Approximately 25% of funds contracted in Program Year 2006 were contracted with farmers in the Neuse and Tar-Pamlico River Basins to help them achieve the required 30 percent reduction in agricultural nitrogen losses. Districts in the Neuse and Tar-Pamlico Basins will continue to use ACSP to sustain the reductions already achieved and to attain further voluntary reductions in these nutrient sensitive watersheds. ACSP funds are also being used to reduce phosphorus losses from agriculture to help achieve the goal of no net increase in phosphorus loading to the Tar-Pamlico Basin. Participating farmers continue to assess phosphorus losses using the Phosphorus Loss Assessment Tool (PLAT).

The Commission also targeted $204,346 of Program Year 2006 funds to 16 districts to assist with implementation of riparian buffers in nutrient sensitive watersheds under the Conservation Reserve Enhancement Program.

NEW PROGRAM ENHANCEMENTS TO IMPROVE EFFICIENCY AND PROGRAM DELIVERY

Because of the need to continually improve the program's cost effectiveness, and because of recurring budget reductions in the program's appropriation, the Commission is moving forward on several enhancements for the 2006-2007 program year. These enhancements were designed to improve the efficiency by which program funds are used by agricultural cooperators to install best management practices and to improve the responsiveness of the program to state and local water quality priorities.

One efficiency improvement was to initiate an Programmatic Review of the North Carolina Agriculture Cost Share Program. The purpose of the review will be to evaluate the effectiveness of the NCACSP with special emphasis on ensuring the program and cost shared BMPs are meeting the conservation needs on the private working agricultural lands of North Carolina.

Leadership for the program assessment shall reside with the Technical Review Committee. The Committee will establish a subcommittee to complete an assessment of the NCACSP. TRC representatives from the Division, NRCS, NCDA, Farm Bureau, the Grange, Wildlife Resources Commission, the District Employees Association have agreed to participate in the process along with others so named by the TRC.

The objectives of the program review will be to assess 1) the efficiency and effectiveness of program implementation at the state and local level, 2) the degree to which the program is meeting the needs of working lands conservation and water quality protection, and 3) the relationship of dollars expended to resource problems addressed.

To address objective one, the subcommittee will review feedback received from local SWCDs through the Division's cost share training sessions and program reviews. The subcommittee will also solicit additional feedback from districts to assess opportunities to improve program delivery.

To address objective two, the subcommittee will develop and distribute a survey of program participants to a random number of participants statewide. The objective is to receive feedback from our customers on their experiences with our program and how we can improve the program to better serve the private working lands of North Carolina. The subcommittee will also review the current set of approved practices to determine if additional practices are necessary or if modification are needed to improve practice effectiveness.

Objective 3 will be addressed by on-site farm visits to assess the extent to which the installed practices address the resource problems and the cost effectiveness of the installed BMP as compared to other alternatives.

The Subcommittee will compile the results of the assessment and will present the findings to the TRC and to the Commission at a future meeting in the Summer of 2007.

Another efficiency improvement was to initiate an upgrade to the existing ACSP database. The Division has worked with the DENR Information Technology Services Division to upgrade the current ACSP database. Funding for the new database is being provided by Clean Water Act Section 319 grant funds administered by the Division of Water Quality (DWQ). The proposed upgraded system will utilize the DENR-Integrated Build Environment for Application Management (IBEAM) approach to permit more efficient on-line contracting and contract approval to eliminate duplicative data entry and to shorten contract review and approval time. The proposed system will also include mechanisms to attach GPS and GIS information and digital photographs to better present the benefits and outcomes associated with BMP implementation. The proposed system will also better coordinate with the federal Pro-Tracks system to permit a more complete accounting for agricultural BMP implementation and progress reporting in North Carolina.

This database will provide real-time 24 hours a day, seven days a week ACSP information that can easily be updated by the Division, DENR Regional Office and local Soil & Water Conservation District staff, with minimal errors, and be used to generate standard reports on program use and water quality benefits. Non-sensitive information will be accessible for public view on the internet (read-only format).

The Division has nearly completed the process for hiring a computer programmer to assist with the ACSP database upgrade project. When completed, this new web-based database will enable districts to develop and submit cost share contracts over the internet, and Division staff will be able to review and approve contracts electronically. The project is expected to be ready for evaluation by districts by the Summer of 2007.

The Commission also established a policy in 2005 relating District Strategy Plans to the DWQ's Basinwide Water Quality Plans. The Commission is now requiring that all district strategy plans for ACSP include a section describing waters listed as impaired or with notable water quality problems and concerns as documented in the most recent applicable basinwide water quality plan(s), and for which agriculture is a potential source or stressor. The District should also list any waters of local concern that has been identified by the district, and for which agriculture is a potential source or stressor. The section of the strategy plan shall

also describe how the district intends to address agricultural nonpoint source problems impacting these waters. This policy became effective for the Program Year 2007. All 96 Districts completed this new section of the strategy plan and did an exceptional job with documenting the impaired waters in their county and the actions the District plans to take to address the problems impacting these waters.

At its May 2006 meeting the Commission added to the cost share program a practice for removing suspended solids from tank-based aquaculture production operations. The central component of the system, which is based on a system being demonstrated at the NCSU Fish Barn on Lake Wheeler Road in Raleigh, is a permeable plastic geotube which collects the flocculated solids and allows the treated water to percolate out to be reused or land applied. The Division received a $150,000 Conservation Innovation Grant from NRCS in August 2006 . These funds will supplement the ACSP to assist aquaculture producers to install best management practices on farms in North Carolina.

During the 2006 Program Year the Soil & Water Conservation Commission also expanded its delegated approval program (formerly pilot project) to an additional 14 districts. This brings the total to 30 districts to whom the Commission has delegated contract approval, including Alamance, Beaufort, Bertie, Buncombe, Camden, Catawba, Chatham, Columbus, Craven, Currituck, Davidson, Forsyth, Guilford, Henderson, Iredell, Johnston, Lee, Madison, Moore, Onslow, Orange, Pasquotank, Pender, Pitt, Surry, Wake, Warren, Wayne, Wilkes and Yancey SWCDs. These Soil & Water District Boards have the authority to approve their own NCACSP contracts. Districts are selected for this program based on the following criteria: 1) results from the most recent program review (within the last 2 years), 2) percentage of contracts that have been approved by the District Board and submitted that end up being pended for more information by the Division, 3) experience and longevity of the District staff. The delegated approval program has been very successful at allowing cost share staff to devote more time to technical assistance and field training, and it has decreased the time delay in permitting the cooperators to begin work for BMP implementation since it began in the 2003 Program Year.

COST-EFFECTIVENESS CONSIDERATIONS

The ACSP is a cost-effective program from both a state expenditure perspective and the farmer's perspective. This program has been credited with helping the state to achieve considerable success in protecting and improving water quality. Many farmers could not afford to implement BMPs (many of which are required by regulations) without cost share assistance. Because a farmer must invest at least 25% of the cost for BMPs, the farmer has ownership in the practice and is more likely to maintain it. The educational value of local farmers participating the program is substantial in helping to change local practices.

Use of ACSP to Leverage Additional BMP Implementation Funds From Other Sources

The Commission's 2006 allocation to districts included $182,170 for the intended purpose of installing BMPs in watersheds of streams on the state list of impaired waters due to sediment from agricultural sources. Because of this targeted allocation the Division of Soil and Water Conservation and districts were able to obtain $1,000,000 in grant funds from the Clean Water Management Trust Fund and $700,497 from the US Environmental Protection Agency 319 (EPA-319) program to implement sediment reducing BMPs in these watersheds. The Division has also entered into a cooperative agreement with the United States Geological Survey who will provide an additional $150,000 of water quality monitoring services to document reduction in sediment loading. Please see Attachment E, for a detailed map of project locations for the Agricultural Sediment Initiative grant funds that have been implemented in the 2006 Program Year.

ACSP funds are an essential part of the state match for the Conservation Reserve Enhancement Program (CREP), a federal/state partnership. ACSP and other state programs (CWMTF) are providing a total of $54 million over eight years to match $221 million in federal payments to North Carolina landowners participating in CREP.

ACSP funds for BMP implementation and technical assistance also provide the required state match for three EPA-319 grants for accelerating BMP implementation in the Neuse and Tar-Pamlico river basins. The total of the three grants is $1,419,180.

Whenever possible, the districts use the ACSP in conjunction with other programs, such as the federal Environmental Quality Incentive Program and the Conservation Reserve Enhancement Program, to stretch scarce resources as far as possible. Districts also partner to meet the needs of cooperating producers and landowners.

Leveraging of Local and Federal Resources for Technical Assistance and Local Delivery

This program is delivered locally by 492 elected and appointed volunteer Soil and Water Conservation District Supervisors and by over 400 local staff of districts and NRCS. District supervisors receive no state salary, yet are responsible for seeing that state funds are spent where they are most needed to improve water quality. District supervisors are required to develop a prioritization ranking system for administering the ACSP in their respective district to maximize the water quality benefits of the program. Applications to each district are evaluated and prioritized according to this system. District supervisors also must inspect at

least five percent of all cost share contracts in their district every year to ensure the BMPs are properly maintained.

The ACSP is heavily dependent on the technical resources of the local soil and water conservation districts and the NRCS. District and federal employees develop conservation plans, design BMPs, and provide engineering assistance for water quality improvements at no cost to the farmers whose applications are accepted for cost share assistance. These staff also assist farmers and other landowners in implementing water quality projects using other funding sources such as the USDA's Environmental Quality Incentives Program and Conservation Reserve Enhancement Program, the U.S. Environmental Protection Agency's Section 319 Non-Point Source Program, and North Carolina's Clean Water Management Trust Fund.

A critical portion of the General Assembly's appropriation for ACSP provides a state match for salaries for many of these district technical employees and for their operating expenses to carry out the cost share program. For 2006, the General Assembly appropriated $1,875,000 in recurring funds for cost sharing technical assistance positions in local districts and directed DENR to continue to transfer $240,000 from BMP assistance to support technical assistance. County commissions provide more than 50% match for salaries and operating expenses, including office space and administrative support for these technical assistance positions. In program year 2006 the cost share technical assistance program cost shared on 116 technical positions in 90 counties to assist farmers in designing and installing BMPs. These state technical assistance cost share funds maintain a local conservation infrastructure and are critical to sustain local county support and funding for local delivery of the program.

NRCS engineers and conservation specialists are also available to each district. These federal employees carry out a portion of the cost share work support without cost to the state, and they provide additional technical resources and expertise to ensure that cost-shared practices are properly installed and maintained for the expected life of the practice.

In addition, NRCS allows district staff in some districts to use federal vehicles for use on state cost share work. NRCS also provides computers and sophisticated natural resources materials and computer software in all 100 county field offices, and develops the technical standards for most of the BMPs used in the cost share program. This state program leverages a much greater amount of federal funding for water quality improvements in North Carolina.

PROGRAM MANAGEMENT

Attachment D is an overview of the funding and compliance process used for implementing the Agriculture Cost Share Program.

A Division program staff of four FTEs reviews approximately 1,600 contracts annually and processes about 2,500 requests for payment each year. The Division also maintains the ACSP Manual, trains local personnel, provides daily technical assistance to the districts, and conducts oversight through district program reviews to ensure proper record keeping and BMP maintenance for continued water quality protection.

Because the state specifies that the purpose of the program is to assist agricultural operations in addressing an existing water quality problem, the program does not assist new operations to go into business. It is the policy of the Commission that new producers or companies constructing new agricultural operations should be aware of the existing environmental requirements and technical standards and should be prepared to meet them without state funding assistance. This is especially important when existing operations are struggling to comply with new requirements that were not in place when they began operating. Therefore, the Commission has restricted eligibility for Cost Share funds to those operations, which have been in existence for three years prior to the date of cost share application. Operations that were not in existence for three years prior to application date may still be eligible for cost-share if changes in environmental statutes or regulations create new requirements that could, without assistance, make the facility out of compliance. These exceptions require Commission approval.

IMPACT OF INCREASED COSTS TO THE NCACSP

The NCACSP has experienced many challenges due to the increased costs of fuel, labor, and materials over the past few years. Since the NCACSP is based on 75% of a predetermined average cost for each practice it has been almost impossible to keep up with the cost changes in areas such as gravel, pipe, fencing, lumber, and the cost of operating heavy machinery to install a lot of the BMPs in the program. In Program Year 2004 the NCACSP was able to contract with 2,053 projects statewide encumbering $6,827,880 compared to only 1,498 projects statewide in the 2006 Program Year encumbering $8,854,934. Because of the price increase the Soil & Water Conservation Districts are not able to help as many farmers install conservation practices on the ground. The NCACSP continues to monitor the established average costs list for the program and receives feedback from the local Soil & Water Conservation Districts on any adjustments that are needed. Division cost share staff plan on completing a total review of the current average cost manual in the Spring of 2007 and making the correct adjustments to be effective for the 2008 Program Year.

CONCLUSIONS AND RECOMMENDATIONS

Based on the above considerations, the Commission believes the ACSP is being administered very cost-effectively and that considerable water quality benefits are being realized for the investment made with state funds. The program aids agricultural operations in making essential water quality improvements, the cost of which cannot be passed on to the consumer in the price of the food or fiber product, and thereby contributes both to water quality and to sustaining a strong state agricultural economy. The Commission continues to emphasize prioritizing, targeting, accountability, leveraging, and adaptability in managing these public funds to further improve the water quality benefits intended by the General Assembly.

Increased costs of fuel, labor, and materials have significantly impacted the amount of conservation the program can effect and the number of cooperating farmers who can be assisted. The Commission has taken actions to improve program efficiencies that have helped to partly offset these impacts in the short-term. The ACSP continues to play a vital role in assisting farmers and ranchers with voluntary water quality protection and with compliance with state and federal regulatory requirements. The program is our state's cornerstone in efforts to support private working lands stewardship for the benefit of water quality and all the citizens of North Carolina.

Attachment A
DETAILED IMPLEMENTATION PLAN – PROGRAM YEAR 2006

Definition of Practices

(1) An agrichemical handling facility means a permanent structure that provides an environmentally safe means of mixing agrichemicals and filling tanks with agrichemicals for application and storage to improve water quality. Benefits may include prevention of accidental degradation of surface and ground water. Cost share for this practice is limited to $25,000 per facility.

(2) Agricultural road repair/stabilization means repair or stabilization of existing access roads utilized for agricultural operations, including roads to existing crop fields, pastures, and barns.

(3) A fertigation or chemigation backflow prevention system means a system for preventing backflow of fertilizers or chemicals from contaminating water sources in fertigation and or chemigation applications. It can include retrofitting or installing injection equipment, check valves, gauges, drains, and vacuum breakers. It does not include items unrelated to backflow prevention (e.g., tanks, mixers, or filters). Cost share for this practice is limited to $1,500 per system.

(4) A Christmas Tree Conservation Cover practice means to establish and maintain a conservation cover of grass, legumes, or other approved plantings on fields previously with no groundcover established, to reduce soil erosion and improve water quality. Other benefits may include reduced offsite sedimentation and pollution from dissolved and sediment-attached substances.

(5) A three-year conservation tillage system means any tillage and planting system in which at least (60) sixty percent of the soil surface is covered by plant residue for the same fields for three consecutive years to improve water quality. Benefits may include reduction of soil erosion, sedimentation and pollution from dissolved and sediment-attached substances. The three-year conservation tillage incentive is broken down into two categories depending on the crop(s) to be grown:

a. Grain crops and cotton
b. Vegetables, tobacco, peanuts, and sweet corn

Cost share for each category of this practice is limited to $15,000 per cooperator in a lifetime.

(6) A critical area planting means an area of highly erodible land that cannot be stabilized by ordinary conservation treatment on which permanent perennial vegetative cover is established and protected to improve water quality. Benefits may include reduced soil erosion and sedimentation.

(7) A cropland conversion practice means to establish and maintain a conservation cover of grasses, trees, or wildlife plantings on fields previously used for crop production to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(8) A diversion means a channel constructed across a slope with a supporting ridge on the lower side to control drainage by diverting excess water from an area to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances

(9) A field border means a strip of perennial vegetation established at the edge of the field that provides a stabilized outlet for row water to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(10) A filter strip means an area of permanent perennial vegetation for removing sediment, organic matter, and other pollutants from runoff and waste water to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination and pollution from dissolved, particulate, and sediment-attached substances.

(11) A grade stabilization structure means a structure (earth embankment, mechanical spillway, detention-type, etc.) used to control the grade and head cutting in natural or artificial channels to improve water quality. Benefits may include reduced soil erosion and sedimentation.

(12) A grassed waterway means a natural or constructed channel that is shaped or graded to required dimensions and established in suitable vegetation for the stable conveyance of runoff to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(13) A heavy use area protection means an area used frequently and intensively by animals, which must be stabilized by surfacing with suitable materials to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved, particulate, and sediment-attached substances.

(14) A land smoothing practice means reshaping the surface of agricultural land to planned grades for the purpose of improving water quality.

(15) A livestock feeding area is a sized concrete pad where feeders are located, surrounded by a Heavy Use Area. The Livestock Feeding Area is designed for the purpose of improving the lifespan of the heavy use area and to reduce the runoff of nutrients and fecal coliform to adjacent water bodies. The practice is to be used to address water quality concerns where livestock feeding areas are in close proximity to streams and where relocation or rotation of feeding areas is infeasible due to physical limitations (e.g., slope) and where other stream protection measures are insufficient to protect water quality. Cost share for the concrete pad for this practice is limited to $3,000.

(16) A livestock exclusion system means a system of permanent fencing (board or barbed, high tensile or electric wire) installed to exclude livestock from streams and critical areas not intended for grazing to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination and pollution from dissolved, particulate, and sediment-attached substances.

(17) A long term no-till practice means planting all crops for five consecutive years with at least 80 percent plant residue from preceding crops to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances. Cost share for this incentive or this incentive combined with 3-year conservation tillage for grain and cotton is limited to $25,000 per cooperator in a lifetime.

(18) A nutrient management practice means a definitive plan to manage the amount, form, placement, and timing of applications of nutrients to minimize entry of nutrients to surface and groundwater and improve water quality.

(19) A nutrient scavenger cover crop means a crop of small grain grown primarily as a seasonal nutrient scavenger. The purpose is to scavenge and cycle plant nutrients, add organic matter to the soil, improve infiltration, aeration and tilth, improve soil quality, reduce soil crusting, provide residue for conservation tillage and sequester carbon. Benefits may include reduction of soil erosion, sedimentation and pollution from dissolved and sediment-attached substances. Cost share for this incentive practice is limited to $25,000 per cooperator in a lifetime. (DIP)

(20) A pastureland conversion practice means establishing trees or perennial wildlife plantings on excessively eroding land with a visible sediment delivery problem to the waters of the state used for pasture that is too steep to mow or maintain with conventional equipment to improve water quality. Benefits may include reduced soil erosion and sedimentation.

(21) A rock-lined outlet means a waterway having an erosion-resistant lining of concrete, stone or other permanent material where an unlined or grassed waterway would be inadequate to improve water quality. Benefits may include safe disposal of runoff, reduced erosion and sedimentation.

(22) A sediment control basin means a basin constructed to trap and store waterborne sediment where physical conditions or land ownership preclude treatment of a sediment source by the installation of other erosion control measures to improve water quality.

(23) A sod-based rotation practice means an adapted sequence of crops, grasses and legumes or a mixture thereof established and maintained for a definite number of years as part of a conservation cropping system which is designed to provide adequate organic residue for maintenance or improvement of soil tilth to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances. Cost share for this incentive practice is limited to $25,000 per cooperator in a lifetime.

(24) A stock trail or walkway means to provide a stable area used frequently and intensively for livestock movement by surfacing with suitable material to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved, particulate, and sediment-attached substances.

(25) A stream protection system means a planned system for protecting streams and stream banks that eliminates the need for livestock to be in streams by providing an alternative-watering source for livestock to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination, and pollution from dissolved, particulate and sediment-attached substances. System components may include:

(A) A spring development means improving springs and seeps by excavating, cleaning, capping or providing collection and storage facilities.

(B) A stream crossing means a trail constructed across a stream to allow livestock to cross without disturbing the bottom or causing soil erosion on the banks.

(C) A trough or tank means devices installed to provide drinking water for livestock at a stabilized location.

(D) A well means constructing a drilled, driven or dug well to supply water from an underground source.

(E) A windmill means erecting or constructing a mill operated by the wind's rotation of large vanes and is used as a source of power for pumping water.

(26) A Streambank Stabilization system means the use of bioengineering practices, native material revetments, channel stability structures, and/or the restoration or management of riparian corridors in order to protect upland BMPs, restore the natural function of the stream corridor and improve water quality by reducing sedimentation to streams from streambank erosion and decreasing the delivery of nitrogen, phosphorus and other pollutants to the stream from adjacent pasture or cropland. Cost share for this practice is limited to $25,000 per cooperator per year.

(27) A stripcropping practice means to grow crops and sod in a systematic arrangement of alternating strips or bands on the contour to improve water quality. Benefits may include reduced soil erosion, sedimentation, and pollution from dissolved and sediment-attached substances. The crops are arranged so that a strip of grass or close-growing crop is alternated with a strip of clean-tilled crop, fallow, or no-till crop, or a strip of grass is alternated with a close-growing crop.

(28) A riparian buffer means an area adjacent to solid blue line streams as shown on 7.5 minute USGS maps where a permanent, long-lived vegetative cover (sod, shrubs, trees, or a combination of vegetation types) is established to improve water quality. Benefits may include reduced soil erosion, sedimentation, pathogen contamination and pollution from dissolved, particulate and sediment-attached substances.

(29) A terrace means an earth embankment, a channel, or a combination ridge and channel constructed across the slope to improve water quality. Benefits may include reduced soil erosion, sedimentation and pollution from dissolved and sediment-attached substances.

(30) A waste management system means a planned system in which all necessary components are installed for managing liquid and solid waste to prevent or minimize degradation of soil and ground and surface water resources. System components may include:

(A) A Closure of Abandoned Waste Impoundment means the safe removal of existing waste and waste water and the application of this waste on land in an environmentally safe manner. Cost share for this practice is limited to $75,000 per cooperator.

(B) A constructed wetland for land application practice means an artificial wetland area into which liquid animal waste from a waste storage pond or lagoon is dispersed over time to lower the nutrient content of the liquid animal waste.

(C) A controlled livestock lounging area means a planned, stabilized and vegetated area in which livestock are kept for a short duration.

(D) A drystack means a fabricated structure for temporary storage of animal waste. Cost share for drystacks for poultry and non-.0200 animal operations are limited to $30,000 per structure.

(E) A feeding/waste storage structure means a fabricated structure for the combined purpose of animal feeding and temporary storage of animal waste. Cost share for this practice is limited to $25,000 per structure.

(F) An insect control system means a practice or combination of practices (planting windbreaks, pre-charging structures, incorporation of waste into soil, etc.) which manages or controls insects from confined animal operations, waste treatment and storage structures, and waste applied to agricultural land.

(G) A livestock mortality management system is a facility for managing livestock mortalities such as to minimize water quality impacts or to produce a material that can be recycled as a soil amendment and fertilizer substitute. Cost shareable mortality management system components include: composter, rotary drum composter, forced aeration static pile composter, mortality freezer, mortality incinerator, and mortality gasification system.

(H) An odor control management system means a practice or combination of practices (planting windbreaks, pre-charging structures, incorporation of waste into soil, etc.) which manages or controls odors from confined animal operations, waste treatment and storage structures and waste applied to agricultural land.

(I) An offsite or an alternative poultry dry litter waste utilization means applying, processing and/or transporting poultry dry litter such that it is properly utilized to reduce nutrient impacts. Payments for this incentive shall be limited to $15,000 per farm per year for no more than 3 years.

(J) A Retrofit of On-Going Animal Operations means modification of structures to increase storage or to correct design flaws to meet current standards. This practice may also be used to close waste impoundments on on-going operations, including the safe removal of existing waste and waste water and the application of this waste on land in an environmentally safe manner. .

(K) A storm water management system means a system of collection and diversion practices (guttering, collection boxes, diversions, etc.) to prevent unpolluted storm water from flowing across concentrated waste areas on animal operations.

(L) A waste application system means an environmentally safe system (such as solid set, dry hydrant, mobile irrigation equipment, etc.) for the conveyance and distribution of animal wastes from waste treatment and storage structures to agricultural fields as part of an irrigation and waste utilization plan. Cost share for this practice is limited to $25,000 per cooperator in a lifetime.

(M) A waste storage pond means an impoundment made by excavation or earthfill for temporary storage of animal waste, waste water and polluted runoff.

(N) A waste treatment lagoon means an impoundment made by excavation or earthfill for biological treatment and storage of animal waste.

(31) A water control structure means a permanent structure placed in farm canals and ditches, which

provides control of surface and subsurface drainage to improve water quality. The primary benefit is to reduce nutrient pollution. Other benefits may include reduced pollution from other dissolved and sediment-attached substances, reduced sedimentation and reduced stormwater surges of fresh water into estuarine areas.

(32) A wetland restoration system means a system of practices designed to restore the natural hydrology of an area that had been drained and cropped.

*To be used in conjunction with the most recent version of the APA Rules for the North Carolina Agriculture Cost Share Program for Nonpoint Source Pollution Control and the NC-ACSP Manual.

Attachment B

NC Agriculture Cost Share Program
Practice Log Summary

Year : **2006**
Program : **CS, SE, CE**

Best Management	Planned Units	Msr.	Cost	Implemented Units	Msr.	Cost
Erosion/Nutrient Reduction						
Conservation Tillage (3 Yr.)	7,167.31	Acre	$571,436	5,654.32	Acre	$445,495
Long Term No-Till	2,944.60	Acre	$356,287	2,076.34	Acre	$259,700
Sod-Based Rotation	2,089.70	Acre	$314,291	1,538.08	Acre	$233,569
Cropland Conversion - Grass	4,981.36	Acre	$1,059,244	3,955.68	Acre	$841,642
Cropland Conversion - Trees	1,755.15	Acre	$162,903	1,145.28	Acre	$103,679
Cropland Conversion - Wildlife	1.60	Acre	$360	0.00	Acre	$0
Christmas Tree Conservation Cover	211.00	Acre	$23,565	33.00	Acre	$3,592
Critical Area Planting	58.59	Acre	$120,525	23.33	Acre	$55,612
Diversion	6,051.00	Feet	$9,598	3,179.00	Feet	$2,774
Land Smoothing	1,484.47	Acre	$178,386	531.47	Acre	$69,132
Terraces	11,188.00	Feet	$14,390	10,239.00	Feet	$13,189
Pastureland Conversion To Trees	27.70	Acre	$5,373	0.00	Acre	$0
Stripcropping	26.00	Acre	$3,510	0.00	Acre	$0
Nutrient Scavenger Crop	1,285.70	Acre	$28,012	448.40	Acre	$8,072
Ag Road Repair-Stabilization	20,914.64	Feet	$138,766	2,470.84	Feet	$49,204
Sediment/Nutrient Reduction						
Grassed Waterway	115.73	Acre	$277,539	68.69	Acre	$162,107
Field Border	212.06	Acre	$385,946	127.19	Acre	$240,599
Filter Strip	3.50	Acre	$7,131	3.90	Acre	$7,561
Riparian Buffer	1,046.24	Acre	$91,412	985.66	Acre	$74,582
Water Control Structure	70.00	Units	$182,941	15.00	Units	$48,573
Nutrient Management	8,230.30	Acre	$129,843	6,331.30	Acre	$81,556
Rock-Lined Outlet	3.00	Units	$17,733	1.00	Units	$636
Streambank Stabilization	5,786.00	Feet	$78,571	1,414.00	Feet	$31,261
Grade Stabilization Structure	14.00	Units	$39,867	6.00	Units	$11,583
Wetlands Restoration System	4.00	Units	$28,814	0.00	Units	$1,427
Sediment Control Basin	1.00	Units	$2,338	1.00	Units	$2,338
Stream Protection						
Trough Or Tank	369.00	Units	$587,569	114.00	Units	$161,275

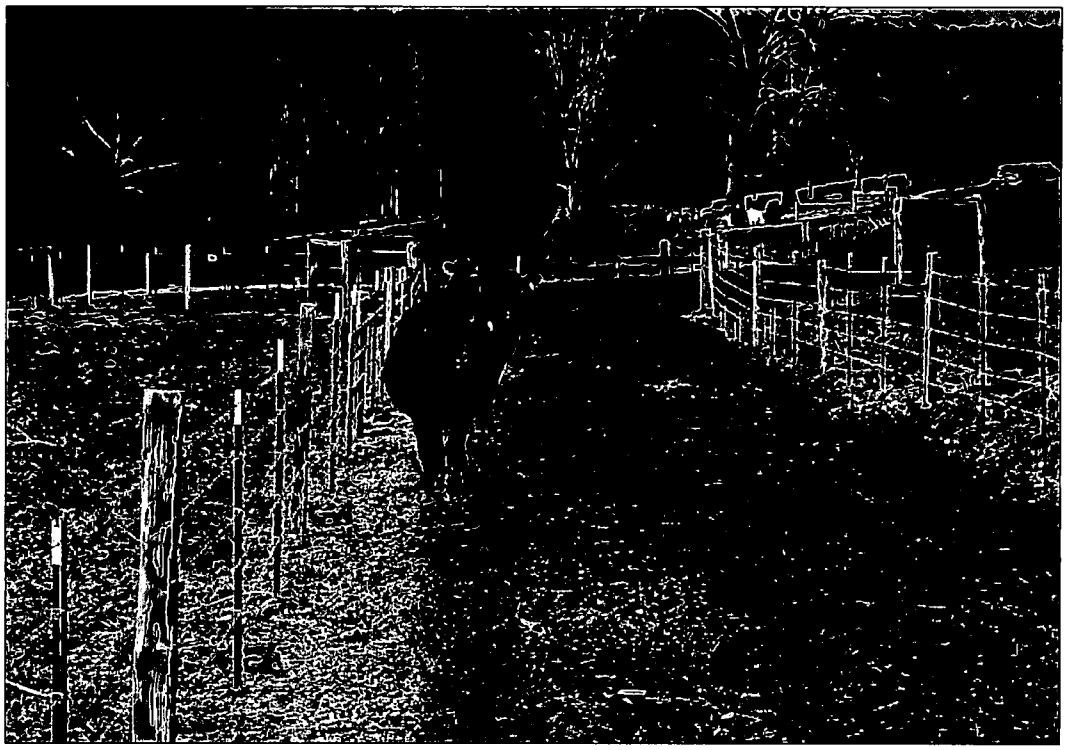
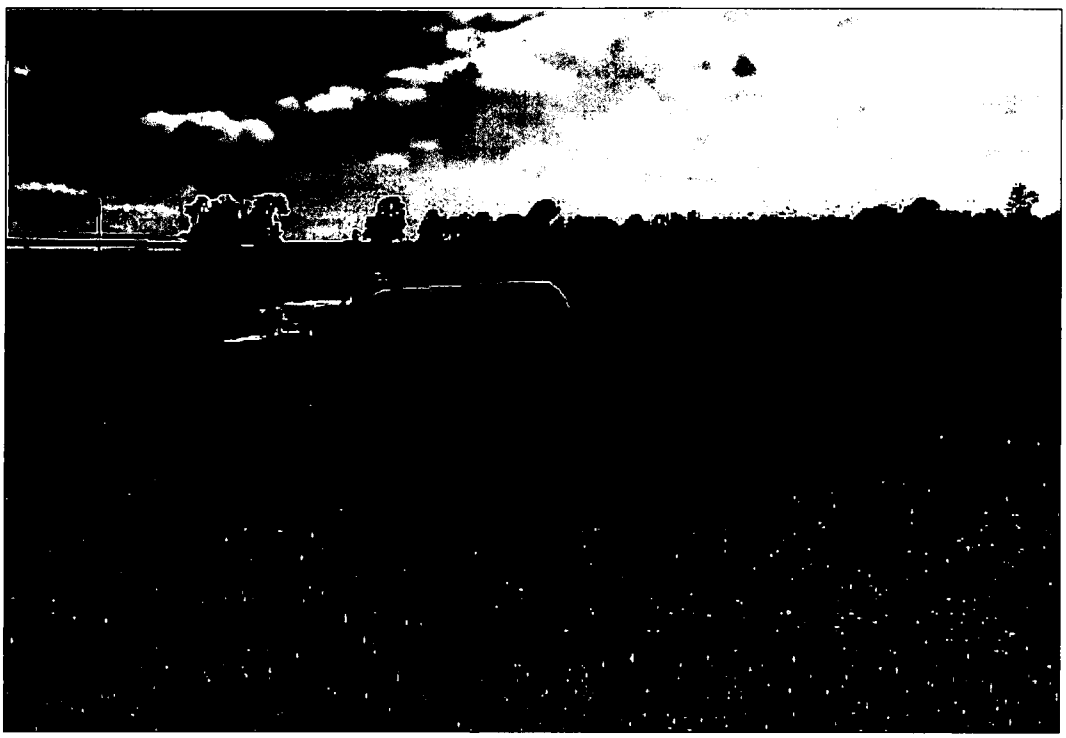
ATTACHMENT F

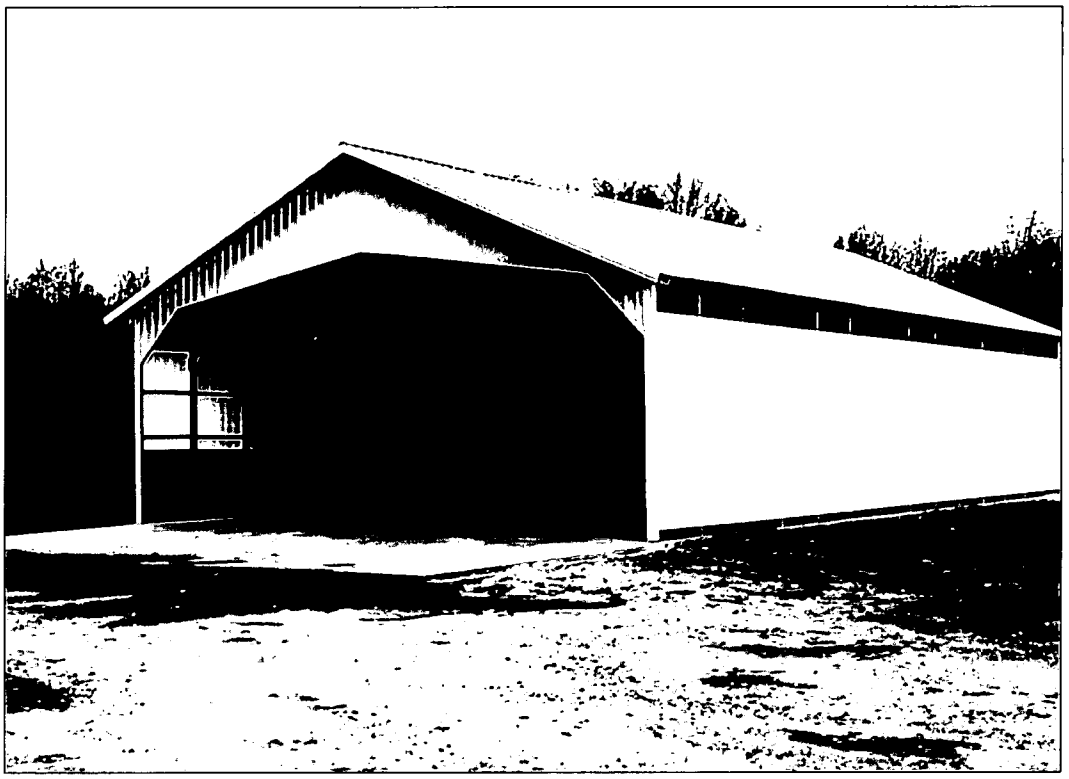
EXAMPLES OF SEVERAL COMMONLY USED ACSP BEST MANAGEMENT PRACTICES



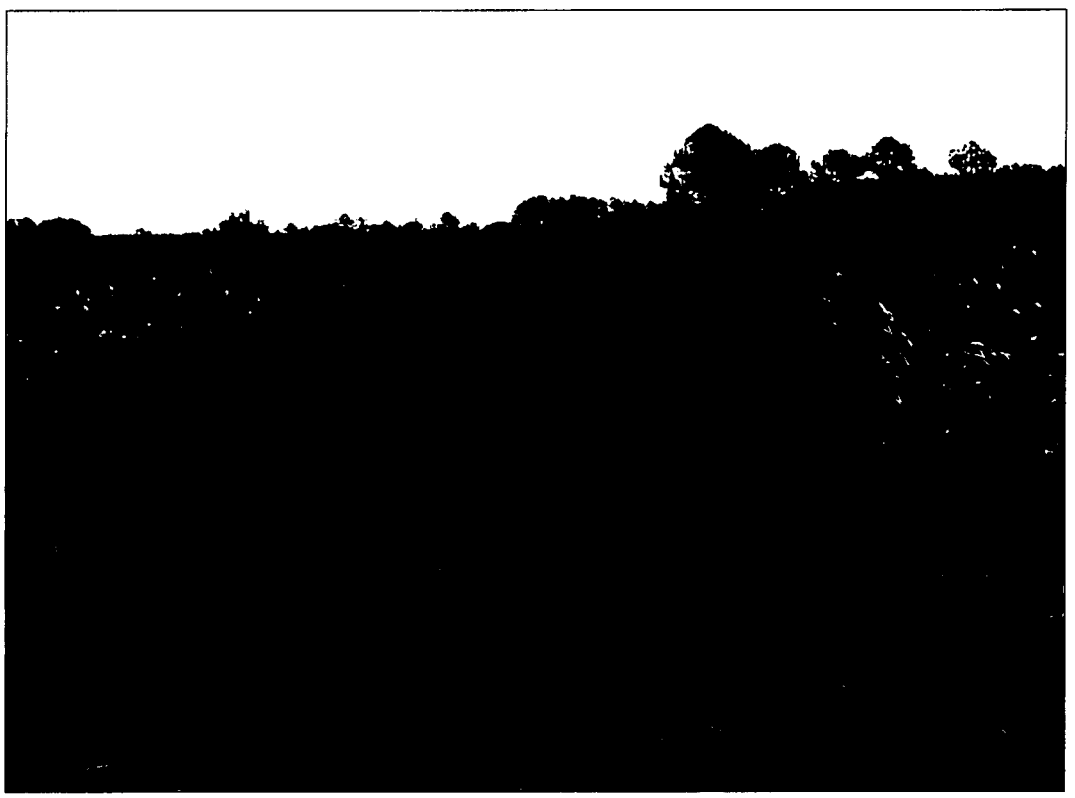
STOCK TRAIL: A stock trail or walkway stabilizes an area used frequently and intensively by livestock. The practice involves surfacing with material that helps improve water quality by reducing soil erosion, sedimentation and nutrient pollution, and sediment-attached substances.



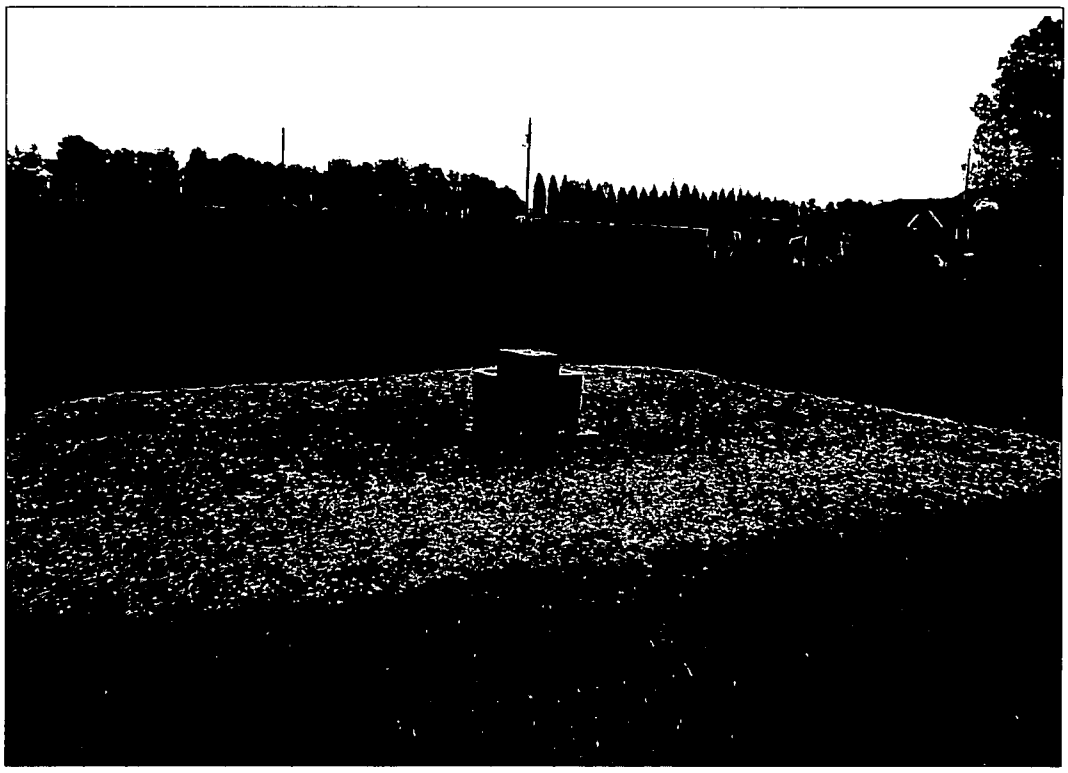
SLURRY SPREADER: This is a mobile irrigation device that conveys and distributes animal waste from treatment and storage structures to fields as part of an overall irrigation and waste utilization plan.



DRYSTACK: A drystack is a fabricated structure designed for temporary storage of animal waste.

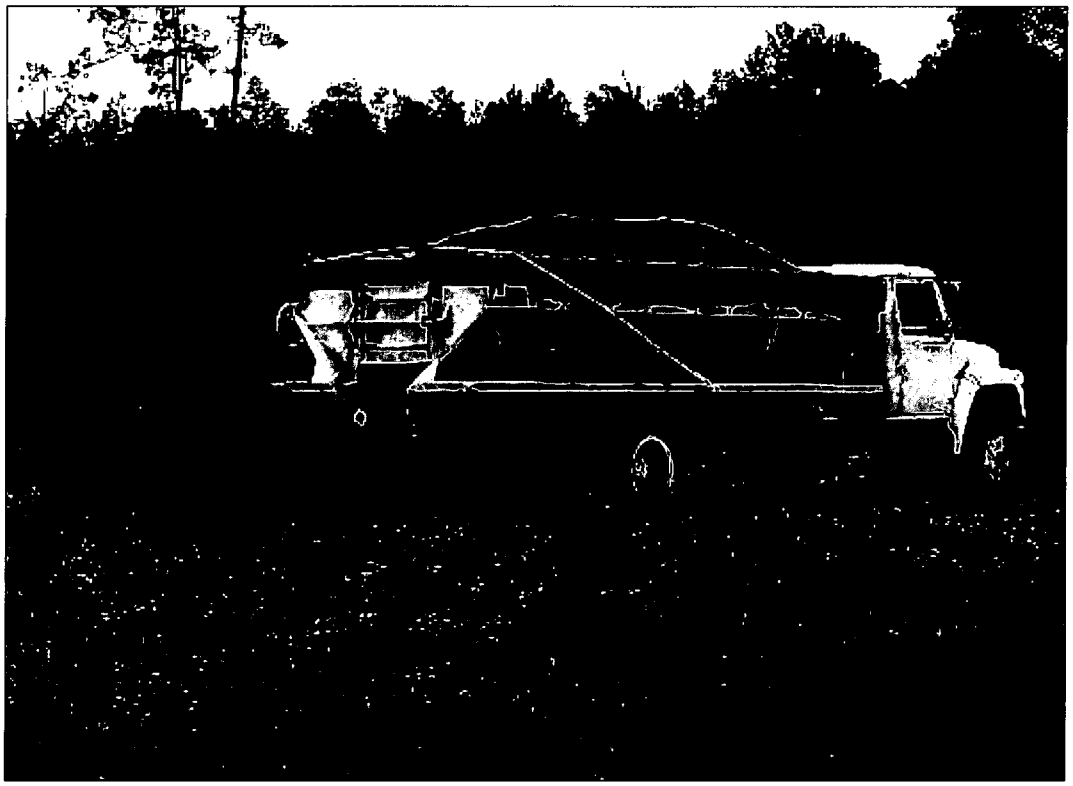


GRASSED WATERWAY: A grassed waterway is a natural or constructed channel that is shaped or graded to required dimensions and established with suitable vegetation for the stable conveyance of runoff to improve water quality.

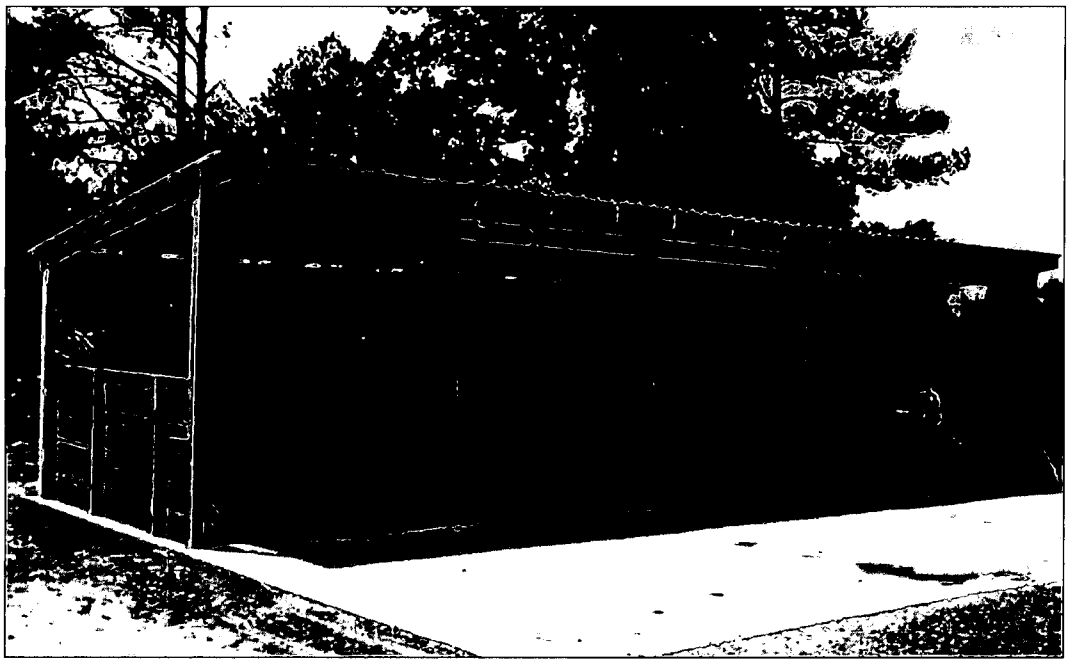


TANK: A tank or trough is a device installed to provide drinking water for livestock at a stabilized location.

STREAM CROSSING: A stream crossing is a trail constructed across a stream to allow livestock to cross without disturbing the bottom or causing soil erosion on the banks.



POULTRY LITTER SPREADER: A poultry litter spreader is a truck mounted device utilized for applying, processing and/or transporting poultry dry litter to reduce nutrient impacts.



COMPOSTER: A composter is used as part of an overall animal mortality management system. In addition to the type shown above, there are rotary drum composters, forced aeration static pile composters, mortality freezers, mortality incinerators, and mortality gasification systems.

CONTRACT FOR A STUDY OF THE COSTS ASSOCIATED WITH PROVIDING NUTRIENT CONTROLS THAT ARE ADEQUATE TO OFFSET POINT SOURCE AND NONPOINT SOURCE DISCHARGES OF NITROGEN AND OTHER NUTRIENTS.

THIS AGREEMENT, made and entered into this the 8th day of February, 2007, by and between RTI International, hereinafter referred to as the "RTI", and the Environmental Review Commission, hereinafter referred to as the "ERC", with the approval of the Legislative Services Commission established pursuant to Article 7 of Chapter 120 of the General Statutes, hereinafter referred to as the "Commission.

WITNESSETH:

Whereas, S.L. 2006-215 became law on 8 August 2006.

Whereas, Section 2 of S.L. 2006-215 directs the ERC, with the assistance of the Division of Water Quality of the Department of Environment and Natural Resources, to study issues related to the nutrient offset payment program and to specifically study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen; whether nutrient offset payments should be authorized for additional nutrients, including phosphorus; and whether the nutrient offset program should be expanded to other areas of the State.

Whereas, Section 2 of S.L. 2006-215 directs the ERC to report its findings, together with any recommended legislation, to the 2007 General Assembly.

Whereas, the ERC issued a Request for Proposal on 15 December 2006, seeking a consultant to:

1. Estimate the length of time that the existing North Carolina Nutrient Offset Fee Payments Program (NOFPP) will be able to continue as a

completely self-sustaining program capable of providing adequate mitigation for the additional nitrogen loading purchased at the current cost of $11 per pound of nitrogen.

2. Study the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen in the Neuse River Basin.
3. Study how a total nutrient offset payment fee should be determined.
4. Provide information and outline options, including the advantages and disadvantages of each option, to assist the ERC in deciding whether nutrient offset payments should be authorized for additional nutrients, including phosphorus, and whether the NOFPP should be expanded to other river basins, including the Tar-Pamlico River Basin.
5. Evaluate the ability of public entities other than the Environmental Enhancement Program (EEP) and private entities to provide nutrient offsets.
6. Prepare a comprehensive review and discussion of the types of potential nutrient mitigation efforts available.

Whereas, RTI's response has been accepted by the ERC.

Whereas, the parties to this agreement desire to reduce the terms of their agreement to writing.

NOW THEREFORE, for and in consideration of the mutual promises made to each other, as hereinafter set forth, the parties do hereto mutually agree as follows:

1. Performance of Study

RTI shall perform services in a manner consistent with the degree of care and skill ordinarily exercised by members of the same profession and consistent with this agreement to accomplish the study described in the Request for Proposal, Appendix B. RTI agrees to perform the study as provided in RTI's response, Appendix C. In the event of a conflict of terms between this agreement, the Request for Proposal, and RTI's response, the provisions of the designated documents shall control in the following order: First, this agreement; second, the Request for Proposal; and third, RTI's response.

2. Contract Period and Schedule

RTI agrees that time is of the essence in the completion of this agreement and agrees that services under this agreement are to commence on the execution date of this agreement and shall terminate on 15 May 2007, or upon the filing of the final report, whichever occurs first, unless extended or terminated as provided herein.

RTI agrees to the following reporting schedule:

First Phase Report:	26 February 2007
Presentation of draft final results:	30 April 2007
Final Report:	15 May 2007

3. Contract Administrator

George F. Givens, Commission Counsel, ERC, is designated as the Contract Administrator for the ERC. The contract administrator shall be responsible for ensuring that RTI complies with the terms, conditions, and performance specifications set forth in this contract, and an evaluation of RTI's performance. The ERC has complete discretion in replacing the contract administrator with another person of its own choosing. The ERC shall notify RTI of any replacement of the contract administrator.

4. Availability of Funds

The payment of compensation specified in this agreement, its continuation, or any renewal or extension thereof, is dependent upon and subject to the allocation or appropriation of funds to the ERC for the purposes set forth in this agreement.

5. Payments

ERC shall make payments to RTI for its services as provided below:

a. An invoice for the first payment of thirty percent (30%) of the contract amount twenty-seven thousand nine hundred and forty dollars ($27,940) may be submitted by RTI upon signing of the contract. Payment shall be made within thirty (30) days of approval of the invoice by the Contract Administrator.

b. An invoice for the second payment of thirty percent (30%) of the contract amount twenty-seven thousand nine hundred and forty dollars ($27,940) may be submitted by RTI upon submittal of a progress report five weeks after the contract signing date. Payment shall be made within thirty (30) days of approval of the invoice by the Contract Administrator.

c. An invoice for the third and final payment of forty percent (40%) of the contract amount thirty-seven thousand two hundred fifty-three dollars ($37,253) may be submitted by RTI upon delivery of the final report. Payment shall be made within thirty (30) days of approval of the invoice by the Contract Administrator.

Notwithstanding any other provision of this contract, total payment under this contract, including expenses, shall not exceed ninety-three thousand one hundred and thirty-three dollars ($93,133) for services described in this agreement.

6. Additional Contract Expenses

The contract for the project is not a time and materials agreement. Any expenses of RTI in addition to those contracted for are the sole responsibility of RTI.

7. Independent Contractor

RTI shall be considered to be an independent contractor and shall be wholly responsible for the work to be performed and for the supervision of its employees. RTI shall hold and save the ERC harmless from any and all claims, demands, or causes of action that may be asserted due to the production activity of RTI under this contract. RTI represents that it has, or will secure at its own expense, all personnel required in performing the services under this agreement. These employees shall not be employees of, or have any individual contractual relationship with the ERC or the Legislative Services Commission.

8. Key Personnel

RTI shall not substitute key personnel designated in the RTI's response and assigned to the performance of this contract without prior written approval by the ERC. The individuals designated as key personnel for purposes of this contract are Michael Gallaher and Kathy Heller.

9. Subcontracting

Work proposed to be performed under this contract by RTI or its employees shall not be subcontracted without prior written approval of the ERC.

10. Confidentiality

RTI agrees to protect the confidentiality of any files, data, or other materials provided by the ERC and to restrict their use to the purpose of performing the contract. RTI shall comply with the provisions of Article 17 of Chapter 120 of the General Statutes of North Carolina regarding confidentiality between the RTI and members of the General Assembly. For purposes of this paragraph only, employees of RTI shall be considered "legislative employees" as defined in General Statute 120-129.

11. Care of Property

RTI agrees to be responsible for the proper custody and care of any files or other property furnished by the ERC. RTI shall take all steps necessary to safeguard any property, including data, files, reports, or other information from loss, destruction, or erasure. Any costs or replacement expenses, or damages resulting from the loss shall be borne by RTI when the loss occurred through its negligence.

12. Copyright

No deliverable items produced in whole or in part under this agreement shall be the subject of an application for copyright by or on behalf of RTI or any employee of RTI.

13. Advertising

RTI agrees not to use the existence or results of the contract, or the products produced pursuant to the contract as a part of any news release or commercial advertising without the prior written approval of the ERC.

14. Access to Persons and Records; Public Records

The State Auditor shall have access to persons and records as a result of all contracts or grants entered into by State agencies or political subdivisions in accordance with General Statute 147-64.7. RTI shall retain all records for a period of three years following completion of the contract.

To the extent that RTI acts on behalf of the ERC pursuant to this contract, RTI shall comply with and take any action necessary to facilitate compliance by the ERC with the provisions of Chapter 132 of the General Statutes.

15. Transfer or Assignment

This contract shall not be transferred or assigned to a third party.

16. Termination and Default

(a) Mutual Termination. -- Upon mutual written agreement of the ERC and RTI, the contract may be terminated at any time.

(b) ERC Termination. – The ERC has the right to terminate the contract at its discretion with 10 days written notice. In the event of termination under this subparagraph, RTI will be paid or reimbursed an amount commensurate with work completed or expenses incurred. In the event that RTI has received funds in excess of the amount commensurate with work completed or expenses incurred, RTI shall repay the excess funds to the ERC.

(c) RTI failure to perform. -- If, for any reason, RTI shall fail to fulfill in timely and proper manner the obligations under this agreement, the ERC shall thereupon have the right to terminate this contract by giving written notice to RTI and specifying the effective date thereof. In that event, all finished or unfinished deliverable items under this contract prepared by RTI shall, at the option of the ERC, become its property, and RTI shall be entitled to receive just and equitable compensation for any satisfactory work completed on these items. RTI shall not be relieved of liability to the ERC for damages sustained by the ERC by virtue of any breach of this agreement, and the ERC may withhold any payment due RTI for the purpose of setoff until a time that the exact amount of damages due the ERC from the breach can be determined. In case of default by RTI, the ERC may procure the services to which it is entitled under this contract from other sources and hold RTI responsible for any cost occasioned thereby.

(d) Liability of RTI. -- In the case of termination or default, the total liability of RTI shall not exceed the total contract amount.

(e) Acts of God, etc. -- No party to this agreement shall be deemed to be in default of any obligation hereunder if and so long as it is prevented from performing the obligation by any act of war, hostile foreign

action, nuclear explosion, riot, strikes, civil insurrection, earthquake, hurricane, tornado or other catastrophic natural event or act of God.

17. General Indemnity

RTI shall hold and save the State of North Carolina, its officers, agents, and employees harmless from liability of any kind, including liability from all claims and losses accruing to any other person, firm, or corporation furnishing or supplying work, services, materials, or supplies in connection with the performance of this contract, and from any and all claims and losses accruing to any person, firm, or corporation that may be injured or damaged by RTI in the performance of this contract and that are attributable to the negligence or intentionally tortious acts of RTI if RTI is notified in writing that the State has knowledge of a claim within 30 days after the State acquires actual knowledge of the claim. RTI represents and warrants that it shall make no claim of any kind or nature against the State's agents who are involved in the delivery or processing of RTI's goods to the State. The representation and warranty in the preceding sentence shall survive the termination or expiration of this contract.

18. Bankruptcy

Upon the filing for bankruptcy or insolvency by or against RTI, the ERC may terminate the contract, and the provisions of the paragraph entitled "Termination and Default" shall apply.

19. Compliance with Laws

RTI shall comply with all laws, ordinances, codes, rules, regulations and licensing requirements that are applicable to the conduct of its business, including those of federal, state, and local agencies having jurisdiction or authority.

