, wildlife areas, and similar public purposes;
- The Clean Water Management Trust Fund - to acquire buffers that help to conserve surface water and drinking water supplies as well as to restore wetlands.

The law authorizes the governing body of each fund to allocate a portion of its stream of income for debt service on debt incurred to acquire property. The three trust funds must work together to keep the total debt below the maximum dollar amounts for the authorized projects. The authorization is limited to a total of $45 million as follows:

- $20 million to acquire up to 17,000 acres near North Carolina military bases in order to prevent encroachment by incompatible development.

- $25 million to acquire up to 6,000 acres to expand an existing state park, provide game lands to help protect North Carolina's rivers, provide two new state parks along North Carolina's rivers and to provide capital improvements to an existing state park as part of its expansion.

Repayment of COPs Indebtedness - The Parks and Recreation Authority may allocate up to 50% of the portion of the Parks and Recreation Trust Fund dedicated for projects in state parks to repay the debt. The PARTF revenue designated for grants to local governments cannot be used to repay debt. In FY 2005-06, the Authority members approved $ 705,267 for debt repayment as requested by the State Treasurer.

Table 5-3
Parks and Recreation Trust Fund Projects
Using Certificates of Participation (COPs) Fiscal Year 2005-06

Unit	Acres	Project Description	Amount
Carvers Creek State Park	772	Tract containing extensive Sandhills natural communities within the Fort Bragg buffer area.	$3,600,000
Haw River State Park	250	Multiple tracts along the Haw River. Recently authorized new state park.	$1,250,000
Lake James State Park	na	Capital improvements to provide initial public access.	$2,500,000
Mayo River State Park	250	Multiple tracts along the Mayo River. Recently authorized new state park.	$1,250,000
Lake James State Park	up to 25	In holding tracts	$101,616
Total	**1,297**		**$8,701,616**

6.0 Public Beach and Coastal Waterfront Program

6.1 *Program Description*

North Carolina's Public Beach and Coastal Waterfront Access Program was established by the General Assembly in 1981. In fiscal year 1996-97, the program began receiving 5% of the revenues from the Parks and Recreation Trust Fund. The programs enabling legislation (GS 113A-134.1) states that public purpose would be served by providing increased access to coastal waters, public parking facilities, or other related public uses.

The program provides matching grants to local governments for low-cost capital projects designed to improve pedestrian access to the state's beaches and waterways. The program, administered by the Division of Coastal Management (DCM), offers matching grant funds to local governments throughout the 20 coastal counties. Since 1981, over 300 public access sites have been constructed at a cost of over $27 million ($15 million state/federal and $12 million local funds). Local governments are responsible for construction, operation and long-term maintenance of the facilities. While most of the early projects were located along the oceanfront, more and more projects are now designed to improve access to estuarine shorelines, coastal rivers, and urban waterfronts.

The Division of Coastal Management sends requests for proposals to local governments in the 20 coastal counties in March of each year. The division uses criteria developed by the Coastal Resources Commission to select grant recipients. Local governments are required to match at least 25% of the project costs. Recipients are usually selected in July and contracts are awarded in between September and January. Grant recipients have one year to complete their projects. However, extensions are granted for unforeseen events and delays such as hurricanes.

6.2 *Types of Projects Funded*

Communities can apply for five different types of water access sites: local, neighborhood, regional, multi-regional and urban waterfront redevelopment projects.

- Local access sites include public access points, which offer minimal, or no facilities. Pedestrians who reside within a few hundred yards of the site primarily use them. Generally, these access ways are a minimum of ten feet in width and provide only a dune crossover or pier, if needed, litter receptacles and public access signs. Vehicle parking is generally not available at these access sites. However, bicycle racks may be provided.

- Neighborhood access sites are public access areas offering parking, usually for five to twenty-five vehicles, a dune crossover or pier, litter receptacles and public access signs. Such accesses are typically 40 to 60 feet in width and are primarily used by individuals within the immediate subdivision or vicinity of the site. Restroom facilities may be installed.

- Regional access sites serve the public throughout an island or community including day visitors. These sites normally provide parking for 25 to 80 vehicles, restrooms, a dune crossover, pier, foot showers, litter receptacles and public access signs. Where possible, one-half acre of open space in addition to all required setback areas should be provided for buffering, day use, nature study or similar purposes.

- Multi-regional access sites are generally larger than regional accessways but smaller than state parks. Multi-regional facilities provide parking for 80 to 200 cars, restrooms with indoor showers and changing rooms, and concession.

- Urban waterfront redevelopment projects improve public access to utilized urban waterfronts. Such projects include the establishment or rehabilitation of boardwalk areas, shoreline stabilization measures such as the installation or rehabilitation of bulkheads, and the placement or removal of pilings for the purpose of public safety and/or increased access and use of the urban waterfront.

6.3 *PARTF Revenues and Grant Awards Based On Fiscal Year 2005-2006*

The beach access program grants are funded on a calendar year cycle. Historically, DCM has solicited pre-application proposals from coastal communities in March of every year. Invited final applicants proposals are usually due in June and prioritized requests are awarded contracts to begin sometime between October and the end of January. Annually, DCM pre-determines funds available, by using PARTF revenues from the last quarter of the previous fiscal year (2004-05), and the first three quarters of the more current (2005-06) fiscal year. The actual amount transferred from the PARTF fund to DCM during fiscal year 2005-2006 was $2,878,910 however only the first three quarters of these funds ($2,212,791) are considered available plus the last quarter of previous 2004-2005 fiscal years' deposit ($517,812). Additionally, any monies from the previous year, due to cancelled projects or projects that came in under budget, are also incorporated into the available budget for grant awards. For this fiscal year's report the total funds available were $4,210,784. (see Table 6-1).

DCM has prioritized $3,421,230 for grant contracts to begin in September of 2006 for the local governments listed in Table 6-2. The balance of $779,554 will be reserved for fiscal year 2006-2007.

DCM received 36 pre-applications from 22 local governments requesting $4,230,000. DCM reviewed 29 final applications from 19 local governments with the requests totaling $3,421,230. Table 6-2 is the list of local governments prioritized to receive funding.

Table 6-1 Division of Coastal Management Distribution of PARTF Revenues for Fiscal Year 2005-06	
Item	Amount
PARTF revenues received in first three quarters of fiscal year 2005-2006	$ 2,212,791
Fiscal year 2004-05 (4th quarter PARTF revenues) and a	$ 517,812
Reserve from canceled projects and projects completed under budget as of July 1, 2006	$ 1,480,181
***Total available for fiscal year 2005-2006 grant cycle**	**$ 4,210,784**
Prioritized Awards (May 2006)	**$ 3,421,230**
Budget for New and Replacement Access Signs	(10,000)
Carryover for grants to be awarded in fiscal year 2006- 2007	$ 779,000
PARTF 4th quarter 2005-2006 revenue received and reserved for 2006-07 fiscal year.	$ 664,980
*Balance available for FY 2006-2007 Cycle	$ 1,443,980

* Annual funding cycle is based on PARTF revenues for the first three quarters of fiscal year 2005-2006 and any reserve from the previous fiscal years including the fourth quarter revenues. The balance of $1,443,980 will be added to upcoming PARTF deposits and used to fund projects based on the fiscal year 2006-07 cycle.

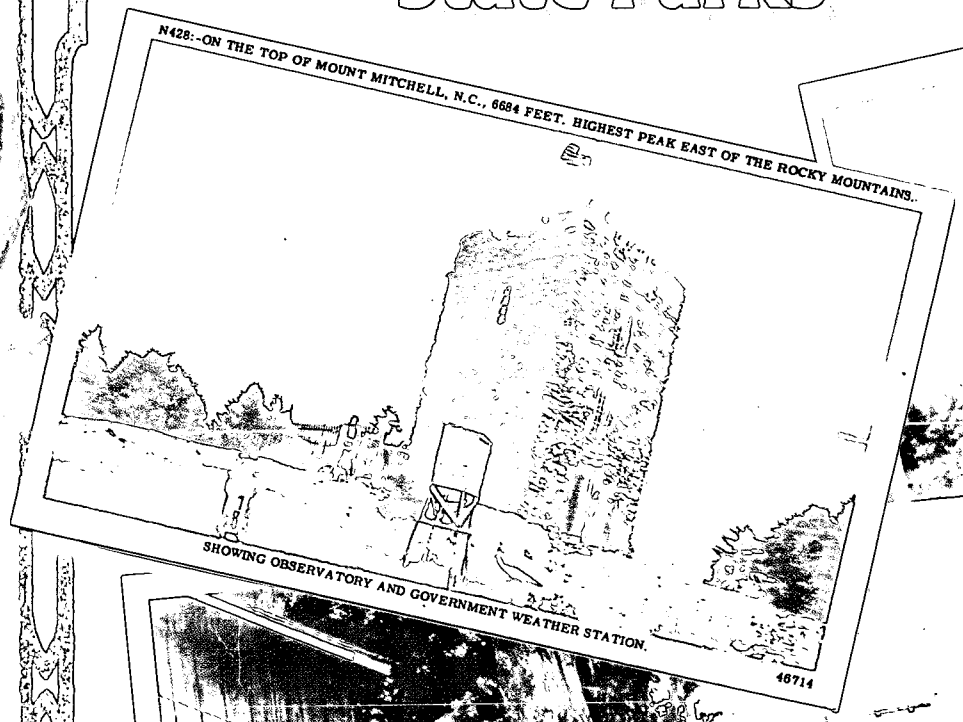
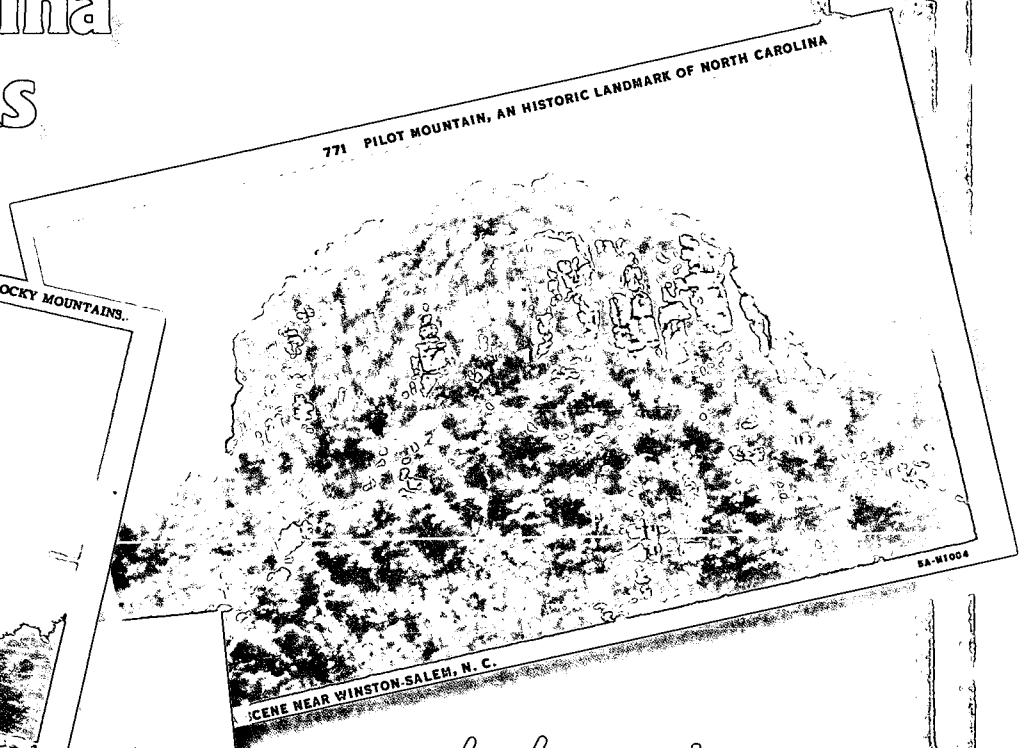
North Carolina State Parks





Celebrating 90 Years of Stewardship

EXHIBIT M

Post Card.

Over the past 90 years, the people of this great state have demonstrated foresight and wisdom in protecting exceptional natural resources and providing outstanding recreational opportunities through the North Carolina state park system, which attracts 13 million visitors each year. It is with great pride that I share this synopsis of our history and our recent accomplishments. I also commend to you the Friends of North Carolina State Parks organization and its support of our efforts. I hope you will have an opportunity to visit one of our parks in the very near future. I am sure you will find them to be "Naturally Wonderful."

Sincerely,
Lewis R. Ledford
Director, North Carolina State Parks & Recreation

To
Present and Future
Friend of State Parks

Our Mission

The mission of the North Carolina Division of Parks & Recreation is to protect North Carolina's natural diversity; to provide and promote outdoor recreation opportunities throughout North Carolina; and to exemplify and encourage good stewardship of North Carolina's natural resources for all citizens and visitors of North Carolina.

We in North Carolina are blessed with beautiful beaches, majestic mountains and countless rivers and streams in between.

State Parks System History

1891 Geological Survey for North Carolina established to determine the nature and extent of mineral and timber resources.

1905 Geological Survey reorganized into the North Carolina Geological and Economic Survey. The survey examined mineral, forest, fish, and all other material resources of the state.

1916 **Championed by Governor Locke Craig, Mount Mitchell State Park, was authorized through legislation passed in 1916 and established with the initial land acquisition (purchase by the state) of 795 acres.**

1921 Division of Forestry created within the Geological and Economic Survey. Parks administered under the Division of Forestry.

1924 **Fort Macon State Park** established with a gift of land from federal government surplus property.

1925 G.S. 113-22 gave the Department of Conservation and Development control of **Mount Mitchell** and other state parks.

1929 Chapter 165 of General Statutes directed that state-owned lakes of 50 acres or more be administered, as provided for other recreation areas by the Department of Conservation and Development. **White Lake** and the following state lakes were established: Bay Tree, Waccamaw, Phelps, Singletary, Salters and Jones.

Chapter 282 established policy that new park land would not be purchased by the state, but that "public spirited citizens" would purchase or donate land for park purposes.

1934 Civilian Conservation Corps and other federal public works programs began the expenditure of $2.25 million for park development.

1935 **Morrow Mountain State Park** established from gifts of land from private individuals and Stanly County.

1936 The Recreation Area Study formed a list of requirements for establishing areas to be state parks. Requirements included natural beauty, recreation possibilities, statewide historic or scientific values, natural scenery, and locations near population centers.

Hanging Rock State Park established from a gift of land from private individuals.

1939 **Baytree Lake State Park** established from legislative reallocation of administrative authority.
Singletary Lake and **Jones Lake State Park** were established initially as leases and then a land gift from federal government.

1940 Park, Parkway, and Recreation Area Study prepared a comprehensive plan for establishing the administration and operations of the state parks system. However, the study was not funded as World War II directed attention from the parks.

1945 **Cliffs of the Neuse State Park** established from a gift of land from a private individual. The North Carolina Recreation Commission – the country's first – was established.

1947 The General Assembly appropriated $50,000 for the construction of public facilities. Appropriation was marked as the first state park capital improvement appropriation. **Pettigrew State Park** established as first a lease and then a gift of land from the federal government.

1948 State parks elevated to divisional status within the Department of Conservation and Development.

1949 The General Assembly appropriated $1,074,144 to the Division of Parks for the purchase of small tracts of land within park boundaries, and for the construction of roads, parking areas, and other types of facilities.

1951 **Kerr Lake Reservoir** opened under the Kerr Reservoir Development Commission, as a lease from the U.S. Army Corps of Engineers.

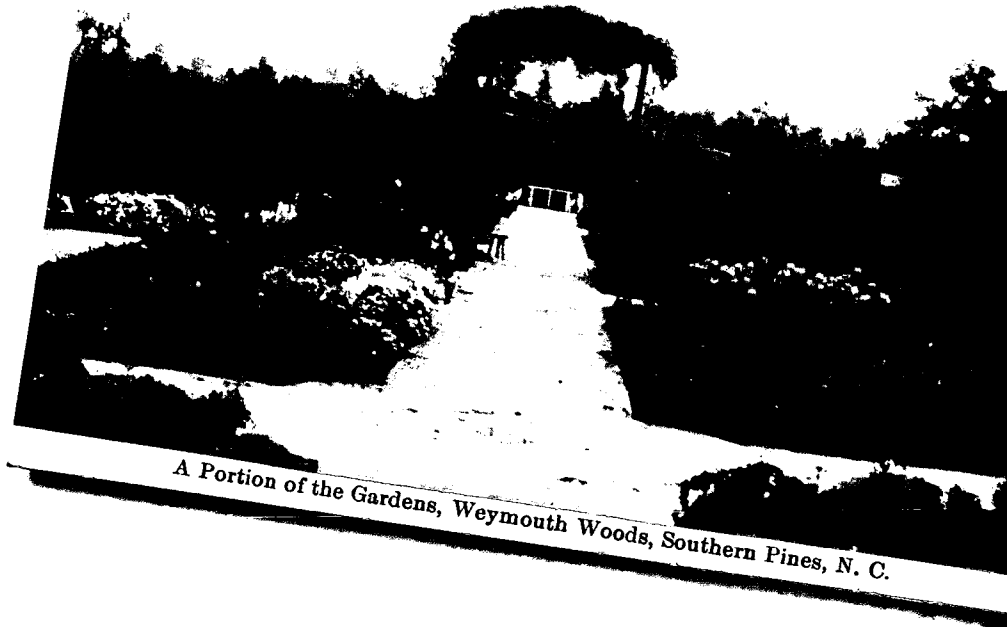
1955 The General Assembly transfered historic sites from the Division of Parks to the newly formed Department of Archives and History to allow the Division of Parks to concentrate on recreational and scenic values.

1956 **Mount Jefferson State Park** (later redesignated as a State Natural Area) established with a gift of land from private individuals and the Town of West Jefferson.

1961 **Hammocks Beach State Park** established with a gift of land from the North Carolina Teachers' Association and the Hammocks Beach Corp.

1962 **Duke Power State Park** established with a gift of land from Duke Power Co. (Later renamed Lake Norman State Park)

1963 The Board of Conservation and Development adopted principles for state natural areas.



A Portion of the Gardens, Weymouth Woods, Southern Pines, N. C.

Weymouth Woods State Nature Preserve established with gift of land from a private individual.

1965 Land and Water Conservation Fund, a federally funded program to provide matching funds for park acquisition and development, was created.

1967 State Parks and State Forest Study Commission created by the General Assembly to examine outdoor recreation. The study recommended purchasing new parks, upgrading existing facilities, and expanding staff.

1968-1971

Pilot Mountain State Park established with purchase of land using funds raised by local support group and Appalachian Regional Commission to match grant from LWCF. **Stone Mountain State Park** established with a gift of land from the N.C. Granite Corporation. Funds from the Appalachian Regional Commission also used to match LWCF grant. **Carolina Beach State Park** established with purchase of land by state. **Raven Rock State Park** established with purchase of land using LWCF grant funds matched with state funds. **Bushy Lake State Natural Area** established by administrative reallocation of authority.

1972 "Now or Never" report identified potential park lands, lost opportunities, and highlighted the need for action. State Parks, Kerr Reservoir, and the Recreation Commission merged under the Department of Natural and Economic Resources as the Office of Recreation Resources. Natural and Scenic Rivers System Act passed. North Carolina Environmental Policy Act passed.

Theodore Roosevelt State Natural Area established with a gift of land from the Roosevelt heirs.

1972 A constitutional amendment to conserve and protect North Carolina's natural resources was passed.

1973 North Carolina Trails System Act passed. The General Assembly appropriated $11.5 million for new park lands and $2.4 million to improve existing facilities. **Crowders Mountain, Eno River, Medoc Mountain, Merchants Millpond state parks** are established.

1974 **Dismal Swamp** and **Chowan Swamp state natural areas** and **Goose Creek State Park** were established.

1975 The General Assembly appropriated $5.5 million for park lands and $3 million for capital improvements. **Jockey's Ridge and South Mountains state parks** were established.

1976 **Linville River** designated as a component of the Natural and Scenic River System.

Hemlock Bluffs, Masonboro Island and **Mitchell's Mill** state natural areas and **Lake Waccamaw State Park** were established.

1977 **New River State Park** established and designated as a component of the Natural and Scenic River System.

1979 ew Directions" report from the second State Park Study Commission (crea 1977) recommended expanding existing parks, increasing recreational activities and staffing, and increasing revenues generated by parks. A five-year plan was outlined.

Baldhead Island State Natural Area established with a gift of land from The Nature Conservancy.

1982 **Jordan Reservoir State Recreation Area** opened with lease from U.S. Army Corps of Engineers.

1983 **Falls Reservoir State Recreation Area** opened with lease from U.S. Army Corps of Engineers.

1984 Third State Parks Study Commission concluded that insufficient funds existed for acquiring critical lands; that 50-year old park buildings needed repairs; and that the system was understaffed and rangers were underpaid.

1985 State Goals and Policy Board made six recommendations for action to reverse deplorable condition of parks. General Assembly appropriated $25 million for land acquisition. Subsequent adjustments in the appropriation diverted some funds to other purposes.

1986 **Fort Fisher State Recreation Area** was established, and **Horsepasture River** was designated as a component of the Natural and Scenic River System.

1987 The 4th State Parks and Recreation Area Study Commission recommended establishing a trust fund to purchase and manage land. At the behest of Gov. James G. Martin, the General Assembly passed the State Parks Act. The act defined the mission and purpose of the State Parks System and called for a system plan to be submitted to the General Assembly. A State Auditor's report made recommendations which included staffing, funding, land acquisition, and capital improvements.

The General Assembly created the North Carolina Natural Heritage Trust Fund to provide supplemental funding for the acquisition and protection of important natural areas, to preserve the state's ecological diversity and cultural heritage, and to inventory the natural heritage resources of the state.

Lake James State Park became the first state park established under the new State Parks Act. Funding was appropriated for land, capital improvements, staff and operating budget.

At the direction of Gov. Martin, State Parks initiated a commitment to bring environmental education and interpretation to the lives of all the state's citizens, particularly school children.

1988 In response to the recommendations of a multi-agency task force, the first group of state park rangers was commissioned as fully trained and certified state law enforcement officers. Commissioning rangers as special peace officers had been restricted by the administration since the mid-1970s due to costs ociated with mandated training.

1989 The General Asse harged the N.C. Department of Transportation with maintaining the state road system. $500,000 per annum is allocated for this purpose.

Fifth State Parks and Recreational Areas Study Commission recommended capital improvements of $20 million over an eight-year period and additional staff to support construction projects, planning, land acquisition and the rivers and trails programs.

Lumber River State Park established and designated as a component of the Natural and Scenic River System.

1993 $35 million bond referendum passed.

1994 The General Assembly established the Park and Recreation Trust Fund with the support of Gov. James B. Hunt.

1995 **Run Hill** and **Occoneechee Mountain state natural areas** were established.

1996 The General Assembly created the Clean Water Management Trust Fund in order to issue grants to local governments, state agencies and conservation non-profits to help finance projects that specifically address water pollution problems.

1997 The **Gorges State Park** was established.

1998 The federal government designated the **New River** as an American Heritage River and designated 81 miles of the **Lumber River** as a Wild and Scenic River.

1999 The General Assembly amended the State Nature and Historic Preserve Act, and dedicated property in the State Parks System into the State Nature and Historic Preserve. The bills provided important recognition and protection for significant natural areas in the State Parks System.

2000 During a ceremony adding 1,300 acres to **Crowders Mountain State Park**, Gov. Jim Hunt announced his plan to preserve an additional million acres of open space in the state by 2010. Later that year, Hunt signed legislation putting the goals of his "Million Acre Initiative" into state law.

2001 2,500 acres were purchased from International Paper Co. and added to **Lumber River State Park**. Significant land purchases were also made in 2001 to expand and protect areas of **Crowders Mountain, Hanging Rock, Morrow Mountain, Stone Mountain, William B. Umstead, Raven Rock** and **South Mountains state parks.**

Lea Island State Natural Area was established. Museums dedicated to environmental education were completed at **Mount Mitchell** and **William B. Umstead state parks** and **Weymouth Woods Sandhills Nature Preserve**. A visitor center at **Hammocks Beach**, a community center at **Lake Norm** and an equestrian cen **South Mountains** were completed.

2002 DENR unveils "One North Carolina Naturally," a new statewide land and water protection initiative established to guide North Carolina's future conservation efforts. The "One North Carolina Naturally" initiative was established to lead the development and implementation of a comprehensive statewide conservation plan involving government agencies, private organizations, landowners and the public.

2003 The division launched its "New Parks for a New Century" initiative in conjunction with DENR's One North Carolina Naturally program. The planning effort identified 47 sites in North Carolina as potential additions to the parks system as state parks, recreation areas or natural areas. Two of the 13 potential state parks identified were authorized by the General Assembly in the **Haw** and **Mayo river corridors**, and natural areas were established at **Elk Knob** and **Beech Creek Bog**.

A new exhibit hall was built at **Hammocks Beach** and exhibits and the restoration at **Fort Macon** were completed. The four-year restoration at **Fort Macon** was the largest single capital project in the division's history at $12.3 million.

2004 Gov. Easley authorized the purchase of 2,915 acres in Burke County for $18.3 million to expand **Lake James State Park** by nearly six times its current size, protecting key natural resources and boosting tourism and recreational opportunities. A 531-acre acquisition on the western side of the **Mayo River** in Rockingham County provided the first property for the new state park.

A bathhouse and picnic complex were completed at **Hammocks Beach** and an exhibit hall was built at **Crowders Mountain**.

2005 The New Parks for a New Century initiative moved forward with the General Assembly's authorization of new state parks at **Carver Creek** in Cumberland County and at **Hickory Nut Gorge** in Rutherford County. The division purchased the former Browns Summit Center in Rockingham County as part of **Haw River State Park** and created the state parks system's second regional environmental education center and the first with overnight accommodations.

A new visitor center with exhibits was completed at **Jones Lake**.

As part of a special agreement, 454 acres, known as the School for the Deaf Watershed, were transferred to **South Mountains State Park**, where an environmental education center designed for people with disabilities will be developed.

2006 Gov. Easley requested and the General Assembly approved $15 million for the expansion of **Hickory Nut Gorge State Park.**

The Mountain Bogs (Sugar Mountain and Pineola) and **Sandy Run Savanna** were authorized as ate natural areas.

State Parks System Accomplishments

2005

1. The division forged ahead on the New Parks for a New Century initiative with the General Assembly's authorization of new state parks at Carver Creek in Cumberland County and at Hickory Nut Gorge in Rutherford County. The division is acquiring key properties for both parks with the help of land conservancies and the state's three conservation trust funds.

   Using grants from the Parks and Recreation Trust Fund, the division added the former Browns Summit Center in Rockingham County into Haw River State Park. The center will be the state parks system's second regional environmental education center. Land acquisition efforts continue at the new Mayo River State Park, also in Rockingham County, with its size doubled in the past year to 1,588 acres.

2. Significant land acquisitions at existing state park units in 2005 included more than 2,500 acres purchased and donated to create a new Scuppernong River Section at Pettigrew State Park in Washington and Tyrell counties. This important conservation effort along one of the state's last undeveloped river corridors protects rare species and habitat. The division also acquired 785 acres at Elk Knob State Natural Area in Watauga and Ashe counties. And, 113 acres (former Eure property) were added at William B. Umstead State Park.

3. A new 6,273 square-foot visitor center and extensive renovations to related visitor facilities at Jones Lake State Park in Bladen County were completed. Also, new visitor centers are being constructed at New River, South Mountains and Merchants Millpond state parks. A new access area providing day-use recreation and overnight camping is now available to the public along the Lumber River in Scotland County. And, overnight camping facilities at Stone Mountain State Park in Wilkes County were significantly expanded.

4. The division launched a major planning effort for 2,914 acres purchased in 2004 from Crescent Resources Inc. and added to Lake James State Park. The acquisition, representing about 30 miles of shoreline, protects critical watershed and viewshed areas in Burke County and provides room for much-needed recreation facilities.

5. A record $13.7 million was channeled into local park acquisition and improvement projects through 50 grants from the Parks and Recreation Trust Fund, administered by the division. In the 11-year history of the fund, more than $74 million has been awarded through 422 matching grants to municipal and county recreation programs in all areas of the state.

6. North Carolina's state parks system was one of four finalists for the 2005 Gold Medal Award for Excellence in Park and Recreation Management presented by the American Academy for Park and Recreation Administration. The Gold Medal Awards are considered the most prestigious in the field of parks and recreation management. The division was judged on 11 criteria including the quality of long-range planning, the response to population and economic trends, the extent of citizen support, the quality of natural resource protection and the types of services to special population groups.

2006 (interim)

1. The General Assembly appropriated $15 million to support land acquisition at Hickory Nut Gorge State Park in Rutherford County.

2. Two rare and highly sensitive types of ecosystems were added to the state parks system during the 2006 General Assembly. Legislators authorized the Mountain Bog State Natural Area in Avery County and Sandy Run Savannas State Natural Area in Pender and Onslow counties. The clusters of mountain bogs and savannas are identified as important additions in the division's New Parks for a New Century initiative, which surveys all known significant sites in the state.

*N.C. Recreation Commission

The threefold mission of the state parks system - to conserve North Carolina's natural resources, to educate citizens about those resources, and to promote quality recreation - is grounded in the State Parks Act of 1987. The act declares it appropriate that a state parks system be established and defines state parks, natural areas and recreation areas as well as state trails, rivers and lakes.

In 1972, North Carolinians took an exceptional step in voting for a constitutional amendment supporting land and water preservation. As a result, language was added to the State Constitution that set out North Carolina's responsibility for protecting natural resources.

The Parks and Recreation Trust Fund was created by the N.C. General Assembly in 1994 and provides dedicated funding to carry out the mandates of the State Constitution and State Parks Act. The trust fund is supported by a portion of the state's tax on real estate deeds transfers. The Parks and Recreation Authority, appointed by the governor and the legislature, makes decisions on how the trust fund is to be distributed under guidelines set out by law. In its 11-year history, more than 25,000 acres of land and water have been protected within the state parks system, and the trust fund has supported more than 400 local park projects.

The Natural Heritage Program, formed in 1976 (formalized in state statute in 1985) through a partnership with The Nature Conservancy and supported by a Land and Water Conservation Fund grant, is a vital link to the state park system. The program inventories, catalogues, and supports conservation of the rarest and the most outstanding elements of the natural diversity of our state. The trust fund is supported by 25 percent of the state's portion of the tax on real estate deed transfers and by a portion of the fees for personalized license plates.

The state trails and natural and scenic river programs are key parts of the state park system. The State Trails Program originated in 1973 with the North Carolina Trails System Act. It is dedicated to helping citizens, organizations and agencies plan, develop and manage all types of trails. Under the Natural and Scenic Rivers Program, rivers or river segments are protected upon designation by restrictions on projects such as dams, reservoirs, and water resource projects that would have direct and adverse effects.

Friends of State Parks

North Carolina's Friends of State Parks is an all-volunteer group dedicated to the understanding, enjoyment, and protection of North Carolina's State Parks.

FSP supports the N.C. Parks System by promoting and raising awareness of the system's mission: "to protect and manage the unique biological, geological, archeological, recreational, and scenic resources of the state."

FSP also fosters and engenders an atmosphere of appreciation and support for the division's 500-member staff who are the stewards of our "Best in the Nation" state parks system. Our state park staff achieve national recognition with the second lowest per capita investment in state parks in the Southeast.

Resources to finance exhibits, publications, division programs such as the Junior Ranger program, milestone recognitions, most notably the 75th and 90th anniversary celebrations, educational opportunities for ranger staff, and legislative advocacy are derived from membership dues, grants, private donations and the sale of FSP sponsored publications.

As the division plans for and addresses the needs of more than 12 million annual visitors to our naturally diverse park system and envisions the changes and challenges facing what will be the seventh most populous state in the nation in the year 2020, FSP stands in partnership to make the efforts more easily achievable.

We need your voices and hands to support all these key efforts and to help make the visions of "New Parks for a New Century" a reality.

Join us today by completing the enclosed membership application along with tax-deductible dues and/or donations.

We are a 501(c)(3) nonprofit, state of North Carolina chartered organization.

We invite you to learn more about Friends of State Parks by visiting our website at www.ncfsp.org.

Sincerely,
John Graham, President

Annual Update for Environmental Review Commission

Lisa Riegel
Executive Director
(919) 715-8014
January 23, 2007

MISSION
protect natural & cultural heritage lands

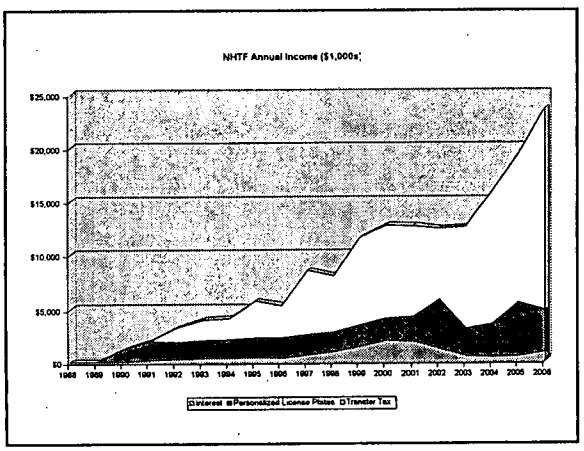
- Recreation, scientific, education, cultural and aesthetic purposes
- Additions to state parks, trails, forests, wildlife areas
- Historic properties program
- Other beneficial use and enjoyment by the public

Natural Heritage Program

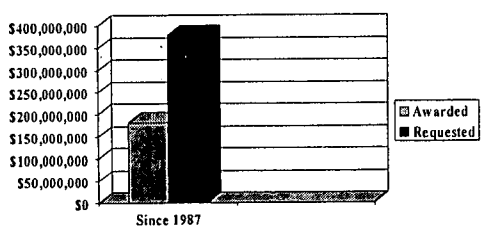
- ID most important natural areas in state
- 76 of 100 Counties complete
- Info used in conservation planning

Program Overview

- Established 1987
- 12 member citizen board
- Accepts applications from 4 state agencies: DENR, DoACS, DCR, WRC
- Awards - twice a year



NHTF Funded/Unfunded Comparison 1987-2006

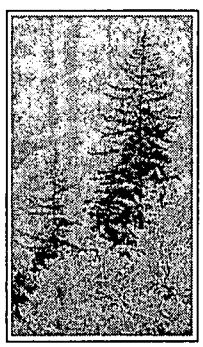


NHTF 2006 Income

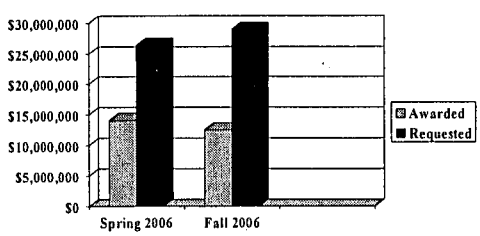
Real Estate Tax	$18,981,304
License Plate Fee	$ 4,166,738
Interest	$ 970,907
Total	**$24,118,949**

2006 Awards

- 33 Projects
- 15,329 Acres
- $26,643,982



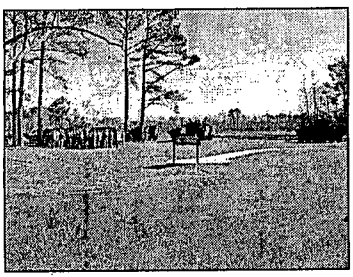
NHTF Funded/Unfunded Comparison 2006



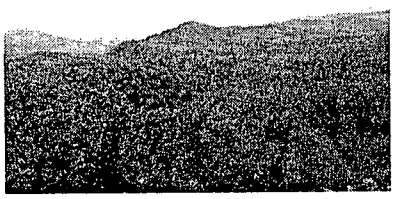
WRC - Game Lands Addition
Johns River Loop

- 1000 acres
- Central Burke County
- Protect water quality
- Improve waterfowl wetlands areas rare in Western NC

DCR – Civil War Sites
Bentonville Battlefield



DCR – Adj. to Blue Ridge Parkway
Overmountain Victory National Historic Trail



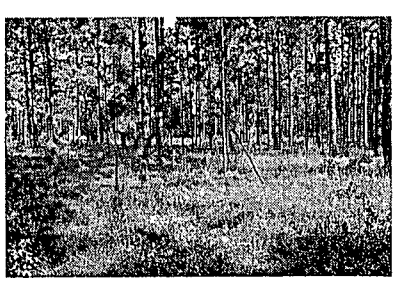
Ag's Plant Conservation Program
NC73 Savanna

- First Preserve in Moore County
- 124 acres
- High quality, scenic longleaf pine forests
- Rare, threatened and endangered species

Ag's Plant Conservation Program

- Penny's Bend/Eno River
- Tater Hill
- Boiling Springs

State Park
Carvers Creek Sandhills



DENR-DPR
Sugar Mt. Bog

Partnerships

- Project coordination with Clean Water Management Trust Fund, and Park & Recreation Trust Fund
- Frequent coordination with applicant agencies, private donors and conservation groups
- Most projects have matching funds or landowner gifts

MEMORANDUM

TO: Senator Charles Albertson, Senator Daniel Clodfelter, Representative Pryor Gibson, III

FROM: William G. Ross, Secretary, Department of Environment and Natural Resources

SUBJECT: Natural Heritage Trust Fund Annual Report – Calendar Year 2006

As required by G.S. 113-77.9(e), we are pleased to present to the Environmental Review Commission the calendar year 2006 grant award report for the N.C. Natural Heritage Trust Fund. During the calendar year 2006, the Board of Trustees for the Natural Heritage Trust Fund awarded $26,643,982 for 33 projects to help protect 15,329 acres of land with outstanding natural and/or cultural heritage value.

If you have any questions, please contact the Natural Heritage Trust Fund's Executive Director, Lisa Riegel, at (919) 715-8014.

ANNUAL REPORT

CALENDAR YEAR 2006

A Report to the Governor and General Assembly

William G. Ross, Jr., Secretary
N.C. Department of Environment
and Natural Resources

J. Robert Gordon, Chairman
Board of Trustees
NC Natural Heritage Trust Fund

NORTH CAROLINA
NATURAL HERITAGE TRUST FUND
AWARD REPORT
Calendar Year 2006

Origins and Mission

The North Carolina Natural Heritage Trust Fund (NHTF) was established by the 1987 General Assembly (G.S. 113-77, effective July 1, 1987) as a supplemental funding source for state agencies to acquire lands and to pay for the inventory of natural areas by the North Carolina Natural Heritage Program. A twelve-member board of trustees administers the Trust Fund.

Board of Trustees

NHTF is delegated the authority to grant funds to eligible state agencies pursuant to applications which meet statutory criteria and board guidelines. The governing authority for the Trust Fund is a 12 member board of Trustees. This number was increased from nine members during the 2001 legislative session. Four members are appointed by the Governor who also designates the chairman. Eight members are appointed by the General Assembly with four recommended by the President Pro-Tempore of the Senate and four recommended by the Speaker of the House. Appointments are made effective January 1 and are for staggered six year terms. Persons appointed are to be knowledgeable in the acquisition and management of natural areas.

Board of Trustees

Governor Appointees	Senate Appointees	House Appointees
Charles E. Clement Watauga County 2002-2008	J. Robert Gordon, Chairman Scotland County 2002-2007	Alan D. Briggs Wake County 2006-2011
Thomas D. "Bud" Hunter Henderson County 2004-2009	Lois McIver Winstead Person County 2005-2009	William Joslin Wake County 2002-2007
R. Michael Leonard Forsyth County 2006-2011	Portia Hawes Warren County 2006-2011	Henry L. Kitchin Richmond County 2002-2007

Natural Heritage Trust Fund Staff

For the past year, beginning September 2005, the Board has been supported by an Executive Director:

Lisa D. Riegel
521 N. Salisbury St., MSC 1601
Raleigh, NC 27699-1601
(919) 715-8014
lisa.riegel@ncmail.net

Funding Sources

Since 1987, and as of December 31, 2006, NHTF has received approximately $176 million dollars including an initial appropriation of $275,000 (Table 1). The primary source of funding for the NHTF is the state excise tax on real estate conveyances. NHTF receives 25% of the state's portion of the $2 per $1,000 value deed stamp tax. The County retains half of this tax while the state receives 50% less allowable administrative costs. The second major source of funding is a portion of the additional fee charged for personalized license plates. The state charges an additional fee of $30 for each personalized license plate; $15 of this additional fee is credited to the NHTF. NHTF also receives a portion for specialty license plates in some cases: $10 for each "First in Forestry" license plate and $15 for each out-of-state college specialty license plate. Monies not expended remain in the interest-accumulating Natural Heritage Trust Fund account and do not revert to the General Fund. The final source of funding is interest from funds in this account.

Grant Criteria and Eligible Agencies

Grants are awarded for the purposes of acquiring lands that represent the state's ecological diversity to ensure their preservation and conservation

- for recreation, scientific, education, cultural and aesthetic purposes;
- for additions to the system of parks, state trails, aesthetic forests, wild and scenic rivers, fish and wildlife management areas;
- to develop a balanced state program of historic properties; and
- for other beneficial use and enjoyment of the public.

Funds are also allocated to the N.C. Natural Heritage Program for natural area inventories and conservation and protection planning of natural areas. State agencies authorized to apply for grant awards are:

- Department of Environment and Natural Resources,
- Wildlife Resources Commission,
- Department of Cultural Resources, and
- Department of Agriculture and Consumer Services.

Priority consideration is given to protection of land having outstanding natural or cultural heritage values. Land with outstanding natural heritage values is land that is identified by the N.C. Natural Heritage Program as having state or national significance. Land with outstanding cultural heritage value is land that is identified, inventoried or evaluated by the Department of Cultural Resources.

Income and Awards

Income by calendar year and award history is shown in Table 2. For the most recent year, 2006, income was $24,118,949. In general, income has increased with time, more markedly since 2003 as a result of the increased activity in the real estate market (Tables 1 and 2).

Since 1987, and as of December 31, 2006, NHTF has contributed to the protection of 244,276 acres through 376 grants totaling over $182 million in funding (Tables 2 and 3). The locations of these projects are shown on Figure 1. Awards are higher in some years than the income due to returned funds. These are funds that are returned to NHTF to be re-granted because the properties were unable to be acquired and/or the final acquisition costs were less than the grant.

During calendar year 2006, NHTF awarded 33 grants totaling $26,643,982 which contributed to the protection of over 15,329 acres (Table 4). In the spring 2006 award cycle, the Trustees also set aside $20,000 for stewardship (monitoring) of the Valle Crucis conservation easement. The NHTF plans to use the Department of Environment and Natural Resources' new Stewardship Program to contract for monitoring of this and possibly any future easements funded by NHTF.

Due to insufficient funds, the NHTF Board was unable to fund an additional $28,866,678 in requests (about 52%) from eligible applicants for high-quality projects. Detailed summaries of the Spring 2006 and Fall 2006 awards are included as Tables 5 and 6 respectively. Project locations are shown in Figure 2 (Spring 2006 projects) and Figure 3 (Fall 2006 projects).

SPRING 2006 AWARDS

No.	AGENCY	PROJECT	SIGNIFICANCE	COUNTY	FUNDING	ACRES	DESCRIPTION
1	DAg	NC 73 Powerline Savanna Plant Conservation Preserve	(B) State	Moore	$1,260,000	124	Purchase will ensure long term survival and protection of rare plant species, especially the Sandhills lily, a globally rare and endangered species.
2	DAg	Tater Hill Plant Conservation Preserve - Miller Tract Addition	(A) National	Watauga	$185,000	20	Increase Tater Hill Conservation Preserve to include the Miller Tract, one of the largest & most significant private inholdings within the Preserve.
3	DAg	Penny's Bend/Eno River Diabase Sill - Penny Tract	(A) National	Durham	$55,000	115	Additional tract has been offered by owner to an already existing NHTF/EEP acquisition; tract would increase Preserve to include a relict rare plant population and extensive wetlands.
4	DAg	Penny's Bend/Eno River Diabase Sill - Stevens Trust Tract	(A) National	Durham	$253,600	20	Increase Preserve to include undeveloped tracts, which will provide large landscape necessary to protect and/or restore habitat of rare plants. This tract is specifically necessary as a buffer for prescribed burns.
5	DAg	Penny's Bend/Eno River Diabase Sill - Arlen Parks Tracts	(A) National	Durham	$17,850	2	Increase Preserve to include undeveloped tracts, which will provide large landscape necessary to protect and/or restore habitat of rare plants. These 2 inholdings support restorable, undeveloped habitat that will provide buffer to facilitate prescribed burning on preserved lands.
6	DAg	Hebron Road Plant Conservation Preserve	(B) State	Durham	$904,650	29	Recent discoveries by the Plant Conservation Program will probably redesignate this land as Nationally Significant; site contains a number of attributes that appear unique to known diabase sill sites in NC. 58 acres in original request.
	DAg			***SUBTOTAL***	**$2,676,100**	**310**	
7	DCR	Bentonville Battlefield Preservation	(N) National Historic	Johnston	$115,000	34	Purchase will protect integrity of Bentonville Battlefield, which has been designated as a Nationally Historic site, from encroaching development. 218 acres in original request.

No.	AGENCY	PROJECT	SIGNIFICANCE	COUNTY	FUNDING	ACRES	DESCRIPTION
8	DCR	Roanoke Breastworks Land Acquisition	(L) Local & Regional Historic	Northampton	$400,000	200	Preservation of a surviving section of Civil War-era earthworks, built to guard the Wilmington & Weldon Railroad.
9	DCR	Valle Crucis Easement Acquisition	(L) Local Historic	Watauga	$327,828	29	Purchase will protect viewshed of the Valle Crucis Historic District as well as existing easements already acquired by the State.
	DCR			***SUBTOTAL***	**$842,828**	**263**	
10	DENR/ DPR	New River State Park Land Acquisition	(B) State	Ashe	$2,000,000	200	Acquisition will preserve 1.5 miles of undeveloped shoreline along the state significant South Fork New River Aquatic Habitat and the New River Macrosite corridor.
11	DENR/ DPR	Hickory Nut Gorge State Park Land Acquisition	(A) National	Rutherford, Henderson, Polk	$1,300,000	98	Acquisition will preserve much of the nationally important World's Edge/Sugarloaf Mountain SNHA, as well as the regionally significant Round Top Mountain. 300 acres in original request.
12	DENR/ DPR	Sandy Run Conservation Land (TNC Tracts)	(A) National	Pender, Onslow	$1,000,000	2206	Proposed acquisition will protect three significant tracts within the highest priority conservation corridor identified by the Onslow Bight Conservation Forum.
13	DENR/ DPR	Sugar Mountain Bog Land Acquisition	(A) National	Avery	$1,225,000	102	Acquisition will preserve a large portion of the Sugar Mountain SNHA, including all three distinct bog areas present.
	DENR			***SUBTOTAL***	**$5,525,000**	**2606**	
14	WRC	Angola Bay Tract - Final Phase	(B) State	Pender	$3,956,604	5510	Final phase of the Angola Bay Project, which will protect a total of 14,825 acres of pocosin habitat.
15	WRC	Howell Land Acquisition	(C) Regional	Richmond	$666,450	430	This tract, in conjunction with the Chalk property, has been designated as a Regional SNHA and will be enrolled in the Game Lands program for permanent protection as one of the network of ecological preserves along the Pee Dee River corridor.

TABLE 5

Fall 2006 Award Summary

Agency	Project Title	Significance	County	Award	Acres	Description
DAg/ PCP	Hebron Road Plant Conservation Preserve (Phase 2)	TBD	Durham	$340,000	10	Half of the funding was previously granted by the NHTF Board, Spring 2006. An option agreement was secured by the Trust for Public Land (TPL) for the Plant Conservation Program. Tract supports endangered Smooth Coneflower and other rare plant species. Will help recover declining species and restore historic ecosystems. Request was for 29 acres for $904,650; acreage reduced because grant was for about 1/3 of request.
DAg/ PCP	Penny's Bend/Eno River Diabase Sill Plant Conservation Preserve-William's Tract	(A) National	Durham	$115,000	9	Expand existing Plant Conservation Preserve. Option agreement negotiated by the Eno River Association for the PCP. Tract supports federally-endangered Smooth Coneflower in NC, the only Piedmont population of tall larkspur, and remnants of fire-adapted glades and woodland's that support 30 rare species.
DAg/ PCP	White Oak Mountain Plant Conservation Preserve - Cecil Tract	(A) National	Polk	$1,325,000	162	This tract is a key piece of the nationally significant White Oak Mountain site. Site supports rare species and community occurences including one of the best known Montane Mafic Cliffs in NC. Site supports the largest known global population of White Irisette. TPL is partner.
DAg/ PCP	Tater Hill Plant Conservation Preserve - Hodges tract addition	(A) National	Watauga	$7,324	35	Additional funds requested because final land survey of the tract revealed approx. 2 additional acres over previous reports. These acres were not included in the financial estimates made in the initial application for this project site.
DAg/ PCP			***SUBTOTAL***	**$1,787,324**	**216**	
DENR/ DPR	Hickory Nut Gorge State Park - Phase III (Rumbling Bald Tracts)	(A) National	Rutherford & Buncombe	$1,775,000	100	Request funds for the acquisition of 172 acres for the recently authorized Hickory Nut Gorge State Park. Acquisition will preserve much of the nationally important Rumbling Bald natural heritage areas. Acreage is part of the Southeastern Escarpment Megasite and the Hickory Nut Gorge Macrosite; project is part of a larger effort including The Nature Conservancy's Bat Cave and Rumbling Bald Preserves. Request was for 172 acres and additional funding.
DENR/ DPR	Hickory Nut Gorge State Park - Chimney Rock Park	(A) National	Rutherford & Buncombe	$1,800,000	85	Request funds for the acquisition of 170 acres at Chimney Rock Park natural heritage area, which will be added to Hickory Nut Gorge State Park. Request was for $3,600,000 for 170 acres.

Table 6

Fall 2006 Award Summary

Agency	Project Title	Significance	County	Award	Acres	Description
DENR / NHP	Conservation Planning at a Landscape Scale	(B) State	N/A	$185,000	N/A	Grant requested to fund the development of a landscape level conservation plan. The plan will integrate Significant Natural Heritage Area conservation priorities with conservation plans being developed by WRC and private conservation organizations.
DENR/ NHP	Inventory of Federally Listed and Candidate Aquatic Species	(B) State	N/A	$58,000	N/A	Inventory of high priority populations of federally listed and candidate species of mussels and fish in historic and potential habitiats. WRC staff will conduct field inventories and provide NHP staff with data. Results of the 1993-2002 aquatic studies indicate the need to continue this work and expand the effort into areas not previously surveyed.
DENR/ DFR	Bladen Lakes State Forest - John Stevens Tract	Not Ranked	Bladen	$109,100	140	To acquire the parcel from the NC Wildlife Habitat Foundation and make it a part of Bladen Lakes State Forest with which it is contiguous.
DENR/ DPR	Deep River Conservation Land	(A) National	Chatham	$234,300	30	Aquisition will aid in preserving an identified SNHA - the Deep River Aquatic Habitat. This tract is adjacent to the Justice and Hanson tracts recently acquired by the state along the Deep River.
DENR			***SUBTOTAL***	**$4,161,400**	**355**	
DCR	Overmountain Victory National Historic Trail Conservation Area	(A) National (B) State & (D) Local SNHA	McDowell	$1,133,950	1680	DCR, CTNC, CWMTF and other donors want to secure a conservation easement on forested land owned by the Holston Land Company (CSX Comp) to provide public access to the Overmountain Victory National Historic Trail (the only National Historic Trail in NC), to protect portions of the Blue Ridge Parkway scenic views and to provide critical habitat connections. CTNC negotiated an easement purchase agreement with Holston for $4,017,900. Funding has been secured through CTNC ($733,900), private donations ($900,000), CWMTF ($936,000) and an additional $400,000 has been requested from DOT.
DCR			***SUBTOTAL***	**$1,133,950**	**1680**

Fall 2006 Award Summary

Agency	Project Title	Significance	County	Award	Acres	Description
WRC	Johns River Loop Road Tract	(B) State	Burke	$1,223,300	400	Acquisition is significant as part of the total management project for the lower Johns River area. Tract is part of a phased acquisition of a total 1,000 acres. First land bought in March 2006, using CWMTF funds and will be included in the WRC Game Lands Program. This project will provide unique opprtunities for wildlife viewing and education related to the importance of riparian zones and wetland/waterfowl habitat which are unparalleled in the mountains. CWMTF grant $2,238,000.
WRC	Upper Tar River International Paper Tracts	(A) National (B) State (C)Local	Franklin, Halifax, Nash,Warren	$1,005,130	890	To acquire SNHA land: Fishing Creek Aquatic Habitat, Little Fishing Creek/Odell Hardwood Forest, Shocco Creek Aquatic Habitat, Little Shocco Creek Acquatic Habitat, Shocco Creek/Centerville Floodplain Forest, Shocco Creek/Lickskillet Hardwood Forest and Lower Shoccco Creek Bluffs and Floodplain Forest while expanding protected land holdings in the upper Tar-Pamlico River Basin and SNHA while contributing to the WRC Game Land Program.
WRC	Lower Roanoke River International Paper Tracts - Conoconnara Swamp, Cypress Swamp,Sandy Run, Pollock's Ferry Access, US Hwy 258	(B) State	Halifax & Northampton	$1,971,020	1596	To acquire lands which are part of the SNHA: Cypress Swamp/Sandy Run Floodplain, Middle Roanoke River Aquatic Habitat and Pollock's Ferry Natural Area to allow expansion of protected land holdings along the Roanoke River and SNHA, while enlarging the WRC Roanoke River Wetlands Game Land. (Total 8432 acres).
WRC	Chowan River International Paper Tracts - Lower Meherrin, Uppper Chowan West and Lower Wiccacon	(B) State	Hertford	$1,196,084	789	Expand protected land holdings along the Chowan River and SNHA, while contributing acreage to the WRC Game Land Program; incorporate into a much larger landscape wetland protection project. Acquire SNHA lands: Meherrin River Aquatic Habitat, Chowan Swamp, Chowan River Aquatic Habitat, Wiccacon River Bluffs and Swamp and Wiccacon River Freshwater Marsh.
WRC	Johnson's Landing International Paper Tract	(C) Regional	Bertie	$91,464	68	Acquisition will be incorporated into a larger landscape wetland protection project which is part of the SNHA, Cashie Swamp and Wading Place Creek to allow expansion of protected holdings along the Cashie River and SNHA while enlarging the WRC Game Land Program. CWMTF proposed match.
WRC			***SUB-TOTAL***	**$5,486,998**	**3743**	
ALL APPLIC.			***GRAND TOTAL***	**$12,569,672**	**5993**

Fall 2006 Award Summary

Agency	Project Title	Significance	County	Award	Acres	Description
DENR/ OCCA	Schenck Project - Green River Preserve (GRP)	(B) State	Henderson	deferred	1050	Project will complement a 1,550 acre riparian easement grant from CWMTF by conserving an additional 1,050 acres of upland habitat on the Green River Preserve, resulting in the protection of 2,600 acres of the Green River Preserve. This tract will extend the ecological viability of nearby privately and publicly protected parks and preserves and will create a protected corridor connecting Dupont State Forest with over 30,000 acres of protected land in South Carolina. Funding would be highly leveraged with private donation ($1,300,000), landowner bargain sale ($11,025,000) and CWMTF ($5,141,000) grant. Awaiting details of the conservation easement.
DENR/ OCCA	Ball Project - Green River Preserve	(B) State	Henderson	deferred	550	Ball Tract will complement a 316 acre riparian easement grant from CWMTF ($1,523,00) by conserving an additional 234 acres of upland habitat on the Green River. Funding further leveraged with private donation ($740,135) and landowner bargain sale ($1,611,740). Ball Tract will link a network of conserved lands stretching from the Mountain Bridge Wilderness of SC to DuPont State Forest. Awaiting details of the conservation easement.

NORTH CAROLINA
NATURAL HERITAGE
TRUST FUND

Land and Water Conservation Study Commission
S.L. 2006-223
Executive Summary

The Land and Water Conservation Study Commission was established to consider funding options for a major initiative for conservation of land, water, and historic resources that was proposed in HB 2827/SB 1907 during the 2006 Regular Session of the 2005 General Assembly.

Commission Charge:

- To identify and evaluate existing State funding sources for historical preservation, for acquiring public lands for various conservation purposes, and for related economic development related to land and water conservation and historic preservation.
- To collect information from other states regarding incentive-based techniques and management tools used to protect land and water resources.
- To recommend a way to address the funding needs of land and water conservation.
- To hold public meetings in three different areas of the State.

Commission Findings:

Land and water conservation, including preservation of the State's cultural heritage, benefits the State in many ways: economic growth and job creation; protection of the public health; enhancement of our citizens' quality of life, and protection of native species of flora and fauna.

A number of factors have converged in recent years to make now a key time in protecting the environment of the State for generations to come: population growth; rapid development of land; and an unusually high percentage of large tracts of land for sale.

The State-established trust funds, coupled with other conservation-oriented entities, have a strong history of serving the conservation needs of North Carolina and of coordinating with one another: Natural Heritage Trust Fund; Parks and Recreation Trust Fund; Clean Water Management Trust Fund; Agriculture Development and Farmland Preservation Trust Fund; the Wildlife Resources Commission; the Ecosystem Enhancement Program; the State Historic Preservation Office and State Historic Sites; the conservation tax credit; and the present-use value property taxation system.

There are at least seven 'best practices' related to land and water conservation and cultural and historic preservation: substantial state investment in these areas; enabling local financing; providing state incentives for projects; allowing for the purchase of development rights; supporting public-private partnerships; conservation tax credits; and partnerships with federal agencies. The State has been active in each of these areas, but the Commission

finds that the State could improve its record on land and water conservation and cultural and historic preservation by adopting some of the strategies used in other states.

Commission Recommendations:

The Commission recommends that the General Assembly provide an additional $1 billion in funding over five years for land and water conservation, cultural and historic preservation, and related economic development needs. The Commission does not have a specific recommendation as to how the additional funds should be allocated. The Commission recommends that the additional funding be allocated among the existing trust funds and used for a variety of different programs.

The Commission recommends that the existing entities involved in land and water conservation and cultural and historic preservation continue to improve the manner in which they coordinate with one another in order to function in a more collaborative, systematic, and integrated manner so as to maximize the use of State investments. As part of this coordination, the Commission encourages the development of statewide priorities for land and water conservation and cultural and historic preservation and enhanced data collection efforts regarding conservation and preservation needs and efforts.

The Commission recommends a balanced financing approach based on debt financing and dedicated sources of tax or fee revenue. The Commission does not have a recommendation as to the specific mix of additional funding sources for conservation efforts. However, it has identified a number of possible revenue sources for consideration: broad-based tax options; development-based tax options; and tourism-based tax options.

The Commission recommends that both chambers of the General Assembly establish a committee at the start of the 2007 Regular Session to address the State's infrastructure needs including conservation, water and sewer, public schools, transportation, university facilities, state facilities, and affordable housing.

The Commission recommends that the General Assembly study further the idea of land mitigation requirements and any authorizing legislation needed to authorize voluntary or mandatory mitigation banking.

The Commission finds that encouraging local government participation in land and water conservation and cultural and historic preservation is a necessary part of any reform to the State's current conservation and preservation efforts. The Commission recommends that the General Assembly consider proposals that would provide additional funding options at the local level for conservation purposes. In addition, the Commission recommends that the General Assembly evaluate the means by which it encourages local participation with projects funded by the four major conservation trust funds with the goal of encouraging greater local participation.

The Commission recommends that the General Assembly consider an enhancement of the tax credits for real property donations for conservation purposes.

The Commission recommends that the General Assembly consider establishing a tax incentive to encourage people to manage lands for conservation. The incentive could take the form of a property tax deferral or an income tax credit.

The Commission recommends that the General Assembly further study the potential effect of time-limited conservation agreements on the State's conservation and preservation efforts.

The Commission recommends that the General Assembly study alternative allocations of State funds to ensure that the State fully leverages available federal funds.

OUR THOUGHTS

Making the case for using tax money to buy open spaces

Sometimes, change is for the good.
In the not-too-distant past, land wasn't very valuable unless it was developed. Now, open space is gaining popularity as a tax-funded public investment to maintain or improve quality of life and attract conscientious CEOs and entrepreneurs who care about their employees.

Indeed, local governments have always been easily convinced to raise taxes to build roads, sewer projects and spec buildings in hopes that they could do a better job than their neighbors of promoting growth. Times have changed, and now the counties and towns that do the best job of learning how to invest in open spaces will be the successful, prosperous places to live in the coming decades. Those who understand and grasp this model will have a leg up on their neighbors.

In North Carolina, that means putting pressure on state legislators to ensure that the Land For Tomorrow initiative makes it to a statewide referendum this fall. In our individual communities, we can take steps to help already existing land trusts succeed or — as many are now trying to do in Haywood County — create new organizations that work with local government and landowners to preserve farmland and forestland for future generations.

The conservation movement in this county is maturing. When we first started creating national parks, the aim was to save large tracts of wild America. Today, however, as populations surge and urban areas swell with buildings and roads, we have come to a new understanding about the value of working farmland, forestland at the edge of large neighborhoods, small watersheds that feed clean streams, and mountaintops surrounded by roads and development. These smaller holdings have become vital pieces in the patchwork of land uses, and they are worth preserving.

North Carolina's Land For Tomorrow initiative would set aside $1 billion for land conservation over the next five years. The bill had the support of many in the legislature last year, but reportedly Gov.. Mike Easley worried funding it could jeopardize some of his other priorities, so it was shelved for further study.

Hearings around the state have revealed wide-ranging support for the measure. In a public hearing held recently in Asheville, an overwhelming majority supported the initiative, though there was disagreement about how best to come up with the money. Land-transfer taxes, impact fees, statewide room taxes and a host of other funding mechanisms have been discussed. It's likely a combination of revenue sources will be needed so that no one sector of the economy is hit too hard. In Florida a land-transfer tax has successfully helped pay for conserving land without adversely affecting growth.

According to the National Land Trust Alliance, conservation measures have been on the ballot 889 times in the country since 2001, and 74 percent of those passed. A recent poll conducted in Haywood County's Bethel community found that 65 percent of the residents supported some kind of taxpayer-funded conservation program.

This is a plan whose time has come. The state needs to help counties buy conservation rights from farmers and other large landowners who need money to retire but would rather save than develop their land. That's what the Land For Tomorrow initiative would accomplish. The state's citizens need to make sure their lawmakers understand how much they support this effort.

Hawks have flown in the face of ever encroaching development

AL CLARK

Not long ago, the neighborhood where I live was all farm and forest, with a creek running through it and plenty of sky overhead. Red-tailed hawks rode the wind, eyeing the foxes that followed the rabbits through the twilight.

As I watched these animals, I have enjoyed thinking how I was sharing a place with creatures who first staked it out in days of prehistory.

Century after century passed and this spot of earth was theirs alone. Their lineage went beyond even the native peoples whose link to the wild was closer and dearer than ours, and who surely admired the birds just as I have.

I liked counting the hawks sitting high on the power poles that lined the railway, and hearing them call to each other as I brought in the groceries. At those moments, it was like I had become part of their world and history, so natural and so old. Their voices were timeless.

There were voices heard, too, at a public forum held in Greenville last week. It was held to draw public response to a state legislative commission's ideas on how to save North Carolina's land and water resources. These voices were talking money.

The commission proposed it will take $1 billion over five years for the state to invest in conservation and preservation efforts just to get the process started.

The group suggested a variety of funding sources to make this happen. Among these were property taxes, sales taxes, real estate fees, water fees and the like.

Farmers at the meeting argued that the proposals' tax implications would put an unfair financial burden on them. Home builders said increasing deed stamp fees would hurt their business, while real estate developers and representatives said home-buyers would suffer, too.

Some folks in the nursery industry said water-related fees were worrisome as were state land purchases, which ultimately would drive up property taxes and hurt everyone in the pocketbook.

But there were voices that said anyone who would share the benefit of land and water resources should also share the expense and maybe not worry so much about the bottom line but about what else we might be losing. The commission shared some facts:

North Carolina loses 277 acres of open land a day; and as our population continues to grow, large tracts of timber and farm land are being sold for development. (Watched any bulldozers clear-cutting lots lately?) The commission reported that the state has substantial investment in conservation and historical preservation, but development is catching up — and getting ahead — one subdivision at a time.

My neighborhood has gradually filled with houses over the last five years. It is very pleasant and comfortable.

Residents enjoy brisk walks and balmy bike rides. Children move from yard to yard, playing their games, walking their dogs. There are songbirds, too, sparrows, wrens and bluebirds.

But I don't see the hawks much now or hear their shrieks. As the houses have come, they have mostly moved on — after all those centuries — to new places, wilder places, to start over, I guess, to find new perches with unobstructed views.

If you go looking there are still such places in eastern North Carolina, where a raptor's voice is the only one you hear on the wind, at least for now. Those ancient peoples would smile at that.

But I'm going to miss the red-tails. Won't we all?

LESS LAND, MORE COMPETITION FOR FUNDING

Growth builds need, rivals for conservation

N.C. task force to report on protection priorities, what state should spend

MARGARET LILLARD
Associated Press

RALEIGH - With shellfishing grounds shrinking due to pollution and development taking over acres of timberland and farm fields every day, there's little argument that North Carolina needs to act swiftly to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of need when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer plants and lines , transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, government relations director for the Conservation Trust for North Carolina. "It just becomes a challenge to figure out how to pay for it."

With 8.86 million people, North Carolina is the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.3 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development in the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across the state.

New homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the legislature's Land and Water Conservation Commission.

The commission met several times and prepared a draft report before Christmas. Last week, it held public meetings in Asheville, Greenville and Greensboro to hear comment on the plan. It plans to issue its final recommendations to the legislature later this month .

The draft report calls for increasing spending on natural and historic conservation programs from the $161 million a year to $361 million a year by adding money to five existing programs and creating a sixth to support jobs and economic development that promote conservation.

The report says any plan "must include the issuance of general obligation bonds."

State Treasurer Richard Moore said he expects lawmakers to field debt funding requests totaling $6 billion to $9 billion over five years for an array of "worthy and important projects."

Though his yearly debt affordability study won't be released until February, Moore has said he expects the state will be able to borrow somewhere from $1.5 billion to $2 billion over five years.

That plays out to $300 million to $400 million a year, up from the $214 million in new debt per year Moore forecast as affordable last February, but still "clearly far short of $6 billion worth of need," he said.

A case could be made for needs in several areas. Moore acknowledged a "massive need" for building public schools, which haven't benefited from a bond issue since 1996 and have $9.7 billion in outstanding capital needs.

"We could use a $20 billion bond referendum to cover our needs, but that's not going to happen," said Rep. Doug Yongue, D-Scotland, chairman of House Select Committee of Public School Construction Funding. "So there's going to be a lot of negotiating over who gets what in the final analysis."

Conservation vies for funds with schools, roads as General Assembly opens

MARGARET LILLARD
Associated Press

RALEIGH, N.C. - With shellfishing grounds shrinking due to pollution and development taking over acres of timberland and farm fields every day, there's little argument that North Carolina needs to act swiftly to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of need when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the Legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, government relations director for the Conservation Trust for North Carolina.

"It just becomes a challenge to figure out how to pay for it."

With 8.86 million people, North Carolina is the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.3 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development over the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across North Carolina.

The impact of population growth is visible as new homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the Legislature's Land and Water Conservation Commission.

The commission met several times and prepared a draft report before Christmas. Last week, it held public meetings in Asheville, Greenville and Greensboro to hear comment on the plan. It plans to issue its final recommendations to the Legislature in late January.

The draft report calls for increasing spending on natural and historic conservation programs from the $161 million a year to $361 million a year by adding money to five existing programs and creating a sixth to support jobs and economic development that promote conservation.

While it lists a number of funding mechanisms ranging from sales, income and tourism-related taxes to water usage tariffs and landfill tipping fees, the report says any plan "must include the issuance of general obligation bonds."

"The Commission notes that future generations will greatly benefit from the investments made in land and water conservation and historic preservation today and believes that some of the burden for conserving these important resources should be borne by taxpayers in the future," the report said.

It also noted that the state could miss its chance for some conservation efforts unless it buys property that is available and - in comparison to higher future prices - affordable now. "Borrowing today makes more sense than having to buy the land 10 to 20 years down the road, and of course the big 'if' there is, will the land still be there," said Miller, whose organization is an umbrella for 23 local and regional land trusts across the state and is part of Land for Tomorrow's steering committee.

Any bond issuance requires voter approval, because repayment of the debt is based on the state's taxing power. Small projects could be issued without a referendum through "special indebtedness," in which the lender could seize the property at issue if the debt is unpaid.

The commission's draft didn't set a dollar amount for its bond recommendation.

State Treasurer Richard Moore said he expects lawmakers to field debt funding requests totaling $6 billion to $9 billion over five years for an array of "worthy and important projects."

Though his yearly debt affordability study won't be released until February, Moore said earlier this month that he expects the state will be able to borrow somewhere $1.5 billion to $2 billion over five years.

That plays out to $300 million to $400 million a year, up from the $214 million in new debt per year Moore forecast as affordable last February, but still "clearly far short of $6 billion dollars worth of need," he said.

A case could be made for needs in several areas. Moore acknowledged a "massive need" for building public schools, which haven't benefited from a bond issue since 1996 and have $9.7 billion in outstanding capital needs.

"We could use a $20 billion bond referendum to cover our needs but that's not going to happen," Rep. Doug Yongue, D-Scotland, chairman of House Select Committee of Public School Construction Funding, said this week. "So there's going to be a lot of negotiating over who gets what in the final analysis."

At the top of the list would be any bond issue needed to pay for maintenance of state government facilities such as roads or schools, "since the state is the only available payer for those things," said Dan Gerlach, Gov. Mike Easley's chief budget adviser and a member of the conservation commission.

"Everything else can be paid for by another layer of government or philanthropy," Gerlach said.

But Miller said initial public reaction to more spending for conservation appears strong, reflecting a growing understanding that a healthy environment is good for business as well simple quality of life.

"You take agriculture - that's about a $60 billion a year contribution to the state's economy. But you can't have that kind of industry if you don't have the land," he said. "In many cases a good environment is the key to having a good economy, whether it's healthy fisheries or healthy forests. . . It's not just about protecting a pretty view."

Conservation vies for funds with schools, roads as General Assembly opens

RALEIGH, N.C.
The Associated Press

With shellfishing grounds shrinking due to pollution and development taking over acres of timberland and farm fields every day, there's little argument that North Carolina needs to act swiftly to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of need when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the Legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, government relations director for the Conservation Trust for North Carolina.

"It just becomes a challenge to figure out how to pay for it."

With 8.86 million people, North Carolina is the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.9 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development over the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across North Carolina.

The impact of population growth is visible as new homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the Legislature's Land and Water Conservation Commission.

The commission met several times and prepared a draft report before Christmas. Last week, it held public meetings in Asheville, Greenville and Greensboro to hear comment on the plan. It plans to issue its final recommendations to the Legislature in late January.

The draft report calls for increasing spending on natural and historic conservation programs from the $161 million a year to $361 million a year by adding money to five existing programs and creating a sixth to support jobs and economic development that promote conservation.

While it lists a number of funding mechanisms ranging from sales, income and tourism-related taxes to water usage tariffs and landfill tipping fees, the report says any plan "must include the issuance of general obligation bonds."

"The Commission notes that future generations will greatly benefit from the investments made in land and water conservation and historic preservation today and believes that some of the burden for conserving these important resources should be borne by taxpayers in the future," the report said.

It also noted that the state could miss its chance for some conservation efforts unless it buys property that is available and _ in comparison to higher future prices _ affordable now. "Borrowing today makes more sense than having to buy the land 10 to 20 years down the road, and of course the big 'if' there is, will the land still be there," said Miller, whose organization is an umbrella for 23 local and regional land trusts across the state and is part of Land for Tomorrow's steering committee.

Any bond issuance requires voter approval, because repayment of the debt is based on the state's taxing power. Small projects could be issued without a referendum through "special indebtedness," in which the lender could seize the property at issue if the debt is unpaid.

The commission's draft didn't set a dollar amount for its bond recommendation.

State Treasurer Richard Moore said he expects lawmakers to field debt funding requests totaling $6 billion to $8 billion over five years for an array of "worthy and important projects."

Though his yearly debt affordability study won't be released until February, Moore said earlier this month that he expects the state will be able to borrow somewhere $1.5 billion to $2 billion over five years.

That plays out to $300 million to $400 million a year, up from the $214 million in new debt per year Moore forecast as affordable last February, but still "clearly far short of $6 billion dollars worth of need," he said.

A case could be made for needs in several areas. Moore acknowledged a "massive need" for building public schools, which haven't benefited from a bond issue since 1996 and have $9.7 billion in outstanding capital needs.

"We could use a $20 billion bond referendum to cover our needs but that's not going to happen," Rep. Doug Yongue, D-Scotland, chairman of House Select Committee of Public School Construction Funding, said this week. "So there's going to be a lot of negotiating over who gets what in the final analysis."

At the top of the list would be any bond issue needed to pay for maintenance of state government facilities such as roads or schools, "since the state is the only available payer for those things," said Dan Gerlach, Gov. Mike Easley's chief budget adviser and a member of the conservation commission.

"Everything else can be paid for by another layer of government or philanthropy," Gerlach said.

But Miller said initial public reaction to more spending for conservation appears strong, reflecting a growing understanding that a healthy environment is good for business as well simple quality of life.

"You take agriculture _ that's about a $60 billion a year contribution to the state's economy. But you can't have that kind of industry if you don't have the land," he said. "In many cases a good environment is the key to having a good economy, whether it's healthy fisheries or healthy forests. ... It's not just about protecting a pretty view."

Conservation vies for funds with schools, roads as General Assembly opens

RALEIGH, N.C. There's little argument that North Carolina needs to act swiftly to protect its natural resources.

Shellfishing grounds are shrinking due to pollution. Development is taking over acres of timberland and farm fields every day.

The question is where conservation will fall in the state's hierarchy of need when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the Legislature declined last year to act on a proposed billion-dollar bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

Conservation funds needed across state

■ The question is where it will fall in the state's hierarchy of needs when lawmakers consider doling out dollars.

By Margaret Lillard
The Associated Press

RALEIGH — With shellfishing grounds shrinking due to pollution and development taking over acres of timberland and farm fields every day, there's little argument that North Carolina needs to act swiftly to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of needs when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the Legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the

See FUNDS, B3

FUNDS

Continued from B1

coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, government relations director for the Conservation Trust for North Carolina.

"It just becomes a challenge to figure out how to pay for it."

With 8.86 million people, North Carolina is the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.3 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development over the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across North Carolina.

The impact of population growth is visible as new homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the Legislature's Land and Water Conservation Commission.

The commission met several times and prepared a draft report before Christmas. Last week, it held public meetings in Asheville, Greenville and Greensboro to hear comment on the plan. It plans to issue its final recommendations to the Legislature in late January.

The draft report calls for increasing spending on natural and historic conservation programs from $161 million to $361 million a year by adding money to five existing programs and creating a sixth to support jobs and economic development that promote conservation.

While it lists a number of funding mechanisms ranging from sales, income and tourism-related taxes to water usage tariffs and landfill tipping fees, the report says any plan "must include the issuance of general obligation bonds."

"The Commission notes that future generations will greatly benefit from the investments made in land and water conservation and historic preservation today and believes that some of the burden for conserving these important resources should be borne by taxpayers in the future," the report said.

It also noted that the state could miss its chance for some conservation efforts unless it buys property that is available and — in comparison to higher future prices — affordable now.

"Borrowing today makes more sense than having to buy the land 10 to 20 years down the road, and of course the big 'if' there is, will the land still be there," said Miller, whose organization is an umbrella for 23 local and regional land trusts across the state and is part of Land for Tomorrow's steering committee.

Any bond issuance requires voter approval, because repayment of the debt is based on the state's taxing power. Small projects could be issued without a referendum through "special indebtedness," in which the lender could seize the property at issue if the debt is unpaid.

The commission's draft didn't set a dollar amount for its bond recommendation.

State Treasurer Richard Moore said he expects lawmakers to field debt funding requests totaling $6 billion to $9 billion over five years for an array of "worthy and important projects."

Though his yearly debt affordability study won't be released until February, Moore said earlier this month that he expects the state will be able to borrow somewhere $1.5 billion

That plays out to $300 million to $400 million a year, up from the $214 million in new debt per year Moore forecast as affordable last February, but still "clearly far short of $6 billion dollars worth of need," he said.

A case could be made for needs in several areas. Moore acknowledged a "massive need" for building public schools, which haven't benefited from a bond issue since 1996 and have $9.7 billion in outstanding capital needs.

"We could use a $20 billion bond referendum to cover our needs but that's not going to happen," Rep. Doug Yongue, D-Scotland, chairman of House Select Committee of Public School Construction Funding, said this week. "So there's going to be a lot of negotiating over who gets what in the final analysis."

At the top of the list would be any bond issue needed to pay for maintenance of state government facilities such as roads or schools, "since the state is the only available payer for those things," said Dan Gerlach, Gov. Mike Easley's chief budget adviser and a member of the conservation commission.

RALEIGH

Shellfishing grounds are shrinking because of pollution, and development is taking over acres of timberland and farm fields every day. So there's little argument that North Carolina needs to act fast to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of needs when legislators consider doling out dollars in the coming session.

Wary of taking on new debt, the legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation. It is expected to make its report late this month.

People with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, the government relations director for the Conservation Trust for North Carolina.

"It just becomes a challenge to figure out how to pay for it."

North Carolina's population of 8.9 million makes it the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.3 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development over the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across North Carolina.

The impact of population growth is visible as new homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the Legislature's Land and Water Conservation Commission.

"The Commission notes that future generations will greatly benefit from the investments made in land and water conservation and historic preservation today and believes that some of the burden for conserving these important resources should be borne by taxpayers in the future," the report said.

It also noted that the state could miss its chance for some conservation efforts unless it buys property that is available and - in comparison with higher future prices - affordable now.

"Borrowing today makes more sense than having to buy the land 10 to 20 years down the road, and of course the big if there is, will the land still be there," said Miller, whose organization is an umbrella for 23 local and regional land trusts across the state and is part of Land for Tomorrow's steering committee.

With shellfishing grounds shrinking due to pollution and development taking over acres of timberland and farm fields every day, there's little argument that North Carolina needs to act swiftly to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of need when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the Legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, government relations director for the Conservation Trust for North Carolina.

"It just becomes a challenge to figure out how to pay for it."

With 8.86 million people, North Carolina is the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.3 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development over the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across North Carolina.

The impact of population growth is visible as new homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the Legislature's Land and Water Conservation Commission.

The commission met several times and prepared a draft report before Christmas. Last week, it held public meetings in Asheville, Greenville and Greensboro to hear comment on the plan. It plans to issue its final recommendations to the Legislature in late January.

The draft report calls for increasing spending on natural and historic conservation programs from the $161 million a year to $361 million a year by adding money to five existing programs and creating a sixth to support jobs and economic development that promote conservation.

While it lists a number of funding mechanisms ranging from sales, income and tourism-related taxes to water usage tariffs and landfill tipping fees, the report says any plan "must include the issuance of general obligation bonds."

"The Commission notes that future generations will greatly benefit from the investments made in land and water conservation and historic preservation today and believes that some of the burden for conserving these important resources should be borne by taxpayers in the future," the report said.

It also noted that the state could miss its chance for some conservation efforts unless it buys property that is available and _ in comparison to higher future prices _ affordable now. "Borrowing today makes more sense than having to buy the land 10 to 20 years down the road, and of course the big 'if' there is, will the land still be there," said Miller, whose organization is an umbrella for 23 local and regional land trusts across the state and is part of Land for Tomorrow's steering committee.

Any bond issuance requires voter approval, because repayment of the debt is based on the state's taxing power. Small projects could be issued without a referendum through "special indebtedness," in which the lender could seize the property at issue if the debt is unpaid.

The commission's draft didn't set a dollar amount for its bond recommendation.

State Treasurer Richard Moore said he expects lawmakers to field debt funding requests totaling $6 billion to $9 billion over five years for an array of "worthy and important projects."

Though his yearly debt affordability study won't be released until February, Moore said earlier this month that he expects the state will be able to borrow somewhere $1.5 billion to $2 billion over five years.

That plays out to $300 million to $400 million a year, up from the $214 million in new debt per year Moore forecast as affordable last February, but still "clearly far short of $6 billion dollars worth of need," he said.

A case could be made for needs in several areas. Moore acknowledged a "massive need" for building public schools, which haven't benefited from a bond issue since 1996 and have $9.7 billion in outstanding capital needs.

"We could use a $20 billion bond referendum to cover our needs but that's not going to happen," Rep. Doug Yongue, D-Scotland, chairman of House Select Committee of Public School Construction Funding, said this week. "So there's going to be a lot of negotiating over who gets what in the final analysis."

At the top of the list would be any bond issue needed to pay for maintenance of state government facilities such as roads or schools, "since the state is the only available payer for those things," said Dan Gerlach, Gov. Mike Easley's chief budget adviser and a member of the conservation commission.

"Everything else can be paid for by another layer of government or philanthropy," Gerlach said.

But Miller said initial public reaction to more spending for conservation appears strong, reflecting a growing understanding that a healthy environment is good for business as well simple quality of life.

"You take agriculture _ that's about a $60 billion a year contribution to the state's economy. But you can't have that kind of industry if you don't have the land," he said. "In many cases a good environment is the key to having a good economy, whether it's healthy fisheries or healthy forests. ... It's not just about protecting a pretty view."

NEWS & RECORD

OUR OPINIONS

Room to grow naturally

Local voters have a chance to voice their support for a statewide initiative to preserve the state's forests, farmland and streams. Before it's too late.

Rolling hills, verdant meadows and sweeping forests that cling to misty mountains like vast quilts of green cotton have helped define North Carolina every bit as much as its people and its history. But the state's open spaces aren't forever.

By some estimates, the state loses approximately 400 acres of open space to development per day and it is losing its farmland at a faster clip than every other state except Ohio and Texas. Couple that with one of the fastest-growing populations in the nation and what once had been taken for granted could be lost to future generations.

Without a thoughtful plan and a serious commitment to preserving some of its open spaces, the state will continue to cut, clear and pave over farmland and forests.

This isn't simply some wild-eyed, state-sanctioned attempt to hug trees. For all the benefits of development there are comparable, if not greater, benefits to prudent land use beyond pure aesthetics. Land preservation can enhance the quality of drinking water by protecting streams, rivers and lakes. It bolsters tourism and quality of life, two key ingredients to attracting industries that pay good wages.

That's why a General Assembly-inspired initiative to preserve 1 million acres of open space by 2009 was a welcome, if ambitious, attempt to act before it's too late. But as the News & Record's Jason Hardin recently reported, only slightly more than 400,000 acres thus far have been preserved.

Part of the problem is the rapid pace of population growth and development. North Carolina now is the 10th most-populous state in the Union. Another is the steep price of the land. And still another is the politically delicate dilemma of how to fund such an initiative with so many other needs, such as education and health care, vying for attention.

Where to find that kind of cash? A state commission's report suggests such options as raising the income tax and sales tax or creating new fees for building permits and landfill use. None is likely to be popular.

The least politically radioactive approach clearly would be a general obligation bond on the November ballot. That way the state, and preservation ists, would have the chance to make their case before the voters. And the voters would have the right to approve or veto the expenditure at the ballot box.

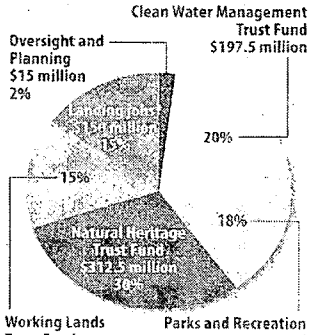
Voters deserve more credit than they sometimes receive in recognizing what's good for them. For instance, in 1988, county voters approved $25 million in bonds to buy land around lakes Brandt, Higgins, Townsend and Mackintosh and to build retention ponds, and protect water quality.

In 2004, Guilford County voters approved $10 million in bonds to buy land for preservation. More recently, in November Greensboro voters approved $5 million in bonds for parks and recreation while saying no to several other high-profile initiatives.

The state commission will hold one of three public hearings about open spaces today at GTCC's Jamestown campus. If you care about preventing some of North Carolina's most precious natural treasures from disappearing, tell the commission tonight. And send a message to Raleigh.

INVESTING IN OPEN SPACES

Land for Tomorrow, a land preservation group, has proposed that the state spend $1 billion over the next five years to protect open spaces, parks, farms and lakes and streams. Here's how that money would be spent.



*Landing Jobs is a proposed initiative that would create jobs and related economic and community development "in ways that promote land conservation, historic preservation, parks and recreation."

Action needed now to preserve our land, water

Louis Bissette

Sue McClinton

GUEST OPINION

When the legislature adjourned this year, time officially ran out for proposed legislation that would have put a $1 billion statewide land and water conservation bond referendum on the ballot this fall. It is disappointing that the bill, authorizing land and water conservation bonds, did not pass during this legislative session; however, the need is still dire and we must move forward to protect our state's land and water.

Each year, North Carolina loses more than 200,000 acres of forests and farmland to the pressures of population growth and 3,000 miles of our streams still don't meet state water quality standards. Action needs to happen now.

The group spearheading this effort, Land for Tomorrow, proposed the bonds as a funding source to help conserve land to safeguard drinking water, protect fish and wildlife habitat, preserve working farms, restore historic landmarks, expand parks and trails and prevent polluted runoff from contaminating streams, rivers and lakes. The organization, a diverse partnership of more than 245 organizations and local governments including representatives of business, farmers, foresters, community groups, health professionals and conservation groups, worked diligently to engage and educate legislators and communities on the urgent conservation needs facing North Carolina.

As a part of this partnership, the Buncombe County Committee made up of numerous entities and individuals is continuing its efforts to make the Land for Tomorrow proposal a reality in North Carolina.

We thank all of our legislative sponsors – more than 70 in the House and more than 20 in the Senate – for their leadership and the ownership they took of the issue. Despite their efforts, however, bill supporters ran into roadblocks because Gov. Easley opposed adding additional general obligation bond debt this year.

Although a bond referendum is not on this year's ballot, legislation was passed to create a study commission charged with recommending alternative funding sources for the plan to the 2007 General Assembly. The study commission will examine all options to help us protect North Carolina's natural and historic beauty, and then make recommendations and report back no later than February 1, 2007. We are optimistic that the study commission will review the plan, strengthen it and find a way to get it done before it is too late.

As citizens of Buncombe

Please see PRESERVE on B2

PRESERVE: Open land vanishing

Continued from B1

County, we must double our efforts and continue to advocate for the protection of our most treasured resources and places. Land for Tomorrow continues to garner advocates statewide and we are confident that when we go to the legislature with this issue next year, support will only be stronger and more focused.

Each day, we lose more of the natural areas that are so important to protecting our children's future. There is a very narrow window of opportunity we have to protect these places that are so important to our quality of life and the economy. We must continue to act — now. By 2030 the U.S. Census Bureau expects North Carolina's population to surpass that of urban states like Michigan, New Jersey and Ohio. But while our population is growing, our supply of land is not. Matters continue to worsen, while land prices continue to skyrocket.

Over the last decade, one million acres of prime farmland, game lands, working forests, unique natural areas, scenic beauty and potential parks and recreation areas have been converted to other uses. Between 1987 and 1997, North Carolina lost more prime farmland than any other state except Ohio and Texas. And for the first time since the 1930s, falling forest acreage contributed to a decline in the volume of the state's timber growing stock.

Thirty-five years ago, a new amendment was adopted to the state constitution that said we must use "every appropriate way to preserve as part of the common heritage of this state its forests, wetlands, estuaries, beaches, historical sites, open lands and places of beauty."

That is exactly what the Land for Tomorrow plan is about, and that's why we look forward to working with the newly formed study commission and implementing conservation efforts that make sense for North Carolina. Learn more and get involved today by visiting www.landfortomorrow.org.

Louis Bissette and Sue McClinton serve as co-chairs of the Buncombe County Land for Tomorrow Committee. Lou Bissette is president of the lawfirm McGuire, Wood & Bissette. He lives in Asheville. McClinton is also on the Board of Trustees of UNCA and lives in Asheville.

Conservation vies for funds with schools, roads as General Assembly opens

MARGARET LILLARD
Associated Press

RALEIGH, N.C. - With shellfishing grounds shrinking due to pollution and development taking over acres of timberland and farm fields every day, there's little argument that North Carolina needs to act swiftly to protect its natural resources.

The question is where conservation will fall in the state's hierarchy of need when lawmakers consider doling out dollars in the coming session.

Wary of taking on new debt, the Legislature declined last year to act on a proposed $1 billion bond package to buy and preserve land and historic sites across the state.

Instead, it created a commission to study ways to finance and set priorities for conservation efforts. It's due to make its report late this month.

But people with competing interests are preparing their arguments as well. Water and sewer infrastructure, transportation, schools and affordable housing projects also need more money as demand in those areas grows.

"When you look at the state's increase in population and pressures resulting from growth and development, particularly in some of our most outstanding resource areas like the coast and the mountains, there's a great deal of public support for at least putting a balance of resources into conservation," said Edgar Miller, government relations director for the Conservation Trust for North Carolina.

"It just becomes a challenge to figure out how to pay for it."

With 8.86 million people, North Carolina is the nation's 10th most-populous state and is expected to rise in rank as the number of residents swells to 12.3 million by 2030.

The state has lost more than 1 million acres of natural and rural areas to development over the past 10 years, according to Land for Tomorrow, a conservation coalition of nearly 300 local governments and historic and ecological groups from across North Carolina.

The impact of population growth is visible as new homes, shopping centers and other developments swallow up 277 acres of natural or agricultural land every day, according to a draft report by the Legislature's Land and Water Conservation Commission.

The commission met several times and prepared a draft report before Christmas. Last week, it held public meetings in Asheville, Greenville and Greensboro to hear comment on the plan. It plans to issue its final recommendations to the Legislature in late January.

The draft report calls for increasing spending on natural and historic conservation programs from the $161 million a year to $361 million a year by adding money to five existing programs and creating a sixth to support jobs and economic development that promote conservation.

While it lists a number of funding mechanisms ranging from sales, income and tourism-related taxes to water usage tariffs and landfill tipping fees, the report says any plan "must include the issuance of general obligation bonds."

"The Commission notes that future generations will greatly benefit from the investments made in land and water conservation and historic preservation today and believes that some of the burden for conserving these important resources should be borne by taxpayers in the future," the report said.

It also noted that the state could miss its chance for some conservation efforts unless it buys property that is available and - in comparison to higher future prices - affordable now. "Borrowing today makes more sense than having to buy the land 10 to 20 years down the road, and of course the big 'if' there is, will the land still be there," said Miller, whose organization is an umbrella for 23 local and regional land trusts across the state and is part of Land for Tomorrow's steering committee.

Any bond issuance requires voter approval, because repayment of the debt is based on the state's taxing power. Small projects could be issued without a referendum through "special indebtedness," in which the lender could seize the property at issue if the debt is unpaid.

The commission's draft didn't set a dollar amount for its bond recommendation.

State Treasurer Richard Moore said he expects lawmakers to field debt funding requests totaling $6 billion to $9 billion over five years for an array of "worthy and important projects."

Though his yearly debt affordability study won't be released until February, Moore said earlier this month that he expects the state will be able to borrow somewhere $1.5 billion to $2 billion over five years.

That plays out to $300 million to $400 million a year, up from the $214 million in new debt per year Moore forecast as affordable last February, but still "clearly far short of $6 billion dollars worth of need," he said.

A case could be made for needs in several areas. Moore acknowledged a "massive need" for building public schools, which haven't benefited from a bond issue since 1996 and have $9.7 billion in outstanding capital needs.