20. Applicability of State Ethics Laws

RTI is subject to all applicable provisions of Chapter 138A of the General Statutes, including but not limited to the prohibition on the acceptance of specified gifts from lobbyists and lobbyist's principals, the required reporting of authorized gifts from lobbyists and lobbyist's principals, identification and reporting of names of assigned personnel, and required ethics training.

21. Equal Opportunity Statement

The nondiscrimination clause contained in Section 202 of Executive Order 11246, as amended by Executive Order 11375, relative to equal employment opportunity for all persons without regard to race, color, religion, sex, age or national origin, and the rules and regulations prescribed by the United States Secretary of Labor, are incorporated herein by reference. The program for Employment of the Handicapped (Affirmative Action) Regulations issued by the Secretary of Labor of the United States in Title 20, Part 741, Chapter VI, Subchapter "C" of the Code of Federal Regulations, pursuant to the provisions of Executive Order 11758 and Section 503 of the Federal Rehabilitation Act of 1973, are incorporated herein by reference.

22. Workers Compensation Insurance

RTI shall obtain, pay for, and keep in force, for the duration of the contract, worker's compensation insurance, as required by the laws of North Carolina, covering all employees of RTI engaged in any work pursuant to this contract performed in the State.

23. Amendment

This contract may be amended only by written agreement duly executed by the ERC and RTI and approved by the Commission.

24. Incorporations by reference

S.L. 2006-215, is attached to this contract as Appendix A and incorporated herein by reference. The Request for Proposal issued by the ERC, entitled "Report on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients", is attached to this contract as Appendix B and incorporated herein by reference. RTI's response is attached to this contract as Appendix C and incorporated herein by reference.

25. Entire agreement

This contract, including any documents or exhibits specifically incorporated by reference, represents the entire agreement between the parties and supersedes all prior oral or written statements or agreements.

26. Notice

Any notice under this contract to the ERC shall be sufficient if mailed to the Legislative Services Office as indicated below:

George F. Givens, Commission Counsel
Environmental Review Commission
General Assembly of North Carolina
300 North Salisbury Street
545 Legislative Office Building
Raleigh, NC 27603

Any notice under this contract to RTI shall be sufficient if mailed to RTI as indicated below:

Sherri Spinks
Office of Research Contracts
RTI International
3040 Cornwallis Road
Research Triangle Park, NC 27709-2194

27. Governing Law

This contract is made under and shall be governed and construed in accordance with the laws of the State of North Carolina.

28. Situs

The place of this contract, its situs and forum, shall be Wake County, North Carolina, where all matters, whether sounding in contract or tort, relating to is validity, construction, interpretation, or enforcement, shall be determined.

29. Applicability of terms

All promises, requirements, terms, conditions, provisions, representations, guarantees, and warranties contained herein shall survive the contract expiration or termination date unless specifically provided otherwise herein, or unless superseded by applicable Federal or State statutes of limitations.

IN WITNESS THEREOF, the parties have executed this agreement in duplicate originals, one of which is retained by each of the parties effective this the day and year first written above.

1. INTRODUCTION AND BACKGROUND

The Neuse River Basin has experienced significant environmental harm as a result of high levels of nutrients being emitted into its water. These nutrients are directly emitted into the water at "point sources" (such as wastewater treatment facilities) and indirectly emitted at "nonpoint sources" (such as agricultural and developed lands where rain runoff carries the nutrients into the river). To address this problem, the North Carolina General Assembly set limits for the amount of nutrients these sources could emit into the river system (NCDOWQ, 2006).

In lieu of meeting this limit, dischargers and developers can either construct more stringent nutrient controls on site or they can pay a specified fee to the Riparian Buffer Restoration fund as part of the Nutrient Offset Fee Payment Program (NOFPP). The NOFPP is administered by the Ecosystem Enhancement Program (EEP), which can use the funds paid by excess emitters to construct nutrient controls within the river basin that offset the excess nutrients they emit (NCDOWQ, 2006).

During fiscal year 2005–06, payments were made by 302 customers located in the counties of Craven, Durham, Johnston, Pitt, Wake, Wayne, and Wilson and the municipalities of Cary, Durham, Garner, Goldsboro, Greenville, Havelock, New Bern, Raleigh, Smithfield, and Wilson. During fiscal year 2005–06, EEP received $2,349,247 in payments for 213,567.9 pounds of nutrient reduction.

EEP has accepted 526,373.04 total pounds of nitrogen removal in the Neuse River Basin since the program's inception. EEP has instituted projects that will reduce 527,339.68 total pounds of nitrogen. NOFPP projects are currently a combination of traditional NOFPP projects and instituted Riparian Buffer Restoration projects in the Neuse River Basin. During the last year, EEP began accepting mitigation payments to reduce nitrogen and phosphorus in the Tar-Pamlico River Basin. The mitigation for these payments is not yet due.

Currently, the cost of reducing nitrogen and phosphorus exceeds the fee schedule. In 2006, the Department of Water Quality (DWQ) raised fees through rulemaking, but the General Assembly postponed these rules so that a cost study could be implemented.

The original offset fee NOFPP charged for excess nitrogen emissions was set in 1998 at $11 per pound of nitrogen per year for the Neuse River Basin. However, this fee was estimated without the benefit of historical data for what offset mitigation projects would cost (NCDOWQ, 2006). Thus, in 2006, several changes to the original 1998 payment rules were proposed to better reflect the true costs of mitigation and to expand the program to new river systems. These changes included the following:

- raising the nitrogen offset fee from $11 to $57 per pound per year,
- expanding the NOFPP to the Tar-Pamlico River Basin, and
- creating a nutrient offset program for phosphorous in the Tar-Pamlico River Basin.

These changes became effective on March 1, 2006, during the 2005 session of the North Carolina General Assembly (NCDOWQ, 2006). However, later in the 2005 General Assembly session, some of these changes were temporarily rescinded by Senate Bill 1862. This bill required that nitrogen offset fees be temporarily returned to their previous levels of $11 per pound per year and that there be no nutrient offset program for phosphorous. The bill also called for the General Assembly's Environmental Review Commission to conduct a study of the NOFPP. The objectives of this study include the following:

- Objective 1: Evaluate the sustainability of the program at the current fee of $11 per pound of nitrogen
- Objective 2: Develop a proposed fee based on the cost-effectiveness analysis
- Objective 3: Develop a formula for the calculation of the offset payment fee
- Objective 4: Assess the advantages and disadvantages of expanding the nutrient offset payments to other nutrients and additional areas of the state
- Objective 5: Evaluate the ability of public (other than the EEP) and private entities to provide nutrient offsets
- Objective 6: Develop a comprehensive review of potential nutrient mitigation efforts available

This study was contracted to RTI International in 2007. RTI's approach to meeting each of the seven study objectives is

based on the formula for emission payments that was introduced by the 2006 amendments to the 1998 Nutrient Offset Payments Rule. This formula is described in Section 2. Sections 3 through 6 discuss how the parameters of this formula will be estimated. Section 7 concludes with a discussion of the timeline for completing the study.

2. OVERVIEW OF NITROGEN AND PHOSPHOROUS PAYMENT FORMULAS

Among the changes presented in the 2006 amendments to the original Nutrient Offset Payments Rules were new formulas for calculating the total dollar amount that a new development or wastewater discharger would be required to pay in lieu of meeting the nutrient loading limits. The formula for calculating the nitrogen offset payment is:

Nitrogen Payment = [(*$ / lb*)(*# of lbs / year*)(*30 years*) + (*Land Cost $ / Ac*)(*1 Ac / 35 Ac*)(*Devel. In Ac*)] × (*1.1 Ad Costs*)

where,

$/lb =	the cost of mitigation in dollars per pound of nitrogen mitigation. As discussed in the previous section, this cost is currently set to $11 per pound.
# of lbs/year =	the number of pounds of nitrogen discharged each year for which mitigation is being requested.
Land Cost $/Ac =	the current property value of the property being developed as measured in dollars per acre. This value is based on the most recent county tax assessment.
1 Ac / 35 Ac =	an adjustment factor, indicating that 1 acre of mitigation is required for every 35 acres of development.
Devel. in Ac =	the overall size of the development, as measured in acres, for which mitigation is being requested.
1.1 Ad Costs =	an adjustment factor used to reflect the administrative costs associated with the requested mitigation.

The formula for calculating payments for phosphorus is similar (NCDENR, 2005). These formulas will serve as the backbone of

how RTI will address the seven study objectives discussed in the introduction. The remainder of this document explains how RTI will evaluate the formulas and their specific components.

3. COST ESTIMATION "$/LB"

At the core of this study will be the identification, integration, and analysis of project costs. RTI's team has a significant amount of information in-house that we can leverage. In 1997 and more recently in 2006, the Center for Watershed Protection (CWP) compiled and analyzed actual cost data for constructing ponds, wetlands, bioretention, filtering systems, and retrofits around the country. This effort generated average costs for design, engineering, and permitting of these projects; maintenance costs have not been well estimated. In addition, Dr. Bill Hunt, at North Carolina State University (NCSU), has access to expenses accrued by NCSU for constructing bioretention cells and storm water wetlands, including maintenance costs (annual labor hours to maintain, maintenance equipment costs, and materials).

RTI will augment this information through interviews and literature reviews described below. Because construction costs will vary regionally depending on differences in labor and materials costs, we recommend as much as possible acquiring and analyzing cost data specifically from North Carolina to either support or adjust the national retrofit cost estimates discussed in Section 7.

3.1 Recommended Protocol to Acquire and Analyze New North Carolina Retrofit Cost Data

This task involves three components: identifying projects to analyze, interviewing project managers, and analyzing the data. We recommend starting with EEP offset program records to identify appropriate retrofit projects, then following up with other state agencies or the Natural Resources Conservation Services (NRCS) offices, municipal staff from progressive jurisdictions with retrofit programs, and NCSU and other university researchers.

Table 3-1 summarizes the type of data that will need to be collected on each project based on our previous efforts to determine retrofit costs. This table includes the minimum amount of information needed, as well as a list of desirable information.

Table 3-1. North Carolina Retrofit Cost Data to Collect

Minimum Data Required	Desirable Data
▪ Retrofit identifier and contact person ▪ Primary best management practice (BMP) type ▪ Secondary BMP type(s) ▪ Physiographic region ▪ Geographic location ▪ Urban/suburban/rural ▪ Drainage area ▪ % impervious or impervious area ▪ Drainage area land use ▪ Design storm and/or volume treated ▪ Year built (to account for inflation) ▪ Design cost ▪ Construction cost ▪ Land acquisition cost (if applicable)	▪ Surface area or volume (depends on practice) ▪ Funding source ▪ Costs broken down by actual expenses versus in-kind costs (e.g., staff time) ▪ Costs broken down by BMP, if multiple BMPs part of same retrofit site ▪ Design cost broken down by – Permitting – Landscape – Engineering ▪ Project management costs separated from design/construction, as – Planning and misc. project management – Project management during construction ▪ Construction costs broken down by at least – Landscaping – Erosion and sedimentation control – Educational signage or brochures And, if possible – Filter media – Stone – Earthwork – Drainage structures – Labor (if reported separately)

In addition to these data, a narrative of factors that contributed to the cost being especially high or low (e.g., site owner did design and project management, project had to be rebuilt after first storm) would also be helpful. If maintenance or land acquisition costs are available, then they should be collected as well.

Once this information is collected, it should be analyzed by retrofit type and a cost/area treated/practice type can be developed. These data will be compared with the national study conducted by CWP and used to develop standard retrofit costs for developing the dollar-per-pound portion of the offset fee.

3.2 Protocol for Estimating Retrofit Program Delivery Costs

The offset fee should adequately cover not only the cost of constructing a retrofit or pushing paper, but should also be used to cover the costs to administer a retrofit offset program. This cost relates to the local government cost to find, prioritize and choose best retrofit sites in a subwatershed and to deliver those projects.

We have fairly good data on staff effort (hours) to perform all basic subwatershed retrofit assessment methods presented in the forthcoming *Manual on Stormwater Retrofit Practices*. Given a decent labor rate for consultants/local government, it would be possible to estimate these costs as well. To estimate this associated cost, the following subtasks should be completed:

- Gain an understanding of what the current 10% administrative portion of the Neuse offset fee covers. This may involve interviewing EEP program staff to obtain actual or anecdotal information regarding program administration effort.
- Identify staff costs and appropriate labor rates for agency staff, consultants, and watershed group volunteers.
- Establish average staff effort involved (using CWP manuals) for various administrative tasks for the program including, at a minimum, the following components:
  - Project management costs: to include budgeting, scoping, data management, and developing subcontracts
  - Direct costs: travel, printing, reproduction, phone, field supplies, and GIS equipment
  - Identifying appropriate retrofit opportunities in the watersheds: compilation of appropriate GIS mapping data to prepare for watershed assessment, conducting a retrofit inventory, postprocessing data (e.g., determining drainage areas, impervious cover)
  - Developing retrofit concept designs (30% and final)
  - Ranking and prioritizing projects: based on cost, area treated, watershed benefit, feasibility, synergy with other restoration projects, and visibility, for example

- Soliciting support for the project: community involvement/stakeholder meetings to include direct outreach costs
- Modeling to show benefits associated with the project (e.g., water quality and flooding)
- Developing a monitoring and maintenance plan
- Establishing and maintaining a project tracking database

3.3 Discuss Nitrogen/Phosphorus Reduction Issues Associated with Stream Repair/Riparian Reforestation

The majority of the dollars per pound is based on stormwater retrofits in urban settings. This is based on the assumption that most projects under the offset fee program are retrofits. A secondary offset option is to include other restoration alternatives such as stream restoration and rural/agricultural practices. Currently, we have limited cost data on urban stream repair, riparian reforestation practices, impervious cover removal, and on-site retrofits, but we lack much quantifiable removal data. We also lack good data on rural/agricultural practices.

What We Know about Stream Restoration Costs

CWP compiled stream restoration costs in Manual 4 of the Urban Watershed Restoration Manual for Stream Restoration. Table 3-2 summarizes unit costs for various repair practices. These costs were derived in 2004; however, the cost data came from projects dated even earlier.

What We Know about Nitrogen/Phosphorous Pollutant Removal from Stream Restoration or Riparian Reforestation

Stream restoration projects are primarily used to improve aquatic habitat and physical channel conditions in degraded streams, with little attention to their nutrient removal capabilities. Consequently, little research is available for setting an accurate removal efficiency number for total nitrogen (TN) or total phosphorous (TP). Table 3-3 provides some guidance on estimated TN and TP removal efficiency for stream restoration based on the stream restoration efficiency numbers used by the Maryland DNR. Recent research has begun to examine the issue of the removal efficiencies of stream restoration projects for nitrogen and phosphorus. The work of a number of researchers suggests that urban stream restoration

Table 3-2. Comparative Cost of Stream Repair Practices

Repair Practice	Unit Cost	Feasibility Notes
Boulder revetments	$20 to 40 per linear foot (lf)	Noncohesive soils
Rootwad revetments	$10 to 100 per lf	recreational use
Imbricated rip-rap	$60 to 90 per lf	Nondeformable
A-jacks	$65 to 85 per lf	Toe protection only
Live cribwalls	$250 to 300 per lf	Slope failure
Streambank shaping	varies	Need toe protection
Coir fiber logs	$8 to 30 per lf	2 to 5 year lifespan
Erosion control fabrics	$1 to 5 per sy	Woven/non-woven
Soil lifts	$12 to 30 per lf- f	Need toe protection
Live stakes	$1 to 3 per stake	Reach water table
Live fascines	$ 5 to 22 per lf	Sunlight
Brush mattresses	$ 30 to 50 per lf	Toe protection
Vegetation establish.	varies	Invasive species
Wing deflectors	$400 to 800 each	Rock size
Rock or log vanes	$ 400 to 1400 each	Outflanking
Rock vortex weirs	$1200 to $2100 each	High failure rate
Rock cross vanes	$1200 to $1700 each	Outflanking
Step pools	$2000 to $6000 each	Head drop
V-log drops	$800 to $2600 each	Armoring
Lunkers	$45 to 60 per lf	Bedload transport
LWD placement	$20 to 40 per lf	Orientation
Boulder clusters	$60 to 250 each	Rock size
Baseflow enhancement	varies	Bedload transport
Parallel pipes	$50 to 300 per lf	Available head
Stream daylighting	$100 to 300 per lf	Overburden depth
Culvert modification	Varies	
Culvert replacement	Varies	Needs of target fish species
Devices to pass fish	Varies	
Combinations	Varies	Varies
Channel redesign	Varies	Incision
Dechannelization	Varies	Utilities

Note: These cost estimates were derived in 2004 and are based on numbers from earlier studies.

projects may increase the ability of streams to act as nitrogen "sinks" and remove additional levels of nitrogen from urban streams (Groffman et al., 2005; Mayer et al., 2003). Mayer suggests that restoration may enhance denitrification by reestablishing flood plain hydrology and increasing carbon availability, and that structures installed in the stream channel to reduce erosion also may trap organic matter that increase opportunities for nitrogen assimilation. The restoration projects should theoretically also function to reduce phosphorus, because much of the phosphorus will be bound to sediment loads that will be controlled by stream repair practices.

Although the research on pollutant removal appears promising, currently the documented research is not to the point that a reasonable pollutant removal efficiency number could be derived. There is also the issue of high-volume urban stream scenarios, which may result in stream restoration not providing nitrogen removal during storm events because of the rapid movement of water.

Nitrogen and phosphorus removal efficiencies for riparian reforestation are more easily derived. Numerous literature reviews on riparian buffers have been conducted that document their effectiveness (Mayer et al., 2003; Wenger, 1999; Castelle, 1994). Table 3-3 provides some pollutant removal efficiencies for riparian forest planting.

To support this analysis, we recommend completing the following tasks:

1. Determine percentage of current projects funded by offset fees that are nonurban, retrofit projects.
2. Conduct similar investigation specifically in North Carolina for stream repair and buffer restoration project costs as described in Task 1 with retrofits.
3. Investigate additional pollutant removal data for stream restoration and potentially riparian buffer restoration from other sources such as North Carolina Stream Restoration Institute, University of Maryland Center for Environmental Science (http://www.al.umces.edu/), Institute of Ecosystem Studies (http://www.ecostudies.org/), USGS Baltimore Ecosystem Study (http://www.beslter.org/frame4-page_3f_02.html).

Table 3-3. Pollutant Reduction Efficiencies and Reporting Units for Stream Restoration and Riparian Reforestation Practices

Practice	Total Nitrogen (TN) Efficiency (%)	Total Phosphorus (TP) Efficiency (%)	Total Suspended Solids (TSS) Efficiency (%)	Reporting Units
Stream restoration	0.02 lbs/ft	0.0035 lbs/ft	2.55 lbs/ft	Linear feet
Riparian forest buffer planting (urban)	25	50	50	Acres
Upland reforestation (from turf)[a]	90	90	0	Acres
Upland reforestation (from Impervious Cover)[a]	95	95	50	Acres
Riparian forest buffers (rural)[a]	60	70	75	Per acre treated
Riparian grass buffers (rural)	17–57	50–75	50–75	

[a]Provisional estimate

4. METHODS FOR ESTIMATING "# OF LBS/YEAR"

As part of evaluating the formula for payments, we will investigate methods used for calculating both the incremental pounds of nuturients generated from development as well as the number of pounds offset through restoration. It is essential that pounds "in" (generated) equal pounds "out" (offset) by the offset program. To this end, as part of this project, we will investigate how the number of pounds per acre purchased is calculated by design engineers/contractors, as well as how the pounds per acre from site restoration are calculated by the program. Below is our current understanding of how these calculations are developed.

4.1 Nutrient Loads Resulting from Development

An important component of the offset fee formula is establishing the dollar per pound of nitrogen or phosphorus. The basic approach involves the following steps:

Step 1: Calculate Predevelopment Pollutant Load (Estimate acceptable background unit area nutrient load [e.g., forest]). The simple method is used to calculate the pollutant load per acre of impervious cover based on rainfall, impervious cover, mean pollutant concentration, and site area. Impervious cover

is any surface in the urban landscape that cannot effectively infiltrate or absorb rainwater, including roofs; buildings; paved streets; parking areas; and any concrete, asphalt, compacted dirt, or compacted gravel surface.

Step 2: Calculate Postdevelopment Pollutant Load (Estimate unit nitrogen and phosphorus loading rate per acre of impervious cover for new or existing development). The simple method is also used with estimated postdevelopment event-mean-concentrations (EMCs) to obtain the postdevelopment pollutant load.

Step 3: Calculate Pollutant Removal Requirement. The pollutant removal requirement (RR) is calculated by subtracting the predevelopment pollutant loads from the postdevelopment loads.

$$\%RR = [(Load_{post} - Load_{pre})/Load_{post}]*100.$$

The engineer designing the stormwater management plan for the new development site determines the nitrogen and phosphorus loading for the site based on NCDENR's *Manual of Stormwater Best Management Practices* (draft 2005), *Neuse River Basin:* (1999) and *Tar-Pamlico River Basin:* (2004). The calculation for total nutrient export from a proposed site is slightly different for each river basin but is based on the total area and nutrient export coefficients for impervious surfaces and open spaces on the developed site. The Tar-Pamlico River Basin has different calculations for the Piedmont and Coastal regions. If the overall nitrogen and/or phosphorus export is greater than specified in the regulations (15A NCAC 02B.0235 for the Neuse River Basin and 15A NCAC 02B.0258 for the Tar-Pamlico River Basin), then the three nitrogen export reduction options described in Table 4-1 are available.

4.2 Nutrient Loads Offset Through Restoration

The removal efficiencies listed in Table 4-2 are used as listed in NCDENR's *Manual of Stormwater Best Management Practices* (draft 2005).

Table 4-1. Nitrogen Export Reduction Options for the Neuse and Tar-Pamlico River Basins

Residential	Commercial/Industrial
If the computed export is less than 6.0 lbs/ac/yr, then the owner may either 1. Install BMPs to remove enough nitrogen to bring the development down to 3.6 (4.0) lbs/ac/yr. 2. Pay a one-time offset payment of $330/lb to bring the nitrogen down to the 3.6 (4.0) lbs/ac/yr. 3. Do a combination of BMPs and offset payment to achieve a 3.6(4.0) lbs/ac/yr export.	If the computed export is less than 10.0 lbs/ac/yr, then the owner may either 1. Install BMPs to remove enough nitrogen to bring the development down to 3.6 (4.0) lbs/ac/yr. 2. Pay a one-time offset payment of $330/lb to bring the nitrogen down to the 3.6 (4.0) lbs/ac/yr. 3. Do a combination of BMPs and offset payment to achieve a 3.6 (4.0) lbs/ac/yr export.
If the computed export is greater than 6.0 lbs/ac/yr, then the owner must use on-site BMPs to bring the development's export down to 6.0 lbs/ac/yr. Then, the owner may use one of the three options above to achieve the reduction between 6.0 and 3.6 (4.0) lbs/ac/yr.	If the computed export is greater than 10.0 lbs/ac/yr, then the owner must use on-site BMPs to bring the development's export down to 10.0 lbs/ac/yr. Then, the owner may use one of the three options above to achieve the reduction between 10.0 and 3.6 (4.0) lbs/ac/yr.

Note: Values in parentheses apply to Tar-Pamlico Basin.

These data are based on available research data and were updated in 2004. Actual reductions of some BMPs are determined by DWQ based on site-specific design, and others require identification of soil characteristics to determine actual removal efficiencies. BMP pollutant removal efficiencies from the National Pollutant Removal Performance Database (NPRPD) can be examined for the Piedmont and Coastal Plain physiographic regions to determine the magnitude of any differences.

Some factors affecting selection of BMPs include depth to the water table, shallow depth to bedrock, high sediment input, poorly drained soils, slope, and on-site space limitations. These factors will vary between river basins and will even vary between individual regions inside a single river basin. Therefore, the selection of BMP will differ based on the characteristics of the proposed location. For example, Table 4-3 indicates the most acceptable BMPs for each part of the Neuse River basin, as based on decisions of the Neuse River Basin Oversight Committee.

Table 4-2. Assumed Removal Efficiencies (NCDENR, 2005 Draft)

BMP	Nitrogen Removal Efficiency	Phosphorous Removal Efficiency
Stormwater wetlands	40%	35%
Bioretention	35%[a]	45%[b]
Wet detention basin	25%	40%
Extended dry detention basin	10%[c,d]	10%
Grassed swale	20%[c,d]	20%
Filter strip with level spreader	20%	35%
Infiltration device	40-70%[c,d]	
Manufactured BMP system	Varies[e]	Varies[e]
Buffer (50-ft restored buffer with level spreader)	30%	30%
Rooftop runoff management	Varies[c]	Varies[c]
Open sand filter	35%	45%
Closed sand filter	35%	45%

[a]To achieve the nutrient removal efficiency listed requires the use of fill soils with an infiltration rate of between 1 and 3 inches per hour, and the use of mulch on the surface.

[b]To achieve the nutrient removal efficiency listed requires the testing of soils to meet a phosphorus index value of less than 50. Visit http://www.agr.state.nc.us/agronomi/sthome.htm for soil testing information.

[c]Actual reduction will be determined based on site-specific design and installation and DWQ approval.

[d]EPA (2002).

[e]Per manufacturer subject to DWQ approval.

Historically, the BMP most commonly used by the EEP has been riparian buffers—strips of land covered in vegetation (such as trees, shrubs, or grass) and located between a potential pollutant source (such as an agricultural field) and a body of surface water. These buffers are designed to trap nonpoint source pollution, such as runoff from agricultural fields, and to prevent it from entering the body of water. Riparian buffers can be used to mitigate the discharge of a variety of sediments and pollutants, including nutrients like nitrogen and phosphorous (Osmond et al., 2002).

Nitrogen typically reaches surface water from agricultural fields by being dissolved into the groundwater that moves below the surface of the soil and traveling as nitrate. The plant-root system created by the riparian buffer can prevent this nitrate

Table 4-3. BMPs by Region in the Neuse River Basin

Design	Region		
	Piedmont	Upper and Middle Coastal Plain	Lower Coastal Plain
Buffer: trees 30 ft + grass 20 ft[a]	x	x	
Tree buffer ≥ 20 ft	x	x	
Shrub buffer ≥ 20 ft		x	
Grass buffer ≥ 30 ft	x	x	
Filter strip ≥ 20 ft[b]	x	x	
Nutrient management	x	x	x
Controlled drainage[c]		x	x
Cover crops	x	x	x

[a]The forested area near the stream and the grass area away from the stream. Notice that given the width of 20 feet, the grass area is a filter strip according to NRCS definitions.

[b]Only effective if the drainage area above the filter strip has a greater than 1% but less than 10% slope. Filter strips have to be planted with permanent herbaceous vegetation consisting of grass, legumes, and/or other forbs.

[c]Only effective if slope in channel is less than 1% and water table can be kept within 36 inches of surface soil for 50% of field area.

Source: Wossink, Ada. 2000. "The Economics of BMPs to Control Nitrogen in the Neuse River Basin." NCSU CALS Publ. AGW-2. Available at http://www2.ncsu.edu/unity/lockers/users/g/gawossin/Papers/bmpecon.pdf. As obtained on February 22, 2007.

from reaching the surface water by either absorbing it as food or by creating an environment that supports bacteria that convert nitrate into a gas that escapes into the atmosphere (Osmond et al., 2002).

In contrast, phosphorous reaches a body of water almost exclusively as surface runoff. Therefore, to mitigate phosphorous discharge, runoff water must be intercepted before it reaches the relevant body of water. This interception is performed by the vegetation that comprises a riparian buffer, which slows down the runoff water, allowing phosphorous to settle to the ground before reaching the surface water (Osmond et al., 2002).

The most important site characteristic determining the effectiveness of riparian buffers is how the water moves through or over the buffer itself (hydrology). In the example of phosphorus mitigation, the surface runoff must be slowed so the phosphorous can settle to the ground. If water does not spread evenly over the buffer, it may move through the buffer

in "channels." These "channels" allow the water to flow through the buffer more quickly, making it less effective at mitigation (Osmond et al., 2002).

However, the hydrology of a site is not a characteristic of the buffer itself and it is not easily changed. The most important *buffer* characteristic in determining mitigation effectiveness is buffer width. The wider the buffer, the more vegetation can grow, and the more effectively sediments and pollutants can be mitigated. Buffers that are too narrow may not be effective at protecting surface water. On average, the recommended size of an effective buffer is approximately 100 ft in width. Other characteristics that determine the effectiveness of riparian buffers include the types of vegetation used and their location within the buffer (Osmond et al., 2002).

In addition to the removal effectiveness measures reported by NCDENR, other studies have attempted to estimate the effectiveness and appropriateness of various BMPs, including riparian buffers, in the Neuse River Basin. These studies include Osmond et al. (2002) and Wossinick (2000). As part of this study, the RTI team will review these literature estimates and compare them to the efficiency estimates reported in NCDENR's *Manual of Stormwater Best Management Practices*.

The RTI team will also work with DWQ and EEP staff to determine if new data (available in the last 2 years), data not originally considered, or data evaluation approaches indicate a need to change either the export coefficients or removal efficiencies reported in NCDENR's *Manual of Stormwater Best Management Practices*. RTI will additionally investigate the rationale for differing export values in the two basins (3.6 versus 4.0 lbs/ac/yr) and generally compare the methods of the Neuse and Tar-Pamlico River Basins and provide recommendations as appropriate.

5. EVALUATE "1 AC/35 AC PER YEAR" FACTOR

According to Tom Reeder, chief of the Wetland and Storm Water Branch (NCDWQ), a factor of 1 acre mitigation per 35 acres of development was recommended by Dr. Bill Hunt as the average area of mitigation needed for area of site developed. This factor was added to equation to help EEP recoop the cost for mitigation. This factor is roughly based on the average number of acres draining into 1 acre of wetland. This factor

varies as a result of a variety of factors such as slope and soil composition and hence will vary by river basin and within river basin.

RTI will investigate whether the "1 ac/35 ac" factor is appropriate for the projected portfolio of future restoration sites. We will talk with buffer experts such as Deanna Osmond and Robert Evans at NCSU to determine if this factor is relevant for both rural and urban restoration projects and how/if it should be interpreted/modified.

In addition, the RTI team will work with EEP and DWQ and look at available data from other states, and work with private entities within North Carolina to review this adjustment factor in order for the administering agencies to be compensated for the actual cost of the mitigation effort. Upon determining the need for the adjustment factor, RTI will determine the degree of the adjustment factor needed and will determine if there are any differences based on river basin (Neuse vs. Tar-Pamlico) or physiographic location (Coastal Plain vs. Piedmont).

6. ASSESSING FUTURE LAND COSTS PER ACRE

To date, nutrient offset payments have been used for the most part to fund riparian buffer restoration. This approach is in general perceived as a cost-effective approach for pursuing nutrient offsets. Factors that influence the selection—and eventual cost—of buffer restoration include available land, current use of land, land cost, slope of land, depth to water table, in-situ soil type, contributing upslope drainage area, and pollutant removal credit/nutrient removal efficiency. In general, the program requires that offset locations are selected within the river basin upstream of the estuary. At the same time, the EEP has mechanisms in place (e.g., through local watershed planning) to prioritize watersheds. Additionally, as mentioned in the public hearing comments and responses, the intent of the offset procedures is

> to create a spatial relationship between the payment and mitigation.....Furthermore, limiting off site mitigation to a more specific spatial relationship, such as a 14-digit hydrologic unit code (HUC), is not considered practical....The EEP must be allowed the flexibility to allow the nutrient payments to be targeted to areas where they can be most beneficially utilized....in keeping

with the original goal of mitigation of nutrient loading into the respective estuaries.

Including a land cost term in the calculation was viewed by staff as a means for encouraging proximity in the relationship between developing and mitigation lands.

These considerations suggest that an important factor in looking at potential future costs of mitigation is projecting the availability of lands for riparian restoration given the 30-year planning horizon for the program and the likely geographic disparity in land available for riparian restoration. With this in mind, RTI will first work with EEP staff to determine where nutrient offset mitigation has been pursued historically and is currently prioritized within the basins, and we will also pursue GIS-based analyses to provide a robust basin-scale estimate of land available for mitigation. These analyses will not involve any field scale truthing or have site-level validity. The analyses will be based on these assumptions and constraints:

- Given resource and time constraints, RTI will rely on data readily available for the entire study area (i.e., including both river basins). RTI will pursue data acquisition for data not currently housed in RTI's geodatabase first from state-level sources (e.g., CGIA, EEP, DWQ) and then from local sources to the degree that project resources allow.
- RTI will use the Neuse and Tar-Pamlico buffer rules (15NCAC 02B.0233 and 15NCAC 02B.0260) as the basis for operationally pursuing an analysis of lands available for riparian restoration. It is important to note that some provisions of these rules require field data or data that are not generally available for a basin-scale analysis (e.g., higher resolution data), and which RTI will not be able to obtain and use in these planning-level estimates for this large area.

RTI will work with EEP to determine how EEP estimates the cost of riparian restoration. For example, is grading for hydrologic control upslope part of cost (e.g., level spreader)? What buffer nutrient reduction efficiency does EEP assume?

Depending on the findings, RTI may provide recommendations to adjust the approach for calculating the offset fee. As a part of the larger assessment, RTI may attempt to complete spatial analyses looking at the spatial variability in land value across the basins based on county tax assessment data. RTI will

initially investigate the availability and resource requirements to compile these data before pursuing this analysis.

7. COMPARISON OF NORTH CAROLINA OFFSET FEE AND SITE RESORATION COSTS WITH OTHER STATES

Given that actual nitrogen and phosphorus costs are expected to be higher than the current offset fee, it might be useful to provide some comparative documentation from other municipalities and states with offset fee rules (e.g., Maryland 10%; Austin, TX; Maine; Henrico and Fairfax counties, VA).

7.1 Provide a Brief Summary of Other Offset Fee Programs in Other States

This task will involve the following:

- A survey of other communities' offset fees (broad sweep of other communities with offset fees). Specifically, we want to know from this quick search what the dollars per pound are and when they were established. For example, the Austin, TX, Offset Fee Program appears to be fairly robust and would be a good case study for comparison (http://stormwaterfinance.urbancenter.iupui.edu/PDFs/AustinStrmwtrPrgrm.pdf).
- Interview program managers for some of the communities' offset fee programs identified that appear to have reasonable and updated offset fees. Information to collect on each program should include at a minimum what the offset fee covers (e.g., design, engineering, permitting, construction, program administration, project delivery, maintenance), how the fees were set, whether current fees are covering costs to do equivalent water quality improvements elsewhere, and lessons learned (anything they would do differently).
- Write-up communities' offset fee programs as case studies (1 page per community) or summarize in a comparative table (preferred). This table could be used to quickly establish a valid range for effective offset fees and provide examples/models of other programs.

7.2 Review of Key National Cost Data Sources and How They Compare within North Carolina

Much of the data available to establish runoff EMCs, retrofit costs, and removal efficiencies are based on national data sources. Regional variations may result in average EMCs and

BMP removal efficiencies for North Carolina that differ from national averages. In addition, the national cost data are probably higher than North Carolina costs (more complex design requirements, union labor, and expensive metropolitan labor markets). We will conduct a quick analysis to isolate North Carolina-specific data from these databases to compare against national averages.

Table 7-1 summarizes the national databases to be mined for North Carolina-specific analysis.

As part of this task, we will need to determine which databases to mine for North Carolina studies and decide which parameters to run comparative statistics on. Final data can be shown to compare North Carolina with national data to determine if national averages are appropriate to use for the offset fee.

8. NEXT STEPS

The RTI team will present our proposed methodology for the study at a stakeholder meeting to be held March 2, 2007. At this meeting, we will solicit feedback from stakeholders on how the approach could be enhanced. In particular, we will request data that organizations might have on engineering design costs and implementation costs for restoration projects.

Based on comments received during the stakeholder meeting, RTI will revise this methodology document and resubmit it to the Environmental Review Commission for final approval. In general, RTI will make every effort to accommodate stakeholders' concerns and suggestions in light of the constraints of the existing budget.

Table 7-1. North Carolina vs. National Databases

Database	National	North Carolina	Comments
2005 National Stormwater Quality Database (NSQD)	3,770 separate storm events from 66 agencies and municipalities from 17 states.	Data are available for 114 individual storm events, and a total of 318 observations. The jurisdictions where data were collected include the City of Charlotte, City of Fayetteville, City of Greensboro, and City of Raleigh. Data were collected from a total of 30 different monitoring stations.	Can run stats on EMCs per land use for North Carolina, national, national – North Carolina http://www.eng.ua.edu/~rpitt/Research/ms4/mainms4.shtml http://www.stormwatercenter.net/
2000 National Pollutant Removal Performance Database (NPRP)	139 studies of removal efficiencies for variety of practice types, minimum storm sample criteria of 5. 76 studies include concentration and other data where available.	Five studies, all pond performance (Greenville, Davis, Regional, Runaway Bay, Lakeside)	May need to supplement with removal efficiencies of other types of BMPs
1997 BMP study	73 studies on BMP cost	One from North Carolina	Updated with 2006 study
2006 CWP Retrofit Cost Study	Looked at over 120 projects to estimate costs; combined with CalTrans Study. Also supplemented costs with Wossink and Hunt 2003 study from North Carolina.	Wossink and Hunt had approximately 40 studies	Projects from Maryland, Virginia, Delaware, Oregon, Texas, California, and North Carolina. Most final cost information from Chesapeake Bay area, supplemented with North Carolina data.
1983 NURP	Studied 81 outfalls in 28 communities throughout the U.S. included monitoring of approximately 2,300 storm events.	Currently unknown	Old; can access data at http://www.eng.ua.edu/~awra/download.htm.
USGS	More than 1,100 storms from 98 monitoring sites in 20 metropolitan areas.		Old
Federal Highway Administration (FHWA)	Analyzed stormwater runoff from 31 highways in 11 states during the 1970s and 1980s.		Strecker (personal communication) is also collecting information from highway monitoring as part of a current NCHRP-funded project.

BILL DRAFT 2007-SBz-11 [v.7] (02/27)

(THIS IS A DRAFT AND IS NOT READY FOR INTRODUCTION)
3/12/2007 6:39:40 PM

Short Title: Extend Nutrient Offset Payment Sunset. (Public)

Sponsors: .

Referred to:

DRAFT FOR REVIEW ONLY

A BILL TO BE ENTITLED

AN ACT TO EXTEND THE SUNSET FOR THE LAW THAT SETS THE PER POUND FACTOR USED BY THE ENVIRONMENTAL MANAGEMENT COMMISSION TO CALCULATE NUTRIENT OFFSET PAYMENTS AND REQUIRES THAT THE NUTRIENT OFFSET PAYMENT FOR NITROGEN BE CALCULATED AS IT WAS PRIOR TO CERTAIN RULE AMENDMENTS, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION.

Whereas, the General Assembly established the Riparian Buffer Protection Program (G.S. 143-214.20) to provide alternatives for persons who would otherwise be required to maintain riparian buffers, and;

Whereas, the General Assembly directed the Environmental Management Commission to establish a compensatory mitigation fee to be paid into the Riparian Buffer Restoration Fund, and;

Whereas, the Environmental Management Commission adopted a revised schedule of compensatory mitigation fees for nutrient loading offsets on 12 January 2006 in accordance with the Administrative Procedure Act, and;

Whereas, the General Assembly enacted S.L. 2006-215, as amended by S.L. 2006-218 and S.L. 2006-255, which established a temporary per pound factor and method of calculation for nutrient offset fees in lieu of the fee schedule adopted by the Environmental Management Commission and directed the Environmental Review Commission to study issues related to the nutrient offset payment program, and;

Whereas, the Environmental Review Commission has entered into a contract with Research Triangle Institute, International (RTI), to provide consultant services for a study of the costs associated with providing nutrient controls that are adequate to offset point source and nonpoint source discharges of nitrogen and other nutrients, and;

Whereas, the contract between the Environmental Review Commission and RTI provides that RTI will make a final report to the Environmental Review Commission on 15 May 2007, and;

Whereas, once the Environmental Review Commission has received the final consultant's report from RTI, additional time may be required for the Environmental Review Commission to complete its study and make findings and recommendations; Now, therefore,

The General Assembly of North Carolina enacts:

SECTION 1. Section 5 of S.L. 2006-215, as amended by S.L. 2006-218 and S.L. 2006-255, reads as rewritten:

"**SECTION 5.** This act becomes effective 1 August 2006, and applies to all nutrient offset payments, including those set out in 15A NCAC 2B.0240, as adopted by the Environmental Management Commission on 12 January 2006. This act expires 1 September ~~2007.~~2008."

SECTION 2. This act is effective when it becomes law.

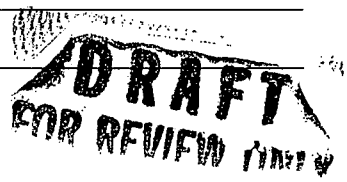
BILL DRAFT 2007-RTz-4 [v.3] (02/06)

(THIS IS A DRAFT AND IS NOT READY FOR INTRODUCTION)
3/12/2007 5:49:18 PM

Short Title: Clarify Animal Waste Tech. Specialist Req. (Public)

Sponsors: Unknown.

Referred to:



A BILL TO BE ENTITLED

AN ACT TO CLARIFY THE TRAINING AND QUALIFICATION REQUIREMENTS APPLICABLE TO ANIMAL WASTE MANAGEMENT TECHNICAL SPECIALISTS IN THE PROVISION OF SERVICES RELATED TO THE DEVELOPMENT, IMPLEMENTATION, OR OPERATION OF AN ANIMAL WASTE MANAGEMENT PLAN OR ANIMAL WASTE MANAGEMENT SYSTEM, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION.

The General Assembly of North Carolina enacts:

SECTION 1. G.S. 89C-25 reads as rewritten:

"**§ 89C-25. Limitations on application of Chapter.**

This Chapter shall not be construed to prevent or affect:

...

(6) Practice by members of the armed ~~forces or~~ forces; employees of the government of the United States while engaged in the practice of engineering or land surveying solely for the government on government-owned works and projects; or practice by those employees of the Natural Resources Conservation ~~Service having~~ Service, county employees, or employees of the Soil and Water Conservation Districts who have federal engineering job approval authority that involves the planning, designing, or implementation of best management practices on agricultural lands.

..."

SECTION 2. This act is effective when it becomes law.

~~metal~~specification grade commodities including facilities where a shredder or fragmentizer is utilized for ~~sale~~processing and ~~whose primary product is~~manufacturing scrap ~~automobiles~~ vehicles into shredded scrap ~~iron, scrap steel, or nonferrous metallic scrap~~and facilities where end-of-life vehicles may be prepared for shredding.

(~~7~~5) "Vehicle" means any passenger automobile or passenger car, station wagon, truck, van, or sport utility vehicle with a gross vehicle weight rating of less than 12,000 pounds.

(6) "Vehicle crusher" means a person, who engages in the business of flattening, crushing, or otherwise processing end-of-life vehicles for recycling. Vehicle crushers include, but are not limited to, persons who use fixed or mobile equipment to flatten or crush end-of-life vehicles for a vehicle recycler or a scrap ~~automobile~~ vehicle processing facility.

(7) "Vehicle manufacturer" means a person, firm, association, partnership, corporation, governmental entity, organization, combination, or joint venture that is the last person in the production or assembly process of a motor vehicle that used one or more mercury switches or, in the case of an imported vehicle, the importer or domestic distributor of the vehicle. "Vehicle manufacturer" does not include any person engaged in the business of selling new motor vehicles at retail or converting or modifying new motor vehicles after the production or assembly process.

(8) "Vehicle recycler" or "vehicle dismantler" means an individual or entity engaged in the business of acquiring, dismantling, or destroying six or more end-of-life vehicles in a calendar year for the primary purpose of resale of parts of the vehicle, including scrap metal.

"§ 130A-310.51. Purpose.

The purpose of this Part is to reduce the quantity of mercury that is released into the environment by removing mercury switches from end-of-life vehicles and by creating a removal, collection, and recovery program for mercury switches that are removed from end-of-life vehicles in this State.

"§ 130A-310.52. ~~Mercury minimization plan~~ Plan for the removal of mercury switches from end-of-life vehicles.

~~(a) The Department shall develop and administer a mercury minimization plan to achieve the goal of having a capture rate of at least ninety percent (90%). In preparing the plan, the Department shall consult with manufacturers of vehicles, who shall participate in the development of the plan on an advisory basis. To the extent practicable, the mercury minimization plan shall utilize the currently available end-of-life vehicle recycling infrastructure. To the extent adequate, affordable, and environmentally sound~~

~~end-of-life vehicle recycling infrastructure is unavailable, the plan shall provide for the development of this infrastructure.~~

~~(b) A plan developed under subsection (a) of this section shall include the following:~~

~~(1) A compilation of the make, model, and year of any vehicle that was sold or offered for sale by the vehicle manufacturer and contains one or more mercury switches and a description and the location of each mercury switch in the vehicle. A vehicle manufacturer shall report to the Department the information needed to make the compilation.~~

~~(2) A description of all safe and environmentally sound methods for removal of mercury switches from end-of-life vehicles. A vehicle manufacturer shall report to the Department the information needed to make the description.~~

~~(3) A presumption that if the manufacturer does not know or is uncertain as to whether or not a switch contains mercury, the switch does contain mercury.~~

~~(4) A system to mark end-of-life vehicles that are to be shredded or crushed to indicate the presence or absence of a mercury switch.~~

~~(5) Educational materials to assist a vehicle recycler or a scrap metal recycling facility in undertaking a safe and environmentally sound method for the removal of the mercury switches from end-of-life vehicles. The materials shall include information on hazards related to mercury and on the proper handling of mercury.~~

~~(6) A method for storage and disposal of the mercury switches, including packaging and shipping of mercury switches to permitted recycling, storage, or disposal facilities. To the extent adequate, affordable, and environmentally sound mercury switch disposal technology is unavailable, a method for the temporary storage of mercury switches.~~

~~"§ 130A-310.53. Removal of mercury switches from end-of-life vehicles.~~

~~(a) A vehicle recycler that conveys ownership of an end-of-life vehicle to a scrap metal recycling facility shall remove all mercury switches identified in the mercury minimization plan prior to delivery of the vehicle to the scrap metal recycling facility.~~ (a) A vehicle recycler that conveys ownership of an end-of-life vehicle to a scrap ~~automobile~~ vehicle processing facility, vehicle crusher or other vehicle recycler shall remove all accessible mercury switches, and mark the vehicle indicating the all mercury switches removed, prior to delivery of the vehicle to the scrap ~~automobile~~ vehicle processing facility, vehicle crusher, or other vehicle recycler, provided however, a scrap ~~automobile~~ vehicle processing facility, vehicle crusher, or other vehicle recycler may agree to accept an end-of-life motor vehicle that has not been flattened, crushed or baled containing mercury switches. If accepted, the scrap ~~automobile~~ vehicle processing facility, vehicle crusher, or other vehicle recycler is responsible for proper removal of

those mercury switches. If a mercury switch is inaccessible, the fact that the mercury switch remains in the vehicle shall be noted on the vehicle recycler's invoice and the vehicle marked indicating that the mercury switch(es) is inaccessible.

(b) A vehicle recycler or vehicle crusher that conveys ownership of an end-of-life vehicle to a scrap ~~automobile~~ vehicle processing facility, or other vehicle crusher or recycler shall remove all accessible mercury switches prior to delivery of the vehicle to the scrap ~~automobile~~ vehicle processing facility, or other vehicle crusher or recycler, provided however, a scrap ~~automobile~~ vehicle processing facility, or other vehicle crusher or recycler, may agree to accept an end-of-life motor vehicle that has not been flattened, crushed or baled containing mercury switches. If accepted, the scrap ~~automobile~~ vehicle processing facility, or other vehicle crusher or recycler is responsible for proper removal of those mercury switches. If a mercury switch is inaccessible, the fact that the mercury switch remains in the vehicle shall be noted on the vehicle recycler's invoice and the vehicle marked indicating that the mercury switch(es) is inaccessible.

(~~b~~c) A scrap ~~metal recycling automobile~~ vehicle processing facility that accepts an end-of-life vehicle that has not been flattened, crushed, baled, or shredded and that contains mercury switches shall remove ~~the~~all accessible mercury switches before the end-of-life vehicle is flattened, crushed, baled, or shredded unless the mercury switch is inaccessible.

(~~e~~d) A mercury switch is inaccessible if, due to the condition of the vehicle, the switch cannot be removed in accordance with the mercury switch removal ~~minimization~~ plan and removal of the switch would significantly increase the risk of a release of mercury into the environment.

~~(d) A vehicle recycler or scrap metal recycling facility that removes mercury switches pursuant to subsection (a) or (b) of this section shall make quarterly reports to the Department on the following:~~

~~(1) The number of vehicles that it processed for recycling.~~

~~(2) The number of vehicles from which it removed a mercury switch by make.~~

~~(3) The number of vehicles for which it could not remove the mercury switch because the switch was inaccessible.~~

(e) Mercury switches that are removed from end-of-life vehicles are considered ~~'universal waste' as defined in 40 Code of Federal Regulations § 273.9 (1 July 2004 Edition).~~ universal waste. Mercury switches that are removed from end-of-life vehicles shall be collected, transported, treated, stored, disposed of, and otherwise handled in accordance with rules adopted by the Commission governing universal waste.

"(f) Vehicle manufacturers shall develop and bear the costs of operating, in cooperation with the Department, a mercury switch collection system in accordance with the National Vehicle Mercury Switch Recovery Program (NVMSRP) Memorandum of Understanding (MOU). This program must advance environmental efforts in the areas of vehicle recyclability, education and outreach, and the proper collection and disposal of mercury switches from end-of-life vehicles.

§ 130A-310.~~54~~53. Funds to implement plan.

(a) The Mercury Pollution Prevention Account is established in the Department. Revenue is credited to the Account from the certificate of title fee under G.S. 20-85.

(b) Revenue in the Mercury Pollution Prevention Account shall be used to reimburse the Department and others for costs incurred in implementing the mercury minimization plan. The reimbursable costs are:

(1) Five dollars ($5.00) for each mercury switch removed by a vehicle recycler, vehicle crusher, or scrap ~~metal recycling automobile~~ vehicle processing facility pursuant to this Article and sent to destination facilities in accordance with the National Vehicle Mercury Switch Recovery Program for recycling or disposal.

(2) Costs incurred by the Department in administering the plan.

(c) The Department shall reimburse vehicle recyclers, vehicle crushers and scrap ~~metal recycling~~ vehicle processing facilities based on a reimbursement request attesting to the ~~quarterly reports submitted under G.S. 130A-310.53. The Department may request any information needed to determine the accuracy of~~ number of switches sent to destination facilities [in accordance with the National Vehicle Mercury Switch Recovery Program] for recycling or disposal, and shall be verified against information posted on the ~~reports~~web site provided by Vehicle Manufacturers in accordance with the National Vehicle Mercury Switch Recovery Program. The ~~Department may request from a~~ vehicle recycler, vehicle crusher, or scrap ~~automobile~~ vehicle processing facility shall provide to the Department any information, as needed, to determine the accuracy of a reimbursement request. Vehicle recylers, vehicle crushers, and scrap vehicle processing facilities shall keep records supporting their reimbursement requests for three years. ~~and may specify the length of time supporting documentation must be kept.~~

"§ 130A-310.~~55~~54. Violations of Article; enforcement.

(a) It is unlawful for a person to do any of the following:

(1) Knowingly flatten, crush, bale, shred, or otherwise alter the condition of a vehicle from which accessible mercury switches have not been removed, in any manner that would prevent or significantly hinder the removal of a mercury switch.

(2) Willfully fail to remove a mercury switch when the person is required to do so.

(3) Knowingly make a false report that a mercury switch has been removed from an end-of-life vehicle.

(4) Obtain a mercury switch from another source and falsely report that it was removed from a vehicle processed for recycling.

~~(b) This Part may be enforced as provided in Part 2 of Article 1 of this Chapter.~~

(b) Any person who violates subsection (a)(1)&(2) of this section shall be guilty of a Class 1 misdemeanor and upon conviction shall be punished as provided in G.S. 14-3.

(c) Any person who violates subsection (a)(3)&(4) of this section shall be guilty of a Class 2 misdemeanor and upon conviction shall be punished as provided in G.S. 130A-26.2.

(d) A violation of any provision of this Part, ~~including subsections (a) and (c) of this section~~ and any rules adopted by the Commission governing universal wastes, may be enforced by an administrative or civil action as provided in Part 2 of Article 1 of this Chapter.

§ 130A-310.~~56. Evaluation of vehicle design changes that affect mercury recyclability; reporting requirements~~

~~(a) Each vehicle manufacturer shall, either individually or as part of a group, submit an annual report to the Department that describes in detail the status of vehicle design changes that are intended to facilitate recycling of vehicle components that contain mercury. The report is due on or before 1 July. At a minimum, the report shall include all of the following:~~

~~(1) For each make and model for the upcoming model year, a list of all vehicle components that contain mercury.~~

~~(2) A description of all design changes that each manufacturer has implemented for the upcoming model year or plans to implement in future model years to reduce or eliminate vehicle components that contain mercury, the achieved or anticipated amount of each reduction.~~

~~(3) A summary of all policies that each manufacturer has implemented or will implement to ensure that the manufacturers' vehicles are designed to be recycled in a safe, cost-effective, and environmentally sound manner.~~

~~(4) A summary of any recommendations, complaints, or reports that the manufacturer has received within the previous calendar year from vehicle recyclers, scrap metal~~

~~recycling facilities, government entities, or other persons, as well as any other information available to the manufacturer, regarding vehicle design features that adversely affect the recyclability of vehicle components that contain mercury.~~

~~(b) A vehicle manufacturer or group of vehicle manufacturers that submits the report required by subsection (a) of this section may designate any information in the report that constitutes a trade secret, as defined in G.S. 66-152, as confidential information in accordance with G.S. 132-1.2. Information so designated shall be protected as provided in G.S. 130A-304.~~

~~(c) The Department may evaluate the extent to which vehicle design promotes or impedes recycling of vehicle components that contain mercury. The Department may conduct hearings from time to time to receive public comment regarding vehicle design changes that affect recycling of vehicle components that contain mercury. The Department may develop recommendations as to changes in vehicle design that would further promote the recyclability of these components. If the Department develops recommendations pursuant to this subsection, it shall report these recommendations, together with its findings and any legislative proposals, to the Environmental Review Commission.~~

"§ 130A-310.5~~7~~5. Report on the plan for the removal of mercury switches.

The Department shall publish an annual report, on ~~the mercury minimization plan on~~ or before November 1, based on its evaluation of information provided by an approved manufacturer-sponsored collection program in accordance with the National Vehicle Mercury Switch Recovery Program or provided by any association of government officials. The report shall include, at a minimum, all of the following:

(1) A detailed description and documentation of the ~~capture~~ mercury switch removal performance rate achieved.

(2) In the event that a ~~capture~~ mercury switch removal performance rate of at least ninety percent (90%) is not achieved, a description of additional or alternative actions that may be implemented to improve the mercury ~~minimization~~ switch removal plan and its implementation.

(3) The number of mercury switches collected, ~~the number of end-of-life vehicles containing mercury switches, the number of end-of-life vehicles processed for recycling,~~ the pounds of mercury collected from mercury switches collected in the State, the pounds of mercury estimated to be available from mercury switches in end-of-life vehicles expected to be scrapped in the State, the total pounds of mercury recovered by the National Vehicle Mercury Switch Recovery Program, the pounds of mercury estimated to be available from mercury switches in end-of-life vehicles expected to be scrapped nationally, -and a description of how the mercury switches were managed.

(4) A statement that details the costs required to implement the mercury minimization plan.

"**§ 130A-310.~~58.~~56. Adoption of rules; administrative procedure.**

(a) The Department may adopt temporary and permanent rules to implement this Part.

(b) Chapter 150B of the General Statutes governs implementation of this Part."

SECTION 2. If Senate Bill 622, 2005 General Assembly, becomes law, then G.S. 20-85, as amended by Section 44.1 of that act, reads as rewritten:

"§ 20-85. Schedule of fees.

(a) The following fees are imposed concerning a certificate of title, a registration card, or a registration plate for a motor vehicle. These fees are payable to the Division and are in addition to the tax imposed by Article 5A of Chapter 105 of the General Statutes.

(1) Each application for certificate of title ..... ~~$39.00~~$40.00

(2) Each application for duplicate or corrected certificate of title..... ~~14.00~~15.00

(3) Each application of repossessor for certificate of title..... ~~14.00~~15.00

(4) Each transfer of registration..... 15.00

(5) Each set of replacement registration plates..... 15.00

(6) Each application for duplicate registration card..... 15.00

(7) Each application for recording supplementary lien..... ~~14.00~~15.00

(8) Each application for removing a lien from a certificate of title..... ~~14.00~~15.00

(9) Each application for certificate of title for a motor vehicle transferred to a manufacturer, as defined in G.S. 20-286, or a motor vehicle retailer for the purpose of resale..... ~~14.00~~15.00

(10) Each application for a salvage certificate of title made by an insurer 15.00

(11) Each set of replacement Stock Car Racing Theme plates issued under G.S. 20-79.4 ..... 25.00.