"We could use a $20 billion bond referendum to cover our needs but that's not going to happen," Rep. Doug Yongue, D-Scotland, chairman of House Select Committee of Public School Construction Funding, said this week. "So there's going to be a lot of negotiating over who gets what in the final analysis."

At the top of the list would be any bond issue needed to pay for maintenance of state government facilities such as roads or schools, "since the state is the only available payer for those things," said Dan Gerlach, Gov. Mike Easley's chief budget adviser and a member of the conservation commission.

"Everything else can be paid for by another layer of government or philanthropy," Gerlach said.

But Miller said initial public reaction to more spending for conservation appears strong, reflecting a growing understanding that a healthy environment is good for business as well simple quality of life.

"You take agriculture - that's about a $60 million a year contribution to the state's economy. But you can't have that kind of industry if you don't have the land," he said. "In many cases a good environment is the key to having a good economy, whether it's healthy fisheries or healthy forests. ... It's not just about protecting a pretty view."

Self-preservation

By Becky Johnson • Staff Writer

Land For Tomorrow is a statewide initiative launched last year to set aside $1 billion for land conservation over the next five years. The money would fund private conservation easements for working farmland, paying farmers to protect their land for future generations instead of selling out to developers. It would also buy land outright for new state parks, greenways and wildlife preserves.

The Land for Tomorrow Commission held a public hearing last week in Asheville, one of several held around the state to gather public input prior to the opening of this year's General Assembly.

1: Strike one

Backers of Land for Tomorrow wanted to put the measure on the ballot in November — confident the public would vote yes to a $1 billion bond for land conservation. Despite broad support in the General Assembly to do so, Gov. Mike Easley allegedly nixed the bond idea, fearing where the state would come up with the $1 billion if the people approved it.

2: Another go

Instead, the state legislature created a Land for Tomorrow commission to study the idea. The commission's main job was figuring out how the state could raise the money and the best way to go about preserving land. The commission has 16 members — Sen. John Snow, D-Murphy, and Rep. Phil Haire, D-Sylva, are on the commission.

3: Best way to conserve land

The Land for Tomorrow commission recommended funneling the $1 billion through existing state trusts, namely the Natural and Cultural Heritage Trust Fund, the Parks and Recreation Trust Fund, Clean Water Management Trust Fund, and Farmland Preservation Trust Fund. These agencies can do everything that needs to be done — saving working farms, building greenways or creating new state parks — they simply need more money to do it. Utilizing existing programs would decrease overhead expenses.

4: Finding the money

The commission developed a laundry list of options to pay for Land for Tomorrow.

• Regular old taxes: Take the money out of the state's budget, garnered primarily from income and sales tax.

• Real estate tax: A 0.1 percent tax on all real estate transactions — or $1 per $1,000 of the sale price — would net roughly $60 million a year.

• Impact fees: There were 100,000 homes built in North Carolina in 2005. A $100 building permit fee for every house would raise $10 million per year.

• Tourist taxes: The top reason tourists visit is for natural beauty, so let them pay to preserve it. A 1 percent statewide tax on overnight lodging would generate $28 million annually. A food and beverage tax on 1 percent on meals eaten out at restaurants who generate $100 million.

• Water use fee: Charge for the use of water. People on town water systems currently don't pay sales tax on water, while residential developments that draw water from wells are getting a free ride off the ground water table. A tax of 1 cent per 1,000 gallons of water would generate roughly $8.91 million per year currently.

5: Going to the mat

Many at a Land for Tomorrow public hearing last week liked the idea of the real estate tax to fund land conservation. While the real estate and development lobbyists are already gearing up to fight the idea, such a tax was imposed in Florida in 2000 and is raising $3 billion for conservation over 10 years and hasn't slowed the real estate market there. The method was recommended as a reasonable one by the Land for Tomorrow commission. "The State loses 277 acres of natural or agricultural land a day to development. The Commission believes that a portion of the costs of conservation and preservation should be borne by those responsible for the changing environment," the commission stated in its report.

6: Oops

Farmers overwhelmingly spoke out against the water tax. Farmers need water for irrigation, watering their cattle and trout farming. Taxing farmers to pay for a bill intended to save farming didn't go over too well. It would also impact businesses like Blue Ridge Paper that borrow water from rivers to operate.

7: People want it

North Carolina isn't the first state to talk about funding land conservation from public coffers. Just like paying for schools, roads and prisons, conservation is becoming part of what society wants its government to do. Since 2001, conservation measures have been on the ballot in 883 times in state and local elections — 74 percent of them passed. There have been 26 conservation votes on the ballot in various cities and counties in North Carolina, and 84 percent of them passed.

Speaking out

SMN

More than 300 people attended a public hearing on Land For Tomorrow in Asheville last week, overwhelming the expectations of those conducting the hearing. Some people drove for nearly two hours to come voice their support for the initiative.

The top emphasis from the public — what most at the hearing most wanted to see done with the money — was farmland conservation. Here's a sample of what some had to say.

Don Smart, Haywood County, full-time farmer

"This doesn't go far enough. What's $1 billion going to do? Run the Iraq war for three days? With the price of land in Western North Carolina, that's not going to go far. We want to save the farms but fellers, a man can't make a living on a farm. What you going to do with a farm when you preserve it if a man can't make a living on a farm? The General Assembly should do something to make farming more profitable. Putting more tax on the farmers to try to pay for this Land for Tomorrow, that's not to solve the problems folks."

George Ivey, Bethel Rural Preservation committee

"The state Farmland Preservation Trust Fund has been given a grand total of $50,000 over the past two years. That's not enough to help farms in Bethel much less in all of North Carolina."

Bill Yarborough, Bethel, farmer

"A working land protection program, if properly implemented, will keep land in the county tax base, provide jobs, provide open space and protect the resource base. Some say farming is dead. I don't believe that. In Haywood County, agriculture comprises nearly a third of the economy. The Bethel area of Haywood County has a high concentration of intensive agriculture yet water quality is documented as some of the best. Working lands are important habitat for rare and endangered species. If this land is lost to development, most studies show a decline in resources will be evident."

Paul Carlson, Macon County, director of Land Trust for the Little Tennessee

"There is evidence of 4,000 continuous years of agriculture on some of the lands that we've have been able to preserve as working lands in the last few years — 150 to 200 generations of mountain farmers. On our watch it is fixing to become extinct. The Farmland Preservation Trust has been getting zero. It has got to go up."

Ted Carr, Bethel

"I lived in a state with no coordinated effort for farmland preservation. I saw hundreds and hundreds of farmland acres converted into private streets and cookie-cutter houses. That's why we left. I encourage the legislature to continue this effort. Support farming — make it financially profitable."

TJ Walker, Dillsboro, inn owner

"I want to salute you farmers. A couple words I haven't heard yet today: urban sprawl and impact fees. I think a lot of our challenges and a lot of the profits for the developers need to be addressed with greater and more fair and equitable impact fees because a lot of our problems come from urban sprawl. We know there is going to be constant development and consistent growth. We need a consistent source of revenue."

Becky Smucker, Asheville, hiker with Carolina Mountain Club

"We have to face the fact that we must pay for this now or the opportunities will be gone. We are united in not wanting to explain to our children and grandchildren how we failed at this critical front."

Jim Moore, Macon County, owner of Spring Ridge Dairy, who placed his farm in conservation easement with the Land Trust for the Little Tennessee

"It it had not been for funding we would not have been able to do this. We have a generation of men and women who feel very strongly about what happens to this land. They are willing to give for a few cents on the dollar, but the window is closing very fast. This is a great way to leverage that."

John Ager, manager of Hickory Nut Gap Farm and chair of Buncombe County Farmland Preservation board

"We want to keep it a farm. We are desperate to keep it a farm. But without the kind of funding that you all are talking about, it has a very good shot at being developed. There are six heirs who all have a different idea of what to do with the land. I am really counting on you guys to help us save our farm."

Charlie Owen, board of directors of Nature Conservancy

"If we want future generations to have clean air and clean water, this project becomes all the more important. We have to continue to invest in our own natural resources. You need to consider all sources of revenue to make this a reality for future generations."

Caroline Sutton, Asheville Home Builders Association

"We strongly support land and water conservation. However, funding based on development fees such as land transfer taxes is not appropriate. One industry or one sector of the economy should not be singled out to support this effort."

Rachel Doughty, Asheville, attorney

"I have heard the real estate community up here worrying about homeowners, but I have seen a lot of homeowners come up and talk. If you look at who is making money right now, it is developers. I support taxing these luxury homes. I don't think you can really call them homes because people don't spend that much time in them."

Jack Meckler, Asheville

"You can't fund land conservation with a bake sale."

Matt Ray, Haywood County trout farmer

"It is imperative we not have a water usage fee for farmers. We rank second in the state for trout farms. As farmers, we cannot be taxed to try to help us. You don't tax them on one hand to try to help them on the other hand."

Will Hamilton, Southern Appalachian Highlands Conservancy

"I have become acutely aware of the desperation among the farmers and landowners I talk to every day. I am here to speak for the landowners beating down our doors to help save their farms. The will of the land owners is there, the entity to provide support is there, but the funding to complete the land conservation deals is not there. The Land for Tomorrow bill is a ray of hope in a lot of my conversations with farmers."

Hearing focuses on land initiative

■ A state commission has developed funding proposals to purchase property and protect resources from development.

By T. Scott Batchelor
The Daily Reflector

With the state's population rising by 50 percent to about 12 million in the next 25 years, driving development that gobbles up natural resources, the state Legislature has joined forces with a nonprofit conservation group to find ways to save "the goodliest land."

Formed last year by the General Assembly, the Land and Water Conservation Commission has met four times to work out funding options for preserving property, and its draft report will be up for public comment at a hearing at Pitt Community College tonight.

WANT TO GO?

■ The state Land and Water Conservation Commission is seeking public comment on its draft report at 7 tonight in Pitt Community College's Leslie Building, Room 143.

Two other meetings, in Asheville and Greensboro, also are scheduled.

Water quality is key to public health and keeping the state's tourism industry intact, said Kate Dixon, executive director of Land for Tomorrow, a partnership of more than 235 conservation organizations, businesses, preservationists, farmers, health professionals and community groups.

"We also feel like the beauty of the state, its natural habitats, are much of the part of what people love in North Carolina, and one of the major reasons we do so well economically," Dixon said.

The draft report looks at a number of funding opportunities, from sales taxes to general obligation bonds to state purchases of land, she said.

"Some are very broad-based, like income tax and sales tax; some are more related to land development; some are related to tourism," she said.

Another option would see the state purchasing development rights for agricultural lands, which are being snapped up and developed rapidly, she said.

See HEARING, A7

HEARING

Continued From A1

Tonight's meeting is being held "to hear what the public has to say about different funding options," Dixon said

The Legislature has adopted a goal of 3 percent land held out of development, but the state "hasn't been able to meet that goal, because there has not been sufficient funding for it," she said.

Gov. Mike Easley appointed David Womack, owner of an electric-supply business in Greenville, to the land and water conservation commission.

He said land would be purchased by the state and turned over to agencies such as parks and recreation and Wildlife Resources Commission.

Womack said he's a passionate conservationist, which led to his involvement as a board member of Land for Tomorrow and his appointment to the temporary state commission.

"I've been involved in conservation in the state for 25 years ...," he said. That service is driven by "a passion for preserving the last great places in North Carolina."

The commission should have a final report recommending actions and funding avenues to the General Assembly by the first of February, he said.

Debbie Vargas, executive director of the Greenville-Pitt County Convention and Visitors Bureau, said preserving land and water is key to eastern North Carolina's future.

"One of the things we have is a lot of property," Vargas said. "As the state urbanizes, it's not going to stay that way. We have the opportunity to continue to have natural habitats, the recreational areas and natural scenic beauty that has made our state" attractive for tourists.

"... We can preserve those areas of land so that we end up with a balanced mixture, because once they're developed, you can't go backward."

Over the last decade more than 1 million acres of natural and rural areas have been developed, or 100,000 acres were lost per year, according to Land for Tomorrow. Between 1987 and 1997 North Carolina lost more prime farmland than any other state except Ohio and Texas. And for the first time since the 1930s, the state is experiencing falling forest acreage, the group reports.

Land for Tomorrow conducted a statewide public opinion poll. Eighty-two percent say that they would be likely to support increased funding if it would protect family farms and farmland. Of those polled, 59 percent agreed that the state is losing land so fast that a way must be found to preserve natural areas, farmland and water supply areas.

Conservation catch: Who pays?

■ **Residents can weigh in on the plan Wednesday when the land and water conservation panel meets.**

By Taft Wireback
Staff Writer

State legislators rallied enthusiastically last session around a $1 billion plan to preserve more of North Carolina's natural resources, badly needed in a state where asphalt, bricks and concrete are breeding at rates far outpacing the wildlife they supplant.

But the General Assembly's bold initiative hit a snag on just one thorny little question: Where on earth to get the money?

Triad residents have an opportunity this week to suggest their own remedies both to reenergize conservation programs and to pay for them.

The General Assembly's land and water conservation commission convenes Wednesday evening at GTCC for one of three hearings being held this month across the state.

WANT TO GO?

What: General Assembly's land and water conservation commission, regional meeting

Where: GTCC auditorium, 601 High Point Road, Jamestown

When: 7 p.m.

"There was overwhelming support for this idea in the House and Senate last session. Initially, I think they were looking at a plan for five years, $200 million a year," said state Rep. Pricey Harrison, a Democrat from Greensboro and a member of the study commission.

The commission was formed after plans for that five-year plan foundered when Gov. Mike Easley and others in the executive branch questioned the state's ability to take on the additional debt.

The initial proposal called for a statewide bond referendum that would have distributed the $1 billion among the state's various environmental and cultural trust funds, dedicated to such purposes as increased park land, forest preservation and clean water

See **Meeting**, Page B2

Meeting

Continued from Page B1

management.

But the General Assembly kept the proposal alive by creating the 16-member commission to suggest other ways of paying for the new initiative.

"We're really happy the legislature didn't kill the concept but is taking the time to study it further," said Charles Brummitt, executive director of the nonprofit Piedmont Land Conservancy that works to preserve undeveloped acreage ranging from farms to parks and wildlife habitat.

There are a variety of alternatives to bonds that could pay for some amount of increased conservation, said Kate Dixon, director of Land for Tomorrow, a nonprofit coalition formed to support improved conservation measures.

But it's hard to imagine a robust plan that would not involve some bond financing for at least part of the additional conservation money, she said.

Bonds are a good way to provide a lump sum enabling state government to make significant purchases "before the prices go up even more," Dixon said.

"If we don't start now, we'll lose what's special about North Carolina," she said.

Brummitt, Dixon and Harrison all said they hope the efforts won't be limited to raw land conservation but will include steps to preserve the state's vanishing farmland, as well.

"We have the seventh largest agricultural industry in the country," Dixon said. "We really don't want to give that up."

Study says land, water need to be protected

By Ginger Livingston
The Daily Reflector

Tuesday, January 09, 2007

Rapid and often uncontrolled development is robbing North Carolinians of the forests, waterways and open farm fields that nourish their souls and pocketbooks, according to leading conservationists.

The concerns prompted the General Assembly to form a commission to study how the state's land and waterways can be protected. The Land and Water Conservation Study Commission has produced a draft report and is currently gathering public comment on its recommendations.

The study concludes land and water can be preserved, but it will take $1 billion over five years to get started and funding sources should be varied.

About 175 people attended a meeting Monday to comment on the proposals, filling the aisles and hall outside a 100-seat classroom in Pitt Community College's Leslie Building. A meeting in Asheville last week drew nearly 300 people, said Rep. Lucy Allen, commission co-chairwoman.

When the commission was formed last year it was charged with evaluating existing conservation funding sources, finding out how other states developed conservation programs and addressing the state's funding needs, said Cindy Avrette, a legislative staff attorney who consulted with the commission.

"Now is the time to invest in land and water conservation," Avrette said. "It's only going to get more expensive if it isn't done now."

North Carolina loses 277 acres of open land a day, she said. With an ever-growing population, rapid development and unusually large tracts of timberland and farmland being sold, the losses will grow. The commission's draft report has found the state has substantial investment in areas of land and water conservation and historic preservation but more is needed, she said.

The state should invest $1 billion over the next five years in conservation and preservation, but the commission hasn't recommended one funding method over another, Avrette said. It should be balanced between broad-based tax options like a sales tax, development-based options like a land-transfer tax and tourism-based options.

"Will agriculture be targeted (to pay) most of the cost?" asked Kelly Vann, president of the Northampton County Farm Bureau. "We are in favor of land and water conservation but don't think farmers should pay most of the cost."

Farmers argued that several funding proposals involving the use of water would be an unfair financial burden.

"We're trying to farm, and urban development is all around us," said James Barbour of Johnston County, a fast-developing area next to Wake County. He said the proposed water fee will hurt farmers who don't want to sell to developers.

Representatives from the real estate and home building community protested the development-based proposals.

The current tax stamp fee charged when new deeds are registered raises $60 million for land conservation, said Connie Corey, a Greenville real estate agent and president of the N.C. Association of Realtors. Increasing the stamp fees would make it harder for first-time home buyers to purchase property, she said.

Vance County nursery owner Sam Franklin Jr. said not only is a water fee worrisome, he fears the purchase of land by the state for conservation will reduce the amount of taxable land in counties like his and drive up property taxes of remaining landowners.

Greenville attorney Tom Taft, who also is a developer, offered a different perspective.

Land conservation is as important as other infrastructure development, like roads and water and sewer systems. He said anyone who would share the benefits of land conservation, whether builders, farmers or the tourism industry, should share the expense.

Former Jacksonville City Manager Ken Hagan said tourism should have to share the funding burden, pointing out recreational areas lure people to spend money in the state.

Phillip Horne, president of the economic development group Foundation of Renewal for Eastern North Carolina, recommended providing incentives to developers who support conservation through environmentally sensitive design. Laura Williams, another Foundation staffer, said there should be development rules that keep waterfront development from harming the values of the land behind it.

Halifax County farmer Ray Garner, whose family land dates to 1867, said the current recommendation only gives 15 percent of the $1 billion funding proposal to aid farmers with land conservation. He said more is needed.

Max Merrill with the state's agriculture department said the commission should finance a trust fund dedicated to protecting working farmland so it can stay on community tax rolls.

Camilla M. Herlevich, N.C. Coastal Land Trust's executive director, supported funding a farmland trust. The trust tries to help working farmers with land preservation but has limited resources, she said.

"Demand is outstripping need," she said. "There are more people who want their land saved that we can handle."

Numerous people voiced support for the project.

Conservation funding has helped the city of Rocky Mount establish recreational areas, said Pete Armstrong, the city's parks and recreation director.

Marion Blackburn of Greenville argued for protecting farmland and developing recreational areas.

"Development has been raging through eastern North Carolina like Sherman's Army," she said.

Heather Jacobs, Riverkeeper for the Pamlico-Tar River Foundation, said the loss of waterfront acreage to development means that most people don't have access to local waters unless they own the property.

A growing state's growing concerns

Citizens have an opportunity to be heard on vital issue of conserving natural resources

By Charles S. Brummitt
GUEST COLUMNIST
Saturday, January 6, 2007

Occasionally, happenstance seems to logically connect one news story to another in a fitting way. Before Christmas, it was widely reported that the U.S. Census Bureau estimates that North Carolina passed New Jersey last year to become the 10th most populous state. And the General Assembly's Land and Water Conservation Commission will solicit comments on its draft recommendations at 7 p.m. Wednesday, Jan. 10, at the Guilford Technical Community College auditorium in Jamestown. Many of us should attend.

North Carolina's and the Piedmont's rapid growth is more and more evident. More than 180,000 new Tarheels joined us last year, including more than 100,000 who moved here from other states. North Carolina's good economy, spectacular natural resources and great reputation are a perfect storm of attraction for many across the nation and the world. That storm bodes well for North Carolina if we can manage to retain the attractions that will continue to bring people to the state - if we can retain a quality of place to support our quality of life.

Our starting point to prepare for this continuing growth isn't ideal. On average, each month nearly 10,000 acres of farms and forestlands are converted to other uses. Most of our food comes from thousands of miles away, and sources of local food are rare. One out of every four monitored streams and rivers in North Carolina doesn't meet clean-water standards, and we monitor only a fraction of our streams. We live in a special place, but we must be better stewards of our resources if we are to pass them to our children and grandchildren.

An amendment to our state's Constitution requires that we use "every appropriate way to preserve as part of the common heritage of this state its forests, wetlands, estuaries, beaches, historical sites, open land and places of beauty." This wonderful list captures this special place, the place Sir Walter Raleigh's men called "... the goodliest soile under the cope of heaven."

To begin meeting the amendment's challenge, a coalition of more than 240 organizations and local governments, more than half the General Assembly, and thousands of individuals called Land for Tomorrow, believes that an additional $1 billion in state funds is needed over five years. The funds will pay to protect drinking water, streams and game lands; purchase land for state parks and local recreation programs; preserve historical places and scenic vistas; and conserve working forests and farms.

State and federal agencies, private partners and landowners have conserved such important places in our area as the Mitchell River watershed, historic lands in Bethania, Randolph County farmland and the new Haw and Mayo River state parks. However, current methods and funding levels are simply not sufficient to meet the challenge laid out for us in 1971.

Land for Tomorrow's proposal attracted wide support in the General Assembly's last session, but foundered when it came to funding. The legislature then wisely created the Land and Water Conservation Commission. The 16-member commission is charged with evaluating North Carolina's existing methods and sources of funds for conserving land and water, researching how others protect land and water, and evaluating how the best tools and techniques can be applied in North Carolina.

They've identified seven "best practices," ranging from public investment to partnership with federal agencies, as the best ways to conserve land, water and our historical and cultural heritage. The commission has also identified likely funding sources to support those best practices. (The entire draft report and more information on the commission are available at www.landfortomorrow.org/page354.html.)

If North Carolina is to deal with its current problems and a huge influx of new neighbors, we need leadership, innovation and initiative. In the 1950s and later, we were known as the "Good Roads" state because strong and farsighted leaders worked to invest in transportation infrastructure. Later, Research Triangle Park came into existence with Gov. Luther Hodges' foresight and guidance. The Land and Water Commission's work points to a new type of change - change to protect our resources and our economy. Conservation is critical to our future public health, jobs and quality of life.

Now we have a chance to put a personal best practice in place. We can show up on Jan. 10 and voice our opinions on the commission's draft report. By so doing, we will help find ways to support our economy while preserving our land and water, our natural and cultural heritage, and this wonderful state for generations to come.

Residents: Preserve open land

By John Boyle
JBOYLE@CITIZEN-TIMES.COM

ASHEVILLE — An overflow crowd gave the state Land and Water Conservation Commission an earful Thursday night about its proposal to fund up to $1 billion in land and clean water conservation projects over the next five years.

Overall, the crowd in Asheville-Buncombe Technical Community College's Ferguson Auditorium — with a strong contingent of farmers from several mountain counties — was supportive of the idea but varied in how the funding should be garnered and distributed.

But one overriding theme emerged: North Carolina is losing too much undeveloped land.

"My brothers and I are fourth-generation dairy farmers over in Henderson County, and we're going to be the last," said Billy Johnston, president of the Buncombe County Farm Bureau.

He and his three brothers have been farming more than 3,000 acres, but that land has dwindled by 2,000 acres because the owners they were renting from are selling their land to housing developers.

The commission, which will submit a report to the General Assembly this year, is seeking comment on its ideas at three meetings in the state.

The commission noted the Legislature has been willing to fund preservation through trust funds but "a larger dedicated source of revenue is needed." It has identified several possible revenue sources, "ranging from broad-based taxes to development-based taxes to tourism-based taxes."

Speakers suggested the state ensure farming remains profitable, in part by maintaining the current "present-use tax" system, not taxing water usage and keeping property taxes down. Some residents suggested ending tax breaks for buyers of luxury second homes or charging tourists more in hotel room taxes.

No one seemed opposed to spending $1 billion to preserve open land.

Jan. 5, 2007

As state grows, land preservation becomes crucial

When the Johnston brothers moved their dairy operation to Henderson County in 1975, there were about 33 dairies in the county.

Now there are only five.

"It's all been lost to development," said Bradley Johnston, who operates the 1,300-head Tap Root Dairy with his three brothers.

And Johnston can see the writing on the wall. There's a day coming when the constant temptation from developers waving big money for their land will be too much and they'll sell, ending a business that's been in their family for four generations.

The pressure from developers results from a market for new homes created in large part by people moving in.

An analysis of migration trends by the nation's largest mover, United Van Lines, found that North Carolina had the highest inbound migration of any state in the country, with 64 percent of moves coming into the state.

Such changing population and land use trends underscore the urgency to protect undeveloped land in North Carolina for farming, outdoor recreation, environmental preservation and the natural beauty that's one of our greatest assets.

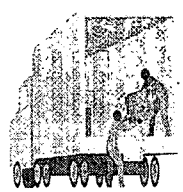
If the two hearings held during the past week by the state Land and Water Conservation Commission are any indication, plenty of North Carolinians want to see the state do something before it's too late. Overflow crowds in Asheville and Greenville have shown support for a proposal to spend $1 billion on land and clean water conservation projects over the next five years, though some speakers were opposed to some methods of raising the money, such as a tax on water usage or an increase in deed transfer taxes

Bond push fell short

The commission was created after the state Legislature failed to put a $1 billion statewide land and water conservation bond referendum on the ballot for last fall's election. Land for Tomorrow, founded by a group of farm preservation, conservation and community development nonprofits, proposed the referendum.

The commission will submit a report to the General Assembly this year. It is seeking comment at three meetings around the state on the proposal to spend a billion dollars and various options for raising the money, including a general obligation bond referendum. So far, that method seems to have garnered the most support, according to Land for Tomorrow's Kate Dixon.

The state already has a mechanism for distributing the money through various trust funds including the Clean Water Management Trust Fund, the Natural Heritage Trust Fund and the Parks and Recreation Trust Fund. It would be available for buying such treasures as Chimney Rock Park, should the state be able to arrange the purchase with the owners.



MOVING IN

United Van Lines has been tracking moving trends since 1977. The study of 227,254 moves handled by the company in 2006 was released Monday. It looked at all moves that involved either going to or leaving a state. North Carolina had the highest inbound migration with 64 percent of moves going into the state.

- THE ASSOCIATED PRESS

The stewardship issue

"There's a tremendous stewardship issue here," state Rep. Lucy Allen, D-Louisburg, said before the meeting in Asheville last Thursday.

The money would be used to protect nine different land types: stream banks and floodplains, farms, forests, parks, game lands, historic places and land visible from scenic highways such as the Blue Ridge Parkway.

The benefits of providing the money for land preservation include maintaining places to hunt, fish, observe wildlife and participate in other outdoor recreation, protecting places of historical, cultural and ecological significance, saving healthy farms and forests, and strengthening the state's economy. The state will also enjoy cleaner water and air and less damage from flooding.

In 2003, the N.C. Public Interest Research Group reported that between 1982 and 2002, North Carolina lost 1.9 million acres of open space to development and by 2022 is projected to lose another 2.4 million acres.

It's time to act.

We urge Western North Carolina lawmakers to support a fair and equitable method of funding the proposal to spend $1 billion to preserve land so that North Carolina's tomorrow is as healthy as its past has

CITIZEN-TIMES.com
ASHEVILLE CITIZEN-TIMES • VOICE OF THE MOUNTAINS

Jan. 4, 2007

Preservation's future begins here tonight

Anyone who has walked the North Flatwood Loop Trail in DuPont State Forest on a crisp, sunny winter morning when it's nearly deserted, or any of a number of other trails of our state and national forests, won't need convincing of the need to preserve special places in North Carolina from development.

Serenaded by Shoals Creek, splashing and gurgling beside the trail, it's possible to almost feel the stress of hectic holidays melt away. The beauty and serenity of the natural world feed some essential part of the human spirit.

Once, many of us in Western North Carolina only had to walk a few steps outside our back doors to view unobstructed landscapes and find forest trails to meander. But as the population increases, that's no longer true for most people. To satisfy the need for wild places and for outdoor recreation, people increasingly turn to public lands. It's easy for popular trails to be overrun, as has happened in the Shining Rock Wilderness area.

Incredible growth

The U.S. Census Bureau expects North Carolina's population to surpass that of urban states like Michigan and Ohio by 2030. Each year the state is losing 100,000 acres to population pressures. If we hope to retain the interaction with the natural world that has long defined our way of life, steps must be taken to preserve more land from development.

Last year the General Assembly created a Land and Water Conservation Commission to examine options to protect North Carolina's natural and historic beauty. The commission is to make its recommendations no later than Feb. 1, 2007.

Meeting tonight

The first of three statewide public hearings held by the commission will be tonight at 7 p.m. in the Laurel Building on the Asheville Buncombe Technical Community College campus. This is an important meeting for those who care about preserving water quality, land for recreational opportunities and the natural beauty of our region's landscapes. The commission was created after the Legislature failed to put a $1 billion statewide land and water conservation bond referendum on the ballot for last fall's election.

Despite numerous sponsors, the referendum ran into trouble because Gov. Mike Easley opposed adding general obligation bond debt this year.

Land for Tomorrow, founded by a group of farm preservation, conservation and community development nonprofits, proposed the bond referendum.

Land for Tomorrow proposes spending the $1 billion over five years to protect nine different land types: Stream banks and floodplains; working farms; working forests; urban forests; local parks and recreation; state parks; game lands; historic places; land visible from scenic highways such as the Blue Ridge Parkway. Such efforts have a major economic component for a region like ours, so heavily dependent on tourism. They add enormously to the quality of life and that helps attract mobile entrepreneurs, retirees and others who contribute to our economic well being.

Take advantage of this opportunity to help shape our future by going to the meeting tonight and making your voice heard.

Land for Tomorrow call to action

What Are We Waiting For?

- More than 3,000 miles of North Carolina streams and rivers do not meet the state's water quality standards. That's the distance from Asheville to Anchorage.
- Nothing is more important than having clean water to drink. By protecting land around rivers, lakes, estuaries and streams we can prevent polluted runoff from flowing into North Carolina's water supply.
- Each year 100,000 acres of irreplaceable natural areas, family farms, game lands, forests and historic places are developed in North Carolina, which has one of the Nation's fastest growing populations. Our quality of life is being diminished forever.
- Given our population growth, there is a very narrow window of opportunity to make the investments necessary to protect critical natural and economic resources for eternity. The price for the remaining lands will only get higher.

Public hearing on conservation options slated

BY PAUL B. JOHNSON
ENTERPRISE STAFF WRITER

TRIAD – State Rep. Pricey Harrison has a succinct reason for wanting to promote conservation of land and water in North Carolina – "They aren't making it anymore."

If state leaders and residents don't come together and fi nd ways to secure and preserve open lands, water sources and historic properties, development and growth may wipe out the chance, said Harrison, D Guilford.

Peoplein theTriad will get their chance next week to offer suggestions on ways to preserve land during a public meeting of the N.C. General Assembly's Land and Water Conservation Commission. The meeting – which is the one for input from the central part of thestate– will beheld Jan. 10 at 7 p.m. in the auditorium at Guilford Technical Community College in Jamestown.

North Carolina "is losing land at the fourth- or fifth-fastest rate in the country," said Harrison, the lone Triad representative on the conservation commission. "We are losing open space, vital agricultural lands and forest areas. We've got to preserve what we can."

The General Assembly last year considered a bill to put a bond referendum before state voters to raise $1 billion for conservation trust funds. But the bill didn't pass, in part because of concerns about the state taking on further debt loads.

Gov. Mike Easley and legislators will face up to a $1 billion budget shortfall this year, meaning that funding through the general state budget might be hard to come by for conservation efforts. Harrison said legislators can consider policies that would promote the preservation of land and water resources. The General Assembly created the conservation commission last year to come up with recommendations for the 2007 legislative session.

"What we'd like to see is an opportunity for the voters to voice their opinions about conservation in the state," said Charles Brummitt, executive director of the Piedmont Land Conservancy.

Many legislators want to find a way to apply more money for conservation, but fiscal challenges have hamstrung them so far, Brummitt said.

Even if the state can't raise $1 billion for conservation,a smaller amount might get the effort started, he said. Harrison said the longer action is delayed, the more land and water is lost.

"There's an opportunity here to protect some valuable resources for future generations of North Carolinians," Harrison said. "Some big money now will pay off in major dividends down the road.

ELKIN TRIBUNE

Dec. 29, 2006

Citizens needed to speak out for conservation at meeting

To the editor:

The North Carolina Land and Water Conservation Commission, created and appointed by the 2006 General Assembly and the Governor, will hold three public meetings in early January. These meetings are the perfect time for citizens to tell legislators that conservation of our state's open spaces, rivers and streams, farmland and historic places is a critical issue for the state's future.

The Piedmont-area meeting will be held at 7 p.m. on Jan.10, in the Auditorium of Guilford County Technical College's Jamestown Campus. The commission was created to study and recommend alternative funding sources to the upcoming legislative session after the 2006 session failed to approve proposed legislation for a $1 billion, statewide land and water conservation bond referendum. The bond legislation was originally proposed by Land for Tomorrow www.landfortomorrow.org), a partnership of more than 235 conservation organizations, businesses, preservationists, farmers, health professionals and community groups.

For those able to attend, I'd like to encourage you to speak "from the heart" about why more funding for conservation matters to you, personally and/or professionally. Our presence at this meeting will make a difference; after hearing from the public, the Commission will refine their recommendations and present them to the 2007 General Assembly. In preparing my own comments for the meeting, I called to mind the life lessons offered up as "family outings" by my grandfather — Sundays at the trout hatchery at Shatley Springs, feeding the geese at Gaddy's Goose Refuge, and raising bob-white chicks for release into the woods "just so we can hear them calling." Or simply sitting with him atop Grandfather Mountain, so lovingly and unselfishly preserved for the people of the state by the Morton family. My Paw-Paw planted the seeds of my deeply-felt affection for the natural world.

The issue here is NOT "conservation vs. development." It is only fair to expect a healthy balance of each, done with careful thought and concern for the future. We're woefully off balance here in our region, where the quick buck gets all the attention. It's time for the rest of us to have a voice in our future.

Our God-given, beautiful vistas, quiet places, and historic sites are at risk, as are our relatively clean air and water (and therefore, our health). If these assets, which are readily at hand, are preserved, they will support our growing viticulture industry and assure our successful (read: prosperous) long-term participation in regional heritage tourism projects such as the Blue Ridge National Heritage Area. We must be wise enough to acknowledge these assets, and unselfish enough to save them.

Several tourism-related events scheduled

On Jan. 3 there will be a Yadkin River Heritage Corridor Meeting at the Kerr Scott Reservoir Visitor Center on Jan. 3 at 1 p.m. The YRHC is an initiative by Caldwell, Wilkes, Yadkin and Surry counties to establish a heritage and recreational corridor along the Yadkin River, beginning in Happy Valley at Hwy. 268 and Hwy. 321, continuing through N. Wilkesboro, Ronda, and Elkin, ending at Huntsville and the historic Shallow Ford.

"Planning Today for a Better Tomorrow," a seminar on the many facets of Rural Tourism in the Yadkin Valley, will be held from 9 a.m.-3 p.m. on January 12, 2007, at the Village Inn Golf & Conference Center, Clemmons. Participants will have the chance to network with other individuals and tourism-related businesses and organizations. Learn tips to starting and/or improving your business, how to network with other owners of tourism-based businesses, the benefits of working together, and about your own regional "backyard." Cost: $35. Deadline for registration is January 2. For more information see surry.ces.ncsu.edu or call 401-8025.

The North Carolina Land and Water Conservation Commission will hold a public meeting at 7 p.m. on Wednesday, January 10, 2007, in the auditorium of Guilford County Technical College's Jamestown Campus, 601 High Point Road. The public is encouraged to attend and contribute their opinions about the future funding of conservation efforts in the state. Visit www.landfortomorrow.org for more information.

Letter from reader

Push for something positive

The Land and Water Conservation Commission, created and appointed by the 2006 General Assembly and the Governor, will hold a public meeting on Thursday, Jan. 4, 2007 at Asheville-Buncombe Technical College, Laurel Building, Ferguson Auditorium, 340 Victoria Road in Asheville at 7 p.m.

In partnership with Land for Tomorrow, they are asking the North Carolina General Assembly to provide $1 billion over five years to preserve and protect its special places before it's too late. Land for Tomorrow will help the state reach its goal of conserving a million acres -- ensuring that working farms and forests; sanctuaries for wildlife; land bordering streams, parks and greenways; land that helps strengthen communities and promotes job growth; historic downtowns and neighborhoods; and more, will be there to enhance the quality of life for generations to come.

These public meetings are the perfect time to show legislators that we North Carolinians think that conservation is a critical issue for the state's future.

For more information about the program, visit www.landfortomorrow.org. If you plan to go, it is not required, but you can sign up on their website at www.landfortomorrow.org/page354.html.

What a great opportunity! Let's all get behind this one and push for something positive rather than pushing against something detrimental. It's so much easier this way. Please pass this far and wide so that the state government knows how passionate we about preserving the beauty we have been entrusted with. Please mark your calendars today. Talk to your friends and neighbors, and come with something to say. It's not hard to express what you hold dear.

Preserving county's rural charm is vital to the future

Commissioners were right to fund effort

Haywood County has many charms, but perhaps the most appealing are the divergent and breathtaking landscapes that surround us.

In our county, we basically have all the qualities that lure people to the great outdoors — the rugged mountainsides, babbling brooks and rushing waterways, pastoral scenes where cattle or goats graze and horses run with the wind. All these are mixed in with plenty of agricultural production, ranging from small vegetables to tobacco and hay.

The scenes vary with the season and are so familiar they are easy to take for granted. But experience and forward thinking tell us our rural landscapes are quickly disappearing. Top-dollar offers from developers to families struggling to make ends meet in the farming business are hard to resist.

But there is another way. Haywood County is forming a committee to foster land preservation and eventually purchase property or development rights to property as a way to retain the rural charm of the area.

The effort is in the early stages, but county commissioners have made an important first step in granting $50,000 to be used as seed money in attracting some of the matching grants available for land preservation.

There are plenty of organizations dedicated to advancing land preservation, including the Southern Appalachian Highlands Conservancy, the N.C. Conservation Trust and Land for Tomorrow, all of which have done some work within the county.

There are also plenty of landowners with a deep desire to see agricultural traditions continued on their family land. If economic incentives can be made available, many would willingly consider options besides selling land for housing development or commercial use.

The Haywood County land trust effort is a way to make that happen.

The idea of a piece of property having several values is not a new one. In some cases, those owning the land and the mineral rights are different entities. Landowners routinely grant or sell easements across their property for utilities or transportation.

Separating a property's development right is the latest in a long stream of land ownership possibilities. With the development right sale, future use can either be restricted to present use or allowed to branch out in only select ways.

The county governing board is to be commended for recognizing the importance of moving forward. We encourage the new board members being sworn in next month to keep the momentum going.

The issue at hand affects every part of the county, from Fines Creek to Cruso, Balsam to Beaverdam. Our landscape is a large part of what makes Haywood County a special place to live. We must preserve what we can before it is too late.

Land for water

Regarding your Oct. 30 editorial "Safe water," the General Assembly and the Land and Water Conservation Commission may have the largest impact on the success of the public-private efforts to protect water quality in the Neuse River Basin.

The General Assembly has charged the commission with making recommendations to the 2007 session on how to significantly increase funding for protecting critical water resources, natural areas and historic places through land acquisition. The legislature was responding to numerous reports showing an alarming rate of land conversion, with no letup in sight.

A portion of any increase in land and water conservation funds will reach the Triangle region, one of the fastest-growing in the country. But similar challenges are being faced throughout our state. From along coastal waterways to mountain streamsides, the thirst for land in close proximity to water is growing by the day.

Consequently, we have a narrow window of opportunity to acquire the lands that can make a real difference for the long-term health of our water supplies and our quality of life.

I look forward to following the commission to its final recommendations and fully support its efforts in making North Carolina a better place for us all. The next meeting of the commission will be in Raleigh on Thursday. More information can be found at www.landfortomorrow.org

NEWS & RECORD

Sept. 17, 2006

Land for Tomorrow funding is vital

CAROLYN ALLEN

As a person long involved with efforts to protect the environment, I was distressed that the N.C. General Assembly did not take action on the Land and Water Conservation Bond Act in its last session.

Land for Tomorrow, the program to be funded by these bonds, is a plan to carry out an amendment to our state constitution which voters approved 35 years ago. This amendment says we must use "every appropriate way to preserve as part of the common heritage of this state its forests, wetlands, estuaries, beaches, historical sites, open lands and places of beauty." We had hoped to put a bond referendum statewide on the November ballot that, if approved, would have provided $200 million annually for five years for conservation and preservation.

Guilford County is fortunate to have organizations that understand the importance of preserving our natural and historic heritage. More importantly, we have individuals who work daily with dedication and skill to carry these activities forward.

But new industry and business and our colleges and universities continually bring new residents to the area. This is a "desirable destination." Development grows all across the county. Thus we must expand efforts to protect those places that distinguish our history and quality of life.

Our splendid park and trail system provides exercise and pleasure for more people every year. The new state park along the Haw River must purchase additional land to meet the recreational needs of area residents. Historic buildings must be made accessible to the disabled. Farmers who wish to continue production on their lands need access to conservation easements. Drinking water that comes from surface reservoirs must be adequately protected. Storm water must be controlled and erosion of stream banks stopped if we are to secure the future of our water supplies. Without water, no future for this region is possible.

Instead of putting the bond referendum on the ballot, state legislators put in place a study commission that seeks alternative ways to fund the Land for Tomorrow program. It is to report back to the legislature in the new session. The environmental and historic future of North Carolina depends on the success of the commission's review. Our children and grandchildren lose their heritage if Land for Tomrrow does not become the gift our generation bequeaths to the future.

Carolyn Allen is a former mayor of Greensboro and chairs, with Davy Davidson, Guilford County's Land for Tomorrow chapter.

Protect more land

Thanks to the Council of State for its support for the acquisition of more than 10,000 acres to protect water quality and unique natural areas, and enhance park and recreation opportunities across North Carolina (news story, Sept. 12).

While this is the right thing for North Carolina, during the next year the state will see 100,000 acres of its farms, forests and natural areas converted to more urbanized uses. According to the federal Census, by 2030 our state will need to make room for a population larger than that of Michigan, Ohio and New Jersey.

That's why the General Assembly and governor have appointed a Land and Water Conservation Study Commission to determine how the state can significantly increase its investment to protect our great natural assets in the face of such growth.

Land for Tomorrow is a coalition of more than 230 diverse organizations, communities and individuals, including farmers, foresters, business executives, conservationists, health professionals and many others, all supporting the efforts of the commission.

They share one thing: They believe we owe it to ourselves, our families and our grandchildren to find a way to significantly increase land and water conservation. Otherwise, the North Carolina we love will disappear forever.

State's future growth depends on conservancy's success

GUEST COLUMN
CHARLES BRUMMITT

North Carolina's needs are as diverse and urgent today as ever. Balancing those needs must seem a thankless job to our legislators, especially when critical needs go unmet.

Our legislature adjourned this year without giving the voters an opportunity to vote on two of those critical needs — land and water conservation.

A coalition of more than 230 organizations and local governments called Land for Tomorrow built a strong case that North Carolina's future economic well-being will be greatly affected by today's investment in clean water, working lands, parks and greenways.

Even in tight times, we cannot afford the loss of our state's land and water along with the quality of life they support. The threats are daunting.

Each year, North Carolina loses more than 100,000 acres of forests and farmland to the pressures of population growth and 3,000 miles of our streams already don't meet state water quality standards.

By 2030, the U.S. Census Bureau expects North Carolina's population to surpass Michigan, New Jersey and Ohio. Between 1987 and 1997, North Carolina lost more prime farmland than any other state except Ohio and Texas. And for the first time since the 1930s, falling forest acreage contributed to a decline in the volume of the state's timber growing stock.

Close to home, Alamance, Forsyth, Guilford, Randolph and Rockingham counties lost 167,000 acres of farmland between 1974 and 1997. Between 1990 and 2000, Greensboro's area grew by 24 percent while its population grew by 22 percent. Similarly, Winston-Salem's area grew by 35 percent while its population grew by 30 percent.

Still, growth does not have to result in a degraded quality of life if we invest wisely. The proposed billion dollars of land and water conservation bonds over five years would help protect more of our farmland and support local foods.

It would help protect more streams to give us a safer, less expensive water supply. It would help protect the quality of life we all want to pass to future generations.

The legislative sponsors of the land and water conservation bonds deserve our thanks for their leadership on this issue. They were numerous — more than 70 in the House and more than 20 in the Senate.

Despite their efforts and those of many citizens, fulfilling our need to protect more land and water has been postponed at least a year.

The legislature did, however, create a study commission charged with recommending alternative funding sources for land and water conservation to the 2007 General Assembly. The study commission is required to examine all options to help protect North Carolina's natural and historic beauty, and then report to the Legislature and Governor by Feb. 1, 2007.

It is vital that the Commission enjoy the support of Gov. Easley, legislators and the public. If it gets that support, I am optimistic the commission will strengthen Land for Tomorrow's original proposal and recommend decisive action to support both our economy and our natural resources.

Julian & Ethel Clay Price Park in Greensboro

The northern Piedmont's development will almost certainly continue to accelerate. We have a rapidly disappearing opportunity to support development and protect our farming heritage, green space and water.

But, we will not do so without additional investment. We are confident that with good work by the Commission and continued focus, citizens of North Carolina will have an opportunity to support land and water conservation bonds in 2007.

Thirty five years ago, our state constitution was amended to say we must use "every appropriate way to preserve as part of the common heritage of this state its forests, wetlands, estuaries, beaches, historical sites, open lands and places of beauty."

Each day, we lose more of the natural areas that are so important to protecting our children's future. We have a narrow window of opportunity to protect places that are so important to our quality of life and the economy. We must continue to act — now.

That is exactly what the Land for Tomorrow and the proposed land and water conservation bonds aim to do — and that's why we look forward to working with the newly formed study commission and implementing conservation efforts that make sense for North Carolina.

Help protect rivers, land, parks

To the editor:

I hope that most of you have heard of and read about Land For Tomorrow, the partnership asking the N.C. General Assembly for $ 1 billion over five years to protect river, farms, lands, parks and historic places.

This is a status report. We asked the N.C. Legislature to provide funding through general obligation bonds, and, thanks to superb volunteer efforts the bill was co-sponsored by 75 of the 120 House members and 22 of the 50 Senators. The group was diverse: Republicans, Democrats, rural and urban, mountain, coastal, Piedmont, African American and Caucasian.

We thought that the bill would pass and get on the November ballot but Gov. Easley came out strongly against additional debt and Senate leaders became unwilling to act.

The House then, not having support from the Senate or the Governor, did not bring the bill to the floor.

So we are building towards next year. The legislature was encouraged to establish a study commission to investigate financing options and to recommend how to meet the funding needs. The commission's final report is due in February of 2007, time enough to get the legislation introduced next session.

Now we need the help of anyone interested in contacting the representatives in Raleigh. They need the push from us to keep working on this important legislation.

They aren't making land anymore, or rivers or mountains. We must try to save what we have, especially in Haywood County, one of the most sought after areas in the Southeast.

'Wait 'til next year'

Many leaders from the business, local government and the environmental community are disappointed that the legislation to allow North Carolinas voters to vote on the Land for Tomorrow Bond Issue was not brought up for a vote in the General Assembly this year. The bills that were submitted had overwhelming support. In the House, the legislation was co-sponsored by 75 of 120 members. In the Senate, 25 of 50 Senators took the same position of leadership on the issue.

Land for Tomorrow will be a five-year, $1 billion bond issue to strengthen existing mechanisms to protect open spaces, farmlands, forests and other important parts of North Carolina "natural infrastructure." This added investment is vital at this time of North Carolina's exploding growth and development.

The U.S. Census Bureau estimates that by 2030 North Carolina will be the fifth most populous state, exceeding New Jersey, Michigan and Ohio. As a consequence, North Carolina loses more than 100,000 acres of forests and farmland each year. More than 3,000 miles of our streams still don't meet state water quality standards. These things will only become more critical if prompt action is not taken.

While the bill authorizing the land and water conservation bonds did not pass this legislative session, at the end the Legislature took a farsighted position. They established a study commission to report back to the Legislature in February 2007 and determine the most appropriate way of meeting the increasingly dire needs to protect our state's water and open spaces.

So "wait 'til next year" sounds good. Not in the sense of the Chicago Cubs, but with the energy of the Carolina Hurricanes. A committed group of people from Durham and from around North Carolina will continue to work hard to protect those values that make our state such a special place for future generations.

Ecosystem Enhancement Program

2006 Report to:

Environmental Review Commission

Presentation Overview:

- History and Overview
- Trends
- 2005 – 2006 Financials
- Status

The Ecosystem Enhancement Program

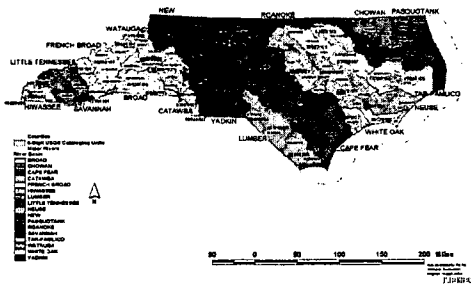
- 1977 Clean Water Act
- Wetlands Restoration Program est. NCGA in 1996
- Established in 2003 to assist NCDOT
- No projects delayed.
- Innovative state-federal partnership with many national awards

EEP contracts with the private sector, and partners Government Agencies, NGO's and Universities to:

- Plan
- Design and construct
- Acquire
- Inspect

EEP provides compensatory mitigation within watersheds

USGS 8-DIGIT CATALOGING UNITS- NORTH CAROLINA



EEP oversight/coordination:

- State and Federal Agencies
- Program Assessment and Consistency Group (PACG)
- Partnerships and Councils
- NCDOT- BOT
- Policy and Oversight Committee
- Environmental Review Commission

EEP maximizes efficiencies programmatically to:

- Restore and protect natural resources
- Reduce redundancy
- Reduce number of contracts
- Provide economies of scale (larger more effective projects)
- Provide efficient and effective use of resources

EEP Process:

1. Receives and develops needs
   - from Customers:
   - from LWP's (Environmental/Watershed needs)
2. Develops strategies to meet statewide needs
3. Secures funds
4. Contracts work

Demand Trends FY 05/06

NCDOT (MOA)	30% reduction
In-lieu Stream and Wetland (MOU)	12 to 20% reduction
Buffer	16% increase
Nutrient Offset	31% increase

Costs

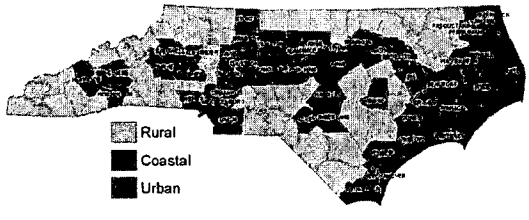
Proposed Fee Revision

- Last fee revision occurred in 2003
  - Increased stream fee
  - Added annual adjustment for inflation
- EEP has most data ever related to restoration costs
  - DBB projects in monitoring phase
  - FD contracts awarded
- Latest data analyses reveal need for revision

Proposed Fee Revisions

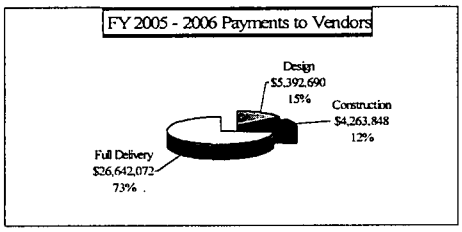
Mitigation Type	Existing Fee	Proposed Fee		
		Urban	Rural	Coastal
Stream	$232	$332	$232	$232
Riparian WL	$27,847	$56,000	$32,000	$38,000
Non-Rip WL	$13,924	$21,000	$21,000	$24,000

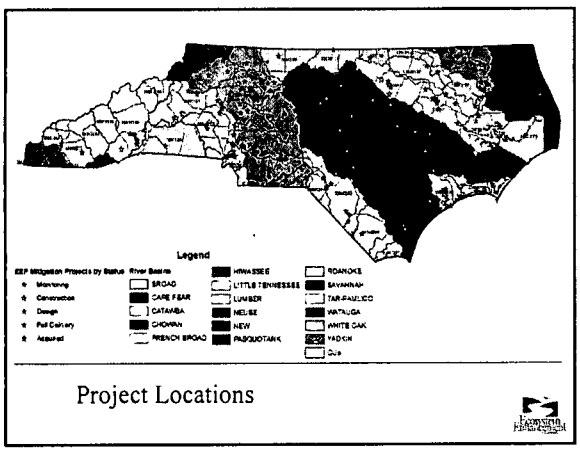
Proposed Category Locations



Production contracts FY 2005-2006

Full Delivery:	35
DBB- Design and Construction:	50





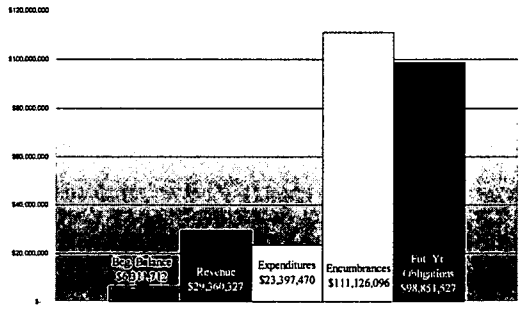
Project Locations

EEP funds are managed under four programs:

NCDOT
- MOA program

Developers, Local Governments, Citizens (voluntary)
- MOU in-lieu program
- Buffer program
- Nutrient Offset program

MOA Fund – current (NCDOT)



Fund Status (In-lieu, Buffer, N.O.) current

	General	MOU Wetland and Stream	Buffers	Nutrient Offset
Beg. Balance	$1,697,493	$18,753,441	$13,309,732	$5,305,207
Revenue	$20,168	$19,516,426	$3,177,602	$898,042
Expenditures	$1,435,002	$9,592,097	$10,599,926	$3,038,466
Encumbrances	$287,808	$25,309,671	$2,229,764	$1,841,864
Balance	(55,149)	$3,368,099	$3,657,644	$1,322,919

Statewide Stream Status (July 22, 2006 in credits):

Credit requirements (July 22, 2006):	508,323
Projected needs (2008):	871,230
Total requirements (through 2008)	1,379,553
Statewide (EEP Managed Assets*):	1,471,107

*EEP Managed (DOT, WRP and self generated)

Stream Permit Compliance

98.43%

Statewide Wetland Assets (July 22, 2006 in credits):

Credit requirements (July 22, 2006):	902
Projected needs (2008):	2,200
Total production requirements:	3,102
Statewide EEP Managed Assets*:	13,087

*EEP Managed assets come from transferred DOT and WRP projects, along with EEP produced projects

Wetland Permit Compliance

95.60%

Buffer Program (acres)

	Cape Fear	Neuse	Tar-Pamlico	TOTAL
Accepted	61.56	303.69	21.45	386.71
Provided	61.66	410.95	103.90	599.91

Nutrient Offset ILF Program Status FY 05—06 (Mitigation Nitrogen Pounds)

	Neuse
Mitigation Due	526,373.04
Mitigation Instituted	527,339.68

And for the past 42 months:

Has supplied mitigation to permitees with no project delays.

Helped NCDOT toward awards totaling $2.2 billion in transportation construction.

Restored, Enhanced or Protected

Streams	500 miles
Restoration lands	13,800 acres
HQP lands	35,700 acres
Total Acreage	49,500 acres

Future Actions

- Meet customer needs
- Quality mitigation
  - for the environment
  - cost effective
- With regulatory partners, continue to seek new means and methods to advance our environmental mission

ECOSYSTEM ENHANCEMENT PROGRAM

2005-2006 ANNUAL REPORT

Restoring... Enhancing... Protecting Our State

Ecosystem Enhancement PROGRAM

State of North Carolina
Michael F. Easley, Governor

A Partnership of:

North Carolina Department of Transportation

U.S. Army Corps of Engineers, Wilmington District

North Carolina Department of Environment and Natural Resources

MISSION

The mission of the Ecosystem Enhancement Program (EEP) is to restore, enhance, preserve and protect the functions associated with wetlands, streams and riparian areas, including but not limited to those necessary for the restoration, maintenance and protection of water quality and riparian habitats throughout North Carolina.

Ecosystem Enhancement PROGRAM

Table of Contents

Executive Summary

Section I: EEP Mitigation Production Process p. 1

Section II: Financial Accounting, Cost Data and Property Acquisition p. 3

Section III: Restoration, Enhancement, and High Quality Preservation p. 7

Section IV. Stream and Wetland Compliance p. 15

Section V: Property Acquisition p. 17

Section VI: Planning and Project Implementation p. 18

Section VII: Local Watershed Planning; Benefits Beyond Mitigation p. 20

Section VIII: Monitoring Reports p. 24

Section IX: Organizational Support Activities p. 25

Appendices:

A: Private Mitigation Banking Survey
B: Payments to Vendors
C: Compensatory Mitigation Payments and Requirements
D: 2005—2006 Properties Closed
E: 2005—2006 Properties Optioned
F: Cumulative Properties
G: Local Watershed Plans Completed
H: Local Watershed Plans On-going
I: Monitoring Table

Executive Summary

As the N.C. Ecosystem Enhancement Program completes its third year of service to the State of North Carolina in providing environmental mitigation to offset regulatory permit requirements of State and Federal governments, the initiative continues to accomplish its overriding purpose: facilitating improvements to the state's transportation infrastructure and fostering responsible economic development.

Since July 2003, EEP has succeeded in streamlining North Carolina's transportation-project delivery without fail. More than $2 billion in approved and pending transportation infrastructure is moving forward in the state without a single delay because of a lack of compensatory mitigation.

During the 2005-06 fiscal year, EEP has continued to maximize the environmental benefits of mitigation resources through high quality restoration and protection efforts across the state. As the program continues to mature, data validates accelerated levels of restoration activity, advancement of mitigation ahead of permitted impacts, significant compliance with regulatory protocols and adherence to the program's watershed approach to restoration-project implementation.

State fiscal year 2005-06 was an active period for EEP as evidenced by requests for compensatory mitigation and the production of restoration assets. Requests for mitigation have trended differently for each of the four primary programs managed by EEP. These four program include the Transportation Stream and Wetland mitigation program (under EEP's tri-party Memorandum of Agreement), the Statewide Stream and Wetland In-Lieu Fee mitigation program (under EEP's two-party Memorandum of Understanding), the Riparian Buffer mitigation program, and the Nutrient Offset mitigation program. Trends are summarized in this section but additional details of the funds are provided later in this report.

Compensatory mitigation provided for the N.C. Department of Transportation (NCDOT) is based on forecasted impacts related to the seven- year Transportation Improvement Program. Impact projections submitted to EEP from NCDOT have shown a marked decrease from data provided in previous years. As compared to projections associated with FY 2004-2005, projected needs for FY 2005-06 were reduced by approximately 30 percent. Even though the forecasted needs have declined, program requirements have increased due to the accelerated timelines contained within the tri-party MOA between the Department of Environment and Natural Resources (NCDENR), NCDOT and the U.S. Army Corps of Engineers (USACE). This agreement is structured to move production of compensatory mitigation in advance of permitted impacts, and achieves this objective by requiring multiple years worth of mitigation within more narrow time frames.

Requests for mitigation from applicants to the EEP In-Lieu Fee Program have varied. Stream mitigation requests decreased by almost 20 percent from the previous fiscal year, while wetland mitigation requests increased by 12 percent. Monetary payments into the program grew six percent as compared to payments during the past fiscal year, which is likely a reflection of the annual fee adjustment made to account for increasing project costs associated with inflation.

The Riparian Buffer and Nutrient Offset programs both experienced increased use from the previous fiscal year. Participation in the buffer program went up by 16 percent, while participation in the nutrient offset program increased by 31 percent.

In FY 2004-05 , the program recorded 210 new contracts and amendments totaling $72 million. In contrast, EEP recorded 258 contracts valued at $130 million in FY 2005-06. This represents a 23-percent increase in total new contracts and an 80-percent increase in dollar volume—an indicator of increased production rates. Other indicators of increased production include the fact that EEP brought on line approximately 310,000 feet of stream and 589 acres of wetland-mitigation projects during FY 2005-06. Restoration construction activities have increased and EEP expects to experience a peak in this activity in 2008 and 2009 as restoration projects move through the design phase and into construction.

The development of restoration assets has outpaced mitigation demand as intended. EEP currently has over 600,000 feet of stream and 7,000 acres of advance mitigation available for pending road projects. Overall program compliance with regulatory protocols for stream and wetland mitigation is in excess of 95 percent.

The significant increases in restoration production and program compliance have been facilitated by a unique public-private sector partnership. The vast majority of EEP's work is outsourced to environmental consultants, mitigation bankers and construction contractors. The program presently engages over 40 unique firms and companies in the planning, design, construction, monitoring and maintenance of its projects. Thirty-five Full Delivery mitigation contracts were awarded for $67 million in FY 2005-06 to produce 217,336 feet of stream and 389 acres of wetland mitigation. Twenty-six engineering and planning firms and nine construction firms have been awarded 50 contracts for the design and construction of projects that will produce an additional 70,000 feet of stream and 180 acres of wetlands.

EEP has conducted an analysis of project costs statewide and determined that an adjustment of the program's fee schedule is necessary. EEP is in the process of proposing rule revisions to raise fees for streams and wetlands and is participating in a legislative study to address fees associated with Nutrient Offset requirements. In the coming fiscal year, the program will focus on continuing to maximize the environmental benefits of its restoration projects while providing cost-effective mitigation to its customers.

This report is intended to satisfy all annual reporting requirements as defined in G.S. 143-214.13 and the MOU with USACE, and to provide a programmatic accounting of both the MOA and MOU programs.

William D. Gilmore

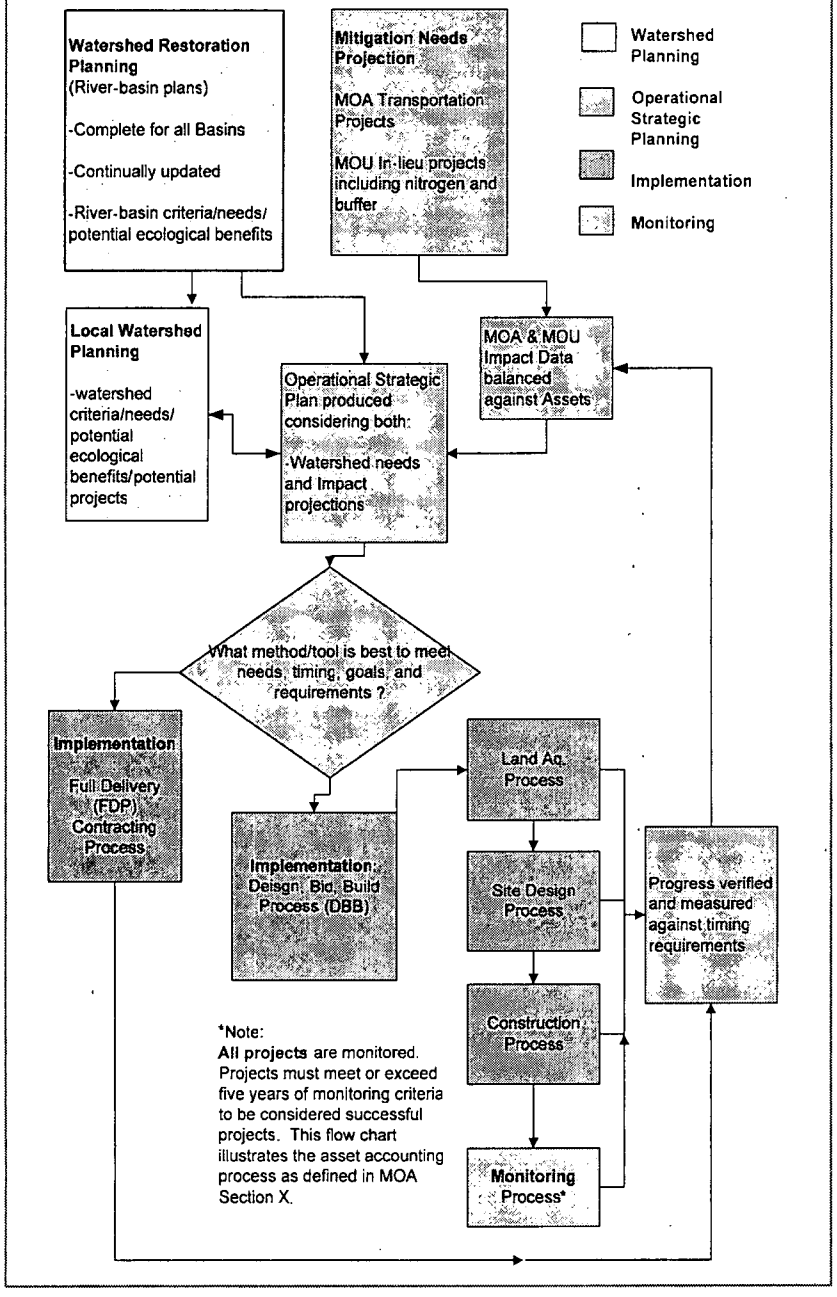
William D. Gilmore, PE, Director

11-29-2006

Date

I: EEP Mitigation Production Process

Figure 1: Mitigation Production



The N.C. Ecosystem Enhancement Program (EEP) is producing stream and wetland mitigation at unprecedented rates in North Carolina. **Figure 1: Mitigation Production** (at left) illustrates the process that EEP uses in order to meet environmental goals, regulations, and develop strategies for meeting mitigation commitments. Updated statistics for mitigation needs and restoration assets are reviewed on a regular basis. Strategic action plans are adjusted as necessary to keep the program on target for compliance. Each EEP section, described below, plays a vital role in this process.

Operational Strategic Planning sets the framework for the acquisition, planning, design, and construction of all ecosystem projects undertaken by EEP. Based on projections of unavoidable wetland, buffer and stream impacts of future transportation projects submitted annually by NCDOT, and historic in-lieu fee customer requests, EEP develops strategies to achieve watershed-based compensatory mitigation in each of North Carolina's 54 hydrologic cataloging units.

The projected needs are examined in concert with watershed planning.

EEP identifies Targeted Local Watersheds in each of the state's 17 river basins based on resource value, restoration need and opportunities for partnering with local agencies and communities. **River Basin Restoration Priorities** for each river basin rely heavily on information contained in the Division of Water Quality (DWQ) Basinwide Water Quality Plans and are generated on the same five-year planning timeline.

In collaboration with local stakeholders and resource professionals, EEP works to identify projects and management strategies to restore, enhance and protect local watershed resources. Through its **Local Watershed Planning** initiative, EEP focuses resources in specific 14-digit hydrologic units -- local watersheds -- in order to address critical watershed issues.

Local Watershed Plans include three key components:

1) An inventory of the specific causes of watershed degradation identified through a detailed assessment;
2) A plan that links watershed problems with specific restoration strategies that are supported by the local community; and
3) A strategy for implementing restoration projects and other watershed initiatives identified in the plan.

In carrying out EEP's stated mission "to restore, enhance, preserve and protect the functions associated with wetlands, streams and riparian areas," the initiative's **Watershed Planning and Project Implementation** section works to produce ecologically effective mitigation in advance of permitted impacts from transportation-infrastructure improvements and other economic development.

EEP watershed planners establish restoration priorities in each of the state's 17 river basins to target local watersheds for EEP projects. EEP project-implementation managers work with interested public and private landowners and private-sector contractors to oversee design and construction of restoration and enhancement projects across the state.

The **Project Control and Research** Section (PCR) is responsible for the technical review and oversight of the EEP Design-Bid-Build programs, and administering the EEP Full-Delivery Program, monitoring restoration projects for success, and developing functional measures for restoration projects and watersheds. PCR is establishing data for:

- Short-term ecological effectiveness of current restoration practices;
- Long-term restoration site studies to quantify wetland and stream functional measures;
- Catchment studies to demonstrate the watershed benefit of restoration practices in association with various best management practices; and
- Maintenance costs and methods for wetland, stream and riparian restoration projects.

Technical reviews include restoration plans, construction plans and monitoring reports.

PRC also acquires project permits and permit modifications, and identifies and directs research related to stream and wetland restoration, water-quality improvement, and wetland and riparian-habitat enhancement.

Together with partnering interests from the public and private sectors, EEP has contributed to the preservation of natural areas across North Carolina. EEP's **High Quality Preservation** (HQP) activities support mitigation for unavoidable environmental impacts from transportation-infrastructure improvements. Assets from this initiative supplement restoration that is provided for all permitted impacts.

The program's alliance with local and regional land trusts across the state, believed to be unprecedented in the nation on its scale, harnesses the expertise, innovation and local knowledge of 23 separate trusts to promote land acquisition and open-space protection. The partnership's aim is to provide fair economic return to landowners while achieving open-space protection for the state.

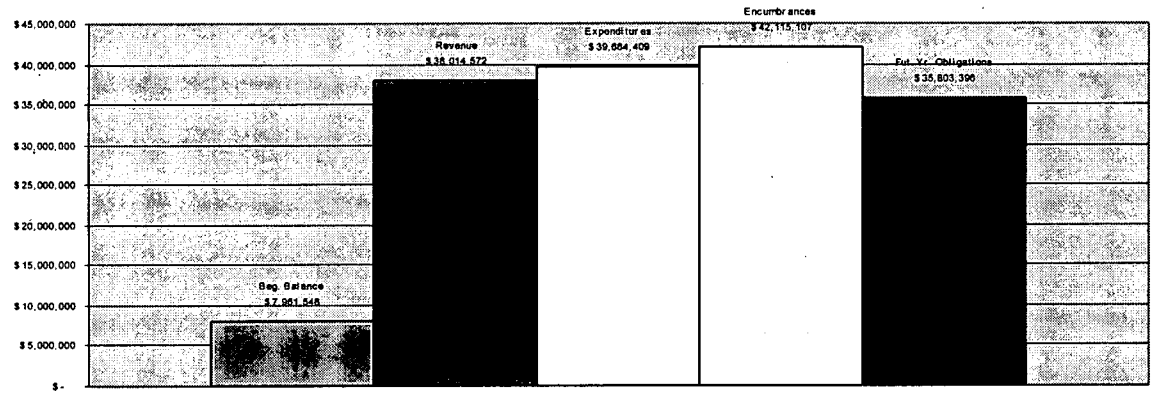
II: Financial Accounting, Cost Data and Property Acquisition

Revenues, Expenditures and Encumbrances

The figures and tables below depict expenditures and end of year balances for the MOA and MOU Stream and Wetland mitigation programs, as well as the buffer and nutrient offset programs, the data shows beginning balances, revenues, expenditures, cash balances, encumbrances and unencumbered balances.

Figure 2 below, is a report on the status of the Transportation, MOA Stream and Wetland mitigation program (fund 2984). Mitigation production and payments are programmed on a cash-flow basis and as a result reflect only the amount paid into the account versus future year obligations.

Figure 2: MOA Fund 2984 Fiscal Year 2005-2006

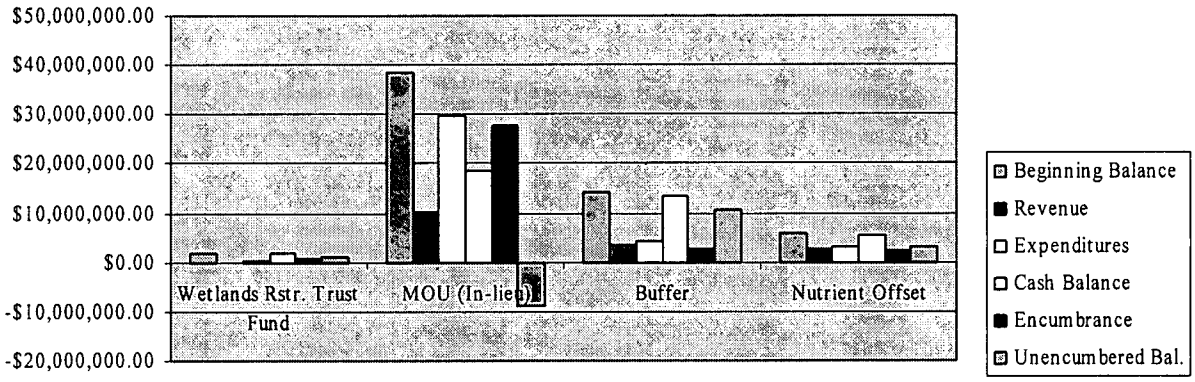


Fund	2984
	MOA
Beginning Balance	$7,961,548.74
Revenue	$38,014,572.44
Expenditures	$39,664,408.78
Cash Balance	$6,311,712.40
Encumbrance	$42,115,107.10
Future Yr. Obligations	$35,803,394.70

This accounting method is in place at the request of NCDOT and is consistent with their method of managing Transportation Improvement Program project costs. EEP invoices NCDOT on a quarterly basis and secures only those funds required to pay operating costs for the upcoming quarter. Future year obligations are guaranteed by NCDOT to be paid in accordance with a Memorandum of Agreement between NCDOT and NCDENR. Revenue accounting is reported to NCDOT by EEP quarterly during routine invoicing processes.

The MOU Stream and Wetland (in-lieu fee) program (fund 2981), the Nutrient Offset mitigation program, and Riparian Buffer mitigation programs (fund 2982) are depicted in Figure 3. Fund 2980 is also shown. Fund 2980 (Wetlands Trust Fund) was established by the legislature when the Wetland Restoration Program (WRP) was initiated. This account is a repository for General Assembly appropriations to EEP and has been historically used to provide non-mitigation restoration projects.

Figure 3: Trust Fund, In-Lieu, Buffer, and Nutrient Offset Fund Status
Fiscal Year 2005-2006



Fund	2980	2981*	2982	2982-9829
	Wetlands Trust Fund	MOU (In-lieu)	Buffer	Nutrient Offset
Beginning Balance	$1,815,888.60	$38,588,673.30	$14,124,786.44	$5,710,563.95
Revenue	$61,763.60	$10,062,353.28	$3,508,262.91	$2,706,419.18
Expenditures	$180,159.16	$29,897,585.22	$4,323,316.95	$3,111,775.74
Cash Balance	$1,697,493.04	$18,753,441.36	$13,309,732.40	$5,305,207.39
Encumbrance	$679,926.06	$27,799,177.95	$2,570,646.70	$2,351,471.08
Unencumbered Bal.	$1,017,566.98	-$9,045,736.59	$10,739,085.70	$2,953,736.31

** As of November 7, 2006 the unencumbered balance for fund 2981 is $3,060,857.79*

Fund 2981 is a statewide, receipt based in-lieu fee account that provides for wetland and stream compensatory mitigation. The fee schedule associated with this fund is currently proposed for revision through rulemaking. EEP has significantly increased production within the MOU program, resulting in a substantial decrease in the fund's cash balance and an increase in the amount of encumbered contracts. As a result, the fund was showing a negative balance at the close of FY 2005-06. At the time of this publication, the unencumbered balance was positive (see footnote to Figure 3) as a result of program revenues and adjustments made to encumbered, yet inactive contracts. The significant restoration activity paid for through this fund has also resulted in the development of mitigation assets of close to $20,000,000 (see Table 7 in Section IV). These assets are a byproduct of the fact that restoration project sizes tend to be greater than the mitigation requirements accepted into the program, and represent a moderate level of advancement for what is fundamentally a program where restoration occurs subsequent to permit issuance.

Fund 2982 is the repository for monies related to the state's buffer-mitigation program that applies to the Neuse and Tar-Pamlico River basins, and parts of the Catawba River basin. Within the buffer mitigation program, EEP was running an unencumbered balance of $10,739,085.70 at the end of the fiscal year.

Fund 2982-9829 is the repository for funds of the nutrient offset program. This program has been in place for Neuse River basin since 1998. Payments to offset exports of nitrogen and phosphorus in the Tar-Pamlico River Basin began in mid-2006. Thus far, nitrogen reductions in the Neuse River basin have been achieved primarily through buffer restoration, which is the most cost-effective manner of meeting reduction requirements. Recognizing that the fee associated with reduction requirements was insufficient to implement appropriate projects, DWQ increased the fees for nitrogen payments in the Neuse and established fees for phosphorus and nitrogen in the Tar-Pamlico. These fee revisions became effective in March of 2006. The N.C. General Assembly subsequently retracted the new fees and called for a study to determine what they should be (see Senate Bill 1862 and Senate Bill 927). EEP will participate in the study of the fees.

EEP Project Costs for FY 05- 06

EEP utilizes two different delivery methods for project implementation: Design-Bid-Build and Full Delivery. Costs of project implementation were evaluated by examining contracts associated with these two components of the program.

In FY 05 –06, EEP obtained:

- 249,255 Stream Mitigation Units at an average of $289.49 per unit
- 305.67 Riparian Wetlands Mitigation Units at an average of $40,934.72 per unit
- 143.60 Non-riparian Wetlands Mitigation Units at an average of $20,982.51 per unit
- 24.54 Buffer Mitigation Units at an average of $17,037.29 per unit

Cost Analysis of Private Mitigation Banks

Reporting requirements of G.S. 143 require EEP to compare the cost of wetlands restoration on a per-acre basis between the State's Wetlands Restoration Program and private mitigation banks. To obtain the data necessary to accomplish this task, an electronic web-based survey requesting restoration cost information was sent to the sponsor of each approved bank in North Carolina. Appendix A includes a listing of banks who were requested to respond, and a copy of the survey with responses.

There were two responses from mitigation banks for fiscal year 2005-2006, the Barra Farms/ Cape Fear Regional Mitigation Bank and the Neu-Con Umbrella Wetland and Stream Mitigation Bank. Based on the survey responses the average costs are as follows:

- Riparian Wetlands Mitigation Units: average reported = $37,500.00 per unit
- Non-Riparian Wetlands Mitigation Units: average reported = $27,500.00 per unit

No data were reported for stream mitigation.

Stream and Wetlands Projects Cost Study

EEP has secured the services of UNC-Wilmington to conduct a stream- and wetland-project cost analysis that incorporates both biophysical and economic variables. The study will ultimately result in a methodology to compare project costs with the fee schedule. This tool will be used to develop regional project cost estimates and aid in calculating yearly program budgets. The study will also look at how variables, such as length, width, location and construction technique, affect total project cost. Initial findings were presented at the N.C. Stream Restoration Institute Stream Conference in October 2006 and the study will be completed in December 2006. Data derived from the analysis have been used to develop proposed revisions to the schedule of fees applied to the MOU program.

Full Delivery Program

The Full Delivery Program (FDP) procures compensatory mitigation by issuing Requests for Proposals (RFPs) through the N.C. Department of Administration. Each RFP specifies the river basin and cataloging unit within which mitigation is being sought, and the amount and type of mitigation needed (i.e. buffer, stream and/or wetland). Offerors are required to submit both a Technical Proposal and a Cost Proposal for each prospective submittal. The Technical Proposal details: 1) the experience, qualifications and financial stability of the firm submitting the proposal; 2) the geomorphologic features of the site that make it suitable for restoration; and 3) the conceptual plan for restoring the site to a more natural, stable condition, both physically and biologically. The Cost Proposal provides a Unit Cost (i.e. per BMU, SMU or WMU) for the submittal. Qualifying proposals are evaluated based on the technical merits of the restoration and the overall per-unit cost. Firms associated with selected proposals enter into a contract with EEP to convey a conservation easement on the project area to the State, develop and implement a restoration plan, and monitor the project for five years to verify that the restoration meets established success criteria. In FY 2005-06, EEP entered into 35 FDP contracts for 217,336 Stream Mitigation units, 283.6 Riparian Wetland Mitigation units, and 105.5 Nonriparian Wetland units at a cost of $67,571,074.

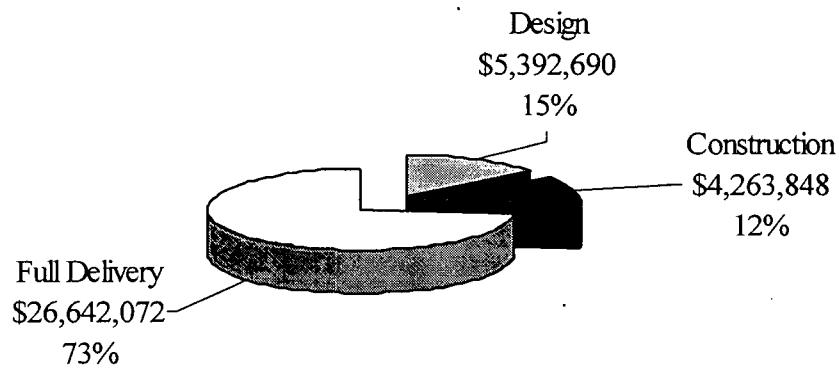
Design-Bid-Build

The Design-Bid-Build Program operates by contracting for specific services for various stages of project development. In FY 2005-06, EEP entered into 50 new contracts (design and construction) as part of this program.

Fiscal Year 2005-06 Payments to Vendors

Payments to vendors totaled $36,298,611 for FY 2005-06. Figure 4 (below) illustrates Full Delivery and Design-Bid-Build payments (shown in the figure as design and construction), but does not include any costs for property acquisition. Appendix B provides a listing of payments by contract type and vendor.

Figure 4 - FY 2005 - 2006 Payments to Vendors



III. Restoration, Enhancement, and High Quality Preservation

Gross Assets

At the end of FY 05-06, EEP had gross assets of 1,399,938 linear feet of stream and 18,932 acres of wetlands in addition to HQP assets. The table below is a summary of gross restoration assets by river basin and mitigation type.

Table 1: EEP Gross Assets FY 05 –06

River Basin	Stream Restoration	Stream Enhancment I	Stream Enhancement II	Stream Preservatioion	Riparian Restoration	Riparian Creation	Riparian Enhancement	Riparian Preservation	Nonriparian Restoration	Nonriparian Creation	Nonriparian Enhancement	Nonriparian Preservation	Coastal Marsh Restoration	Coastal Marsh Creation	Coastal Marsh Enhancement	Coastal Marsh Preservation

Note: EEP's mitigation assets and requirements are accounted for on a cataloging unit basis. This table, along with table 2, is intended as a summary. A complete listing of these tables by river basin *and cataloging unit* can be found in the EEP's Fourth Quarterly Report, located on the EEP website at: http://www.nceep.net/news/eeppublications.htm.

Net Remaining Asset Credits

Table 2 lists net asset credits by river basin for FY 05-06. These are the remaining credit assets after application of credits to compensatory-mitigation requirements. Remaining asset credits are also summarized by credit amounts in the MOA and MOU programs. Assets in this table have been simplified and converted to restoration and restoration equivalents. HQP remaining assets are summarized at the bottom of Table 2.

At the end of FY 05 –06 EEP had remaining unused assets of both restoration and restoration equivalents of:

- Stream: 887,970 credits
- Riparian: 4,609 credits
- Nonriparian: 6,742 credits
- Coastal Marsh: 144 credits

Net remaining assets represent progress that EEP, and its partners have achieved to produce mitigation in advance of impacts and permits. Each of these mitigation assets will be used to offset future permit requirements. Net remaining assets in the MOA program have been developed based on impact projections submitted to EEP by NCDOT. Figure 5, Stream Status, and Figure 6, Wetland Status, show the existing net assets, outstanding requirements, and projected future mitigation needs for all programs.

Table 2: EEP Net Remaining Asset Credits by River Basin, FY 05-06

River Basin	Stream Restoration	Stream Restoration Equivalent	Riparian Restoration	Riparian Restoration Equivalent	Nonriparian Restoration	Nonriparian Restoration Equivalent	Coastal Marsh Restoration	Coastal Marsh Restoration Equivalent

In-Lieu Fee Compensatory Mitigation Programs and Status

EEP currently manages four separate In-Lieu Fee programs: 1) Stream and Wetland In-Lieu Fee Program (as governed by the 1998 MOU), 2) Riparian Buffer In-Lieu Fee Program, 3) Nutrient Offset In-Lieu Fee Program, and 4) Stream and Wetland In-Lieu Fee Program for NCDOT (as governed by the 2003 MOA). Eligibility to participate in EEP's In-Lieu Fee Programs is a joint decision made by the applicants, EEP and the regulatory agencies. In each of these programs, applicants make payments to EEP in lieu of providing mitigation themselves or by other means. Upon successful payment, EEP assumes responsibility for planning, developing and implementing the required types and amounts of mitigation. After successful payment, applicants are no longer liable for the mitigation associated with their payment.

The Stream and Wetland In-Lieu Fee Program provides applicants of Section 404 permits, Section 401 Water Quality certifications, and/or Coastal Area Management Act permits the option to satisfy compensatory mitigation requirements for wetland and stream impacts in all 17 N.C. river basins through payment into EEP's In-Lieu Fee program. Payments made into the Stream and Wetland In-Lieu Fee Program are deposited into Fund 2984 and 2981.

The Nutrient Offset In-Lieu Fee Program is an option to meet compensatory mitigation requirements associated with nutrient offset requirements in the Neuse River Basin. Payments made into the Nutrient Offset In-Lieu Fee Program are deposited into Fund 2982-9829.

Table 3a: Payments (in credits) into MOU Stream and Wetland, Buffer, and Nutrient Offset ILF Programs

Stream:	22,971 credits
Riparian Wetland:	43.6 credits
Nonriparian Wetland:	29.2 credits
Coastal Marsh:	0.2 credits
Buffer:	3,183,304.8 square feet
Nutrient Offset	213,567.9 pounds

The Riparian Buffer In-Lieu Fee Program is an option to meet compensatory mitigation requirements associated with riparian buffer impacts in the Neuse, Tar-Pamlico, and Catawba river basins, and the Randleman Reservoir watershed in the Upper Cape Fear River basin. Payments are made to the Riparian Buffer Restoration Fund (Fund 2982) according to the fee schedules for buffers.

The 2003 Memorandum of Agreement among NCDENR, NCDOT, and USACE outlines the procedures for the NCDOT to utilize the Ecosystem Enhancement Program as an In-Lieu Fee program for NCDOT's offsite stream and wetland mitigation needs and specifies performance metrics for EEP.

In FY 05-06, 152 customers made payments into the Stream and Wetland (MOU) In-Lieu Fee Program. Stream and Wetland In-Lieu Fee payments totaled $5,803,852.50. Of this total,76 customers had requirements from both USACE (404) and DWQ (401), 70 customers had requirements from USACE only and six customers had requirements from DWQ only. Appendix C (Compensatory Mitigation Payments and Requirements) lists the individual payments and requirements, payment date, payment amount, USACE identification and DWQ permit numbers.

During Fiscal Year 05-06, Nutrient Offset payments were made by 302 customers located in the counties of Craven, Durham, Johnston, Pitt, Wake, Wayne and Wilson, and the municipalities of Cary, Durham, Garner, Goldsboro, Greenville, Havelock, New Bern, Raleigh, Smithfield and Wilson. During Fiscal Year 05-06, EEP received $2,349,247 in payments for 213,567.9 pounds of nutrient reduction.

In Fiscal Year 05-06, the EEP received $3,056,867 in payments for 3,183,304.8 square feet or 73.1 acres of buffer mitigation. At the close of the fiscal year, EEP had accepted responsibility for 471.6 buffer acre requirements cumulatively (cumulative payments equaling $19,271,181) since the program's inception from the Cape Fear, Catawba, Neuse and Tar-Pamlico river basins.

Total of all Programs (MOU and MOA) Statewide Status

Figures 5 and 6, below and on the next page, provide a total statewide summary status as of July 22, 2006. The figures depict EEP current gross assets, the mitigation requirements as of July 22, 2006, outstanding mitigation requirements as of July 22, 2006, and the projected future mitigation needs that EEP expects over the next two years. Please note that the EEP tracks credits and credit requirements by program (MOU or MOA), by impact type, and by watershed cataloging unit. All mitigation credits are applied within mitigation type, within CU of impact, and within program unless the regulatory agencies have approved otherwise. In previous reports, the Wetlands Restoration Program listed statewide losses and gains using DWQ's permit information. These graphs reflect the statewide picture of EEP's programmatic gains (credits) and estimated losses (requirements). *(Note: Since mitigation requirements are typically twice as large as actual permitted impacts, the actual losses are approximately one-half the magnitude of requirements shown.)*

Figure 5: Total of all Programs (MOU & MOA) Stream Status

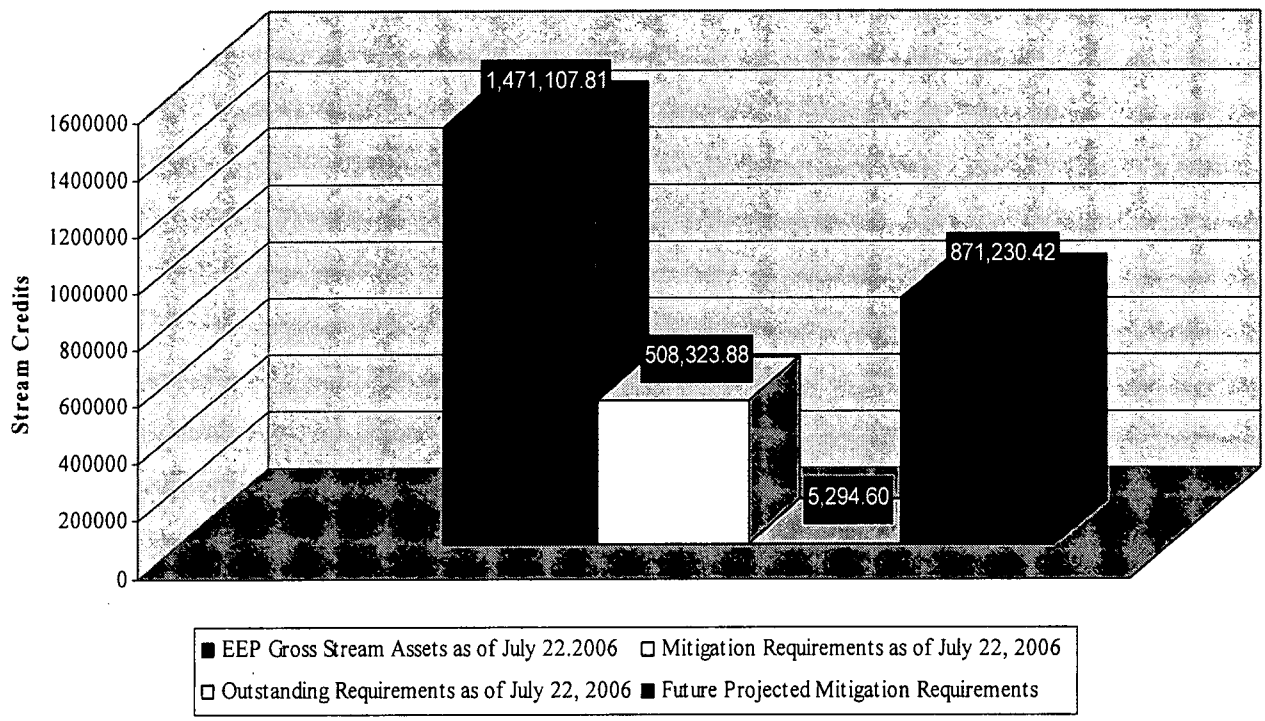

Figure 5 displays the status of the Stream In-Lieu Fee Programs (MOU and MOA). Currently, EEP has instituted 1,471,108 credits of stream mitigation and accepted mitigation requirements of 508,324 credits. Excess mitigation is planned to be allocated to future needs as per agreements. Outstanding requirements equal 5,295 credits.