(a1) ~~An additional one~~One dollar ($1.00) of the fee ~~shall be~~ imposed for any transaction assessed a fee under subdivision (a)(1), (a)(2), (a)(3), (a)(7), (a)(8), or (a)(9) of this ~~section. The fees collected pursuant to this~~ section shall be credited to the North Carolina Highway Fund. The Division shall use the fees derived from transactions with the Division for technology improvements. The Division shall use the fees derived from transactions with commission contract agents for the payment of compensation to commission contract agents. An additional one dollar ($1.00) of the fee imposed for any transaction assessed a fee under subdivision (a)(1) of this section shall be credited to the Mercury Pollution Prevention Account in the Department of Environment and Natural Resources.

(b) The fees collected under subdivisions (a)(1) through (a)(9) of this section shall be credited to the North Carolina Highway Trust Fund. The fees collected under subdivision (a)(10) of this section shall be credited to the Highway Fund. Fifteen dollars ($15.00) of each title fee credited to the Trust Fund under subdivision (a)(1) shall be added to the amount allocated for secondary roads under G.S. 136-176 and used in accordance with G.S. 136-44.5.

(c) The Division shall not collect a fee for a certificate of title for a motor vehicle entitled to a permanent registration plate under G.S. 20-84."

SECTION 3. The Commission for Health Services shall amend 15A NCAC 13A .0119 to adopt rules governing the management of waste mercury-containing devices, as defined in the Notice of Proposed Rulemaking published on 12 June 2002 in the Federal Register, Volume 67, Number 113, Pages 40507 through 40528, as universal waste. The Commission is authorized to adopt temporary rules pursuant to the provisions of G.S. 150B-

"**SECTION 4.** Sections 1, 2, 3, and 4 of this act are effective when this act becomes law, except that G.S. 130A-310.~~53~~52, 130A-310.~~54~~53(c), and 130A-310.~~55~~54 become effective 1 July ~~2006.~~2007. Section 2 of this act becomes effective 1 October 2005. ~~Each vehicle manufacturer that is subject to the requirements of this act shall provide the information required by G.S. 130A-310.52(b), either individually or as a group of manufacturers, on or before 1 January 2006.~~The first annual report required by G.S. 130A-310.55 is due 1 November 2008. This act expires on ~~1 July 2026.~~31 December 2017.

RECEIVED
2007
RESEARCH DIVISION

The Honorable William G. Ross, Jr.
Secretary of Environment and Natural Resources
1601 Mail Service Center
Raleigh, North Carolina 27699-1601

By Hand Delivery and Electronic Mail

Dear Secretary Ross:

As you are aware, the 2006 General Assembly imposed a 12-month moratorium on the issuance of permits by your Department for new landfills in the State. The legislation that imposed this moratorium, S.L. 2006-244 directed the Environmental Review Commission (ERC), "*with the assistance of the Division of Waste Management of the Department of Environment and Natural Resources*," (emphasis added) to study issues related to solid waste and report its findings and recommendations to the 2007 Regular Session of the General Assembly.

The ERC has devoted a great deal of time and attention to the study of solid waste and, consistent with the legislative directive, has sought and received the assistance of the Division of Waste Management and the Department. This assistance has been generously provided and has been quite valuable to the ERC but is, regrettably, incomplete for the following reason. At the 17 January 2007 meeting of the ERC, we expected to hear specific legislative proposals from the Division and the Department that would address many of the outstanding concerns over landfills and other solid waste management issues that have been considered by the ERC at earlier meetings. Our expectation was that the presentation of these proposals would provide the ERC with the opportunity to evaluate them for possible inclusion in the report of the ERC to the General Assembly.

Instead, the ERC was presented with general recommendations that, although helpful, lack the detail and specificity required of legislative proposals. This was particularly frustrating because we believe that the general recommendations aim in the right direction and would, if presented as specific legislative proposals, address many of the solid waste management problems that led to the moratorium. In other words, in our opinion many, if not all, of the general recommendations, if presented as specific legislative proposals, would be adopted as recommendations by the ERC and ultimately would be enacted by the General Assembly.

Accordingly, pursuant to S.L. 2006-244, G.S. 120-19 and G.S. 120-70.44 we ask that you immediately provide the ERC with specific legislative proposals that, if enacted, would implement the general recommendations presented to the ERC by Assistant Secretary Smith on 17 January 2007.

We understand that specific legislative proposals are being withheld while the Administration determines its position on the issues involved. We welcome the Administration's interest in these issues and we understand and respect the right of the Administration to develop its own policy recommendations at its own pace. We do not wish to interfere with that process. Our request is not for policy recommendations or for the Administration's position, but rather is for specific legislative proposals that would implement each of the general recommendations that have already been presented publicly to the ERC. Our understanding is that these proposals either have already been drafted or are in the process of being drafted and could be made available to the ERC more or less immediately.

In this same vein, we note that G.S. 130A-309.06(c) directs the Department of Environment and Natural Resources to report to the ERC on or before 15 January of each year on the status of solid waste management efforts in the State. This annual report is to include, among other information, "[r]ecommendations to the Governor and the Environmental Review Commission to improve the management and recycling of solid waste in the state, including any proposed legislation to implement the recommendations." (G.S. 130A-309.06(c)(7)). The ERC has not received the report due 15 January 2007. We request that you provide this report, including proposed legislation, without further delay.

As you are aware, the 2007 Session of the General Assembly in now underway. The ERC needs to complete its work. Our legislative leadership has asked us to move swiftly on the landfill issue. We in turn have directed our staff to begin working with legislators and interested parties to develop a comprehensive solid waste management bill. We urgently need the best thinking that your Department can provide to us on this issue now, and we welcome the continued involvement of your Department as we all move forward on this issue in the coming weeks and months.

Your prompt attention to this matter will be most appreciated.

Respectfully yours,

Charles W. Albertson, Cochair

Pryor A. Gibson, Cochair

Daniel G. Clodfelter, Cochair

RESEARCH DIVISION

6:30 pm

Gentlemen:

Thank you for your letter of January 31, 2007 requesting specific proposals to improve the permitting and management of solid waste landfills. The Division of Waste Management is developing specific recommendations, but has not yet completed work on those proposals.

As you may recall, the Division reported to the Environmental Review Commission in January on its survey of solid waste management practices in sixteen eastern seaboard states. Since that meeting, the Division has been evaluating standards and practices identified in the survey for possible use in North Carolina. The Division also needed to do more work to fully develop some of the ideas for improvement in landfill permitting and management previously presented to the ERC. A few issues required additional legal research.

Work on the recommendations is nearing completion and the Department should be ready to provide specific proposals for the Environmental Review Commission's consideration by February 16, 2007.

I appreciate the ERC's strong interest in the environmental and public health

Gentlemen:

Enclosed is a summary of the Department's specific recommendations for improved management of sanitary landfills in North Carolina. These recommendations provide additional detail, but closely follow the general outline of landfill recommendations previously presented to the Environmental Review Commission. The Department has also provided draft language for these recommendations to the Environmental Review Commission's counsel, George Givens.

In both the summary and the bill draft, there is a placeholder for recommendations related to the landfill franchise statute. The Department is continuing to work on the franchise recommendation in consultation with Mr. Richard Whisnant at UNC's School of Government. The Department wants to be sure that any proposal for amendment of the franchise statute maintains an appropriate role for both local government and the State with respect to landfill siting decisions.

I look forward to working with you to improve the landfill permitting process. If you have questions about the specific recommendations, I would encourage you to contact either Assistant Secretary Robin Smith at 715-4141 or the Director of the Division of

February 19, 2007
DENR

SUMMARY OF LANDFILL RECOMMENDATIONS

1. Specify how a landfill applicant must demonstrate financial qualifications to construct and operate the landfill.

The applicant should provide cost estimates for: performing environmental studies; acquiring the site; designing the landfill; constructing and operating the landfill; and financial assurance required for corrective action and closure of the landfill. To show financial qualification, the applicant should submit an audited, certified, financial statement and identify sufficient assets to cover the estimated costs. Where assets of a parent, subsidiary, affiliate or joint venturer are offered in support of the financial qualifications of the applicant, then that party must be listed as an owner/operator on the facility permit.

2. Expand financial assurance requirements.

Require that the landfill operator provide financial assurance to cover possible corrective action (in the event of a leak from the landfill, for example). This would be in addition to the financial assurance currently required for the cost of closing the landfill and providing post-closure case. The minimum amount of financial assurance for corrective action should be $3 million. Financial assurance for corrective action should apply to both new and existing facilities. For new facilities, the financial assurance would be required before permit issuance.

3. Strengthen environmental compliance review of potential landfill operators.

Expand the scope of the existing environmental compliance review to include any past environmental violation (not just those related to solid waste) and a larger group of people associated with the permit applicant. For example, the environmental compliance review would be broadened to cover a person who holds a minority interest in the entity applying for a landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

4. Broaden the definition of "owner or operator".

Include in the definition of "owner or operator" any person who has a financial or equitable interest in the entity that has applied for the landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

5. Clarify solid waste enforcement provisions.

Amend the statute sections that authorize injunctive relief and civil penalties for solid waste violations to expressly allow the use of those enforcement remedies in response to a violation of a permit issued by the Department or an order issued by the Commission for Health Services. Increase the maximum civil penalty allowed for a solid waste or hazardous waste violation. Authorize the Department to recover the costs of investigating a violation.

6. Require notice to the Department of any significant change in the structure or assets of the business entity that holds a landfill permit.

The Department should be notified within 30 days of any significant change in the structure of the business entity that owns or operates the landfill facility; the identity of any person or business entity previously identified as an owner or operator of the facility pursuant to G.S. 130A-309.27(a)(1); or in the financial assets identified in the financial qualification of the owner or operator. A change is significant if it could effect the financial qualifications of the permit holder or result in a change in the identity of the owners or operators for purposes of either financial qualification or environmental compliance review. When the Department receives notice of a change, it can require a new environmental compliance or financial qualification review.

7. Set standards for safe transportation of solid waste by railway or barge.

Containers used to transport solid waste should be leak-tested and covered. Records of leak testing should be retained at the permitted solid waste facility for 3 years. It would be a violation to allow liquid to enter a container of solid waste or to allow solid waste, liquids or odors to escape from a container.

8. Require a traffic study for larger solid waste facilities.

Require that applications for solid waste management facilities proposed to handle more than 100,000 tons of waste per year include a study of the traffic impacts of the facility. The results of the study would be considered in the permit decision.

9. Authorize local landfill liaisons.

Authorize a local government with planning authority over a sanitary landfill that has a service area of greater than a 100-mile radius to designate a landfill liaison. The liaison would be a certified landfill manager, but would not direct the operation of the landfill. The landfill liaison would have authority to enter the landfill facility at reasonable times and inspect the landfill operation for purposes of: ensuring that the facility meets all local requirements; identifying and notifying the Department of potential violations; and identifying and notifying the Department of potentially hazardous conditions.

10. Require the permittee to employ an independent quality assurance engineer to oversee construction of the landfill.

The permittee should employ a licensed engineer who is independent of both the landfill owner and any person engaged in the design or construction of the landfill to inspect during construction. The project engineer would be responsible for certifying that construction of the solid waste management facility units, leachate handling facilities and landfill appurtenances conforms to the plan approved by the Department, the permit to construct, and the rules adopted by the Commission.

11. Establish minimum standards for new landfills and for landfill expansions onto previously unpermitted property.

Minimum standards for new landfills and for landfill expansion onto property that was not included within the scope of a previous permit would include:

a. double liners and a leachate collection system for municipal solid waste landfills;
b. composite liners for construction and demolition landfills;
c. a minimum separation of 5 feet between the bottom elevation of the waste (or the liner system, if the landfill has a liner) and seasonal high groundwater and bedrock;
d. a 200-foot buffer between the waste boundary and streams or wetlands (unless no feasible alternative location is available that would comply with the buffer requirement); and
e. a prohibition against siting landfill units in the 100-year floodplain or in area reclaimed from the floodplain.

12. Establish new standards for construction of lined sanitary landfill units permitted on or after the effective date of the bill

Specific standards for leachate collection systems and liners would include:

a. leachate collections systems should be designed to maintain a head of less than one foot during leachate recirculation.
b. the leachate collection system should be designed to return the head to one foot or less within 72 hours based on a 25 year-24 hour design storm falling on an empty cell.
c. geomembrane base liner systems must be tested for leaks and damage.
d. leachate collection lines should be designed and constructed to allow for remote camera inspection and cleaning. Lines should be cleaned and remotely inspected annually.
e. all pipes used to carry leachate should be constructed with dual containment outside of the lined disposal unit.
f. new units and lateral expansions should be constructed without pipe penetrations of the bottom liner, whether for leachate, stormwater or gas.

13. Direct the Commission for Health Services to review landfill rules and adopt new rules necessary to protect public health and the environment.

Rules adopted by the Commission should:

a. establish standards for the collection, control and utilization or destruction of landfill gasses at municipal solid waste landfills;
b. establish standards for the construction, operation, and maintenance of bioreactor landfills;
c. establish criteria for development of bird and wildlife management plans; and
d. incorporate measures necessary to minimize impacts to natural, historic and cultural resources, including but not limited to wetlands, critical fisheries habitat, parks, recreation areas, cultural and historic sites, and potential water supplies.

14 Require that all sanitary landfills have a waste screening plan to ensure that the facility is in compliance with waste bans.

15 Require an environmental study of very large landfills and landfills with an extended service area.

The existing exemption from the N.C. Environmental Policy Act for landfills owned and operated by local governments should be removed for facilities that receive more than 300,000 tons of waste per year; have a total disposal capacity of more than 15 million cubic yards of solid waste; or have a service area of more than 100 miles in radius. An environmental study should also be required for privately-constructed landfills that will exceed one of more of those thresholds. The environmental document would need to meet the standards for an environmental impact statement under the N.C. Environmental Policy Act and rules adopted by the Department of Administration to implement the act. The documents would also be subject to the same public notice and a public hearing would be required.

16. Change landfill franchise authority to differentiate between landfills that provide local service and those that have large regional or multi-state service areas.

The Department is still working on the specific recommendation to alter local government franchise authority.

17. Add a new statute section setting out the grounds for denial of a landfill permit.

The statute should authorize the Department to deny a landfill permit if it finds one of the following:

(a) Construction or operation of the landfill would violate water quality standards for groundwater or surface waters;

(b) The landfill would jeopardize a renewable resource of more than local concern, such as watersheds or aquifers that are sources of public water supply.
(c) Construction or operation of the landfill would damage fragile or historic areas or areas containing environmental or natural resources of more than local significance. Examples of these areas would include national or State parks or forests; wilderness areas; historic sites; recreation areas; segments of the natural and scenic rivers system; wildlife refuges, preserves and management areas; areas that provide habitat for threatened or endangered species; primary nursery areas and critical fisheries habitat designated by the Marine Fisheries Commission; and Outstanding Resource Waters designated by the Environmental Management Commission.
(d) Construction or operation of the facility would jeopardize public rights to access or use public trust waters.
(e) The facility will be located in a natural hazard area, such as an area subject to excessive seismic activity, that would increase the risk to public health or safety.
(f) The proposed facility would be inconsistent with statutory standards or rules adopted by the Commission for Health Services.
(g) The proposed facility would be inconsistent with ordinances adopted by the local government that has planning jurisdiction over the site of the proposed facility.
(h) There is a practicable alternative to be proposed landfill that would have less adverse impact on public resources.
(i) Construction of the landfill would contribute to cumulative effects that would damage a natural, historic, or cultural resource protected under the statute.

18. Establish permit fees for solid waste facilities. A copy of the proposed fee schedule is attached. Fee revenue would be used to support the solid waste regulatory program.

19. Establish a state-wide surcharge on disposal of solid waste at $2 per ton. The surcharge would apply to municipal solid waste and to construction and demolition waste that is either disposed of at a permitted solid waste facility or moves through a permitted transfer station en route to a disposal facility outside the State. The surcharge would be used to pay for cleanup of orphan landfills and other orphan inactive hazardous waste sites; provide state matching funds for remediation, monitoring and maintenance of Superfund sites in North Carolina; provide funds to local government for redevelopment of contaminated sites; and provide funds for administration of contracts to cleanup orphan landfills and inactive hazardous waste sites.

DRAFT
DENR
Feb. 19 2007

PROPOSED PERMIT FEES FOR SOLID WASTE MANAGEMENT FACILITIES

"**§ 130A-293.1. Fees applicable to permits for solid waste management facilities.**

(a) It is the intent of the General Assembly that the fees collected pursuant to this section shall be used to support the Department's solid waste management program.

(b) The Solid Waste Management Account is established as a non-reverting account within the Department. All fees collected under this section shall be credited to the Account and shall be used for personnel and other resources necessary to do any one or more of the following:

(1) Provide a high level of professional review of permit applications for solid waste landfills and other solid waste management facilities;

(2) Provide timely review of permit applications;

(3) Improve monitoring of solid waste management facilities;

(4) Increase compliance activities related to solid waste management facilities; and

(5) Review and update rules governing the construction and operation of solid waste landfills to recognizing advances in technology and research to better protect public health and the environment.

(c) Applicants for permits shall pay an application fee according to the following schedule:

(1) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$25,000

(2) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$15,000

(3) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(4) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $50,000

(5) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $30,000

(6) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Modification - $3,000

(7) Construction and Demolition Landfill accepting less than 100,000 tons/year of solid wasteNew Permit-$15,000

(8) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(9) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(10) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $30,000

(11) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $18,500

(12) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Modification - $2,500

(13) Industrial Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$15,000

(14) Industrial Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(15) Industrial Landfill accepting less than 100,000 tons/year of solid waste Modification - $1,500

(16) Industrial Landfill accepting 100,000 tons/year or more of solid waste New Permit - $30,000

(17) Industrial Landfill accepting 100,000 tons/year or more of solid waste Amendment - $18,500

(18) Industrial Landfill accepting 100,000 tons/year or more of solid waste Modification - $2,500

(19) Tire Monofill New Permit - $1,750

(20) Tire Monofill Amendment - $1,250

(21) Tire Monofill Modification - $500

(22) Treatment and Processing New Permit - $1,750

(23) Treatment and Processing Amendment $1,250

(24) Treatment and Processing Modification $500

(25) Transfer Stations New Permit - $5,000

(26) Transfer Stations Amendment - $3,000

(27) Transfer Station Modification - $500

(28) Incinerator New Permit - $1,750

(29) Incinerator Amendment - $1,250

(30) Incinerator Modification - $500

(31) Large Compost Facility New Permit - $1,750

(32) Large Compost Facility Amendment - $1,250

(33) Large Compost Facility Modification - $500

(34) Land Clearing and Inert New Permit - $1,000

(35) Land Clearing and Inert Amendment - $500

(36) Land Clearing and Inert Modification -$250

(d) The application permit fee under this section shall be paid upon submission of the permit application.

(e) A permitted solid waste management facility shall pay an annual permit fee on or before August 1 of each year according to the following schedule:

1. Municipal Solid Waste Landfill $3,500
2. Post Closure Municipal Solid Waste Landfill $1,000
3. Construction and Demolition Landfill $2,750
4. Post Closure Construction and Demolition Landfill $500
5. Industrial Landfill $2750
6.. Post Closure Industrial Landfill $500
7. Transfer Station $750
8. Treatment and Processing Facility $500
9. Tire Monofill $500
10. Incinerators $500

11. Large Compost Facility $500
12. Land Clearing and Inert Debris Landfill $500

(f) As used in this section, the following definitions apply:

(1) 'New permit' means all of the following:

a. An application for a new solid waste management facility not previously permitted by the Department. It includes one site suitability review, the initial permit to construct and one permit to operate the constructed portion of a phase included in the permit to construct.

b. An application that proposes to expand the boundary of a permitted waste management facility for the purpose of expanding the permitted activity.

c. Any application that includes a proposed expansion to the boundary of a waste disposal unit within an existing permitted solid waste management facility.

d. An application for a substantial amendment to a solid waste permit, as defined in G.S. 130A 294(b1).

(2) 'Permit amendment' means all of the following:

a. An application for a permit to construct and one permit to operate for the second and subsequent phases of landfill development depicted in the approved facility plan for an existing solid waste management permit.

b. An application for a renewal or a permit review every five years after issuance of the existing solid waste management facility permit, as required by rule.

c. Any application that proposes a change in ownership or corporate structure of a permitted solid waste management facility

(3) 'Permit modification' means all of the following:

a. an application for any change to the plans approved in the existing permit for a solid waste management facility that does not constitute a 'permit amendment' or a 'new permit'."

b. a second or subsequent permit to operate for a constructed portion of a phase included in the permit to construct.

EXHIBIT M

RECOMMENDATIONS FROM THE DEPARTMENT OF ENVIRONMENT AND NATURAL RESOURCES TO THE ENVIRONMENTAL REVIEW COMMISSION ON SOLID WASTE MANAGEMENT

16 February 2007

A BILL TO BE ENTITLED
THE SOLID WASTE MANAGEMENT ACT OF 2007

Whereas, it is the declared public policy of the state to protect and enhance the water quality of the State's rivers and coastal estuaries; and

Whereas, it is the policy of the State to ensure the continued public enjoyment of the natural attractions of the State; and

Whereas, the ownership of solid waste facilities has taken new form in recent years; and

Whereas, the potential exists for the state of North Carolina and local government to incur costs from an environmental release from a landfill; and

Whereas, there have been substantial and beneficial changes in technology, materials, processes, and engineering practices in the field of solid waste management; and

Whereas, North Carolina should set a high standard in solid waste management practices and there is a desire to immediately improve solid waste management in North Carolina by implementing changes that account for the substantial and beneficial changes in technology, materials, processes and engineering practices in the field of solid waste management.

Now therefore the General Assembly of North Carolina enacts:

SECTION 1.(a). Financial qualifications for solid waste facility owners.

G.S. 130A-290 is amended by adding a new definition:

"(1aa) "Business entity" has the same meaning as in G.S. 55-1-40 (2a)."

SECTION 1.(b).

G.S. 130A-294(b2) is amended as follows:

"(b2) The Department may require an applicant for a permit under this Article to satisfy the Department that the applicant, and any parent, subsidiary, or other affiliate of the applicant or parent, and including any joint venturer with a direct or indirect financial or equity interest in the applicant:

(1) Is financially qualified to carry out the activity for which the permit is required.

The applicant shall demonstrate financial qualifications adequate to ensure proper design, construction, operation, maintenance, and closure of the facility. The applicant shall also demonstrate financial qualifications sufficient to obtain the financial assurance required under subpart (b) of this section. The initial demonstration of financial qualification for the design, construction, and closure of the facility may be limited to the first five-year phase of construction for which a permit to construct is sought. The applicant may be required to demonstrate financial qualification for each successive five-year phase of design, construction and operation of the facility when applying for a permit to construct each successive phase of the facility. The applicant shall provide cost estimates for site investigation; land acquisition, including financing terms and land ownership; design of the facility; construction of the first five-year phase of the facility, operation of the facility; closure of the facility; and the cost of providing financial assurance required under subpart (b) of this section.

The applicant shall provide an audited, certified, financial statement and a combination of cash deposits, insurance policies, and binding letters of loan commitments from a triple A or higher rated rated financial institution licensed to do business in North Carolina sufficient to cover the anticipated costs. Where assets of a parent, subsidiary or other affiliate of the applicant or a joint venturer with a

direct or indirect financial or equity interest in the applicant is proposed to be used to determine the financial qualifications of the applicant, then that party must be listed on the permit of the facility. The applicant must show the ability to obtain financial assurance required under this Chapter and rules adopted by the Commission. A letter of intent to provide financial assurance provided by a North Carolina registered provider of at least triple A credit rating shall suffice for adequate demonstration

SECTION 2. Financial assurance for assessment and corrective actions.

G.S. 130A-294(b) is amended as follows:

" (b) The Commission shall adopt and the Department shall enforce rules to implement a comprehensive statewide solid waste management program. The rules shall be consistent with applicable State and federal law; and shall be designed to protect the public health, safety, and welfare; preserve the environment; and provide for the greatest possible conservation of cultural and natural resources. Rules for the establishment, location, operation, maintenance, use, discontinuance, recordation, post-closure care of solid waste management facilities also shall be based upon recognized public health practices and procedures, including applicable epidemiological research and studies; hydrogeological research and studies; sanitary engineering research and studies; and current technological development in equipment and methods. The rules shall not apply to the management of solid waste that is generated by an individual or individual family or household unit on the individual's property and is disposed of on the individual's property.

The Commission shall adopt rules for financial responsibility to ensure the availability of sufficient funds for closure and post-closure maintenance and monitoring at solid waste management facilities and for any corrective action the Department may require during the active life of a facility or during the closure and post-closure periods. To meet the financial responsibility requirements of this section for potential assessment and corrective action, the owner or operator of a sanitary landfill shall provide financial assurance sufficient to cover a minimum of $3,000,000.00 in costs. The Department may require financial assurance in a higher amount and may adjust the amount of financial assurance required upward after initial permit issuance, based upon the types of waste disposed in the landfill, the projected amount of waste to be disposed in the landfill, the location of the landfill, potential receptors of releases from the landfill, and inflationary factors. This amount is in addition to any financial assurance required for closure of the facility and for routine post-closure care. The rules may permit demonstration of financial responsibility through the use of a letter of credit, insurance, surety, trust agreement, financial test, or guarantee by corporate parents or third parties who can pass the financial test. The rules shall require that an owner or operator of a privately owned solid waste management facility demonstrate financial responsibility by a method or combinations of methods that will ensure that sufficient funds for closure, post-closure maintenance and monitoring, and any corrective action that the Department may require will be available during the active life of the facility, at closure, and for a period of not less than 30 years after closure even if the owner or operator becomes insolvent or ceases to reside, be incorporated, do business, or maintain assets in the State. The financial assurance shall be in a form that allows the Department to access the financial assurance for the purposes enumerated in this section and may not be accessed by the permit holder except as approved by the Department. Financial assurance for potential releases of contaminants shall be demonstrated prior to issuance of new permits and within six months of the effective date of this section for existing permits.

SECTION 3 HISTORY OF ENVIRONMENTAL COMPLIANCE

SECTION 3a.

G.S. 130A-309.06(b) is amended as follows:

(b) The Department may refuse to issue a permit to an applicant who by past conduct ~~in this State~~ has repeatedly violated ~~related~~ statutes, rules, orders, or permit terms or conditions relating to ~~any solid waste management facility~~ environmental protection and who is deemed by the Department to be responsible for the violations. For the purpose of this subdivision, an applicant includes the owner or operator of the facility, or, if the owner or operator is a business entity, the parent, subsidiary or other affiliate of the applicant, ~~the parent of the subsidiary corporation,~~ a partner, ~~a corporate~~ officer, ~~or~~ director, ~~or a stockholder holding more than fifty percent (50%) of the stock of the corporation.~~ member, manager, and any person with a direct or indirect financial or equity interest in the applicant, other than a minority shareholder of a publicly traded corporation who has no involvement in management or control of the corporation or any of its subsidiaries or affiliates.

SECTION 3b.

G.S. 130A-294(b2)(2) is amended as follows:

(2) Has substantially complied with the requirements applicable to any ~~solid waste~~ activity in which the ~~applicant~~ applicant, or a parent, subsidiary or other affiliate of the applicant or parent, or a joint venturer with a direct or indirect financial or equity interest in the applicant, has previously engaged and has been in substantial compliance with federal and state laws, regulations, and rules for the protection of the environment. In determining whether the applicant and its affiliates have substantially complied with environmental laws in previous activities, the Department may consider the environmental compliance history of:

a. Officers, directors, managers, members, and partners in the applicant business entity;
b. All persons with a direct or indirect financial or equity interest in the applicant;
c. Officers, directors, managers, members, and partners in any business entity which has a direct or indirect financial or equity interest in the applicant;
d. Officers, directors, managers, members and partners in any business entity which is a parent, subsidiary or other affiliate of the applicant.

The applicant shall provide environmental compliance history information for each facility, business, business entity, joint venture or other undertaking in which any of the persons listed above is or has been an owner, operator, officer, director, manager, member, or partner, or in which any of the persons listed above has had a direct or indirect financial or equity interest, as requested by the Department."

SECTION 4. Sanitary landfill owner defined.

G.S. 130A-309.27(a)(1) is amended as follows:

"(1) "Owner or operator" means, in addition to the usual meanings of the term, any owner of record of any interest in land on which a landfill is or has been sited, and any person or ~~corporation~~ business entity which owns, directly or indirectly, a ~~majority~~ financial or equity interest in any other ~~corporation~~ business entity which is the owner or operator of a landfill, except that a minority shareholder of a publicly traded corporation who has no involvement in management or control of the corporation or any of its subsidiaries or affiliates shall not be considered an owner or operator solely on the basis of his stock holdings."

SECTION 5. Violation of permits

G.S. 130A-18 (a) is amended as follows:

" (a) If a person shall violate any provision of this Chapter; ~~or~~ the rules adopted by the Commission or rules adopted by a local board of health; or a condition or term of a permit or order issued under this Chapter, the Secretary or a local health director may institute an action for injunctive relief, irrespective of all other remedies at law, in the superior court of the county where the violation occurred or where a defendant resides.

(b) The Secretary of Environment and Natural Resources and a local health director shall have the same rights enumerated in subsection (a) of this section to enforce the provisions of Part 4 of Article 5 and Articles 8, 9, 10, 11, and 12 of this Chapter. (1983, c. 891, s. 2; 1997-443, s. 11A.61; 2001-474, s. 20; 2006-255, s. 13.4.)

.G.S. 130A-22(a) is amended as follows:

"(a) The Secretary of Environment and Natural Resources may impose an administrative penalty on a person who violates Article 9 of this Chapter, rules adopted by the Commission pursuant to Article 9, or any term or condition of a permit or order issued under Article 9. Each day of a continuing violation shall constitute a separate violation. The penalty shall not exceed ten thousand dollars ($10,000) per day in the case of a violation involving nonhazardous waste. The penalty shall not exceed thirty-two thousand five hundred dollars ($32,500) per day in the case of a first violation involving hazardous waste as defined in G.S. 130A-290 or involving the disposal of medical waste as defined in G.S. 130A-290 in or upon water in a manner that results in medical waste entering waters or lands of the State; and shall not exceed fifty thousand dollars ($50,000) per day for a second or further violation involving the disposal of medical waste as defined in G.S. 130A-290 in or upon water in a manner that results in medical waste entering waters or lands of the State. The penalty shall not exceed thirty-two thousand five hundred dollars ($32,500) per day for a violation involving a voluntary remedial action implemented pursuant to G.S. 130A-310.9(c) or a violation of the rules adopted pursuant to G.S. 130A-310.12(b). If a person fails to pay a civil penalty within 60 days after the final agency decision or court order has been served on the violator, the Secretary of Environment and Natural Resources shall request the Attorney General to institute a civil action in the superior court of any county in which the violator resides or has his or its principal place of business to recover the amount of the assessment. Such civil actions must be filed within three years of the date the final agency decision or court order was served on the violator.

G.S. 130A-22 is amended by the addition of a new paragraph (j) which reads as follows:

"(j) The Secretary of Environment and Natural Resources may also assess a person who is assessed a civil penalty under this section the reasonable costs of any investigation, inspection, or monitoring that results in the assessment of the civil penalty."

SECTION 6. Notice of change of ownership.

G.S. 130A-294 is amended by adding a new subsection to read:

"( ) Solid waste management permits are not transferable. The person holding a permit for a solid waste management facility shall notify the Department of any significant change in the structure of the business entity that owns or operates the facility; the identity of any person or business entity previously identified as an owner or operator of the facility pursuant to G.S. 130A-309.27(a)(1); or in the financial assets identified in the financial qualification of the owner or operator. Notice to the Department shall be provided within 30 days. A change shall be considered significant if it has the potential to effect the financial qualifications of the permit holder or if it would result in a change in the identity of the owners or operators for purposes of either financial qualification or environmental compliance review. The Department may require new

financial qualification and environmental compliance reviews based those changes and may modify, revoke or require issuance of a new permit based on the outcome of the reviews."

SECTION 7. Transportation of nonhazardous solid waste.

G.S. 130a-294(a) is amended by adding a new subdivision to read:

"( ) Waste containers used for transport of solid waste by railway or barge, including the barge or railcar if the waste is not containerized, shall:

(1) be designed, constructed, loaded, operated, secured and maintained so as to prevent the escape of wastes, liquids, and odors and to prevent the loss or spillage of wastes in the event of an accident.

(2) be stacked safely and be secured to prevent accidents during transportation, loading and unloading.

(3) be completely enclosed or covered.

(4) be certified as having passed the following test to show that it is watertight, when it is placed in service and at least once every six months thereafter while it remains in service:

(i) have a minimum internal head of 24 inches of water applied to the container in an upright position for at least 15 minutes during which the container shall remain free from the escape of water.

(ii) be visually inspected for damage on all sides, plus the top and bottom and must have no visible holes, gaps or structural damage affecting its integrity or performance.

Owners of all containers shall keep a record of testing of each container for three years and provide copies of those records to persons who lease or handle the container. Such records shall be available to the Department for inspection at any receiving facility permitted by the Department.

The entry of liquids into a container; escape, loss or spillage of wastes or liquids from a container; or escape of odors from a container during transportation, holding and storage operations or in the event of an accident, shall be a violation of this subsection."

SECTION 8. Traffic study required.

G.S. 130A-294(a) is amended by adding a new subsection to read:

"( ) No application for a permit for a new solid waste management facility that is proposed to accept greater than 100,000 tons of waste per year shall be considered until a traffic study is completed. The study shall at a minimum include the following:

a. Identification of routes from the nearest limited access highway used to access the proposed facility and daily and hourly traffic volumes that will result along each approach route;

b. A map identifying land uses located along the identified approach routes, including but not limited to residential, commercial, and industrial development; agricultural operations; and identification of residences, schools, hospitals, nursing homes and other significant buildings fronting the roadways. Describe potential adverse impacts of increased facility traffic volumes and describe mitigation measures.

c. Identification of locations on approach routes where road conditions are inadequate to handle the increased traffic associated with the proposed facility. Describe potential mitigation measures.

The Department shall condition any permit issued for a solid waste management facility to provide mitigation of adverse impacts identified from the traffic study. The Commission may adopt rules to implement this section."

SECTION 9. Local government landfill liaison

G.S. 153A/160A (for counties/municipalities) is amended by adding a new subsection to read:

"( ) A local government that has planning jurisdiction over the site of a solid waste management facility with a service area greater than or equal to a 100 mile radius may employ a local government landfill liaison. The landfill liaison shall be a certified landfill manager in accordance with G.S. 130A-309.06. The landfill liaison may enter the landfill facility at reasonable times and inspect the landfill operation for purposes of :

a. ensuring that the facility meets all local requirements

b. identifying and notifying the Department of potential violations of landfill requirements; and

c. identifying and notifying the Department of potentially hazardous conditions.

The landfill liaison may not direct the operation of the facility."

SECTION 10. Independent engineer perform construction quality assurance

G.S. 130A-294 is amended by adding a new subsection as follows:

" ( ) The owner of a sanitary landfill shall employ a project engineer to inspect the construction of sanitary landfill units, landfill leachate handling facilities and landfill appurtenances. The project engineer shall be licensed to practice engineering in the State of North Carolina and must be independent of both the landfill owner and any person engaged in the design or construction of the landfill. The project engineer is responsible for observing, documenting and certifying that construction of the solid waste management facility units, leachate handling facilities and landfill appurtenances conforms to the plan approved by the Department, the permit to construct, and the rules adopted by the Commission. The project engineer or the engineer's representative shall be at the site at all times during the initial construction phase of the containment and leachate collection systems, shall observe and perform all required systems audits of the quality control inspections and shall ensure proper implementation of the design and permit requirements. All certifications must bear the seal and signature of the professional engineer and the date of certification."

SECTION 11(a) Minimum standards for new landfills and for landfill expansions onto previously unpermitted property .

G.S. 130A-294 is amended by adding a new subsection as follows:

"( ) The following standards shall apply to landfill facilities permitted after the effective date of this section and lateral expansions of landfill facilities onto property that was not included in a landfill permit issued prior to the effective date of this section:

(1) Municipal Solid Waste landfill units shall be constructed with double liners and must include a leak detection system between the liners and a low permeability layer under the secondary liner.

(2) Construction and Demolition landfill units shall be constructed with a composite liner system consisting of two components. The upper component shall consist of a flexible membrane liner and the lower component shall consist of a minimum of two feet of compacted soil with a maximum permeability of 1×10^{-7} centimeters per second. The liner shall be a minimum of 30 mil in thickness, except that a liner composed of high density polyethylene shall be a minimum of 60 mil in thickness. The liner shall be installed in direct and uniform contact with the compacted soil layer. The Department may approve an alternate liner system if the Department finds, based on modeling, that the alternate liner system will provide equivalent or greater impermeability.

(3) Sanitary landfill units shall be constructed so that the post-settlement bottom elevation of the liner system, or the post-settlement bottom elevation of the waste if no liner system is required, is a minimum of five feet above the seasonal high groundwater table and the bedrock datum plane contours established during the hydrogeologic investigation phase of the permit process.

(4) Sanitary landfill units and lateral expansions of existing units shall establish a minimum buffer distance between the waste boundary and streams or wetlands of 200 feet. The Department may approve a buffer that is less than 200 feet, but in no case less than 100 feet, upon finding that both of the following apply:

a. The proposed landfill or landfill expansion will serve a critical need in the community.
b. No feasible location exists that would allow for siting or expansion of the landfill in compliance with the requirement for 200 foot buffers.

(5) Sanitary landfill units shall not be placed in the 100-year flood plain or in lands reclaimed from previously designated 100-year flood plains.

[We need to harmonize (5) with the floodplain statutes – G.S. 143-215.54 and 143-215.54A. G.S. 143-215.54(c) prohibits solid waste disposal facilities, hazardous waste management facilities, salvage yards and chemical storage facilities in the 100-year floodplain, but 143-215.54A(b) allows the local government to issue a variance from that prohibition. We have not yet decided whether to keep the variance option and if so whether it should be at the state or local level.]

Section 11(b) Standards for landfill units that received a permit to construct after effective date

G.S. 130A-294 is amended by adding a new subsection to read:

"( ) The following criteria shall apply to all lined sanitary landfill units permitted on or after the effective date of this section.

(1) Any required leachate collection system shall be designed to return the head on the liner to one foot (30 cm) or less, within 72 hours, from a design storm of 25 year-24 hour falling on an empty cell. The leachate collection system shall maintain a head of less than one foot (30 cm) at all times during leachate recirculation. The operator may be required to monitor head on the liner to demonstrate that the head is being maintained in accordance with the rules and this section.
(2) All geomembrane base liner systems used in sanitary landfill units shall be tested for leaks and damage, by methods approved by the Department, to ensure that the liner is 100% evaluated.
(3) All leachate collection lines shall be designed and constructed to permanently allow remote camera inspection and cleaning. All leachate lines shall be cleaned and shall be remotely inspected by camera on an annual basis. The documentation of the camera inspection and the annual cleaning shall be placed in the facility operating record and provided to the Department upon request.
(4) All pipes used to transmit leachate shall provide dual containment outside of the lined disposal unit. New units and lateral expansions shall be constructed without pipe penetrations of the bottom liner, whether for leachate, stormwater or gas.

The Commission may adopt rules as needed to implement this section."

SECTION 11(c) Improve landfill standards.

The Commission shall review rules relating to the siting, construction and design of solid waste facilities to determine whether changes are required to protect the public health and environment; to improve the performance of solid waste management facilities; to take advantage of technological advances in landfill construction, maintenance and design; and to provide additional protection to environmentally sensitive areas of the state. The Commission shall enact rules necessary to minimize impacts to the environment and protect public health. These rules shall:

(1) Establish standards for the collection, control and utilization or destruction of landfill gasses at municipal solid waste landfills;
(2) Establish standards for the construction, operation, and maintenance of bioreactor landfills;
(3) Establish criteria for development of bird and wildlife management plans; and
(4) Incorporate measures necessary to minimize impacts to natural, historic and cultural resources, including but not limited to wetlands, critical fisheries habitat, parks, recreation areas, cultural and historic sites, and potential water supplies.

SECTION 11(d) Waste screening.

G.S. 130A-294 is amended by adding a new subsection to read:

"( ) Solid waste management facilities [permitted after the effective date of this section] shall have a waste screening plan approved by the Department. The plan shall identify measures adequate to ensure compliance with state laws, rules and applicable local ordinances that ban specific types of waste from disposal in solid waste landfills. The plan shall address all sources of waste generation."

SECTION 12a.

G.S. 130A-294 (4)(b) is amended as follows:

"The issuance of permits for sanitary landfills operated by local governments is exempt from the environmental impact statements required by Article 1 of Chapter 113A of the General Statutes, entitled the North Carolina Environmental Policy Act of 1971 unless the sanitary landfill will exceed any of the following thresholds:

1.The landfill will receive more than 300,000 tons of solid waste per year.
2. The landfill will have the capacity to dispose of more than 15,000,000 cubic yards of solid waste.
3. The landfill has a proposed service area equal to or greater than a 100 mile radius.

All sanitary landfill permits issued to local governments prior to July 1, 1984, are hereby validated notwithstanding any failure to provide environmental impact statements pursuant to the North Carolina Environmental Policy Act of 1971;"

Section 12b Note: should apply to pending applications.

G.S. 130A-294 is amended by adding a new subsection to read:

" ( ) An applicant for a permit to construct a sanitary landfill shall conduct a study of environmental impacts if the landfill will exceed any of the following thresholds:

1. The landfill will receive more than 300,000 tons of solid waste per year.
2. The landfill will have the capacity to dispose of more than 15,000,000 cubic yards of solid waste.
3. The landfill will have a proposed service area equal to or greater than a 100 mile radius.

The study of environmental impacts shall meet all of the requirements for an environmental impact statement under G.S. 113A-4 and rules adopted by the Department of Administration to implement the statute. In addition to information required for an adequate environmental impact statement under G.S. 113A-4 , the study shall address: the need for additional waste disposal capacity; consistency with North Carolina's solid waste management plan; the applicant's ability to ensure compliance with state law affecting

olid waste disposal (including bans on disposal of certain types of waste in landfills); and an alternative sites nalysis. The Department shall publish notice of the draft environmental impact statement and shall hold a public hearing in the county where the landfill will be located no sooner than 30 days following the public notice. The Department shall consider the study of environmental impacts and mitigation measures proposed by the applicant in making the decision to issue or deny a permit."

SECTION 13. Amendments to Franchise Authority
Hold for language

SECTION 14 Denial of Permits for Solid Waste Facilities
G.S. 130A-294 is amended by addition of a new subsection to read:
"( ) The Department shall deny an application for a permit for a solid waste facility upon finding:
(1) That construction or operation of the facility will violate water quality standards for groundwater or surface waters, including wetlands, adopted by the Environmental Management Commission.
(2) That construction or operation of the facility will result in loss or significant reduction of continued long-range productivity that would jeopardize a renewable resource of more than local concern, including but not limited to watersheds or aquifers that are sources of public water supply.
(3) That construction or operation of the facility will result in significant damage to fragile or historic areas and other areas containing environmental or natural resources of more than local significance. These areas include, but are not limited to national or State parks or forests; wilderness areas; historic sites; recreation areas; segments of the natural and scenic rivers system; wildlife refuges, preserves and management areas; reas that provide habitat for threatened or endangered species; primary nursery areas and critical fisheries abitat designated by the Marine Fisheries Commission; and Outstanding Resource Waters designated by the Environmental Management Commission.
(4) That construction or operation of the facility will jeopardize public rights to access or use public trust waters.
(5) That the facility will be located in a natural hazard area, such as a floodplain or an area subject to excessive seismic activity, such that the facility will present a risk to public health or safety.
(6) In any case, that the proposed facility is inconsistent with rules adopted by the Commission for Health Services.
(7) In any case, that the proposed facility is inconsistent with ordinances adopted by the local government that has planning jurisdiction over the site of the proposed facility.
(8) In any case, that considering engineering requirements and all economic costs there is a practicable alternative that would accomplish the overall project purposes with less adverse impact on public resources.
(9) In any case, that the proposed development would contribute to cumulative effects that would be inconsistent with the guidelines set forth in subdivisions (1) through (5) of this subsection. Cumulative effects are impacts attributable to the collective effects of a number of projects and include the effects of additional projects similar to the
requested permit in areas available for development in the vicinity."

SECTION 15 Permit fees.
Article 9 of Chapter 130A of the General Statutes is amended by adding a new section to read:
"**§ 130A-293.1. Fees applicable to permits for solid waste management facilities.**
(a) It is the intent of the General Assembly that the fees collected pursuant to this section shall be used to support the Department's solid waste management program.

(b) The Solid Waste Management Account is established as a non-reverting account within the Department. All fees collected under this section shall be credited to the Account and shall be used for personnel and other resources necessary to do any one or more of the following:

(1) Provide a high level of professional review of permit applications for solid waste landfills and other solid waste management facilities;

(2) Provide timely review of permit applications;

(3) Improve monitoring of solid waste management facilities;

(4) Increase compliance activities related to solid waste management facilities; and

(5) Review and update rules governing the construction and operation of solid waste landfills to recognizing advances in technology and research to better protect public health and the environment.

(c) Applicants for permits shall pay an application fee according to the following schedule:

(1) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$25,000

(2) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$15,000

(3) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(4) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $50,000

(5) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $30,000

(6) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Modification - $3,000

(7) Construction and Demolition Landfill accepting less than 100,000 tons/year of solid wasteNew Permit-$15,000

(8) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(9) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(10) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $30,000

(11) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $18,500

(12) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Modification - $2,500

(13) Industrial Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$15,000

(14) Industrial Landfill accepting less than 100,000 tons/year of solid waste-Amendment - $9,000

(15) Industrial Landfill accepting less than 100,000 tons/year of solid waste Modification - $1,500

(16) Industrial Landfill accepting 100,000 tons/year or more of solid waste New Permit - $30,000

(17) Industrial Landfill accepting 100,000 tons/year or more of solid waste Amendment - $18,500

(18) Industrial Landfill accepting 100,000 tons/year or more of solid waste Modification - $2,500

(19) Tire Monofill New Permit - $1,750

(20) Tire Monofill Amendment - $1,250

(21) Tire Monofill Modification - $500

(22) Treatment and Processing New Permit - $1,750

(23) Treatment and Processing Amendment $1,250

(24) Treatment and Processing Modification $500

(25) Transfer Stations New Permit - $5,000

(26) Transfer Stations Amendment - $3,000

(27) Transfer Station Modification - $500

(28) Incinerator New Permit - $1,750

(29) Incinerator Amendment - $1,250

(30) Incinerator Modification - $500

(31) Large Compost Facility New Permit - $1,750

(32) Large Compost Facility Amendment - $1,250

(33) Large Compost Facility Modification - $500

(34) Land Clearing and Inert New Permit - $1,000

(35) Land Clearing and Inert Amendment - $500

(36) Land Clearing and Inert Modification -$250

(d) The application permit fee under this section shall be paid upon submission of the permit application.

(e) A permitted solid waste management facility shall pay an annual permit fee on or before August 1 of each year according to the following schedule:

1. Municipal Solid Waste Landfill $3,500
2. Post Closure Municipal Solid Waste Landfill $1,000
3. Construction and Demolition Landfill $2,750
4. Post Closure Construction and Demolition Landfill $500
5. Industrial Landfill $2750
6.. Post Closure Industrial Landfill $500
7. Transfer Station $750
8. Treatment and Processing Facility $500
9. Tire Monofill $500
10. Incinerators $500
11. Large Compost Facility $500
12. Land Clearing and Inert Debris Landfill $500

(f) As used in this section, the following definitions apply:

(1) 'New permit' means all of the following:

a. An application for a new solid waste management facility not previously permitted by the Department. It includes one site suitability review, the initial permit to construct and one permit to operate the constructed portion of a phase included in the permit to construct.

b. An application that proposes to expand the boundary of a permitted waste management facility for the purpose of expanding the permitted activity.

c. Any application that includes a proposed expansion to the boundary of a waste disposal unit within an existing permitted solid waste management facility.

d. An application for a substantial amendment to a solid waste permit, as defined in G.S. 130A 294(b1).

(2) 'Permit amendment' means all of the following:

a. An application for a permit to construct and one permit to operate for the second and subsequent phases of landfill development depicted in the approved facility plan for an existing solid waste management permit.

b. An application for a renewal or a permit review every five years after issuance of the existing solid waste management facility permit, as required by rule.

c. Any application that proposes a change in ownership or corporate structure of a permitted solid waste management facility

(3) 'Permit modification' means all of the following:

a. an application for any change to the plans approved in the existing permit for a solid waste management facility that does not constitute a 'permit amendment' or a 'new permit'."

b. a second or subsequent permit to operate for a constructed portion of a phase included in the permit to construct.

SECTION 16. Waste disposal surcharge.

[Note: DWM proposed to recodify an existing definition of "parent" and then insert the new definition of "orphan landfill" where the definition of "parent" now appears to keep the terms being defined in alphabetical order. I don't know whether that works or not as a matter of legislative drafting.]

G.S. 130A-290(a)(21a) is recodified as G.S. 130A-290(a)(21b).

SECTION 17.

G.S. 130A-290(a)(21a) is amended to read:

"(21a) Orphan landfill' means any area, whether publicly or privately owned, that was operated as a landfill for the disposal of municipal solid waste generated by the local citizenry and general public, that ceased to receive any waste after December 31, 1982, and for which assessment and remediation is needed in order to protect public health and the environment, but does not include any landfill used primarily for waste disposal from industrial sources."

SECTION 18.

Part 2A of Article 9 of Chapter 130A of the General Statutes is amended by adding a new section to read:

"§ 130A-309.08A. Solid waste disposal fee; use of proceeds.

(a) Fee Imposed. – A fee of two dollars ($2.00) per ton of waste is imposed on the disposal of municipal solid waste or construction or demolition debris in any landfill permitted pursuant to this Part. A fee of two dollars ($2.00) per ton of waste is imposed on the transfer of solid waste to a transfer station permitted pursuant to this Part for disposal outside the State.

(b) Determination and Payment of Fee. – The owner or operator of each landfill and transfer station permitted pursuant to this Part shall maintain scales, designed to determine waste tonnage, that are approved by the Department of Agriculture and Consumer Services. Each owner or operator shall record waste tonnage at the time the waste is received and calculate and record the fees due under this section for each

quarter of the calendar year on forms approved by the Department. Each owner or operator shall provide the completed forms, report the total number of tons of waste received and pay the fees due for each quarter of the calendar year to the Department no later than the 15th day of the following calendar month. The Department shall credit all fees received pursuant to this section to the Inactive Hazardous Sites Cleanup Fund established by G.S. 130A-310.11.

(c) Use of Proceeds. – The Department shall use the proceeds of the fees imposed by this section for the following purposes:

(1) Assessment and remediation of orphan landfills.

(2) Assessment and remediation of inactive hazardous substance or waste disposal sites for which a private party is or may be responsible if the private party cannot be identified or located or if the private party is unable or refuses to assume responsibility for the assessment or remediation.

(3) Up to fifteen percent (15%) of the proceeds may be used to fund staff to administer contracts for the assessment and remediation of orphan landfills and of inactive hazardous substance or waste disposal sites pursuant to subdivisions (1) and (2) of this subsection.

(4) Up to ten percent (10%) of the proceeds may be used for grants to units of local government to support redevelopment of brownfields.

(5) Up to ten percent (10%) of the proceeds may be used by the Department to provide the State's share of the cost of assessment and remediation of sites in the State that are listed on the federal National Priorities List sites."

SECTION 19.

G.S. 130A-310.6 is amended by adding a new subsection to read:

(c) The Secretary is authorized to develop and implement a remedial action plan for orphan landfills. Environmental and human health risks posed by an orphan landfill may be mitigated using a risk-based approach for assessment and remediation. The Secretary shall not seek cost recovery for work performed under this subsection at orphan landfills from any otherwise potentially responsible party provided that that party cooperates with assessment of the site and implementation of control and mitigation measures at the site, including but not limited to granting access to the site, allowing installation of monitoring wells, allowing installation and maintenance of improvements to the landfill cap, allowing installation of security measures, agreeing to record and implement land use restrictions, and providing access to any records regarding the orphan landfill."

SECTION 20

G.S. 130A-310.11 reads as rewritten:

"§ 130A-310.11. Inactive Hazardous Sites Cleanup Fund created.

(a) There is established under the control and direction of the Department the Inactive Hazardous Sites Cleanup Fund. This fund shall be a revolving fund consisting of any monies appropriated for such purpose by the General Assembly or available to it from grants, taxes, fees and other monies paid to it or recovered by or on behalf of the Department. The Inactive Hazardous Sites Cleanup Fund shall be treated as a nonreverting special trust fund and shall be credited with interest by the State Treasurer pursuant to G.S. 147-69.2 and G.S. 147-69.3.

(b) Funds credited to the Inactive Hazardous Sites Cleanup Fund pursuant to G.S. 130A-309.8A shall be used only as provided in G.S. 130A-309.08A(c)."

SECTION 21. The Health Services Commission may adopt rules to implement this act.

SECTION 22. Section X of this act becomes effective TO BE DETERMINED

Rep. Pryor Allan Gibson, III, Co-Chair
Environmental Review Commission
419A Legislative Office Building
Raleigh, NC 27603-5925

Dear Chairs and Members of the Environmental Review Commission:

Last December, I appeared before the Commission on behalf of the International Brotherhood of Teamsters to explain the significant shortcomings in current financial assurance regulations based upon a lengthy report the Center of a Competitive Waste Industry had previously prepared on the subject for the State of California.

At that time, I explained that the present rules completely fail to cover the risks of corrective action at a municipal solid waste (MSW) landfill in the future. These involve the costs of cleaning up after a site failure, as distinguished from the projected costs to maintain the site after it has closed. The absence of coverage for corrective action means that there is no pre-funding mechanism to address the costs of remediating a major site failure. In the case where the costs are substantial, there would be a very significant possibility that, even though the company remains nominally liable, the costs would ultimately fall to the taxpayer.

The purpose of this letter is to follow up with regard to the current proposal by the Department to require assurance in the amount of no less than $3 million for corrective action. *In summary, the Department's recommendation to the Commission does not begin to address the very significant risks presented by several pending landfill proposals to site landfills in inappropriate coastal areas.*

While the recommendation does not limit the corrective action assurance to $3 million, the process is one in which the applicant is asked to submit its estimate. That is one that will tend to also make that figure become the maximum that will be established in practice. For companies aggressively seek to manage the risks of their business by offloading those risks to others wherever possible. They cannot be expected to go out of their way to fully describe the possible negative consequences to the State from an untoward outcome from those risks. Three million dollars would barely be sufficient to pay for the studies and reviews to determine how to respond to a major catastrophic event.

There are two fundamental concerns with the recommendation that we would like to bring to the Commission's attention. First is the appropriate amount of assurance for corrective action, and the second is the appropriate mechanism to provide that assurance.

The Appropriate Amount of Assurance for Corrective Action

Presently pending are a number of permit applications for MSW, C&D and industrial landfills that are both in estuary areas in which the water table is at or near the surface, and also in coastal regions subject to hurricane force storms. Compounding the enormous challenges posed by such unheard of siting criteria, some applicants are also proposing to make them worse by also either recirculating leachate or adding outside liquids to the waste mass, which may be several hundred feet high and encompass a volume greater than 100 football stadiums. This would increase moisture levels in the trash to approximately 45-65%, which is the consistency of wetlands, albeit in this case consisting of solid waste, including their hazardous constituents. That is to say, they want to build a massive marsh-like mountain of garbage, in a wetlands area, subject to violent storms.

You would be well put to bring before you unconflicted engineers to explain to you the implications that these unprecedented conditions create before you allow any further administrative action on these applications. For you may want to reject these applications from being considered for approval in the first instance. But, short of that, you would be well advised to insure that the risk has been fully managed by establishing essential financial assurances in order to protect your constituents from having to bail out such a reckless gamble.

Remember that even most landfills without these special challenges pose substantial risks. This is because, as documented in our report that we distributed to the Commission members earlier, the entire liner-based design for so-called dry tomb landfills, which were devised in the 1980s, are fatally flawed because, as the Environmental Protection Agency itself has stated, all of

the barriers "will ultimately fail," thereby only delaying but not preventing pollution.

Moreover, in the mid-1990s, without ever validating the major change, the landfill industry dramatically scaled up the size of their facilities by approximately 100 times, creating mega-sized landfills that are too big to fix and susceptible to catastrophic landslides, which have a far greater magnitude of cleanup costs than anything that has occurred before.

Now, these enormous site specific and operational risks on the coast are being added to the inherent infirmities in landfill design. Clearly, there is a non-trivial possibility that the entire experiment will fail catastrophically and be discredited, something that could also potentially impact all landfills similarly situated to the one that failed. This reality should shape the contours of legislation needed.

At a minimum, we would suggest, the legislation should direct the Department to:

1. Demarcate the sensitive coastal region where the water table is at or near the surface and are reached by storm surges.

2. Estimate the maximum costs of excavating, shipping and re-interring the wastes to safer sites inland.

3. Estimate the maximum costs of restoring the environment from a waste spill that could occur in operation or after closure in the event the designed barriers failed during a storm event.

Landfills in that demarcated coastal region should be required, as a function of their maximum total size, to show financial assurance in the amount the Department finds for moving the wastes safely inland and cleaning up a spill.

The Appropriate Mechanism for Financial Assurance for Corrective Action

Along with the *amount* for corrective action, it is also necessary to specify the appropriate *mechanisms* to make the required showing.