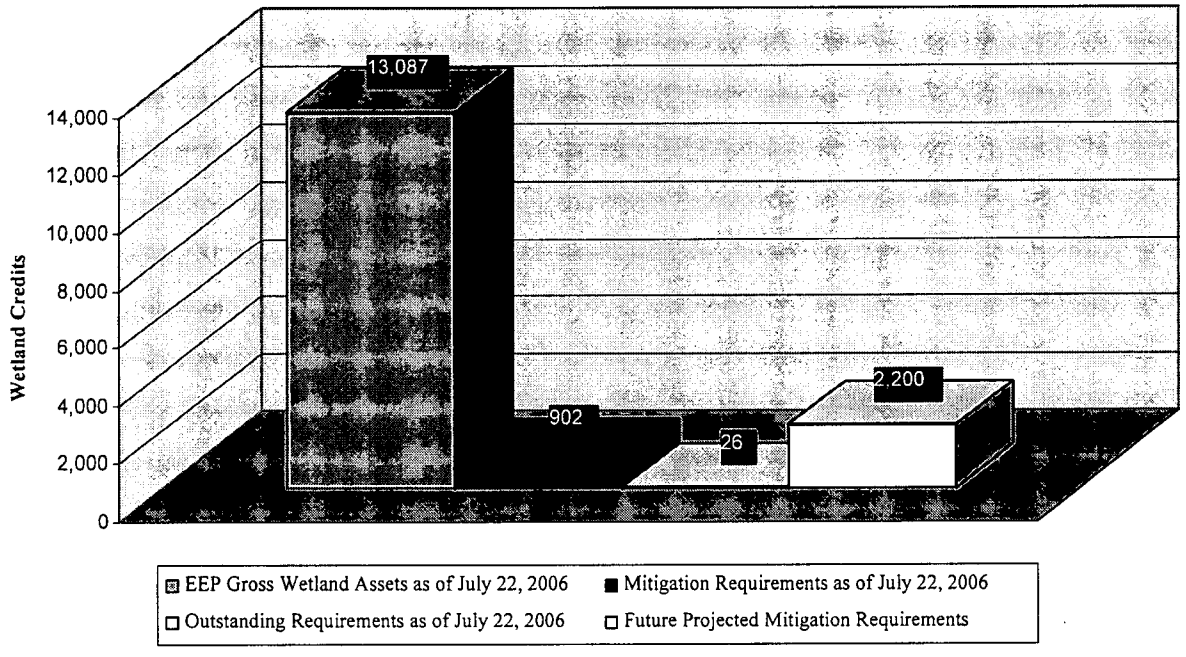
The outstanding requirements represent mitigation needs that are in a different type or cataloging unit location than the assets instituted thus far. EEP is currently working on providing this mitigation. (For more information on EEP's strategies to provide mitigation, see EEP's quarterly reports at www.nceep.net.) In-Lieu Fee Stream and Wetland Compliance is also summarized in Section IV. The generation of mitigation credits in advance of mitigation requirements is a founding principle of the MOA In-Lieu Fee Program for NCDOT. The surplus mitigation currently available in the program is evidence that EEP is succeeding on this front. However, future mitigation demand is expected to be significant over the next three years. As shown in the graph, NCDOT and EEP are projecting mitigation needs of 871,230 stream credits over the next two years. The vast majority of this mitigation need is due to the NCDOT's mitigation advancement schedule outlined in the MOA.

Figure 6 displays the status of the Wetland In-Lieu Fee Programs (MOU and MOA). Currently, EEP is managing instituted assets of 13,087 wetland credits with current requirements equaling 902 credits. Most of these wetland assets (over 7,000 credits) originated from the NCDOT mitigation program that existed prior to EEP's formation. These unused assets were transferred to EEP to be managed within the EEP MOA mitigation program for NCDOT's future mitigation needs. Currently, outstanding requirements equal 26 wetland credits. As shown in the graph, NCDOT and EEP are projecting additional mitigation needs of 2,200 credits over the next two years. On a statewide level, NCDOT and EEP have achieved success for advanced mitigation. However, much of the current advanced mitigation is located in particular cataloging units, whereas the mitigation needs are spread more evenly across the state. Thus, while some cataloging units have already achieved advanced mitigation, others will require additional wetland credit development over the coming years.

Figure 6: Total of all Programs (MOU and MOA) Wetland



The status of the Riparian Buffer In-Lieu Fee Program is illustrated in table 3b on the right. The Riparian Buffer ILF Program has provided all currently required buffer mitigation except for 0.15 credits in Tar Pamlico 03020105. EEP has 82.58 credits of advanced buffer credits upstream in the Tar Pamlico basin (these upstream credits are not allowed to be used to offset the 0.15 deficit) and 213.36 advanced buffer credits statewide.

Table 3b: Riparian Buffer ILF Program Status FY 05—06

	Cape Fear	Neuse	Tar-Pamlico	TOTAL
Mitigation Due	61.56	303.69	21.45	386.71
Mitigation Instituted	61.66	410.95	103.90	599.91

The status of the Nutrient Offset In-Lieu Fee Program is shown in table 3c below. EEP has accepted 526,373.04 total pounds of nitrogen removal in the Neuse River Basin since the program's inception. EEP has instituted projects that will reduce 527,339.68 total pounds of nitrogen. Nutrient Offset projects are currently a combination of traditional Nutrient Offset projects and instituted Riparian Buffer Restoration projects in the Neuse River basin.

Table 3c: Nutrient Offset ILF Cumulative Program Status (Mitigation Nitrogen Pounds)

	Neuse
Mitigation Due	526,373.04
Mitigation Instituted	527,339.68

During the last year, EEP began accepting mitigation payments to reduce nitrogen and phosphorus in the Tar-Pamlico River Basin. The mitigation for these payments are not yet due.

Currently, the cost of reducing nitrogen and phosphorus exceeds the fee schedule. In 2006, DWQ raised fees through rulemaking, but these rules were postponed by the General Assembly so that a cost study could be implemented.

High-Quality Preservation

Working in partnership with local land trusts and other conservation organizations, EEP funded more than 3,000 acres of high-quality preservation (HQP) sites during the current reporting period. Sites were identified by local land trusts, or state conservation agencies as being the best sites available for conservation purchase within each of the eight ecoregions. To qualify as HQP sites, each parcel was approved for acquisition by an interagency committee comprised of conservation and regulatory agency staff. These stream and wetland credits will offset impacts within the ecoregions. In addition, EEP funded restoration of streams and wetlands within the same watersheds as the impacts to assure no-net-loss requirements within those watersheds.

During the current reporting period, the EEP continued to assist in the purchase of parcels to be added to the new Mayo River State Park and an addition to the Caswell game lands. Rare mussel populations were protected by the acquisition of conservation easements on twenty-six new properties in the Upper Tar River basin. Lands along the Uwharrie, Little, Yadkin and Eno rivers enlarged conservation areas targeted through protection plans of land trusts in those areas. Endangered and rare plant habitats were protected in the Pacolet River and New Hope Creek watershed areas.

Forty-six HQP sites were purchased or placed in conservation easements during the current reporting period, and 34.6 miles of streams and 337 acres of wetlands were protected on these sites. Landown-

ers have entered into formal agreements to place 19 additional tracts under permanent conservation easement by signing option agreements with EEP.

EEP Gross HQP Assets:
Since the inception of the program, EEP has protected 232 miles of stream, along with 7,076 acres of riverine wetland and 1,338 acres of non-riverine wetland through HQP acquisitions on 102 parcels of land. More than 35,000 acres of conservation land across the state has been protected through outright purchase or purchase of permanent conservation easements. Table 4 (next page) summarizes gross assets by ecoregion.

EEP Net HQP Assets:
Table 5 (next page) lists the net remaining HQP assets available for future debits by ecoregion. All HQP assets are MOA assets. Gross stream footage and wetland acreages associated with each site are subject to correction as additional survey work is completed on sites.

Fishing Creek Hall, Edgecombe County

Acres: 231.4 acres

Acquisition date: 5/19/06

Nearly 3.5 miles of nationally significant aquatic habitat of Fishing Creek were protected by this conservation easement. High quality coastal plain bottomland forests grow along the creek on this site.

Photo: Tar River Land Conservancy

Across the state, EEP has net HQP assets of 675,994 feet (127 miles) of stream, 6,490 acres of riverine wetlands and 1,053 acres of non-riverine wetland. These assets include properties secured with recorded option agreements, permanent conservation easements and fee simple purchases.

North Pacolet Childers, Polk County

Acres: 39.8 acres

Acquisition date: 10/25/05

This land lies between two other permanently protected conservation lands. Carolina silverbells and sweet shrub, along with foam flower, ferns and trilliums bloom in spring in these rich cove forests.

Photo: Pacolet Area Conservancy

EEP is working through the Conservation Trust of North Carolina and local land trusts to complete acquisition of all HQP sites that have been approved for purchase. In addition, EEP is partnering with The Nature Conservancy, private donors and organizations, and other state agencies to protect streams and wetlands on several large tracts that are currently owned by International Paper Company. Many of these tracts will be open to the public.

Intact riparian corridors and wetland areas perform many functions that are vital to maintenance of water quality and riparian and aquatic species diversity. EEP and the Natural Heritage Program are developing methods to identify core habitat areas throughout the state to aid in establishing focus areas for future protection efforts.

Table 4	HQP Gross Asset Summary by Ecoregion		
Eco-region	**Stream (feet)**	**Riverine Wetland (acres)**	**Non-Riverine Wetland (acres)**
Central Piedmont	432,957.50	488.790	32.450

IV. Stream and Wetland Compliance

MOA Stream and Wetland Compliance

At the close of FY 05-06, the MOA Stream and Wetland program had achieved tremendous success in establishing advanced mitigation as prescribed by the tri-party MOA . The programs compliance and amount of advanced mitigation credits established within the program are summarized in the table below.

Since the MOA program operates within each of the 54 eight-digit Cataloging Unit (CU) watersheds, a small percentage of requirements were not completely fulfilled by the end of FY 05-06. The MOA Stream compliance was 98.43%, Riparian Wetland compliance was 95.60%, Nonriparian Wetland compliance was 99.29% and Coastal Marsh wetland compliance was 100%. The magnitude of outstanding Stream mitigation was 2,523.6 stream credits. The magnitude of outstanding Riparian Wetland mitigation was 4.6 credits. The magnitude of outstanding Nonriparian Wetland mitigation was 2.5 credits. Nine permits needed additional mitigation . The tri-party MOA also specifies that assets utilized for permits achieve a specified completion or phase status. For FY 05-06 permits, assets were required to meet "begin construction" status. The table below summarizes the mitigation compliance, phase compliance, the percentage of assets utilized that exceeded phase, and amount of advanced mitigation.

A complete listing of the MOA permits and requirements not in full compliance and the corresponding EEP CU Action Strategies can be found in the EEP's Fourth Quarterly Report located on the EEP website at: http://www.nceep.net/news/eeppublications.htm.

Table 6 **MOA Program Compliance**	**Stream (credits)**	**Riparian Wetlands (credits)**	**Nonriparian Wetlands (credits)**	**Coastal Marsh Wetlands (credits)**	**Total Wetlands (credits)**
Mitigation Due	161,031.2	103.8	358.6	1.4	463.8
Mitigation Met	158,507.6	99.2	356.0	1.4	456.7
Mitigation Not Met	2,523.6	4.6	2.5	0.0	7.1
Compliance	98.43%	95.60%	99.29%	100.00%	98.47%
Compliance considering Phase	96.23%	87.93%	97.34%	95.71%	95.23%
Percentage of Mitigation Used Meeting Phase	97.79%	95.20%	97.65%	95.71%	96.77%
Percentage of Mitigation Used Exceeding Phase (Monitoring+)	59.95%	87.22%	97.64%	95.71%	93.92%
Total Advanced Mitigation (Undebited)	842,313.7	4,383.3	7,074.5	140.4	11,598.2

MOU ILF Stream and Wetland Compliance

The MOU Stream and Wetland In-Lieu Fee program experienced a similar degree of success during FY 05-06. As of July 22, 2006, the MOU program had 592 total requirements. Of these, 583 are in

full compliance, four have partial compliance and five are in non-compliance. Therefore EEP has 98.48% of all MOU requirements in compliance, 0.68% in partial compliance and 0.84% in non-compliance. Of these nine non-compliant requirements, seven were related to wetland requirements, and two were related to stream requirements.

Table 7 below summarizes the MOU ILF Stream and Wetland program's mitigation due, mitigation met, mitigation not met, compliance, and advanced mitigation amounts:

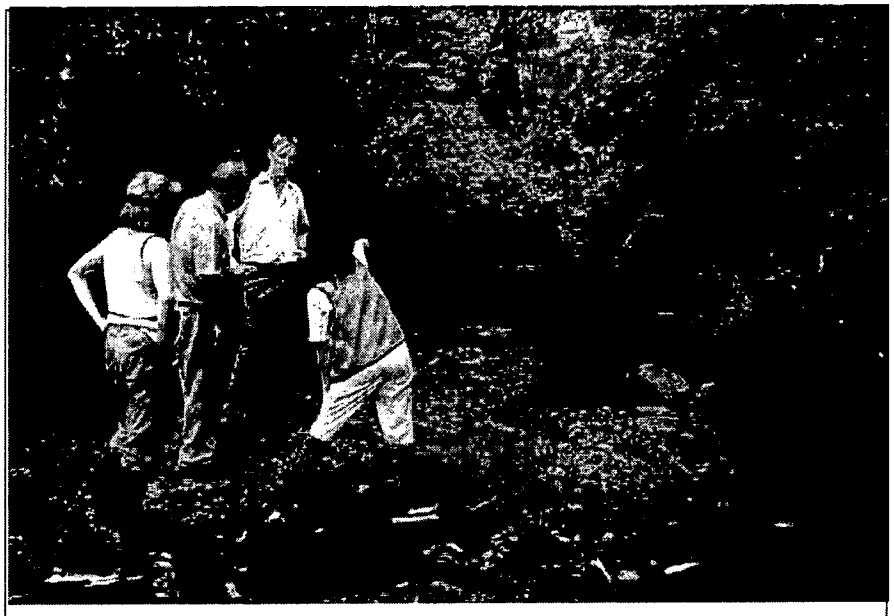
Table 7 MOU Program Compliance	**Stream (credits)**	**Riparian Wetlands (credits)**	**Nonriparian Wetlands (credits)**	**Coastal Marsh Wetlands (credits)**	**Total Wetlands (credits)**
Mitigation Due	347,292.7	299.0	139.1	0.2	438.3
Mitigation Met	344,521.7	287.4	132.1	0.0	419.4
Mitigation Not Met	2,771.0	11.6	7.0	0.2	18.8
Compliance	99.20%	96.11%	94.97%	0.00%	95.70%
Advanced Mitigation (Undebited)	62,871.2	186.7	114.3	3.5	304.6

A complete listing of the program's permits and requirements not in full compliance and the corresponding EEP CU Action Strategies can be found in the EEP's Fourth Quarterly Report, located on the EEP website at: http://www.nceep.net/news/eeppublications.htm.

V: Property Acquisition

During FY 2005-06, the State Property Office closed on 98 parcels associated with preservation and restoration projects, totaling 4,673 acres. Twelve of the acquisitions were outright acquisitions and 86 were acquisitions of conservation easements. Restoration and preservation properties that closed between July 1, 2005 and July 22, 2006 are shown in **Appendix C: Properties Closed**. Acreages are included for sites that have been surveyed to date. Landowners have formally agreed to give EEP the right to acquire an easement or property for all sites listed in **Appendix E: Properties Optioned**.

Appendix F: Cumulative Properties is a cumulative inventory of all properties acquired since the inception of the Wetlands Restoration Program, which was absorbed into EEP in 2003. More than 42,100 acres have been purchased or donated.



EEP Project Managers Julie Vann and Andrea Leslie talk about potential stream restoration with interested landowners in Caldwell County.

VI: Planning and Project Implementation

EEP's Targeted Local Watersheds and Local Watershed Planning areas are priorities for project implementation because they are selected based on analysis of the watersheds' needs for restoration and protection. EEP has identified 26.4 percent of the state as Targeted Local Watersheds and Local Watershed Plans (LWPs) have been conducted in 6.5 percent of the state's geographic area.

Figures 9 through 12 (below and next page) show the distribution of EEP Tier 1 projects as mitigation credits (i.e., restoration, enhancement or preservation projects that are past the acquisition phase, converted into credits). These data are presented separately for the program's two main restoration project delivery systems: Design-Bid-Build and Full Delivery. The figures exclude projects that were transferred from NCDOT or are High Quality Preservation because these projects were identified outside of the watershed planning process. Figures 9 and 10 represent the distribution of Design-Bid-Build stream and wetland projects throughout the state and show that 72.8 percent of stream projects and 71.8 percent of wetland projects have been implemented in EEP Planning areas.

Figures 11 and 12 represent the distribution of Full Delivery stream and wetland projects. These figures indicate that 31.7 percent of stream and 43.6 percent of wetland Full Delivery projects have been implemented in EEP planning areas. EEP is working to increase the congruence of the program's Full Delivery projects with watershed targets. Toward that end, additional weight was recently added to the environmental-justification component of the review criteria for these types of projects.

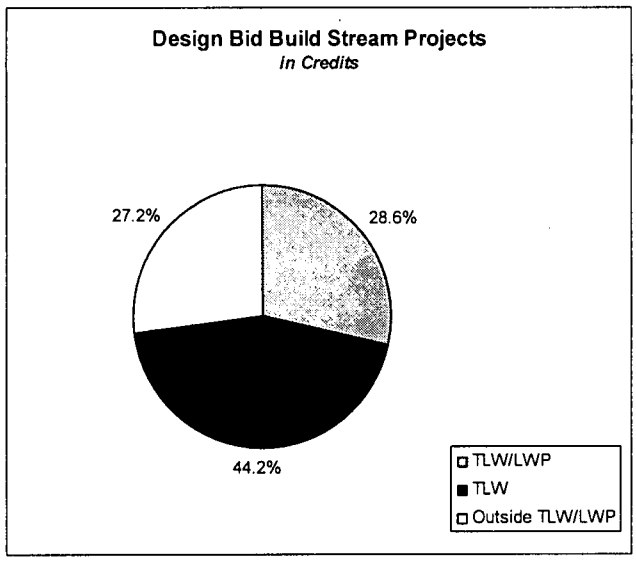


Figure 9. Distribution of Design-Bid-Build Stream Projects within EEP Targeted Local Watersheds Watershed Planning Areas

The data show that for Design-Bid-Build projects, 28.6 percent of stream credits and 10.7 percent of wetland credits are located in LWPs. Due to the large mitigation needs in a short period of time, LWP opportunities have not yet been fully realized. As more LWPs are completed and move into implementation, EEP expects more projects to come from the Local Watershed Planning areas.

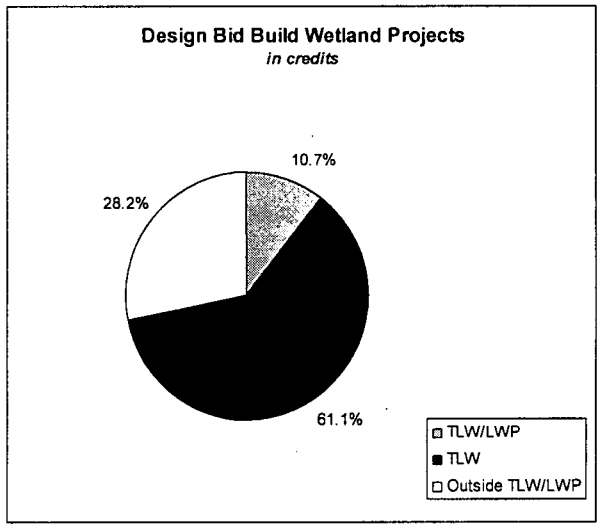

Figure 10. Distribution of Design-Bid-Build Wetland Projects within EEP Targeted Local Watersheds and Local Watershed Planning Areas

Watersheds and Local Watershed Planning Areas.

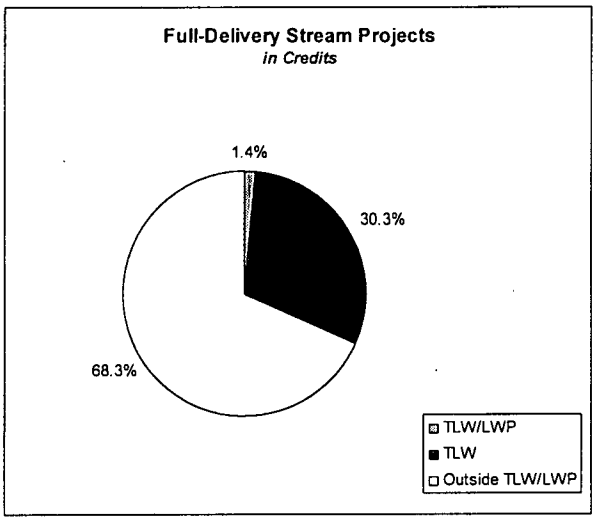

Figure 11. Distribution of Full Delivery Stream Projects within EEP TLWs and LWPs.

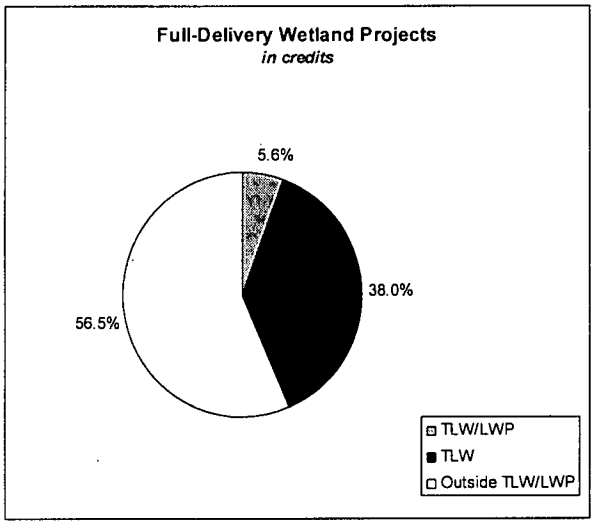

Figure 12. Distribution of Full Delivery Wetland Projects within TLWs and LWPs.

During the past year, EEP has conducted further evaluation of all of its LWPs. Staff has carefully reviewed each completed or ongoing LWP and its supporting documents and data, and the results demonstrate the far-reaching benefits of the planning process.

To cater LWPs to EEP's compensatory mitigation needs, atlases of potential projects are now included as a product of the watershed assessment and management report. These atlases detail opportunities for restoration, preservation and enhancement of streams, wetlands and riparian areas and relate them to watershed benefits. Statewide, LWP atlases have detailed over 320 miles of potential stream restoration, 7,300 acres of wetland restoration, and 625 acres of riparian reforestation opportunity.

Additionally, plans identify potential stormwater and agricultural best-management practices (BMPs). These practices can be particularly relevant to watersheds with degradation related to sedimentation or nutrient enrichment. In existing atlases, projects have been identified to treat nearly 50,000 acres of stormwater runoff, while potential BMP's on agricultural land have been identified to treat 65,000 acres of runoff.

Local Stakeholder Efforts/Leveraging Resources

Many LWPs have been used by local stakeholders to leverage additional support for watershed restoration efforts beyond that which EEP can do for mitigation credit. For example, the Mud Creek LWP is part of an integrated effort by the Mud Creek Watershed Restoration Council to restore the Mud Creek watershed. After the watershed plan was developed in 2003, the Council obtained U.S. Environmental Protection Agency (EPA) funds to hire a watershed coordinator. This coordinator has been the central advocate for stormwater education, stream and riparian restoration, and agricultural and residential BMPs in the watershed. They have successfully applied for Section 319 grant funds to continue education efforts, plant riparian buffers, and fund apple pesticide-reduction BMPs.

While EEP is currently implementing projects identified in the New Hanover County LWP, including stream restoration on Mineral Springs Branch and Burnt Mill Creek, the Watershed Education for Communities and Officials (WECO) at N.C. State University has received Section 319 grant funds ($600,000) to continue work in the Burnt Mill Creek Watershed. Building on the efforts of the participants in the New Hanover LWP, WECO continues to meet with stakeholders in the Wilmington, N.C. area to develop stormwater management projects and facilitate education and outreach.

Mud Creek and the partners in the Morgan and Little Creeks Local Watershed Plan have been targeted by EPA and the NCDENR Non-point Source Program for participation in an aspect of the Section 319 grant that will support local "champions" to implement their watershed restoration plans. With a focus on the Bolin Creek portion of the LWP, members of the original Morgan and Little Creeks stakeholder group continue to meet and are preparing a proposal to the Clean Water Management Trust Fund to continue efforts to restore their watershed, including implementation of some of the stormwater BMP retrofits identified in the LWP. Ongoing EEP implementation of projects identified in the LWP, such as projects on Morgan Creek and Chapel Creek, can potentially be used by this group as matching funds toward such grants.

Watershed Monitoring

LWPs have produced original data on stream conditions statewide. Twenty LWPs used channel assessment methods, such as the Natural Resources Conservation Service's Stream Visual Assessment Protocol, to examine and evaluate

SPECIES OF CONCERN IN LWP AREAS: FISHING CREEK CASE STUDY

- Earlier plans addressed Species of Concern (SCs) in the screening phase only as a GIS coverage of heritage point occurrences
- Project recommendations tended to avoid stream and wetland projects that might impact SCs in any way, negatively or positively
- The current direction of LWP 's is toward addressing issues related to SCs wherever improvement goals overlap with mitigation goals
- The Fishing Creek LWP is one of the first plans attempting to incorporate rare species protection and improvement with EEP's general goals of providing watershed functional uplift via mitigation projects
- The projects that EEP will recommend for the LWP will be prioritized to encourage instream habitat improvements in heavily sedimented reaches and highly erodible areas: the object is to reestablish good instream habitat and connect it to population sources for rare native bivalve species
- Part of the initial biological monitoring for Fishing Creek and its tributaries included fish sampling
- Particular fish species play a role in the life cycle of many of these bivalves; they carry the mussel juveniles or glochidia in their gills until the mussels are ready to "fall out" to develop into adults in appropriate benthic areas of high quality streams
- Discreet segments of streams were identified during preliminary watershed characterization as suitable for SCs
- LWP recommendations will address projects within prioritized catchments
- Modeling will be done using collected WQ and biological data to determine which catchments should receive priority
- Within these catchments, projects will be evaluated to determine relative importance to habitat and water quality improvement
- High priority projects within high priority catchments will be the focus of the first round of project implementation.

individual reaches of streams during the Detailed Assessment phase of the planning process, compiling records on the conditions of the channel for a total of 192 miles of stream. Approximately 4,630 water samples have been taken by DWQ at 82 stations, generating original data on 103 water quality parameters in LWP areas. Table 8 (below) reports the total number of samples and stations for the parameters, which have been grouped into 14 categories. This effort has provided a record of conditions in streams and supported the process of characterizing watershed conditions and setting priorities for restoration used by planners and stakeholders. Intensive assessment efforts during early phases of planning contributed to removal of two streams from the 303(d) list of impaired streams, an important example of cooperative use of data generated through LWPs.

Table 8. Water Quality Assessment in Support of Local Watershed Plans

PARAMETER	TOTAL # OF SAMPLES	TOTAL # OF STATIONS
Water Temperature (°C)	365	81
Dissolved Oxygen (mg/L)	365	81
pH	350	78
Specific Conductance (µS/cm)	367	76
Turbidity (NTU)	181	57
Salinity (PPT)	47	21
Total Residual Chlorine (µg/L)	12	3
Fecal Coliform (colonies/400 mL)	135	31
Nutrients	539	31
Metals	2007	31
Organic Compounds (pesticides, herbicides, etc.)	108	12
Organic Carbon	8	2
Suspended Residue	134	31
Miscellaneous	12	10
TOTAL	4630	82

Methods Development

Some LWPs have a secondary goal of producing methodologies where none exist, or where current methods are inadequate to support restoration recommendations. One such case is the development of a coastal plain stream assessment methodology. In recent years as the science and art of stream restoration has matured, mainstream stream assessment has become a combination of Rosgen-based classification and rapid assessment protocols. Due to differences in topography and the general nature of coastal streams, these methods often failed to yield useful results that clearly differentiated types and habitat conditions of streams in coastal North Carolina. East Carolina University researchers proposed a different, reference-based methodology that utilized more subtle indicators to determine habitat condition than did the prior methods. Working with consultants and DWQ and EEP staff, the methodology was tested in three LWP areas. The collaboration yielded the basis for future stream assessment in coastal plain LWP areas.

The coastal plain stream assessment methodology makes use of traditional indicators found in established protocols as well as innovative new ones. One-hundred-meter sampling sites are categorized based on land use and stream order; sampling sites fall into one of four categories: (1) urban, low order; (2) urban, high order; (3) agricultural, low order; and (4) agricultural, high order. Streams larger than fourth order are too large to be assessed with this method. Using traditional restoration practices, EEP typically does not attempt full restoration projects in streams larger than fourth order; the risk of failure and costs of construction are significantly greater in very large streams. Each category is assessed differently using eight or nine indicators of stream and riparian habitat integrity; indicators represent the major functions of a watershed, hydrology, water quality, and habitat, both in-stream and ri-

parian. In the three test LWP areas, 277 sites were categorized then scored in the field. The 277 sites provided enough data to adequately calibrate the method for agricultural areas, but the urban method required more data. Preliminary results indicate that this method performs better in the inner coastal plain. Currently, additional efforts to refine the urban indicators and to develop new estuarine indicators for the outer coastal plain are underway in a new LWP area.

GIS Dataset Development

The Tennessee Valley Authority performed an Integrated Pollutant Source Identification for the 143-square-mile Peachtree-Martins Creek LWP extended area in Western North Carolina. They conducted low-altitude color infraed photography in winter 2005 and developed an extensive GIS dataset, including land cover, impervious surface, road network, and stream and buffer datasets. This GIS dataset will complement IPSI datasets already developed for adjacent areas in the Hiwassee basin, bringing the total area covered to 355 square miles. These data are essential for the work performed by local resource professionals, the Hiwassee River Watershed Coalition, local governments and EEP.

Local Conditions: Ordinance Evaluation and Predicting Change

Several Local Watershed Plans have incorporated evaluations of the local ordinances and development regulations and produced recommendations that would either remove barriers to, or enhance protection of water quality and habitat. The Morgan and Little Creeks and the Middle Cape Fear LWPs used the Better Site Design Questionnaire from the Center for Watershed Protection to identify specific actions local government agencies could take to reduce requirements for unnecessary impervious surfaces, enhance protection of existing natural areas, and reduce the impacts of stormwater in their communities. Participants from the local planning departments compared their scores on the questionnaire and examined changes in rules and practices that could lead to increased scores and consequently improved watershed management in their local communities.

LWPs often incorporate the use of models to predict impacts on water quality and quantity of changes in the watershed. Sometimes this is as simple as the projection of development and impervious surfaces when the current zoning in completely built out. In addition, plans sometimes examine how the built out watershed might affect parameters such as nutrients and sediment loads, with and without the recommended restoration projects and BMPs. Plans sometimes combine these projected impacts with estimates of the costs of the potential projects to provide an analysis of cost-effectiveness and a ranking of the projects.

Of the 22 completed Local Watershed Plans, the following summary statistics apply:

Total area covered = 2,347 square miles

Number of counties = 32

Predominant land use type: 2 planning areas primarily rural; 14 with mixed land use; 6 primarily urban

Geographic regions: 11 in the eastern region; 6 in the central region; 5 in the western region

Number of plans producing Project Atlases = 20

Number of plans in which public meetings have been held (in addition to stakeholder meetings) = 11

Summary of Local Watershed Plans, 1999-2006
As of July 1, 2006, EEP has engaged in a total of 34 LWP initiatives, comprising a total area of approximately 3,100 square miles and portions of 46 counties (of 100 total counties) across the state. The average area covered by an individual LWP effort is 94 square miles. Of the 34 total LWP initiatives, 22 are complete as of July 1, 2006. The completed plans comprise an area of approximately 2,347 square miles. Of the 22 completed LWP efforts, 11 have had Phase IV tasks initiated; these are areas in which a focused effort to implement LWP projects has begun, often using outside consultants or groups. All 22 areas for which final plans have been produced have some level of effort currently being applied towards implementing projects identified in the LWP.

Ongoing Local Watershed Plans
Appendix G presents a summary of ongoing Local Watershed Plans; these are efforts that haven't yet produced a final *Watershed Management Plan* or *Project Atlas*, but which should be doing so within the next six to 18 months. There are 12 plans in various stages of development and expected to be completed later in 2006 or in 2007. These plans encompass approximately 784 square miles (excluding the White Oak planning area, for which specific component HUs have yet to be determined).

Completed Local Watershed Plans
During the 05-06 fiscal year, Local Watershed Plan Phases I through III were completed for the following five local watersheds (8-digit CU in parentheses): in the Eastern region – Bear Swamp and Lumber River (Lumber 03040203) and Stoney Creek (Neuse 03020202); in the Western region – Bald Creek (French Broad 06010108), South Hominy Creek (French Broad 06010105), and Cathey's Creek (Broad 03050105). Appendix H presents a summary of completed plans.

In order to support the Tri-Party MOA goal of achieving mitigation in advance of permitted impacts, in certain areas EEP employs an abbreviated (or "Fast Track") approach for the development and implementation of Local Watershed Plans. The Fast Track strategy can accelerate the procurement of restoration, enhancement and high-quality preservation projects within targeted local watersheds with urgent needs for compensatory mitigation, typically over a nine- to 12-month period.

Local Watershed Plans and their associated documents can be reached through a clickable map on the EEP website (http://www.nceep.net/services/lwps/localplans.htm). This map links to fact sheets on individual plans, and within the fact sheets are links to documents such as the Plan Summary and supporting reports, which can be downloaded in their entirety. Examples are the Stoney Creek Local Watershed Plan in the Eastern Region (http://www.nceep.net/services/lwps/Stoney%20Creek/Stoney_Creek.pdf), the Morgan and Little Creeks Local Watershed Plan in the Central Region (http://www.nceep.net/services/lwps/Morgan_Creek/Morgan.pdf), and the Little River and Brush Creek Local Watershed Plan in the Western Region (http://www.nceep.net/services/lwps/Little_River/Little_River.pdf). The latter plan illustrates the new Fast Track approach, the former two plans are more traditional..

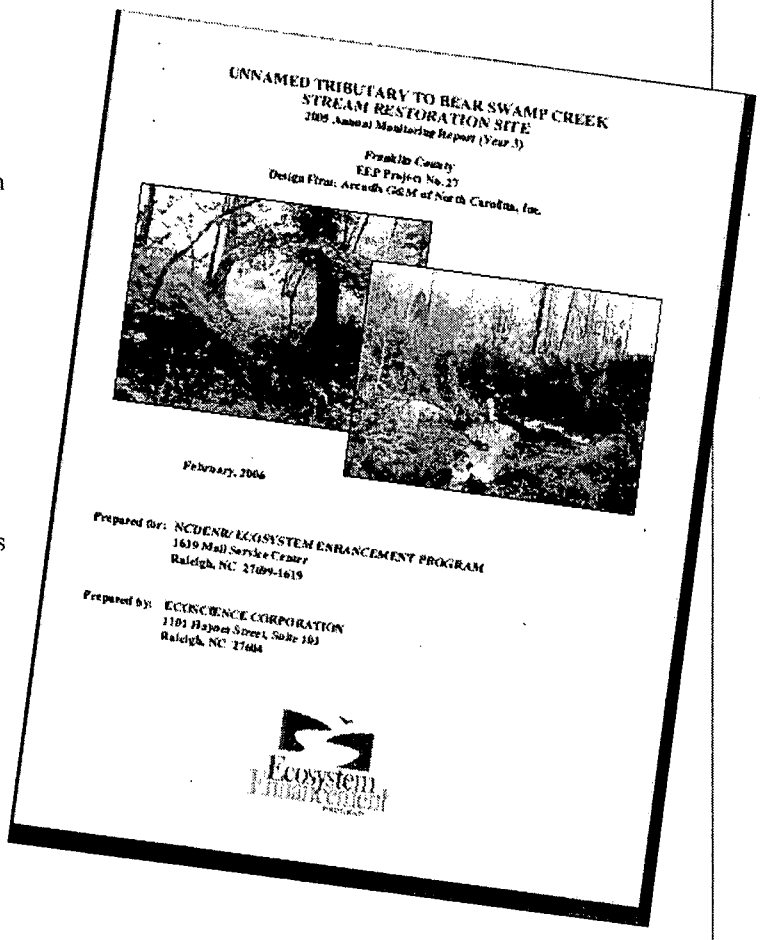
VIII: Monitoring Reports

For FY 2005-06, EEP monitored 77 restoration and enhancement projects. Appendix I lists the reports. Monitored this year are 19 wetland restoration projects, 47 stream restoration projects, and 11 projects with both wetland and stream components. These projects totaled 7,983 acres of wetland restoration, enhancement and preservation and 257,612 linear feet of stream restoration, enhancement and preservation.

Monitoring reports are available for review on the EEP Web site at http://www.nceep.net/business/monitoring/Monitoring_report_web/Projects_By_Basin.htm

Monitoring Report Example:
Excerpts from Bear Swamp Creek Executive Summary

The Unnamed Tributary to Bear Swamp Creek Stream Mitigation Site (hereafter referred to as the "Site") was constructed for the North Carolina Ecosystem Enhancement Program (EEP) to provide compensatory stream mitigation in the Tar/Pamlico River Basin. This stream restoration project is located on an unnamed tributary to Bear Swamp Creek at the Murphy Hay Farm just north of the Town of Louisburg.



UNNAMED TRIBUTARY TO BEAR SWAMP CREEK
STREAM RESTORATION SITE
2005 Annual Monitoring Report (Year 5)
Franklin County
EEP Project No. 27
Design Firm: Arcadis G&M of North Carolina, Inc.
February, 2006
Prepared for: NCDENR/ ECOSYSTEM ENHANCEMENT PROGRAM
1619 Mail Service Center
Raleigh, NC 27699-1619
Prepared by: ECOSCIENCE CORPORATION
1101 Haynes Street, Suite 103
Raleigh, NC 27604

This project involves the permanent exclusion of cattle from the stream, stabilization of eroding stream banks, installation of cross-vane structures for habitat, and the planting of a forested riparian buffer.

Vegetation Monitoring
Vegetation success criteria for the forested riparian restoration areas is based on a minimum survival of 320 stems per acre of planted species at the end of Year 5. Volunteer woody vegetation will also be included in the survivability calculations. Based on the third year surveys, the average count of the surviving planted species is 620 stems per acre. If volunteer species are included, the total number of stems increases to 8,120 stems per acre.

The Site is meeting the established success criteria for vegetation based on the survival of the planted species.

Stream Enhancement Monitoring
Success criteria for the restored stream reach has been established to confirm no significant changes have occurred to the dimension, pattern, profile, and bed material over the 5-year monitoring period. Location surveys of the constructed features were conducted to verify the performance of the stream. A total station survey was used to describe the stream longitudinal profile and five permanent stream crosssection (3 riffles and 2 pools). A modified Wolman pebble count and assessment of the constructed features was also undertaken. Overall, the stream channel bed form is stable.

Based on the cross-sections and visual observations, the channel dimensions have not changed significantly. However, observed features and surveyed cross-section indicate that the channel has narrowed slightly and is developing a bankfull bench at many locations. The stream was designed as a B5c (step-pool) stream (Rosgen 1996), which provides a sand bed channel with moderate entrenchment and a moderate width-depth ratio. The current classification measurements are split, with the current channel exhibiting the moderate entrenchment characteristic of a B-channel, yet exhibiting a very low width-depth ratio of an E-channel.

IX: Organizational Support Activities

This section of the annual report focuses on activities and actions that the EEP has taken over the past year to support mitigation production, improve processes, communication, projects, and efficiencies, and to promote a better understanding of the EEP.

EEP Organizational Improvement

When EEP was established in 2003, there were two distinct divisions, Planning and Implementation, each working toward the same goal but following slightly different paths. As EEP grew, these divisions were further broken into Eastern and Western Planning, as well as Eastern and Western Implementation, still working somewhat independently. In an effort to improve efficiency and more closely align itself with the MOA, EEP reorganized in January 2006. A major part of this reorganization was establishment of the Watershed Planning and Project Implementation (WPPI) section. WPPI combined the Planning and Implementation functions into three groups, East, Central and West. These groups consist of Planners and Project Managers working in concert to develop Local Watershed Plans (LWPs) and implement restoration projects that are identified and prioritized in the LWPs.

This alignment of Planners and Project Managers is producing increased interaction and cooperation between the two program functions, and will better serve to improve both the LWPs and the projects they provide. Project Managers are becoming more involved in the development of the LWPs in their assigned work areas by assisting the Planners in assessing the planning areas and providing technical knowledge regarding availability of restoration activities. In addition, Project Managers are gaining a more thorough understanding of the reasons for undertaking a planning effort in those areas and the goals and objectives of the plans. At the same time, Planners are being called upon to help in the site assessment and design phases to ensure that the project sites being pursued are those that will: (1) provide greater ecological improvement within the watersheds by addressing the critical issues that were identified during the planning process; and (2) meet the goals and objectives laid out in the LWPs. Even though this reorganization is fairly recent, it has already improved the functions and capabilities of each group within WPPI.

EEP Staff inspect a rock vane structure at the King Creek stream restoration project site in Brevard.

"Groundtruthing" Potential Projects Identified by Local Watershed Plans

WPPI regional sections have begun an exercise called "groundtruthing," It involves identifying priority Cataloging Units consistent with the Operational Strategic Plan; and sending teams of Planners and Implementers to each of the Local Watershed Planning Areas in these CUs to visit each potential project identified and evaluated in the Project Atlases associated with the Plans. Staff conduct field evaluations of the feasibility and potential assets associated with each of the potential projects, and enter these into the Project Tracking System database. WPPI staff then follow-up on the best projects by contacting the landowners to learn of their interest in participating in restoration activities with EEP and willingness to agree to conservation easements, construction and long-term stewardship on their land. In this way, the connection was immediately strengthened between the formerly separate units of Planning and Project Implementation, and potential projects that had been evaluated in Local Watershed Plans were fully integrated into the EEP mitigation credit accounting system. This turned out to be invaluable during the Strategic Planning process, as participants could view the assets associated with potential projects coming from Lo-

cal Watershed Plans directly in the context of their deliberations over how to meet EEP's future need for mitigation credit.

WPPI Staff Training and Development:
Since its inception, EEP has hired a number of new technical staff. The new staff come from a variety of backgrounds including research, regulatory, planning, and consultant, with varying degrees of expertise in varying environmental and watershed restoration science, engineering and planning fields. Watershed planning and restoration requires a core knowledge of all these fields. In the past, on-the-job training combined with limited additional courses or workshops was adequate to fulfill the staff training and development requirements for EEP's predecessor, the Wetlands Restoration Program. However, considering the amount of mitigation required to be implemented and the amount of new staff hired since the inception of EEP, it was determined that a more deliberate approach to staff training and development was needed.

EEP established a base training requirement for each of its watershed planning and implementation staff positions in addition to its on-the-job training activities. The base training includes assessment and restoration principles, watershed planning, policy and procedures, ecosystem science, best management practices, electronic tools and skills training, and contract management. As of June 30, 2006, the majority of WPPI staff had completed base requirements.

Contractor Training
EEP recognizes that adequately trained contractors are required to achieve successful project implementation. EEP also recognizes the need for more qualified stream and wetland construction contractors in North Carolina. In response to this need, EEP teamed with the N.C. State University Stream Restoration Institute (SRI) to develop a workshop for contractors interested in the construction of stream-restoration projects. The SRI Contractors Training has been offered on three occasions since December 2005. Each workshop has consisted of classroom presentations and field demonstrations, with a focus on three important topics: contracts, construction techniques, and sediment- and erosion-control measures.

In coordination with the N.C. State Construction Office and other partners, EEP recently standardized construction contract documents and payment schedules. Workshop attendees were educated on the following:

- Design development, review, and permitting
- Project advertisement, bid document, and schedule of unit prices
- Project bidding and contract execution
- Construction milestones and construction issues (e.g., rain delays, liquidated damages)
- Minority Business Enterprise (MBE) requirements.

In addition to a sound design, successful project implementation also requires proper project installation. Attendees were given field demonstrations of:

1. Channel excavation
2. Structure installation
3. Proper ground preparation, soil amendments, mulch selection, matting installation, and vegetative seeding methods
4. Woody stem selection and installation

EEP has worked with the NCDENR Division of Land Quality to develop a comprehensive sedimentation- and erosion-control program for stream- and wetland-restoration projects. Workshop attendees were provided classroom and field instruction on:

1. The basic tenants of the Sedimentation Pollution Control Act of 1973 and the importance of S&EC Plan compliance.
2. Proper installation and maintenance of sediment and erosion control devices.
3. How to interact with Land Quality Division inspectors, what an inspector looks for, and how to answer an inspector's questions.
4. Land Quality Division inspection reports, enforcement mechanisms, and contractor liability to EEP.

As a result of the positive feedback and comments received from the contractor community, efforts are now underway by to establish a contractor pre-qualification process for EEP construction projects. The next SRI Contractors Training will be offered in December 2006, and contractor pre-qualification will be an additional topic.

FEMA Process Streamlining

The Federal Emergency Management Administration (FEMA) is responsible for the management of the National Flood Insurance Program (NFIP) and the enforcement of federal floodplain regulations. FEMA regulations restrict modifications to properties within floodways and minimize changes in the elevation of the 100-year floodplain. FEMA compliance can impact project-implementation schedules and costs due to additional hydraulic modeling requirements, permit review process and permit fees.

During the 2005-2006 timeframe, FEMA was in the process of delegating regulatory responsibility to the state, and at the same time revising the boundaries of the state's regulated floodplains. These efforts would affect the number of waterways under FEMA jurisdiction and how these waterways would be managed. As a result, many EEP stream-restoration projects were destined to become subject to federal floodplain regulations and would be reviewed by officials unfamiliar with stream-restoration practices.

EEP recognized the potential for project delays and chose to engage the regulatory community in an effort to streamline FEMA processes. EEP met with NFIP and the N.C. Floodplain Mapping Unit (NCFPMU), the agencies responsible for floodplain management in the state. The following objectives were met as a result of this coordination:

1. EEP and NFIP gave a joint presentation on stream-restoration project scenarios and floodplain regulation compliance at the April 2005 N.C. Association of Floodplain Managers Conference.
2. In July 2006, the EEP floodplain compliance procedure was approved. All layers of compliance were streamlined including notification, certificate of compliance, no-rise certificate, Conditional Letter of Map Revision (CLOMR), and Letter of Map Revision (LOMR).
3. A Floodplain Requirement Checklist was developed for use on all EEP-funded projects

Over the next year, EEP plans to meet regularly with NFIP and NCFPMU to ensure programmatic compliance with floodplain regulations and improve the efficiency of regulatory review. EEP will work towards a Memorandum of Understanding between EEP, NFIP and NCFPMU that further streamlines FEMA compliance and coordinates information exchange.

Contractor Vegetation Training

In addition to on-site review involving project managers and designers, a three-day workshop focused on establishing vegetation and vegetation monitoring was presented in June 2006. The schedule for the first day included presentations and activities focused on improving planting plans, planting plan format, species lists, exotic invasive control, and how to handle various problems related to success of vegetation. The schedule for the second and third days focused on the CVS-EEP Protocol for Recording Vegetation to representatives from all the On-Call design firms, currently engaged in monitoring contracts. Attendees were given hands on experience with the tasks of setting up sample plots, recording vegetation, and entering data using a recently developed MS Access data entry tool.

Application of a New Vegetation Monitoring Protocol

After evaluating the vegetation data status of all the projects currently being monitored, 15 (or one to three per On-Call Design Firm) were selected to be monitored according to the newly developed CVS-EEP Protocol for Recording Vegetation. The selected projects will serve as a pilot test for a developing a process involving data exchange between the On-Call designers, EEP and CVS. Additionally, the new monitoring protocol is being incorporated into all new EEP projects, and will likely be applied to a greater number of existing projects in the future.

Research

During the fiscal year 2005-06, EEP has begun to develop and formalize a research program. The purpose of the research program is to improve EEP effectiveness by helping increase project success and reduce costs. The program encompasses three broad focus areas: functional assessment, catchment studies and restoration methods. Primary goals include:

- Improving project success, reduce maintenance requirements and overall costs by increasing understanding of the limitations and applicability of specific restoration methods;
- Improving the ability to measure and demonstrate success both at individual project scale and larger watershed scales;
- Improving monitoring methods and reducing monitoring costs;
- Providing quantitative measures of effectiveness of alternative mitigation strategies at watershed scales; and
- Contributing to the advancement of restoration ecology and the technical practice of wetland and stream restoration.

Current projects underway in support of EEP's research program include:

- N.C. vegetation survey (with N.C. State University and UNC-Chapel Hill);
- Urban stream nitrogen uptake study (with Duke University);
- Urban stream reference and outer coastal plain assessment (with East Carolina University);
- North River farms (with N.C. State University; and
- Sand bed streams sediment study (with Buck Engineering, part of a cooperative agreement with EPA Region IV).

In fiscal year 2005-06, several projects were completed or final reports were received. These include:

- Brinson, M. M.; Miller, K.H.; Rheinhardt, R.D.; Christian, R.R.; Meyer, G.F.R.; and

O'Neal, J. April 2006. Developing reference data to identify and calibrate indicators of riparian ecosystem condition in rural coastal plain landscapes in North Carolina. Report to the Ecosystem Enhancement Program, N.C. Department of Environment and Natural Resources, Raleigh, N.C

- Rheinhardt, R.D.; Miller, K.H.; Christian, R.R.; Meyer, G.F.R.; Bason, C.W.; Hardison, E.C.; and Brinson, M.M. (August 2005). Applying Ecological Assessments to Planning Stream Restorations in Coastal Plain North Carolina. Report to the Ecosystem Enhancement Program, N.C. Department of Environment and Natural Resources, Raleigh, N.C

Copies of these two final reports are available on the EEP "resources" web site (http://www.nceep.net/pages/resources.htm) under "Papers."

Construction Related Document Format and Review

New standards for the format of construction-related documents are being developed to ensure the information derived from EEP's experience and monitoring data is incorporated into future projects. Additionally, the processes for distribution and review of construction-related documents are being revamped. By involving the Vegetation Specialist in the formal review process, a more thorough documentation and review of what is being proposed and approved with regard to vegetation will be possible.

Information Management

EEP has signed a contract for programming of an information/data management system. The system will automate reporting, accounting of impact projections, permit requirements and due dates, asset and project tracking and credit management. Beta testing is expected to begin in summer 2007.

Policy, Process, and Procedures

EEP continues to improve and develop operating procedures. The EEP Policy, Process and Procedures Manual is located on the EEP web-site at: http://www.nceep.net/abouteep/analysis_procedures.htm.

Establishment of the Western EEP Regional Field Office

Because of a high volume of projects in the west, EEP established offices for its Western Regional Office in Swannanoa. Benefits include increased productivity; decreased travel time and expenses; fostering improved local relationships; fulfilling the goals of mitigation on a watershed level; and increasing safety.

List of HU's in which credits can be utilized:	03030004 03030005 03030006	Neuse 01, 02, 03, 04
This Bank produces: (select all that apply)	Wetland Credits	Wetland Credits & Stream Credits
What is the total cost per acre?	$8,675	$5,639
What is the cost/acre of Land purchase?	$3,296	$2,143
What is the cost/acre of Pre-Monitoring?	$93	$113
What is the cost/acre of Design?	$661	$1,015
What is the cost/acre of Construction?	$3,179	$1,297
What is the cost/acre of Hydrological Modifications (includes cost of structures)?	$89	included in Item 8
What is the cost/acre of Planting?	$409	included in Item 8
What is the cost/acre of Post Monitoring?	$507	$846
What is the cost/acre of Long-Term Management?	$441	$226
What is the total cost per linear foot?		$180
What is the cost/linear foot of Land purchase?		$59
What is the cost/linear foot of Pre-Monitoring?		$4
What is the cost/linear foot of Design?		$40
What is the cost/linear foot of Construction?		$50
What is the cost/linear foot of Hydrological Modifications (includes cost of structures)?		included in Item 8
What is the cost/linear foot of Planting?		included in Item 8
What is the cost/linear foot of Post-Monitoring?		$20
What is the cost/linear foot of Long-Term Management?		$7
How many acres of RESTORATION?	425	277 WMU and 277 acres
How many acres of ENHANCEMENT?	172	5 WMU and 10 acres
How many acres of CREATION?	0	0
How many acres of PRESERVATION?	26	233 WMU and 1165 acres
Please list the total number of credits (that the bank started with) by credit type. For example: 20 non-riparian restoration credits 10 non-riparian enhancement credits etc.	240 non-riparian credits	515 WMU 22, 645 SMU
How many credits of each type have been sold?	240 non-riparian credits	465 WMU 22,500 SMU
How many credits of each type are remaining?	0	50 WMU no SMU
What is the cost of one Salt-water wetland credit in your bank? (What you charge to sell 1 credit)	n/a	N/A
What is the cost of one Riparian wetland credit in your bank? (What you charge to sell 1 credit)	n/a	$35,000-$40,000
What is the cost of one non-riparian wetland credit in your bank? (What you charge to sell 1 credit)	$25,000	$25,000-$30,000
What is the cost of one Stream credit in your bank? (What you charge to sell 1 credit)	n/a	N/A

Appendix G Local Watershed Plans (Phase III) Completed as of July 1, 2006

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]	Phase IV Completion Date and Comments (if applicable)
Lower Cape Fear [East]	03030007	140010	Northeast Cape Fear tributaries [80 sq. mi.]	Sept. 2000	- 100% complete - Many projects identified, including stormwater BMPs; several funded (and/or funding being sought)	Completed December 2002 [KCI]	WECO pursuing stormwater BMPs through Section 319 Grant Funding
Upper Neuse [East]	03020201	060010	Lake Rogers sub-watershed [17 sq. mi.]	Jan. 2002	- 100% complete - Limited opportunities for stream restoration	Dec. 2003 [No assessment consultant, but used Tetra Tech data]	
Upper Neuse [East]	03020201	050010	Ellerbe Creek [37 sq. mi.]	Jan. 2002	- 100% complete - Several restoration projects both initiated and completed	Jan. 2004 [used UNRBA data for this CU]	
Upper Neuse [East]	03020201	110010 and 110020	Upper Swift Creek [66 sq. mi.]	Fall 2003	- Phases I - III 100% complete - Phase IV underway - 4 EEP projects underway	June 2005 [Amec/Tetra Tech]	
Lower Catawba [Central]	03050101 and 03050103	03050101 – 170010 and 170020; 03050103-020020 to 020050	Charlotte-area Local Watersheds [6 HUs totaling 257 sq. mi.]	Feb. 2002	- Phases I - III 100% complete July 2003 - ID'd many stormwater BMPs/retrofits and ~50,000' stream restoration in 6 "focus areas" - 4 EEP projects underway	July 2003 [CH2M Hill]	July 2006 [Tetra Tech]- assessment of stormwater BMPs for non-traditional mitigation; may extend contract to evaluate preservation in CAT03
Lower Yadkin [Central]	03040105	010010 and 010020	Upper Rocky River – Dye Branch & Clarke Creek [77 sq. mi.]	Dec. 2001	100% complete Many potential projects & BMPs id'd, including ~ 80,000' stream restoration. Several projects in acquisition.	Feb. 2004 [CDM]	

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]	Phase IV Completion Date and Comments (if applicable)
Lower Yadkin [Central]	03040105	03040105 – 010030 to 010050 and 020010	Upper Rocky River part 2 [4 HUs; 200 sq. mi.]	Dec. 2002	Phases I through III are 100% complete. - NCSU/WECO has modified "Phase IV" contract to do education/outreach to landowners & local gov'ts in this LWP area [ongoing; contract ended 2/06]	Spring 2005 [Mactec]	Feb. 2006 [WECO and EEP field staff presentations to general public, landowners, town councils, and county commissions]
French Broad [West]	06010105	030020 to 030040	Mud Creek [3 HUs; 113 sq. mi.]	Sept. 2000	- 100% complete - Documented many non-point sources of impairment, degradation - Two EEP projects underway - 319 grant received for Ag BMPs	Jan. 2003 [No assessment consultant; relied in part on TVA IPSI work]	Received EPA funding for local *Watershed Coordinator* to implement plan
Pasquotank [East]	03010205	050010, 00020 and 040010	Pasquotank River [3 HUs; 370 sq. mi.]	Dec. 2001	- Final Plan development 100% complete - Some potential restoration, enhancement & preservation sites id'd; also, BMP opportunities	Feb. 2004 [DS Pro]	Resolving issue of mitigation needs associated with U.S. 64 before pursuing projects
Middle Neuse [East]	03020203	020040	EPA *Contentnea Grant* – Hominy Swamp Creek [16 sq. mi.]	1999	- Final plan development 100% complete - Several restoration projects & BMP site identified.	May 2004 [No assessment consultant; some support from NCSU & ECU]	
Middle Cape Fear [East]	03030004	020010, 030010 and 040010	Harris Lake tributaries; Kenneth & Parkers Creeks [180 sq. mi.]	Spring 2003	- Final plan development 100% complete - Several restoration projects & BMP sites identified	Sept. 2004 [Buck Engineering]	

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]	Phase IV Completion Date and Comments (if applicable)
Middle Cape Fear [East]	03030004	070010 & 070020	Cranes Creek [2 HUs; 101 sq. mi.]	Dec. 2001	- Assessment tasks completed May 2005 [Blue] - Several potential projects delivered to EEP Implementation staff - Final stakeholder summary & preliminary plan completed (WECO, 2005)	WECO report completed June 2005; additional planning efforts on indefinite hold pending annual updates to Op Strategic Plan	
Upper Cape Fear [Central]	03030002	060100, 060070, 060080	Morgan and Little Creeks [3 HUs; 75 sq. mi.]	Nov. 2002	- Final plan development 100% complete - Many restoration projects & BMP site identified and evaluated. - Phase IV contract underway to pursue Plan identified sites	Dec. 2004 [TetraTech]	Winter 2007 [Stantec]
Upper Cape Fear [Central]	03030002	010010 and 010030	Troublesome & Little Troublesome Creeks [69 sq. mi.]	Nov. 2001	- 100% complete - Many potential preservation, restoration, and BMP sites id'd - Phase IV contract underway to pursue Plan identified sites	February 2004 [TetraTech]	Winter 2007 [Stantec] (combined with Phase IV for Morgan and Little Creeks)
Upper Yadkin [West]	03040101	010080 to 010110 and 020010	K. Scott Lake – Lewis Fork & Warrior Ck. [5 HUs; 137 sq. mi.]	Nov. 2001	- 100% complete - ~ 60,000' of stream restoration id'd; negligible wetland opportunities - Ag BMPs targeted for CWMTF grant	June 2004 [TetraTech]	Landowner outreach by EEP staff planned for fall 2006 to spring 2007

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]	Phase IV Completion Date and Comments (if applicable)
French Broad [West]	06010108	080020	Bald Creek [18 sq. mi.] + additional HUs added for Phase IV [59 sq. mi.]	Fall 2003	- Phase III (Plan & Atlas) completed - Habitat degradation and straight-piping issues	Feb. 2006 [Equinox]	Spring 2007 [Equinox]
French Broad [West]	06010105	060020	South Hominy Creek [38 sq. mi.]	Fall 2003	- Phase III completed - Sediment, nutrients are key stressors - Phase IV in progress	Nov. 2005 [Buck Engineering]	Dec. 2006 [Buck Engineering]
Broad [West]	03050105	070020	Catheys Ck. [45 sq. mi.]	June 2003	- Phases I - III are 100% complete - Contract amendment to perform fast track LWP in Cove Ck.	Sept. 2005 [Earth Tech]	Landowner outreach performed by EEP staff
Middle Tar-Pamlico [East]	03020103	15 sq. mi. subwatersheds with HUs: 010020, 060020, 050030, and 080010	Conetoe to Chicod Cks. + Tar River [133 sq. mi. total]	Fall 2003	- Phases I – III 100% complete - Phase IV effort on hold indefinitely	Phases I – III completed Mar. 2005	Phase IV June 2005 [Blue]
Middle to Lower Neuse [East]	03020202	010010, 010020 and 010021	Initial: Core Ck. Now: Stoney Ck. [4 HUs, 29.8 sq. mi. total]	Fall 2003	- Phase I on Core Ck. 100% complete [KCI] - Decision made to move LWP to Stoney Ck. HUs beginning 2004 - Stoney Ck. Phases I & II 100% complete - Phase III near completion - Phase IV effort in progress	Phases I through III Dec. 2005	Phase IV scheduled for completion Fall 2006 [KCI]

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]	Phase IV Completion Date and Comments (if applicable)
Lumber [East]	03040203	030010 and 050010	Bear Swamp & Lumber River [52 sq. mi.]	Fall 2003	- Phase I 100% complete [Earth Tech] - Phase II detailed assessment 100% complete - Phase III 100% complete	Dec. 2005 [Earth Tech]	
Upper Cape Fear [Central]	03030003	070010, 070020 and 070050	Initial: Hasketts Ck. Now: Upper Rocky River & tribs [3 HUs; 177 sq. mi.]	Fall 2003	- Moved LWP from Hasketts Ck. (Asheboro area) to Upper Rocky River (3 HUs) in Siler City area due to great restoration opportunities and more favorable stakeholders - Phases I – III are 100% complete	June 2005 [TetraTech]	

Appendix H Local Watershed Plans Ongoing (Phases 1 – III) as of July 1, 2006.

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]
New [West]	05050001	030020 and 030030	Little River [77 sq. mi.] + Brush Ck. [34 sq. mi.] = 111 mi^2 total	Fall 2003	- Phase I completed Mar. 2004; only addressed Little River HU - Amended contract has re-initiated efforts; Phases II & III began Jan. 2006, to end spring 2007 - Preliminary project atlas by Fall 2006; Bledsoe Ck. Plan by Spring '07	Spring 2007 [WKDickson]
Hiwassee [West]	06020002	090020, 100040, 100050, and 170010	Hiwassee River [39 sq. mi.]	June 2005	- Phase II in progress - Working with Hiwassee River Watershed Coalition	Summer 2007 [Equinox]
Broad [West]	03050105	040040, 040060, and 040050	Cove Ck. [80 sq. mi.]	May 2006	- Fast track LWP in order to identify and acquire cold/cool stream mitigation needs will be pursued - Planning and assessment in progress - Landowner outreach in progress	May 2007 [EarthTech]
Upper Catawba [West]	03050101	080010 and 080020	Lower Ck. [98 sq. mi.]	Fall 2003	- Phase III almost complete - WPCOG to assist with stakeholder involvement and landowner recruitment - Caldwell Co. Pathways to host ad hoc committee to investigate grant funding opportunities	July 2006 [Mactec}
Upper Neuse [East]	03020201	050020	Little Lick Ck. [22 sq. mi.]	Fall 2004	- Phases I & II complete - Phase III ongoing - Demonstration projects underway	Dec. 2006 [Upper Neuse River Basin Assn.]
Upper Cape Fear [Central]	03030002	030010, and 040110	Travis, Tickle, & Little Alamance [51 sq. mi.]	Summer 2006	- Phase I underway - Stakeholder group being formed - Demonstration projects identified	Dec. 2007 [Piedmont Triad Council of Government]
Lower Yadkin [Central]	03040104	010010 and 010020	Mountain & Jacobs Cks. [68 sq. mi.]	Fall 2003	- Phase I tasks 100% complete - Final Phase I report from HDR delivered spring 2004	On hold; will re-evaluate. Possible re-start in 2007

River Basin [EEP Region]	8-digit CU	14-digit HU(s) (6-digit suffix)	Local Watershed Name [approx. total area in sq. miles]	Initiation Date	Status/Comments	Plan (Phase III) Completion Date [Consultant]
Middle Yadkin [Central]	03040103	050010, 050020, and 050040	Upper Uwharrie [3 HUs; ~ 135 sq. mi.]	Apr. 2005	- Phase I 100% complete - LWP effort on hold per 2005 Op Strategic Plan	Phase I completed Aug. 2005 [Buck Engineering] Further planning on hold
Lumber [East]	03040207	020010, 020030, 020040, and 020050	Lockwoods Folly [~ 50 sq. mi.]	June 2005	- Phase I was 100% complete by Dec. 2005 - Phase II more than 50% complete	Fall 2006 [Stantec]
Neuse [East]	03020204	Subwatersheds within 030020, 030050, 040010, and 050020 to 050040	Havelock [~ 60 sq. mi.]	June 2005	- Phase I activities ended Jan. 2006	On Hold [EcoScience]
Tar-Pamlico [East]	03020101	020010, 030010, and 030020	Fishing Ck. [69.7 sq. mi.]	May 2005	- Phase I completed Feb. 2006 - Phase II being scoped	Fall 2007 [WKDickson]
White Oak [East]	03020106 & 03030001	Currently undetermined	White Oak	Apr. 2006	- Phase I in progress - Secondary focus is to develop coastal watershed-specific mitigation strategy	Summer 2008 [ECU & NCED]

Brownfields Property Reuse Act - Annual Report to the General Assembly October 2006

Executive Summary

This report to the General Assembly, required by the Brownfields Property Reuse Act (BPRA) of 1997 (G.S. 130-310.30 *et seq.*), describes the activities and status of the N.C. Brownfields Program for Federal Fiscal Year (FFY) 2006. The Department of Environment and Natural Resources (DENR) is pleased to report continued success and growth in the state's efforts to revitalize and safely reuse brownfields properties through the N.C. Brownfields Program and its partnership with the U.S. Environmental Protection Agency (EPA). The program continues to be a model of high return on public investment in the way relatively small sums of public funds spent leverage large sums of private investment in brownfields redevelopment. DENR receives no state-appropriated funds for the program. To date, all of the public dollars spent are federal funds from a cooperative agreement with the U.S. EPA. With these funds, the program has facilitated over $1.8 billion in committed private investment in brownfields redevelopment.

The history of the program is one of steady expansion over time to accommodate the needs of brownfields developers. Through an examination of historical increases in demand for the program, DENR recognized that the program must continue to add capacity to meet this demand. However, the available U.S. EPA funds for state brownfields programs are at their likely maximum and indeed may be cut in the future, depending on the federal budget. Therefore, this year DENR has proposed three additional positions for the program to be paid by initiation of the existing fee provisions to cover cost incurred by DENR and the Department of Justice. The positions were recently approved through the Government Operations committee of the legislature and are in the process of being created. However, as shown in details provided below, despite reaching a plateau for federal resources, the program managed to finalize more brownfields agreements than ever before as the program continues to streamline its processes and staff become further experienced.

Program progress for the one-year period from October 1, 2005 through September 30, 2006 can be summarized with the following statistics:

- Program applications received: 72 (a 24 percent increase over previous year)
- Brownfields agreements finalized: 23 (more than any previous year and a 43 percent increase over FFY 2005)

The total number of completed agreements since the inception of the program stands at 87. More important than the numbers themselves is what they represent: that the state brownfields agreement is a sought-after mechanism for breaking down barriers prospective developers encounter in obtaining financing on environmentally-impacted brownfields properties.

Background

Redeveloping brownfields properties has become increasingly popular as developers and local governments realize that these properties offer viable opportunities to bring economic growth, public health protection, jobs, and quality of life benefits to cities and rural areas. Brownfields are abandoned, idled or underutilized properties where environmental contamination hinders

redevelopment due to concerns about environmental liability. The BPRA gives DENR the authority to enter into brownfields agreements with prospective developers who did not cause or contribute to site contamination. The BPRA modifies the environmental liability barrier for prospective developers and motivates them to bring these properties and their hindrances to DENR's attention. DENR partners with the prospective developer to evaluate the possible risks associated with site contamination, and then negotiates a brownfields agreement that stipulates the steps necessary to make the site safe for a specific intended reuse. The result is a redevelopment project that works economically and also protects public health and the environment.

Because brownfields agreements afford prospective developers liability protection for as long as they make and maintain the site safely for its intended reuse, the specter of open-ended financial uncertainty is lifted. This economic shield allows prospective developers to obtain financing previously unavailable for these properties.

Thus, the BPRA allows DENR to distinguish between prospective developers of brownfields properties and the properties' polluters. Instead of mandating that the site be cleaned to current standards, the BPRA requires developers who did not cause or contribute to the contamination to make the site safe for reuse. The program must examine the risks to public health or environment posed by the site. Then, DENR determines what the prospective developer must do to ensure safe redevelopment. These actions can range from land-use restrictions to cleanup, or a mixture of both. In addition to holding prospective developers accountable to their agreements, DENR reserves the right to enforce against those parties responsible for the original contamination. The process is summarized in Table 1 below.

Table 1. Summary of the Brownfield Process

Step 1 – A prospective developer with a brownfields site that needs liability protection submits a letter of intent with basic site facts. DENR determines if the prospective developer and the property proposed for reuse are eligible under the BPRA statute.
Step 2 - DENR reviews existing site data to determine the risk posed by contamination at the site. If the data are insufficient to evaluate such risk, DENR advises the prospective developer on further site assessment to gather the necessary data.
Step 3 - DENR determines what actions are necessary to make the site safe for reuse and includes these actions in a draft brownfields agreement. The prospective developer pays statutory fee and negotiates/concurs with DENR on provisions in brownfields agreement.
Step 4 - The brownfields agreement is published with a 60-day public comment period.
Step 5 - The brownfields agreement is finalized after any public comments are considered and incorporated. The prospective developer uses the final brownfields agreement, which provides liability protection, to obtain financing for the project. Liability protection is contingent upon the completion of the actions required by the brownfields agreement. The brownfields agreement makes the site eligible for the brownfields property tax incentive.

The ancillary brownfields property tax incentive for prospective developers allows them to recoup funds spent on assessment and cleanup. The program motivates the market to recycle these sites to productive reuse, while preserving or reducing the use of pristine or undeveloped "greenfields" property. While the environmental benefits are obvious, most redevelopments also

create a significant number of jobs and put properties back on the tax rolls. This dual economic-environmental gain benefits the state, local government, and the brownfields developer. As these benefits have become better known, the program's popularity and demand for its services have increased significantly. In 2006, the program saw its sixth consecutive year of record-setting growth, represented at the end of FFY 2006 by 87 completed brownfields agreements and 107 others in the pipeline. More than $1.8 billion in private investment dollars have been committed to redevelop abandoned properties that blight urban and rural landscapes.

The overall result is a winning scenario for both the environment and economic development. Risk reductions and cleanups are achieved at sites that could have harmed the public or the environment, and prospective developers redevelop abandoned properties that once had little hope for productive reuse. The public benefits of job creation, improved quality of life in the surrounding neighborhoods, local tax base expansion and contribution to the general fund are other positive impacts.

The program also supports smart growth, sustainability and the One North Carolina Naturally agenda. Every project that reuses property, whether it is in an urban center or a rural area, preserves green space. Often it also reduces suburban sprawl and supports sustainable urban development. In a very real sense, for each brownfield redeveloped, a greenspace is saved. The properties that have received the 87 completed agreements are estimated to represent approximately 2,000 acres, and the other 108 in the pipeline represent another 2,500 acres. This is, in effect, acreage that is being recycled into reuse rather than greenspace that is being developed.

Program Status

The program is preparing to receive its third year of funding from the U.S. EPA under its State Response Program Cooperative Agreement authorized under the federal brownfields act. The program has hired a full complement of staff under its planned cooperative agreement budget. This amounts to 5.5 brownfields project managers, an environmental toxicologist, and an IT database professional. These staff members are all fully engaged in processing and tracking of brownfields agreements. However, federal funds are leveling, and additional capacity must come from other funding sources in the future.

The program experienced its first occurrence of staff turnover since inception, as one project manager left state employment in July. However, a replacement project manager was hired and was working the following month. While the program did not lose much in time it did lose valuable experience. Despite this turnover and other resources challenges that decrease available staff hours, the program managed to *increase* its output of brownfields agreements. Gains in this regard are from continuing program efforts to add efficiencies in internal communication and agreement processing procedures. The program has thus made strides in productivity.

During FFY 2006, the program received a record 72 applications for projects seeking entry into the program and a brownfields agreement for a specific brownfields redevelopment project. This demand for program services compares to 58 applications received during FFY 2005, and represents 24 percent growth over last year's applications.

During FFY 2006, the program completed a record 23 brownfields agreements. This is an increase of 43 percent over last year's 16 agreement completions.

Table 2 below shows the progress during the program's history since the BPRA became effective in 1997. One can see the steady upturn in demand for the program in the number of brownfields applications and the number of cumulative brownfields agreements. There was a noticeable growth in completed agreements in 2000 when the program received sufficient EPA funds to hire its first full time staff person. Successive hires in years 2002 onward have lead to greater brownfields agreement processing capacity and outreach ability. Hence, there is clear growth in

Table 2. Program Progress Summary

	FY1997	FY1998	FY1999	FY2000	FY2001	FY2002	FY2003	FY2004	FY2005	FY2006
■ Site Applications	2	14	8	16	15	23	29	42	58	72
▣ Finalized BFAs	0	2	0	2	7	11	15	11	16	23
□ Cumulative Finalized BFAs	0	2	2	4	11	22	37	48	64	87

applications into the program and completed agreements. At the same time, the number of finalized brownfields agreements annually is tending towards leveling off at the number that can be produced by the current staff resources. This year, that number is 23 agreements, which is an increase over last year. However, if that number is to increase along with the number of sites in the program, the staff capacity must expand as well. Although federal brownfields act resources have allowed an increase in the number of staff and a corresponding increase in the number of agreements completed, the demand for more agreements continues to grow. This demand threatens to outstrip the ability of the existing staff to provide services to brownfields developers to obtain a brownfields agreement in a timely manner. Hence, increased resources commensurate with the demand are key to the continued success of the program. Proposals for accomplishing this are discussed in greater detail in the Improving Effectiveness section. We anticipate continued increases in demand as the program's expansion serves to better educate

both the public and the development community about the benefits of brownfields redevelopment.

Local interest in brownfields continues to grow and local governments in this state continue to have great success in competing for EPA brownfields grant funds. The federal grants for brownfields assessment and cleanup totaling $1.45 million were awarded by the U.S. EPA to North Carolina local governments in 2006 (increased from $787,500 in 2005), including Durham, Forest City Land-of-Sky Regional Council, Navassa, Pembroke, Piedmont Triad Council of Governments, and Sparta.

More local governments received EPA brownfields grants than in any other state in EPA Region 4, and for the third year in a row these represent more federal grant funds than any other southeastern state. These local brownfields activities will serve to strengthen local interest in brownfields redevelopment and will certainly further increase interest in developers seeking brownfields agreements from DENR as these communities begin their local brownfields redevelopment efforts. Moreover, these grant funds dovetail with DENR's efforts to support brownfields redevelopment because the U.S. EPA continues to advise these grantees to gain entry into DENR's Brownfields Program in order to best utilize their grant funds. In this way, DENR's efforts are truly in concert with those of EPA and local government.

Outreach and Education

The program is largely market-driven in that prospective developers bring their sites to the program in order to break liability barriers for financing. One of the clear goals of the program is to educate the development community and local governments as to the program's existence and usefulness as a tool for both private and public redevelopment stakeholders. We have again done so this year and efforts to increase awareness of the program have clearly worked well with an ever increasing number of applicants and a strong award rate for them.

Through our staff person in Asheville, the program participated heavily in the Western North Carolina Brownfields Workshop sponsored by the Land-of-Sky Regional Council. Brownfields staff continue to conduct outreach at conferences and programmatic information booths and attend meetings held by EPA for local governments in order to meet and serve their interest in brownfields redevelopment. The program also has made concerted efforts to continually improve information offering on its web site (**www.ncbrownfields.org**) and receives consistent positive feedback on the informative nature of this important outreach component.

Cooperation with Local Government

The Brownfields Program has long held the strategy that brownfields redevelopment is largely a local issue, and therefore has made strong efforts to coordinate with local governments. The success of its cooperative agreement with the City of Charlotte that placed a DENR employee in city offices in May of 2002 was the culmination of much work with local governments. This provides direct face-to-face cooperation with the developers, lenders, and economic developers in that locality. This formula has enabled the completion of 32 brownfields agreements in the Charlotte area.

Seeking to duplicate this success in western North Carolina, in 2005 the program placed a project manager in the offices of the Land-of-Sky Regional Council in Asheville to work in much the same way. Several projects came into the program as a result of this placement, and it has continued to yield very positive results. The project manager has improved the program's local effectiveness there and developers have brought numerous projects to the program as a result. The manager is a participating member of the Land-of-Sky's Regional Brownfields Team and coordinates efforts with Land-of-Sky to encourage brownfields redevelopment in partnership with them. As part of the mutual benefits of such a relationship, the Land-of-Sky Regional Council continues to grow its federal brownfields grants such that to date they have received more federal grant funding than any other local government in the state.

Site Summaries

For brief descriptions of all brownfields projects in the program as of September 30, 2006, please see the Appendix. The table there is divided into three sections: active eligible projects, projects pending eligibility, and projects with finalized brownfields agreements.

Active eligible projects have been deemed eligible for a brownfields agreement under BPRA statutory criteria. These developers are working with DENR in some stage of data gathering, analysis or agreement negotiation. As of September 30, 2006 there were 107 active projects. Projects at this stage receive guidance from DENR as the developers gather the additional data needed to ensure protection of public health and the environment. Once research is complete, DENR analyzes the data, then drafts and negotiates the terms of the brownfields agreement with the prospective developer. At most of these sites, DENR is waiting for additional data requested by the program.

Projects pending eligibility are in the initial stage of the brownfields process as they apply for entry into the program. Sites in this category have yet to meet the requirements under the statute for eligibility for a brownfields agreement. For the sites in this category, the program has requested clarification or additional information from prospective developers regarding a site. Normally developers respond to these requests for clarification, the sites are usually deemed eligible and are then quickly moved into the active eligible category. As of September 30, 2006, 27 sites were in this category.

Projects with finalized brownfields agreements have completed the public notice phase of the brownfields process and either have a signed brownfields agreement or are waiting for the agreement to be executed. As of September 30, 2006, 87 projects were in this category, 23 of which were completed in the one year period from October 1, 2005 to September 30, 2006.

Improving Effectiveness

Throughout its existence, the Brownfields Program has provided a high economic development value for the federal funds it uses. The program's 87 brownfields agreements and 108 other projects in the pipeline represent in excess of $1.8 billion in committed private redevelopment investment. The high ratio to which the federal funds have been successfully leveraged into

private development dollars for brownfields redevelopment is just one measure of the effectiveness and efficiency of the BPRA.

While DENR continues to report that the program is highly effective, this year the program is also at a crossroads regarding resources and must address this issue for continued success in supporting the brownfields redevelopment economy of the state. By continuing to add needed staff over the last several years, the program has significantly increased its volume capacity for brownfields agreements during that time. The program has always recognized that encouraging brownfields redevelopment means that it must maintain the capability to respond quickly and provide brownfields agreements within timeframes that help developers make time critical business decisions. However, the trend lines discussed above clearly show that demand for brownfields agreements continues to grow, while future federal resources are anticipated to be level or slightly decreased. The program cannot serve the increasing numbers of applicants with the same effectiveness it traditionally has. Unless further resources are found, the program will develop a large waiting list, developer's transactions will be threatened, and applicants will hesitate to seek the program's services. Redevelopment opportunities will be lost.

The Brownfields Property Reuse Act requires that the program collect a $2,000 initial fee plus an additional fee equivalent to all costs to the Department. However, since inception, the brownfields program has defrayed the expenses of the program by using purely federal funds without cost to the Department. These funds have grown from $100,000 in 1999 to nearly $1,000,000 in recent years. Therefore, in the past the program could grow in capacity through these federal funds and not have to pass on any fees to the prospective developer other than the statutory $2,000 initial fee. The program purposefully maintained these fees as low as possible in order to encourage developers to come into the program. However, as federal funds have leveled off, the Brownfields Program continues to see growth in demand for its services. The program will employ the statutory authority for imposing fees to meet this challenge. Prospective developers will be bearing more of the resource burden for the program as a result.

The program believes strongly that increased cooperation between DENR and local governments has yielded significant benefits and is a trend it wants to continue to strengthen. DENR has recognized the effectiveness of placing a staff person in the City of Charlotte offices and has duplicated that effort by placing a staffer in the offices of the Land-of-Sky Regional Council. It will continue to look to similar cooperative efforts across the state as it grows in capacity.

Internally, as the program has more and more projects, its data management needs have increased commensurately. The program has been developing business automation application along with a project inventory tracking database. This system is being developed as a completely web-based tool consistent with DENR's initiative to share program information across programs and with the public via the Internet. The first module of this application has been developed, implemented and is being actively used by program staff, and is available to other DENR programs as well. The database has enhanced program efficiency and is assisting the program in tracking project status, as well as tracking land use restrictions placed on the properties.

Fund Status

The Brownfields Property Reuse Act Implementation Account authorized under the statute receives the $2,000 fee charged to prospective developers who enter the program and is to be used by DENR to defray the cost of the program. For the reporting year from October 1, 2005 through September 30 2006, the Brownfields Property Reuse Act Implementation Account had a beginning balance of $148,997, receipts from fees and interest of $46,247 and expenditures of $7,854. This yields an ending balance in the fund of $187,390. In previous years, this fund has not been large enough to be used for hiring staff. It is now large enough to be used for such purposes and will fit into DENR's plans for fee-funded positions for the program in the future in addition to additional outreach, software, database development needs.

Further Information

For additional information on the Brownfields Program and how it works, please visit our Web site at **www.ncbrownfields.org.**

APPENDIX

Status Summary of Brownfield Projects as of September 30, 2006

Appendix

Status Summary of Brownfield Projects as of September 30, 2006

Project Inventory is divided into three segments as follows:

Active eligible projects have been deemed eligible for a brownfields agreement under BPRA statutory criteria. These developers are working with DENR in some stage of data gathering, analysis or agreement negotiation.

Projects pending eligibility are in the initial stage of entering the program. Sites in this category have yet to meet the requirements under the statute for eligibility for a brownfields agreement.

Projects with finalized brownfields agreements have completed the public notice phase of the brownfields process and either have a signed brownfields agreement or are waiting for the agreement to be executed.

FINALIZED BROWNFIELDS AGREEMENTS (87)

(either in force or pending signature)

PD = Prospective Developer; RP = Responsible Party

A GREAT ESCAPE
1806 Funtime Blvd.
Winston-Salem, Forsyth County
PD: A Great Escape LLC

Prospective developer wants to purchase this approximately 5-acre abandoned amusement park (miniature golf and go cart track), which is located on edge of a former municipal landfill, refurbish it, and re-open it with in same use.

ABC ENGRAVERS
724 Montana Drive
Charlotte, Mecklenburg Co.
PD: Holden Business Park, LLC

Former engraving and plating facility with known chromium and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site as an office complex.

ALAMAC AMERICAN
1885 Alamac Road
Lumberton, Robeson Co.
PD: Alamac American Knits, LLC

The former knit textile manufacturing facility has perchloroethylene contamination associated with former drycleaning operations. The PD is using the facility to also manufacture knit textiles but does not use perchloroethylene on the premises.

ALAMAC KNIT FABRIC
NC Hwy 125
Hamilton, Martin Co.
PD: Penco Products, Inc.

106-acre former textile manufacturing facility with known soil and groundwater contamination involving chlorinated solvents. Site is undergoing active remediation under NC DWQ. Intended reuse is as a non-polluting school locker-manufacturing facility that will employ some 350 workers.

ALCAN PACKAGING FOOD
1600 Westinghouse Blvd.
Charlotte, Mecklenburg County
PD: Alcan Packaging Food & Tobacco

Approximately 9-acre parcel in a industrial portion of Charlotte. The soil and groundwater are impacted from historic operations with n-propyl acetate and n-propyl alcohol. The PD intends to sell the property for redevelopment of industrial and commercial uses.

ALPHA MILLS
312 E. 12th Street
Charlotte, Mecklenburg Co.
PD: Crosland, Inc.

A 5.77-acre parcel that was historically a textile mill. Most recently the site was the former Consolidated Group Incorporated engraving facility. The site has known soil, groundwater, surface water, and sediment impacts from historical site operations. PD intends to redevelop the property for residential apartments with compatible commercial and retail development.

ANCHOR MILL
404 Church Street
Huntersville, Mecklenburg Co.
PD: Town of Huntersville

Abandoned textile manufacturing facility with known metals contamination in soil, and lead, chlorinated solvent, and petroleum hydrocarbon contamination in groundwater. PD intends to redevelop the 32-acre site as a mixed-use transit village that reuses the old mill building and adds new office, retail, and residential components.

ANDREX INDUSTRIES
180 Deaverview Road
Asheville, Buncombe Co.
PD: Milkco, Inc.

A 9-acre light manufacturing site formerly used as a textile production facility that operated a knitting, weaving and cutting business along with dry cleaning, shrinking and packaging of fabrics. Tetrachloroethylene groundwater contamination from drycleaning operations being remediated by RP with pump-and-treat system. PD is adjacent property owner, a milk processing and distributing plant. Initial plan is to use part of property for truck and trailer parking. Within 3 years they plan to demolish Andrex

	buildings and expand the Milkco Plant to double capacity within 8 years.
ARCHDALE MARKETPLACE 5801 South Boulevard Charlotte, Mecklenburg Co. PD: Eastbourne Investments, Ltd.	Approximately 13-acre parcel known as Archdale Marketplace Shopping Center. Groundwater is contaminated at the Property due to historical site operations by an A&P grocery store, Sno-White Cleaners, and K-mart auto service center. PD intends to redevelop the property for commercial and retail.
BALDOR ELECTRIC 3821 Barringer Drive Charlotte, Mecklenburg Co. PD: K. Brown Trust	Former electric motor and motor component assembly and manufacturing facility with solvent impacted soil and groundwater. PD intends to redevelop the property for use as industrial condominiums.
BOULIGNY SITE 2320 N. Davidson Street Charlotte, Mecklenburg Co. PD: NODA Properties, LLC	Approximately 3.5-acre parcel that was the former R.H Boulingy facility. The site has known groundwater impacts from chlorinated solvents. PD intends to redevelop the property for mixed-use development with commercial, retail, industrial and residential.
BROWN'S SOLVENT CO. 2935 Griffith Street Charlotte, Mecklenburg Co. PD: Estate of K. C. Bell	Former paint and solvent formulation facility with known solvent-impacted soil and groundwater. PD intends to initially renovate & reuse the existing structure for office/warehouse use, and ultimately raze the building and redevelop the site as a mixed office/retail complex in keeping with other redevelopment taking place in Charlotte's South End.
BURKHART CAROLINA 1703 Dabney Drive Henderson, Vance Co. PD: MPP Properties, Inc.	Former pickle processing and packing facility with chloride impacted soil and groundwater and minor solvent contamination in groundwater. PD intends to redevelop the property for commercial retail use. Simultaneously, the responsible party will implement groundwater remediation at the site under separate action. The PD's development will provide an impervious cap on the site, further assisting remedial efforts.
BURLINGTON – JAMESTOWN 6008 High Point Road Jamestown, Guilford Co. PD: Alberdingk Boley, Inc.	A 22-acre site containing a abandoned chemical formulation facility operated in support of Burlington Industries textile manufacturing operations. Known chlorinated and petroleum hydrocarbon contamination exists in site soil and groundwater and is being addressed under a consent order with DENR. PD intends to redevelop the property as polyurethane and polyacrylate emulsions manufacturing facility.
BURLINGTON MILLS 476 S. Main Street Mooresville, Iredell Co. PD: Cherokee Investment Partners, LLC	Abandoned textile manufacturing facility with known petroleum hydrocarbon contamination in soil and groundwater, and chlorinated solvent contamination in groundwater. PD intends to redevelop the site as an auto racing industry complex with office, flex, shop, and R&D space.
C. C. DICKSON 1520 South Boulevard Charlotte, Mecklenburg Co. PD: C. K. Land Development	A large mixed use development on a former industrial services firm adjacent to a manufactured gas plant. Ground floor retail and studio with Office and residential units above. Project is in vicinity of Camden Square and provides redevelopment to economically depressed area. Capping and land use restrictions regarding PAHs in soil and chlorinated solvents in soil and groundwater.

CAMDEN ROAD
1600 Camden Road
Charlotte, Mecklenburg Co.
PD: Harris Murr & Vermillion, LLC

Approximately 0.25-acre parcel in Historic SouthEnd of Charlotte. The site has known groundwater impacts from historical site operations as a gas station, tire repair, plumbing repair, and other uses. PD intends to redevelop the property for commercial and retail purposes

CAMDEN SQUARE
127 W. Worthington Avenue
Charlotte, Mecklenburg Co.
PD: Camden Square Associates

Abandoned Knitting and Printing Operations rebuilt into the "Design Center of the Carolinas". Development supported by the Wilmore Community as a vital redevelopment in an economically depressed area. Land Use restrictions for chlorinated solvents in groundwater.

CAMDEN SQUARE ADDITION
307 W. Worthington Avenue
Charlotte, Mecklenburg Co.
PD: Camden Square Associates

This project will add, by amendment, 4.5 acres to the first brownfields agreement completed in North Carolina, Camden Square, in Charlotte's South End redevelopment corridor. Contamination includes VOC- and SVOC-impacted soil and groundwater. Intended reuse is for mixed office and retail.

CAMDEN SQUARE AMENDMENT
W. Worthington Avenue
Charlotte, Mecklenburg Co.
PD: Camden Square Associates

By amending the Brownfields Agreement, this project served to add residential to the uses approved under the Agreement for a portion of the Property. Prospective Developer conducted additional environmental assessment to evaluate the potential for vapor intrusion in the area of planned residential use, and will install a vapor barrier beneath the slab-on-grade construction.

CAROLINA LOG BUILDINGS
Howard Gap Road
Fletcher, Henderson Co.
PD: Town of Fletcher

Former wood treating facility with known pentachlorophenol contamination in soil and groundwater. PD intends to redevelop the 30-acre site as the new heart of the Town of Fletcher to include various office and retail uses.

CAROLINA PRODUCTION FINISHING
105 Fairview Road
Asheville, Buncombe Co.
PD: Western Investments Co.

Former textile finishing facility with metals contamination in both soil and groundwater. PD intends to redevelop the site for warehousing and as a sewing operation. PD is in the process of reviewing DENR's draft brownfields agreement for this site.

CENTRAL PARK LANDFILL
Salem and Main Streets
Winston-Salem, Forsyth Co.
PD: Salem Recreational Fields

Former municipal landfill for the City of Winston-Salem. Site is 7.23 acres in size, and has been used as a city park since the 1950s. Low levels of chlorinated solvents, with no surficial soil contamination. PD intends to redevelop the site for soccer and a softball field for the adjoining Salem Academy and College so their current fields can be used for additional building space. A passive methane collection system will be installed prior to installation of the recreational fields.

CHEROKEE OIL
925 S. Summit Avenue
Charlotte, Mecklenburg Co.
PD: M & J Equities, LLC

Approximately 2-acre site was formerly a non-permitted hazardous waste storage facility and the site of an EPA removal action. Known arsenic, oil & grease, and solvent contamination exists in site soil and groundwater. PD intends to redevelop the property as a nightclub and parking facility.

CHESTER STREET PROPERTY
N. Chester Street
Gastonia, Gaston County
PD: City of Gastonia

Site contained former Carson Dry Cleaner located in the center city area of Gastonia. Property has known chlorinated solvents contamination in the soil and groundwater. PD intends to redevelop the site in commercial retail uses.

CITY WEST COMMONS
1506 West Boulevard
Charlotte, Mecklenburg Co.
PD: CMDC Westover No. 1, LLC

Dilapidated shopping center seized in a drug raid by the U.S. Dept. of Justice that has been approved for transfer to the city of Charlotte. Site had VOC and chlorinated solvent contamination in soil and groundwater. The City intends to transfer the property to a not-for-profit development corporation to redevelop the site as commercial retail shopping facility.