First, the landfill companies ought to be encouraged to work with the various risk management agents, to create an insurance-like mechanism, which do not presently exist in the market, to provide assurance at the least cost, as an alternative to bonding mechanisms, which will be the most expensive means of meeting these requirements.

The advantage of developing insurance-like instruments is that the costs of coverage will be minimal if the risks of the covered event occurring are, in fact, non-existent, as the landfill industry will argue. For apart from transaction fees, the premiums are essentially the amount of the coverage multiplied by the probability of the covered event.

If, on the other hand, the costs that the risk management industry put forward are very large, that means the risks are very significant, and that is something the State will want to know now, not later when it is too late. It would be wholly imprudent and irresponsible to rely upon the waste industry's self-interested representations, because the industry exists in a zero sum relationship with the State.

The legislation should specify that the coverage should meet the following minimum criteria. It should be provided by a financially sound counter-party, such as Best A+ for insurance companies, it should be actuarially calculated today based upon the long term risk so that the cost of premiums in the future will not rise by more than normal adjustments for inflation, and shall be renewable for not less than 100 years. In addition, diversifying risk further by such techniques as reinsurance should be encouraged.

Second, in the event that risk management instruments are not used, two of the presently allowed mechanisms should not be allowed. These are the financial means test, which is not much more than a corporate IOU, and captive insurance, which, again, is another form of self-insurance providing no diversification.

If you chose to follow these policy recommendations, we would be more than pleased to work with the Department to develop statutory language.

•

Presumably, you will hear testimony from the waste industry assuring you that there is no need to harbor any concerns, nonetheless to take any concerted action to protect the State's taxpayers, because their projects on the coast are perfectly safe.

As you listen to that testimony you may find it useful to turn to the Epilogue to the *Day of Reckoning* report that we previously provided to you that describes how South Carolina accepted unsupported assurances by a waste company in lieu of a bond. Rather than posting a large bond for the threat its Pinewood landfill posed to Lake Marion, a major source of drinking water for the coastal population, as demanded by the Department of Health and Environmental Control (DHEC), Laidlaw spent $250,000 lobbying. In this way, it secured and got three new appointees to the agency's Board, which allowed a corporate IOU to be posted instead of cash.

Not long after, Laidlaw went bankrupt, leaving almost the entire cleanup costs, estimated to be a billion dollars, for the State to pay. Only then did the new appointees understand what they had done and express their regrets:

> "Some of these things you just want to put out of your mind," Richard Jabbour reflected recently, recalling the financial fallout from the Pinewood landfill. "This," he exclaimed, "is one of them."

"We felt surely they would never go bankrupt," remembered Roger Leaks, who had been one of those new Board members appointed to remove the bonding requirement. "Maybe," he now wonders, "we should have held out for cash."

"The costs could be astronomical," fretted Sandra Molander, another former state environmental board member. "I'm sure there's not enough money there," she said.

We should learn from, and act upon, the lessons to be learned from South Carolina, and not repeat the mistakes from the past.

Sincerely,

Peter Anderson

Peter Anderson

BILL DRAFT 2007-RIxz-4 [v.8] (01/30)

(THIS IS A DRAFT AND IS NOT READY FOR INTRODUCTION)
3/13/2007 11:04:42 AM

Short Title: Cleanup of Abandoned Manufactured Homes. (Public)

Sponsors: .

Referred to:

A BILL TO BE ENTITLED

AN ACT TO PROTECT PUBLIC HEALTH AND THE ENVIRONMENT BY ENCOURAGING COUNTIES TO DEVELOP PLANS THAT PROVIDE FOR THE DECONSTRUCTION OF ABANDONED MANUFACTURED HOMES AND THE REMOVAL OF REUSABLE OR RECYCLABLE COMPONENTS, BY PROVIDING FOR THE ABATEMENT OF ABANDONED MANUFACTURED HOMES THAT ARE DETERMINED TO BE A NUISANCE, AND BY IMPOSING AN ENVIRONMENTAL REMEDIATION TAX ON THE SALE OF NEW AND USED MANUFACTURED HOMES TO ENSURE THAT FUNDS WILL BE AVAILABLE FOR THE DECONSTRUCTION OF ABANDONED MANUFACTURED HOMES, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION.

The General Assembly of North Carolina enacts:

SECTION 1. Article 9 of Chapter 130A of the General Statutes is amended by adding a new Part to read:

"Part 2E. Management of Abandoned Manufactured Homes.

"**§ 130A-309.90. Findings; purpose.**

(a) The General Assembly finds that:

(1) The number of manufactured homes in North Carolina has risen dramatically as land has become scarce and the housing market has become more expensive.

(2) Manufactured homes may be difficult and expensive to repair when they begin to deteriorate. Often consumers simply buy another manufactured home unit rather than refurbish a manufactured home that needs repair.

(3) According to data obtained through the 2000 United States Census, there are more than 80,000 vacant manufactured homes in North

Carolina, of which 40,000 are estimated to be permanently untended or in need of extensive repair.

(4) Abandoned manufactured homes create public health and environmental problems and are a visual blight on the landscape of North Carolina. Further, an abandoned manufactured home poses a fire hazard, a safety hazard to unsupervised children, and is a potential source of toxic or hazardous materials that may escape into the environment. As a result, abandoned manufactured homes constitute a nuisance.

(5) Most landfills will not accept intact manufactured homes due to their bulky nature. In those instances where landfills do accept intact manufactured homes for disposal, the cost of disposal can be prohibitive for many manufactured homeowners. Landfill disposal costs include tipping fees, the costs of transporting the obsolete structures to the landfill, and the costs of removing any hazardous materials, such as asbestos and other harmful chemicals.

(6) Many components of manufactured homes can be reused or recycled, including windows, screens, doors, copper tubing, copper wiring, aluminum, tin, steel, lumber, steel frames, pipes, countertops, cabinets, and other appliances and fixtures. It is estimated that twenty-six percent (26%) to thirty-eight percent (38%) of the components of a manufactured home can be reused or recycled without extensive manual labor.

(7) It is desirable to allow units of local government to manage the disposal of abandoned manufactured homes for themselves and to encourage regional approaches to the deconstruction of abandoned manufactured homes, the removal of components from abandoned manufactured homes that are reusable or recyclable, and the proper disposal of the remainder.

(8) It is in the State's best interest to encourage the reduction of the volume of intact manufactured homes being disposed of at public sanitary landfills, to encourage the deconstruction of abandoned manufactured homes, the removal of components from abandoned manufactured homes that are reusable or recyclable, and to encourage the proper disposal of the remainder.

(b) The purpose of this Part is to provide units of local government with the authority, funding, and guidance needed to provide for the efficient and proper identification, deconstruction, recycling, and disposal of abandoned manufactured homes in this State.

"**§ 130A-309.91. Definitions.**

The following definitions apply to this Part:

(1) 'Abandoned manufactured home' means a manufactured home that is both:

a. Vacant or in need of extensive repair.

b. An unreasonable danger to public health, safety, welfare or the environment.

(2) 'Account' means the Manufactured Homes Management Account established pursuant to G.S. 130A-309.94.

(3) 'Intact' when used in connection with 'abandoned manufactured home' means an abandoned manufactured home from which the wheels and axels, white goods, and recyclable materials have not been removed.

(4) 'Manufactured home' is defined in G.S. 105-187.60.

(5) 'Responsible party' means any person or entity that possesses an ownership interest in an abandoned manufactured home.

"**§ 130A-309.92. Management of abandoned manufactured homes.**

(a) Plan. – Each county shall consider whether to implement a program for the management of abandoned manufactured homes. If, after consideration, the county decides not to implement a program, the county must state in the comprehensive solid waste management plan that it is required to develop under G.S. 130A-309.09A(b) that the county considered whether to implement a program for the management of abandoned manufactured homes and decided not to do so. A county may, at any time, reconsider its decision not to implement a program for the management of abandoned manufactured homes. If the county decides to implement a program, the county shall develop a written plan for the management of abandoned manufactured homes and include the plan as a component of the comprehensive solid waste management plan it is required to develop under G.S. 130A-309.09A(b). At a minimum, the plan shall include:

(1) A method by which the county proposes to identify abandoned manufactured homes in the county, including, without limitation, a process by which a manufactured home owner or other responsible party may request designation of their home as an abandoned manufactured home.

(2) A plan for the deconstruction of these abandoned manufactured homes.

(3) A plan for the removal of the components thereof for reuse or recycling, as appropriate.

(4) A plan for the proper disposal of abandoned manufactured homes that are not deconstructed under subdivision (2) of this subsection.

(b) Authority to Contract. – A county may contract with another unit of local government or a private entity in accordance with Article 15 of Chapter 153A of the General Statutes to provide for the management of abandoned manufactured homes within the county and the implementation of its plan under subsection (a) of this section.

(c) Restrictions. – A county or a party that contracted with the county under subsection (b) of this section shall not charge a disposal fee for the disposal of any abandoned manufactured home sold on or after 1 January 2008.

(d) An intact abandoned manufactured home shall not be disposed of in a landfill.

"**§ 130A-309.93. Process for the disposal of abandoned manufactured homes.**

(a) If a county adopts and implements a plan for the management of abandoned manufactured homes pursuant to this Part, the county shall notify the responsible party for each identified abandoned manufactured home in the county that the abandoned manufactured home must be properly disposed of by that person within 90 days. The notice shall be in writing and shall be served on the person as provided by Rule 4(j) of the Rules of Civil Procedure, G.S. 1A-1. The notice shall disclose the basis for the action, and advise that a hearing will be held before a designated public officer at a place within the county in which the manufactured home is located fixed not less than 10 days nor more than 30 days after the serving of the notice; that the responsible party shall be given the right to file an answer to the order and to appear in person, or otherwise, and give testimony at the place and time fixed in the notice; and that the rules of evidence prevailing in courts of law or equity shall not be controlling in hearings before the public officer.

(b) If, after notice and hearing, the public officer determines that the manufactured home under consideration is abandoned, the officer shall state in writing his findings of fact in support of that determination and the county shall order the person to dispose of the abandoned manufactured home within 90 days of the expiration of this period. If the responsible party fails to comply with this order, the county shall take any action it deems reasonably necessary to dispose of the abandoned manufactured home, including entering the property where the abandoned manufactured home is located and arranging to have the abandoned manufactured home deconstructed and disposed of in a manner consistent with the plan developed under G.S. 130A-309.92(a). If the responsible party is not the owner of the property on which the abandoned manufactured home is located, the county may order the property owner to permit entry onto the owner's property by an appropriate party to permit the removal and proper disposal of the abandoned manufactured home.

(c) When a county removes, deconstructs, and disposes of an abandoned manufactured home pursuant to subsection (a) of this section, whether directly or through a party that contracted with the county, the responsible party or the owner of the property on whose land an abandoned manufactured home is located shall be joint and severally liable for the actual costs incurred by the county, directly or indirectly, for its abatement activities and its administrative and legal expenses incurred, less the amount of grants for reimbursement received by the county under G.S. 130A-309.94(c) for the disposal activities for that manufactured home. The county may initiate a civil action to recover these unpaid costs from the responsible party or the owner of the property on whose land an abandoned manufactured home is located. Nonpayment of any portion of the actual costs incurred by the county shall result in the imposition of a lien on any real property in the county owned by the responsible party, or the owner of the property on whose land the abandoned manufactured home is located.

(d) This section does not apply to any of the following:

(1) A retail business premises where manufactured homes are sold.

(2) A solid waste disposal facility where no more than 10 manufactured homes are stored at one time if all of the manufactured homes received

for storage are deconstructed or removed from the facility within one year after receipt.

(e) This section does not change the existing authority of a county or a municipality to enforce any existing laws or of any person to abate a nuisance.

"**§ 130A-309.94. Manufactured Homes Management Account.**

(a) The Manufactured Homes Management Account is established within the Department. The Account is nonreverting and consists of revenue credited to the Account from the proceeds of the manufactured home environmental remediation tax imposed by G.S. 105-187.61. Funds in the Account may be used to:

(1) Provide grants to counties to reimburse their expenses for activities under this Part.

(2) Provide technical assistance and support to counties to achieve the purposes of this Part.

(3) Implement this Part, including costs associated with staffing, training, submitting reports, and fulfilling program goals.

(b) Each county that requests a reimbursement grant from the Account shall also submit to the Department a proposed budget specifying in detail the expenses it expects to incur in a specified time period in connection with the activities under this Part. The Department shall review each submitted budget and make modifications, if necessary, in light of the availability of funds in the Account, the county's capacity to effectively and efficiently manage the abatement of abandoned manufactured homes, and any other factors that the Department reasonably determines are relevant. When the Department and a county agree on the amount of the county's budget under this subsection, the Department and the county shall execute an agreement that reflects this amount and that specifies the time period covered by the agreement, and the Department shall reserve funds for the county in the amount necessary to reimburse allowable costs. The amount of a reimbursement grant shall be calculated in accordance with subsections (c) and (d) of this section. A county shall not receive a reimbursement grant unless it has filed all the annual reports it is required to submit under G.S. 130A-309.96.

(c) Reimbursement grants from the Account shall be made in accordance with the terms of the grant agreement developed pursuant to subsection (b) of this section, but in any event, all reimbursements shall be calculated on a per unit basis and based on the actual cost of such activities, not to exceed one thousand dollars ($1,000.00) for each unit. For a county designated as an enterprise tier one, two, or three area pursuant to G.S. 105-129.3 where the costs associated with the disposition of an abandoned manufactured home in a manner consistent with this part exceed one thousand dollars ($1,000) per unit, a county may request a supplemental grant in an amount equal to fifty percent (50%) of the amount in excess of one thousand dollars ($1,000). The Department shall consider the efficiency and effectiveness of the county program in making the supplemental grant, and the county participation must be a cash match.

(d) A county shall use reimbursement grant funds only for operating expenses that are directly related to the management of abandoned manufactured homes. If an operating expense is partially related to the management of abandoned manufactured homes, a county may use the reimbursement grant funds to finance the percentage of the

cost that equals the percentage of the expense that is directly related to the management of abandoned manufactured homes.

"**§ 130A-309.95. Authority to adopt ordinances.**

A county, or a unit of local government that is delegated authority to do so by the county, may adopt ordinances it deems necessary in order to implement this Part.

"**§ 130A-309.96. Reporting on the management of abandoned manufactured homes.**

(a) On or before 1 August of each year, any county that receives a reimbursement grant under G.S. 130A-309.94 shall submit a report to the Department that includes all of the following information:

(1) The number of units and approximate tonnage of abandoned manufactured homes removed, deconstructed, recycled, and disposed of during the previous fiscal year.

(2) A detailed statement of the county's abandoned manufactured homes account receipts and disbursements during the previous fiscal year that sets out the source of all receipts and the purpose of all disbursements.

(3) The obligated and unobligated balances in the county's abandoned manufactured homes account at the end of the fiscal year.

(4) An assessment of the county's progress in removing, deconstructing, recycling, and disposing of abandoned manufactured homes consistent with this Part.

(b) The Department shall include in its annual report to the Environmental Review Commission under G.S. 130A-309.06(c) a description of the management of abandoned manufactured homes in the State for the fiscal year ending the preceding 30 June. The description of the management of abandoned manufactured homes shall include all of the following information:

(1) The amount of taxes collected and distributed under G.S. 105-187.64 during the reporting period.

(2) The cost to each county of managing its abandoned manufactured home program during the reporting period.

(3) The beginning and ending balances of the Account for the reporting period and a list of grants made from the Account for the period, itemized by county.

(4) A summary of the information contained in the reports submitted by counties pursuant to subsection (a) of this section.

(5) Any other information the Department considers helpful in understanding the problem of managing abandoned manufactured homes in the State.

"**§ 130A-309.97. Effect on local ordinances.**

This Part shall not be construed to limit the authority of counties under Article 18 of Chapter 153A of the General Statutes or the authority of cities under Article 19 of Chapter 160A of the General Statutes."

SECTION 2. G.S. 130A-309.06(c) is amended by adding a new subdivision to read:

"(14) A description of the activities related to the management of abandoned manufactured homes in the State in accordance with G.S. 130A-309.96, the beginning and ending balances in the Manufactured Homes Management Account for the reporting period, the amount credited to the Manufactured Homes Management Account during the reporting period, and the amount of revenue used, itemized by county, for grants made under Part 2E of Article 9 of Chapter 130A of the General Statutes."

SECTION 3. G.S. 130A-309.09A(b) is amended by adding a new subdivision to read:

"(9) Include as a component a written plan for the management of abandoned manufactured homes as required under G.S. 130A-309.92(a)."

SECTION 4. Chapter 105 of the General Statutes is amended by adding a new Article to read:

"Article 5G.

"Manufactured Home Environmental Remediation Tax.

"**§ 105-187.60. Definitions.**

The definitions in G.S. 105-164.3 apply to this Article, except that the term 'sale' does not include lease or rental. 'Manufactured home' is defined in G.S. 105-164.3(20). Manufactured home also means any structure that otherwise satisfies the definition in G.S. 105-164.3(20) but that, although designed for use as a dwelling, is in fact used for commercial or other nonresidential purposes, and that may or may not be placed on a permanent foundation at the time of sale.

"**§ 105-187.61. Tax imposed.**

(a) A privilege tax is imposed on a manufactured home retailer at a flat rate for each new manufactured home sold by the retailer and for each used manufactured home sold by the retailer. An excise tax is imposed on each new manufactured home and on each used manufactured home purchased outside the State for storage, use, or consumption in this State. These taxes are in addition to all other taxes. The rate of the privilege tax and the excise tax is as follows:

(1) For each new or used singlewide manufactured home, three hundred dollars ($300.00).

(2) For each new or used multi-section manufactured home, three hundred dollars ($300.00) for each section of the manufactured home.

(b) The tax imposed by this Article shall only be paid once on each manufactured home throughout the useful life of the manufactured home.

"**§ 105-187.62. Administration.**

(a) The privilege tax this Article imposes on a manufactured home retailer who sells new or used manufactured homes at retail is an additional State sales tax, and the excise tax this Article imposes on the storage, use, or consumption of a new or used manufactured home in this State is an additional State use tax. Except as otherwise provided in this Article, these taxes shall be collected and administered in the same manner as the State sales and use taxes imposed by Article 5 of this Chapter. As under

Article 5 of this Chapter, the additional State sales tax paid when a new or used manufactured home is sold is a credit against the additional State use tax imposed on the storage, use, or consumption of the same manufactured home.

(b) The Secretary shall maintain a record of all manufactured homes on which the Manufactured Home Environmental Remediation Tax has been paid, listed by serial number.

"**§ 105-187.63. Exemptions.**

The exemptions in G.S. 105-164.13 and the refunds allowed in G.S. 105-164.14 do not apply to the taxes imposed by this Article.

"**§ 105-187.64. Use of tax proceeds.**

(a) The Secretary shall distribute the taxes collected under this Article, less the Department of Revenue's allowance for cost of collecting the taxes, in accordance with this section. The Secretary may retain the Department of Revenue's cost of collection, not to exceed one hundred thousand dollars ($100,000), as reimbursement to the Department of Revenue.

(b) Each quarter, the Secretary shall credit the net tax proceeds to the Manufactured Homes Management Account. Funds in the Manufactured Homes Management Account may be used only as provided in G.S. 130A-309.94.

"**§ 105-187.65. Proof of payment required to issue permit to manufactured home.**

(a) Retailers of manufactured homes shall provide proof of payment of all taxes due to be paid on a transaction under G.S. 105-187.61 at the time of sale. The proof of payment shall include the name and address of the retailer; the name and address of the owner; the make, model, size, and serial number of the manufactured home; the amount of sale; and the amount of tax due to be paid on the transaction.

(b) In lieu of proof of payment from the retailer pursuant to subsection (a) of this section, a person may obtain a record of payment from information maintained by the Secretary, or a person may pay the amount due to be paid on a transaction under G.S. 105-187.61 to the office of the tax collector for the county in which the manufactured home is to be located. The tax collector shall provide proof of payment to the person making payment. The tax collector shall promptly remit such payments to the Department of Revenue with relevant information concerning the transaction, including: the name and address of the retailer; the name and address of the owner; the make, model, size, and serial number of the manufactured home; the amount of sale; and the amount of tax paid.

(c) The tax collector may retain the county's cost of collection, not to exceed one percent (1%), of the Manufactured Home Environmental Remediation Tax collected by the county, as reimbursement to the county.

(d) The local government having jurisdiction shall not issue any permit to allow occupancy of a manufactured home subject to the tax imposed by this section without proof of payment pursuant to subsections (a) or (b) of this section from the owner of the manufactured home."

SECTION 5. The Department of Environment and Natural Resources may use up to fifty thousand dollars ($50,000) in the Manufactured Homes Management

Account, as established in Section 1 of this act, during each calendar year for the following purposes:

(1) Training and program development across the State

(2) Identification of qualified contractors

(3) Dissemination of best deconstruction practices.

SECTION 6. A county designated as an enterprise tier one, two, or three area pursuant to G.S. 105-129.3 may, upon resolution by the Board of Commissioners of their intent to (i) develop a plan for the management of abandoned manufactured homes and (ii) implement the plan once developed, request a planning grant of up to twenty five hundred dollars ($2,500) from the Manufactured Homes Management Account, as enacted by Section 1 of this act, to assist the county in preparing the plan pursuant to G.S. 130A-309.92 and in to identify abandoned manufactured homes.

SECTION 7. This act becomes effective 1 October 2008 and expires 1 October 2020. Section 4 of this act applies to sales of new or used manufactured homes made on or after that date.

Referred to:

A BILL TO BE ENTITLED

AN ACT TO PROTECT PUBLIC HEALTH AND THE ENVIRONMENT BY ENCOURAGING COUNTIES TO DEVELOP PLANS THAT PROVIDE FOR THE DECONSTRUCTION OF ABANDONED MANUFACTURED HOMES AND THE REMOVAL OF REUSABLE OR RECYCLABLE COMPONENTS, BY PROVIDING FOR THE ABATEMENT OF ABANDONED MANUFACTURED HOMES THAT ARE DETERMINED TO BE A NUISANCE, AND BY IMPOSING A DISPOSAL TAX ON THE SALE OF NEW AND USED MANUFACTURED HOMES TO ENSURE THAT FUNDS WILL BE AVAILABLE FOR THE DECONSTRUCTION OF ABANDONED MANUFACTURED HOMES, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION.

The General Assembly of North Carolina enacts:

SECTION 1. Article 9 of Chapter 130A of the General Statutes is amended by adding a new Part to read:

"Part 2E. Management of Abandoned Manufactured Homes.

"**§ 130A-309.90. Findings; purpose.**

(a) The General Assembly finds that:

(1) The number of manufactured homes in North Carolina has risen dramatically as land has become scarce and the housing market has become more expensive.

(2) Manufactured homes may be difficult and expensive to repair when they begin to deteriorate. Often consumers simply buy another manufactured home unit rather than refurbish a manufactured home that needs repair.

(3) According to data obtained through the 2000 United States Census, there are more than 80,000 vacant manufactured homes in North

Carolina, of which 40,000 are estimated to be permanently untended or in need of extensive repair.

(4) Abandoned manufactured homes create public health and environmental problems and are a visual blight on the landscape of North Carolina. Further, an abandoned manufactured home poses a fire hazard, a safety hazard to unsupervised children, and is a potential source of toxic or hazardous materials that may escape into the environment. As a result, abandoned manufactured homes constitute a nuisance.

(5) Most landfills will not accept intact manufactured homes due to their bulky nature. In those instances where landfills do accept intact manufactured homes for disposal, the cost of disposal can be prohibitive for many manufactured homeowners. Landfill disposal costs include tipping fees, the costs of transporting the obsolete structures to the landfill, and the costs of removing any hazardous materials, such as asbestos and other harmful chemicals.

(6) Many components of manufactured homes can be reused or recycled, including windows, screens, doors, copper tubing, copper wiring, aluminum, tin, steel, lumber, steel frames, pipes, countertops, cabinets, and other appliances and fixtures. It is estimated that twenty-six percent (26%) to thirty-eight percent (38%) of the components of a manufactured home can be reused or recycled without extensive manual labor.

(7) It is desirable to allow units of local government to manage the disposal of abandoned manufactured homes for themselves and to encourage regional approaches to the deconstruction of abandoned manufactured homes, the removal of components from abandoned manufactured homes that are reusable or recyclable, and the proper disposal of the remainder.

(8) It is in the State's best interest to encourage the reduction of the volume of intact manufactured homes being disposed of at public sanitary landfills, to encourage the deconstruction of abandoned manufactured homes, the removal of components from abandoned manufactured homes that are reusable or recyclable, and to encourage the proper disposal of the remainder.

(b) The purpose of this Part is to provide units of local government with the authority, funding, and guidance needed to provide for the efficient and proper identification, deconstruction, recycling, and disposal of abandoned manufactured homes in this State.

"**§ 130A-309.91. Definitions.**

The following definitions apply to this Part:

(1) 'Abandoned manufactured home' means a manufactured home that is both:

a. Vacant or in need of extensive repair.

b. An unreasonable danger to public health, safety, welfare or the environment.

(2) 'Account' means the Manufactured Homes Management Account established pursuant to G.S. 130A-309.94.

(3) 'Intact' when used in connection with 'abandoned manufactured home' means an abandoned manufactured home from which the wheels and axels, white goods, and recyclable materials have not been removed.

(4) 'Manufactured home' is defined in G.S. 105-187.60.

(5) 'Responsible party' means any person or entity that possesses an ownership interest in an abandoned manufactured home.

"**§ 130A-309.92. Management of abandoned manufactured homes.**

(a) Plan. – Each county shall consider whether to implement a program for the management of abandoned manufactured homes. If, after consideration, the county decides not to implement a program, the county must state in the comprehensive solid waste management plan that it is required to develop under G.S. 130A-309.09A(b) that the county considered whether to implement a program for the management of abandoned manufactured homes and decided not to do so. A county may, at any time, reconsider its decision not to implement a program for the management of abandoned manufactured homes. If the county decides to implement a program, the county shall develop a written plan for the management of abandoned manufactured homes and include the plan as a component of the comprehensive solid waste management plan it is required to develop under G.S. 130A-309.09A(b). At a minimum, the plan shall include:

(1) A method by which the county proposes to identify abandoned manufactured homes in the county, including, without limitation, a process by which a manufactured home owner or other responsible party may request designation of their home as an abandoned manufactured home.

(2) A plan for the deconstruction of these abandoned manufactured homes.

(3) A plan for the removal of the components thereof for reuse or recycling, as appropriate.

(4) A plan for the proper disposal of abandoned manufactured homes that are not deconstructed under subdivision (2) of this subsection.

(b) Authority to Contract. – A county may contract with another unit of local government or a private entity in accordance with Article 15 of Chapter 153A of the General Statutes to provide for the management of abandoned manufactured homes within the county and the implementation of its plan under subsection (a) of this section.

(c) Restrictions. – A county or a party that contracted with the county under subsection (b) of this section shall not charge a disposal fee for the disposal of any abandoned manufactured home sold on or after 1 January 2008.

(d) An intact abandoned manufactured home shall not be disposed of in a landfill.

"**§ 130A-309.93. Process for the disposal of abandoned manufactured homes.**

DRAFT FOR REVIEW ONLY

DRAFT FOR REVIEW ONLY

(a) If a county adopts and implements a plan for the management of abandoned manufactured homes pursuant to this Part, the county shall notify the responsible party for each identified abandoned manufactured home in the county that the abandoned manufactured home must be properly disposed of by that person within 90 days. The notice shall be in writing and shall be served on the person as provided by Rule 4(j) of the Rules of Civil Procedure, G.S. 1A-1. The notice shall disclose the basis for the action, and advise that a hearing will be held before a designated public officer at a place within the county in which the manufactured home is located fixed not less than 10 days nor more than 30 days after the serving of the notice; that the responsible party shall be given the right to file an answer to the order and to appear in person, or otherwise, and give testimony at the place and time fixed in the notice; and that the rules of evidence prevailing in courts of law or equity shall not be controlling in hearings before the public officer.

(b) If, after notice and hearing, the public officer determines that the manufactured home under consideration is abandoned, the officer shall state in writing his findings of fact in support of that determination and the county shall order the person to dispose of the abandoned manufactured home within 90 days of the expiration of this period. If the responsible party fails to comply with this order, the county shall take any action it deems reasonably necessary to dispose of the abandoned manufactured home, including entering the property where the abandoned manufactured home is located and arranging to have the abandoned manufactured home deconstructed and disposed of in a manner consistent with the plan developed under G.S. 130A-309.92(a). If the responsible party is not the owner of the property on which the abandoned manufactured home is located, the county may order the property owner to permit entry onto the owner's property by an appropriate party to permit the removal and proper disposal of the abandoned manufactured home.

(c) When a county removes, deconstructs, and disposes of an abandoned manufactured home pursuant to subsection (b) of this section, whether directly or through a party that contracted with the county, the responsible party or the owner of the property on whose land an abandoned manufactured home is located shall be joint and severally liable for the actual costs incurred by the county, directly or indirectly, for its abatement activities and its administrative and legal expenses incurred, less the amount of grants for reimbursement received by the county under G.S. 130A-309.94(c) for the disposal activities for that manufactured home. The county may initiate a civil action to recover these unpaid costs from the responsible party or the owner of the property on whose land an abandoned manufactured home is located. Nonpayment of any portion of the actual costs incurred by the county shall result in the imposition of a lien on any real property in the county owned by the responsible party, or the owner of the property on whose land the abandoned manufactured home is located.

(d) This section does not apply to any of the following:

(1) A retail business premises where manufactured homes are sold.

(2) A solid waste disposal facility where no more than 10 manufactured homes are stored at one time if all of the manufactured homes received

for storage are deconstructed or removed from the facility within one year after receipt.

(e) This section does not change the existing authority of a county or a municipality to enforce any existing laws or of any person to abate a nuisance.

"**§ 130A-309.94. Manufactured Homes Management Account.**

(a) The Manufactured Homes Management Account is established within the Department. The Account is nonreverting and consists of revenue credited to the Account from the proceeds of the manufactured home disposal tax imposed by G.S. 105-187.61. Funds in the Account may be used to:

(1) Provide grants to counties to reimburse their expenses for activities under this Part.

(2) Provide technical assistance and support to counties to achieve the purposes of this Part.

(3) Implement this Part, including costs associated with staffing, training, submitting reports, and fulfilling program goals.

(b) Each county that requests a reimbursement grant from the Account shall also submit to the Department a proposed budget specifying in detail the expenses it expects to incur in a specified time period in connection with the activities under this Part. The Department shall review each submitted budget and make modifications, if necessary, in light of the availability of funds in the Account, the county's capacity to effectively and efficiently manage the abatement of abandoned manufactured homes, and any other factors that the Department reasonably determines are relevant. When the Department and a county agree on the amount of the county's budget under this subsection, the Department and the county shall execute an agreement that reflects this amount and that specifies the time period covered by the agreement, and the Department shall reserve funds for the county in the amount necessary to reimburse allowable costs. The amount of a reimbursement grant shall be calculated in accordance with subsections (c) and (d) of this section. A county shall not receive a reimbursement grant unless it has filed all the annual reports it is required to submit under G.S. 130A-309.96.

(c) Reimbursement grants from the Account shall be made in accordance with the terms of the grant agreement developed pursuant to subsection (b) of this section, but in any event, all reimbursements shall be calculated on a per unit basis and based on the actual cost of such activities, not to exceed one thousand dollars ($1,000.00) for each unit. For a county designated as an enterprise tier one, two, or three area pursuant to G.S. 105-129.3 where the costs associated with the disposition of an abandoned manufactured home in a manner consistent with this part exceed one thousand dollars ($1,000) per unit, a county may request a supplemental grant in an amount equal to fifty percent (50%) of the amount in excess of one thousand dollars ($1,000). The Department shall consider the efficiency and effectiveness of the county program in making the supplemental grant, and the county participation must be a cash match.

(d) A county shall use reimbursement grant funds only for operating expenses that are directly related to the management of abandoned manufactured homes. If an operating expense is partially related to the management of abandoned manufactured homes, a county may use the reimbursement grant funds to finance the percentage of the

cost that equals the percentage of the expense that is directly related to the management of abandoned manufactured homes.

"**§ 130A-309.95. Authority to adopt ordinances.**

A county, or a unit of local government that is delegated authority to do so by the county, may adopt ordinances it deems necessary in order to implement this Part.

"**§ 130A-309.96. Reporting on the management of abandoned manufactured homes.**

(a) On or before 1 August of each year, any county that receives a reimbursement grant under G.S. 130A-309.94 shall submit a report to the Department that includes all of the following information:

(1) The number of units and approximate tonnage of abandoned manufactured homes removed, deconstructed, recycled, and disposed of during the previous fiscal year.

(2) A detailed statement of the county's abandoned manufactured homes account receipts and disbursements during the previous fiscal year that sets out the source of all receipts and the purpose of all disbursements.

(3) The obligated and unobligated balances in the county's abandoned manufactured homes account at the end of the fiscal year.

(4) An assessment of the county's progress in removing, deconstructing, recycling, and disposing of abandoned manufactured homes consistent with this Part.

(b) The Department shall include in its annual report to the Environmental Review Commission under G.S. 130A-309.06(c) a description of the management of abandoned manufactured homes in the State for the fiscal year ending the preceding 30 June. The description of the management of abandoned manufactured homes shall include all of the following information:

(1) The amount of taxes collected and distributed under G.S. 105-187.64 during the reporting period.

(2) The cost to each county of managing its abandoned manufactured home program during the reporting period.

(3) The beginning and ending balances of the Account for the reporting period and a list of grants made from the Account for the period, itemized by county.

(4) A summary of the information contained in the reports submitted by counties pursuant to subsection (a) of this section.

(5) Any other information the Department considers helpful in understanding the problem of managing abandoned manufactured homes in the State.

"**§ 130A-309.97. Effect on local ordinances.**

This Part shall not be construed to limit the authority of counties under Article 18 of Chapter 153A of the General Statutes or the authority of cities under Article 19 of Chapter 160A of the General Statutes."

SECTION 2. G.S. 130A-309.06(c) is amended by adding a new subdivision to read:

"(14) A description of the activities related to the management of abandoned manufactured homes in the State in accordance with G.S. 130A-309.96, the beginning and ending balances in the Manufactured Homes Management Account for the reporting period, the amount credited to the Manufactured Homes Management Account during the reporting period, and the amount of revenue used, itemized by county, for grants made under Part 2E of Article 9 of Chapter 130A of the General Statutes."

SECTION 3. G.S. 130A-309.09A(b) is amended by adding a new subdivision to read:

"(9) Include as a component a written plan for the management of abandoned manufactured homes as required under G.S. 130A-309.92(a)."

SECTION 4. Chapter 105 of the General Statutes is amended by adding a new Article to read:

"Article 5G.

"Manufactured Home Disposal Tax.

"**§ 105-187.60. Definitions.**

The definitions in G.S. 105-164.3 apply to this Article, except that the term 'sale' does not include lease or rental. 'Manufactured home' is defined in G.S. 105-164.3(20). Manufactured home also means any structure that otherwise satisfies the definition in G.S. 105-164.3(20) but that, although designed for use as a dwelling, is in fact used for commercial or other nonresidential purposes, and that may or may not be placed on a permanent foundation at the time of sale.

"**§ 105-187.61. Tax imposed.**

(a) A privilege tax is imposed on a manufactured home retailer at a flat rate for each new manufactured home sold by the retailer and for each used manufactured home sold by the retailer. An excise tax is imposed on each new manufactured home and on each used manufactured home purchased outside the State for storage, use, or consumption in this State. These taxes are in addition to all other taxes. The rate of the privilege tax and the excise tax is as follows:

(1) For each new or used singlewide manufactured home, three hundred dollars ($300.00).

(2) For each new or used multi-section manufactured home, three hundred dollars ($300.00) for each section of the manufactured home.

(b) The tax imposed by this Article shall only be paid once on each manufactured home throughout the useful life of the manufactured home.

"**§ 105-187.62. Administration.**

(a) The privilege tax this Article imposes on a manufactured home retailer who sells new or used manufactured homes at retail is an additional State sales tax, and the excise tax this Article imposes on the storage, use, or consumption of a new or used manufactured home in this State is an additional State use tax. Except as otherwise provided in this Article, these taxes shall be collected and administered in the same manner as the State sales and use taxes imposed by Article 5 of this Chapter. As under

Article 5 of this Chapter, the additional State sales tax paid when a new or used manufactured home is sold is a credit against the additional State use tax imposed on the storage, use, or consumption of the same manufactured home.

(b) The Secretary shall maintain a record of all manufactured homes on which the Manufactured Home Disposal Tax has been paid, listed by serial number.

"**§ 105-187.63. Exemptions.**

The exemptions in G.S. 105-164.13 and the refunds allowed in G.S. 105-164.14 do not apply to the taxes imposed by this Article.

"**§ 105-187.64. Use of tax proceeds.**

(a) The Secretary shall distribute the taxes collected under this Article, less the Department of Revenue's allowance for cost of collecting the taxes, in accordance with this section. The Secretary may retain the Department of Revenue's cost of collection, not to exceed one hundred thousand dollars ($100,000), as reimbursement to the Department of Revenue.

(b) Each quarter, the Secretary shall credit the net tax proceeds to the Manufactured Homes Management Account. Funds in the Manufactured Homes Management Account may be used only as provided in G.S. 130A-309.94.

SECTION 5. The Department of Environment and Natural Resources may use up to fifty thousand dollars ($50,000) in the Manufactured Homes Management Account, as established in Section 1 of this act, during each calendar year for the following purposes:

(1) Training and program development across the State

(2) Identification of qualified contractors

(3) Dissemination of best deconstruction practices.

SECTION 6. A county designated as an enterprise tier one, two, or three area pursuant to G.S. 105-129.3 may, upon resolution by the Board of Commissioners of their intent to (i) develop a plan for the management of abandoned manufactured homes and (ii) implement the plan once developed, request a planning grant of up to twenty five hundred dollars ($2,500) from the Manufactured Homes Management Account, as enacted by Section 1 of this act, to assist the county in preparing the plan pursuant to G.S. 130A-309.92 and in to identify abandoned manufactured homes.

SECTION 7. This act becomes effective 1 October 2008 and expires 1 October 2020. Section 4 of this act applies to sales of new or used manufactured homes made on or after that date.

A BILL TO BE ENTITLED

AN ACT TO AMEND CERTAIN ENVIRONMENTAL LAWS TO PROVIDE THAT AN APPLICATION FOR A CONSTRUCTION PERMIT FOR A PRIVATE DRINKING WATER WELL THAT IS TO BE LOCATED ON A SITE ON WHICH A WASTEWATER SYSTEM IS LOCATED MAY BE ACCOMPANIED BY A SITE PLAN RATHER THAN A PLAT AND TO PROVIDE THAT PROOF OF COMPLETION OF ANY REQUIRED PROFESSIONAL DEVELOP IS REQUIRED FOR RENEWAL OF A WELL CONTRACTOR CERTIFICATE, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION:

The General Assembly of North Carolina enacts:

SECTION 1. G.S. 87-97 (d) reads as rewritten:

"(d) Well Site Evaluation. – The local health department shall conduct a field investigation to evaluate the site on which a private drinking water well is proposed to be located before issuing a permit pursuant to this section. The field investigation shall determine whether there is any abandoned well located on the site, and if so, the construction permit shall be conditioned upon the proper closure of all abandoned wells located on the site in accordance with the requirements of this Article and rules adopted pursuant to this Article. If a private drinking water well is proposed to be located on a site on which a wastewater system subject to the requirements of Article 11 of Chapter 130A of the General Statutes is located or proposed to be located, the application for a construction permit shall be accompanied by a ~~plat,~~ plat or site plan, as defined in G.S. 130A-334."

SECTION 2. G.S. 87-98.7(b) reads as rewritten:

"(b) Renewal. – A certificate shall be renewed annually by payment of the annual fee and proof that the applicant has completed any professional development hours as may be required by the rules of the Commission. A person who fails to renew a

certificate within 30 days of the expiration of the certificate must reapply for certification under this Article."

SECTION 3. This act is effective when it becomes law.

A BILL TO BE ENTITLED

AN ACT TO AMEND CERTAIN NATURAL RESOURCES LAWS TO CLARIFY THAT DRAFT FISHERY MANAGEMENT PLANS ARE NOT SUBMITTED FOR REVIEW TO THE ENVIRONMENTAL REVIEW COMMISSION, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION:

The General Assembly of North Carolina enacts:

SECTION 1. G.S. 113-182.1 (c1) reads as rewritten:

"(c1) The Department shall consult with the regional advisory committees established pursuant to G.S. 143B-289.57 (e) regarding the preparation of each Fishery Management Plan. Before submission of a plan for review by the Joint Legislative Commission on Seafood and Aquaculture ~~or the Environmental Review Commission~~, the Department shall review any comment or recommendation regarding the plan that a regional advisory committee submits to the Department within the time limits established in the Schedule for the development and adoption of Fishery Management Plans established by G.S. 143B-289.52. The Commission shall consult with the regional advisory committees regarding the development of any temporary management measure that the Commission determines to be necessary to ensure the viability of the species or fishery while the plan is being developed and regarding the development of any management measure to implement the plan. Before the Commission adopts a temporary management measure or a management measure to implement a plan, the Commission shall review any comment or recommendation regarding the management measure that a regional advisory committee submits to the Commission."

SECTION 2. G.S. 113-182.1(e) reads as rewritten:

"(e) The Secretary of Environment and Natural Resources shall monitor progress in the development and adoption of Fishery Management Plans in relation to the Schedule for development and adoption of the plans established by the Marine Fisheries Commission. The Secretary of Environment and Natural Resources shall report to the

Joint Legislative Commission on Seafood and Aquaculture on progress in developing and implementing the Fishery Management Plans on or before 1 September of each year. The Secretary of Environment and Natural Resources shall report to the Joint Legislative Commission on Seafood and Aquaculture within 30 days of the completion or substantial revision of each proposed Fishery Management Plan. The Joint Legislative Commission on Seafood and Aquaculture shall ~~concurrently~~ review each proposed Fishery Management Plan within 30 days of the date the proposed Plan is submitted by the Secretary. The Joint Legislative Commission on Seafood and Aquaculture may submit comments and recommendations on the proposed Plan to the Secretary within 30 days of the date the proposed Plan is submitted by the Secretary."

A BILL TO BE ENTITLED

AN ACT TO AMEND OR REPEAL VARIOUS ENVIRONMENTAL REPORTING REQUIREMENTS, AS RECOMMENDED BY THE ENVIRONMENTAL REVIEW COMMISSION.

The General Assembly of North Carolina enacts:

SECTION 1. G.S. 77-98 reads as rewritten:

"**§ 77-98. Annual report.**

The Commission shall submit an annual report, including any recommendations, on or before 1 October of each year to the Governor of North Carolina, the Environmental Review Commission of the General Assembly of North Carolina, the Governor of Virginia, and the General Assembly of Virginia."

SECTION 2. G.S. 106-744 reads as rewritten:

"**§ 106-744. Purchase of agricultural conservation easements; establishment of North Carolina Agricultural Development and Farmland ~~Preservaton~~ Preservation Trust Fund and Advisory Committee.**

. . .

(i) The Advisory Committee shall report no later than May 1 of each year to the Joint Legislative Commission on Governmental Operations, the Environmental Review Commission, and the House of Representatives and Senate Appropriations Subcommittees on Natural and Economic Resources regarding the activities of the Advisory Committee, the agriculture easements purchased, and agricultural projects funded during the previous year.

..."

SECTION 3. G.S. 130A-310.57 reads as rewritten:

"**§ 130A-310.57. (For expiration date – see note) Report on plan.**

The Department shall ~~publish~~ submit an annual report to the Environmental Review Commission on the mercury minimization plan on or before November 1. The report shall include, at a minimum, all of the following:

(1) A detailed description and documentation of the capture rate achieved.

(2) In the event that a capture rate of at least ninety percent (90%) is not achieved, a description of additional or alternative actions that may be implemented to improve the mercury minimization plan and its implementation.

(3) The number of mercury switches collected, the number of end-of-life vehicles containing mercury switches, the number of end-of-life vehicles processed for recycling, and a description of how the mercury switches were managed.

(4) A statement that details the costs required to implement the mercury minimization plan."

DRAFT
END REVIEW

SECTION 2. G.S. 104E-10.1 reads as rewritten:

"**§ 104E-10.1. Additional requirements for low-level radioactive waste facilities.**

(a) An applicant for a permit for a low-level radioactive facility shall satisfy the ~~department~~ Department that:

(1) Any low-level radioactive waste facility heretofore constructed or operated by the applicant (or any parent or subsidiary corporation if the applicant is a corporation) has been operated in accordance with sound waste management practices and in substantial compliance with federal and state laws and regulations; and

(2) The applicant (or any parent or subsidiary corporation if the applicant is a corporation) is financially qualified to operate the subject low-level radioactive waste facility.

The approval of a permit shall be contingent upon the applicant first satisfying the ~~department~~ Department that ~~he~~ the applicant has met the above two requirements. In order to continue to hold a ~~license~~ permit under this Chapter, ~~a licensee~~ the permittee must remain financially qualified, and must provide any information requested by the Department to show that ~~he~~ the permittee continues to be financially qualified.

(b) Each permit applicant or permit holder (or any parent or subsidiary corporation if the permit applicant or permit holder is a corporation), as a condition of receiving or holding a permit, shall have an independent annual audit by a firm of duly licensed certified public accountants carrying a minimum of five million dollars ($5,000,000) professional liability insurance coverage, proof of which coverage shall be provided with the issuance of the audit report. Each permit applicant or permit holder referred to above shall also provide the Department ~~of Environment and Natural Resources~~ with a copy of the report and shall submit a copy of the report to the State Auditor for approval regarding its adequacy and completeness. As a minimum, the required report shall include the financial statements prepared in accordance with generally accepted accounting principles, all disclosures in the public interest required by law, and the auditor's opinion and comments relating to the financial statements. The audit shall be performed in conformity with generally accepted auditing standards.

(c) Within 10 days of receiving an application for a ~~license~~ permit or an amendment to a ~~license~~ permit to operate a low-level radioactive waste facility, the Department shall notify the clerk of the board of commissioners of the county or counties in which the facility is proposed to be located or is located, and, if the facility is to be located or is located within a city, the clerk of the governing board of the city, that the application has been filed, and shall file a copy of the application with the clerk. Prior to issuing a ~~license~~ permit or an amendment to an existing ~~license~~ permit the Secretary ~~of the Department~~ or ~~his~~ the Secretary's designee shall conduct a public hearing in the county, or in one of the counties, in which a person proposes to operate a low-level radioactive waste facility or to enlarge an existing facility. The Secretary shall give notice of the hearing at least 30 days prior to the date thereof by:

(1) Publication in a newspaper or newspapers having general circulation in the county or counties where the facility is to be located for three

DRAFT END REVIEW

consecutive weeks beginning 30 days prior to the scheduled date of the hearing; and

(2) First class mail to persons who have requested such notice. The Department shall maintain a mailing list of persons who request notice pursuant to this subsection."

SECTION 3. G.S. 120-70.36 reads as rewritten:

"**§ 120-70.36. Staffing.**

The Legislative Services Officer shall assign as staff to the Joint Select Committee professional employees of the General Assembly, as approved by the Legislative Services Commission. Clerical staff shall be assigned to the Joint Select Committee through the offices of the ~~Supervisor of Clerks of the Senate and Supervisor of Clerks of the House of Representatives~~ Directors of Legislative Assistants of the Senate and House of Representatives. The expenses of employment of clerical staff shall be borne by the Joint Select Committee."

SECTION 4. G.S. 120-70.46 reads as rewritten:

"**§ 120-70.46. Staffing.**

The Legislative Services Officer shall assign as staff to the Environmental Review Commission professional employees of the General Assembly, as approved by the Legislative Services Commission. Clerical staff shall be assigned to the Environmental Review Commission through the offices of the ~~Supervisor of Clerks of the Senate and Supervisor of Clerks of the House of Representatives~~ Directors of the Legislative Assistants of the Senate and House of Representatives. The expenses of employment of clerical staff shall be borne by the Environmental Review Commission."

SECTION 5. G.S. 120-70.65 reads as rewritten:

"**§ 120-70.65. Staffing.**

The Legislative Services Officer shall assign as staff to the Commission professional employees of the General Assembly, as approved by the Legislative Services Commission. Clerical staff shall be assigned to the Commission through the ~~Offices of the Supervisor of Clerks of the Senate and Supervisor of Clerks of the House of Representatives~~offices of the Directors of Legislative Assistants of the Senate and House of Representatives. The expenses of employment of clerical staff shall be borne by the Commission."

SECTION 6. G.S. 130A-294(f) reads as rewritten:

"(f) Within 10 days of receiving an application for a permit or for an amendment to an existing permit for a hazardous waste facility, the Department shall notify the clerk of the board of commissioners of the county or counties in which the facility is proposed to be located or is located and, if the facility is proposed to be located or is located within a city, the clerk of the governing board of the city, that the application has been filed, and shall file a copy of the application with the clerk. Prior to the issuance of a permit or an amendment of an existing permit the Secretary or ~~his~~ the Secretary's designee shall conduct a public hearing in the county, or in one of the counties

in which the hazardous waste facility is proposed to be located or is located. The Secretary or ~~his~~ the Secretary's designee shall give notice of the hearing, and the public hearing shall be in accordance with applicable federal regulations adopted pursuant to RCRA and with Chapter 150B of the General Statutes. Where the provisions of the federal regulations and Chapter 150B of the General Statutes are inconsistent, the federal regulations shall apply."

SECTION 7. G.S. 143-215.74 reads as rewritten:

"**§ 143-215.74. Agriculture cost share program.**

(a) There is created the Agriculture Cost Share Program for Nonpoint Source Pollution Control. The program shall be created, implemented, and supervised by the Soil and Water Conservation Commission.

(b) The program shall be subject to the following requirements and limitations:

(1) The purpose of the program shall be to reduce the input of agricultural nonpoint source pollution into the ~~water courses~~ watercourses of the State.

(2) The program shall initially include the present 16 nutrient sensitive watershed counties and 17 additional counties.

..."

SECTION 8. G.S. 160A-479.7(a) reads as rewritten:

"(a) The charter may confer on the regional sports authority any or all of the following powers:

...

(16) To study and plan for new and improved major regional sports and recreational facilities including but not limited to arenas, stadia, gymnasia, natatoria, pitches, fields, ~~water courses~~watercourses, and other areas for the conduct of sports and recreational activities. These facilities should be of such sizes and in such locations that they will be adequate to serve the population of the entire jurisdiction of the authority (and beyond) to the extent possible;

..."

SECTION 9. Section 12.7.(d) of S.L. 2006-66 read as rewritten:

"**DEPARTMENT OF COMMERCE/REPORT ON AGRIBUSINESS FUNDS**

...

SECTION 12.7.(d) The Department shall submit the report to the House Appropriations ~~Committee~~ Subcommittee on ~~Environment, Health, and~~ Natural and Economic Resources, the Senate Appropriations Committee on Natural and Economic Resources, and the Fiscal Research Division no later than May 1, 2007."

SECTION 10. Section 2 of S.L. 2006-139 reads as rewritten:

"**SECTION 2.** The Commissioner of Agriculture shall file a report no later than 31 March of each year with the Chairs of the House of Representatives Appropriations Subcommittee on Natural and Economic Resources and Senate Appropriations ~~Subcommittees~~ Committee on Natural and Economic Resources, the

DRAFT FOR REVIEW

Chair of the House of Representatives Agriculture Committee, and the Chair of the Senate Committee on Agriculture, Environment, and Natural Resources which shall include the following:

(1) The short- and long-term problems associated with maintaining a viable dairy industry in the State.

(2) Ways to sustain the existing dairy industry in the State.

(3) Opportunities to expand the dairy industry, including attracting both new dairy producers and new processors to the State.

(4) The contribution of dairy farms to the maintenance of prime agricultural land and the quality of life in the State.

(5) An analysis of the effectiveness of the Dairy Stabilization and Growth Program in achieving the goals of maintaining a local supply of fresh milk for processing and consumption, facilitating the entry of young farmers into the dairy industry, and preserving green space along the urban fringe.

(6) Other factors that impact the dairy industry in the State."

SECTION 11. This act is effective when it becomes law.

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
3 April 2007

The Environmental Review Commission (ERC) met on Tuesday 3 April 2007 at 11:00 a.m. in Room 544 of the Legislative Office Building. Senator Albertson presided.

The following members were present: Senators Albertson, Bingham, Kinnaird, Swindell and Weinstein; and Representatives Harrison, Justice, and Warren. Other General Assembly members present were Representative Lucy Allen, Chair of the House Committee on Environment and Natural Resources; Representatives Dewey Hill, Wil Neuman, and Ruth Samuelson; and Senators Andrew Brock, Jerry Tillman, and John Snow. Mr. George Givens, Commission Counsel; Jeffrey Hudson, Assistant Commission Counsel; Jennifer McGinnis, Assistant Commission Counsel; Jennifer Mundt, Commission Analyst; Mariah Matheson, Research Assistant; and Mary Watson, Substitute Commission Clerk, were also present.

On 28 March 2007, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. Copies of the agenda for the meeting and visitor registration sheets are included in the attachments as **Exhibits B** and **C**.

Senator Albertson called the meeting to order. He stated that the meeting was called to receive a report about the biofuels industry. He then asked Mr. George Givens to comment on the agenda items. Mr. Givens announced that there had been one report received by the ERC, entitled "North Carolina's Strategic Plan for Biofuels Leadership: Fueling North Carolina's Future", which is the subject of the meeting (see **Exhibit D**).

Senator Albertson introduced Mr. Norris Tolson, Secretary of the Department of Revenue, to present the final report from the Biofuels Industry Strategic Plan Work Group on the development of the strategic plan. Mr. Tolson said looking at the future of fuels in North Carolina is a most important issue, not only for the immediate future, but also for the future of our children and grandchildren. An equally important question is what the State will do to ensure our energy independence. As the population of North Carolina grows and the demand for fuel rises as well, we will need creative answers to increase our fuel supply. We in North Carolina currently use about 5-6 billion gallons of petroleum-based liquid fuel a year. All of the fuel we use in North Carolina is refined somewhere else from crude oil that comes from places around the world that are not friendly to us. Mr. Tolson stated the Task Force believes that if the strategies devised by the group are used correctly, the State could develop a strong leadership position in alternative fuels along the East Coast of the United States. A new industry can be developed to increase the availability of alternative feed stocks. He added that many of our neighboring states have committed significant resources to generate alternative energy and the feedstocks necessary to drive the industry. Private and public partnerships need to work together to make it happen because the state cannot do it alone. Crops that we can grow in North Carolina offer us an opportunity to create a significant niche in the production of biofuels.

The plan will require action on the part of the General Assembly during this session if the state is to achieve the objectives laid out in the document. The results are sound, practical and encouraging. The plan is built around five strategic work groups: organizational leadership; market transformation; science, research and development on feedstocks and biomass; production and distribution; and the culture and education that will be required to get the consuming public to shift from traditional fuels to biofuels.

Senator Albertson next recognized Mr. Steven Burke, Senior Vice President for Corporate Affairs, North Carolina Biotechnology Center, to speak about the nine strategies:

1. Realistic vision and compelling commitment
2. Statewide Biofuels Commission
3. Statewide economic development initiatives
4. Creation of a new industry sector
5. A biofuels roadmap across the State
6. Science, research and development capabilities
7. Advanced biofuels acceleration facility
8. Advancing public commitment and workforce development
9. Appropriate and targeted incentives

At the conclusion of Mr. Burke's presentation, Senator Albertson thanked the members of the Task Force and all others who were involved in the development of the plan on behalf of the members of the ERC.

Senator Kinnaird asked about involving representatives of the big oil companies in the planning for alternative fuels. Mr. Tolson replied that some of the energy companies are starting their own resource programs and investing large sums of money in alternative energy. The Committee believes strongly that in order to make the plan work in North Carolina, a private/public partnership, including the energy companies should they choose to be involved, is essential.

Senator Bingham asked what the most practical use of biomass fuels would be. Mr. Tolson replied that according to the Strategic Plan, every gallon of fuel used in 2017 would contain 10 percent ethanol. Five good-size ethanol plants would be required to produce the 500 million gallons of alternative fuel needed to reach this goal. The committee has determined that the state will not be able to depend on corn as the only feedstock. Therefore the plan stresses the development of new feedstocks that can be grown in the state to make alternate fuels.

Senator Weinstein asked the presenters to define the word, "biomass" and the potential of biomass. Mr. Burke responded that biomass refers to any potential source of material grown in the ground that can be converted to the sugars that yield biofuels. Corn is a biomass of sorts, but more important for North Carolina's future is the grouping called cellulosic biomass. This type of biomass is obtained from forest resources, a resource that North Carolina has in abundance. While all of the 18 million acres of forest resources would not be used, they would provide the greatest source of cellulosic biomass of any state in the country. Hog waste and algae are other possibilities.

Representative Warren asked how advanced we are in our capability to produce some of the feedstocks we are not currently using. Secretary Tolson replied that we are further along in growing the crops than we are in converting them to use as fuel. The issue is figuring out how to convert them to ethanol economically and efficiently.

Senator Swindell asked what other states in the South and Midwest are doing to develop biofuels programs. Secretary Tolson replied that Tennessee has committed $76 million, Georgia $75 million, and New York $85 million to conduct the research to convert feedstocks to ethanol. Most of the current ethanol plants are in the Midwest, so the Midwest states are also spending a lot of money, not only to convert starch to ethanol, but also to determine how to distribute it and get people to convert to it at the gasoline station.