CONBRACO FACILITY
701 Matthews-Mint Hill Rd
Matthews, Mecklenburg County
PD: Carlton Development

The site is the former sediment and runoff basin for the former Conbraco Facility. The site was remediated in the EPA Superfund Program and given a "No Further Remedial Action Planned (NFRAP)" status. PD intends to redevelop the site as a medical office with other commercial uses.

COSTCO
PD: Costco Wholesale Corporation
14.8 acres
2838 Wake Forest Road
Raleigh, Wake County

The former Pepsi manufacturing and bottling company was located on this site until it relocated in 2002. The southeastern portion of the property covers about 2.6 acres of a former City of Raleigh 44-acre municipal landfill. The former Alcatel site is upgradient and a potential source of chlorinated solvents found in the groundwater. Prospective Developer plans to build a 149,000 SF Costco membership warehouse and a membership gasoline station outparcel on the property.

COTTON MILL SQUARE
801 Merritt Drive
Greensboro, Guilford Co.
PD: Carl Johnson

Former cotton mill and manufacturing facility with chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the site in mixed commercial retail/office and residential.

CUMBERLAND SHOPPING CENTER
709 E. Market Street
Greensboro, Guilford Co.
PD: Project Homestead

Site of former shopping center and dry cleaners with chlorinated solvent impacted soil and groundwater. PD is a not-for-profit community development corporation. The PD has performed soil remediation activities and intends to redevelop the site with affordable residential housing.

DON CHRISTIAN PROPERTY
Main Street
Carrboro, Orange County
PD: Main Street Properties

This approximately 0.5-acre underused site had been in use as a bulk oil facility and gas station since the 1920s and is currently in use as an auto repair shop. The site contains petroleum hydrocarbon impacts in soil and groundwater. PD intends to reuse the property in commercial/retail use as part of the renovation and expansion of the existing, adjoining shopping center.

DYNATECH INDUSTRIES
2213 Toomey Avenue
Charlotte, Mecklenburg Co.
PD: R. G. Automation, Inc.

Former plating facility with metals-impacted soil and groundwater. EPA conducted soil removal activities at the site and has classified it as NFRAP. PD intends to redevelop the property for use as mixed office/retail complex.

EAST GANNON PROPERTY
102 East Gannon Avenue
Zebulon, Wake Co.
PD: Berkshire-Hudson Capital XI, LLC

This property consists of four parcels of land totaling 1.75 acres with four existing structures (former restaurant, current auto sales, auto service garage and hair salon). Site planned to be redeveloped into a stand-alone Eckerd Drug Store, with other surrounding complimentary retail tenants. Soil and groundwater are contaminated with petroleum constituents from above ground storage tanks used by previous gas station.

EAST PARK – BOYER
1607 E. 4th Street
Charlotte, Mecklenburg Co.
PD: Torrence Street Partners, LLC

Approximately 0.39-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian urban infill multiple use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.

EAST PARK – CRAVER
1609 Elizabeth Avenue
Charlotte, Mecklenburg Co.
PD: Providence Road Land Partners, LLC

Approximately 0.65-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian urban infill multiple use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.

EAST PARK – DOROTHY HALL
1423 E. 4th Street
Charlotte, Mecklenburg Co.
PD: 1427 East Fourth Street, LLC

Approximately 0.8-acre parcel that is a portion of the East Park Development Project, with known chlorinated solvent and gasoline contamination. PD intends to redevelop the site as a pedestrian urban infill multiple use development with commercial, residential, recreational and common open space. The site is part of the City of Charlotte's East Park re-development zone.

EAST PARK – JOAL REALTY
1534 Elizabeth Avenue
Charlotte, Mecklenburg Co.
PD: Joal Realty

Part of the 24-acre site encompassing a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the needs of pedestrians in an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the CBD and the historic residential neighborhoods of Elizabeth and Myers Park.

EAST PARK – KOSSOVE
1515 E. 4th Street
Charlotte, Mecklenburg Co.
PD: David Kossove

Part of the 24-acre site encompassing a six-block area with known chlorinated solvent contamination. PD intends to redevelop the site as a model for urban infill mixed use development with an emphasis on the needs of pedestrians in an urban setting. The site is part of the City of Charlotte's East Park re-development zone located between the CBD and the historic residential neighborhoods of Elizabeth and Myers Park.

ECUSTA
1 Ecusta Road
Pisgah Forest, Transylvania Co.
PD: Ecusta Business Development Centers, LLC

In its prime, this 540-acre site was the world's largest non-wood pulp and specialty paper manufacturing facility. Closed since late 2002, the site has known metals, caustic and solvent contamination. PD intends to re-start flax pulping operations and to market the pulp to paper manufacturers. PD may also undertake other uses of site buildings and facilities, including office space and possible use of excess wastewater treatment capacity by local municipalities.

ELECTRONICS COMPONENTS CORP.
513 S. Dudley Street
Burgaw, Pender County
PD: MoJo Properties, LLC

The approximately 5-acre site was first developed in 1966 as a facility for manufacturing small transformers. The property was idled in 1999. Site groundwater is contaminated with chlorinated solvents. Prospective Developer intends to reuse the site to manufacture sound equipment and other music related equipment.

ERWIN SQUARE
2211 Hillsborough Road
Durham, Durham Co.
PD: WP East Acquisitions, LLC

This approximately 6-acre property is a portion of a decommissioned former Burlington Industries site, other portions of which have already been redeveloped. There is known chlorinated solvent contamination in groundwater, and these impacts are being addressed under an approved Division of Water Quality corrective action plan. PD intends to redevelop the site in high-density residential use.

FISHBURNE EQUIPMENT
Airport Road
Arden, Buncombe Co.
PD: R. & P. Van Praag

Former metal fabrication and tobacco press manufacturing facility with suspected VOC contamination in soil and groundwater, based on detection of these compounds on adjoining, downgradient property, the former Buncombe County landfill. PD intends to redevelop the site for light manufacturing/assembly, warehousing, and public storage uses.

FLEMINGTON LANDFILL
US Hwy 421 North
Wilmington, New Hanover Co.
PD: Cape Fear Soccer Association

Site of a closed (1979), privately operated domestic and industrial solid waste landfill with VOC-impacted soil and groundwater. Intended reuse is for a soccer complex. This is the first former landfill property proposed for redevelopment under the NC brownfields statute, and the project's feasibility and technical challenges are being carefully evaluated.

FLORENCE MILL
186 Mill Street
Forest City, Rutherford County
PD: Florence Mill Redevelopment

Consisting of approximately 8.2 acres, the Florence (Cone) Mill is a former industrial mill that went out of business in 2001. The property also has a number of former mill warehouses that are vacant, as well as dry cleaner properties that are separate from the Cone Mill but included in Prospective Developer's submittal. Site impacts include petroleum contaminated soil and PCE impacts to site soil and groundwater. The PD intends to redevelop the property into a town hall, residences, restaurant, cinema, and pavilion with open space.

FLYNT FABRICS MILL PROPERTY
202 S. Nash Street
Hillsborough, Orange County
PD: Falk Companies

Former Flynt Fabrics, a textile dyeing and finishing operation, closed in late 2000. Potential, but not confirmed, contamination at the site includes asbestos, lead, peroxide, acetic acid, #5 fuel oil, dyes, salts, bleaches, cleaners, and oils. Prospective Developer desires to purchase the old mill and parking portion of the Property and redevelop it in residential use.

FONTAINE 5th WHEEL
3883 South Church Street
Rocky Mount, Nash County
PD: New Standard Corporation

This former metals fabrication/manufacturing facility has been vacant since 2001 and the property contains chlorinated solvent and petroleum contamination in soil and groundwater. Prospective Developer intends to reuse the three site buildings for metal stamping, fabrication and assembly operations.

FOOD LION
Waughtown & Sprague Streets
Winston-Salem, Forsyth Co.
PD: Food Lion, Inc.

A new large supermarket placed on the site of an abandoned grocery store in urban Winston-Salem. Project had strong community support as a quality of life issue as the community had no supermarket. Land use restrictions for chlorinated solvent contamination in groundwater. Brownfield Assessment determined

	the source to be nearby drycleaner.
FULFLEX, INC. PROPERTY 500 E. 7th Street Scotland Neck, Halifax County PD: Town of Scotland Neck	Approximately 20-acres property contains a vacant 100,000 SF building, the site of rubber product manufacturing until 2002. Fulflex is the responsible party and is currently working with the Aquifer Protection program to remediate a petroleum and chlorinated solvent plume. The town plans to make site improvements to attract a new manufacturing tenant, who will purchase the site at a reduced rate if they bring enough jobs to the area.
GATEWAY AT OLD SALEM 1198 S. Broad Street Winston-Salem, Forsyth County PD: Southeast Gateway Ventures	Project size is approximately 51 acres. The property is planned for mixed-use redevelopment including offices, commercial/retail space, residences, a YWCA , a private school and parking. Contamination is from a former Duke Power Plant substation (PCBs, PAHs in soil) and groundwater contamination from a number of sources, mainly petroleum but with a few chlorinated solvents. Cleanup of contamination at the Duke Power facility under the Inactive Hazardous Sites Program is almost complete. The Duke Power site comprises only a portion of this large brownfields redevelopment project.
GENERAL WOOD 1901 Wood Treatment Road Leland, Brunswick County PD: Leland Land, LLC	A 120-acre pole treatment facility (creosote, chromated copper arsenate (CCA) and pentachlorophenol (PCP)) under Chapter 11 bankruptcy that is currently under RCRA jurisdiction. PD's intent is to be able to distinguish old from new contamination and then continue with pole treatment (CCA and PCP only). Groundwater contamination mainly associated with creosote and petroleum. Metal and PCP contamination in soil.
GRIFFITH STREET PROPERTY 565 Griffith St. & 536 Jetton St. Davidson, Mecklenburg Co. PD: Five Six Five, LLC	Prior industrial operations resulted in soil and groundwater contamination by petroleum and VOCs. The PD plans to redevelop the facility as a charter school and as retail and commercial space.
GUILFORD MILLS W. Wendover Avenue Greensboro, Guilford Co. PD: Wendover Crossing, LLC	A 55-acre site containing former textile manufacturing facility with known VOC contamination in soil and groundwater. PD intends to redevelop the property in mixed retail uses. Public benefits include the creation of an estimated 500 jobs and substantial tax roles increases.
GUILFORD MILLS - W. MARKET STREET 4925 W. Market Street Greensboro, Guilford County PD: Kim's Greensboro Real Estate, LLC	A 19.8-acre vacant textile facility with ancillary buildings. Minor groundwater contamination associated with former underground storage tanks. Other non-UST contamination has been documented but information has not yet been sent to us. PD plans to use the site for general commercial property.
HAMILTON PROPERTY 216 Dunavant Street Charlotte, Mecklenburg Co. PD: Rush Family, LLC	As small, dilapidated property bought for the expansion of Cost Effective Maintenance Inc., a small business in the South End area of Charlotte. Expansion into this property allowed CEM to stay in Charlotte instead of move to suburbs. Land use restrictions for chlorinated solvent contamination in groundwater.

HILLSBOROUGH VENTURES
3011 Hillsborough Street
Raleigh, Wake Co.
PD: Hillsborough Ventures, LLC

Project involves redeveloping an area of parking lots and dilapidated, underused retail structures. Land use restrictions are in place for the petroleum hydrocarbon and chlorinated solvent contamination in soil and groundwater. PD intends to redevelop the property as mixed residential (private student dormitory for N.C. State University) and retail complex.

HILLSBOROUGH VENTURES ADDITION
3 Concord St, 24 McKnight Ave,
3101 Stanhope Dr
Raleigh, Wake Co.
PD: Hillsborough Ventures, LLC

Prospective developer added acreage to the footprint of original Hillsborough Ventures project, which involves redeveloping an area of parking lots and dilapidated, underused retail structures adjacent to N.C. State University for mixed residential (private student dormitory) and retail uses.

HISTORIC COTTON MILL
191 Riverside Drive
Asheville, Buncombe Co.
PD: RiverLink, Inc.

A 2.63-acre site formerly occupied by a cotton mill that operated from the 1900s but has been abandoned for many years. PD will conduct environmental assessment to determine if the site has any contamination. PD intends to redevelop the site in mixed commercial/retail and residential uses. This project is part of the Asheville French Broad Riverfront Plan.

HOME DEPOT – SOUTH BOULEVARD
4750 South Boulevard
Charlotte, Mecklenburg County
PD: CNR Properties, RLLLP

A 12-acre site currently occupied by a produce grocer and office rental store (1 acre), parking (7 acres), abandoned plant nursery (1 acre); the rest is undeveloped. Operations at adjacent Academy Steel Drum (ASD) from 1947-69 included the disposal of wastes and sludge from drums into pits/lagoons. The location of the lagoons and overflow drainage is suspected to have been partially on subject property. After ASD burned in 1969 the property was thoroughly re-graded with contaminated soil moved around. Elevated concentrations of lead, chromium, and PCBs in soil along with lead, 2-chlorophenol, and trichloroethene. PD plans to lease property to Home Depot for construction of a new Home Depot home improvement retail store.

KIDD LANE BATTERY DISPOSAL
3607 Kidd Lane
Charlotte, Mecklenburg Co.
PD: Joshua's Farm

Abandoned dairy farm with historical lead battery disposal operations. The approximately 1-acre parcel is adjacent to a 22-acre horse & animal farm area for the Joshua's Farm Operations. The site has a limited area with lead contamination in the surficial soils. PD intends to redevelop the area as a parking lot for the horse and animal farm operations.

LEWITH TEXTILE
3539 Wilkinson Boulevard
Charlotte, Mecklenburg Co.
PD: CMDC Wilkinson No. 1, LLC

Project involves the redevelopment of 50+ acres of abandoned and underused commercial and industrial property, including the former Lewith Textile facility. Contaminants include Petroleum hydrocarbon and chlorinated solvents in soil and groundwater. PD intends to redevelop the site as an industrial park for light manufacturing and warehousing/distribution.

MALLARD CREEK
3021 Driwood Court
Charlotte, Mecklenburg Co.
PD: Colonial Realty, Ltd.

A 21-acre site adjacent to former auto service station and chainsaw service center operations. Petroleum hydrocarbon and chlorinated solvent contamination in groundwater, sourced from underground and aboveground storage tanks releases on the adjacent site, has migrated onto the subject property. PD intends to redevelop the property as an apartment complex.

MODEL LINEN
PD: QUB Studios
120 West Lewis Street
Greensboro, Guilford Co.

The site was used to manufacture wood stoves and has low levels of chlorinated solvents in the groundwater. The site will be redeveloped as a photographic studio and other commercial space.

MTE HYDRAULICS
105 Chickasaw Road
(intersection of Chickasaw Rd. & Pearson's Turnpike (state Hwy 2663)
Gastonia, Gaston County
PD: Liberty Land, LLC

A 9.76-acre parcel in Gastonia. The site has known soil and groundwater impacts from historical site operations which included the manufacturing of hydraulic components and brake pads and other uses. Prospective Developer intends to upgrade the property for manufacturing purposes and additional commercial use.

OXFORD PRINTING
8 Industry Drive
Oxford, Granville Co.
PD: FHO Partners, LLC

Former textile printing and finishing facility with VOC contamination in groundwater. PD has conducted remediation of floor drain contents. PD intends to redevelop the site for industrial/distribution use.

PARKER HANNIFIN
12415 Capital Boulevard
Wake Forest, Wake Co.
PD: St. Ives 220 Commercial, LLC

A 33-acre former air control devices manufacturing facility with known Trichloroethene contamination in soil and groundwater resulting from former wastewater treatment operations. PD intends to redevelop the site in mixed commercial, retail, and office space uses. Responsible party is currently undertaking assessment and remediation within RCRA and N.C. Hazardous Waste Section oversight.

PILOT MILLS
1121 Haynes Street
Raleigh, Wake Co.
PD: Capital Way, Inc, & Hedgehog Holdings, LLC

Abandoned, condemned turn-of-the-century textile mill in Downtown Raleigh redeveloped into office space and preserved on the National Register of Historic Places. Land use restrictions for chlorinated solvent in groundwater and capping of mercury in soils.

PPD HEADQUARTERS
SW corner of Harnett and Front Streets
Wilmington, New Hanover County
PD: River Ventures, LLC

Approximately 8-acre site is a small portion of the ~ 40-acre Almont Shipping site that will all eventually be redeveloped once Almont moves to the Wilmington Port Authority. Almont has been a dealer in bulk commodities (saltcake, urea, potash, phosphate, etc.). The site as a whole has been in business for almost a hundred years, with warehouses currently on this property being built in the late 1970s. Prior to that time it was operated as a fuel depot with large ASTs located on the site. Contamination from the adjacent CSX property spill of 2.2 million gallons of diesel in 1982 is suspected, although a Phase II assessment is currently underway. PD intends to demolish the buildings on site in order to construct a 400,000 SF office building.

QUALITY METAL PRODUCTS
1111 Oates Road
Gastonia, Gaston Co.
PD: Wede Corporation, LLC

This 11- acre site contains an abandoned facility of 48,000 square feet formerly used as for metal fabrication. Parts cleaning activities resulted in solvent impacts to site soil and groundwater. PD intends to refurbish the facility for metal fabrication utilizing high-tech, non-contaminating methods.

REDMAN HOMES
Redman Road
Mebane, Orange Co.
PD: Barber & Ross Co.

Former mobile home manufacturing facility with metals and solvent contamination in soil and groundwater. PD has performed drum removal and soil remediation activities. PD intends to redevelop the site as a manufacturing facility to produce windows and doors.

REEVES SITE
8900 Research Drive
Charlotte, Mecklenburg County
PD: Linda Wolfe, Paul Ferrigan

Approximately 20-acres parcel that was historically the former Reeves Brother Facility that operated as a textile research and development laboratory. The site has known groundwater impacts from chlorinated solvents. PD intends to redevelop the property for commercial and light industrial uses.

RUSAK PROPERTY
3331 Griffith Street
Charlotte, Mecklenburg Co.
PD: CharMeck Board of Education

A 1.21-acre parcel that is adjacent to the Marie G. Davis Middle School. The site is contaminated from historical operations as a metal plating facility. The PD intends to incorporate the adjacent parcels into the new middle school construction. The brownfields parcel will be the plaza entrance.

SALEM UNIFORM
4015 N. Cherry Street
Winston-Salem, Forsyth County
PD: Winston Weaver Co. Inc.

2.53-acre site that has been vacant for many years. Was leased out from 1967-83 to Salem Uniform and from 1983-86 to Cintus Corporation who purchased the assets for Salem Uniform. During a Limited Site Assessment for petroleum USTs, high levels of PCE were discovered, probably from dry cleaning solvents. PD is currently leasing space, but would like to improve it for use for fertilizer storage and other commercial usage.

SANFORD WWTP
1351 Douglas Drive
Sanford, Lee Co.
PD: S. Wornnom & G. Perkins

Former municipal wastewater treatment plant site with petroleum impacted sewer sludge and metals impacts in site soils and low concentrations of volatile and semi-volatile compounds in groundwater. PD intends to redevelop the property in commercial use, including restaurant, retail space and a multi-screen movie theater.

SCHLAGE LOCK FACILITY
3551 North Wesleyan Blvd.
Rocky Mount, Nash County
PD: Community Resource Exchange

49.15 acre/196,000 square foot former manufacturing facility for lock/doorknob plating and assembly that used PCE as a degreasing solvent. Working with the Hazardous Waste Section as site is a RCRA TSD post-closure facility with active voluntary GW remediation system (Ingersoll-Rand is RP). Chlorinated solvents (PCE, TCE, 1,2-DCE, toluene and acetone are main constituents of concern in both soil and groundwater. PD is non-profit organization who needs loan in order to make improvements to former manufacturing facility in order to provide tenant space for non-profit organizations and possible outparcels for commercial retail businesses.

SINGER COMPANY
357 Amilite Way
Chocowinity, Beaufort Co.
PD: DMB NC 2, LLC

Abandoned rural manufacturing facility with lead and phthalate contamination in soil and groundwater. The brownfields agreement provides for partial site remediation. PD intends to redevelop the site with mixed retail and light industrial uses.

SMITH METAL & IRON
725 W. 4th Street
Charlotte, Mecklenburg Co.
PD: City of Charlotte

Former site of a scrap metal yard and of a waste cell created for the temporary disposal of impacted soil removed during the construction of the adjoining Carolina Panther's practice field. The waste in the cell has been removed, and minor chlorinated solvent impacts remain in site groundwater. PD intends to redevelop the site in high density residential with additional office, entertainment, and retail potential.

SMITH PROPERTY
309 Campbell Street
Shelby, Cleveland Co.
PD: Cleveland County

Project involves the redevelopment of an area occupied by seven underused and dilapidated residential homes with petroleum hydrocarbon and chlorinated solvent contamination in groundwater. PD has the support of local residents to reuse the site as a parking

	lot serving the Cleveland County Offices.
SOUTH TRYON STREET 2036 S. Tryon Street Charlotte, Mecklenburg Co. PD: Citiline, LLC	A 2.88-acre parcel near historic SouthEnd. PD intends to redevelop the property for commercial purposes such as office and showroom condominiums. Groundwater is contaminated at the Property due to historical site operations as industrial/warehouse storage.
SOUTHERN MANUFACTURING 1000 Seaboard Street Charlotte, Mecklenburg Co. PD: Fiber Mills, LLC	This 9-acre site located in inner Charlotte was a former asbestos tile manufacturing facility. Asbestos was discontinued in 1986, and the facility was closed in 1999. The site has asbestos contamination in soils. Intended reuse of the site includes an outdoor amphitheater, a technical business park, or a mixed-use development with industrial, commercial, and residential uses.
STATE FARM ROAD 660 State Farm Road Boone, Watauga Co. PD: Glen Wilde, LLC	Project involves the redevelopment of property occupied by a rural residence with chlorinated solvent contamination in groundwater and in a spring from an off-site source. PD intends to redevelop the site as a medical office complex.
STONEVILLE FURNITURE CO. 525 S. Henry Street Stoneville, Rockingham County PD: Community Resource Exchange	The site is a 22.5 acre historic furniture manufacturer that was idled in 2003. PD plans to redevelop the facility for light industrial, warehousing and flex space, thereby creating at least 200 jobs and greatly improving the tax base. The site has chlorinated solvent impacts to soil and groundwater.
TARTAN MARINE S. NC Hwy 177 Hamlet, Richmond Co. PD: Chair Specialist Co.	Former boat manufacturing facility with lead contamination in soil. Additional site sampling conducted by the PD has shown previous soil removal actions have left no health-based lead problems. PD intends to redevelop the site as a chair and table base manufacturing facility.
TERRELL MACHINE 3030 South Boulevard Charlotte, Mecklenburg Co. PD: SESCO Group-Carolina Bldg., LLC	Site of former textile manufacturing and gear box machining operations, property in Charlotte's South End district is being redeveloped with ground floor retail and office/residential above. Remedial actions to eliminate hot spot contamination included soil removal and groundwater pump and treat. Land use restrictions are in place to address chlorinated solvent contamination remaining in groundwater.
V F Site 2831 Wilson Park Road Statesville, Iredell Co. PD: Statesville Partnership LLC	This former textile plant has chlorinated solvent contamination as a result of on site drycleaning operations. The PD plans to upgrade the property for light manufacturing or distribution facility.
VANIER GRAPHICS 655 E. Meadow Road Eden, Rockingham Co. PD: A. C. Furniture Co.	Former printing facility with petroleum and chlorinated hydrocarbon contamination in the soil and solvent contamination in the groundwater. Developer intends to redevelop the site as a furniture assembly and upholstering facility.
WEST MOREHEAD 1310 W. Morehead Street Charlotte, Mecklenburg Co. PD: Addison Investments, LLC	Former automobile repair and maintenance facility with chlorinated solvent contamination in soil and groundwater. Developer intends to redevelop the site, to include both facility renovation and new construction for use as commercial office/retail.
WILSON LANDFILL US Hwy 301 South	This underused 14-acre site was formerly occupied by a wastewater treatment facility owned and operated by the City of

Wilson, Wilson Co. PD: Dillon Properties, LLC	Wilson. The site has known metals contamination in groundwater. Developer intends to redevelop in mixed commercial, warehousing, and residential uses.

EXHIBIT U

Report

to

the Honorable Michael F. Easley, Governor of the State of North Carolina

from the

Governor's Hazardous Materials Task Force

H. Douglas Hoell, Jr., Co-Chair Dempsey E. Benton, Co-Chair

December 14, 2006

December 14, 2006

The Honorable Michael F. Easley
Governor, State of North Carolina
The State Capitol
Raleigh, North Carolina

RE: Hazardous Materials Task Force

Dear Governor Easley,

Pursuant to your directive, the Hazardous Materials Task Force has undertaken an examination of the current regulations for hazardous waste storage facilities in North Carolina. On behalf of the task force, a report is hereby presented with recommendations to address the State's oversight of these facilities.

We believe the adoption of these proposals will improve public awareness, contingency planning, emergency response and overall on site management by the operators. It is noted that the investigation of the cause of the EQ fire in Apex is still underway, and therefore, the task force has not received a final report on this incident.

During the task force's review of hazardous waste facilities, a speaker urged the State to review the handling of chemicals and hazardous materials in the public schools. It is respectfully suggested that this concern be transmitted to the Department of Public Instruction for their review.

The task force appreciates the opportunity to work on this assignment, and are available for follow-up review of our report or further directions.

Respectfully submitted,

Dempsey E. Benton, Co-Chair

H. Douglas Hoell, Jr., Co-Chair

Task Force Members:
Dr. Leah Devlin
Bradley Harvey
Johnny Teeters
Dr. Wynn Mabry
Drexdal Pratt
Dr. Marty Zaluski
David F. Thompson
S. Ellis Hankins
Dr. Viney P. Aneja

(govhaz)

Report to the Honorable Michael F. Easley, Governor of the State of North Carolina, from the Governor's Hazardous Materials Task Force

RECOMMENDATIONS OF THE GOVERNOR'S HAZARDOUS MATERIALS TASK FORCE

REGULATORY RECOMMENDATIONS

Regulatory Recommendation 1: Require commercial treatment, storage, and disposal facilities (TSDs) to provide financial assurance for cleanup and for off-site screening for potential contaminant migration in the case of a release of hazardous waste or hazardous waste constituents to the environment.

Explanation: The TSD would be required to provide financial assurance sufficient to cover the cost of cleanup after an event resulting in a release of hazardous waste or hazardous waste constituents to the environment. Funds available through the financial assurance mechanism (such as an insurance policy or bond) would be used by the State if the facility owner/operator failed to complete necessary cleanup and removal actions, or failed to pay legally assessed state or local costs. Financial assurance should also be immediately accessible to fund State actions to assess off-site contamination that could pose a threat to public health, safety or the environment.

Existing Requirements: Current regulations require financial assurance for closure and third party claims for damages from releases from commercial TSDs, but do not require financial assurance for cleanup costs or offsite screening following a release or hazardous waste or contaminants associated with hazardous waste from the facility.

Parties Affected or Costs: Commercial treatment, storage, and disposal facilities would be required to purchase insurance or provide letters of credit or other financial assurance mechanisms acceptable to the State that would ensure availability of funds.

Actions: Amend solid waste management statutes and authorize hazardous waste rules as needed.

Regulatory Recommendation 2: Require all TSD permit applicants to seek local government input on the contingency plan for response to emergencies at the proposed facility.

Explanation: Applicants for both commercial and noncommercial TSD permits should be required to provide the following information to the local government that has planning jurisdiction over the site of proposed TSD facility and to emergency response agencies (including the fire department, police department and Division of Public Health) that may be called on to respond to an emergency at the facility: 1. information on the nature and type of operations proposed at the TSD facility; 2. the properties of the hazardous waste that will be managed there; and 3. a copy of the TSD facility's draft contingency plan.

The TSD applicant should request comments from the local government and the emergency response agencies on the adequacy of the contingency plan and the availability of resources and equipment to respond to an emergency at the facility. The TSD applicant should be required to submit documentation from the local government and the emergency response agencies that they have received the facility information and contingency plan, their comments on the plan and each agency's verification of the role that it will play in responding to an incident at the facility. This documentation shall be submitted to DENR with the permit application. Renewal of the verification of roles should occur every two years and with permit modifications.

Existing Requirements: Permit applicants for TSDs are required to send a copy of the their contingency plan to local police departments, fire departments, hospitals, and state and local emergency response teams that may be called upon to provide emergency services.

Parties Affected or Costs: The requirement will call for more active engagement between TSD facility personnel and local emergency responders.

Actions to Accomplish: Amend solid waste management statutes and authorize hazardous waste rules as needed.

Regulatory Recommendation 3: Require that the commercial TSD facility operator make information on the types of waste on site at a commercial TSD accessible to DENR, to local government and to emergency response agencies from off-site in a form and manner to be approved by DENR.

Existing Requirements: Commercial TSDs are required to maintain waste profiles of hazardous waste managed at the facility and manifests of waste received and transported off site. These documents are maintained at the facility.

Parties Affected or Costs: Commercial TSDs would be required to maintain hazardous waste information off site and to ensure availability of the information to emergency response agencies in a form approved by DENR. Emergency response agencies will be affected to a degree determined by final requirements for disclosure and needed maintenance of data.

Actions: Amend solid waste management law and authorize hazardous waste rules as needed.

Regulatory Recommendation 4: Require applicants for a commercial TSD permit (both new permits and significant modifications of existing permits) to send notice of the permit application to every property owner within a ¼ mile radius of the proposed TSD facility boundary and provide documentation to DENR. The operator of a commercial TSD facility should also be required to provide information about the facility's contingency plan to property owners within a ¼

mile radius of the facility boundary by first class mail notice at the mid-point of each permit term.

Existing Requirements: Current rules require that an applicant for a commercial TSD permit provide notice to the public, provide a public comment period, and hold a public meeting on the permit as part of the application process. DENR also publishes a public notice regarding a draft permit, provides a public comment period, and holds a public hearing on a draft permit before a final permit decision is issued.

Parties Affected or Costs: Applicants for commercial TSDs will bear the costs of postage for letters sent to property owners.

Action: Amend solid waste management statutes and authorize hazardous waste rules as needed.

Regulatory Recommendation 5: Include changes in surrounding land use and population density as criteria in determining the frequency of inspections of commercial TSDs.

Existing Requirements: Commercial TSDs are required to be inspected a minimum of two times per month to a maximum of a full-time resident inspector. Factors used in determining the frequency of inspection include: volume and type of waste managed, type of treatment performed, uniformity or variety of waste types, and compliance history.

Parties Affected or Costs: Any additional inspections will result in an increase in costs to commercial TSDs in the form of fees paid to the Division of Waste Management.

Action: Amend solid waste management statutes and authorize hazardous waste rules as needed.

Regulatory Recommendation 6: Require commercial TSDs to have twenty-four hour, seven day a week site security by personnel meeting minimum hazardous waste and hazmat training or, alternatively, install an electronic security system meeting State standards.

Explanation: Full time security would allow earlier detection of hazardous or potentially hazardous conditions such as a fire. Early detection increases the likelihood that the situation can be contained and off-site damage avoided. The same benefits could also be achieved by use of an electronic security system that meets certain standards.

Existing Requirements: Current security regulations focus on preventing unauthorized entry onto a site rather than monitoring site conditions.

Parties Affected or Costs: Commercial TSDs will bear the expense of 24 hour, seven day a week site security or the electronic security system.

Action: Amend solid waste management statutes and authorize hazardous waste rules as needed.

Regulatory Recommendation 7: Revise the permitting cycle for commercial TSDs to five years.

Existing Requirement: Current federal regulations, adopted by the State, allow hazardous waste permits to be issued for a term not to exceed ten years.

Parties Affected or Costs: Costs to prepare renewal applications will be paid by applicants. Fees paid to the Division of Waste Management are $10,000 for storage and $15,000 for treatment.

Action: Amend solid waste management statutes.

Regulatory Recommendation 8: Direct DENR to conduct an evaluation of siting, design and operating requirements for commercial TSDs.

Explanation: A more in depth evaluation of the siting, design and operating requirements for TSDs is needed to identify other steps that would make operation of these facilities safer. The evaluation should include consideration of mandatory fire wall separation that could prevent or slow the spread of fire; the adequacy of off-set distances from property lines; and use of automatic fire suppression systems.

Existing Requirements: Before a commercial facility treats or stores any hazardous waste, it must obtain a detailed chemical and physical analysis of a representative sample of the waste. That information must be updated if the process that generated the waste changes, or if the commercial facility identifies a concern that waste specified on the accompanying manifest or shipping paper received does not match the waste profile or record at the facility.

Facilities managing reactive or incompatible wastes must take special precautions to prevent accidental ignition or reaction of the wastes. Separation distances and protection from sources of ignition such as sparks and heating sources are mandated. They are required to take precautions to prevent reactions that will generate extreme heat or pressure, fire/explosions or violent reactions, and those that would produce uncontrolled toxic mists, fumes, dusts, or gases that would threaten human health or the environment.

Current storage requirements state that containers holding waste that is incompatible with any waste or other materials stored nearby must be separated or protected by means of a dike, berm, wall or other device. Containers of ignitable or reactive waste must be located at least 50 feet from the facility's property lines.

Parties Affected or Costs: Any resulting enhancements to facility design will increase costs to TSD facilities.

Action: The Division of Waste Management, Department of Environment and Natural Resources, with assistance from the Office of the Fire Marshall, Department of Insurance, Division of Emergency Management, Department of Crime Control and Public Safety, and other stakeholders, conducts the evaluation to determine any needed regulatory changes.

Regulatory Recommendation 9: Develop and adopt operational requirements for 10-day transfer sites.

Explanation: There is a need to adopt minimum standards for sites where hazardous waste is temporarily stored. Most of the standards that apply to storage of hazardous waste do not apply to shipments of hazardous waste stored for no more than 10 days. Even though there are potential hazards (spills, releases, fires and explosions) associated with such shipments, an unlimited number of containers with multiple waste streams can be stored without any inspections, contingency plans or closure plans.

Existing Requirements: Transporters of hazardous waste may temporarily store manifested shipments at a location, including a commercial TSD, for no longer than 10 days without meeting any requirement other than having the manifest available.

Parties Affected or Costs: Costs of any new requirements and any permit fees will be paid by those operating 10-day transfer sites.

Action: Amend solid waste management statutes and authorize hazardous waste rules as needed.

Regulatory Recommendation 10: Provide Division of Waste Management inspection reports and compliance orders for hazardous waste facilities to local first response agencies and invite the local fire marshal to accompany DWM inspectors on at least one facility inspection each year.

Explanation: Local fire and police officials would benefit from a better understanding of these facilities and access to information on problems.

Existing Requirements: Although there are no specific requirements for sending copies of compliance actions, with respect to commercial hazardous waste facilities, to local government, DENR sends copies of compliance orders to county health directors. Penalties are also posted on the Division of Waste Management's web site. Many minor problems identified in a facility inspection are corrected at the time of inspection and never lead to a compliance action.

Parties Affected or Costs: Minor cost associated with providing notice to additional agencies.

Action: The Division of Waste Management can provide notice of compliance actions; share routine inspection information with first response agencies; and invite the local fire marshal to accompany DWM's inspector under existing authority.

Regulatory Recommendation 11: Clarify NC Fire Code provisions concerning hazardous waste, hazardous chemicals and hazardous material.

Explanation: Fire inspectors do not always have sufficient information to classify hazardous waste based on specific hazard. Existing hazardous waste rules require an initial analysis of the waste (prepared by the waste generator). If the waste is not a listed hazardous waste, it is characterized based on ignitability, corrosivity, reactivity or toxicity. Hazardous waste rules also address how waste is stored with respect to type of storage container and required separation of incompatible waste. It may not be possible, however, for a fire inspector to determine the characteristics of a particular waste from simple visual inspection of the container; it would be necessary to look at a waste manifest or waste profile to find the waste characteristics.

Parties Affected or Costs: Amendment of the Fire Code may result in new labeling requirements affecting hazardous waste generators; operators of hazardous waste TSD facilities and other facilities that use large quantities of hazardous materials.

Action: A) Request the Building Code Council to amend the Fire Code to include more specific provisions concerning identification and classification of hazardous waste, hazardous chemicals and hazardous materials in a way that will allow fire inspectors to identify risk. B) A committee, as referred in Appendix IV should be established to make recommendations to the Building Code Council.

Regulatory Recommendation 12: Authorize State Emergency Assets (State Medical Assistance Teams, Division of Public Health and others) to seek reimbursement for deployment costs, when activated and/or authorized through the State EOC for deployment.

Explanation: There are eight regional State Medical Assistance Teams (SMAT II teams) based at a Level 1 or Level II Trauma Center in each of the eight Regional Advisory Committees. These teams are comprised of physicians, nurses, EMS personnel, pharmacists and other healthcare personnel and are capable of operating a mobile hospital in addition to patient decontamination capabilities. There are also twenty-nine county SMAT III teams strategically placed throughout the state. These teams, comprised primarily by emergency response personnel, are associated with counties and Cherokee Tribal EMS. The SMAT III teams are capable of providing pre-hospital emergency care and patient decontamination capabilities. Type III teams generally respond to more local events that do not require significant medical surge capabilities. There is no mechanism for the SMAT teams to recover the cost of deploying in response to an emergency at a hazardous waste facility.

The Division of Public health, Epidemiology Section is staffed with medical epidemiologists, toxicologists, industrial hygienists, public health nurses, and public

health veterinarians. These professionals are often called on during emergencies and during follow-up to emergencies to assess potential exposures to toxic or hazardous substances, review sampling data from an emergency event, conduct surveillance for health symptoms or syndromes associated with emergency events, and to communicate with citizens and health and environmental agencies regarding health risks associated with emergency events.

Parties Affected or Cost: The owner/operator of the hazardous waste TSD would be required to cover the cost of mobilizing State emergency response medical teams in response to an incident at their facility. The provision would offset costs otherwise falling on state and local agencies.

Action: Enact statute that allows State, local and regional emergency response teams to bill the hazardous waste facilities for the cost associated with deployment of these resources.

Regulatory Recommendation 13: Require commercial hazardous waste TSDs to install wind monitors on site.

Explanation: Wind monitors would allow emergency personnel to more accurately determine wind direction for purposes of assessing risk to first responders and to nearby residents. Information on wind direction during the event could also be used to determine the likely direction of any off-site contamination by air-borne contaminants.

Existing Requirements: There is no requirement that hazardous waste facilities have on-site wind monitors.

Parties Affected or Costs: The operators of commercial hazardous waste TSDs would bear the cost of installing a wind monitor.

Action: Enact legislation and adopt rules as necessary to implement the requirement.

Regulatory Recommendation 14: Amend G.S. 132-1.5 to clarify that the data contained in a municipal 911 system is confidential and not a public record.

Explanation: The existing statutes classify data contained in a county 911 system as confidential and not a public record. Several municipalities own and operate 911 systems separate from the county system. Information in municipal systems should receive the same protection.

Existing Requirements: G.S. 132-1.5 already classifies this information as confidential for a county system. This change would simply give municipal systems the same classification.

Parties Affected or Costs: None.

Action: Amend G.S. 132-1.5

Regulatory Recommendation 15: Amend G.S. 132-1.5 to clarify that data contained in a county or municipal telephonic or electronic emergency notification system (or reverse 911) is confidential and not a public record.

Explanation: Local governments, such as the town of Apex, are in the process of establishing enhanced reverse 911 systems to alert citizens in the case of an emergency. There is concern about the growing number of unlisted telephone numbers (cell phone, Voice Over Internet Protocol telephone service, etc.). Citizens should be given an opportunity to register phone numbers and email addresses for use only for emergency notification purposes. Data entered into this database should be protected and not subject to the public records statutes, otherwise many citizens may be reluctant to register this contact information.

Existing requirements: The existing statute, G.S. 132-1.5 does not cover reverse 911 systems.

Parties Affected or Costs: None.

Action: Legislation to amend G.S. 132-1.5.

Regulatory Recommendation 16: G.S. 130A-293 should be amended to state that all land use requirements that are generally applicable are presumed to be valid and enforceable unless the Secretary makes findings of fact otherwise. These land use requirements would include all generally applicable provisions, such as setbacks, buffers, and stormwater requirements. We also recommend clarifying G.S. 130A-293 to protect local government's authority to adopt ordinances related to the siting of hazardous waste facilities to the extent those ordinances are based on public health, safety, or the environment. We recommend that the Governor's office seek the advice of local governments to determine whether additional or amended criteria are necessary to protect public health, safety and the environment.

Explanation: G. S. 130A-293 gives the Secretary of the Department of Environment and Natural Resources the authority to preempt any local ordinance that prohibits or has the effect of prohibiting the establishment or operation of a hazardous waste facility. Federal regulations allow local governments to regulate the siting of hazardous waste facilities to protect public health and the environment. We recommend amending the statute to include additional criteria regarding the surrounding land uses, population density, or other criteria associated with the health and public safety adjacent to proposed facilities.

Existing requirements: Local governments have the authority to zone property in order to protect the health, safety and public welfare of its citizens. G.S. 130A-293 allows the Secretary to override these ordinances relating to the siting of hazardous waste facilities.

Parties Affected or Costs: Commercial treatment, storage or disposal facilities required to comply with the local ordinances.

Action: Legislation to amend solid waste management statutes.

FUNDING RECOMMENDATIONS

Funding Recommendation 1: Develop a digital information exchange system for facilities that handle hazardous materials and toxic chemicals.

Explanation: The Committee proposes to replace the current paper-driven reporting systems for hazardous materials and toxic chemicals with a single digital information exchange system. The system would be able to digitally exchange facility reporting data for both the Tier II (hazardous materials) facilities and the Toxic Release Inventory (TRI) sites regulated by EPCRA. Another component of the system would be the DENR Facilities Registry System (FRS), which is a database of facilities regulated by DENR (such as permitted water and wastewater systems; facilities that have air quality permits; landfills and permitted hazardous waste facilities). The data exchange will provide a one-stop, real-time information source for all regulated hazardous material and toxic release sites and all sites where NCDENR has environmental permit authority. Through DENR's Facilities Registry System, information will be available on all permitted hazardous waste facilities. If new reporting requirements are imposed on hazardous waste TSDs, the system will become repository for that information.

Existing Requirements: Federal reporting requirements currently apply only to facilities that handle large quantities of hazardous materials and to facilities that release toxic chemicals to the environment in excess of threshold amounts. The required reports are generally submitted on paper. Existing reporting requirements do not apply to most hazardous waste TSD facilities because they generally fall under the reporting thresholds.

Parties Affected or Costs: The cost of $ 650,000 is detailed in the grant application budget and supporting paperwork for a U.S. Environmental Protection Agency (EPA) Data Exchange Challenge Grant which was submitted by NCDENR in November 2006. A copy of the budget is attached as Appendix VI. It is unclear whether EPA will approve the grant application. If approved federal grant funds would not be available until September of 2007 at the earliest.

Action: Seek state funding in the amount of $650,000 to accelerate the proposed exchange node grant so that it can be accomplished as soon as possible.

Funding Recommendation 2: Increase annual state appropriation in support of the State of North Carolina's seven (7) Regional Response Teams for Hazardous Materials Response.

Explanation: The legislature originally created six Regional Response Teams for Hazardous Materials Response. In FY 2000-2001, a seventh Regional Response Team

(RRT) was created without a corresponding increase in funding. An increase in continuing appropriations in the amount of $372,744.00 is required to account for the following: the operational costs of the seventh team; a 10% inflationary increase since the program's inception in 1996; a time phased replacement of vehicles and equipment; and increased cost of repairs and maintenance. Additionally, there are ongoing requirements for training and certification as well as participation in local and regional exercises to ensure quality response capability.

Currently, the North Carolina Regional Response Teams for Hazardous Materials Response receive $864,168.00 in annual state appropriations. The funding supports maintenance and operational costs for the seven RRTs. It also provides salary and benefits for two Emergency Management Officers who work in the Division of Emergency Management's 24-hour Communications Center. Additionally, a portion of the salary of the Division's designated attorney is paid from these funds. When the program was designed and implemented ten (10) years ago, no plan was developed or funded for the eventual replacement of necessary equipment.

Parties affected: The State of North Carolina has developed a necessary regional capability for hazardous materials response. The purpose was to provide a critically needed service that could not be afforded by every local government that might be affected by a hazardous materials incident. The State has built a quality program that must be maintained, or service to the regions and local governments will have to be reduced.

Action: Request an additional annual appropriation of $372,744.00 to adequately support North Carolina's seven Regional Response Teams for Hazardous Materials Response.

Funding Recommendation 3: Fund development of a plan for public health response to events with a potential for chemical, biological or radiological contamination, and related training for First Responders.

Explanation: The events of the recent Apex hazardous materials fire demonstrated that public health concerns were not sufficiently integrated into local and state agency response during and after the event. State and local agencies need to develop better protocols for addressing public health issues associated with any event that creates a potential for off-site chemical, biological or radiological contamination, such as a large hazardous waste spill or a chemical or radiological terrorist attack. It is important that a knowledge base and response recommendations be developed, taught to appropriate emergency personnel, and then overseen in case of a hazardous materials event.

To address these concerns, the Task Force recommends that the Division of Public Health implement the following 3-point plan:

- The Occupational and Environmental Epidemiology Branch develop a planning and training project entitled: "Model Plan for Responding to Environmental

Emergencies". The plan would include opportunities for training in all counties. To accomplish this, an 18 month contract for an industrial hygienist is recommended.

- The contractor will develop a statement of need for integration of existing environmental data around the 11 hazardous waste sites in NC. Following analysis, additional testing will be recommended including the establishment of background levels of selected hazardous materials. This will allow the state to assess the human health risks and vulnerabilities of these sites, and to focus future planning and training efforts.
- The contractor will initiate and facilitate a staff level workgroup of federal, state and local response partners for continuity, and to further develop "best practice" response protocols.

Action: Obtain funding in the amount of $144,155.00 for implementation of an 18-month project to develop baseline information; response protocols; and training program. (A more detailed project description and proposed budget is attached as Appendix VII.)