Representative Harrison asked what the infrastructure and regulatory structure impediments are to accomplishing the goals. Mr. Burke replied that impediments are to be explored in the future. If the state is to attempt to grow and produce at least 560 million gallons of liquid fuels in ten years, there will be new strains on the distribution system, on the review system, on what to do with fuel tanks, on how it is shipped, and on how it moves from the plant to the public. Part of the task over the next 15-20 years is to deal with those issues. Determining the answers to those questions will be a part of the task of the Biofuels Commission.

Senator Bingham asked for a comment on the practicality of diesel fuel versus ethanol and in what direction the work on biofuels will be going. Secretary Tolson responded that biodiesel is easier to make than ethanol. Almost everything can be converted to biodiesel fuel immediately and used in current engines. At the present time, however, there are no active projects with a goal of producing large quantities of biodiesel. He added that the work should go forward on ethanol with equal importance. Senator Bingham asked about the comparative cost and efficiency of diesel versus the ethanol fuel. Secretary Tolson responded that he did not know. He did say that ethanol is about 20 percent less efficient than gasoline.

The meeting adjourned at 11: 50 a.m.

Representative Pryor Gibson, Co-Chair

Senator Charlie Albertson, Co-Chair, Presiding

Dot Waugaman, Commission Clerk

RE: **Notice of Commission Meeting**
Additional Information

COMMISSION MEETING:

The Environmental Review Commission (ERC) will meet at 11:00 a.m. Tuesday 3 April 2007 in Room 544 of the Legislative Office Building in Raleigh. At this meeting the ERC will hear the final report of the Biofuels Industry Strategic Plan Work Group pursuant to S.L. 2006-206.

This meeting is expected to last no more than one hour and to adjourn no later than 12:00 noon. No public staff planning meeting will be held in connection with this meeting.

ADDITIONAL INFORMATION:
If you have questions related to the Commission, you may contact the Commission Counsel or other Commission staff at (919) 733-2578.

Imperative and Vision Well Combined

What combination of vision, policies, and resources is required for North Carolina to develop a liquid biofuels industry that is substantial in output, agriculturally and economically important, sustainable, and significant across the State?

Almost 5.6 billion gallons of petroleum-based liquid fuels are consumed by North Carolinians each year.

Every gallon is produced elsewhere, yielding main economic return elsewhere. Each gallon verifies further that citizens are dependent upon fuels produced in other places, not all of which are reliably attentive to State or national security. No gallon contributes to the agricultural, forestry, or production economy of North Carolina.

North Carolina is well-advised to gain internal capability for production of a measurable percentage of its liquid biofuels consumption. Doing so reflects increasingly strong national and federal mandates, and is also mirrored by other states – many of which are targeting biofuels development far more aggressively and measurably than North Carolina. More importantly, gaining increased internal biofuels capability is eminently feasible in this State in coming decades. North Carolina is remarkably well-positioned to shape science, biotechnology, agricultural and biomass resources, smart participants, and policies into an internally strong biofuels sector.

In fact, more is realistically possible. With the right grouping of vision, strategy, and resource commitment over time, North Carolina can gain Mid-Atlantic and Southern leadership in a growing biofuels industry in coming years.

Many resources and capabilities will work together for this outcome. Among them, methodical and strategic development of new fuel feedstocks will be key. Few states can study, adapt, and grow as many possible sources. Canola, switchgrass, hulless barley, coastal Bermuda grass, industrial sweet potatoes, and miscanthus are among possibilities, along with animal waste, algae, and forest-based resources. As a result, North Carolina's future will target these feedstocks – as well as crops perhaps today barely envisioned – and will not be based on corn.

Working for these crops, a new industry, and increased biofuels capability impels sustained State policy and leadership. Resources must be committed. Varied institutional parties, public and private, must work together for common purpose. Thinking and outcomes must be shaped by the significance of the task, which remarkably touches so many large components of North Carolina's life and landscape: environmental stewardship, transportation and consumers, science and research, agriculture and forestry, counties, economy, and security.

Addressing the question above and these interrelated components has been for seven months the task of more than 70 engaged North Carolinians statewide. Their work, thoughtful discussion, and sound ideas have yielded this *Strategic Plan for Biofuels Leadership.*

Results are sound, practical, and encouraging, and so is the responsible future-thinking at hand. Is any state better prepared to address the imperative for biofuels leadership?

Project Process and Approach

North Carolinians have a tradition of coming together to address ideas and needs important to the State's future. Our ability to do so has been since June of 2006 directed effectively to biofuels.

In June of 2006, a first-ever *Biofuels Summit* convened 15 State, academic, and corporate leaders around the imperative for informed, future-directed State planning and policy. Key legislative participants, including Senator Charlie Albertson and Representative Dewey Hill, judged the imperative significant enough to catalyze legislation. In August, *Senate Bill 2051: State Energy Use/Energy Assistance* passed, mandating a statewide strategic plan.

The legislation yielded the process for *North Carolina's Strategic Plan for Biofuels Leadership,* a Project:

- Led by five Co-conveners: the College of Agriculture and Life Sciences at North Carolina State University, the School of Agriculture and Environmental Sciences at North Carolina Agricultural and Technical State University, the North Carolina Biotechnology Center, the North Carolina Rural Economic Development Center, and Secretary of Revenue E. Norris Tolson.

- Guided by a 24-member Steering Committee, comprised of the Co-conveners and appropriately diverse parties statewide, as listed on page 8.

Discussions and ideas were shaped in full Steering Committee meetings or in five Strategic Workgroups: Organizational Leadership; Market Transformation; Science, Research, Development, Feedstocks, and Biomass; Production & Distribution; and Culture & Education. In addition, all participants were requested early in the process to submit their initial roster of ideas, recommended activities, or suggested strategies, to trigger Committee learning and discussion.

Taken in total, the roster of ideas, recommendations, and strategies revealed main areas of necessary attention, yielded a logical framework for action over time, and provided a foundation for the broad strategies. Funding requirements were carefully considered and set.

The widely varied participating citizens worked productively, smartly, and very collegially. Their synthesis and consensus yielded this document and the Nine Realistic Strategies that follow.

Nine Realistic Strategies

North Carolina's goal is simple and bold in statement but challenging to bring about over time: *to develop a liquid biofuels industry that is substantial in output, agriculturally and economically important, sustainable, and significant across the State.*

Bringing about this outcome requires a smart combination of sustained policy, resources, and vision. Varied parties must work productively and interactively together over time. Commitment must be maintained over years, possibly decades, and will be shaped by new learning and expected challenges.

The following nine strategies in total address and bring together the combination of commitment, practical tools, and guiding vision required for comprehensive, cohesive activities statewide over many years.

STRATEGY 1 • Realistic Vision and Compelling Public Commitment

A **compelling goal** will shape policy and actions – and also trigger commitment and passion – by citizens, leadership, and institutions statewide:

North Carolina's vision is strong and ambitious. By 2017, 10 percent of liquid fuels sold in North Carolina will come from biofuels grown and produced within the State.

REQUIRED: Legislation and widespread endorsement of State leaders.

MORE INFORMATION provided under *Strategies Delineation*, on page 10.

STRATEGY 2 • Statewide Biofuels Commission

A **new entity** must be constituted to guide and oversee North Carolina's sustained, high-level, and policy-based biofuels initiative over time. Possibly a State-level Commission established by the General Assembly with staff assistance provided by a nonprofit, it will be granted lead responsibility and authority for: policy development and oversight, building upon appropriate work already undertaken by varied parties statewide, coordination and assistance for the ongoing work and missions of varied parties statewide, development of key activities, identification and implementation of specific programs and incentives, funding of certain research or development activities, and targeted progress reports to public, policy, and legislative leaders. Working for comprehensive, effective, and steady movement from research and development to deployment – production, distribution, and use statewide – will be a key mandate as well as responsibility. A catalyst and convener in approach, the Commission will constitute and draw on Task Forces and other groups statewide.

REQUIRED: Legislation and funding of $500,000 annually.

MORE INFORMATION provided under *Strategies Delineation*, on page 10.

STRATEGY 3 • Statewide Economic Development Imperatives

Because development of biofuels offers extraordinary opportunity for gain statewide, **sustained State policies and activities** must work aggressively for:

- National security
- Economic security
- Rural development
- Gain to farmers and agriculture
- Environmental benefits and stewardship
- Identification and development of local and regional resources, feedstocks, and production facilities

REQUIRED: Sustained commitment over time by State leaders and all involved parties.

MORE INFORMATION provided under *Strategies Delineation*, on page 11.

STRATEGY 4 • Creation of a New Industry Sector

Given its unparalleled biotechnology, agricultural, forestry, and resource strengths, North Carolina can realistically work for development within 10-15 years of:

- **A new biofuels industry** and economic sector statewide.
- **Mid-Atlantic and Southern leadership** within that industry.

Attaining both goals must inform all of the above activities and strategies.

REQUIRED: Sustained commitment over time by State leaders and all involved parties.

MORE INFORMATION provided under *Strategies Delineation*, on page 12.

STRATEGY 5 • A Biofuels Roadmap Across the State

Craft, implement, and continually refine **a coordinated plan** for development, production, and commercialization of biofuels throughout North Carolina, building on work undertaken to date by parties statewide. Resources, policy, and involved entities statewide must be merged. All involved parties and steps in the movement from science and research to feedstocks, production, distribution, worker training, and consumer utilization must be comprehensively addressed and integrated.

To be undertaken by the *Statewide Biofuels Commission,* working with its constituted Task Forces and partners statewide.

REQUIRED: Participation and leadership from all parties statewide and from the *Statewide Biofuels Commission.*

MORE INFORMATION provided under *Strategies Delineation*, on page 12.

STRATEGY 6 • Science, Research, and Development Capabilities

Research programs and resources at universities and other facilities statewide provide the requisite foundation for:

- Identification and development of improved or new feedstocks that can be particularly and efficiently grown, harvested, stored, and processed in North Carolina: *$4.5 million initial estimate*
- Development of processing capabilities, treatments, and enzymes key to efficient and competitive development of new feedstocks, including those from forests and other cellulosic sources: *$14.5 million initial estimate*
- Agricultural, forestry, and agronomic development, exploration, and testing: *$2 million initial estimate*
- Small scale pilot/deployment/processing plants to speed the movement of research to outcomes: *$4 million initial estimate*

Targeted and prioritized research over time will yield:

- *Short-term* use of existing feedstocks and process technology.
- *Mid-term* modification of existing feedstocks and process technology.
- *Longer-term* development of new feedstocks and process technology.

Priorities and goals for science, research, and development activities and funding will be established by the *Statewide Biofuels Commission.*

REQUIRED: Total funding of $25 million will be requested from legislative appropriation.

MORE INFORMATION provided under *Strategies Delineation*, on page 12.

STRATEGY 7 • Advanced Biofuels Acceleration Facility

Establishment of **a nationally unique public-private partnership facility** – involving multiple entities and companies – to methodically test, break down, and produce different feedstocks will offer North Carolina significant advantage, in particular to speed identification and development of crops most advantageous statewide for biofuels production.

REQUIRED: Legislation and financial commitment of 25 percent of total costs for a $25 million facility, with that commitment contingent upon the other funding being in place.

MORE INFORMATION provided under *Strategies Delineation*, on page 13.

STRATEGY 8 • Advancing Public Commitment and Workforce Development

To ensure that North Carolinians understand the personal and societal importance of biofuels produced within their State, a **coordinated statewide public endeavor** undertaken by varied parties must in the next five years work for and fund informed leadership, targeted education and workforce development, and consumer awareness.

To be implemented by the *Statewide Biofuels Commission.*

REQUIRED: Legislation and initial funding of $500,000.

MORE INFORMATION provided under *Strategies Delineation*, on page 13.

STRATEGY 9 • Appropriate and Targeted Incentives

A **comprehensive, dovetailed package** of incentives must be identified and implemented, to maximize development, production, distribution, retail infrastructure, and consumer purchase of biofuels produced within North Carolina.

To be identified, organized, and implemented by the *Statewide Biofuels Commission,* working with its constituted Task Forces and respondents statewide.

REQUIRED: Legislation to be developed.

MORE INFORMATION provided under *Strategies Delineation*, on page 14.

Strategies Delineation

Working productively over just seven months, from September of 2006 through March of 2007, 70 smart and engaged North Carolinians addressed the question at hand:

What combination of vision, policies, and resources is required for North Carolina to develop a liquid biofuels industry that is substantial in output, agriculturally and economically important, sustainable, and significant across the State?

Discussions and ideas were shaped in full Steering Committee meetings and in five Strategic Workgroups: Organizational Leadership; Market Transformation; Science, Research, Development, Feedstocks, and Biomass; Production & Distribution; and Culture & Education. In addition, all participants were asked early in the process to submit their initial roster of ideas, recommended activities, or suggested strategies – to trigger Committee learning and discussion.

Taken in total, the roster of ideas, recommendations, and strategies revealed main areas of necessary attention, yielded a logical framework for action over time, and provided a foundation for the broad strategies.

Key recommendations or ideas underlying the strategies are presented below. *They are representative of the types of outcomes and activities discussed and likely to be seen in coming years; they are not at present assumed to be assured or set.* Considering these and other, to-be-explored, recommendations will be a mandated task of the *Statewide Biofuels Commission* as it works with parties across North Carolina.

The content below reveals:

- The range of resources, policies, and bold ideas required.
- The richness of work and ideas already seen from parties statewide.
- The effectiveness and imagination with which engaged North Carolinians can together think about a topic of societal and economic importance to their future.

Strategy 1 • Realistic Vision and Compelling Public Commitment

Discussion was thoughtful and imaginative about ways to trigger policy, public commitment, and resources over time – and granted that states, like persons, often respond well to large visionary goals over time.

Strategy 2 • Statewide Biofuels Commission

Specific goals and tasks of the commission will include:

- Implementing *North Carolina's Strategic Plan for Biofuels Leadership* and meeting the milestones set forth in legislation/statutes;
- Marketing and promotion;
- Coordinating and advocating research;

- Coordinating and advocating policy;
- Administering grants and cost-sharing programs;
- Aggregating information and serving as a repository for biofuels activities;
- Serving as the lead agency representing North Carolina's interest in federal programs and in seeking federal funding;
- Programming the commercialization of biofuels in North Carolina;
- Addressing related areas of research and attention, including social sciences, consumer issues, broader environmental and energy implications, and economics;
- And others to inevitably evolve in coming years.

The Commission's membership would likely be made up of representatives from the following organizations, as well as from others as appropriate:

- Department of Administration
- Department of Agriculture & Consumer Services
- Department of Commerce
- Department of Environment and Natural Resources
- Department of Transportation
- Energy Policy Council
- Institute of Forest Biotechnology
- North Carolina Agribusiness Council
- North Carolina Biotechnology Center
- North Carolina Board of Science and Technology
- North Carolina Community College System
- North Carolina Farm Bureau Federation
- North Carolina Forestry Association
- North Carolina Rural Economic Development Center
- North Carolina Solar Center
- North Carolina State Grange
- Petroleum Marketers Association
- University of North Carolina
- Representatives of private industry that are engaged in the biofuels industry
- Any other entity that the Biofuels Industry Strategic Plan Steering Committee deems appropriate, particularly entities engaged in the biofuels industry

The five Project Co-conveners, drawing on the Steering Committee and other participants, will move the Commission from Strategy to reality and initial staffing in coming months.

Strategy 3 • Statewide Economic Development Imperatives

The six imperatives laid out were judged requisite to outcomes. Working for them should underlie and inform every policy, activity, and decision over coming years.

Meeting these imperatives is in fact key to the overall success of North Carolina's biofuels strategy.

Strategy 4 • Creation of a New Industry Sector

Guided by policy, leadership, and vision, North Carolina has proven successful at moving from traditional to new industry sectors, many of which spring from merging of technology with varied resources statewide.

The presumption is bold but realistic: groundwork laid in the short-term can lead to a new biofuels sector statewide in the longer-term of 10 to 15 years.

Working for this outcome is also key to the overall, long-term success of North Carolina's biofuels strategy – and must be taken seriously by varied parties and leaders in coming years.

Strategy 5 • A Biofuels Roadmap Across the State

Recommendation: Adopt and implement a roadmap for the commercialization of biofuels in North Carolina. The roadmap is to include a target list of recommended feedstocks that can be efficiently and economically grown, harvested, stored, and processed in North Carolina. The list will identify the best energy source feedstocks and highlight byproducts, outputs, and focus on feedstock quality. It will also include an action plan focusing on North Carolina's regional differences in agronomy and agriculture while also addressing the research and development needs of farmers and scientists.

Strategy 6 • Science, Research, and Development Capabilities

Recommendation: To help facilitate and coordinate research and development efforts throughout the State, the *Statewide Biofuels Commission* shall hold an annual symposium/conference bringing together scientists, researchers, and representatives of universities, government, and other organizations for collaboration, networking, information sharing, and coordination of feedstock and biomass research, development, commercialization, and deployment.

Recommendation: Support and promote the commercialization and deployment of new technologies for converting North Carolina grown and harvested feedstocks and biomass into biofuels.

Recommendation (Revenue Neutral): A key component to a strong biofuels industry is a well-trained workforce. A certification process and quality-assurance training program should be developed for technicians in the biofuels industry. Large-scale and small-scale production facilities can benefit from an integrated biofuels training program. Implementing existing curricula while combining resources to develop a comprehensive training program both reduces cost per student and expands the availability of classes. The biofuels training program should include both production techniques and quality-control testing. Quality control is needed to ensure that the biofuels produced in North Carolina meet all applicable specifications. The quality of the biofuels has a direct relationship to public acceptance. An inconsistent or poor-quality fuel will have a negative impact on the newly developing demand for biofuels.

Recommendation (Revenue Neutral): Develop streamlined environmental review and permitting processes required for development of biofuels production and distribution facilities.

Recommendation: To ensure movement from research and production to distribution and use, develop an ASTM-certified laboratory for testing biofuels, to be implemented by the North Carolina Department of Agriculture & Consumer Services at State testing facilities to allow easy access to testing for producers, particularly small producers, and ensure that all North Carolina-produced biofuels are properly tested and meet established specifications.

Strategy 7 • Advanced Biofuels Acceleration Facility

Recommendation: Endorse Novozymes' proposal to the U.S. Department of Energy for a pilot-scale facility focused on creating viable conversion processes specific to North Carolina and the Southeastern United States. The proposed pilot and deployment facility will develop processes for multiple biomass feedstocks relevant to the State and the Southeastern region; integrate technologies of pretreatment, hydrolysis, fermentation, and enzyme production; and deliver basic engineering and technical guidance for developing regional biorefineries. Novozymes is focused on securing federal, state, and local agreement for the regional biomass-to-ethanol technology center by identifying key partners and creating a governing structure for the facility.

Strategy 8 • Advancing Public Commitment and Workforce Development

Recommendation: Induce use of biofuels within State government by coordinating and/or implementing petroleum displacement programs for all State rolling stock. State government should continue to support biofuels use by going beyond the currently mandated 20 percent reduction or displacement of petroleum use.

Recommendation: Design and implement a pilot marketing program for biofuels targeting a pre-determined region within the State. The pilot program will measure the effectiveness of marketing and outreach methods to ascertain the best approach and practices for reaching a statewide audience.

Recommendation: Identify a county in North Carolina as a pilot/test program for converting all rolling stock to biofuels and environmentally friendly vehicles, including but not limited to E85 and biodiesel.

Recommendation: Endorse the Petroleum Displacement Plan as outlined in *Section 19.5, 2005 State Budget Provision* requiring State fleets to achieve a 20 percent reduction or displacement of current petroleum use by 2010 through the use of alternative fuels and hybrid vehicles.

Recommendation: Determine workforce needs and levels of education – certificate, associate, baccalaureate, or higher – necessary to meet those needs. Involve industry, community colleges, and universities in these determinations and in curricula development. Design and implement workforce development, education, and training curricula with clear, concise, and consistent messages for an array of target audiences.

Key messages of workforce development and training will address biofuels basics, energy issues, and mechanisms for behavior change. Key messages of education will address formal and informal instruction. An integral element of workforce development, education, and training will focus on the coordination and collaboration of existing programs and curricula.

Recommendation: Create a broader presence for North Carolina's biofuels efforts by implementing targeted public awareness and media campaigns. Targeted programs should be designed to take advantage of existing public relations and media efforts in an effort to disseminate accurate information, inform lawmakers, educate the public, and build trust.

Recommendation: Within the *Statewide Biofuels Commission*, designate a strategic committee whose purpose is to elevate, communicate, build, and implement a permanent and ongoing public information plan. The committee would provide periodic updates and reports on the *State of Biofuels in North Carolina* and act as a communications conduit to the General Assembly, other State and local leaders, and to the general public.

Strategy 9 • Appropriate and Targeted Incentives

Recommendation: Implement a comprehensive State-funded incentives program to maximize the development of cost-competitive, bio-based fuels, and to expand production and retail infrastructure. Example incentives include the following:

1. Reduce/remove motor fuels tax on biodiesel;
2. Tax ethanol based on energy content of fuel. Ethanol has approximately 30 percent less energy content than gasoline; therefore, reducing the motor fuels tax on the ethanol blend by 30 percent will be revenue neutral because motorists using E85 need to purchase more fuel to go the same distance as a gasoline-powered vehicle;
3. Expand tax credit for biofuels infrastructure (current 15 percent tax credit is set to expire this year); and
4. Provide a per-gallon payment to North Carolina biofuels producers (e.g. $0.10 per gallon for the first 10 million gallons of production).

Recommendation: Implement an incentive program for replacing mid-grade octane fuel tanks with E85 at stations across North Carolina. A grant program could supplement the conversion costs incurred by station owners.

Senate Bill 2051, August 2006

GENERAL ASSEMBLY OF NORTH CAROLINA
SESSION 2005

SESSION LAW 2006-206
SENATE BILL 2051

AN ACT TO REDUCE ENERGY, FUEL, AND WATER CONSUMPTION IN THE STATE THROUGH: (1) DEVELOPMENT OF A PLAN TO INCREASE THE AVAILABILITY AND USE OF ALTERNATIVE FUELS IN STATE-OWNED VEHICLE FLEETS; (2) PROVISION OF ENERGY ASSISTANCE TO LOW-INCOME PERSONS; (3) DEVELOPMENT OF A STRATEGIC PLAN TO EXPAND THE BIOFUELS INDUSTRY IN NORTH CAROLINA; AND (4) STUDY MECHANISMS TO IMPROVE ENERGY AND WATER CONSERVATION IN STATE-OWNED FACILITIES.

The General Assembly of North Carolina enacts:

... PART III. DEVELOP BIOFUELS INDUSTRY STRATEGIC PLAN

SECTION 3.1. There is established the Biofuels Industry Strategic Plan Work Group. The purpose of the Work Group is to develop a strategic plan for expansion of biofuels as an industry in North Carolina. The Work Group shall include representatives of the College of Agriculture and Life Sciences at North Carolina State University, the School of Agriculture and Environmental Sciences at North Carolina Agricultural and Technical State University, the North Carolina Biotechnology Center, and the Rural Economic Development Center, Inc. In developing this strategic plan, the Work Group shall delineate the increasing role of biotechnology in the development of biofuels and may consult with all of the following:

(1) The Department of Administration.
(2) The Department of Agriculture and Consumer Services.
(3) The Department of Commerce.
(4) The Department of Environment and Natural Resources.
(5) The Department of Transportation.
(6) The University of North Carolina System.
(7) The Community College System.
(8) The North Carolina Solar Center at North Carolina State University.
(9) The North Carolina Farm Bureau Federation.
(10) The North Carolina State Grange.
(11) The North Carolina Agribusiness Council.
(12) The North Carolina Forestry Association.
(13) Representatives of private industry that are engaged in biotechnology and the biofuels industry.
(14) Any other entity that the Biofuels Industry Strategic Plan Work Group deems appropriate, particularly entities that are engaged in biotechnology and the biofuels industry.

SECTION 3.2. The Biofuels Industry Strategic Plan Work Group shall submit an interim report on the development of the strategic plan, including any preliminary findings, recommendations, and legislative proposals, to the Environmental Review Commission no later than 15 January 2007. The Biofuels Industry Strategic Plan Work Group shall submit a final report on the development of the strategic plan, including any findings, recommendations, and legislative proposals, to the Environmental Review Commission no later than 1 April 2007.

DRAFT: NOT FOR DISTRIBUTION
Feb. 16, 2007
RWS

A BILL TO BE ENTITLED
THE SOLID WASTE MANAGEMENT ACT OF 2007

Whereas, it is the declared public policy of the state to protect and enhance the water quality of the State's rivers and coastal estuaries; and

Whereas, it is the policy of the State to ensure the continued public enjoyment of the natural attractions of the State; and

Whereas, the ownership of solid waste facilities has taken new form in recent years; and

Whereas, the potential exists for the state of North Carolina and local government to incur costs from an environmental release from a landfill; and

Whereas, there have been substantial and beneficial changes in technology, materials, processes, and engineering practices in the field of solid waste management; and

Whereas, North Carolina should set a high standard in solid waste management practices and there is a desire to immediately improve solid waste management in North Carolina by implementing changes that account for the substantial and beneficial changes in technology, materials, processes and engineering practices in the field of solid waste management.

Now therefore the General Assembly of North Carolina enacts:

SECTION 1.(a). Financial qualifications for solid waste facility owners.

G.S. 130A-290 is amended by adding a new definition:

"(1aa) "Business entity" has the same meaning as in G.S. 55-1-40 (2a)."

SECTION 1.(b).

G.S. 130A-294(b2) is amended as follows:

"(b2) The Department may require an applicant for a permit under this Article to satisfy the Department that the applicant, and any parent, subsidiary, or other affiliate of the applicant or parent, and including any joint venturer with a direct or indirect financial or equity interest in the applicant:

(1) Is financially qualified to carry out the activity for which the permit is required.

The applicant shall demonstrate financial qualifications adequate to ensure proper design, construction, operation, maintenance, and closure of the facility. The applicant shall also demonstrate financial qualifications sufficient to obtain the financial assurance required under subpart (b) of this section. The initial demonstration of financial qualification for the design, construction, and closure of the facility may be limited to the first five-year phase of construction for which a permit to construct is sought. The applicant may be required to demonstrate financial qualification for each successive five-year phase of design, construction and operation of the facility when applying for a permit to construct each successive phase of the facility. The applicant shall provide cost estimates for site investigation; land acquisition, including financing terms and land ownership; design of the facility; construction of the first five-year phase of the facility, operation of the facility; closure of the facility; and the cost of providing financial assurance required under subpart (b) of this section. The applicant shall provide an audited, certified, financial statement and a combination of cash deposits, insurance policies, and binding letters of loan commitments from a triple A or higher rated rated financial institution licensed to do business in North Carolina sufficient to cover the anticipated costs. Where assets of a parent, subsidiary or other affiliate of the applicant or a joint venturer with a

direct or indirect financial or equity interest in the applicant is proposed to be used to determine the financial qualifications of the applicant, then that party must be listed on the permit of the facility. The applicant must show the ability to obtain financial assurance required under this Chapter and rules adopted by the Commission. A letter of intent to provide financial assurance provided by a North Carolina registered provider of at least triple A credit rating shall suffice for adequate demonstration

SECTION 2. Financial assurance for assessment and corrective actions.

G.S. 130A-294(b) is amended as follows:

" (b) The Commission shall adopt and the Department shall enforce rules to implement a comprehensive statewide solid waste management program. The rules shall be consistent with applicable State and federal law; and shall be designed to protect the public health, safety, and welfare; preserve the environment; and provide for the greatest possible conservation of cultural and natural resources. Rules for the establishment, location, operation, maintenance, use, discontinuance, recordation, post-closure care of solid waste management facilities also shall be based upon recognized public health practices and procedures, including applicable epidemiological research and studies; hydrogeological research and studies; sanitary engineering research and studies; and current technological development in equipment and methods. The rules shall not apply to the management of solid waste that is generated by an individual or individual family or household unit on the individual's property and is disposed of on the individual's property.

The Commission shall adopt rules for financial responsibility to ensure the availability of sufficient funds for closure and post-closure maintenance and monitoring at solid waste management facilities and for any corrective action the Department may require during the active life of a facility or during the closure and post-closure periods. To meet the financial responsibility requirements of this section for potential assessment and corrective action, the owner or operator of a sanitary landfill shall provide financial assurance sufficient to cover a minimum of $3,000,000.00 in costs. The Department may require financial assurance in a higher amount and may adjust the amount of financial assurance required upward after initial permit issuance, based upon the types of waste disposed in the landfill, the projected amount of waste to be disposed in the landfill, the location of the landfill, potential receptors of releases from the landfill, and inflationary factors. This amount is in addition to any financial assurance required for closure of the facility and for routine post-closure care. The rules may permit demonstration of financial responsibility through the use of a letter of credit, insurance, surety, trust agreement, financial test, or guarantee by corporate parents or third parties who can pass the financial test. The rules shall require that an owner or operator of a privately owned solid waste management facility demonstrate financial responsibility by a method or combinations of methods that will ensure that sufficient funds for closure, post-closure maintenance and monitoring, and any corrective action that the Department may require will be available during the active life of the facility, at closure, and for a period of not less than 30 years after closure even if the owner or operator becomes insolvent or ceases to reside, be incorporated, do business, or maintain assets in the State. The financial assurance shall be in a form that allows the Department to access the financial assurance for the purposes enumerated in this section and may not be accessed by the permit holder except as approved by the Department. Financial assurance for potential releases of contaminants shall be demonstrated prior to issuance of new permits and within six months of the effective date of this section for existing permits.

SECTION 3 HISTORY OF ENVIRONMENTAL COMPLIANCE
SECTION 3a.

G.S. 130A-309.06(b) is amended as follows:

" (b) The Department may refuse to issue a permit to an applicant who by past conduct ~~in this State~~ has repeatedly violated ~~related~~ statutes, rules, orders, or permit terms or conditions relating to ~~any solid waste management facility~~ environmental protection and who is deemed by the Department to be responsible for the violations. For the purpose of this subdivision, an applicant includes the owner or operator of the facility, or, if the owner or operator is a business entity, the parent, subsidiary or other affiliate of the applicant, ~~the parent of the subsidiary corporation,~~ a partner, ~~a corporate~~ officer, ~~or~~ director, ~~or a stockholder holding more than fifty percent (50%) of the stock of the corporation.~~ member, manager, and any person with a direct or indirect financial or equity interest in the applicant, other than a minority shareholder of a publicly traded corporation who has no involvement in management or control of the corporation or any of its subsidiaries or affiliates.

SECTION 3b.

G.S. 130A-294(b2)(2) is amended as follows:

(2) Has substantially complied with the requirements applicable to any ~~solid waste~~ activity in which the ~~applicant~~ applicant, or a parent, subsidiary or other affiliate of the applicant or parent, or a joint venturer with a direct or indirect financial or equity interest in the applicant, has previously engaged and has been in substantial compliance with federal and state laws, regulations, and rules for the protection of the environment. In determining whether the applicant and its affiliates have substantially complied with environmental laws in previous activities, the Department may consider the environmental compliance history of:

a. Officers, directors, managers, members, and partners in the applicant business entity;
b. All persons with a direct or indirect financial or equity interest in the applicant;
c. Officers, directors, managers, members, and partners in any business entity which has a direct or indirect financial or equity interest in the applicant;
d. Officers, directors, managers, members and partners in any business entity which is a parent, subsidiary or other affiliate of the applicant.

The applicant shall provide environmental compliance history information for each facility, business, business entity, joint venture or other undertaking in which any of the persons listed above is or has been an owner, operator, officer, director, manager, member, or partner, or in which any of the persons listed above has had a direct or indirect financial or equity interest, as requested by the Department."

SECTION 4. Sanitary landfill owner defined.

G.S. 130A-309.27(a)(1) is amended as follows:

"(1) "Owner or operator" means, in addition to the usual meanings of the term, any owner of record of any interest in land on which a landfill is or has been sited, and any person or ~~corporation~~ business entity which owns, directly or indirectly, a ~~majority~~ financial or equity interest in any other ~~corporation~~ business entity which is the owner or operator of a landfill, except that a minority shareholder of a publicly traded corporation who has no involvement in management or control of the corporation or any of its subsidiaries or affiliates shall not be considered an owner or operator solely on the basis of his stock holdings."

SECTION 5. Violation of permits

G.S. 130A-18 (a) is amended as follows:

" (a) If a person shall violate any provision of this Chapter; ~~or~~ the rules adopted by the Commission or rules adopted by a local board of health; or a condition or term of a permit or order issued under this Chapter, the Secretary or a local health director may institute an action for injunctive relief, irrespective of all other remedies at law, in the superior court of the county where the violation occurred or where a defendant resides.

(b) The Secretary of Environment and Natural Resources and a local health director shall have the same rights enumerated in subsection (a) of this section to enforce the provisions of Part 4 of Article 5 and Articles 8, 9, 10, 11, and 12 of this Chapter. (1983, c. 891, s. 2; 1997-443, s. 11A.61; 2001-474, s. 20; 2006-255, s. 13.4.)

G.S. 130A-22(a) is amended as follows:

"(a) The Secretary of Environment and Natural Resources may impose an administrative penalty on a person who violates Article 9 of this Chapter, rules adopted by the Commission pursuant to Article 9, or any term or condition of a permit or order issued under Article 9. Each day of a continuing violation shall constitute a separate violation. The penalty shall not exceed ten thousand dollars ($10,000) per day in the case of a violation involving nonhazardous waste. The penalty shall not exceed thirty-two thousand five hundred dollars ($32,500) per day in the case of a first violation involving hazardous waste as defined in G.S. 130A-290 or involving the disposal of medical waste as defined in G.S. 130A-290 in or upon water in a manner that results in medical waste entering waters or lands of the State; and shall not exceed fifty thousand dollars ($50,000) per day for a second or further violation involving the disposal of medical waste as defined in G.S. 130A-290 in or upon water in a manner that results in medical waste entering waters or lands of the State. The penalty shall not exceed thirty-two thousand five hundred dollars ($32,500) per day for a violation involving a voluntary remedial action implemented pursuant to G.S. 130A-310.9(c) or a violation of the rules adopted pursuant to G.S. 130A-310.12(b). If a person fails to pay a civil penalty within 60 days after the final agency decision or court order has been served on the violator, the Secretary of Environment and Natural Resources shall request the Attorney General to institute a civil action in the superior court of any county in which the violator resides or has his or its principal place of business to recover the amount of the assessment. Such civil actions must be filed within three years of the date the final agency decision or court order was served on the violator.

G.S. 130A-22 is amended by the addition of a new paragraph (j) which reads as follows:

"(j) The Secretary of Environment and Natural Resources may also assess a person who is assessed a civil penalty under this section the reasonable costs of any investigation, inspection, or monitoring that results in the assessment of the civil penalty."

SECTION 6. Notice of change of ownership.

G.S. 130A-294 is amended by adding a new subsection to read:

"( ) Solid waste management permits are not transferable. The person holding a permit for a solid waste management facility shall notify the Department of any significant change in the structure of the business entity that owns or operates the facility; the identity of any person or business entity previously identified as an owner or operator of the facility pursuant to G.S. 130A-309.27(a)(1); or in the financial assets identified in the financial qualification of the owner or operator. Notice to the Department shall be provided within 30 days. A change shall be considered significant if it has the potential to effect the financial qualifications of the permit holder or if it would result in a change in the identity of the owners or operators for purposes of either financial qualification or environmental compliance review. The Department may require new

financial qualification and environmental compliance reviews based those changes and may modify, revoke or require issuance of a new permit based on the outcome of the reviews."

SECTION 7. Transportation of nonhazardous solid waste.

G.S. 130a-294(a) is amended by adding a new subdivision to read:

"( ) Waste containers used for transport of solid waste by railway or barge, including the barge or railcar if the waste is not containerized, shall:

(1) be designed, constructed, loaded, operated, secured and maintained so as to prevent the escape of wastes, liquids, and odors and to prevent the loss or spillage of wastes in the event of an accident.

(2) be stacked safely and be secured to prevent accidents during transportation, loading and unloading.

(3) be completely enclosed or covered.

(4) be certified as having passed the following test to show that it is watertight, when it is placed in service and at least once every six months thereafter while it remains in service:

(i) have a minimum internal head of 24 inches of water applied to the container in an upright position for at least 15 minutes during which the container shall remain free from the escape of water.

(ii) be visually inspected for damage on all sides, plus the top and bottom and must have no visible holes, gaps or structural damage affecting its integrity or performance.

Owners of all containers shall keep a record of testing of each container for three years and provide copies of those records to persons who lease or handle the container. Such records shall be available to the Department for inspection at any receiving facility permitted by the Department.

The entry of liquids into a container; escape, loss or spillage of wastes or liquids from a container; or escape of odors from a container during transportation, holding and storage operations or in the event of an accident, shall be a violation of this subsection."

SECTION 8. Traffic study required.

G.S. 130A-294(a) is amended by adding a new subsection to read:

"( ) No application for a permit for a new solid waste management facility that is proposed to accept greater than 100,000 tons of waste per year shall be considered until a traffic study is completed. The study shall at a minimum include the following:

a. Identification of routes from the nearest limited access highway used to access the proposed facility and daily and hourly traffic volumes that will result along each approach route;

b. A map identifying land uses located along the identified approach routes, including but not limited to residential, commercial, and industrial development; agricultural operations; and identification of residences, schools, hospitals, nursing homes and other significant buildings fronting the roadways. Describe potential adverse impacts of increased facility traffic volumes and describe mitigation measures.

c. Identification of locations on approach routes where road conditions are inadequate to handle the increased traffic associated with the proposed facility. Describe potential mitigation measures.

The Department shall condition any permit issued for a solid waste management facility to provide mitigation of adverse impacts identified from the traffic study. The Commission may adopt rules to implement this section."

SECTION 9. Local government landfill liaison

G.S. 153A/160A (for counties/municipalities) is amended by adding a new subsection to read:

"( ) A local government that has planning jurisdiction over the site of a solid waste management facility with a service area greater than or equal to a 100 mile radius may employ a local government landfill liaison. The landfill liaison shall be a certified landfill manager in accordance with G.S. 130A-309.06. The landfill liaison may enter the landfill facility at reasonable times and inspect the landfill operation for purposes of :

a. ensuring that the facility meets all local requirements
b. identifying and notifying the Department of potential violations of landfill requirements; and
c. identifying and notifying the Department of potentially hazardous conditions.

The landfill liaison may not direct the operation of the facility."

SECTION 10. Independent engineer perform construction quality assurance

G.S. 130A-294 is amended by adding a new subsection as follows:

" ( ) The owner of a sanitary landfill shall employ a project engineer to inspect the construction of sanitary landfill units, landfill leachate handling facilities and landfill appurtenances. The project engineer shall be licensed to practice engineering in the State of North Carolina and must be independent of both the landfill owner and any person engaged in the design or construction of the landfill. The project engineer is responsible for observing, documenting and certifying that construction of the solid waste management facility units, leachate handling facilities and landfill appurtenances conforms to the plan approved by the Department, the permit to construct, and the rules adopted by the Commission. The project engineer or the engineer's representative shall be at the site at all times during the initial construction phase of the containment and leachate collection systems, shall observe and perform all required systems audits of the quality control inspections and shall ensure proper implementation of the design and permit requirements. All certifications must bear the seal and signature of the professional engineer and the date of certification."

SECTION 11(a) Minimum standards for new landfills and for landfill expansions onto previously unpermitted property .

G.S. 130A-294 is amended by adding a new subsection as follows:

"( ) The following standards shall apply to landfill facilities permitted after the effective date of this section and lateral expansions of landfill facilities onto property that was not included in a landfill permit issued prior to the effective date of this section:

(1) Municipal Solid Waste landfill units shall be constructed with double liners and must include a leak detection system between the liners and a low permeability layer under the secondary liner.

(2) Construction and Demolition landfill units shall be constructed with a composite liner system consisting of two components. The upper component shall consist of a flexible membrane liner and the lower component shall consist of a minimum of two feet of compacted soil with a maximum permeability of 1×10^{-7} centimeters per second. The liner shall be a minimum of 30 mil in thickness, except that a liner composed of high density polyethylene shall be a minimum of 60 mil in thickness. The liner shall be installed in direct and uniform contact with the compacted soil layer. The Department may approve an alternate liner system if the Department finds, based on modeling, that the alternate liner system will provide equivalent or greater impermeability.

(3) Sanitary landfill units shall be constructed so that the post-settlement bottom elevation of the liner system, or the post-settlement bottom elevation of the waste if no liner system is required, is a minimum of five feet above the seasonal high groundwater table and the bedrock datum plane contours established during the hydrogeologic investigation phase of the permit process.

(4) Sanitary landfill units and lateral expansions of existing units shall establish a minimum buffer distance between the waste boundary and streams or wetlands of 200 feet. The Department may approve a buffer that is less than 200 feet, but in no case less than 100 feet, upon finding that both of the following apply:

a. The proposed landfill or landfill expansion will serve a critical need in the community.
b. No feasible location exists that would allow for siting or expansion of the landfill in compliance with the requirement for 200 foot buffers.

(5) Sanitary landfill units shall not be placed in the 100-year flood plain or in lands reclaimed from previously designated 100-year flood plains.

[We need to harmonize (5) with the floodplain statutes – G.S. 143-215.54 and 143-215.54A. G.S. 143-215.54(c) prohibits solid waste disposal facilities, hazardous waste management facilities, salvage yards and chemical storage facilities in the 100-year floodplain, but 143-215.54A(b) allows the local government to issue a variance from that prohibition. We have not yet decided whether to keep the variance option and if so whether it should be at the state or local level.]

Section 11(b) Standards for landfill units that received a permit to construct after effective date

G.S. 130A-294 is amended by adding a new subsection to read:

"( ) The following criteria shall apply to all lined sanitary landfill units permitted on or after the effective date of this section.

(1) Any required leachate collection system shall be designed to return the head on the liner to one foot (30 cm) or less, within 72 hours, from a design storm of 25 year-24 hour falling on an empty cell. The leachate collection system shall maintain a head of less than one foot (30 cm) at all times during leachate recirculation. The operator may be required to monitor head on the liner to demonstrate that the head is being maintained in accordance with the rules and this section.
(2) All geomembrane base liner systems used in sanitary landfill units shall be tested for leaks and damage, by methods approved by the Department, to ensure that the liner is 100% evaluated.
(3) All leachate collection lines shall be designed and constructed to permanently allow remote camera inspection and cleaning. All leachate lines shall be cleaned and shall be remotely inspected by camera on an annual basis. The documentation of the camera inspection and the annual cleaning shall be placed in the facility operating record and provided to the Department upon request.
(4) All pipes used to transmit leachate shall provide dual containment outside of the lined disposal unit. New units and lateral expansions shall be constructed without pipe penetrations of the bottom liner, whether for leachate, stormwater or gas.

The Commission may adopt rules as needed to implement this section."

SECTION 11(c) Improve landfill standards.

The Commission shall review rules relating to the siting, construction and design of solid waste facilities to determine whether changes are required to protect the public health and environment; to improve the performance of solid waste management facilities; to take advantage of technological advances in landfill construction, maintenance and design; and to provide additional protection to environmentally sensitive areas of the state. The Commission shall enact rules necessary to minimize impacts to the environment and protect public health. These rules shall:

(1) Establish standards for the collection, control and utilization or destruction of landfill gasses at municipal solid waste landfills;
(2) Establish standards for the construction, operation, and maintenance of bioreactor landfills;
(3) Establish criteria for development of bird and wildlife management plans; and
(4) Incorporate measures necessary to minimize impacts to natural, historic and cultural resources, including but not limited to wetlands, critical fisheries habitat, parks, recreation areas, cultural and historic sites, and potential water supplies.

SECTION 11(d) Waste screening.

G.S. 130A-294 is amended by adding a new subsection to read:

"( ) Solid waste management facilities [permitted after the effective date of this section] shall have a waste screening plan approved by the Department. The plan shall identify measures adequate to ensure compliance with state laws, rules and applicable local ordinances that ban specific types of waste from disposal in solid waste landfills. The plan shall address all sources of waste generation."

SECTION 12a.

G.S. 130A-294 (4)(b) is amended as follows:

"The issuance of permits for sanitary landfills operated by local governments is exempt from the environmental impact statements required by Article 1 of Chapter 113A of the General Statutes, entitled the North Carolina Environmental Policy Act of 1971 unless the sanitary landfill will exceed any of the following thresholds:

1.The landfill will receive more than 300,000 tons of solid waste per year.
2. The landfill will have the capacity to dispose of more than 15,000,000 cubic yards of solid waste.
3. The landfill has a proposed service area equal to or greater than a 100 mile radius.

All sanitary landfill permits issued to local governments prior to July 1, 1984, are hereby validated notwithstanding any failure to provide environmental impact statements pursuant to the North Carolina Environmental Policy Act of 1971;"

Section 12b Note: should apply to pending applications.

G.S. 130A-294 is amended by adding a new subsection to read:

" ( ) An applicant for a permit to construct a sanitary landfill shall conduct a study of environmental impacts if the landfill will exceed any of the following thresholds:

1. The landfill will receive more than 300,000 tons of solid waste per year.
2. The landfill will have the capacity to dispose of more than 15,000,000 cubic yards of solid waste.
3. The landfill will have a proposed service area equal to or greater than a 100 mile radius.

The study of environmental impacts shall meet all of the requirements for an environmental impact statement under G.S. 113A-4 and rules adopted by the Department of Administration to implement the statute. In addition to information required for an adequate environmental impact statement under G.S. 113A-4 , the study shall address: the need for additional waste disposal capacity; consistency with North Carolina's solid waste management plan; the applicant's ability to ensure compliance with state law affecting

solid waste disposal (including bans on disposal of certain types of waste in landfills); and an alternative sites analysis. The Department shall publish notice of the draft environmental impact statement and shall hold a public hearing in the county where the landfill will be located no sooner than 30 days following the public notice. The Department shall consider the study of environmental impacts and mitigation measures proposed by the applicant in making the decision to issue or deny a permit."

SECTION 13. Amendments to Franchise Authority
Hold for language

SECTION 14 Denial of Permits for Solid Waste Facilities
G.S. 130A-294 is amended by addition of a new subsection to read:
"( ) The Department shall deny an application for a permit for a solid waste facility upon finding:
(1) That construction or operation of the facility will violate water quality standards for groundwater or surface waters, including wetlands, adopted by the Environmental Management Commission.
(2) That construction or operation of the facility will result in loss or significant reduction of continued long-range productivity that would jeopardize a renewable resource of more than local concern, including but not limited to watersheds or aquifers that are sources of public water supply.
(3) That construction or operation of the facility will result in significant damage to fragile or historic areas and other areas containing environmental or natural resources of more than local significance. These areas include, but are not limited to national or State parks or forests; wilderness areas; historic sites; recreation areas; segments of the natural and scenic rivers system; wildlife refuges, preserves and management areas; areas that provide habitat for threatened or endangered species; primary nursery areas and critical fisheries habitat designated by the Marine Fisheries Commission; and Outstanding Resource Waters designated by the Environmental Management Commission.
(4) That construction or operation of the facility will jeopardize public rights to access or use public trust waters.
(5) That the facility will be located in a natural hazard area, such as a floodplain or an area subject to excessive seismic activity, such that the facility will present a risk to public health or safety.
(6) In any case, that the proposed facility is inconsistent with rules adopted by the Commission for Health Services.
(7) In any case, that the proposed facility is inconsistent with ordinances adopted by the local government that has planning jurisdiction over the site of the proposed facility.
(8) In any case, that considering engineering requirements and all economic costs there is a practicable alternative that would accomplish the overall project purposes with less adverse impact on public resources.
(9) In any case, that the proposed development would contribute to cumulative effects that would be inconsistent with the guidelines set forth in subdivisions (1) through (5) of this subsection. Cumulative effects are impacts attributable to the collective effects of a number of projects and include the effects of additional projects similar to the
requested permit in areas available for development in the vicinity."

SECTION 15 Permit fees.
Article 9 of Chapter 130A of the General Statutes is amended by adding a new section to read:
"**§ 130A-293.1. Fees applicable to permits for solid waste management facilities.**
(a) It is the intent of the General Assembly that the fees collected pursuant to this section shall be used to support the Department's solid waste management program.

(b) The Solid Waste Management Account is established as a non-reverting account within the Department. All fees collected under this section shall be credited to the Account and shall be used for personnel and other resources necessary to do any one or more of the following:

(1) Provide a high level of professional review of permit applications for solid waste landfills and other solid waste management facilities;

(2) Provide timely review of permit applications;

(3) Improve monitoring of solid waste management facilities;

(4) Increase compliance activities related to solid waste management facilities; and

(5) Review and update rules governing the construction and operation of solid waste landfills to recognizing advances in technology and research to better protect public health and the environment.

(c) Applicants for permits shall pay an application fee according to the following schedule:

(1) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$25,000

(2) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$15,000

(3) Municipal Solid Waste Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(4) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $50,000

(5) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $30,000

(6) Municipal Solid Waste Landfill accepting 100,000 tons/year or more of solid waste – Modification - $3,000

(7) Construction and Demolition Landfill accepting less than 100,000 tons/year of solid wasteNew Permit-$15,000

(8) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(9) CONSTRUCTION AND DEMOLITION Landfill accepting less than 100,000 tons/year of solid waste – Modification - $1,500

(10) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste - New Permit - $30,000

(11) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Amendment - $18,500

(12) Construction and Demolition Landfill accepting 100,000 tons/year or more of solid waste – Modification - $2,500

(13) Industrial Landfill accepting less than 100,000 tons/year of solid waste-New Permit-$15,000

(14) Industrial Landfill accepting less than 100,000 tons/year of solid waste-Amendment -$9,000

(15) Industrial Landfill accepting less than 100,000 tons/year of solid waste Modification -$1,500

(16) Industrial Landfill accepting 100,000 tons/year or more of solid waste New Permit -$30,000

(17) Industrial Landfill accepting 100,000 tons/year or more of solid waste Amendment -$18,500

(18) Industrial Landfill accepting 100,000 tons/year or more of solid waste Modification - $2,500
(19) Tire Monofill New Permit - $1,750
(20) Tire Monofill Amendment - $1,250
(21) Tire Monofill Modification - $500
(22) Treatment and Processing New Permit - $1,750
(23) Treatment and Processing Amendment $1,250
(24) Treatment and Processing Modification $500
(25) Transfer Stations New Permit - $5,000
(26) Transfer Stations Amendment - $3,000
(27) Transfer Station Modification - $500
(28) Incinerator New Permit - $1,750
(29) Incinerator Amendment - $1,250
(30) Incinerator Modification - $500
(31) Large Compost Facility New Permit - $1,750
(32) Large Compost Facility Amendment - $1,250
(33) Large Compost Facility Modification - $500
(34) Land Clearing and Inert New Permit - $1,000
(35) Land Clearing and Inert Amendment - $500
(36) Land Clearing and Inert Modification -$250

(d) The application permit fee under this section shall be paid upon submission of the permit application.

(e) A permitted solid waste management facility shall pay an annual permit fee on or before August 1 of each year according to the following schedule:

1. Municipal Solid Waste Landfill $3,500
2. Post Closure Municipal Solid Waste Landfill $1,000
3. Construction and Demolition Landfill $2,750
4. Post Closure Construction and Demolition Landfill $500
5. Industrial Landfill $2750
6.. Post Closure Industrial Landfill $500
7. Transfer Station $750
8. Treatment and Processing Facility $500
9. Tire Monofill $500
10. Incinerators $500
11. Large Compost Facility $500
12. Land Clearing and Inert Debris Landfill $500

(f) As used in this section, the following definitions apply:

(1) 'New permit' means all of the following:

a. An application for a new solid waste management facility not previously permitted by the Department. It includes one site suitability review, the initial permit to construct and one permit to operate the constructed portion of a phase included in the permit to construct.

b. An application that proposes to expand the boundary of a permitted waste management facility for the purpose of expanding the permitted activity.

c. Any application that includes a proposed expansion to the boundary of a waste disposal unit within an existing permitted solid waste management facility.

d. An application for a substantial amendment to a solid waste permit, as defined in G.S. 130A 294(b1).

(2) 'Permit amendment' means all of the following:

a. An application for a permit to construct and one permit to operate for the second and subsequent phases of landfill development depicted in the approved facility plan for an existing solid waste management permit.

b. An application for a renewal or a permit review every five years after issuance of the existing solid waste management facility permit, as required by rule.

c. Any application that proposes a change in ownership or corporate structure of a permitted solid waste management facility

(3) 'Permit modification' means all of the following:

a. an application for any change to the plans approved in the existing permit for a solid waste management facility that does not constitute a 'permit amendment' or a 'new permit'."

b. a second or subsequent permit to operate for a constructed portion of a phase included in the permit to construct.

SECTION 16. Waste disposal surcharge.

[Note: DWM proposed to recodify an existing definition of "parent" and then insert the new definition of "orphan landfill" where the definition of "parent" now appears to keep the terms being defined in alphabetical order. I don't know whether that works or not as a matter of legislative drafting.]

G.S. 130A-290(a)(21a) is recodified as G.S. 130A-290(a)(21b).

SECTION 17.

G.S. 130A-290(a)(21a) is amended to read:

"(21a) Orphan landfill' means any area, whether publicly or privately owned, that was operated as a landfill for the disposal of municipal solid waste generated by the local citizenry and general public, that ceased to receive any waste after December 31, 1982, and for which assessment and remediation is needed in order to protect public health and the environment, but does not include any landfill used primarily for waste disposal from industrial sources."

SECTION 18.

Part 2A of Article 9 of Chapter 130A of the General Statutes is amended by adding a new section to read:

"§ 130A-309.08A. Solid waste disposal fee; use of proceeds.

(a) Fee Imposed. – A fee of two dollars ($2.00) per ton of waste is imposed on the disposal of municipal solid waste or construction or demolition debris in any landfill permitted pursuant to this Part. A fee of two dollars ($2.00) per ton of waste is imposed on the transfer of solid waste to a transfer station permitted pursuant to this Part for disposal outside the State.

(b) Determination and Payment of Fee. – The owner or operator of each landfill and transfer station permitted pursuant to this Part shall maintain scales, designed to determine waste tonnage, that are approved by the Department of Agriculture and Consumer Services. Each owner or operator shall record waste tonnage at the time the waste is received and calculate and record the fees due under this section for each

quarter of the calendar year on forms approved by the Department. Each owner or operator shall provide the completed forms, report the total number of tons of waste received and pay the fees due for each quarter of the calendar year to the Department no later than the 15th day of the following calendar month. The Department shall credit all fees received pursuant to this section to the Inactive Hazardous Sites Cleanup Fund established by G.S. 130A-310.11.

(c) Use of Proceeds. – The Department shall use the proceeds of the fees imposed by this section for the following purposes:

(1) Assessment and remediation of orphan landfills.

(2) Assessment and remediation of inactive hazardous substance or waste disposal sites for which a private party is or may be responsible if the private party cannot be identified or located or if the private party is unable or refuses to assume responsibility for the assessment or remediation.

(3) Up to fifteen percent (15%) of the proceeds may be used to fund staff to administer contracts for the assessment and remediation of orphan landfills and of inactive hazardous substance or waste disposal sites pursuant to subdivisions (1) and (2) of this subsection.

(4) Up to ten percent (10%) of the proceeds may be used for grants to units of local government to support redevelopment of brownfields.

(5) Up to ten percent (10%) of the proceeds may be used by the Department to provide the State's share of the cost of assessment and remediation of sites in the State that are listed on the federal National Priorities List sites."

SECTION 19.

G.S. 130A-310.6 is amended by adding a new subsection to read:

"(c) The Secretary is authorized to develop and implement a remedial action plan for orphan landfills. Environmental and human health risks posed by an orphan landfill may be mitigated using a risk-based approach for assessment and remediation. The Secretary shall not seek cost recovery for work performed under this subsection at orphan landfills from any otherwise potentially responsible party provided that that party cooperates with assessment of the site and implementation of control and mitigation measures at the site, including but not limited to granting access to the site, allowing installation of monitoring wells, allowing installation and maintenance of improvements to the landfill cap, allowing installation of security measures, agreeing to record and implement land use restrictions, and providing access to any records regarding the orphan landfill."

SECTION 20

G.S. 130A-310.11 reads as rewritten:

"§ 130A-310.11. Inactive Hazardous Sites Cleanup Fund created.

(a) There is established under the control and direction of the Department the Inactive Hazardous Sites Cleanup Fund. This fund shall be a revolving fund consisting of any monies appropriated for such purpose by the General Assembly or available to it from grants, taxes, fees and other monies paid to it or recovered by or on behalf of the Department. The Inactive Hazardous Sites Cleanup Fund shall be treated as a nonreverting special trust fund and shall be credited with interest by the State Treasurer pursuant to G.S. 147-69.2 and G.S. 147-69.3.

(b) Funds credited to the Inactive Hazardous Sites Cleanup Fund pursuant to G.S. 130A-309.8A shall be used only as provided in G.S. 130A-309.08A(c)."

SECTION 21. The Health Services Commission may adopt rules to implement this act.

SECTION 22. Section X of this act becomes effective TO BE DETERMINED

LANDFILL FRANCHISE OPTIONS

A. Eliminate the local franchise for landfills that are not local or regional in nature, which would bring the franchise decision back in line with the normal use of franchise authority and then rely on the State permit review, with an increased emphasis on site selection criteria, to address siting issues for those landfill. This is the approach taken in the first draft. The local governments would still review the landfill application for consistency with local ordinances and consistency with local ordinances would be a factor in the permit decision. Basically, the local government's role would be the same as in any other major environmental permitting process. The local government could influence the siting of a landfill within its jurisdiction, but through the use of its planning, zoning and other regulatory authority. Removing the franchise authority for large landfills will not necessarily eliminate the possibility that a waste management company would negotiate host fees with the local government.

B. Retain the local franchise requirement for all landfills, but also require a State franchise for facilities over a certain size. One difficulty here is figuring out what the criteria would be for issuing a State franchise as distinct from the criteria used to make the permit decision. Another question will be whether a State franchise should be issued by the same agency that issues the permit. We have looked at criteria such as consistency with the State's Solid Waste Management Plan, but the Plan only sets very general goals with respect to waste reduction, recycling, research of new waste management technology, etc. Since a "franchise" is normally intended to authorize a company to provide a specific service within a specific service area, the concept of a State franchise for landfills suggests that the State would be moving toward something analogous to a certificate of need. (That would certainly make for another interesting test case for the Supreme Court.)

C. Retain the local franchise requirement for all landfills, but move the franchise decision to a point later in the permit process -- maybe after the site suitability determination -- to avoid the current situation where local approval of a franchise suggests that the siting decision has already been made. As the bill is currently drafted, that would require the waste management company to prepare an EIS and get through the site suitability review by Division of Waste Management without knowing whether the local government will issue a franchise or not.

D. Retain the local franchise requirement in its current form, but prohibit payments from a waste management company to a local government in excess of any actual costs that will be incurred by the local government as a result of siting the facility within its jurisdiction (and normal taxes, fees, etc.) The money that flows from the waste industry to local government has become a major factor in local government decisions to issue a franchise and also creates political pressure to approve the site for reasons that have nothing to do with the appropriateness of the location. Eliminating the franchise authority (as in A) may or may not end the payment of host fees entirely, although it may remove one major incentive for those payments.

AMENDED FRANCHISE LANGUAGE: OPTION A

G.S. 130a-294(b1)(2) is amended as follows:

(2) A person who intends to apply for a new permit, the renewal of a permit, or a substantial amendment to a permit for a sanitary landfill with a proposed service area of less than 100 miles in radius shall obtain, prior to applying for a permit, a franchise for the operation of the sanitary landfill from each local government having jurisdiction over any part of the land on which the sanitary landfill and its appurtenances are located or to be located. Sanitary landfills that have a proposed service area equal to or greater than 100 miles in radius do not require a local government franchise or local government approval required by the Commission, but are subject to review for consistency with local government ordinances under subsection (4) of this Section. A local government may adopt a franchise ordinance under G.S. 153A-136 or G.S. 160A-319. A franchise granted for a sanitary landfill shall include all of the following:

a. A statement of the population to be served, including a description of the geographic area.

b. A description of the volume and characteristics of the waste stream.

c. A projection of the useful life of the sanitary landfill.

d. An explanation of how the franchise will be consistent with the jurisdiction's solid waste management plan required under G.S. 130A-309.09A, including provisions for waste reduction, reuse, and recycling.

e. The procedures to be followed for governmental oversight and regulation of the fees and rates to be charged by facilities subject to the franchise for waste generated in the jurisdiction of the franchising entity.

f. A facility plan for the sanitary landfill that shall include the exact boundaries of the proposed facility, proposed development of the facility site in five-year operational phases, the boundaries of all waste disposal units, final elevations and capacity of all waste disposal units, the amount of waste to be received per day in tons, the total waste disposal capacity of the sanitary landfill in tons, a description of environmental controls, and a description of any other waste management activities to be conducted at the facility. In addition, the facility plan shall show the location of soil borrow areas, leachate facilities, and all other facilities and infrastructure, including ingress and egress to the facility.

(2a) A local government may elect to award a preliminary franchise. If a local government elects to award a preliminary franchise, the preliminary franchise shall contain, at a minimum, all of the information described in sub-subdivisions a. through e. of subdivision (2) of this subsection plus a general description of the proposed sanitary landfill, including the approximate number of acres required for the proposed sanitary landfill and its appurtenances and a description of any other solid waste management activities that are to be conducted at the site.

(3) Prior to the award of a franchise for the construction or operation of a sanitary landfill, the board of commissioners of the county or counties in which the

sanitary landfill is proposed to be located or is located or, if the sanitary landfill is proposed to be located or is located in a city, the governing board of the city shall conduct a public hearing. The board of commissioners of the county or counties in which the sanitary landfill is proposed to be located or is located or, if the sanitary landfill is proposed to be located or is located in a city, the governing board of the city shall provide at least 30 days' notice to the public of the public hearing. The notice shall include a summary of all the information required to be included in the franchise, and shall specify the procedure to be followed at the public hearing. The applicant for the franchise shall provide a copy of the application for the franchise that includes all of the information required to be included in the franchise, to the public library closest to the proposed sanitary landfill site to be made available for inspection and copying by the public.

(4) An applicant for a new permit, the renewal of a permit, or a substantial amendment to a permit for a sanitary landfill shall request each local government having jurisdiction over any part of the land on which the sanitary landfill and its appurtenances are located or to be located to issue a determination as to whether the local government has in effect a franchise, zoning, subdivision, or land-use planning ordinance applicable to the sanitary landfill and whether the proposed sanitary landfill, or the existing sanitary landfill as it would be operated under the renewed or substantially amended permit, would be consistent with the applicable ordinances. The applicant for a permit for a landfill that will be exempted from the local franchise requirement under subpart (2) of this section shall also request the local government to:

(a) review the application for consistency with the local government's solid waste management plan, including goals for development and implementation of recycling or waste reduction programs; and

(b) comment on the adequacy of emergency and other public services to serve the facility.

The request to the local government shall be accompanied by a copy of the permit application and shall be delivered to the clerk of the local government personally or by certified mail. In order to serve as a basis for a determination that an application for a new permit, the renewal of a permit, or a substantial amendment to a permit for a sanitary landfill is consistent with a zoning, subdivision, or land-use planning ordinance, an ordinance or zoning classification applicable to the real property designated in the permit application shall have been in effect not less than 90 days prior to the date the request for a determination of consistency is delivered to the clerk of the local government. The determination shall be verified or supported by affidavit signed by the chief administrative officer, the chief administrative officer's designee, clerk, or other official designated by the local government to make the determination and, if the local government states that the sanitary landfill as it would be operated under the new, renewed, or substantially amended permit is inconsistent with a franchise, zoning, subdivision, or land-use planning ordinance, shall include a copy of the ordinance and the specific reasons for the determination of inconsistency. A copy of the determination, the review for consistency with the local government's solid waste management plan and comments on the adequacy of local services shall be provided to the applicant when the

determination is submitted to the Department. The Department shall not act upon an application for a permit under this section until it has received a determination from each local government requested to make a determination by the applicant; provided that if a local government fails to submit a determination to the Department as provided by this subsection within 15 days after receipt of the request, the Department shall proceed to consider the permit application without regard to a franchise, local zoning, subdivision, and land-use planning ordinances. Unless the local government makes a subsequent determination of consistency with all ordinances cited in the determination or the sanitary landfill as it would be operated under the new, renewed, or substantially amended permit is determined by a court of competent jurisdiction to be consistent with the cited ordinances, the Department shall attach as a condition of the permit a requirement that the applicant, prior to construction or operation of the sanitary landfill under the permit, comply with all lawfully adopted local ordinances cited in the determination that apply to the sanitary landfill. This subsection shall not be construed to affect the validity of any lawfully adopted franchise, local zoning, subdivision, or land-use planning ordinance or to affect the responsibility of any person to comply with any lawfully adopted franchise, local zoning, subdivision, or land-use planning ordinance. This subsection shall not be construed to limit any opportunity a local government may have to comment on a permit application under any other law or rule. This subsection shall not apply to any facility with respect to which local ordinances are subject to review under either G.S. 104E-6.2 or G.S. 130A-293.

February 19, 2007
DENR

SUMMARY OF LANDFILL RECOMMENDATIONS

1. Specify how a landfill applicant must demonstrate financial qualifications to construct and operate the landfill.

The applicant should provide cost estimates for: performing environmental studies; acquiring the site; designing the landfill; constructing and operating the landfill; and financial assurance required for corrective action and closure of the landfill. To show financial qualification, the applicant should submit an audited, certified, financial statement and identify sufficient assets to cover the estimated costs. Where assets of a parent, subsidiary, affiliate or joint venturer are offered in support of the financial qualifications of the applicant, then that party must be listed as an owner/operator on the facility permit.

2. Expand financial assurance requirements.

Require that the landfill operator provide financial assurance to cover possible corrective action (in the event of a leak from the landfill, for example). This would be in addition to the financial assurance currently required for the cost of closing the landfill and providing post-closure case. The minimum amount of financial assurance for corrective action should be $3 million. Financial assurance for corrective action should apply to both new and existing facilities. For new facilities, the financial assurance would be required before permit issuance.

3. Strengthen environmental compliance review of potential landfill operators.

Expand the scope of the existing environmental compliance review to include any past environmental violation (not just those related to solid waste) and a larger group of people associated with the permit applicant. For example, the environmental compliance review would be broadened to cover a person who holds a minority interest in the entity applying for a landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

4. Broaden the definition of "owner or operator".

Include in the definition of "owner or operator" any person who has a financial or equitable interest in the entity that has applied for the landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

5. Clarify solid waste enforcement provisions.

Amend the statute sections that authorize injunctive relief and civil penalties for solid waste violations to expressly allow the use of those enforcement remedies in response to a violation of a permit issued by the Department or an order issued by the Commission for Health Services. Increase the maximum civil penalty allowed for a solid waste or hazardous waste violation. Authorize the Department to recover the costs of investigating a violation.

6. Require notice to the Department of any significant change in the structure or assets of the business entity that holds a landfill permit.

The Department should be notified within 30 days of any significant change in the structure of the business entity that owns or operates the landfill facility; the identity of any person or business entity previously identified as an owner or operator of the facility pursuant to G.S. 130A-309.27(a)(1); or in the financial assets identified in the financial qualification of the owner or operator. A change is significant if it could effect the financial qualifications of the permit holder or result in a change in the identity of the owners or operators for purposes of either financial qualification or environmental compliance review. When the Department receives notice of a change, it can require a new environmental compliance or financial qualification review.

7. Set standards for safe transportation of solid waste by railway or barge.

Containers used to transport solid waste should be leak-tested and covered. Records of leak testing should be retained at the permitted solid waste facility for 3 years. It would be a violation to allow liquid to enter a container of solid waste or to allow solid waste, liquids or odors to escape from a container.

8. Require a traffic study for larger solid waste facilities.

Require that applications for solid waste management facilities proposed to handle more than 100,000 tons of waste per year include a study of the traffic impacts of the facility. The results of the study would be considered in the permit decision.

9. Authorize local landfill liaisons.

Authorize a local government with planning authority over a sanitary landfill that has a service area of greater than a 100-mile radius to designate a landfill liaison. The liaison would be a certified landfill manager, but would not direct the operation of the landfill. The landfill liaison would have authority to enter the landfill facility at reasonable times and inspect the landfill operation for purposes of: ensuring that the facility meets all local requirements; identifying and notifying the Department of potential violations; and identifying and notifying the Department of potentially hazardous conditions.

10. Require the permittee to employ an independent quality assurance engineer to oversee construction of the landfill.

The permittee should employ a licensed engineer who is independent of both the landfill owner and any person engaged in the design or construction of the landfill to inspect during construction. The project engineer would be responsible for certifying that construction of the solid waste management facility units, leachate handling facilities and landfill appurtenances conforms to the plan approved by the Department, the permit to construct, and the rules adopted by the Commission.

11. Establish minimum standards for new landfills and for landfill expansions onto previously unpermitted property.

Minimum standards for new landfills and for landfill expansion onto property that was not included within the scope of a previous permit would include:

a. double liners and a leachate collection system for municipal solid waste landfills;
b. composite liners for construction and demolition landfills;
c. a minimum separation of 5 feet between the bottom elevation of the waste (or the liner system, if the landfill has a liner) and seasonal high groundwater and bedrock;
d. a 200-foot buffer between the waste boundary and streams or wetlands (unless no feasible alternative location is available that would comply with the buffer requirement); and
e. a prohibition against siting landfill units in the 100-year floodplain or in area reclaimed from the floodplain.

12. Establish new standards for construction of lined sanitary landfill units permitted on or after the effective date of the bill

Specific standards for leachate collection systems and liners would include:

a. leachate collections systems should be designed to maintain a head of less than one foot during leachate recirculation.
b. the leachate collection system should be designed to return the head to one foot or less within 72 hours based on a 25 year-24 hour design storm falling on an empty cell.
c. geomembrane base liner systems must be tested for leaks and damage.
d. leachate collection lines should be designed and constructed to allow for remote camera inspection and cleaning. Lines should be cleaned and remotely inspected annually.
e. all pipes used to carry leachate should be constructed with dual containment outside of the lined disposal unit.
f. new units and lateral expansions should be constructed without pipe penetrations of the bottom liner, whether for leachate, stormwater or gas.

13. Direct the Commission for Health Services to review landfill rules and adopt new rules necessary to protect public health and the environment.

Rules adopted by the Commission should:

a. establish standards for the collection, control and utilization or destruction of landfill gasses at municipal solid waste landfills;
b. establish standards for the construction, operation, and maintenance of bioreactor landfills;
c. establish criteria for development of bird and wildlife management plans; and
d. incorporate measures necessary to minimize impacts to natural, historic and cultural resources, including but not limited to wetlands, critical fisheries habitat, parks, recreation areas, cultural and historic sites, and potential water supplies.

14 Require that all sanitary landfills have a waste screening plan to ensure that the facility is in compliance with waste bans.

15 Require an environmental study of very large landfills and landfills with an extended service area.

The existing exemption from the N.C. Environmental Policy Act for landfills owned and operated by local governments should be removed for facilities that receive more than 300,000 tons of waste per year; have a total disposal capacity of more than 15 million cubic yards of solid waste; or have a service area of more than 100 miles in radius. An environmental study should also be required for privately-constructed landfills that will exceed one of more of those thresholds. The environmental document would need to meet the standards for an environmental impact statement under the N.C. Environmental Policy Act and rules adopted by the Department of Administration to implement the act. The documents would also be subject to the same public notice and a public hearing would be required.

16. Change landfill franchise authority to differentiate between landfills that provide local service and those that have large regional or multi-state service areas.

The Department is still working on the specific recommendation to alter local government franchise authority.

17. Add a new statute section setting out the grounds for denial of a landfill permit.

The statute should authorize the Department to deny a landfill permit if it finds one of the following:

(a) Construction or operation of the landfill would violate water quality standards for groundwater or surface waters;

(b) The landfill would jeopardize a renewable resource of more than local concern, such as watersheds or aquifers that are sources of public water supply.
(c) Construction or operation of the landfill would damage fragile or historic areas or areas containing environmental or natural resources of more than local significance. Examples of these areas would include national or State parks or forests; wilderness areas; historic sites; recreation areas; segments of the natural and scenic rivers system; wildlife refuges, preserves and management areas; areas that provide habitat for threatened or endangered species; primary nursery areas and critical fisheries habitat designated by the Marine Fisheries Commission; and Outstanding Resource Waters designated by the Environmental Management Commission.
(d) Construction or operation of the facility would jeopardize public rights to access or use public trust waters.
(e) The facility will be located in a natural hazard area, such as an area subject to excessive seismic activity, that would increase the risk to public health or safety.
(f) The proposed facility would be inconsistent with statutory standards or rules adopted by the Commission for Health Services.
(g) The proposed facility would be inconsistent with ordinances adopted by the local government that has planning jurisdiction over the site of the proposed facility.
(h) There is a practicable alternative to be proposed landfill that would have less adverse impact on public resources.
(i) Construction of the landfill would contribute to cumulative effects that would damage a natural, historic, or cultural resource protected under the statute.

18. Establish permit fees for solid waste facilities. A copy of the proposed fee schedule is attached. Fee revenue would be used to support the solid waste regulatory program.

19. Establish a state-wide surcharge on disposal of solid waste at $2 per ton. The surcharge would apply to municipal solid waste and to construction and demolition waste that is either disposed of at a permitted solid waste facility or moves through a permitted transfer station en route to a disposal facility outside the State. The surcharge would be used to pay for cleanup of orphan landfills and other orphan inactive hazardous waste sites; provide state matching funds for remediation, monitoring and maintenance of Superfund sites in North Carolina; provide funds to local government for redevelopment of contaminated sites; and provide funds for administration of contracts to cleanup orphan landfills and inactive hazardous waste sites.

North Carolina General Statutes
ARTICLE 12D.

Environmental Review Commission.

§ 120-70.41. Commission established.

The Environmental Review Commission is hereby established.

§ 120-70.42. Membership; cochairs; vacancies; quorum.

(a) The Environmental Review Commission shall consist of six Senators appointed by the President Pro Tempore of the Senate, six Representatives appointed by the Speaker of the House of Representatives, who shall serve at the pleasure of their appointing officer, the Chair or a Cochair of the Senate Committee on Agriculture, Environment, and Natural Resources or the equivalent committee, the Chair or a Cochair of the House of Representatives Committee on Environment and Natural Resources or the equivalent committee, the Chair or a Cochair of the Senate Committee on Appropriations – Natural and Economic Resources or the equivalent committee, and the Chair or a Cochair of the House of Representatives Committee on Appropriations – Natural and Economic Resources or the equivalent committee.

(b) The President Pro Tempore of the Senate shall designate one Senator to serve as cochair and the Speaker of the House of Representatives shall designate one Representative to serve as cochair.

(c) Except as otherwise provided in this subsection, a member of the Commission shall continue to serve for so long as the member remains a member of the General Assembly and no successor has been appointed. A member of the Commission who does not seek reelection or is not reelected to the General Assembly may complete a term of service on the Commission until the day on which a new General Assembly convenes. A member of the Commission who resigns or is removed from service in the General Assembly shall be deemed to have resigned or been removed from service on the Commission. Any vacancy that occurs on the Environmental Review Commission shall be filled in the same manner as the original appointment.

(d) A quorum of the Environmental Review Commission shall consist of nine members.

§ 120-70.43. Powers and duties.

(a) The Environmental Review Commission shall have the following powers and duties:

(1) To evaluate actions of all boards, commissions, departments, and other agencies of the State and local governments as such actions relate to the environment or protection of the environment, including but not limited to an evaluation of:

a. Benefits of each program relative to costs;

b. Achievement of program goals;

c. Use of measures by which the success or failure of a program can be measured; and

d. Conformity with legislative intent;

(2) To study on a continuing basis the organization of State government as it relates to the environment or to the protection of public health and the environment, including but not limited to:

a. Improvements in administrative structure, practices, and procedures;

b. Increased integration and coordination of programs and functions;

c. Increased efficiency in budgeting and use of resources;

d. Efficient administration of licensing, permitting, and grant programs;

e. Prompt, effective response to environmental emergencies;

f. Opportunities for effective citizen participation; and

g. Broadening of career opportunities for professional staff;

(3) To make any recommendations it deems appropriate regarding the reorganization and consolidation of environmental regulatory agencies and the recodification of statutes relating to the environment, including but not limited to:

a. Ways in which agencies may operate more efficiently and economically;

b. Ways in which agencies can provide better services to the State and to the people; and

c. Instances in which functions of agencies are duplicative, overlapping, incomplete in scope or coverage, fail to accomplish legislative objectives, or for any other reason should be redefined or redistributed;

(4) To review and evaluate changes in federal law and regulations, relevant court decisions, and changes in technology affecting the environment or protection of the environment;

(5) To review existing and proposed State law and rules affecting the environment or protection of the environment and to determine whether any modification of law or rules is in the public interest;

(6) To make reports and recommendations, including draft legislation, to the General Assembly from time to time as to any matter relating to the powers and duties set out in this section; and

(7) To undertake such additional studies as it deems appropriate or as may from time to time be requested by the President Pro Tempore of the Senate, the Speaker of the House of Representatives, either house of the General Assembly, the Legislative Research Commission, the Joint Legislative Commission on Governmental Operations, the Joint Legislative Utility Review Committee, or the Joint Select Committee on

Low-Level Radioactive Waste and to make such reports and recommendations to the General Assembly regarding such studies as it deems appropriate; provided that the Environmental Review Commission shall not undertake any study which the General Assembly has assigned to another legislative commission or committee.

(b) The Environmental Review Commission may continue the study of environmental agency consolidation and reorganization. The study of environmental agency consolidation shall include, but is not limited to:

(1) Monitoring the implementation of Session Laws 1989, c. 727;

(2) Evaluation of the organization, programs, and operation of the Department of Environment and Natural Resources;

(3) Evaluation of the organization, functions, powers, and duties of the components of the Department of Environment and Natural Resources, including boards, commissions, councils, and regional offices; and

(4) Recodification of the General Statutes relating to the environment and environmental agencies.

(c) In addition to its general powers and duties, the Environmental Review Commission shall have the following powers and duties with respect to hazardous waste management:

(1) To study the current and projected need for hazardous waste treatment, storage, and disposal capacity in the State in light of anticipated generation of hazardous waste and alternatives for hazardous waste treatment and disposal;

(2) To evaluate the potential for the development of additional hazardous waste treatment, storage, and disposal capacity by the private sector;

(3) To study the necessity for and scope of hazardous waste treatment, storage, and disposal facilities which are sited, owned, or operated by the State;

(4) To review progress in securing a volunteer county to host a hazardous waste treatment facility;

(5) To study incentives and compensation for the community which hosts, either voluntarily or involuntarily, a hazardous waste treatment facility, including any additional incentives and compensation which may be needed, whether there should be differential compensation for a volunteer county, options for use of funds by local governments, distribution of compensation among local governments, and methods of providing flexibility in the development of an incentives and compensation package for a particular local community;

(6) To review progress in developing interstate agreements for the treatment, storage, and disposal of hazardous waste;

(7) To assist in the development of cooperative, comprehensive regional approach to hazardous waste treatment and disposal;

(8),(9) Repealed by Session Laws 2001-474, s. 12.

(10) To study the capacity assurance requirement under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, Pub. L. No. 96-510, 94 Stat. 2767, 42 U.S.C. 9601 et seq., as amended, and the Superfund Amendments and Reauthorization Act of 1986, Pub. L. No. 99-499, 100 Stat. 1613, as amended as it relates to the continued eligibility of North Carolina for remedial actions under Superfund;

(11) To study alternatives available to the State for dealing with hazardous waste and the ramifications of those alternatives; and

(12) To receive and evaluate reports of every State agency, board, and commission which has any power or duty with respect to hazardous waste management.

§ 120-70.44. Additional powers.

The Environmental Review Commission, while in the discharge of official duties, may exercise all the powers provided for under the provisions of G.S. 120-19, and G.S. 120-19.1 through G.S. 120-19.4. The Environmental Review Commission may meet at any time upon the call of either cochairman, whether or not the General Assembly is in session. The Environmental Review Commission may meet in the Legislative Building or the Legislative Office Building upon the approval of the Legislative Services Commission.

Notwithstanding any rule or resolution to the contrary, proposed legislation to implement any recommendation of the Environmental Review Commission regarding any study the Environmental Review Commission is authorized to undertake or any report authorized or required to be made by or to the Environmental Review Commission may be introduced and considered during any session of the General Assembly.

§ 120-70.45. Compensation and expenses of members.

Members of the Environmental Review Commission shall receive subsistence and travel expenses at the rates set forth in G.S. 120-3.1.

§ 120-70.46. Staffing.

The Legislative Services Officer shall assign as staff to the Environmental Review Commission professional employees of the General Assembly, as approved by the Legislative Services Commission. Clerical staff shall be assigned to the Environmental Review Commission through the offices of the Supervisor of Clerks of the Senate and Supervisor of Clerks of the House of Representatives. The expenses of employment of clerical staff shall be borne by the Environmental Review Commission.

§ 120-70.47. Funding.

From funds available to the General Assembly, the Legislative Services Commission shall allocate monies to fund the work of the Environmental Review Commission.

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
11 June 2007

The Environmental Review Commission (ERC) met on Monday 11 June 2007 at 3:00 p.m. in Room 544 of the Legislative Office Building. Representative Pryor Gibson and Senator Charlie Albertson presided.

The following members were present: Senators Albertson, Dorsett, Forrester, Kinnaird, Swindell and Weinstein; and Representatives Gibson, Allen, Harrison, and Warren. Mr. George Givens, Commission Counsel; Mr. Jeffrey Hudson, Assistant Commission Counsel; Ms. Jennifer McGinnis, Assistant Commission Counsel; Ms. Susan Iddings, Assistant Committee Counsel; Ms. Jennifer Mundt, Commission Analyst; Ms. Mariah Matheson, Research Assistant; and Ms. Dot Waugaman, Commission Clerk, were also present.

On 6 June 2007, notice was sent to members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. Copies of the agenda for the meeting and visitor registration sheets are included in the attachments as **Exhibits B** and **C**.

Representative Gibson called the meeting to order. He asked Mr. George Givens to comment on the agenda items. Mr. Givens announced that two reports to be presented have been distributed to members via memorandum from Ms. Jennifer Mundt (see **Exhibit D**). The first is the NC Solid Waste Management Annual report from 1 July 2005 through 30 June 2006 (see **Exhibit D-1**); the second is the final report from RTI International entitled, "A Study of the Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients" (see **Exhibit D-2**). Mr. Givens added that other reports listed on the memorandum have been received but are being held for a future meeting.

Representative Gibson introduced Mr. Paul Crissman, Solid Waste Section Chief, Division of Waste Management, Department of Environment and Natural Resources (DENR), to speak on the annual report (see **Exhibit D-1**). Mr. Crissman showed a chart that demonstrates the increase in solid waste disposal over the last 16 years. Growth in per capita disposal is forecasted to go from 1.36 tons per year per person to 1.58 tons per year per person in 2026. He commented that while the amount of solid waste is increasing, Solid Waste Section staff has decreased by 20 percent.

Added to our increase in population, the growth in the amount of solid waste to deal with is astonishing. Solid waste in the state is very mobile. Most waste travels almost 90 miles to its final destination. Almost 40 percent of the state's solid waste currently goes through a transfer station. Regional landfills handle over half the state's waste. Every regional landfill is currently operated by a company that is different from the company that obtained the original permit. Capacity of a landfill has three criteria: how much cubic space, how much time, and how many cubic tons. Many landfills have unique permit conditions that allow only certain waste from certain areas.

In recent years, the Solid Waste Section has received applications for four new landfills that would be unique: (1) three were primarily for out-of-state waste; (2) the landfills were to be sited in unusual areas. If the three landfills were constructed (one proposal was withdrawn), North Carolina would switch from being an exporter of solid waste to being an importer. Urbanization is causing a problem in finding suitable locations to construct landfills.

There are 500-700 old landfills that were closed in the late 1970s and early 1980s and replaced by permitted sanitary landfills, but before the time of hazardous waste regulations. They were a huge improvement over the old town dumps, but not as protective of the environment as the landfills constructed under more recent legislation. Newer landfills have liners in order to be in compliance with the Resource Conservation and Recovery Act and North Carolina's Health Services Commission 1998 Rule. There have been no problems with base liners to date in North Carolina. In addition, since the

early 1990s, certain materials have been banned from landfills, and programs for other waste such as scrap tires and white goods were developed to keep them out of landfills as well. Goals regarding waste reduction and policies on waste management practices were also set. Mr. Crissman ended his presentation with a discussion of the 9 areas of legislation proposed for 2007.

Senator Forrester asked if any of the old "orphan" landfills are leaking. Mr. Crissman replied that orphan landfills have contamination associated with them, but not all have been inventoried and chronicled. In cases where landfills are not owned by the original permittee, there is a question of who is liable to clean up the contamination. Mr. Crissman replied that the liability issue is not clear.

In answer to a question by Senator Swindell, Mr. Crissman said there is a concern on the part of local governments that the stream of money for cleaning up orphan landfills will not be great enough in the early years to protect them against liability as many old landfill sites are currently being used for other purposes.

Representative Gibson asked Mr. Crissman for a map of North Carolina to superimpose the two maps showing solid waste flow in 1990-1991 and in 2005-2006. He also asked about how the assignment of liability occurs when ownership of landfills changes. Mr. Crissman replied that some are friendly exchanges, but some are court-ordered settlements with anti-trust arrangements. Representative Gibson then asked what is happening on dry tomb reclamation. Mr Crissman replied there is a research project at NC State University on that process, and there will probably be a report on it at a later time. He added that it is unlikely new ways will be found to cut down the cost of reclaiming orphan landfills. Representative Gibson asked if Mr. Crissman could describe the debate between the private sector solid waste administration and the issues affecting public sector solid waste administration. Mr. Crissman answered that the public sector is fearful of being put out of business. He went on to say the Section encourages the local government sector and would like to see more local government landfill facilities. North Carolina needs good landfills.

Mr. Givens said the three main areas of disagreement over the proposed solid waste legislation have to do with the franchise and state-wide review, technical standards, and the tipping fee. Since the current bills propose dramatic increases in technical standards, the cost of tipping will increase, whether or not a tipping tax is imposed. The Department proposed a $1 per ton tipping tax in 2006 and $2 a ton this year. The current Senate bill proposes a $2.50 tipping tax. Cities and counties are opposed to a tipping fee at this point, but have expressed a willingness to talk about what the tipping fee ought to be and what its uses would be. He went on to say that it is clear that one of the things that drives waste across state lines is relative cost of disposal. An attorney for one of the major proposed landfills made that point at the Environmental Law Section of the Bar seminar which focused on the issues. What is happening is that the total tipping fee (the cost of technical standards plus taxes) in other states is overcoming the transportation costs and making North Carolina a more attractive place to dispose of waste. The total tipping fee can be a disincentive for the migration of waste.

Representative Gibson recognized Mr. Scott Mouw, Community and Business Assistance Section Chief, Division of Pollution Prevention and Environmental Assistance, DENR, to speak about the status of recycling and recycling markets in North Carolina (see **Exhibit F**). Mr. Mouw showed pictures of commodities that were once considered waste that now can be recycled into new products. Companies that make products out of recycled products are anxious to receive their raw materials from recycling programs. He said that communities that modernize their recycling programs see excellent results in the form of increased recycling. He added that with the right programs, incentives and funding, over half of North Carolina's waste stream could be diverted from disposal into commodities.

Senator Albertson took over presiding in the absence of Representative Gibson. Senator Swindell asked what the General Assembly could do to help the glass companies who currently have to get cullet from across the country to make their recycled glass. Mr. Mouw replied that we need to make sure the ABC permit requirement for bars and restaurants to recycle bottles is successfully implemented next year. When communities have high participation rates and collect a lot of materials, recycling programs are very efficient.

Representative Harrison asked what new materials will be banned in landfills in the coming years. Mr. Mouw replied plastic bottles will be banned beginning in October 2009; wooden pallets from landfills generated from municipal solid waste landfills; and glass bottles from ABC permit holders. Although there has been a ban on aluminum cans since 1994, only about half the cans are recycled.

Senator Albertson asked how much is being recycled at present. Mr. Mouw said according to reports from local governments, about 1.3 million tons are being recycled by them. Anecdotal data indicates we are recycling 25-30 percent over all. He added that if there were a tax incentive for grocery stores to compost rather than to throw leftover food into a landfill there might be less going into the landfills.

Senator Albertson introduced Mr. Michael Gallaher, RTI International, to present results of "A Study of the Costs Associated with Providing Nutrient Controls that Are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients" (see **Exhibit G**). Mr. Dallas Wood presented information on the data collection and an overview of the cost developed. Mr. Gallaher then discussed the findings for each of six objectives:

- Objective 1: Evaluate the sustainability of the program at the current fee of $11 per pound of nitrogen
- Objective 2: Develop a proposed fee based on the cost-effectiveness analysis
- Objective 3: Develop a formula for calculating the offset payment fee
- Objective 4: Assess the advantages and disadvantages of expanding the nutrient offset payments to other nutrients and additional areas of the state
- Objective 5: Evaluate the ability of public (other than the EEP) and private entities to provide nutrient offsets
- Objective 6: Develop a comprehensive review of potential nutrient mitigation efforts available

In response to a question by Representative Harrison, Mr. Givens said that each house has passed a bill to extend the $11 cost per pound to mitigate discharges of nitrogen and other nutrients for another year. He added that either bill could pass as is or could be modified based on the findings of the report. The co-chairs will decide whether to handle the results of the report in a separate ERC meeting or through the session committees.

The meeting adjourned at 4:45 p.m.

Representative Pryor Gibson, Co-Chair, Presiding

Senator Charlie Albertson, Co-Chair, Presiding

Dot Waugaman, Commission Clerk

Senator Daniel Clodfelter, Co-Chair

RE: **Notice of Commission Meetings**
Additional Information

COMMISSION MEETINGS:

The Environmental Review Commission (ERC) will meet at 3:00 p.m. on Monday 11 June 2007 in Room 544 of the Legislative Office Building in Raleigh. The purpose of this meeting is to receive and review the following:

1. The Annual Report on Solid Waste Management (G.S. 130A-309.06(c)).

2. The Final Report on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and other Nutrients (Nutrient Offset Payments) prepared by Research Triangle Institute, International pursuant to S.L. 2006-215, as amended by S.L. 2006-218 and Section 5.3 of S.L. 2006-255.

The Environmental Review Commission (ERC) and the Joint Legislative Transportation Oversight Committee will meet at 5:00 p.m. on Monday 11 June 2007 in Room 544 of the Legislative Office Building in Raleigh. The purpose of this meeting is to receive and review:

1. The Final Report and recommendations on the Merger of the Ecosystem Enhancement Program and the Clean Water Management Trust Fund prepared by Dye Management Group pursuant to Section 16 of Part XVI of S.L.2006-248.

No public staff meeting will be held in connection with this meeting.

ADDITIONAL INFORMATION:
If you have questions related to the Commission, you may contact the Commission Counsel or other Commission staff at (919) 733-2578.

AGENDA
3:00 p.m. Monday 11 June 2007
Room 544 Legislative Office Building
Raleigh, North Carolina

1. Call to order
   Representative Pryor A. Gibson, Presiding

2. Introductory remarks by Cochairs
   Representative Pryor A. Gibson
   Senator Charles W. Albertson
   Senator Daniel G. Clodfelter

3. Report to the Commission and explanation of agenda items
   George F. Givens, Commission Counsel

4. Annual report on the status of solid waste management efforts (G.S. 130A-309.06(c))
   Paul S. Crissman, Solid Waste Section Chief
   Division of Waste Management, Department of Environment and Natural Resources (DENR)

   Scott B. Mouw, Community and Business Assistance Section Chief
   Division of Pollution Prevention and Environmental Assistance, DENR

5. Final Report by Research Triangle Institute (RTI) International on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients (S.L. 2006-215, as amended by S.L. 2006-218 and Sec. 5.3 of S.L. 2006-255)
   Michael P. Gallaher, Director, Technology, Energy, and the Environment
   RTI International

   Dallas Wood, Research Economist
   RTI International

6. Commission discussion and announcements

7. Adjourn

MEMORANDUM

To: Members of the Environmental Review Commission
From: Jennifer Mundt, Commission Analyst
Re: Reports to the Commission

The following report has been submitted by the Department of Environment and Natural Resources (DENR) to the Environmental Review Commission since the last reports distribution on 13 March 2007. This report is distributed in connection with today's ***Agenda Item # 4*** and is attached to this memorandum:

1. *North Carolina Solid Waste Management Annual Report July 1, 2005 through June 30, 2006.* 15 January 2007. Statutory Authority: G.S. 130A-309.06(c).

The following report has been submitted by Research Triangle Institute (RTI), International to the Environmental Review Commission since the last reports distribution on 13 March 2007. This report is distributed in connection with today's ***Agenda Item #5*** and is attached to this memorandum:

1. *Final Report on the Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and Other Nutrients.* Authority: S.L. 2006-215, as amended by S.L. 2006-218 and Sec. 5.3 of S.L. 2006-255.

The following reports have been received since the last reports distribution on 13 March 2007 and are being held for distribution either as read-only or for presentation at a future meeting of the Commission. If you would like a copy of one of these reports in advance of the next meeting, please contact Jennifer Mundt at (919) 733-2578 or jennifermu@ncleg.net for assistance.

1. *Final Report on the Costs and Benefits of Reducing Emissions of Oxides of Nitrogen, Particulate Matter, and Greenhouse Gases from Motor Vehicles in this State.* 1 April 2007. Authority: S.L. 2006-248, Sec. 43.

2. *Annual Report on the Implementation of S.L. 2002-4 (Clean Smokestacks Act).* 1 June 2007. Authority: S.L. 2002-4, Sec. 14.

3. *Findings of the Community Conservation Assistance Program Review.* 31 March 2007. Authority: S.L. 2006-78.

4. *Semi-Annual Report on the Pilot Program for Inspection of Animal Waste Management Systems.* 15 April 2007. Authority: S.L. 2003-340, Sec. 6.2.

5. *Annual Report and Recommendations on the One-Stop Permit Assistance Program.* 1 October 2006. Statutory Authority: G.S. 143B-279.12.

6. *Annual Report on Litter Enforcement, Prevention, and Removal Efforts.* 1 March 2007. S.L. 2006-79, Sec. 15.

Please contact George Givens, Jeff Hudson, Jennifer McGinnis, Jennifer Mundt, or Mariah Matheson at (919) 733-2578 if you have any questions or comments.

- B County per Capita Rate
- C Imports and Exports
- D Municipal Solid Waste Landfill Capacity by Facility

CHAPTER 1 – Solid Waste Management

Executive Summary

The state per capita disposal rate is 1.36 tons per person per year, a 5 percent increase beyond last fiscal year and an increase of 27 percent from the FY 91-92 base year. North Carolina communities disposed of 11,765,183 tons of waste in North Carolina and out-of-state facilities. This represents an increase of 705,021 tons over the previous fiscal year. North Carolina-permitted solid waste management landfills received a total of 10,668,856 tons of solid waste during FY 2005-2006. Approximately 137,000 tons originated from other states, an increase of over 18,000 tons from FY 2004-2005. South Carolina and Virginia were the sources for all imported waste. North Carolina continues to export more waste than it imports. Over 1,234,000 tons of waste were exported in FY 2005-2006 compared to 137,980 tons imported into the state. During the 2005-2006 Fiscal Year, an increase of 72,381 tons of additional waste were exported from North Carolina to Georgia, South Carolina, Virginia, and Tennessee. There are four proposed landfills to be located in Eastern North Carolina that plan to import waste from out of state. The forecast for waste disposal requirements 10 years into the future indicates a need for disposal capacity to handle approximately 14 million tons of waste annually. Disposal rates of construction and demolition waste over the last five years are increasing at rates which are three times the disposal rates of municipal solid waste.

Waste Disposal

Current Year

North Carolina communities disposed of 11,765,183 tons of municipal and construction and demolition waste in North Carolina and out-of-state facilities.

Per Capita Rates (all waste)

The state measures changes in waste disposal rates by comparing the current year's per capita waste disposal rate to Fiscal Year 91-92 year's base per capita rate. (**Formula: Total Tons Disposed ÷ Population = Per Capita Disposal Rate**). Negative numbers indicate a decrease in the per capita disposal rate; positive numbers an increase. Waste reduction is a change from the base year, not a change from year to year. As seen in the following table, North Carolina continues to increase the absolute amount of waste disposed.

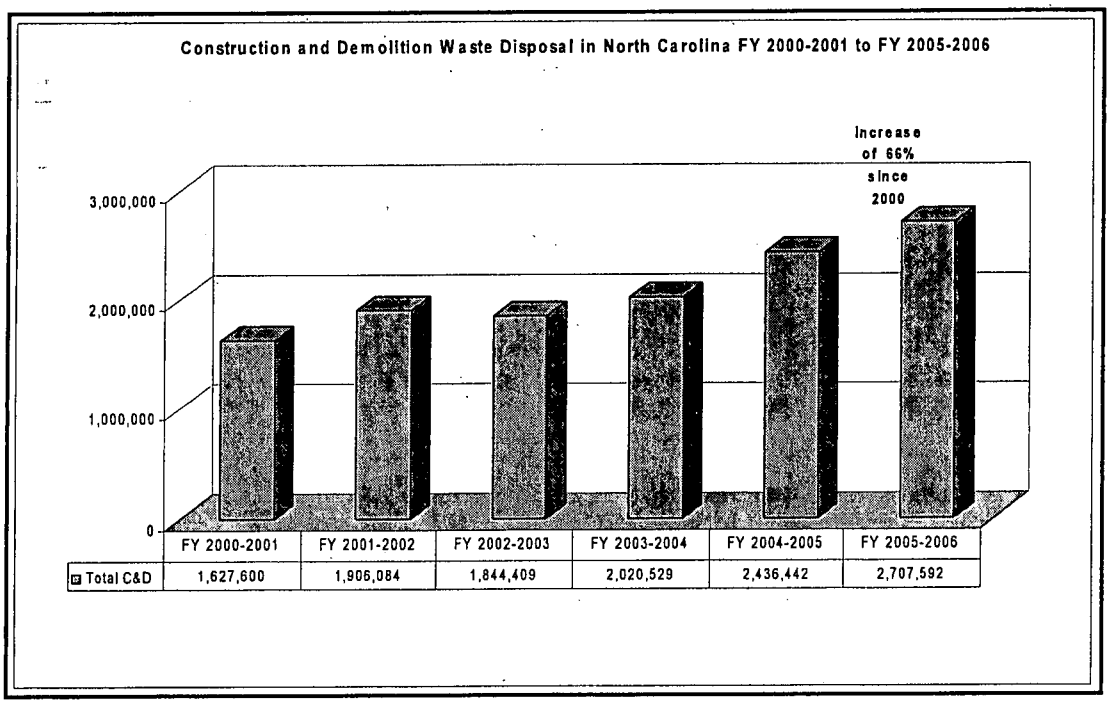
Fiscal Years	Tons Disposed	Population	Per Capita Disposal Rate	Percent Waste Change from Base Year 1991-1992
2005-2006	**11,765,183**	**8,682,066**	**1.36**	**27%**
2004-2005	11,029,485	8,541,263	1.29	21 %
2003-2004	10,713,444	8,418,090	1.27	19 %
2002-2003	10,236,960	8,323,375	1.23	15 %
2001-2002	9,999,284	8,188,008	1.22	14 %
2000-2001	9,752,510	8,049,313	1.21	13 %
1999-2000	10,267,137	7,938,062	1.29	21 %
1998-1999	9,214,323	7,797,501	1.18	10 %
1997-1998	8,607,578	7,645,512	1.13	5 %
1996-1997	8,741,727	7,490,812	1.17	9 %
1995-1996	7,722,795	7,336,228	1.05	-2 %
1994-1995	7,624,144	7,180,525	1.06	-1 %
1993-1994	7,038,505	7,036,927	1.00	-7 %
1992-1993	6,890,818	6,892,673	1.00	-7 %
1991-1992	(managed) 7,257,428	6,781,321	(Base Year Rate) 1.07	
1990-1991	7,161,455	6,632,448	1.08	

Statewide solid waste disposal reporting began in FY 90-91. The state made slight reductions in per capita waste rates in the early 1990s. Several factors caused these reductions. In 1990, weighing of all waste at municipal solid waste landfills was initiated by legislative statute. Facilities started charging a disposal fee for each ton of waste disposed. The disposal fee, commonly called a tipping fee, lessened waste disposal for a period of time and created an incentive to explore alternatives to landfill disposal. Strong public and private interest helped local governments start recycling and waste reduction programs in response to state mandates and a perceived disposal crisis. In 1991, tipping fees charged by landfills averaged $18 per ton. At the time, this additional cost was considered to be economically prohibitive for landfill use as a means of disposal. This year, the average cost in North Carolina is $35 per ton. Despite the increase in price, tipping fees in North Carolina remain some of the lowest in the United States.

Waste disposal is a free-market industry involving competition, which helps to keep disposal costs for consumers low. From 1991 to 2006, the face of waste disposal drastically changed as more stringent state regulations required construction of more costly state-of-the-art lined landfills. Many local governments got out of the "business" of waste disposal. Ownership of landfills has moved primarily toward the private sector. The number of active municipal solid waste landfills managed by local governments has decreased from 105 in 1991 to 32 in June 2006. In the same 15-year time period, private landfills increased from 5 to the current number of 8 privately owned landfills. Of the 11 largest municipal solid waste landfills only 3 - Wake County, Hanes Mill Road (city of Winston-Salem) and New Hanover County - are owned by local governments.

Construction and Demolition Waste

As development continues, roads, new buildings and homes are constructed, and the demolition of old buildings and factories takes place, North Carolina will see a continual increase in construction and demolition waste disposal. The occurrence of a natural disaster such as a hurricane or flood could augment the growth of construction and demolition disposal even further. North Carolina's construction and demolition landfills have seen a significant increase in disposal over the past five years. The previous FY 2005-2006 disposal of construction and demolition waste in North Carolina landfills totaled 2,707,592 tons. This number represents a 66 percent increase above the Fiscal Year 2000-2001 amount of 1,627,600. Increases last year were in part due to demolition of the old Pillowtex Plant in Cabarrus county and large amounts of construction and demolition activities at the Fort Bragg Army base in Cumberland County. Municipal solid waste disposal in North Carolina saw an increase of only 18 percent over the same period.



Imports and Exports

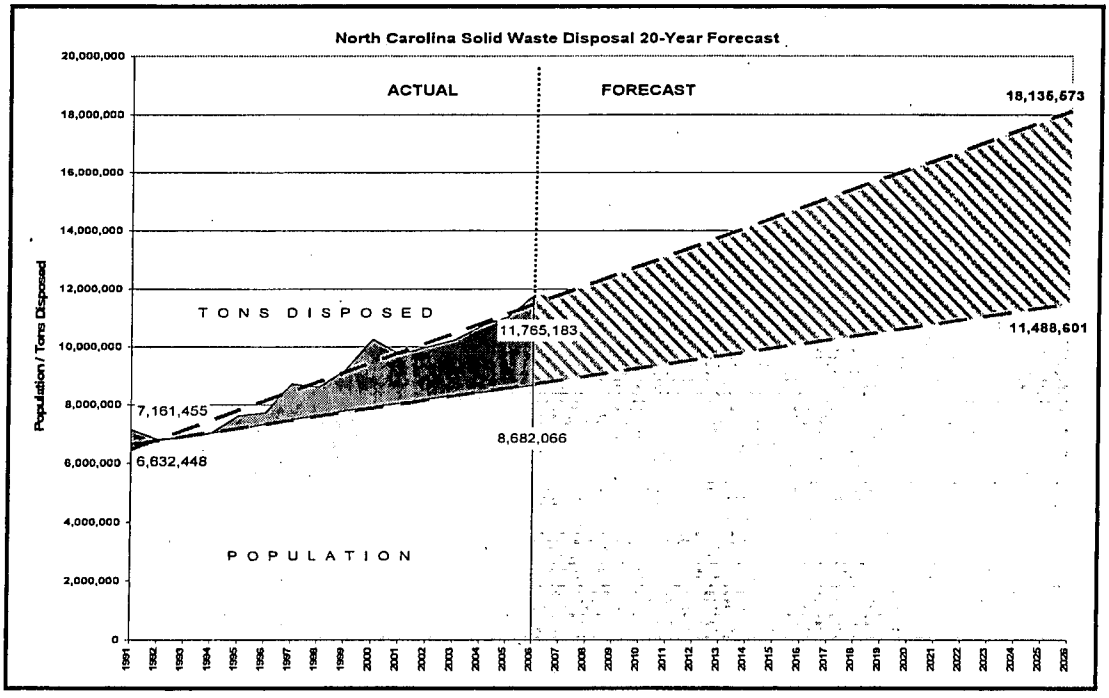
North Carolina continues to export more waste than it imports. Exported waste accounts for approximately 10 percent or a total of 1,234,307 tons of the total waste disposed in the past fiscal year 2005-2006.

In Fiscal Year 95-96, North Carolina exported waste to only one South Carolina landfill. During Fiscal Year 2005-2006, 47 North Carolina counties exported at least some waste to 12 out-of-state landfills and two transfer stations. Back and forth movement - where waste leaves the state only to re-enter for disposal - has continued for the fourth consecutive year. The Fort Mill Transfer Station in South Carolina received approximately 105,200 tons of waste from Mecklenburg County, which was then sent back into North Carolina for disposal. For this reason, the amount has not been included in the report's import or export totals.

Imports continue to increase, since some North Carolina landfills are located near state borders. In FY 95-96, only one landfill, located in Forsyth County, received imported waste. Currently, nine North Carolina landfills receive imported waste. The state has recently received several permit applications for sites that would primarily receive out-of-state waste.

Projections

Regression analysis helps forecast future waste disposal. Factoring in absolute population growth, North Carolina will dispose of approximately 14.5 million tons in 10 years and 16 million tons in 15 years. The 20-year forecast projects 18,135,573 tons of waste disposed for a population of 11,488,601. This means 1.58 tons of waste for every citizen in North Carolina. The obvious implication of this trend is that demand for landfill space will increase with time as populations grow, less waste is diverted and imports become a larger portion of waste disposed in North Carolina landfills.



State Waste Reduction Goal

The 1991 amendment to the Solid Waste Management Act of 1989 (Senate Bill 111), established a statewide goal to reduce the amount of landfilled material 40 percent by 2001. Disposal is measured on a per capita basis. Since FY 91-92, *waste disposal increased 27 percent - from 1.07 to 1.36 tons per person per year.* The statewide goal is unmet and the state per capita rate continues to increase, although several counties achieved the state's waste reduction goal.

Three fundamental, interrelated reasons that contributed to this failure are changes in the dynamics of waste disposal, a lack of commitment to waste diversion and economics. Waste management dynamics changed dramatically after the statewide reduction goal was established. Alternative technologies, such as incineration and mixed waste composting, did not develop as anticipated. Despite a great deal of interest and significant investment in these technologies, they did not decrease landfill disposal as expected. Additionally, the U.S. Supreme Court overturned legislation on flow control and prohibited local governments from directing waste to certain disposal facilities. Legally, waste is a commodity, and is allowed free movement. The economics of landfill disposal evolved since the 1989 adoption of the goal. As private landfill owners competed for tonnages, tipping fees remained low. Landfills did not become as expensive to operate as initially projected. Landfill customers readily adapted to higher tip fees and did not pursue waste reduction as a way to control costs. The combination of strong state and national economies of the early 1990s, moderate disposal costs and local communities establishing their own goals reduced the motivation to divert materials from landfills.

The commitment to reduce waste has waned over the years. Local governments perceive the 40 percent goal as "just a goal" and not a mandate. Funding and resources for waste reduction activities never occurred at the levels required or anticipated for waste reduction success. Despite landfill bans for used oil, yard trash, white goods, antifreeze, aluminum cans, lead-acid batteries, whole scrap tires and oyster shells (oyster shells are only banned from landfills for a 90 day period to promote recycling and alternative uses before disposal) waste disposal continues to increase. Additional landfill bans on alcoholic beverage containers from restaurants, motor vehicle oil filters, recyclable rigid containers and wooden pallets take effect in 2008 and 2009 and may make an impact on disposal.

Landfill Capacity

Current Status

North Carolina currently has 40 operational municipal solid waste landfills and one municipal solid waste incinerator. The total remaining capacity of all North Carolina MSW landfills measures approximately 261 million cubic yards with room for approximately 157 million tons of MSW waste. The estimate was obtained using the state's average utilization factor of .60 tons of waste per cubic yard of air space and does not include waste exported to out-of-state landfills. If North Carolina's rate of landfill use remains steady at last year's rate of approximately 7,910,640/tons annually, the state would have 19.8 years of landfill capacity remaining.

Imports and Proposed Facilities

Imports continue to increase. This increase negatively affects the state's future capacity. New facilities designed to import waste will make a negligible impact on increasing the state's capacity for disposal of North Carolina waste.

Projections

The concept of statewide capacity does not translate into statewide access. Regions of the state have limited capacity. Both eliminating out-of-state capacity and continuing the acceptance of out-of-state waste into North Carolina shrinks this capacity number further. At present, statewide capacity does not appear to be a problem. However, regions may experience disruptions and additional costs as facilities close, open, change jurisdictions or alter the average distance waste is transferred.

Much of the state's capacity is not widely available due to permit conditions, franchise arrangements, service areas and distance. The primary limiting factor regarding access to capacity in North Carolina is distance. The maximum distance that large quantities of waste travels is less than 100 miles one-way. Minor exceptions exist, but an examination of service areas supports this fact. Other examples of limiting factors affecting capacity are illustrated in that the Camp Lejeune landfill is for Marine Corps base use only; the Alamance County landfill is permitted to accept only Alamance County waste; and the Upper Piedmont landfill is permitted for a maximum 600 tons per day. Many landfills' franchise agreements only allow them to accept waste from a particular distance around the landfill. Some landfills owners/operators choose not to accept waste from other jurisdictions, although their permit and franchise allow it. Additionally, landfill owner/operators may elect not to construct or use all of the permitted space. This remaining capacity also assumes a current level of imported and exported waste. Increases in the importing of waste into North Carolina could decrease capacity even further.

Solid Waste Section Activities

The Solid Waste Section, with limited staffing, is facing additional responsibilities due to the increasing complexity of current and new applications, increase in compliance activities, additional mandates to permit and inspect different facility types, and budget reductions that have occurred over the past several years.

Current Facilities

There are 1,582 permitted solid waste facilities in North Carolina. This includes open and closed facilities, whether they are permitted or notified.

Changes to Solid Waste Regulations

On Jan. 1, 2007, construction and demolition landfill rules became effective. Prior to these rules, construction and demolition debris was managed in sanitary landfills under Rules 2A NCAC 13B .0501 through .0505. The new rules, 13B .0531 through .0547, are a greatly improved outline of all necessary steps to perform pre-engineering and hydrogeological site studies, to compile and submit applications for permits, to construct and to operate this type of landfill in North Carolina. The rules for sanitary landfills will in the future only be used to permit and construct landfills for industrial waste.

Compliance Activities

It is the goal of the Compliance Branch within the Solid Waste Section to conduct inspections on all facilities once or twice a year, depending on the type of facility. Facilities scheduled for one inspection a year are tire monofills, composting facilities and land clearing and inert debris landfill sites. Land clearing notified sites and pre-regulatory demolition sites are currently receiving no inspection at all. All other facilities should receive two inspections per year. Field inspections are currently only at 78 percent or 919 out of 1,181 inspection goal under current protocol. This shortfall is a result of a limited staff of field inspectors and hydrogeologists, as well as an increase in staff time spent on activities other than inspections. The compliance branch currently employs 12 field staff and two hydrogeologists who cover the entire state. Field staff spend a large portion of time focusing on complaints of illegal dumps and enforcement activities, handling emergency/disaster cleanup response, collection of local government solid waste plans and reports, and conducting certifications for recycling. As more facilities are permitted, compliance requirements change, disasters and illegal dumping continues, and local governments continue to report that current resources will be spread even further.

Facility Type	Number of Facilities	Minimum Inspections per Year	Total Inspections Needed
Municipal Solid Waste landfills (MSWLF)	177	2	354
Construction and Demolition landfills (CDLF)	86	2	172
Industrial landfills (INDUS)	37	2	74
Treatment and Processing facilities (TP)	28	2	56
Mixed Waste Processors (MWP)	19	2	38
Household Hazardous Waste facilities (HHW)	15	2	30
Incinerators (INCIN)	8	2	16

Land Clearing and Inert Debris Notified sites	731	0	0
Pre-Regulatory Demolition landfills (DEMO)	158	0	0
Total	1587		1181

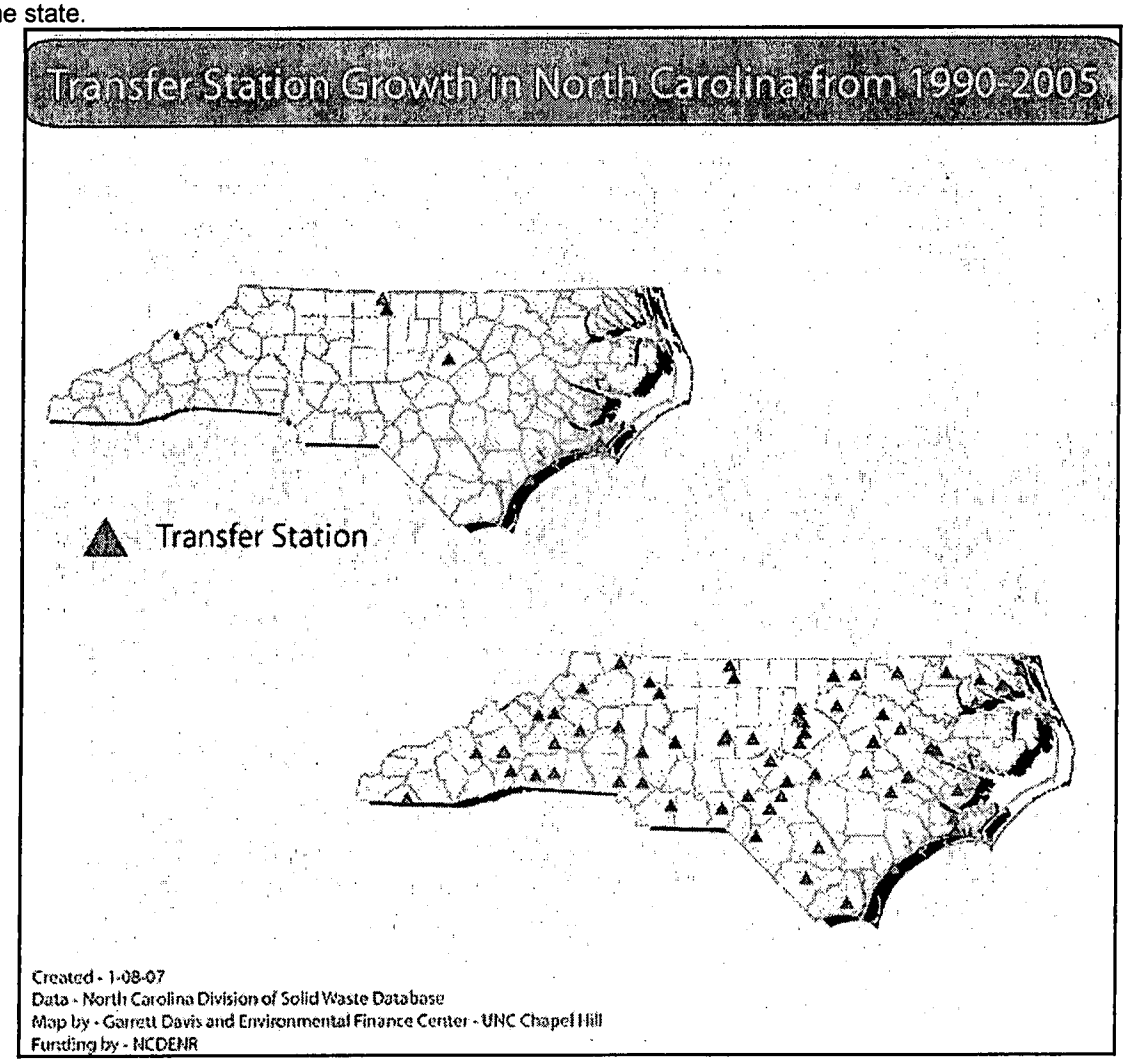
Medical Waste

Two new products have been approved for the treatment of medical waste and for pathological waste in particular. Previously, the only option available for the treatment of pathological waste in North Carolina was incineration. One new product manufactured by Sanitec uses shredding and microwave radiation. The second product is manufactured by Ozonator of Canada and uses shredding and ozone as a sterilizing agent. These two products offer more options for generators of medical waste.