Funding Recommendation 4: Seek funding for the North Carolina Institute for Disaster Studies (NCIDS).

Explanation: The goal of the NCIDS is to establish a multidisciplinary, inter-institutional, basic and applied research program, applying state-of-the-art concepts and technologies to address urgent and important disaster research questions, and to assist the campuses within the UNC system to develop crisis management and crisis communications systems that will help individual campuses to better prepare in the event of a disaster. (A more detailed description of the proposed Institute is attached as Appendix VIII.)

Action: Seek funding in the amount of $300,000 for the start-up of the Institute.

Funding Recommendation 5: Fund research to study the emission and transport of pollutants from fires similar to the fire at the EQ facility in Apex and assess the human health and economic impacts of the fire.

Explanation: There are gaps in knowledge about transport of air-borne pollutants from events like the Apex fire. Additional information about emission and transport of pollutants from this type of fire would support better decision-making by emergency personnel and more effective environmental and public health response.

Action: Provide $75,000 for study of the fate and transport of air-borne pollutants from the fire and $50,000 for a study of the ecological impact of the fire.

Funding Recommendation 6: Provide State funding for the sustainability of the local and regional medical assistance teams (SMAT).

Explanation: To date, the SMAT teams have been funded primarily through federal grants. Federal funds have come through the NC Emergency Management funding for the

State Domestic Preparedness Equipment Program and the North Carolina Hospital Bioterrorism Preparedness grant. Federal funds have not been sufficient to fully fund the SMAT program, however, and hospitals and county governments have provided additional local funding to support the teams. There is no guarantee for future federal funding for this program. North Carolina needs to identify a means of supporting the teams in the future, since local monies will not be sufficient to sustain the program. A program summary is attached as Appendix V.

Action: Identify a source of State funding to support the State Medical Assistance Teams.

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
13 March 2007

The Environmental Review Commission (ERC) met on Tuesday 13 March 2007 at 11:00 a.m. in Room 544 of the Legislative Office Building. Representative Gibson presided.

The following members were present: Senators Albertson, Clodfelter, Kinnaird and Weinstein; and Representatives Gibson, Harrison, Justice, McComas and Warren. Also present was Representative Lucy Allen, Chair of the House Committee on Environment and Natural Resources. Mr. George Givens, Commission Counsel; Jeffrey Hudson, Assistant Commission Counsel; Jennifer McGinnis, Assistant Commission Counsel; Jennifer Mundt, Commission Analyst; Mariah Matheson, Research Assistant; Mary Watson, Substitute Commission Clerk: and Dot Waugaman, Commission Clerk; were also present.

On 7 March 2007, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. Copies of the agenda for the meeting and visitor registration sheets are included in the attachments as **Exhibits B** and **C**.

Representative Gibson called the meeting to order. He then asked Mr. George Givens to present his report and explain the agenda items. Mr. Givens announced that there would be two presentations of the analysis of a renewal energy portfolio standard for North Carolina by LaCapra Associates, the primary consultants on the recently completed study. The study was requested by the ERC in January of 2006 and presented to the ERC in December of 2007. The presentations will be made on Thursday, 15 March, at the Senate Agriculture and Environment Committee meeting at 11:00 a.m. in Room 544 of the Legislative Office Building, and at a joint meeting of the House Energy and Energy Efficiency Committee and the House Public Utilities Committee at 1:00 p.m., also in Room 544 of the Legislative Office Building.

Mr. Givens drew members' attention to a memorandum from Ms. Jennifer Mundt dated 13 March 2007 attaching two reports that have been received since the previous ERC meeting that had been placed on their desks (see **Exhibit D** for a copy of the memorandum). Both the reports have been designated "Read Only" reports. One report is on MTBE (see **Exhibit D-1**) and the other is on the Agricultural Cost-Share Program (see **Exhibit D-2**).

Mr. Givens next explained the other packet of information at members' desks. The first three items refer to the study of the costs associated with providing nutrient controls to offset point source and nonpoint source discharges of nitrogen and other nutrients (see **Exhibit E** for a copy of the contract without attachments, **Exhibit F** for a copy of the study methodology received at the end of February 2007, and **Exhibit G** for a copy of a bill draft, **2007 SBz-11 [v.7] (02/27), Extend Nutrient Offset Payment Sunset**.) One stakeholder meeting was held after the receipt of the study methodology on Friday 2 March 2007 to give interested parties an opportunity to comment on the methodology. The final report is not due to the ERC until May. The existing law will sunset on 1 September 2007; the proposed bill would extend the law for one year to 2008. Mr. Givens commented that he hopes the report will be available in time to make a recommendation in the 2007 session so the temporary situation will not have to exist for another year. Senator Weinstein moved to prepare the draft for introduction. The motion carried.

The next bill draft, **2007-RTz-4 [v.3] (02/06), Clarify Animal Waste Tech. Specialist Req.**, addresses a dispute between the Professional Engineer Board and Soil and Water Conservation District employees (see **Exhibit H**). All parties have agreed to the legislation, which will add to the list of exemptions from the definition of the practice of engineering services to include county employees or employees of the Soil and Water Conservation Districts. Representative Warren moved to prepare the draft for introduction. The motion carried.

Mr. Givens asked the Commission to approve the concept of a draft submitted by the Department of Environmental and Natural Resources (DENR) on the Mercury Switch Removal Program (see **Exhibit I**). The original legislation to require the removal of mercury from cars before they are shredded was passed in

2005. He commented that the proposal will address several changes to the program that were found to be necessary as the Division of Waste Management (DWM) carried out the legislation. Mr. Givens said the proposal is basically a rewrite of the 2005 legislation for technical more than for substantive reasons. The legislation does not consider any new or changed fees. He added that he has been advised by DENR that all the interested parties have accepted the legislation. Representative Gibson recognized Ms. Linda Culpepper, Deputy Director, Division of Waste Management, to comment on the proposal. Ms. Culpepper said DWM has worked with an agency stakeholders work group and the draft is a consensus product with one exception. That exception concerns marking vehicles that have had the mercury switch removed. For enforcement reasons and ease of observation, the Division feels strongly that the vehicles need to be marked. The processors do not want to have to physically mark each vehicle when the mercury switch is removed. Senator Clodfelter asked to be recused from voting on the issue. Representative Warren moved to prepare the proposal for introduction. The motion carried.

Mr. Givens next brought up the issue of the landfill moratorium for the Commission's consideration. He referred to the 31 January 2007 letter to the Secretary of DENR that requested the Department to forward their recommendations as a result of the study they have conducted over the past months as soon as possible (see **Exhibit J**), the 12 February 2007 letter in response from the Secretary (see **Exhibit K**), a letter dated 19 February 2007 also from the Secretary, enclosing a summary of the Department's specific recommendations for improved management of sanitary landfills in North Carolina (see **Exhibit L**), and a proposed draft bill (see **Exhibit M**). Mr. Givens asked the Commission to receive the documents for information. Staff is in the process of drafting a bill to reflect the Department's recommendations. Because of the timing, the bills will be introduced as public bills in both the House and the Senate, not as Study Commission bills. He asked Mr. Dexter Matthews, Director, Division of Solid Waste Management, to speak on the recommendations (see attachment to **Exhibit L**, Summary of Landfill Recommendations).

Representative Harrison asked if the prior proposed mega landfills would be impacted by the changes. Mr. Matthews said they would. He added that one of the issues they are considering is setting various implementation dates and how to phase the various requirements in. The new design requirements would affect any new facility that has not been permitted, but not those that are currently operating across the state. Representative Harrison asked if there would be an opportunity for agencies to comment in regard to repealing the State Environmental Protection Act exemptions for landfills. The language would follow the SEPA process, but it would apply to both public and private facilities.

Mr. Givens told Commission members that staff is still working on the franchise issue. There is a franchise procedure at the local government level. Extensive amendments were made to the statutes during 2006. Consideration is being given to enhanced review at the state level for landfills that have impacts over more than just a few counties or a single county in the state. The public lawyers (Attorney General, Institute of Government, and legislative staff) have been trying to figure out what to do about that situation. A decision about whether the fee structure should be part of the bill or a separate bill needs to be drafted.

Mr. Givens told Commission members that a letter from Mr. Peter Anderson, Executive Director of the Center for a Competitive Waste Industry, received today had been distributed to them (see **Exhibit N**). It relates to the recommendation for $3 million financial assurance.

Senator Clodfelter said the Commission on Health Services and the government lawyers are looking at whether the function of the enhanced state review over large landfills should be performed by an entity other than the Commission of Health Services.

Mr. Givens told the members of the ERC that his goal for the meeting was to cover the five items the Commission was directed specifically to report on: (1) nutrient offset, (2) animal waste technical specialist conundrum, (3) mercury switch, (4) solid waste management, and (5) cleanup of abandoned mobile homes.

In regard to the cleanup of abandoned mobile homes, there are two drafts that differ in the funding mechanism (see **Exhibit O** for a copy of **2007-RIxz-4 [v.8] (01/30)**, and **Exhibit P** for a copy of **2007-RIxz-12 [v.2] (02/16)**). Ms. Jennifer McGinnis stated that both bills would impose a tax on the retail sale of new and used manufactured homes. The tax would be $300 on a single wide manufactured home, and $300 per

section for multiple section homes. In both versions the revenue would be credited to a newly established manufactured home management account, which would provide grants to counties for cleanup of abandoned manufactured homes and technical assistance. The primary difference is that in Section 4 of the version designated as bill draft **2007-RIxz-4 [v.8] (01/30)**, page 8, line 19, there is a provision that would require proof of payment from the owner to the county in order for the county to issue a permit for a manufactured home. If they had no proof of payment, payment would need to be made to the county tax assessor before any permit could be issued for occupancy. The other version of the bill **2007 RIxz-12 [v.2] (02/16)** does not have the second tier collection system at the county level. Mr. Givens commented that the environmental policy is consistent in both of the versions. He added that he believes the financing part will be resolved in a Finance Committee meeting.

Mr. Givens drew attention to the four bills used for environmental technical corrections (see **Exhibit Q** for a copy of **2007-TAz-6 [v.3] (02/01), Amend Environmental Laws 2007**; **Exhibit R** for a copy of **2007-TAz-4 [v.4] (03/06), Amend Natural Resource Laws 2007**, **Exhibit S** for a copy of **2007-TAz-5 [v.3] (03/06), Amend Environmental Report Reqs. 2007**, and **Exhibit T** for a copy of **2007-TAz-3 [v.8] (02/05), Environmental Technical Corrections 2007**.) The bills are considered "works in progress" as staff finds corrections that need to be made throughout the session. At the present time, there are no substantive changes in the bills. Representative Harrison moved to prepare the four drafts for introduction. The motion carried.

Mr. Givens announced the staff would consolidate all the actions into a report and with the approval of the co-chairs, will submit the report on the members' behalf.

The meeting adjourned at 11: 55 p.m.

RE: **Notice of Commission Meeting**
Additional Information

COMMISSION MEETING:

The Environmental Review Commission (Commission) will meet at 11:00 a.m. Tuesday 13 March 2007 in Room 544 of the Legislative Office Building in Raleigh. At this meeting the Commission will hear reports and recommendations from state agencies, consider recommendations to the 2007 Regular Session of the General Assembly related to studies for which the Commission is responsible, and attend to other matters.

This meeting is expected to last one hour and to adjourn at 12:00 p.m. No public staff planning meeting will be held in connection with this meeting. A draft agenda will be available on Monday 12 March 2007.

ADDITIONAL INFORMATION:
If you have questions related to the Commission, you may contact the Commission Counsel or other Commission staff at (919) 733-2578.

MEMORANDUM

To: Members of the Environmental Review Commission
From: Jennifer Mundt, Commission Analyst
Re: Reports to the Commission

The following reports have been submitted by the Department of Environment and Natural Resources (DENR) to the Environmental Review Commission (Commission) since the last reports distribution on 23 January 2007. These reports are designated as a read only and are attached to this memorandum:

1. Study of the feasibility and advantages of a coordinated regional approach for the phaseout of methyl tertiary butyl ether (MTBE) as an additive to motor fuel in the southeast region of the United States. 1 March 2007. Authority: S.L. 2005-93, Sec. 4.

2. Annual report of the Agriculture Cost-Share Program for Nonpoint Source Pollution Control. 31 January 2007. Statutory Authority: G.S. 143-215.74(e).

Please contact George Givens, Jeff Hudson, Jennifer McGinnis, Jennifer Mundt, or Mariah Matheson at (919) 733-2578 if you have any questions or comments.

EXHIBIT D-1

Final Report to the
Environmental Review Commission

A Regional Approach to the Phaseout of MTBE in the Southeast

March 1, 2007

North Carolina Department of Agriculture and Consumer Services

North Carolina Department of Environment and Natural Resources

Executive Summary

In 2005 the North Carolina General Assembly passed legislation banning MTBE in gasoline beginning on January 1, 2008. The legislation also required DENR and DACS to study the feasibility of this ban and prepare an interim report in 2006 and a final report in 2007. The 2007 final report contains much of the information included in the interim report, in addition to providing new information related to recent events.

Subsequent to North Carolina's enactment of its legislation banning MTBE, several other states in the Southeast have had similar legislation introduced and considered. However, ultimately no other state in the Southeast followed North Carolina's lead by enacting legislation to establish a ban on MTBE.

Despite the lack of action by other states and the fact that North Carolina's ban does not take effect until January 1, 2008, the amount of gasoline containing MTBE being sold in North Carolina is minimal. Testing and sampling done by the Department of Agriculture demonstrates that a negligible amount of gasoline containing MTBE is being used in North Carolina. As the table on page 4 indicates, almost all samples of the gasoline supply tested in recent months indicate that the gasoline contains less than .05 percent MTBE. Although the ban on MTBE in North Carolina does not take effect until January 1, 2008, it appears that to a large degree MTBE has already been phased out of the state's gasoline supply.

Much of the reason for the decline in gasoline containing MTBE can be traced to a market decision rather than state or federal regulatory action. In early 2006, Colonial Pipeline, informed gasoline shippers that it intended to remove MTBE from its systems. Colonial pipeline runs from Texas to New Jersey and is a major supplier for North Carolina. It is important to note that the Colonial pipeline is not the sole source for gasoline sold in North Carolina. Some of the supply enters the state through the ports in Wilmington and Norfolk, VA or by rail and will not have the same quality control as those products coming in via the pipeline.

Since informing shippers of its new policy, Colonial has since eased the restrictions on MTBE by allowing the shipment of gasoline that contains MTBE on a "case by case" basis.

The decision by Colonial and other petroleum companies to move away from MTBE was called into question by the Energy Information Administration (EIA) in a 2006 report. The report raised concerns about supply disruptions and price spikes in some regions because of the move away from MTBE. The report was the subject of a Congressional hearing by the Senate Environment and Public Works Committee on March 29, 2006.

As noted above, the critical piece of information that policymakers need to be aware of is that despite the ban not beginning until Jan. 1, 2008 the amount of MTBE in gasoline being sold in North Carolina is minimal.

Background

MTBE (methyl tertiary-butyl ether) is used as a fuel additive in gasoline and is designed to raise the content of oxygen is gasoline. MTBE has been used in U.S. gasoline at low levels since 1979 to replace lead as an octane enhancer or anti-knocking agent. Oxygen helps gasoline burn more completely, reducing tailpipe emissions from cars and trucks..

Air Quality Benefits

In 1990 Congress passed the Clean Air Act Amendments which set oxygenate requirements for areas with high levels of pollution. Although, the Clean Air Act doesn't require MTBE, many refiners have chosen to use MTBE over other oxygenates because of its blending characteristics and for financial reasons. The oil industry relied heavily on MTBE to meet the oxygenate requirements, rather than invest in the other primary alternative at the time, ethanol. Unlike ethanol, MTBE can be shipped through existing pipelines. Ethanol is not shipped in pipelines, in part, because ethanol absorbs water and impurities found in pipelines.

MTBE and ethanol are used in certain areas of the country as an oxygenate in either a winter oxyfuel program or a year-round Federal reformulated gasoline (RFG) program. North Carolina does not require either of these programs.

Counties in North Carolina designated as non-attainment for the 8-hour ozone standard are required to use lower Reid vapor pressure (RVP) gasoline in the summer months. This program is intended to reduce emissions of volatile organic compounds during the ozone season. However, this program does not specifically require MTBE.

Groundwater Concerns

In recent years MTBE has been detected in groundwater throughout the country. Some of these incidents of MTBE contamination have impacted drinking water supplies. These incidents of contamination have caused concerns because MTBE can make water undrinkable due to its offensive taste and odor. While health-related research on MTBE has been conducted results have not been definitive. According to EPA, independent expert review groups have not made a determination as to whether MTBE poses an imminent threat to public health. EPA's Office of Water has concluded that available data are not adequate to estimate the potential health risks of MTBE at low level exposure levels in drinking water. However, EPA does conclude that the data does demonstrate that MTBE is a potential human carcinogen at high doses.

Growing health concerns, in addition to a large number of lawsuits related to MTBE contamination have focused attention on MTBE. A number of states have had water systems contaminated by MTBE. In some instances, these incidents have resulted in lawsuits. For example, in 2003 eighteen petroleum companies settled a suit brought by

Santa Monica, California, agreeing to spend at least $200 million on a filtration system to remove MTBE from the city's water supply.

In North Carolina, MTBE contamination of groundwater is a growing concern. According to the Underground Storage Tank (UST) Section there are approximately 8955 active Underground Storage Tank incidents. The UST Section reports that over 2000 of the releases have had MTBE impacts to groundwater. It should be noted that the UST Section only recently started specifically documenting MTBE contamination from UST releases. Consequently, it is safe to assume that the actual number of UST releases with MTBE impacts to groundwater is higher than 2000.

The Aquifer Protection Section in the Division of Water Quality has overseen approximately 721 gasoline contamination incidents, most of which were either caused by surface spills or above ground storage tanks. Of these incidents, over 400 involved groundwater contamination and seventy-nine private drinking water wells and eight public wells have been impacted from this contamination. Many of these gasoline contamination incidents from surface spills and above ground storage tanks include MTBE contamination.

In many instances, it is difficult to identify whether a petroleum spill contains MTBE. MTBE will move farthest and fastest and it requires significant monitoring to find out how it actually gets dispersed. The current groundwater standard in North Carolina for MTBE is 200 parts per billion.

Much like the incident mentioned above in which the city of Santa Monica's water supply was impacted, North Carolina citizens have also had to deal with the serious consequences of MTBE contamination. In Wrightsboro, a small town outside of Wilmington in New Hanover County, an apparent gas leak from a gas station located near a couple of trailer parks contaminated the drinking water for approximately 180 people. The gas station had leaked gasoline containing MTBE. In court, a toxicologist testified that the persons exposed to the contaminated drinking water had compromised immune systems due to the contamination. A settlement between the parties was reached for a reported $36 million.

North Carolina Petroleum Information

In 2004, there were 4,467,442,000 gallons of gasoline sold at retail in North Carolina according to the North Carolina Petroleum Marketers Association (NCPMA). Data from the U.S. Energy Information Administration (EIA) shows a decline in the use of premium and midgrade over the last 5-10 years while there has been an increase in the use of regular unleaded over the same period.

In 2005, sales by grade were approximately 85% Regular Unleaded, 10% Premium and 5% midgrade based on EIA data.

Gasoline samples were tested by the N.C. Motor Fuels Lab for MTBE in April, May and September of 2005 and again in December 2006 and January 2007:

MTBE Content in N.C. Gasoline

2005 Testing Results

Grade	Range	Average
Premium Unleaded	2--10%	5%
Regular Unleaded	0--2%	0.5%
Midgrade Unleaded	0.7%--4.6%	2%

2006-2007 Testing Results

Grade	Range	Average
Premium Unleaded	0.0--1.5%*	0.17%
Regular Unleaded	0.0--0.5%	0.17%

* There was one premium sample at 1.5%. All other premium samples were between 0.0—0.5%.

As illustrated by the results from the 2006-07 testing the MTBE content in N.C. gasoline, excepting for one sample, is already below the 0.5% limit established by the ban. As noted earlier in the report this reduction in MTBE content is attributable to market forces rather than regulatory action.

MTBE bans

As a result of concerns raised about its public health impact, twenty-six states have banned MTBE, including seven states that passed MTBE bans in 2005. Some of these bans are characterized by EPA as partial bans, such as North Carolina's law which allows up to .5% by volume, while other states have passed complete bans.

Most recently at the federal level, Congress has discussed and debated banning MTBE. In early versions of H.R. 6, the Energy Policy Act of 2005, the legislation would have banned MTBE beginning in 2014. The final version of H.R. 6 that was approved by Congress and signed by the President did not ban MTBE.

Activity in other Southeastern States

As required by Session Law 2005-93, staff from the Department of Environment and Natural Resources and the Department of Agriculture consulted with our colleagues in other southeastern states. The session law identified the following states to be contacted: Alabama, Georgia, Kentucky, Mississippi, South Carolina, Tennessee, and Virginia. Of these states identified in the legislation, all but Kentucky rely largely on the pipelines for the transport and supply of gasoline.

Alabama

2006 Status: State officials with the Alabama Department of Environmental Management indicates that there has been no legislative discussion about banning MTBE.

2007 Status: No change

Georgia

2006 Status: In the 2006 legislative session, a bill was introduced in the Georgia House of Representatives that would ban MTBE. House Bill 983 is similar to North Carolina's ban in that it makes it unlawful to distribute or sell any gasoline containing more than one-half of one percent MTBE by volume. The bill does not prohibit the transport of gasoline containing MTBE through Georgia. The bill does not contain a date that the ban would begin, but rather the ban would be effective upon ratification.

On February 14, 2006 the House Committee on Agriculture and Consumer Affairs approved a substitute version of this bill. The substitute bill would ban MTBE and other gasoline additives by January 1, 2008. On February 21, 2006 the full Georgia House unanimously approved this legislation. The bill has been referred to the Senate.

2007 Status: The MTBE legislation passed by the House was never considered by the full Senate. However, the Georgia legislature passed a bill, SB 636, that was signed by the Governor in April of 2006. This bill authorized the Georgia Department of Environmental Protection to conduct a study on gasoline additives and to coordinate with other adjacent states on an MTBE ban. The Department of Environmental Protection has not conducted such a study.

Kentucky

2006 Status: In 2002 Kentucky passed legislation that banned MTBE beginning on

January 1, 2006. The bill did allow for trace amounts of MTBE, not to exceed one-half of one percent by volume. The bill cited the state's reliance on groundwater for drinking water and for industrial and agricultural purposes, to conclude that "the continued use of MTBE poses an unacceptable threat to public health." As noted above, Kentucky does not rely on the pipelines for its gasoline supply as other Southeastern states do. Consequently, the experiences of Kentucky's transition to an MTBE ban would not be the best indicator of the potential impacts of transition in North Carolina.

2007 Status: No change

Mississippi

2006 Status: Staff with the Underground Storage Tank Section of the Mississippi Department of Environmental Quality does report seeing MTBE in some releases from USTs. The Mississippi Department of Health has been conducting some testing in public water supply wells for MTBE and at this point has not found any contamination.

There has been no legislation introduced related to an MTBE ban.

2007 Status: Legislation, HB 42, was introduced in Mississippi in 2006 that would have banned MTBE. There was no action taken on this bill.

South Carolina

2006 Status: Staff with the South Carolina Department of Health and Environmental Control indicated that there have been discussions about banning MTBE. On February 23, 2006 a bill to ban MTBE was introduced in the South Carolina House. This bill, H 4713, would ban MTBE and certain other oxygenates. The bill has been referred to Committee on Agriculture, Natural Resources and Environmental Affairs. H 4713 is very similar to the legislation in Georgia and would ban MTBE beginning in 2008. The state's Underground Storage Tank Section continues to see incidents of MTBE contamination from UST spills and they continue to monitor the issue.

2007 Status: The bill that was introduced in 2006 never made it out of committee.

Tennessee

2006 Status: Tennessee does not currently have a ban on MTBE. State officials with the Tennessee Department of Environment and Conservation cite the recent testing of gasoline content as one factor in the state's decision not to ban MTBE. Testing demonstrates very low concentrations of MTBE in the gasoline, often below two or three percent. Another factor cited by state officials is that Tennessee has not had any municipal drinking water systems impacted by MTBE contamination.

Although there are no current plans to ban MTBE, this issue has been considered by the Tennessee legislature in recent years. In the 2001 session several legislative proposals were introduced related to MTBE. These bills ranged from developing a timetable to phase out MTBE, studying a ban of MTBE and using funds from the underground storage tank fund to help offset the costs of implementing an MTBE ban. None of these bills were approved by the legislature. However, the Tennessee legislature in 2001 did approve House Joint Resolution 228, a resolution urging Congress to ban MTBE as a fuel additive. The resolution noted that MTBE had been detected in 47 water supplies within the state. The resolution cited the impact of MTBE on drinking water supplies in other parts of the country and its threat to the groundwater and drinking water supply of Tennessee. The resolution also addressed the gasoline supply issue by stating that MTBE would not significantly affect the supply of gasoline. Copies of the resolution were sent to the Tennessee congressional delegation.

2007 Status: In the 2006 legislative session, two companion bills, HB 3955 and SB 3467 were introduced that would have banned MTBE beginning in 2008. Neither bill was acted upon before the session adjourned.

Virginia

2006 Status: According to officials with the Virginia Department of Environmental Quality the state legislature has not taken action to ban MTBE and action is not likely in the next couple of years.

While no ban has been enacted in Virginia, the state did pass legislation in 2000 which requires every public water supply operator to test public water supplies at least quarterly for the presence of MTBE. The locality must maintain a record of the testing and, if the results of any test indicate the presence of MTBE in excess of 15 parts per billion (ppb), the locality must immediately notify the Departments of Environmental Quality and Health. During 2004 there were two notifications of where public water supplies detected MTBE at levels greater than 15 ppb.

2007 Status: Virginia did have some discussions with other Mid-Atlantic states about a regional MTBE ban, but no action has been taken.

Other Considerations

The session law required consultation with representatives of the petroleum industry, such as refiners, suppliers, distributors, transporters, retailers of motor fuel and liquid pipeline operators. In addition, the law required consultation with consumer, environmental and other public interest groups. On January 18, 2006 DENR and the Department of Agriculture held a meeting to discuss the legislation and gather information. Representatives from state agencies, manufacturers of MTBE, petroleum marketers, and environmental organizations attended the meeting. In some cases, interested parties provided information and data that was incorporated into the Interim Report. Since the Interim Report was completed in March of 2006, DENR and the Department of Agriculture have continued a dialogue with interested parties on this issue. We continued to accept comments from the various interested parties and in some cases have included some of that information in the Final Report.

Conclusion

To date, other states in the Southeast have not followed the lead of North Carolina in banning MTBE. However, market activity has had the effect of minimizing the amount of gasoline containing MTBE sold in North Carolina. Although it is unlikely that other states in the Southeast will take action to ban MTBE, because of market decisions they have also indicated that negligible amounts of MTBE gasoline are being sold in their jurisdictions. As the amount of MTBE gasoline has declined, it should be noted that there are no foreseeable regulatory actions or market changes that are likely to change the status quo. However, should there be a sudden interruption in the supply chain, such as a hurricane or terrorism, it is possible that MTBE could be blended with gasoline in an effort to meet demand. The ban does not allow any flexibility in such cases and the production and shipment of MTBE free gasoline just for North Carolina may not be a realistic option for refiners.

North Carolina Department of Environment and Natural Resources
Soil and Water Conservation Commission

Michael F. Easley, Governor
William G. Ross Jr., Secretary
Jeff Turlington, Chairman

EXHIBIT D-2

February 9, 2007

The Honorable Charles Albertson, Co-chairman
Environmental Review Commission
North Carolina General Assembly
525 Legislative Office Building
Raleigh, NC 27603-5925

Dear Senator Albertson:

This letter transmits the 2006 Annual Report on the Agriculture Cost Share Program for Nonpoint Source Pollution Control as required by General Statute 143-215.74. The statute requires the Soil and Water Conservation Commission to provide annual reports to the Environmental Review Commission and the Fiscal Research Division that include a list of projects that received State funding pursuant to the program, the results of the water quality evaluations conducted pursuant to subdivision (7) of subsection (b), findings regarding the effectiveness of each of these projects to accomplish its primary purpose, and any recommendations to assure that State funding is used in the most cost-effective manner and accomplishes the greatest improvement in water quality.

If you have any questions or need additional information, please contact Manly Wilder, Director of the Division of Soil and Water Conservation at 715-6097 or by email at Manly.Wilder@ncmail.net.

Sincerely,

Jeff Turlington,
Chairman

Enclosure

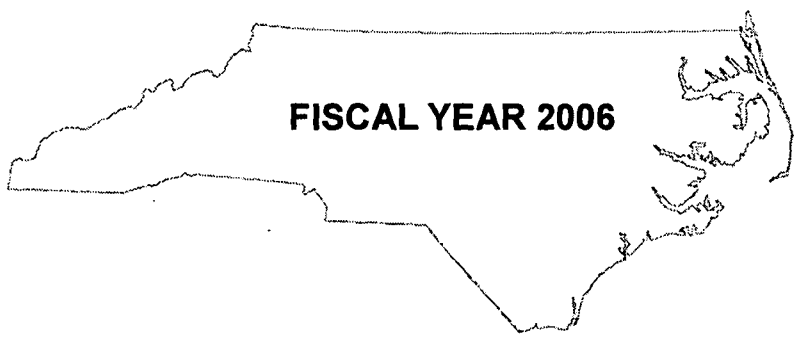
REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION AND FISCAL RESEARCH DIVISION OF THE N.C. GENERAL ASSEMBLY ON WATER QUALITY ACCOUNTABILITY FOR THE AGRICULTURE COST SHARE PROGRAM



Submitted by

The N.C. Dept. of Environment and Natural Resources,
N.C. Soil and Water Conservation Commission
Division of Soil and Water Conservation

NORTH CAROLINA SOIL & WATER CONSERVATION

NCDENR

REPORT TO THE ENVIRONMENTAL REVIEW COMMISSION AND FISCAL RESEARCH DIVISION OF THE N.C. GENERAL ASSEMBLY ON WATER QUALITY ACCOUNTABILITY FOR THE AGRICULTURE COST SHARE PROGRAM FISCAL YEAR 2006

INTRODUCTION

In 1983 the North Carolina Agriculture Cost Share Program (ACSP) was authorized by the General Assembly to improve water quality associated with agriculture in three nutrient sensitive areas of the state covering 16 counties. It was expanded in 1990 to include all 96 Soil and Water Conservation Districts covering all 100 counties.

While the Soil and Water Conservation Commission (Commission) has the statutory responsibility to create, implement and supervise the Cost Share program, it is delivered at the local level by 492 elected and appointed soil and water conservation district (SWCD) supervisors who are assisted by their staff and partners in natural resource conservation. These partners include technical and professional employees of the SWCD or county, the U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS), the Division of Soil and Water Conservation (Division), the Cooperative Extension Service, and the North Carolina Department of Agriculture and Consumer Services.

The Commission continues to adapt the program to respond to changing needs and technology. For Program Year 2006, there were 51 approved BMPs in the ACSP. BMPs include both short-term and long-term practices. The definitions of approved BMPs for the Cost Share program are provided in the Detailed Implementation Plan (Attachment A).

For a BMP to be approved by the Commission for the ACSP, there must be 1) an NRCS technical standard addressing that BMP, and 2) sufficient cost information to determine the appropriate cost share amount. Occasionally, BMPs are approved on a limited scale for evaluation purposes (District BMPs).

For most practices, the amount provided in cost share is based on 75% of a predetermined average cost for the practice up to a maximum of $75,000 per cooperating farmer per year. However, some practices are cost shared on 75% of actual cost due to the variable nature of the practice. (In the 2003-04 Budget Bill, the General Assembly approved a special budget provision that modified N.C.G.S 143-215.74(b) to allow beginning farmers and limited resource farmers to receive up to 90% cost share up to $100,000 per year beginning in the 2004 program year.) The Commission conducts a wholesale review of its cost share rates every three years, but it can make necessary corrections when presented with information that one of its predetermined costs is inaccurate.

Districts spot check a minimum of 5% of randomly selected active contracts each year to ensure that practices are being maintained properly. The Division and NRCS also spot check contracts as part of regular reviews of district office implementation of the ACSP. As shown in Table 1 below, spot checks for 2006 showed excellent compliance with maintenance requirements by participating farmers with only 2.3% of contracts spot checked being out of compliance. When practices are discovered to need additional maintenance, the district is usually able to assist the cooperator to restore the practice to its intended function.

TABLE 1

DISTRICTS	CPO'S	VISITS	% VISITED	COMPLIANT	NEED REPAIR	NON-COMPLIANT	SUPERVISORS PARTICIPATING

PROGRAM ACCOMPLISHMENTS

Since the first Cost Share contracts were issued in 1984, there have been 46,820 contracts for installing BMPs (through the end of program year 2006, which ended on June 30, 2006). Most BMPs have a life expectancy of ten years, which is how long participating farmers must agree to maintain the practices.

Early in the program, the major factor used for determining success was tons of soil saved because the program funded predominantly sediment and erosion control practices. It is estimated that an average of 7.38 million tons of soil have been saved annually during the life of the program. Since the mid-1990s, while continuing its attention on minimizing soil loss and erosion, the program has increased its attention on reducing and managing nutrients from cropland and livestock production. Part of the impetus for this new attention was the promulgation of the 15A NCAC 2H.0200 animal waste management rules and the nutrient sensitive waters strategies for the Neuse and Tar-Pamlico River Basins.

Highlights of additional accomplishments include the following:

- Nearly 123,352 acres of marginal or environmentally sensitive cropland have been converted to trees, grass, or wildlife habitat
- 3,559 waste management structures have been constructed to properly store and manage dry and wet animal waste
- 815 mortality management systems have been installed to properly manage livestock mortalities to minimize water quality impacts.
- 3,846 water control structures have been installed improving water management on and reducing nutrient loss from approximately 295,652 acres
- Over 950 miles of fencing have been erected, in combination with other practices (e.g., watering sources) to exclude livestock from streams
- Over 610,716 acres of cropland acres have been converted to no-till or conservation tillage to reduce sediment loss associated with traditional practices

- Over 209 miles of forested riparian buffer have been established to reduce nutrient loss from approximately 16,362 acres of cropland

A complete list of program accomplishments is included as Attachment B.

REPORTING REQUIREMENTS

Projects Receiving State Funds

Participating farmers have up to three years to complete the work included in ACSP contracts. Therefore, cost share payments made each year may be for contracts written in the current fiscal year or in the two previous fiscal years. For this reason the fund balance for the program will always exceed the amount appropriated in a given year.

Each contract is considered a "project." Each project may include only one BMP or a system of practices that include several BMPs. Cost share payments are made only when installation of the BMP is completed and certified to be in accordance with current NRCS or Commission standards.

Cost Share payments were applied to 1,535 projects statewide between July 1, 2005 and June 30, 2006. These contracts received total payments of $6,956,071.00. A list of individual contracts to which Cost Share funds were applied in Program Year 2006 is available upon request.

New Contracts for Fiscal Year 2006

The General Assembly appropriated $5,244,897 in recurring general funds for BMP installation. For Fiscal Year 2006 soil and water conservation districts requested $22,039,704 to address identified water quality needs. Current appropriations do not enable districts to meet demand for financial assistance for installing BMPs to protect water quality in North Carolina.

For Fiscal Year 2006, the Commission allocated $8,968,935 to districts. In addition to the 2006 appropriation, the Commission also had available for allocation: 1) funds allocated to districts in 2005 which districts were unable to execute contracts with farmers prior to the end of the fiscal year, and 2) funds recovered from completed and expired contracts from Program Years 2003 through 2005. Despite the Commission's actions to improve efficiency of the cost share program (discussed on pp. 7-8), districts still must turn away three out of every five farmers requesting cost share assistance.

In Fiscal Year 2006 districts obligated $8,854,934 to 1,498 new contracts with farmers. Table 2 presents the number and value of 2006 contracts by soil and water conservation district and each district's allocation of cost share funds for 2006.

Table 2: Agriculture Cost Share Program 2006 Contracts and Allocation by County							
County	Number of 2006 Contracts	Amount Contracted	2006 Allocation	County	Number of 2006 Contracts	Amount Contracted	2006 Allocation
Alamance	24	$ 87,722	$ 88,512	Johnston	40	$ 119,815	$ 124,939
Alexander	10	$ 62,327	$ 62,327	Jones	16	$ 68,108	$ 85,409
Alleghany	14	$ 119,638	$ 119,638	Lee	12	$ 58,162	$ 59,420
Anson	7	$ 66,728	$ 87,286	Lenoir	36	$ 97,472	$ 120,493
Ashe	11	$ 133,315	$ 133,315	Lincoln	9	$ 69,597	$ 70,688
Avery	21	$ 80,824	$ 80,962	Macon	7	$ 56,218	$ 60,011
Beaufort	19	$ 124,536	$ 126,276	Madison	20	$ 74,186	$ 75,000
Bertie	14	$ 83,677	$ 83,680	Martin	16	$ 82,241	$ 85,884
Bladen	15	$ 97,897	$ 97,897	McDowell	4	$ 35,184	$ 40,000
Brunswick	7	$ 59,115	$ 64,491	Mecklenburg	1	$ 2,166	$ 22,000
Buncombe	11	$ 82,751	$ 116,621	Mitchell	10	$ 99,534	$ 99,535
Burke	8	$ 72,606	$ 75,000	Montgomery	9	$ 134,565	$ 134,694
Cabarrus	13	$ 61,707	$ 66,707	Moore	12	$ 144,792	$ 144,860
Caldwell	11	$ 90,264	$ 90,264	Nash	12	$ 97,687	$ 101,809
Camden	5	$ 50,215	$ 52,750	New Hanover	1	$ 4,096	$ 41,707
Carteret	1	$ 33,000	$ 33,000	Northampton	36	$ 78,982	$ 84,586
Caswell	34	$ 88,105	$ 88,946	Onslow	16	$ 54,573	$ 76,641
Catawba	5	$ 68,281	$ 68,283	Orange	35	$ 101,733	$ 101,733
Chatham	16	$ 114,264	$ 115,258	Pamlico	8	$ 99,750	$ 102,492
Cherokee	18	$ 88,819	$ 88,819	Pasquotank	12	$ 64,050	$ 64,214
Chowan	15	$ 61,736	$ 69,500	Pender	11	$ 72,198	$ 75,532
Clay	6	$ 95,478	$ 103,014	Perquimans	10	$ 80,619	$ 87,510
Cleveland	5	$ 18,471	$ 64,697	Person	26	$ 82,480	$ 82,486
Columbus	24	$ 86,086	$ 88,906	Pitt	18	$ 134,963	$ 142,850
Craven	7	$ 31,161	$ 59,814	Polk	4	$ 24,315	$ 50,000
Cumberland	12	$ 63,888	$ 68,783	Randolph	8	$ 145,699	$ 145,699

Estimated Water Quality Benefits of ACSP Contracts Initiated in 2006

N.C.G.S 143-215.74(b)(7) requires that each project's benefits to water quality be estimated before funding is awarded. To meet this requirement, the Commission chose three indicators of water quality benefits: tons of soil saved, pounds of nitrogen saved or managed, and pounds of phosphorus saved or managed. Soil savings estimates have been required on all Cost Share contracts since the beginning of the program. Beginning with the 1997 program year, estimates of nitrogen and phosphorus savings were required to be reported. The Division continues to work with the Division of Water Quality, NRCS, and North Carolina State University to improve and refine our method to estimate and account for nutrient reductions.

These estimates have been very useful to help track progress by agriculture relative to the nutrient reduction requirements in the Neuse and Tar-Pamlico

Nutrient Reduction Rules for agriculture. The ACSP is playing a key role in helping farmers achieve the 30% nutrient reduction required by these rules.

Local soil and water conservation districts determine which projects are eligible for funding in their districts according to a required priority ranking process, tailored to each district's water quality concerns. The water quality evaluations on each project are carried out at the district level, and the water quality benefit estimates are provided to the Division on each contract form. The data are entered from the contract form into the Division's cost share database and tracked by Division staff. The estimated sediment and nutrient reduction benefits for program years 2004-2006 are summarized in Table 1.

Some BMPs standing alone will not directly result in sediment or erosion reductions or nitrogen or phosphorus savings, but are used in conjunction with other practices. These BMPs are called "facilitating practices" and are necessary to facilitate and ensure that other practices in the BMP system are effective at reducing nutrient or sediment loading to a water resource. Therefore, their reduction credit is linked to the facilitated practice. An example of a facilitating practice is a water tank, which must be installed for livestock drinking water purposes before fencing can be put up to keep livestock out of a stream.

Table 1: Sediment and Nutrient Reduction Benefits for Program Years 2004 through 2006.

	2004	2005	2006
Number of Contracts	2,053	1,532	1,498
Acres Affected	76,255 acres	67,621 acres	78,085 acres
Soil Saved	277,556 tons	172,378 tons	171,633 tons
Nitrogen Saved	1,717,092 pounds	1,392,754 pounds	926,743 pounds
Phosphorus Saved	626,600 pounds	262,404 pounds	156,766 pounds
Waste Nitrogen Managed	24,923,721 pounds	3,709,391 pounds	4,004,181 pounds
Waste Phosphorus Managed	5,219,734 pounds	3,483,287 pounds	4,483,211 pounds

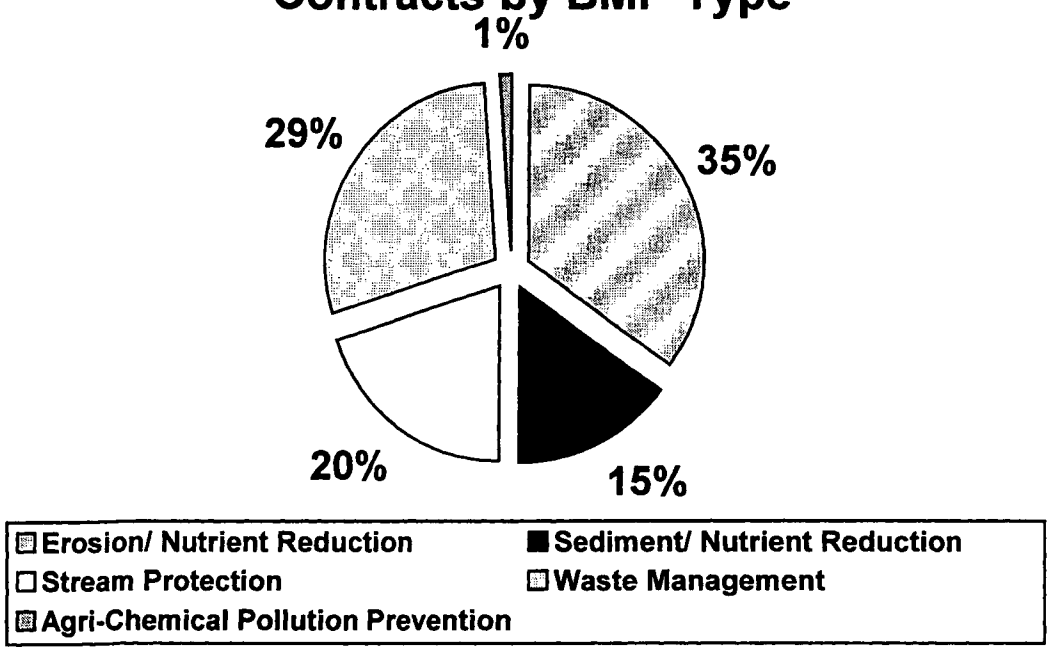
Effectiveness of Each Project to Accomplish Its Primary Purpose

The statutory purpose of the program and each project is to improve water quality by reducing the input of agricultural non-point source pollution into the water courses of the state. Each BMP approved for the Cost Share program is designed for at least one of five major purposes to protect the water resources of the state:

1) sediment/nutrient delivery reduction through reduction of applied nutrients, reduction of soil loss, or interception of nutrients from fields;
2) erosion reduction/nutrient loss reduction in fields through reduction of applied nutrients or prevention of soil detachment;
3) prevention of agricultural chemical pollution of ground or surface water from improper handling or accidents;
4) reduction of nutrient loading through proper management of animal waste; and
5) stream protection measures to reduce the delivery of sediment and nutrients by animals and stabilize streambanks to minimize further erosion and sediment contribution.

As shown in Figure 4, 35% of the 2006 funds were directed toward erosion and nutrient-reducing BMPs (e.g., conservation tillage, cropland conversion to grass or trees), 20% were directed toward stream protection systems (e.g., livestock exclusion from streams), 15% were directed toward sediment and nutrient-reducing BMPs (e.g., riparian buffers, field borders, grassed waterways), 29% were directed toward animal operations for waste management BMPs (e.g., poultry litter storage structures, closure of inactive lagoons, livestock feeding/waste storage structures), and 1% were directed toward agri-chemical pollution prevention measures (e.g. agri-chemical handling facilities).

Figure 4: Breakdown of 2006 ACSP Contracts by BMP Type



Attachment C is a chart showing the approved BMPs in these categories and their relationship to water quality improvement.

Staff of the Division, soil and water conservation districts, and NRCS has verified every project for which program funds have been expended to have been installed in accordance with program standards and to be accomplishing its primary purpose.

TARGETING ACSP FUNDS TO WATERSHEDS OF IMPAIRED WATERS

The Commission continues to exercise leadership in allocating ACSP resources to local districts containing impaired waters and in encouraging district supervisors to use ACSP funds to address impaired waters. This is best illustrated by the fact that the Commission targeted $182,170 of funds available in 2006 for the specific purpose of installing erosion and sediment-reducing best management practices into watersheds of waters listed on the State's 303(d) list of waters as impaired due to sediment from sources including agriculture in 10 counties.

In 2006, about 11% of ACSP funds were used to implement BMPs in watersheds of impaired waters. Considering that only 2.4% of North Carolina's stream miles are attributed to being impaired by agricultural sources, this demonstrates that the ACSP funds are being significantly targeted toward improving streams that do not fully meet their uses.