Trends and Upcoming Issues

Transfer Stations

Since the 1990s, waste management and disposal in North Carolina has changed to a more regionally managed system of disposal. Waste is no longer primarily sent to the county-owned landfill but often to a transfer station in the county or many counties away. From the transfer station, the waste is then sent for disposal in a "regional landfill." The change in the management of waste evolved from stricter and more costly requirements for municipal solid waste landfills. In 1998, all unlined municipal solid waste landfills were required to close and all new landfills were required to be constructed with liners. Additional costs associated with liner construction encouraged this growth of regional landfills and transfer stations. Many counties did not find it economically beneficial to own and operate their own landfill, but chose to transfer their waste elsewhere. Growth in regional management of waste spurred application for the permitting of transfer stations across the state. In 1990, North Carolina had only five permitted transfer stations across the state.



Transfer station growth was relatively constant up until 1998. The largest growth in transfer station permitting occurred between 1998 and 1999 when the requirement for liners took effect. During this

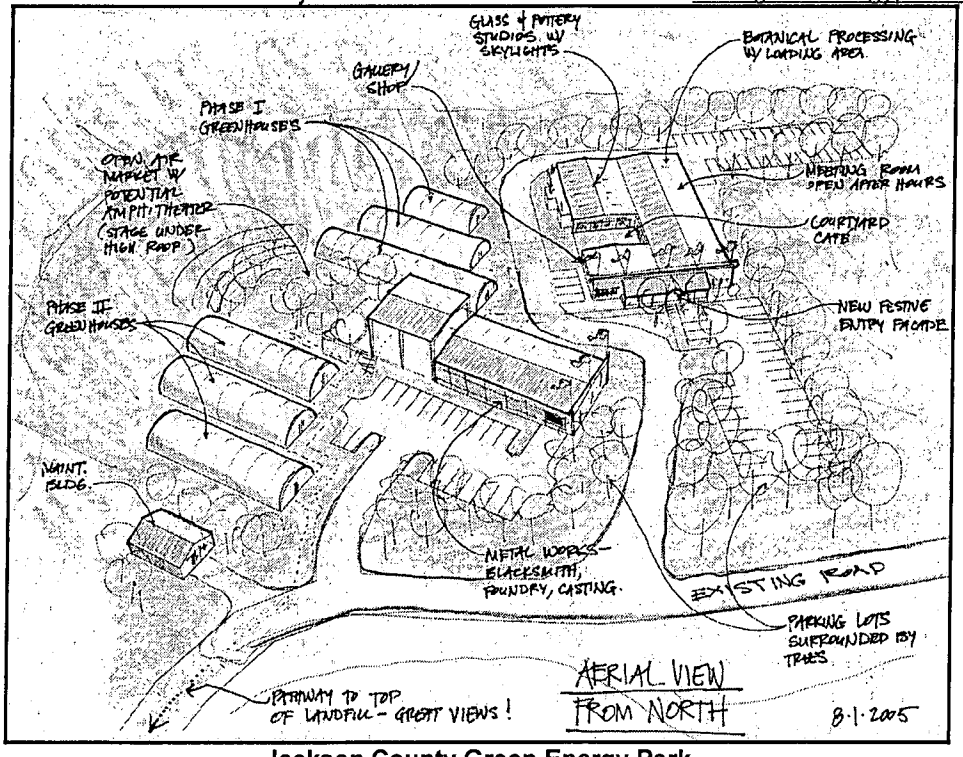
period, the number of transfer stations in North Carolina grew to a total of 72 facilities. Currently, there are 85 transfer stations permitted to receive waste within the state. In addition to the transfer of municipal solid waste, a market has developed for the transfer of construction and demolition waste. In some instances, part of the construction and demolition waste sent to a transfer station is diverted for reuse and taken to places such as Habitat for Humanity. As regional management of waste continues, we should continue to notice transfer stations for both construction and demolition and municipal solid waste increasing throughout the state.

Landfill Gas

North Carolina has many closed and active landfills, which are producing landfill gas. This gas can be a potential danger to the environment and public health if not managed properly. Methane (CH_4), the primary constituent of landfill gas, is over 20 times more effective in trapping heat in our atmosphere than carbon dioxide (CO_2). CH_4 remains in the atmosphere for up to 15 years, trapping in heat. CH_4 is also a primary constituent of natural gas and is an important energy source.

North Carolina's Solid Waste Section is taking an active role working with counties, local public organizations and private organizations in conjunction with EPA's Landfill Methane Outreach Program in developing various programs making use of the CH_4 component of the landfill gas. The programs include the generation of electric power, production of alternate fuels, operation of ceramic craft and glass-blowing studios, blacksmithing and metal working, green house operations for nursery stock, fish farming, kiln drying of lumber, apple storage and processing, heating of governmental buildings, and the provision of low cost energy to our industries, fire-training facilities and business incubators. In addition to protecting our environment and the public health, the energy derived from landfill gas is lowering our demand for the use of fossil fuels and is reducing the dependency on foreign energy sources.

An example of a highly successful methane recovery project is the Jackson County Green Energy Park, which was named EPA's Project of the Year for 2006. This project recovered gas from the closed Dillsboro landfill. The park includes pottery and glass-blowing studios, blacksmithing for horses, greenhouses and a biodiesel refinery. More information is available at: www.greenenergypark.org.



Jackson County Green Energy Park

Recommendations

On July 27, 2005 the North Carolina General Assembly passed Senate Bill 353. Senate Bill 353 imposed a moratorium on new landfills, directed the Environmental Review Commission to study issues related to solid waste disposal and created a Joint Select Committee on Environmental Justice.

The Environmental Review Commission, with the assistance of the Division of Waste Management, was by this bill directed to study issues related to solid waste. According to the text of the bill the study was to include:

> "(1) Financial responsibility requirements for solid waste landfills, including the application of requirements to limited liability companies and other business entity structures of applicants seeking solid waste landfill permits.
>
> (2) Application of franchise requirements and local government approval for solid waste landfill permits, including adequacy of public notice and comment, community studies, and site designations prior to local government approval.
>
> (3) Siting, design, and operational requirements for landfills for the disposal of construction or demolition waste, municipal solid waste, or industrial solid waste that are proposed in areas susceptible to flooding from natural disasters, areas with high water tables, and other environmentally sensitive areas.
>
> (4) Formation of dangerous chemicals and gases in flood-prone landfill environments.
>
> (5) Traffic considerations for proposed landfills.
>
> (6) Regulatory oversight and staffing for permitting and compliance of solid waste landfills, and inspection of waste containers on barges, railways, and trucks.
>
> (7) Compliance with statutory prohibitions on disposal of certain types of solid waste and measures to prevent disposal of hazardous waste in solid waste and construction and demolition landfills.
>
> (8) Ways to reduce the amount of solid waste disposed of within North Carolina landfills, including statewide tipping fees, bans on the disposal of certain types of waste in landfills, more aggressive recycling requirements, and enhanced regulatory requirements for landfills and other solid waste management facilities."

The study indicated several areas that needed to be addressed. The recommendations made by the department satisfy these requests.

1. **Specify how a landfill applicant must demonstrate financial qualifications to construct and operate the landfill.**

The applicant should provide cost estimates for: performing environmental studies; acquiring the site; designing the landfill; constructing and operating the landfill; and financial assurance required for corrective action and closure of the landfill. To show financial qualification, the applicant should submit an audited, certified, financial statement and identify sufficient assets to cover the estimated costs. Where assets of a parent, subsidiary, affiliate or joint venturer are offered in support of the financial qualifications of the applicant, that party must be listed as an owner/operator on the facility permit.

2. **Expand financial assurance requirements.**

Require that the landfill operator provide financial assurance to cover possible corrective action (in the event of a leak from the landfill, for example). This would be in addition to the financial assurance currently required for the cost of closing the landfill and providing post-closure case. The minimum amount of financial assurance for corrective action should be $3 million. Financial assurance for corrective action should apply to both new and existing facilities. For new facilities, the financial assurance would be required before permit issuance.

3. **Strengthen environmental compliance review of potential landfill operators.**

Expand the scope of the existing environmental compliance review to include any past environmental violation (not just those related to solid waste) and a larger group of people associated with the permit applicant. For example, the environmental compliance review would be broadened to cover a person who holds a minority interest in the entity applying for a landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

4. **Broaden the definition of "owner or operator."**

Include in the definition of "owner or operator" any person who has a financial or equitable interest in the entity that has applied for the landfill permit (except for minority shareholders in publicly traded corporations who do have any involvement in management or control of the corporation.)

5. **Clarify solid waste enforcement provisions.**

Amend the statute sections that authorize injunctive relief and civil penalties for solid waste violations to expressly allow the use of those enforcement remedies in response to a violation of a permit issued by the Department or an order issued by the Commission for Health Services. Increase penalties for solid and hazardous waste violations. Authorize the department to recover the costs of investigating a violation.

6. **Require notice to the department of any significant change in the structure or assets of the business entity that holds a landfill permit.**

The department should be notified within 30 days of any significant change in the structure of the business entity that owns or operates the landfill facility; the identity of any person or business entity previously identified as an owner or operator of the facility pursuant to G.S. 130A-309.27(a)(1); or in the financial assets identified in the financial qualification of the owner or operator. A change is significant if it could effect the financial qualifications of the permit holder or result in a change in the identity of the owners or operators for purposes of either financial qualification or environmental compliance review. When the department receives notice of a change, it can require a new environmental compliance or financial qualification review.

7. **Set standards for safe transportation by railway or barge of solid waste.**

Containers used to transport solid waste should be leak-tested and covered. Records of leak-testing should be retained at the permitted solid waste facility for three years. It would be a violation to allow solid waste, liquids or odors to escape from a container.

8. **Require a traffic study for larger solid waste facilities.**

Require that applications for solid waste management facilities proposed to handle more than 100,000 tons of waste per year include a study of the traffic impacts of the facility. The results of the study would be considered in the permit decision.

9. **Authorize local landfill liaisons.**

Authorize a local government with planning authority over a sanitary landfill that has a service area of greater than a 100-mile radius to designate a landfill liaison. The liaison would be a certified landfill manager, but would not direct the operation of the landfill. The landfill liaison would have authority to enter the landfill facility at reasonable times and inspect the landfill operation for purposes of: ensuring that the facility meets all local requirements; identifying and notifying the department of potential violations; and identifying and notifying the department of potentially hazardous conditions.

10. **Require the permittee to employ an independent quality assurance engineer to oversee construction of the landfill.**

The permittee should employ a licensed engineer who is independent of both the landfill owner and any person engaged in the design or construction of the landfill to inspect during construction. The project engineer would be responsible for certifying that construction of the solid waste management facility units, leachate handling facilities and landfill appurtenances conforms to the plan approved by the department, the permit to construct and the rules adopted by the Commission.

11. Establish minimum standards for new landfills and for landfill expansions onto previously unpermitted property.

Minimum standards for new landfills and for landfill expansion onto property that was not included within the scope of a previous permit would include:

a. *double liners and a leak detection system for municipal solid waste landfills;*
b. *composite liners for construction and demolition landfills;*
c. *a minimum separation of 5 feet between the bottom elevation of the waste (or the liner system, if the landfill has a liner) and seasonal high groundwater and bedrock;*
d. *a 200-foot buffer between the waste boundary and streams or wetlands (unless no feasible alternative location is available that would comply with the buffer requirement); and*
e. *a prohibition against siting landfills units in the 100-year floodplain or in area reclaimed from the floodplain.*

12. Establish new standards for construction of lined sanitary landfill units permitted on or after the effective date of the bill.

Specific standards for leachate collection systems and liners would include:

a. *leachate collections systems designed to maintain a head of less than one foot during leachate recirculation;*
b. *leachate collection systems designed to return the head to one foot or less within 72 hours based on a 25 year-24 hour design storm falling on an empty cell;*
c. *geomembrane base liner systems tested for leaks and damage;*
d. *leachate collection lines designed and constructed to allow for remote camera inspection and cleaning and to require leachate lines cleaned and remotely inspected annually;*
e. *all pipes used to carry leachate constructed with dual containment outside of the lined disposal unit; and*
f. *new units and lateral expansions constructed without pipe penetrations of the bottom liner, whether for leachate, stormwater or gas.*

13. Direct the Commission for Health Services to review landfill rules and adopt new rules necessary to protect public health and the environment.

Rules adopted by the Commission should include:

a. *standards for the collection, control and utilization or destruction of landfill gasses at municipal solid waste landfills;*
b. *establish standards for the construction, operation and maintenance of bioreactor landfills;*
c. *Establish criteria for development of bird and wildlife management plans; and*
d. *Incorporate measures necessary to minimize impacts to natural, historic and cultural resources, including but not limited to wetlands, critical fisheries habitat, parks, recreation areas, cultural and historic sites and potential water supplies.*

14. Require that all solid waste management facilities have a waste screening plan to ensure that the facility is in compliance with waste bans.

15. Require an environmental study of very large landfills and landfills with an extended service area.

The existing exemption from the N.C. Environmental Policy Act for landfills owned and operated by local governments should be removed for facilities that receive more than 300,000 tons of waste per year; have a total disposal capacity of more than 15 million cubic yards of solid waste; or have a service area of more than 100 miles in radius. An environmental study should also be required for privately-constructed landfills that will exceed one of more of those thresholds. The environmental document would need to meet the standards for an environmental impact statement under the N.C. Environmental Policy Act and rules adopted by the Department of Administration to implement the act. The documents would also be subject to the same public notice and hearing requirements.

16. Change landfill franchise authority to differentiate between landfills that provide local service and those that have large regional or multi-state service areas.

The department is still working on the specific recommendation to alter local government franchise authority.

17. Add a new statute section setting out the grounds for denial of a landfill permit.

Statutory grounds for permit denial should include:

a. *Construction or operation of the landfill would violate water quality standards for groundwater or surface waters;*
b. *The landfill would jeopardize a renewable resource of more than local concern, such as watersheds or aquifers that are sources of public water supply.*
c. *Construction or operation of the landfill would damage fragile or historic areas or areas containing environmental or natural resources of more than local significance. Examples of these areas would include national or state parks or forests; wilderness areas; historic sites; recreation areas; segments of the natural and scenic rivers system; wildlife refuges, preserves and management areas; areas that provide habitat for threatened or endangered species; primary nursery areas and critical fisheries habitat designated by the Marine Fisheries Commission; and Outstanding Resource Waters designated by the Environmental Management Commission.*
d. *Construction or operation of the facility would jeopardize public rights to access or use public trust waters.*
e. *The facility will be located in a natural hazard area, such as an area subject to excessive seismic activity that would increase the risk to public health or safety.*
f. *The proposed facility would be inconsistent with statutory standards or rules adopted by the Commission for Health Services.*
g. *The proposed facility would be inconsistent with ordinances adopted by the local government that has planning jurisdiction over the site of the proposed facility.*
h. *There is a practicable alternative to be proposed landfill that would have less adverse impact on public resources.*
i. *Construction of the landfill would contribute to cumulative effects that would damage a natural, historic, or cultural resource protected under the statute.*

18. Establish permit fees for solid waste facilities. Revenue would be used to support the solid waste regulatory program.

19. Establish a statewide surcharge on disposal of solid waste at $2 per ton.

The surcharge would apply to municipal solid waste and to construction and demolition waste that is either disposed of at a permitted solid waste facility or moves through a permitted transfer station en route to a disposal facility outside the State. The surcharge would be used to pay for cleanup of orphan landfills and other orphan inactive hazardous waste sites; provide state matching funds for remediation, monitoring and maintenance of Superfund sites in North Carolina; provide funds to local government for redevelopment of contaminated sites; and provide funds for administration of contracts for cleanup of orphan landfill and inactive hazardous waste sites.

Consideration should also be given to the following:

1. **The state should invest resources to increase inspection and compliance activities to ensure the effectiveness of the state's current and pending disposal bans.**

2. **If enforcement of disposal bans can be improved, the state should consider additional disposal bans on readily recyclable materials.**

3. **The state should increase funding of recycling grants to community recycling programs and recycling businesses, as well as public recycling outreach campaigns.**

4. **The state should establish and enforce minimal performance standards for local recycling programs.**

5. **The state should require and/or provide incentives to private haulers to offer recycling services to all of their customers.**

6. **The state should institute incentives to encourage the diversion of large waste streams, such as food and wood wastes.**

7. **The state should enact legislation to establish a comprehensive statewide recovery system for electronics.**

CHAPTER 2 – Government Waste Reduction Activities

Annual reports received from local governments provide data on source reduction, reuse, recycling and composting activities statewide as well as other aspects of solid waste management. Data from these reports develop a picture of waste reduction efforts in North Carolina and of the relative effectiveness of these programs and trends in program implementation.

Source Reduction and Reuse Programs

The number of local governments with source reduction and/or reuse programs decreased again during FY 05-06. The decrease from governments reporting programs from 104 to 102 is possibly due to reporting fluctuations; however, the downward trend over recent years does show that local governments are failing to take advantage of cost effective waste reduction options.

Local Reduction/Reuse Programs

Program Type	FY 99-00	FY 00-01	FY 01-02	FY 02-03	FY 03-04	FY 04-05	FY 05-06

Local Government Recovery Programs

Despite decreases in most of the traditional commodities, local government recovery grew by almost 50,000 tons or four percent during FY 2005-06. The increase was driven primarily by increases in the recovery of construction waste, organics (e.g., yard waste), tires and "other" materials. It should also be noted that the recovery of electronic equipment grew substantially during the past year. Recovery of electronic equipment increased 49 percent during FY 2005-06. Despite the marked increase, local government e-waste programs are only recovering about two percent of what is being generated annually.

The largest decline in recovery was in the fiber category, which fell by almost 10,000 tons. It was the first decline in paper recovery in three years. Most of the other traditional commodities rose or fell only slightly providing a sense of stagnation among local government recovery programs.

Increases in recovery failed to outpace increases in disposal again last year. Recovery grew by four percent as compared to a six percent increase in statewide disposal. **Without substantially increased efforts to improve and expand local waste reduction programs, increases in disposal will likely continue to grow at a faster rate than recovery.**

Local Government Recovery (Tons) and Performance Measures

Material	FY 96-97	FY 97-98	FY 98-99	FY 99-00	FY 00-01

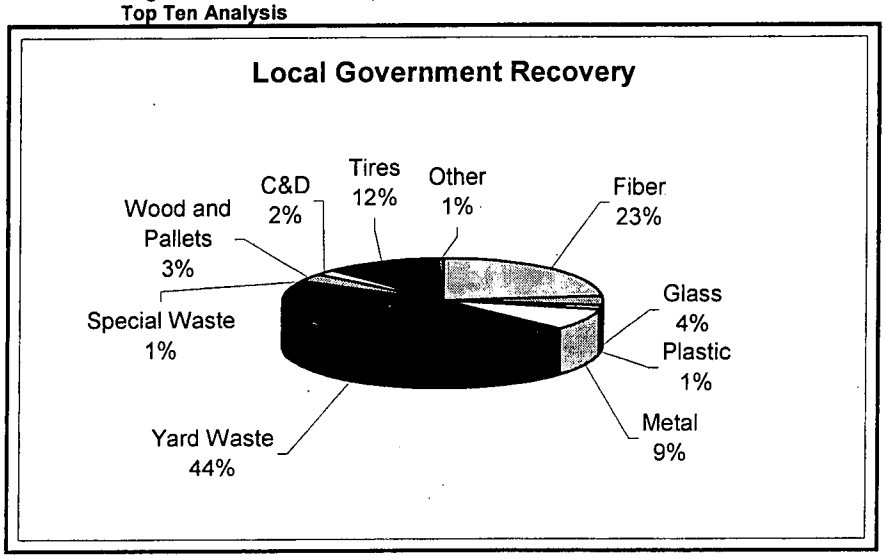
* Includes white goods, aluminum cans, steel cans and other metals.
** Includes yard waste, pallets and wood waste.
*** Includes electronics, used oil, oil filters, antifreeze and batteries.

The following figure provides a breakout by percentage of each commodity's contribution to total local government recovery. As can be seen, local government yard waste mulching and composting programs contribute well over 40 percent of all local government recovery. Yard waste recovery can fluctuate drastically from year to year and is commonly excluded from trend analysis. Fiber products constitute 23 percent of local government recovery, and despite a decline this year, will likely continue to provide for the majority of growth in local government recovery programs.

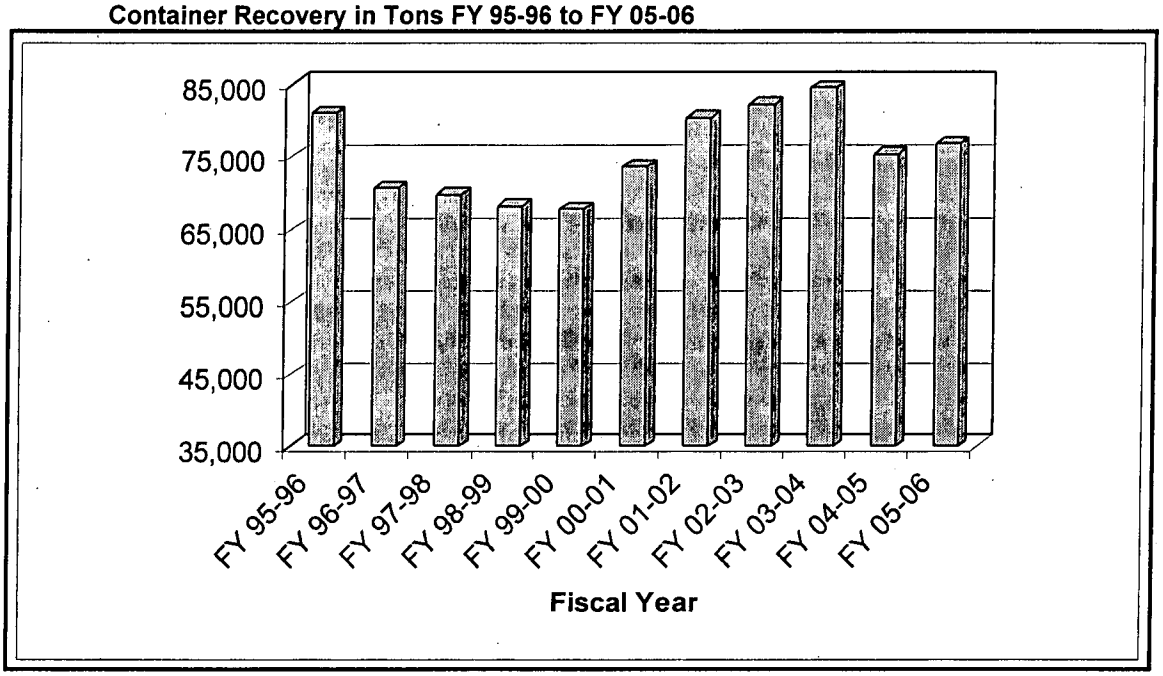
Top Ten Analysis



Recovery of Traditional Materials

Container recovery rebounded slightly from the sharp drop experienced last year, but has not yet recovered to the levels experienced in the early 2000s. Recovery of glass, PET, HDPE, aluminum and steel containers rose to 76,750 tons, up roughly 1,400 tons from FY 04-05. Of the seven commodities in the category, only aluminum containers and PET containers experienced decreases. It is likely that the actual recovery of aluminum did not actually drop, but rather very strong market conditions resulted in individuals selling aluminum cans directly to markets instead of contributing the containers to local government-operated recycling programs. Although small in comparison to the amount of paper recovered annually, container recovery provides the best snapshot of local government recovery program performance.

Container Recovery in Tons FY 95-96 to FY 05-06

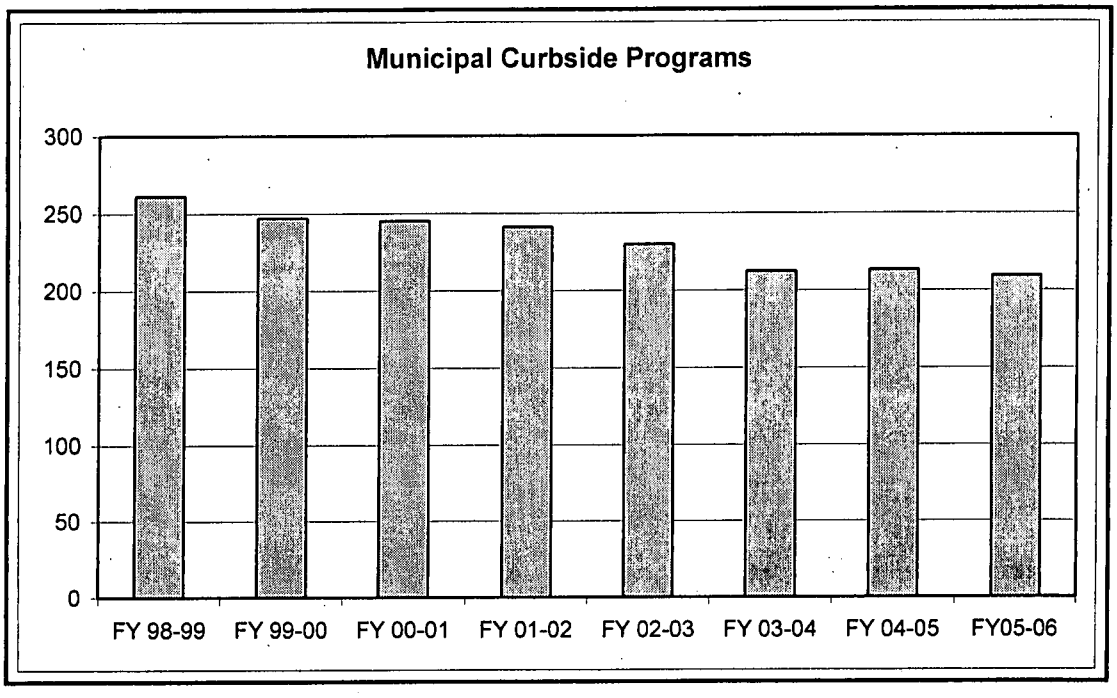


Local Government Recycling Program Management

The number of municipal curbside recycling programs dropped again during FY 2005-06 to 209. This trend has been continuing since 1999 and represents a problem for achieving meaningful waste reduction in North Carolina. Many curbside recycling programs were originally implemented in the early 1990s with out much thought or planning for maintaining the programs into the future. Many of these programs are still being operated in a manner consistent with the state of the recycling industry in the early 1990s. The recycling industry has evolved dramatically in the past 15 years, and unless small and mid-sized municipal governments update their programs to reflect the current state of the industry, it is likely that the trend of fewer curbside recycling programs will continue.

Despite the continuing decreases in the number of curbside programs, annexations and growth in larger municipalities resulted in another increase in the number of households served by curbside recycling. The number of households served by curbside recycling grew by more that 53,000 during FY 05-06. More than 1,438,000 households in North Carolina now have access to curbside recycling.

In a properly developed program, each household could potentially generate up to 750 pounds of recyclables per year. In reality, North Carolina households are contributing only about 225 pounds of recycling per year to their local recovery programs. If these programs were functioning at their potential, recovery of traditional commodities would increase by more than 375,000 tons. It is very clear that improving the breadth of program collection and increasing participation are keys to improving statewide recovery.



Drop-off programs continue to contribute more to recycling than any other type of program. Roughly 46 percent of all material recovered by local governments comes from drop-off recycling programs. The ability of these programs to handle special wastes, white goods and scrap metal is the primary reason why they contribute more than curbside programs. The use of mixed waste processing continues to decline in the state and may no longer be used for processing traditional recyclables in the future.

Recovery by Program Type

Program Type	Percent of Total Recovery
Curbside	37 %
Drop-off	46 %
Mixed Waste Processing	< 1 %
Other Programs	17 %

Special Waste Management

Local government collection of some special wastes fell slightly in FY06 from the previous year, in particular for oil, antifreeze and lead acid batteries, but the amounts were still in line with historical figures. Oil filters enjoyed a jump in tonnage, and a small increase in the number of related active programs. The disposal ban on filters set for October 2009 should spur development of additional programs over the next few years.

The amount of household hazardous waste (HHW) also rose in FY06, breaking the 2,000 ton barrier for the first time. The overall average cost for managing HHW programs fell from FY 05's abnormally high figure to a level more in keeping with the previous years. In general, special waste programs are similar to other local government recovery efforts in being on a solid plateau of activity, neither rising nor falling much from year to year. Despite the need for additional efforts to increase the amount of material being recovered, it is clear that there is little motivation for counties and municipalities to expand programs in this area.

Local Government Special Waste Management, FY02 to FY06

	FY02	FY03	FY04	FY05	FY06
Used Motor Oil					
Number of programs	127	125	124	119	122
Gallons collected	903,951	907,123	939,916	987,057	933,618
Oil Filters					
Number of programs	20	21	19	17	20
Tons collected	17.79	18.64	24.07	20.40	28.21
Antifreeze					
Number of programs	56	58	63	55	58
Gallons collected	27,668	26,308	26,767	41,050	32,415
Lead Acid Batteries					
Number of programs	86	86	90	89	95
Number collected	80,912	92,292	100,217	97,290	91,947
Household Haz. Waste					
Number of programs	28	31	32	34	34
Number of permanent sites	17	17	17	17	16
HHW tons collected	1483.97	1540.59	1760.17	1940.57	2066.91
Total cost reported	$2,180,355 ($1,469/ton)	$2,161,359 ($1,403/ton)	$2,429,912 ($1,381/ton)	$4,417,657 ($2,276/ton)	$2,718,980 ($1,315/ton)

Conversions: Oil, 1 gal = 7.4 lbs; Antifreeze, 1 gal = 8.42 lbs; Lead Acid Battery, 1 battery = 35.9 lbs

Yard Waste Management

Collection and diversion of more than a half million tons per year of yard waste remains a mainstay of local government solid waste management programs. The very slight rise in managed tons for FY 06 from the previous year reflects the absence of major weather events or droughts that can push yard waste collection dramatically up or down. The chart of historical collection below shows the steady nature of local government performance in this area, demonstrating straightforward compliance with the state's yard waste disposal ban. Without the ban, North Carolina disposed waste tonnage would be higher by five percent.

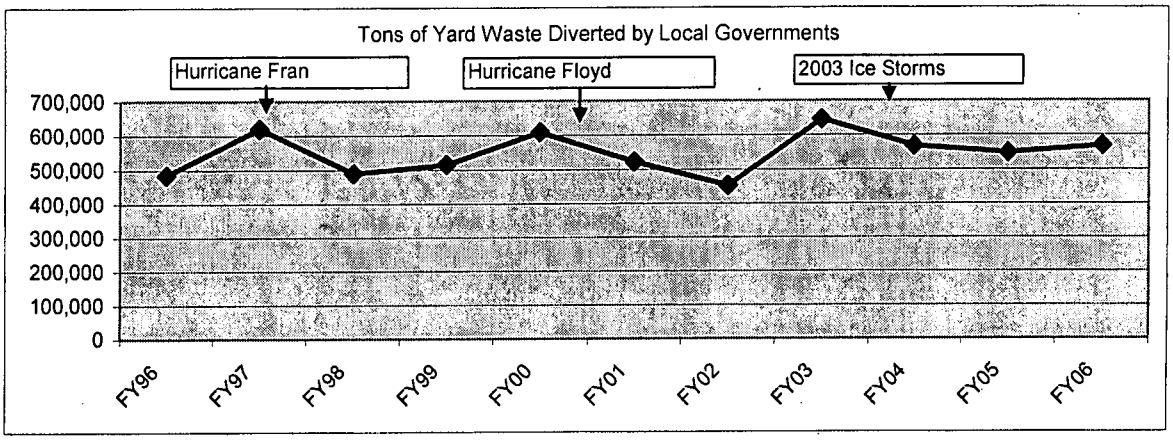
Local Government Yard Waste Management FY05 and FY06

Destination of Materials	FY 05 tons managed	FY 06 tons managed	Percentage Change
End Users (direct delivery)	72,413	54,438	-25%
Local mulch/compost facility	481,143	513,635	+7%
TOTAL DISPOSAL DIVERSION*	**553,556**	**568,073**	**+3%**
Other Public Facility**	141,394	151,960	+7%
Private Facility	77,079	79,854	+4%
LCID Landfill	132,585	128,157	-3%
YARD WASTE TOTALS	**763,220**	**776,084**	**+2%**

* Tonnages under the row for "Total Disposal Diversion" are not included in diversion because of data redundancy, uncertainty about actual disposition of the waste, and actual disposal of noted tonnages.

** Yard Waste Totals exclude tons for "other public facilities" - it is assumed these tons were captured under other categories.

Yard Waste Diverted From Disposal by Local Governments, FY96 – FY06



Recycling Markets and Prices

FY06 saw steady, high prices for recyclable materials, reflecting the global shift to reliance on recovered over virgin commodities. While domestic manufacturers maintained a growing interest in consuming recycled materials, China's influence on secondary material markets was still the big catalyst in material pricing. Some metal commodities, such as copper and aluminum, enjoyed very strong pricing globally due to tremendous demand pressure. Traditional recyclables collected by local government programs were no exception to the remarkably constant demand for recyclable materials. As can be seen in the table below, displaying the price received by three representative processing facilities in eastern, central and western North Carolina, recycling markets are demonstrating a consistency that should give local recovery programs confidence and reason to expand collection programs.

Composite Recycling Market Prices Received by Major NC Processors, FY 06

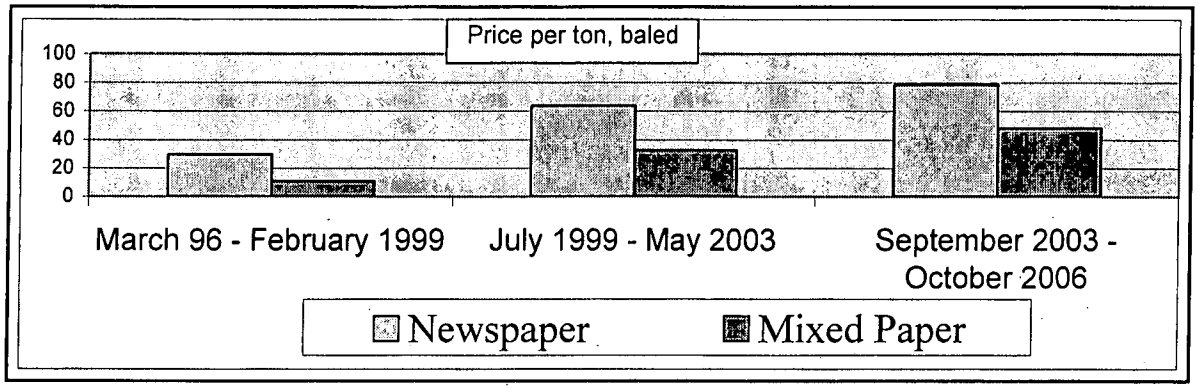
Materials	Summer 05	Fall 05	Winter 06	Spring 06	Summer 06
Aluminum Cans, Lbs., loose	$.56	$.55	$.64	$.71	$.74
Steel cans, gross tons, Baled	$39	$84	$67	$88	$115
PETE, Lbs. Baled	$.19	$.18	$.18	$.18	$.15
HDPE, Lbs., Baled	$.24	$.24	$.34	$.29	$.21
Newsprint, ton, baled	$83	$84	$79	$76	$71
Corrugated, ton, baled	$84	$84	$60	$73	$105
Office paper, ton, baled	$116	$115	$122	$120	$138
Mixed paper, ton, baled	$57	$48	$42	$45	$57
Clear glass, ton	$28	$28	$28	$23	$23
Brown glass, ton	$24	$24	$24	$17	$17
Green glass, ton	$2	$2	$2	-$5	-$5

Fiber prices generally stayed within a narrow range in FY 06. After a slight mid-year dip, both corrugated and mixed paper rebounded to their highs for the year by summer 2006. Steel cans were probably the most volatile commodity in FY 06, ending on a high note, while aluminum cans rose and then stayed in the 70 cents per pound range for the last six months of the fiscal year. Glass struggled to maintain its value, with all colors falling and green becoming a "cost" commodity. Glass pricing belies the demand for more cullet by North Carolina's glass plants, which can use twice as much material as they are currently receiving. But all in all, the basic "curbside mix" of materials has seen a consistent level of pricing over the course of four years, showing real staying power in the strength of recycling markets.

Mixed paper has become something of a bellwether for recycling markets over the past decade. From a commodity with sporadic demand in the mid-1990s, sometimes with no demand at all, it has become a highly marketable commodity, driven in large part by the Chinese appetite for high quality U.S. fiber. Domestic and foreign mills have found value in mixed paper, making it an easy commodity for communities to add to their curbside and drop-off programs. The marketability and thus collectibility of mixed paper bodes well for community efforts to increase participation and diversion, as now a household can put most of its fiber in their curbside and drop-off bins. The figure below shows the pricing history of

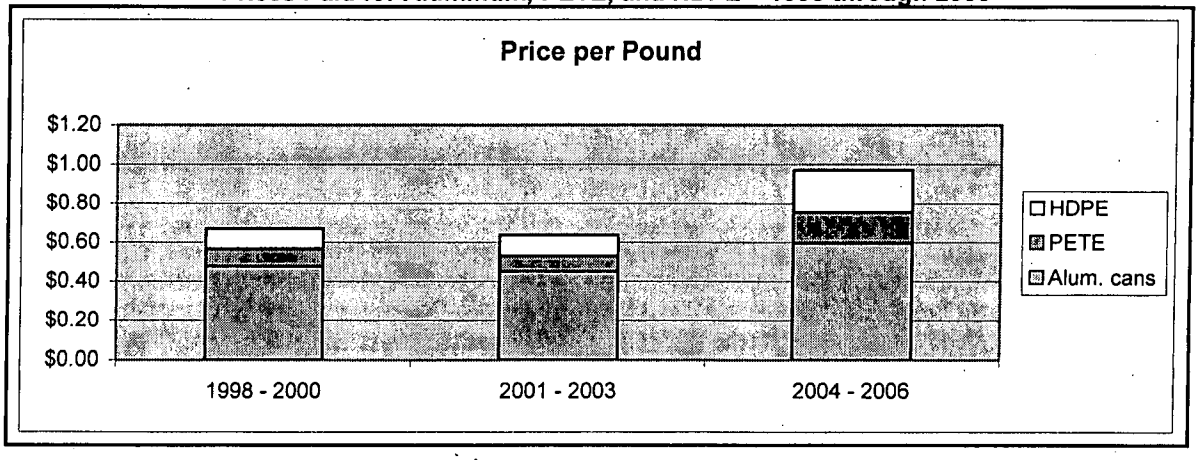
both mixed and newspaper in North Carolina over the course of three four-year time periods, demonstrating the upward climb of these grades.

Prices Received By NC Processors for Mixed Paper and Newspaper, March 1996 through October 2006



The following figure shows a similar price history chart for three types of container materials: PETE, HDPE, and aluminum cans. For the first two periods, 1998 through 2000, and 2001 through 2003, the combined price per pound paid for these materials hovered around just over 60 cents. However, from 2004 through 2006, the price increased by 45 percent to almost a dollar per pound.

Prices Paid for Aluminum, PETE, and HDPE – 1998 through 2006



Recycling Market Development

FY 06 saw the continued expansion of recycling businesses in North Carolina and some major investments in recycling facilities. Recycling remained a dynamic arena of entrepreneurial activity, especially for commodities such as plastics and discarded electronics. Among major investments, the firm GEEP Inc. opened a $4 million shredding plant in 2006 for electronics while Paperstock Dealers started up a new material recovery facility (MRF) in Raleigh, helping that city make major improvements to its curbside recycling program.

Other companies that expanded or made significant investments in FY 06 included FCR's upgrade to its Greensboro MRF, Tidewater Fiber and Orange Recycling's addition of sorting equipment to their processing facilities, EcoResin's opening of a new plant in Rutherford County, McGill-Leprechaun's addition of wood grinding operations, and Envision Plastic's expansion of its HDPE recycling facility. Many other smaller companies made improvements to their operations, investing in equipment and facilities to ramp up their capacity. A range of private sector activities in FY06 increased the availability of market outlets for discarded materials, while creating employment opportunities for North Carolinians in many parts of the state.

CHAPTER 3 – Local Government Assistance (Fiscal Year 2005-06)

Solid Waste Management Trust Fund Annual Report

This report details for FY 06 (July 1, 2005 - June 30, 2006) the activities and expenditures of the Solid Waste Management Trust Fund, which is administered by the Division of Pollution Prevention and Environmental Assistance (DPPEA) in the Department of Environment and Natural Resources. The Trust Fund was created by the Solid Waste Management Act of 1989 (SB 111). It is funded by a portion of the revenues from a fee on the sale of new tires and an advanced disposal fee on white goods (appliances), as well as a tax on virgin newsprint. Additional revenues can come from appropriations and contributions. The purpose of the Trust Fund is to support a range of solid waste management activities including: technical assistance to local governments, businesses and other entities on solid waste issues; public educational programs; research and demonstration projects; and recycling market development (G.S. 130A- 309.12).

As noted in the table below, the Solid Waste Management Trust Fund received $1,015,824 in revenues in FY 06. When added to the beginning balance on July 1, 2005 of $1,896,767, a total of $2,912,591 was managed in the Trust Fund for FY 06. Actual expenditures were $1,289,563, leaving a fund balance at the end of FY 06 of $1,623,028. However, a total of $539,858 of that balance was encumbered for standing grant contracts that have been awarded and for which funding had not been fully disbursed (grant contracts are paid on a reimbursement basis). The unencumbered balance at the end of FY 06 was $1,083,170. An additional set of grant contracts worth approximately $595,000 were in the process of being encumbered at the end of the fiscal year, which further reduced the available balance entering FY06.

FY 06 Trust Fund Expenditures and Revenues

	Total FY 06
Beginning Balance	$ 1,896,767
+ Revenue	$ 1,015,824
- Expenditures	$ 1,289,563
Ending Balance	$ 1,623,028
Encumbrances	$ 539,858
Unencumbered funds on 6/30/06	$ 1,083,170

Breakdown of FY06 Revenue Sources

Revenue Source	Total FY 06
Tire Tax	$ 629,698
White Goods ADF	$ 360,464
Newsprint Tax	$ 1,667
Appropriations	$ 0
Contributions and Misc.	$ 23,995
Total Revenues	$1,015,824

Trust Fund Revenue Sources - FY 06

Trust Fund revenues in FY 06, as indicated in the table above, came from four of the five possible revenue sources identified in the General Statutes. Activity from each revenue source is described below:

2% Tire tax – Trust Fund revenues from the tax on the sale of new tires accounted for $629,698 in FY 06, an increase of almost 5 percent from FY 05. Tire revenue accounted for over 60 percent of total Trust Fund revenues for FY 06.

White Goods Tax – Proceeds from the advanced disposal fee (ADF) on white goods accounted for $360,464 or about 36 percent of total revenues for FY 06. White goods proceeds were down almost 3 percent from FY 05.

Virgin Newsprint Tax – North Carolina newspaper publishers who fail to meet state-required purchasing goals for recycled content newsprint must pay a $15 per ton tax on the virgin newsprint they consume. The law allows wide exemptions for companies who are unable to purchase recycled content newsprint due to availability or pricing constraints, or who are actively involved in the recovery of newspaper for recycling. During FY 06, $1,667 was received from the virgin newsprint tax. Compliance with the law has been consistent - in 11 years, the annual revenue from the newsprint tax has never been higher than $3,000.

General Appropriations - When the Trust Fund was first established in 1989, a one-time appropriation of $300,000 was allocated to provide an initial fund balance. Since that time, however, there have been no further appropriations to the Trust Fund.

Contributions to the Trust Fund and Miscellaneous Revenues – DPPEA continued a recycling promotion program in FY 06 that entailed a cost-sharing partnership with local governments and private sector contributors. Local governments contributed $23,995 toward the campaign, but there were no private contributors in FY 06. The list of outreach program partners is provided in Attachment A to this report. More information on the recycling outreach program is provided below.

Trust Fund Expenditures - FY 06

Most of Trust Fund expenditures in FY 06 went to grants and to the state's recycling outreach efforts. Trust Fund resources were also used to continue delivery of technical assistance to North Carolina communities, recycling businesses, and waste generators. These activities are among the explicit purposes noted for the Trust Fund in G.S. 130A- 309.12, and are described in more detail below.

FY 06 Community Waste Reduction and Recycling Grants

The Community Waste Reduction and Recycling Grants (CWRARGs) are a standard annual grant cycle that DPPEA offers to local government and nonprofit recycling programs to expand and improve community recycling efforts. The CWRARGs usually include targeted grant categories designed to increase activity in certain program areas or to increase the recovery of certain commodities.

DPPEA held one CWRARG grant cycle in FY 06, which was initiated by a Request For Proposals distributed to local governments and to nonprofit agencies involved in waste reduction. Funding categories included Backyard Composting and General recycling activities. Bonus points were awarded in the FY 06 cycle to proposals that addressed new disposal bans and ABC permit recycling requirements passed by the General Assembly in 2005. DPPEA received and evaluated a total of 27 proposals, and selected 22 for a total of $299,866 in grant awards. Details on the grantees and their projects are provided under Attachment B to this report.

In addition to the CWRARG cycles, DPPEA conducts a related, ongoing request for proposals to develop "Swap Shops," which are community reuse centers open to the public. This open grant round resulted in two awards in FY 06 to Rutherford and Durham counties.

FY 06 Business Recycling Grants

To increase market demand and encourage recycling economic development in North Carolina, DPPEA conducted a grant cycle in FY 06 for recycling businesses. The grants are designed to help these businesses afford or leverage a critical capital expenditure and thereby expand their material-handling capacity. These expansions in turn translate into new market opportunities for local government recycling programs and for waste generators of all kinds.

In the spring of 2006, the Business Recycling Grant cycle attracted 25 proposals. Eighteen of these proposals were awarded grants for a total of $295,000 in funding. Details on the grantees and their projects are described in Attachment C to this report.

Recycle Guys and RE3 Outreach Campaigns

One of the greatest waste management challenges in North Carolina is increasing household participation in local government recycling programs. High participation raises the efficiency of local programs and results in a greater supply of materials for recycling businesses.

To boost participation rates, DPPEA continued its statewide recycling promotion campaigns in FY 06 - the "Recycle Guys" and "RE3." DPPEA's outreach efforts included:

- Continuation of broadcasts of RE3 and Recycle Guys television commercials.
- Distribution of supplemental materials that help expand the presence and reach of the campaigns.

- Production and distribution of cinema ads to increase public awareness of different aspects of recycling.

Technical Assistance Activities
The General Statutes direct DPPEA to use the Trust Fund to promote waste reduction and recycling generally, and specifically to provide technical assistance to local governments and to build recycling markets. The following section lists a number of activities that DPPEA pursued in FY 06 to accomplish these requirements.

Waste Reduction Partners Program
The Waste Reduction Partners (WRP) is a highly successful program using retired engineers and business professionals to provide environmental technical assistance to companies and local governments in western North Carolina. DPPEA continued its annual funding of WRP with $25,000 to support industrial solid waste audits and other recycling activities. With this funding, WRP helped western North Carolina businesses and other entities divert more than 18,769 tons of solid waste from landfills, a diverted cost of $1.33 per ton (by comparison, the most efficient curbside programs have costs of around $100 - $120/ton). The estimated solid waste reduction savings for businesses served by Waste Reduction Partners in FY 06 totaled $1,126,000, which translates into a leverage of savings to invested funding of 45 to 1.

Staff Support
To accomplish the technical assistance, public education and recycling market development requirements in the General Statutes, the Trust Fund was used in FY 06 to support staff positions in the Division of Pollution Prevention and Environmental Assistance. A total of $347,136 was expended to pay for salaries, benefits and some limited operational support. These positions are described below:

Recycling Market Development Specialist - This position provides marketing assistance to local governments and others involved in recyclable materials collection. As a part of the Recycling Business Assistance Center in DPPEA, this person is responsible for strengthening recycling capacity for secondary materials collected throughout the state. Among other duties, it manages the recycling markets directory required by state statute.

Recycling Market Development Specialist - This position is shared part-time with the N.C. Department of Commerce and is responsible for working with local and state economic developers to recruit recycling businesses to North Carolina.

Recycling Market Development Specialist - This position focuses on building the recycling infrastructure for the diversion of construction and demolition debris and wood waste, which together constitute one-third of the state's entire waste stream. In addition to managing grants and conducting other technical assistance, this position also produces the *Recycling Works* newsletter, which keeps recycling companies and community recycling programs abreast of market developments, material prices, and news about grants and available assistance.

Waste Management Analyst - In addition to working with local recycling coordinators, this position is responsible for developing educational materials and programs on solid waste issues for audiences ranging from school children to adult populations. In particular, this position implements the multimedia statewide Recycle Guys and RE3 campaigns designed to boost recycling participation rates in North Carolina and to make community recycling efforts more efficient.

Waste Management Analyst - This position is responsible for providing technical assistance to local governments on their waste reduction programs, including solid waste planning and full cost accounting (both statutory requirements for local governments). The position also manages recycling program data from state-mandated local waste reduction reports, which in turn allows completion of the State Solid Waste Management Annual Report.

Waste Management Analyst (DPPEA) – This position manages the WasteTrader waste exchange service, provides direct assistance to commercial and industrial waste generators, helps to manage

grants and the local reporting process, and is responsible for many training and outreach activities to local recycling programs.

Organics Recycling Specialist (DPPEA) This position provides technical assistance to local governments, recycling businesses, waste generators and the general public on the reduction and composting of organic waste streams, including yard wastes, which are banned from disposal by state statute.

Graduate Intern Program
To encourage professional development and complete technical assistance projects, DPPEA hired student interns to work in the division in FY 06. Student projects in FY 06 focused on development and implementation of the RE3 outreach campaign, as well as an analysis of electronics recycling policy issues.

Product Stewardship Initiatives
"Product Stewardship" is a growing movement by state and local governments to increase manufacturer responsibility for the environmental impacts of their products, including the diversion of those products from disposal to recycling. Greater manufacturer responsibility for end-of-life products will reduce cost and tax burdens on state and local governments. In FY 06, North Carolina participated in product stewardship initiatives by supporting the activities of the Product Stewardship Institute, including the development of a national agreement with the paint industry on paint disposal. DPPEA also helped lead a multi-state effort to encourage the producer responsibility for beverage containers and continued its participation with the Carpet America Recovery Effort (CARE), a national product stewardship program for the carpet industry.

Publications and Outreach Efforts
DPPEA used Trust Fund resources in FY 06 for a number of technical assistance and outreach activities, including: production of technical assistance materials to help in the implementation of new disposal bans and requirements for ABC permit holders to recycle; printing and distribution of the *Recycling Works* newsletter and other fact sheets; and travel to provide technical assistance to local governments and Trust Fund grantees.

Workshops and Training
DPPEA used Trust Fund-provided funding and technical assistance to support a major state recycling conference in March 2006 and to support other waste reduction workshops and outreach conducted by the Carolina Recycling Association and the North Carolina chapter of the Solid Waste Association of North America.

Temporary Assistance
As in past years, DPPEA used temporary labor to help enter data from more than 600 local government solid waste management annual reports. These reports are required by North Carolina statutes and they provide information necessary to complete the State Annual Solid Waste Report.

Planned Expenditures for FY 07

In FY 07, the Solid Waste Management Trust Fund will be used to provide technical assistance to local government recycling programs and to recycling businesses statewide. As part of that effort, DPPEA will conduct both a community-based and a recycling business grant cycle, helping directly expand collection and processing capacity for recyclable materials. DPPEA will further work to increase the reach of the Recycle Guys and RE3 campaigns. In addition, the Trust Fund will also continue to support the effective Waste Reduction Partners program in western North Carolina and a similar initiative covering the central and eastern part of the stat. North Carolina will also continue to participate in national coalitions seeking to promote product stewardship.

Questions regarding the North Carolina Solid Waste Management Trust Fund may be directed to Scott Mouw, Chief, Community and Business Assistance Section, Division of Pollution Prevention and Environmental Assistance, at 919-715-6512.

ATTACHMENT A: TRUST FUND REVENUE SOURCES

The North Carolina Solid Waste Trust Fund received more than 97 percent of its revenues in FY 06 from two sources: the statewide fees on the purchase of new tires and white goods (appliances). The Trust Fund only receives a small portion of the proceeds from these fees. The total distribution arrangement of each of these fees is described below:

Scrap Tire Tax - During this reporting period (July 1, 2005 - June 30, 2006), a two percent fee was levied on the purchase of new tires in North Carolina. The tire tax allocation is as follows:

- 68 percent of revenues are distributed to the counties on a per capita basis to pay for the proper management of discarded tires.
- 27 percent of revenues are credited to the Scrap Tire Disposal Account (administered by the Solid Waste Section) for local government grants and nuisance tire site cleanup.
- 5 percent of revenues are credited to the Solid Waste Management Trust Fund (administered by the Division of Pollution Prevention & Environmental Assistance).

White Goods Tax - During this reporting period (July 1, 2005 - June 30, 2006), a $3 dollar fee was levied on the purchase on all appliances. The white goods tax allocation is as follows:

- 72 percent of revenues are distributed to the counties on a per capita basis to pay for the proper management of discarded white goods.
- 20 percent of revenues are credited to the White Goods Management Account (administered by the Solid Waste Section) for grants to local governments for managing discarded white goods.
- 8 percent of revenues are credited to the Solid Waste Management Trust Fund (administered by the Division of Pollution Prevention & Environmental Assistance)

FUNDING PARTNERS FOR THE FY 06 RECYCLE GUYS and RE3 CAMPAIGNS

The Solid Waste Trust Fund received an additional small percentage of its revenues from partners supporting the Recycle Guys and RE3 educational campaign, as detailed below.

Partner Name	Amount Given
Chatham County	$1,000
City of Charlotte	$2,500
City of Raleigh	$5,000
Davidson County	$2,500
Lee County	$1,000
Mecklenburg County	$5,000
New Hanover County	$995
Orange County	$1,000
Catawba County	$1,000
Wake County	$4,000
TOTAL	**$23,995**

ATTACHMENT B: 2006 COMMUNITY WASTE REDUCTION AND RECYCLING GRANTS

GRANTEE	AMOUNT	GRANT DESCRIPTION
Anson County	$12,500	Anson County will implement oil recycling and make general improvements to the county's recycling program.
Town of Raeford	$25,000	The Town of Raeford will implement a commercial PAYT program and add cardboard recycling containers.
Coastal Enterprises	$12,000	Coastal Enterprises will purchase a forklift to help handle recyclables more efficiently at its processing facility.
Edgecombe County	$18,840	Edgecombe County will implement a school recycling program.
Gaston County	$8,750	Gaston County will purchase and put into service a variety of recycling bins to increase paper recycling in County offices and paper and plastic recycling in schools.
Henderson County Schools	$4,000	Henderson County Schools will purchase recycling bins to implement a school recycling program and will conduct a teacher workshop.
Iredell County	$20,355	Iredell County Recycling will purchase containers and trailers for glass, cardboard, steel cans, electronics and textile recycling.
Burke County	$17,580	Burke County will place rolloff containers at six recycling convenience sites for the collection and transport of mixed paper.
Town of Clarkton	$18,000	The Town of Clarkton will build a recycling convenience center beside the Town Hall.
Brunswick County	$4,500	Brunswick County will place composting bins at two schools for composting cafeteria food waste. It will also conduct a composting education program at the schools. The county will distribute 100 compost bins to residents and publish an educational brochure.
New Hanover County	$25,000	New Hanover County will develop a new recycling convenience center in an underserved area of the county for recycling ONP, OCC, RMP, glass, aluminum cans, plastic bottles, and rechargeable household batteries
Habitat for Humanity - Matthews	$17,045	Habitat for Humanity of Matthews will purchase a box-body cargo truck to increase its recovery of furniture, household goods and building supplies.
Land of Sky Regional Council	$12,500	Land-of-Sky Regional Council will create a community based social marketing campaign that helps local ABC permit holders to start recycling programs.
Cumberland County	$15,000	Cumberland County will purchase roll-out carts and implement a recycling program to collect office paper, magazines, aluminum, and plastic throughout the county school system.
Town of Princeton	$13,500	The Town of Princeton will implement an oil, oil filter and antifreeze recycling program.
Onslow County	$20,196	Onslow County will implement school recycling programs at three schools, and will purchase and provide recycling containers, roll carts, stickers, advertising, and collection of recyclables.
Pasquotank County	$16,200	Pasquotank County will purchase recycling containers to expand commercial collection, establish an oil filter recycling program, improve recycling collection at the County Correctional facility, and conduct public recycling education.
Pitt County	$10,000	Pitt Count will purchase a forklift to assist in managing electronics collected for recycling.
Wayne County	$7,400	Wayne County will conduct a pilot mobile home recycling project and establish an oil filter recycling program.
Cabarrus County	$7,000	Cabarrus County will develop and implement a multi-faceted educational

GRANTEE	AMOUNT	GRANT DESCRIPTION
		program targeting the recovery of used oil filters.
Habitat for Humanity – Wake County	$10,000	Habitat – Wake will purchase pallet racking that will expand and improve its ability to handle recyclable construction materials at its Raleigh ReUse Center.
Davidson County	$4,500	Davidson County SW to provide two compost educational programs, subsidize the cost of compost bin and provide a truckload sale event for the bins.

ATTACHMENT C: 2006 RECYCLING BUSINESS GRANT PROJECTS

GRANTEE	AMOUNT	GRANT DESCRIPTION
Cape Fear Site Works	$15,000	Cape Fear Site Works will install a large multi-functional shelter to assist in their C&D recycling operation.
Resource Reformers, LLC dba Clean Green	$30,000	Resource Reformers will develop an oil filter recycling awareness campaign and purchase a delivery truck, forklift, and material handling equipment to further develop its oil filter-recycling program.
DC Foam Recycle Center	$20,000	DC Foam will purchase and install a horizontal baler, forklift(s), trucks, trailers, electronic scales and other miscellaneous equipment needed to upfit a new post-consumer carpet recycling processing facility.
Ensley Plastics	$10,000	Ensley Corporation will purchase and utilize a grinder to grind segregated plastics.
Innovative Recycling Solutions	$25,000	Innovated Recycling Services will purchase a screener to make ground pallet & wood waste more marketable.
New Life Plastics	$10,000	New Life Plastic Recycling, Inc. will purchase and install a pelletizing line for the purpose of repelletizing polyethylene and polypropylene regrind.
Wellmark Plastics	$20,000	Wellmark will expand processing capabilities to meet increased demand for recycling plastic resin with the addition of a new shredder, grinder, and profile extruder.
Piedmont Pallets & Plastic	$15,000	Piedmont Pallets & Plastic will purchase a road tractor, trailers, box truck and pallet repair equipment to develop a pallet reuse and recycling operation.
Pallet One of NC - Siler City	$25,000	Pallet One of NC-Siler City will purchase and utilize a grinder to process scrap wood pallet waste.
GEEP	$30,000	GEEP will install processing equipment for e-waste recycling. The grant funds will be focused on the monitor processing line, which will handle the dismantling of CRT's.
Green Solutions	$15,000	Densified Solutions will collect post-industrial expanded polystyrene currently being disposed in landfills, and process it into third generation plastic.
Paper Stock Dealers - Raleigh	$10,000	Paper Stock Dealers of Raleigh will purchase, install and put into use screening equipment for the purpose of upfitting their new facility with single-stream recycling processing capacity.
PRR Services, LLC	$15,000	PRR Services is upgrading its material handling and processing capabilities through the purchase and installation of a horizontal baler.
Wake Habitat	$10,000	Habitat for Humanity of Wake County will purchase a skid steer loader and trailer to increase diversion capacity of salvaged and donated reusable building materials.
Advanced Recycling	$25,000	Advanced Recycling will purchase the building they are currently leasing, and buy a forklift to assist in material handling.
Alamance Habitat for Humanity ReStore	$5,000	The Alamance Habitat for Humanity Re-STORE will purchase a truck with a lift to further increase the capacity to recycle materials and merchandise.
Asheboro Recycling Center	$15,000	Asheboro Recycling Center, in partnership with the town of Asheboro, will begin a curbside recycling program.

CHAPTER 4 – State Agency Purchases of Recycled Products and Reduction of Solid Waste Disposal

January 2007

Introduction

State agencies are directed to use products containing recycled materials by state law - N.C. General Statute 143-58.2(a), - and by Executive Order. Executive Order 156 was signed in 1999 in support of N.C. Project Green, the state environmental sustainability initiative, and was an updating and strengthening of the original initiative of Executive Order 8, signed in 1993.[1] Purchasing recycled and other environmentally preferable products improves recycling markets, helps reduce environmental impacts from waste, and saves energy and natural resources. Many state agencies and local school districts help achieve these goals through thoughtful purchasing decisions and the use of recycled content products.

North Carolina state government has continued to make progress toward environmental sustainability by offering recycled and environmentally preferable products at affordable prices on state contract. Currently, there are about 20 categories of products on term contract that offer products with recycled content materials, and several more products available exhibit some sort of environmentally preferable attribute, including recycled content packaging or energy efficiency. State agencies and others who can buy from state term contract, such as local governments, have a wide degree of choice in the purchase of high quality, cost-effective recycled products on term contract. The list of products can be seen at: **www.doa.state.nc.us/PandC/recycled.htm**.

This document summarizes the efforts of state agencies to purchase recycled products. It fulfills the reporting mandate of N.C. General Statute 143-58.2(f) for fiscal year 2006. It compiles purchasing reports required from 27 state government department and offices, 12 constituent institutions of the University of North Carolina, 53 community colleges and 82 local public school administrative units. In fiscal year 2005-2006, reports were received from 79 percent of agencies (174 out of 221). The majority of nonreporting agencies are local school entities. Almost half of the agencies that did not report did not comply with reporting requirements last year either. All reporting was conducted online, saving paper and postage.

The N.C. Division of Pollution Prevention and Environmental Assistance is the agency charged with compiling data from agency reports and publishing this summary. Copies of this and past reports may be obtained on-line at **www.p2pays.org/epp** or by calling (919) 715-6505 or (800) 763-0136.

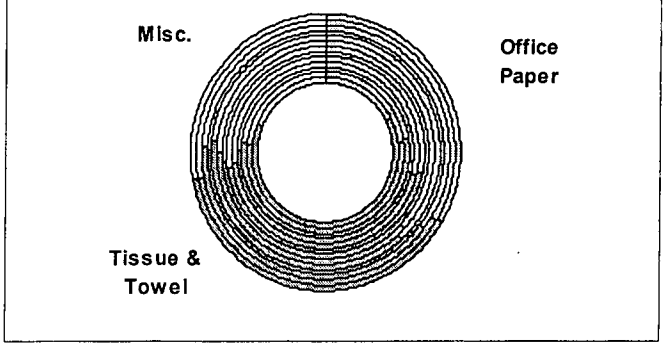
Purchases of Recycled Products

Paper and Paper Products

This is the fifth year in which agencies failed to meet the goal set forth by Executive Order 156: "State agencies shall attempt to meet the goal that, as of Fiscal Year 2000-01, 100 percent of the total dollar value of expenditures for paper and paper products be toward purchases of paper and paper products with recycled content".[2] Just about half the expenditures for paper were spent on office paper, achieving a 69 percent success in recycled content office paper purchases.

Twenty-one agencies succeeded in reaching the 100 percent goal this fiscal year for all paper purchases, including office paper, tissue and towel papers, and miscellaneous papers such as legal pads, file folders, labels and continuous feed forms. This number has been relatively consistent over the past 10 years. More than a third of the agencies achieved a stellar 90 percent or higher in recycled content purchases for their paper needs.

Figure 1. Percentage of Recycled Content Paper Categories 1994-2006



[1] Full text of No. 156 is available online at www.p2pays.org/epp/reports.asp.

Less than a quarter of reporting agencies purchased all their office paper with recycled content, but more than half bought all recycled content towel and tissue products. **Figure 1** demonstrates fluctuations in the three paper categories reported on since 1994, which is the innermost circle. Recycled content towel and tissue paper purchases have been declining the last two years, with 80 percent containing recycled content.

Since 2003, the percentage of recycled content paper purchases has decreased by 9 percent, a decline attributable to the reinstatement of the virgin paper available on state contract at a lower price. Recycled content paper costs just over two dollars more per box than virgin paper, or 20 cents per ream. Seeking more vendors of recycled content paper and implementing waste reduction techniques, such as double-sided printing and reusing one-sided pages, could help neutralize this cost, which is a notable obstacle in reaching statewide goals.

More positively, a significant impact is realized from the state's purchases of recycled content paper. For comparison, assume that the roughly $15 million spent on recycled content office paper and the nearly $7 million on virgin office paper included exclusively 8 1/2X11 white copy paper, all purchased from the state contract. The recycled office paper purchased conserved almost 89 million trees, saved enough BTUs to provide more than 600,000 households with energy for a year, and reduced the CO2 equivalent of removing 708,313 cars off the road for a year. Over 32 billion gallons of wastewater were also conserved, which is the equivalent of nearly 50,000 swimming pools. The solid waste avoidance could fill 148,496 garbage trucks, amounting to 4 billion pounds. If we converted the $7 million in virgin paper to 30 percent post consumer recycled paper, we could save another 37 million trees, 26 million more BTUs, and 63,332 more truckloads of garbage. These comparisons help put the impacts of the state's purchasing decisions in more tangible terms, and validate the motives behind our recycled content purchasing efforts[3].

Another element of recycled paper usage for state agencies includes contracted print jobs. Reported spending on outside print orders was $13.4 million, in-line with last year's data. Agencies achieved an impressive 10 percent increase of recycled content paper purchases in this category.

Figure 2. State Agency Total Purchases of Recycled Paper and Paper Products
Fiscal Years 1994-2006

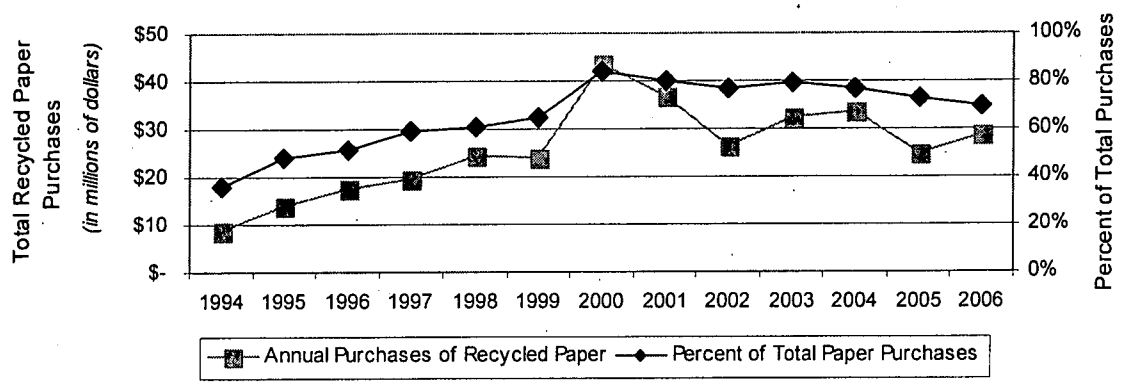


Figure 2 illustrates the trend in overall dollar amounts and percentages of recycled paper purchases over the past 13 fiscal years, including this year's increase in recycled content paper expenditures. Recycled content paper purchases totaled nearly $29 million, which represents 70 percent of all paper purchases, a

[3] These numbers are based on the assumptions outlined in the report. The weight of the office paper was estimated using a calculator at www.replanttrees.org, and the environmental impacts were estimated from the Environmental Defense's paper calculator at www.environmentaldefense.org/papercalculator.

slight decrease from last year. The data indicates a need to enhance efforts to achieve the 100 percent goal across all agencies. The accomplishment of the goal would be helped by a renewed emphasis and commitment from top management in directing agencies to meet the statutory and executive goals. A targeted campaign of outreach to agencies that purchased a high level of virgin paper is also warranted.

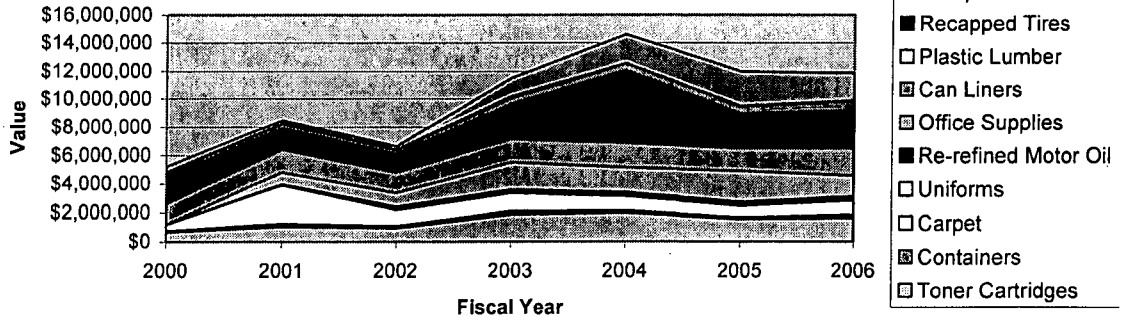
Policy and Administrative Support

While agencies are not required to develop a policy by the General Statutes or Executive Order, it could be the first step to improving our state's effectiveness in recycled content product purchases. Agencies are specifically charged with the responsibility of purchasing recycled content products, as well as designating a lead coordinator. A mere 41 percent of the reporting agencies responded positively to having a buy recycled policy or goal in place, consistent with the last three years. Agencies are also reporting that fewer administrators are communicating the importance of purchasing recycled content products, and less than half report having a lead coordinator for buy recycled efforts. These are key components to a successful recycled content procurement program, along with administrator encouragement, and should be examined as a way to significantly increase participation.

Non-Paper Products

Agencies reported spending $11.8 million on non-paper recycled products in fiscal year 2006, corresponding with last year's expenditures. Agencies seem to be aware of what the categories include due to outreach and education. In general, non-paper recycled product expenditures have begun to increase, and are expected to rise as purchasers become further educated about the products they buy, and as the array of recycled products become more available on term contracts and through vendors. Total expenditures of the recycled non-paper products reflect similar numbers as last year and are illustrated below in **Figure 3**. The size of the colored categories represent the total dollars of purchases in that category and the height in that fiscal year represents total purchases of non-paper recycled products. Reports revealed minor fluctuations in most categories; exceptions included containers, which nearly doubled, office supplies, which were down about half, and compost and mulch, which increased by more than 30 percent. The "other" category decreased by 20 percent and includes furniture, animal bedding, outdoor equipment, and housekeeping supplies. Re-refined motor oil purchases increased by 35 percent this year, which could be a result of education on the availability of the product.

Figure 3. Agency Purchases of NonPaper Recycled Content Products
Fiscal Year 2000-2006



Other Environmental Purchasing Efforts

Some state agencies have excelled beyond buying recycled, and have begun to tackle more sustainable purchasing issues like environmentally preferable purchasing (EPP). EPP, or green purchasing, includes a host of attributes that can be considered to decrease the impact of our purchases on the environment.

Several universities have developed green building initiatives for new facilities or have begun greening energy and water elements in older buildings. Green buildings require architects and contracts to consider many things from building placement, water and energy use and more environmentally friendly products. Other successes in state government this year include the initiation of dialogue between some

of the DOA Purchase and Contract engineers and DPPEA to revise some product specifications. One huge success included updating the carpet specifications to include more recycled content, as well as language that requires the vendor to remove and recycle old carpet.

Conclusion

The purchase of recycled content products is a well-established practice in state government, supported by statutory and executive order requirements, as well as state term contracts that offer high quality, affordable recycled content choices for state purchasers. Still, progress must be made to bring agencies to full compliance with the 100 percent recycled content paper goal.

Several key agencies could, with a few significant purchasing decisions, substantially increase the overall performance of state government in recycled paper purchasing. Converting the current $12.5 million in virgin paper purchases to recycled paper will allow North Carolina state government to contribute substantially to the strength of recycling markets. As a major player in the collection of paper for recycling, state government stands to benefit directly from improved markets. The use of recycled products will also help North Carolina achieve its environmental goals by reducing natural resource, energy and water usage, and preventing air and water pollution. In the case of a product like re-refined motor oil – which meets the exact specifications of virgin oil and is supported for use by engine manufacturers – agency purchases of the product is strongly recommended.

The following recommendations may help to increase recycled content purchasing in the future and help state government meet goals set forth both in Executive Order 156 and General Statutes.

Recommendations

I. Engage agencies regarding sustainability throughout the year. Continuing efforts to reach out and network with state agency purchasers will help establish green purchasing efforts as an every day activity. It will also strengthen the ability for DPPEA to collect and manage data related to state agency purchases. Reinvigorating NC Project Green, continuing onsite visits, and encouraging collegiate participation in the Collegiate Recycling Conference will revitalize this communication.

II. Increase administrative support and educational programs. Disparity among agencies in the degree of support and routine communication received from top management may be the most significant barrier to increased agency participation in recycling and recycled content product procurement. Administrative support is crucial also to the successful implementation of agency sustainability plans that incorporate waste reduction, recycling, and environmentally preferable procurement. For those agencies that have not yet prioritized waste reduction and buying recycled, it is recommended that they:

- Implement and adhere to the goals of Executive Order 156.
- Issue and enforce internal policies, official memoranda and formal declarations that demonstrate administrative leadership and support for Executive Order 156.
- Develop and implement ongoing outreach and education programs for employees and visitors, and take advantage of the assistance DPPEA can offer.

III. Increase procurement of non-paper recycled content products. Outright expenditures for non-paper recycled products continue to lag behind those of paper purchases. A vast variety of products are available with recycled content materials, which is apparent from the federal governments purchasing regulations under Executive Order 13101. Their *Comprehensive Procurement Guidelines* features more than 50 items in eight categories, including paper, non-paper office, construction, landscaping, park and recreational, transportation, vehicles and miscellaneous products (visit http://www.epa.gov/cpg/ for more information). Purchasing a diverse array of recycled content products not only strengthens recycling and job markets in North Carolina, it also helps agencies fulfill their obligation to become more environmentally sustainable. To improve overall buy-recycled efforts, state agencies should:

- Expand the quantity and variety of non-paper recycled products purchased through agency convenience contracts and state term contracts.
- Improve electronic tracking systems for all recycled product purchases.
- Specify or encourage the use of recycled materials and supplies by contracted services, especially in construction, housekeeping and printing.

IV. Make purchasing decisions based on full environmental impact vs. one-time cost. To determine the full environmental impact of a product or service, it is important to look at the full life cycle analysis of a product. By doing so, agencies can begin to make purchasing decisions that will reap short and long term benefits.

- Begin looking at products in terms of broad environmental impacts including: durability, energy efficiency, performance, recycled content and recyclability, toxicity, biodegradability, local manufacturers, and packaging.
- Open dialogue with P&C regarding products on STC and contractual services that take into account environmental impact.

*Completed the 2005 State Agency Source Reduction, Recycling, and Composting Report

State Agency Source Reduction, Recycling, and Composting Efforts

This is the second consecutive year the Division of Pollution Prevention and Environmental Assistance collected the recycling report since FY 1999. Forty-four agencies reported data, consistent with last year, which constitutes 42 percent of the required reporting entities. Universities and community colleges are heavily represented, accounting for 40 reports.

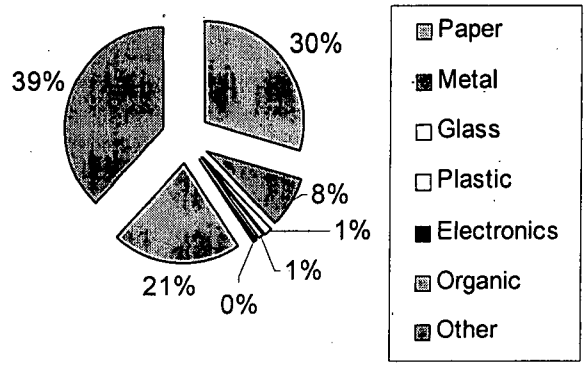
Agency departments pose a difficult challenge in reporting because they often have several regional offices to gather data from, and many work in leased facilities and share buildings with non-state businesses. They make up 27 percent of the required reports, and include more than twice as many state employees than the Capital area. This year four agency departments reported. The Department of Commerce and the Department of Insurance answered questions regarding their internal recycling program. The Department of Transportation filed a complete report, and a complete summary of their solid waste and recycling program is included in this Solid Waste Management Annual Report.

The majority of agency offices located in the Raleigh area are included under one contract for recycling and solid waste collection provided by the Department of Administration and managed by Facilities Management. Facilities Management gathers data from the collection companies and completes this report for agencies in the capital region.

Recycling Performance

In fiscal year 2006, state agencies collectively diverted 29,210 tons from disposal in landfills and incinerators. Respondents reported recycling 8,682 tons of paper, 2,315 tons of metals, 338 tons of glass, 349 tons of plastic, 6,180 tons of organics, and 11,219 tons of other materials, as demonstrated in Figure 1. Many universities and community colleges remarked that they now commingle their containers; glass and plastic categories may therefore represent estimated numbers or a lump sum of mixed containers.

Figure 1. 2006 Recycling Breakout



This data is extremely variable, and drawing comparisons to the 1999 data is difficult because reporting behaviors have most likely changed. **Based on FY 2006 data, the agency recycling rate for all wastes managed during the year was about 27 percent.** This is a 3 percent increase from the 2005 report, but still 8 percent less than the 1999-recycling rate. Three agencies reported recycling tonnages this year but did not include solid waste tonnages.

Figure 2. DOA Recycling Tonnages

Material	Tons
Paper	1852
Metal	15
Glass	3
Plastic	10
Total Tons Recycled	1880

The Capital area recycling data reported by Facilities Management is included in this data. A breakout of the categories is exhibited in Figure 2, representing 6 percent of the total recycling tonnage. Given the data reported, the projected recycling rate of the Capital region would be 53 percent, a gross overestimate that results from a lack of comparative solid waste disposal data

Data was collected for electronics recycling for the second year in a row. An encouraging one third of agencies have a contract set up with a computer recycling vendor, and in FY 2006 collected 126 tons of electronics. This does not include data from DOA or the State Surplus Office. Most agencies assert using the statewide electronics recycling contract

(www.doa.state.nc.us/PandC/926a.htm) to complement recycling through state surplus. A handful of agencies reported other vendors they work with, all of which are listed in our online Recycling Markets directory at www.p2pays.org/dmrm. A few claim to work in conjunction with their local government to dispose of electronics and one or two donated to local schools. Agencies and local governments are becoming keenly aware of the need to recycle electronic materials, bearing in mind their contribution of hazardous substances to landfills and the alternate opportunity of reclaiming valuable resources from electronic products.

Solid Waste and Program Costs

Approximately 80,078 tons of solid waste were landfilled or incinerated for state agencies in FY 2006, costing about $9.8 million in collection and disposal fees at an average cost of just under $123 per ton. This is just a fraction of the 134,599 tons reported in 1999 costing $11.75 million, but it is a 44 percent increase from last year. While the overall cost of disposal increase by almost $3 million from last year, the cost per ton actually decreased by five dollars. This number is extremely fickle depending on how complete agency reports are. Two agencies reported solid waste tonnages but did not report the cost of disposal.

Calculating the total cost of solid waste and recycling programs is difficult, and the report falls short in acquiring sequential data for accurate calculations. Some agencies even responded to this point. In particular, calculating the total cost of solid waste and recycling collection, in conjunction with a successful recycling program, may require more supplemental calculations. In order to determine the true cost or cost avoided, both programs must be considered in the equation. The reliability of this data also depends on how in-depth the reporting agencies examine their program fees.

Agencies are asked to report the cost avoided through recycling, calculated by multiplying the recycling tonnage by the cost per ton of solid waste. While most appeared to do this from the data, eight agencies reported tremendous differences in their cost avoided through recycling. Those discrepancies were either miscalculations or took into consideration other costs of the program that were not supplied in the report. The total cost avoided was over $4 million.

While nearly half the agencies reported some revenues for the sale of recyclables amounting to just over $300,000, the majority still experienced program costs totally nearly $2.7 million. Program costs include collection, processing and outreach and education. **The result is an average cost of $91 per ton of recyclables, $32 less than the cost for solid waste disposal**, which exemplifies the savings in recycling. Recycling programs should not have the expectation of zero cost, but can expect that there will be an overall savings by avoiding the higher disposal fees of solid waste. As with most new programs and efforts, there is sometimes a higher upfront cost for containers and initial education, and minimal costs to continue marketing the program.

Administrative Support and Source Reduction

The majority of agencies report that they receive top-down administrative support for recycling efforts, and well over half have a lead coordinator for waste reduction and recycling program. Forty-one percent have a waste reduction program, and a handful more have ongoing educational and promotional programs for waste reduction and recycling. Most agencies that routinely host the public at their facilities, such as state parks, highway rest areas, museums, and sports venues, provide recycling opportunities for visitors. Information is communicated and distributed via:

- ✓ Meetings with staff, dormitory resident assistants, and employee and student orientation
- ✓ Presentations and tabling special events such as: Move-In, Move-Out, Earth Day, America Recycles Day, Ozone Day
- ✓ Employee manual and materials distributed during student move-in and move-out
- ✓ Web sites, e-mails, electronic bulletin boards, brochures, fliers, newspaper, newsletters
- ✓ Posters, signs, and recycling bins
- ✓ Environmental Clubs and SGA.

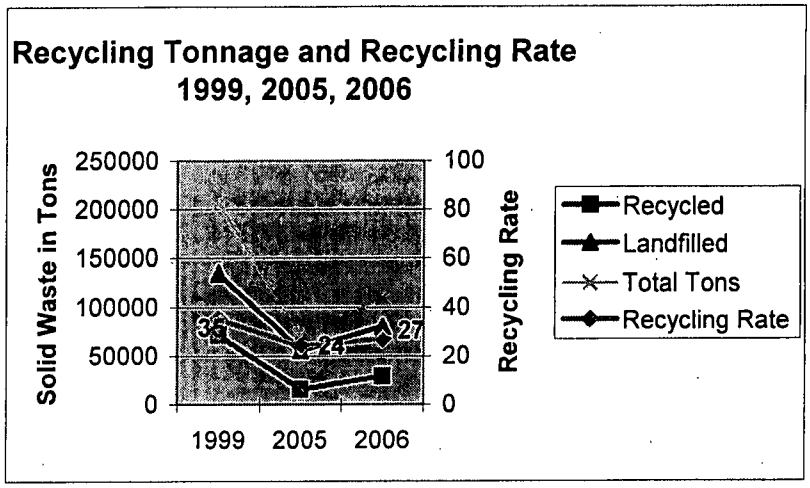
An outstanding 90 percent of state agencies practice waste reduction at the source, including reducing office paper by eliminating unnecessary reports and forms or converted to electronic format, making fewer copies, double sided printing, using email and voice mail to communicate, and posting announcements on bulletin boards or in break areas. Agencies estimate to have reduced 288.5 tons of paper by reducing

their usage in fiscal year 2006. A quarter of agencies conducted solid waste assessments of the amount and types of solid waste at its facilities. Some use this reporting process to reevaluate their program. Other agencies conduct site visits, collect landfill invoices, or audit on-site trash dumpsters. The results help in finding the best place to put recycling containers, deciphering which materials are most feasible to recycle, and identifying where waste reduction techniques would be most efficient.

Conclusion

While in many ways the revitalization of the recycling report has shown a great percentage of agencies continuing their waste reduction and recycling efforts that were established several years ago, there has not been significant overall improvement. Some agencies, including community colleges and a few universities, are struggling to recycle basic material like cardboard and aluminum cans. Sometimes this is a market issue. More often, it is a perceived barrier due to lack of education and funding, which stems from insufficient support internally.

This year's recycling tonnage represents a 70 percent increase from last year, but only a fraction of the 71,344 tons reported in 1999. This and other inconsistencies can be attributed to a few major challenges, making overall comparisons complicated. For instance, some agencies are reporting their data in tons while others in pounds. This year the data was reviewed more acutely. Next year, the integrity of the data will improve further with updates to the final report form. In addition, there has been a decrease in the number of departments reporting for regional offices in particular. Furthermore, some agencies in downtown Raleigh supplement the state's collection contract with their own, and have not reported that data.



Much of the variability in performance difference can be attributed to the inability of agencies to accurately track tonnages. Solid waste and recycling weights are still estimated because collection companies have not integrated onboard truck scales. Exact weights can only be obtained if collection is completed in one region and the truck is brought across scales to calculate the tonnage. For these reasons, data reported by state agencies likely underestimate the true quantities and costs of waste being disposed. Incomplete tracking and estimation may also contribute to fluctuations in reported recycling over time.

The unreliability of the data prevents an accurate comparison between recycling tonnage increasing causing a decrease in solid waste being disposed of in the state's landfills and incinerators. While the amount of recycling increased by 70 percent since 1999, and the solid waste tonnage only increased by 44 percent, which is less than half. Overall, the recycling rate improved by 3 percent, from 24 percent in 2005 to 27 percent in 2006. Improved awareness of agency solid waste streams and more accurate data collection will make a more reliable comparison possible. Data compiled for this report indicate that state agencies are recycling less than a third of their solid waste. It appears that agencies have simultaneously achieved some waste reduction through their efforts.

More encouraging are examples of agencies that have pulled forward as stars in waste reduction and recycling efforts. Many of the universities provide reuse programs including large-scale collection and redistribution of clothing, furniture, household supplies, and sometimes even electronic products. A few universities have conducted sustainability audits over the last year or two, which include energy and water tracking mechanisms as well as waste audits of the campus. With the re-establishment of the recycling report, some community colleges and universities have reached out for assistance to restart or

revitalize their program. UNC-Wilmington, Forsyth Tech and Wake Tech all contacted DPPEA following the reporting season last year for assistance in reviving their programs.

DPPEA has developed a new outreach and education campaign that is available to all universities and community colleges to help promote recycling programs. In FY 2006, many schools took advantage of the RE3 campaign, utilizing posters and commercials on campus. At annual outreach events from job festivals to Earth Day celebrations, campus coordinators gave out promotional materials to encourage students to visit www.re3.org to learn more about recycling. In 2007 DPPEA is planning to develop new materials to continue promoting the program, including online resources such as a web-blog, new commercials, and more promotional materials.

Recommendations

Upon review and consideration of the data contained in this report, DPPEA submits the following recommendations to improve the solid waste reduction and recycling efforts of North Carolina state agencies.

I. Assess the impact of source reduction and recycling on waste disposal and costs. Tracking the amounts of solid waste disposed annually by state agencies is the only way to determine whether efforts to reduce waste, including recycling programs, are impacting the waste stream. This information, along with data on the costs for collection and disposal of solid waste, can be used to evaluate the cost efficacy of agencies' waste management strategies as well as the costs avoided through waste reduction and recycling. To maximize data recovery and assessment, it is recommended that agencies:

- Conduct waste assessments at their constituent facilities, offices and institutions.
- Require full accounting for all costs associated with solid waste collection and disposal services.

II. Develop a means to communicate your recycling program. Programs are ineffective if they are not visible and not explained to employees. This may be as simple as quarterly e-mail reminders of what is accepted at the various bins in your office, and where the bins are located (i.e. by the copy machine, in the staff lounge, in the lobby, etc.). Depending on the work environment, such efforts may include a full-fledged outreach and education program. DPPEA makes materials available for promotional initiatives, including posters, stickers and other advertising tools through the RE3 program at www.re3.org.

CHAPTER 5 – White Goods Management

"White goods" are defined in General Statute 130A-290 (a)(44) as, "refrigerators, ranges, water heaters, freezers, unit air conditioners, washing machines, dishwashers, and clothes dryers and other similar domestic and commercial large appliances." In 1993, the North Carolina General Assembly passed the statute because white goods were difficult to dispose and contained chlorofluorocarbons refrigerants (CFCs). Counties were mandated to manage them by providing at least one disposal site, at no cost to citizens, and to arrange for the removal of CFCs. To fund this statute the General Assembly imposed a $3 tax (advanced disposal fee or ADF) on new white goods purchased.

Overview

- County revenues from scrap metals sales continue to stay high. The demand from overseas markets appears to remain strong despite minor price fluctuations. A number of counties that have made investments in infrastructure to increase efficiency and streamline costs are receiving good profits by selling scrap metals.

- Some counties are continuing to regain control of white goods programs from contractors and third parties. County governments that fail to realize the full worth of scrap metals lose considerable amounts of potential proceeds from their white goods programs.

- A small number of counties with high overhead costs continue to require subsidizing of their deficits. Those counties request cost over-run grants to balance their accounts. As scrap metal prices remain relatively high some counties continue to give away their scrap metals, losing substantial revenue.

- The white goods program continues to promote county infrastructure for improved white goods management through its capital improvements grant program. A number of counties that have used white goods money to improve infrastructure are now receiving lucrative returns.

- Several counties have established in-house chlorofluorocarbons (CFCs) reclamation programs. The white goods program promotes CFC reclamation by providing money to counties for purchasing of machinery and training of personnel. Refrigerant gas recycling provides another source of revenue to counties willing to organize such a program.

- A mechanism should be devised to ensure that counties are spending white goods tax revenues on their white goods programs.

This interim report is based on information supplied by counties' Annual Financial Information Reports (AFIRs). AFIRs are submitted to the Office of the State Treasurer. AFIRs are due by Nov. 1st. 45 counties had submitted AFIRs at the time this report was prepared, Jan. 15, 2007. A final, revised report will be issued when the remaining counties submit their AFIRs. It should be noted that, aside from many AFIRs from counties being late, many have blank or erroneous entries.

Financial Update

- **The white goods management account no longer runs a large surplus.** The number of counties that forfeit their tax proceeds declined significantly while overall grant requests continue to stay relatively high. In FY 98-99, 42 counties forfeited tax proceeds. However, by the fourth quarter of FY 05-06, only 8 counties had forfeited their proceeds.
- The amount of forfeited funds available for redistribution dropped 75 percent in the last few grant periods, at the same time that county requests for cost overrun and capital improvement grants have remained relatively steady.
- In FY 2003-04 the white goods management account received $539,293 in forfeited funds. In FY 05-06 the white goods management account received $295,473.29 in funds forfeited by counties. This represents a drop in revenue of nearly 45 percent.

Advance Disposal Fee

Net white goods ADF collections in FY 05-06 totaled $4,903,323.64. Funds were disbursed as follows:

$ 4,903,323.64	Allocated for direct distribution to counties
$ 935,846.14	Allocated for white goods management account
$ 374,338.46	Solid Waste Management Trust Fund
$ 224,092.96	N. C. Department of Revenue cost of collections
$ 3,369,046.08	Actual amount distributed directly to counties
$ 295,473.29	Forfeited by ineligible counties

Although $3,369,046.08 (72 percent of the net disposal fee collections) was allotted for distribution, ineligible counties forfeited $295,473.29. The forfeited funds went to the white goods management account, which receives 20 percent of net collections.

White Goods Management Account

The White Goods Management Account was established to help counties whose costs exceed their share of ADF revenue. The account receives 20 percent of white goods ADF revenues. It also receives funds forfeited by counties whose surplus exceeds their threshold amount. By the end of FY 05-06, the White Goods Management Account had $1,105,017.50 in actual and projected commitments and an account balance of $969,305.17 which was slightly higher than the starting balance of $878,734.03. These commitments include $500,000 for grant requests for the first half of the next fiscal year and $605,017.50 for capital improvement grants obligations. This account is used to fund counties that incur deficits in their white goods accounts and to provide capital funds to counties to upgrade program infrastructure.

WHITE GOODS DISPOSAL ACCOUNT BALANCE FY 05-06

Beginning Balance (July 1, 2005)	$ 878,734.03
Funds Received during FY 05-06	$ 1,231,319.43
Cost Overrun Grants Disbursed in FY 05-06	$ 498,046.81
Capital Improvement Grants Paid in FY 05-06	$ 642,701.48
Moneys Needed for Future Grant Awards*	$ 1,105,017.50
Ending Balance (June 30, 2006)	$ 969,305.17

*Includes $605,017.50 reserved for capitol improvement grants and $500,000 reserved for next round of overrun grants.

White Goods Management Account Grants

The first graph below shows that total amounts of money requested by counties for cost over-run grants in the last recent grant periods has decreased. There was a sharp rise in the amount of funds requested by counties for cost over-run grants in the January-June 2006 grant round of requests for the fiscal year. This was primarily due to the failure of one county to accurately report its expenses. Otherwise, the graph followed its historic values. The amounts of funds that are requested by counties for cost over-run grants have remained relatively stable for the last few grant rounds. This is thought to be due to the high value of scrap metal. At the end of 2001, the benchmark price (benchmark pricing does not include the costs of shipping and processing metals) of scrap metals was at $95 per ton. At the end of 2003, the benchmark

price was set at $150 per ton. Presently, at the end of 2006, the benchmark price of scrap metal stands at $185 per ton.

Over $289,273.52 in grants went to 24 counties for losses incurred July-December 2005; $208,773.29 was distributed to 24 counties for losses incurred January-June 2006 (Tables 1 and 2).

Table 1

Grant Requests & Awards from the White Goods Disposal Account for Losses Incurred July- December 2005

County	ADF	Amount Requested	Amount Paid
Brunswick	$15,858.97	$29,176.60	$29,176.60
Camden	$1,589.93	$3,421.00	$3,421.00
Chatham	$10,257.58	$18,029.29	$7,211.72
Chowan	$2,698.86	$7,980.37	$7,980.37
Cleveland	$18,165.24	$73,516.40	$29,406.56
Craven	$17,154.40	$736.72	$736.72
Currituck	$4,079.91	$9,173.72	$9,173.72
Duplin	$9,601.47	$6,203.67	$6,203.67
Edgecombe	$10,055.41	$9,346.73	$3,738.69
Gates	$2,048.90	$8,956.55	$3,582.62
Graham	$1,505.81	$25,226.07	$10,090.43
Hyde	$561.64	$4,649.48	$1,859.79
Lenoir	$10,918.91	$41,949.99	$29,364.99
Madison	$3,768.07	$2,924.00	$2,923.73
Moore	$14,797.40	$4,641.41	$4,641.41
Nash	$16,917.91	$40,255.17	$28,178.62
Northampton	$4,022.09	$20,159.22	$8,063.69
Orange	$22,560.15	$15,769.12	$6,307.65
Perquimans	$2,208.17	$8,442.57	$8,441.97
Pitt	$26,391.45	$1,745.60	$1,745.60
Randolph	$25,326.92	$1,665.63	$1,665.63
Rutherford	$67,790.62	$857.82	$857.82
Tyrrell	$415.51	$820.70	$328.28
Washington	$2,514.04	$9,180.02	$3,672.01

Table 2

Disposal Grant Requests & Awards from the White Goods Account for Losses Incurred January- June 2006

County	ADF	Amount Requested	Amount Paid
Beaufort	$0.00	$34,902.78	$17,451.39
Camden	$1,589.93	$5,883.00	$5,883.00
Carteret	$11,538.84	$37,755.84	$26,429.09
Chatham	$10,257.58	$26,205.03	$13,102.52
Cleveland	$18,165.24	$70,961.12	$35,480.56
Currituck	$4,079.91	$5,084.68	$5,084.68
Duplin	$9,601.47	$36,421.44	$18,210.72
Durham	$44,548.67	$162,373.42	$16,237.34
Graham	$1,505.81	$26,182.19	$13,091.10
Lenoir	$10,918.91	$28,600.49	$28,600.49
Macon	$0.00	$8,095.94	$8,095.94
Madison	$3,768.07	$3,569.00	$3,569.00
McDowell	$8,065.62	$1,353.54	$1,353.54
Mitchell	$2,982.53	$14,628.17	$10,239.72
Moore	$14,797.40	$12,407.26	$12,407.26
Nash	$16,917.91	$41,523.58	$29,066.51
Northampton	$4,022.09	$11,493.40	$5,746.70
Orange	$22,560.15	$26,968.64	$13,484.32
Pitt	$26,391.45	$1,706.76	$1,706.76
Rowan	$24,829.68	$218.49	$152.94
Rutherford	$67,790.62	$14,702.00	$7,351.00
Transylvania	$0.00	$4,405.72	$4,405.72
Tyrrell	$415.51	$8,763.77	$4,381.89
Washington	$2,514.04	$11,059.07	$7,741.35

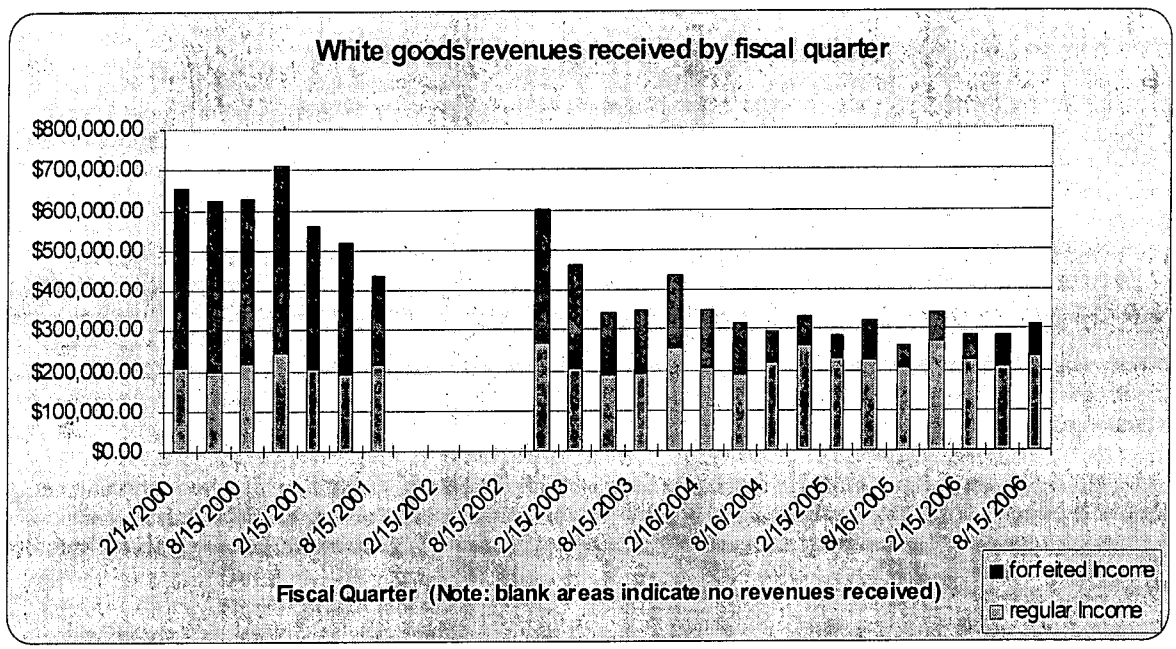
Capital improvement grants totaling $ 642,701.48 were awarded to 13 counties (Table 3). *In FY 05-06, counties received* $1,140,748.29 *in cost overrun and capitol improvement grants, and* $1,231,319.43 *in revenues was received.*

Table 3

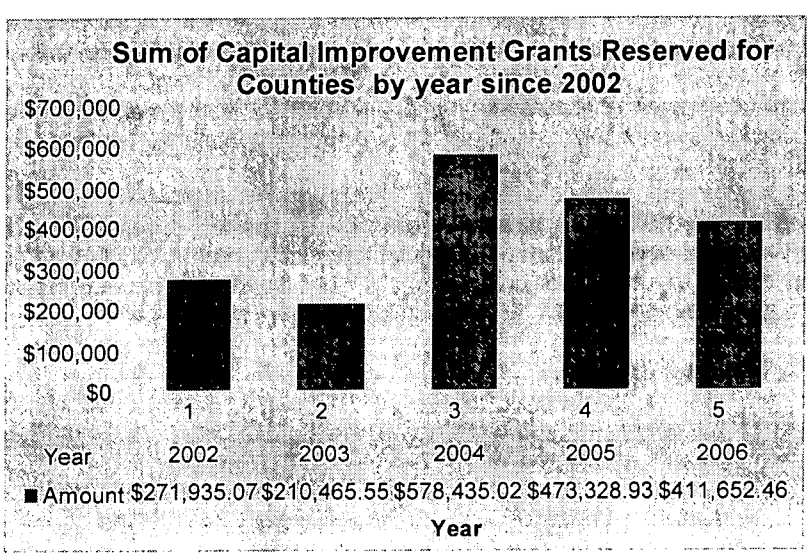
Capital Improvement Grants Paid to Counties for Fiscal Year 2005-2006

County	Amount	Purpose
Ashe	$34,500.00	roll-off truck
Caldwell	$56,100.00	skid steer
Chowan	$10,607.80	roll-off containers
Duplin	$93,569.85	concrete pad
Gates	$10,607.80	roll-off containers
Hoke	$45,898.00	concrete pad
Jackson	$34,304.83	loading area
Lincoln	$9,312.17	concrete pad repair
Lincoln	$53,851.70	Knuckleboom loader
Nash	$15,450.00	concrete pad
Perquimans	$12,918.50	roll-off containers
Pitt	$68,125.00	roll-off containers
Surry	$54,345.88	concrete pad
Wilkes	$143,109.95	road tractor-trailer

As the previous graph demonstrated, the total of the amounts requested have decreased gradually in recent grant periods. As the next graph depicts, the amount of available funds dropped significantly at the same time grant requests declined. Funds are received into the white goods account from the Department of Revenue forty five days after the end of the fiscal quarter.



The graph below shows that since the year 2002 capital improvement grant amounts have increased. The white goods program is actively encouraging counties to improve infrastructure and equipment to enhance county program efficiency. The net effect of these trends is that careful management of the fund is necessary to keep it solvent.



Program Results

Grant and ADF funding made it possible to clean up illegal dumpsites. Previously, many counties gave white goods a low priority and under-funded their management. The white goods account makes it

possible for counties to obtain the specialized equipment or develop collection and loading areas needed to improve white goods management.

In FY 05-06, 45 county collection sites took in 38,788 tons, or an estimated 969,700 appliances. This compares to the 25,749 tons, or 644,000 appliances, collected in FY 91-92 by all 100 counties. Without the program, large numbers of appliances would have likely been dumped or stockpiled.

White Goods Management by County Governments

The banning of white goods from landfills in 1989 has encouraged recycling and better management. Comprehensive white goods management laws enacted in 1993 included an ADF. In 1998, Senate Bill 124 extended the fee for three years but reduced it from $10 to $3. In 2000, the sunset on the fee was removed.

The major accomplishment of the program is a drastic reduction in illegal dumping of white goods. The critical factor was requiring local governments to provide collection sites at no cost to citizens. Counties can use ADF proceeds to clean sites based on the percentage of white goods at the site.

Another accomplishment came when counties began to implement proper management practices to capture and recycle CFCs. The practice avoids illegal venting of CFCs into the atmosphere, but also creates a potential revenue source.

Anecdotal data indicates that more can be accomplished in this area. Accidental and intentional venting of CFCs because of poor management practices may be more widespread than previously thought. Larger regulatory fines would act as a deterrent to illegal venting of CFCs and encourage counties to do more toward recycling.

The white goods program is actively encouraging and promoting counties to reclaim more refrigerant gasses from appliances. This is being done by emphasizing that the program can provide funding for the purchase of equipment and for the training of personnel. It is hoped that the net result will be a decrease in the amounts of ozone depleting CFC's accidentally released into the environment while at the same time opening up new revenue opportunities for counties in reclaimed CFCs.

The white goods program's emphasis on capital improvement grants has enabled counties to acquire the equipment and infrastructure for more efficient white goods management. At the same time, the use of machinery and infrastructure to better manage white goods produces higher revenues from scrap metals.

Though the white goods program has had many accomplishments, some problems remain. Those include the limited accountability by counties to assure that tax disbursements and grants are being used for direct white goods costs.

Many local governments are privatizing their white goods management. Overall, privatization does not necessarily mean that programs are more efficient. In many instances privatized white goods management is incorporated into a more comprehensive solid waste contract between a local government and a private firm, making it more difficult to measure program efficiency.

Counties That Forfeited Funds

Counties That Became Ineligible for Advance Disposal Fees (ADF) In March 2006
(Based on FY 04-05 AFIR Reports)

Anson	Beaufort	Bertie	Cabarrus	Cherokee
Forsyth	Franklin	Greene	Hoke	Hyde
Jones	Macon	Polk	Richmond	Robeson
	Sampson	Transylvania	Tyrrell	

Counties That Will Become Ineligible for Advance Disposal Fees in March 2007 (Based on FY 05-06 AFIR Reports)

These are counties that will not receive ADF distributions because undesignated balances exceed their threshold amounts.

Anson	Bertie	Cabarrus	Cherokee
Forsyth	Graham	Lincoln	New Hanover
Sampson	Union	Wilson	

Counties that do not submit their AFIR by March 1, 2007, will be ineligible to receive tax proceeds.

White Goods Management Costs

Counties can use the white goods ADF proceeds disbursed quarterly by the Department of Revenue for daily expenses incurred to recycle white goods. Funds can also be used for one-time expenses, such as purchasing specialized equipment and making site improvements for better management. Many county programs are not self-sustaining and require subsidies. Expenses for these programs include fuel, labor and the cost of associated items. Low or high program costs are not necessarily good indicators of program efficiency. This means that counties with minimal costs are not necessarily more efficient than counties with high costs. Some counties with low program costs are marginally in compliance with the law's intent.

The 45 reporting counties spent $2,851,767 in FY 05-06. Of this total $2,576,550 was for daily operations, $173,112 for capital improvements, and $102,105 to clean up illegal disposal sites.

Counties with high per-unit costs usually have extensive intra-county collections, a cost allocation plan, lack a local market, or have a combination of these factors. Counties with little or no disposal costs tend to have minimal programs, poor recordkeeping, and lack access to a local market or a combination of these factors. Because of the high value of scrap metal, many counties have metals recyclers willing to provide free pickup from county collection sites and/or provide CFC recovery in exchange for access to the scrap metal.

In recent years scrap metal prices are at historic highs yet some counties continue to pay private contractors to collect and haul scrap metals with little or no remuneration to the county. This imposes financial pressures on the white goods program since several of these counties must apply for taxpayer funded cost over run grants to finance their programs.

Highest Operating Costs Reported

County	Cost per Ton	Cost per Appliance
Chatham	$193.84	$7.75
Cumberland	$165.32	$6.61
Gaston	$163.04	$6.52
Graham	$146.80	$5.87
Cleveland	$117.78	$4.71
Duplin	$117.02	$4.68
Person	$113.65	$4.55
Wake	$109.46	$4.38
Randolph	$102.68	$4.11
Orange	$95.13	$3.81

Lowest Operating Costs Reported

County	Cost per Ton	Cost per Appliance
Anson	$0.00	$0.00
Brunswick	$0.00	$0.00
Martin	$1.66	$0.07
Iredell	$3.24	$0.13
Sampson	$11.62	$0.46
Wilson	$11.95	$0.48
Swain	$12.43	$0.50
Cabarrus	$16.62	$0.66
Lincoln	$17.31	$0.69
Cherokee	$22.50	$0.90

*Estimate assumes an average appliance weight of 80 pounds.

Outsourcing loading and transport to the recycler can reduce some costs. Other counties use in-house labor to sort and segregate metals, recover CFCs or extract motors or oil. Overall, operating costs by counties do not seem restricted by geography. Instead, analysis suggests that a correlation to distance to markets, extent of intra-county collections, extent of record keeping, and cost allocation plans among counties have a greater effect on county costs.

Tonnage Collected by Counties

In FY 05-06, 45 counties reported processing 38,788 tons of white goods. This translates into 969,700 individual appliances (assuming 25 appliances per ton), or about .11 appliances per person in North Carolina. In FY 91-92 all 100 counties collected 25,749 tons, or 644,000 appliances.

CHAPTER 6 – Scrap Tire Management

Scrap Tire Disposal Account

The Scrap Tire Disposal Account was created by the 1993 General Assembly. It receives 27 percent of its revenues from the Scrap Tire Disposal Tax initiated on October 1, 1993. The 2002 Session removed the sunset on the Scrap Tire Disposal Tax.

Beginning in October 1992, 25 percent of the STDA fund was allocated for cost overrun grants to counties and 75 percent was allocated for clean up of nuisance tire sites. Starting with the August 12, 1997 distribution, 50 percent of the fund is allocated for cost overrun grants, 10 percent for clean up of nuisance tire sites and 40 percent for processed tire material market development grants.

FY 05-06 Balances	
Balance of Funds as of July 1, 2005	$4,941,915.16
Deposits Received FY 2005-2006	$3,438,176.52
Total Funds in Account	$8,380,091.68
Grants to County Scrap Tire Programs	$1,706,606.38
Nuisance Tire Site Cleanup Program	$163,085.85
Processed Tire Material Grants	$393,598.29
Balance of Funds as of June 30, 2006	$6,116,801.16
Obligated funds as of June 30, 2006	$3,114,021.24
Net Balance of Funds as of June 30, 2006*	$3,002,779.92

* $3,114,021.24 obligated: $704,510 for tire cleanup, $2,409,511.24 for tire recycling grants under contract and under negotiation

Tire Tax Distribution

Of the state's tire disposal tax revenue, 68 percent is distributed to counties on a per capita basis. In the past year, the total amount distributed was $8,563,897.80. This subsidized tire disposal costs for the counties, but did not cover the total expenses of some counties. The total distributed to the counties represented 77 percent of the total reported disposal costs of $11,041,479.85. This provided an average of $1.57 for each of the 7.1 million scrap tires handled by the counties.

On January 1, 1994, counties stopped charging tipping fees to dispose of tires that were certified as generated in N.C. (G.S. 130A-309.58). Counties may charge a fee for tires presented for disposal that are not accompanied by a scrap tire certification form verifying the tires were generated in North Carolina, scrap tires stockpiled prior to January 1, 1994, or new tires that are scrapped by their manufacturer because they do not meet the standards for salable tires.

Counties whose scrap tire costs exceed the amount they receive in their allocation of the tire tax can apply for a grant to cover the deficit. For the first grant cycle of this fiscal year, 60 counties requested $1,157,388 and were awarded $799,168. In the second grant cycle, 61 counties requested $1,267,951 and were awarded $907,438.

Funds are available to help counties whose costs exceed their allocation. Historically, the amount of grant funds requested by counties has surpassed availability. Scrap tire legislation requires the division to consider county efforts to avoid free disposal of out-of-state tires and county program efficiency in using their allocated funds when making decisions about grant awards. The amounts requested and awarded are as follows.

Grant Period	10/02-3/03	4/03-9/03	10/03-3/04	4/04-9/04	10/04-3/05	4/05-9/05
Funds Available	$694,963	$788,202	$834,700	$974,029	$884,872.58	$1,011,756.57
Funds Awarded	$821,583	$816,985	$767,032	$949,011	$799,168.27	$907,438.11
Grant Requests	60	61	60	67	60	61
Funds Requested	$1,011,560	$1,107,107	$1,094,005	$1,403,584	$1,157,388.16	$1,267,950.84

Processed Tire Material Market Development Grants Awarded

The goal of the division's grant program is to make scrap tire recycling sustainable in North Carolina. This goal can be met. We anticipate awarding grants for manufacturing rubber products such as mats, auto parts, gaskets, flooring material, tire derived fuel, new tire manufacturing and other applications.

The Processed Scrap Tire Material Market Development Grants program received its first allocation of funding in August 1997. Grants awarded to date are:

- Roll-Tech, Inc., Hickory, N.C. — $212,420.00
  Construct additional molds to increase hard rubber tire manufacture
  COMPLETED
- Continental Tire, Inc., Charlotte, N.C. — $1,520,000.00
  Develop "tire to tire" technology with 25 percent recycled content goal
  COMPLETED
- Jackson Paper, Inc., Sylva, N.C. — $377,000.00
  Boiler modifications for tire derived fuel
  COMPLETED
- N.C. State University, Raleigh, N.C. — $38,291.00
  Tooling development for scrap tire recycling
  COMPLETED
- TIRES, Inc., Winston Salem, N.C. — $320,000.00
  Produce playground/industrial mats
  COMPLETED
- Texas Encore Materials, Inc. (Carolina Materials LLC), Belmont, N.C. — $983,360.00
  Manufacture extruded sheets from processed tire material
  COMPLETED
- Roll-Tech LLC, Hickory, N.C. — $855,937.50
  Equipment acquisition for manufacturing solid rubber wheels
- N.C. State University, Raleigh, N.C. — $122,480.00
  Performance of Tire Chips in Bed Systems Drain-fields of Septic Systems

Tire Cleanup Program

A total of 364 nuisance tire sites have been identified in North Carolina; 342 have been cleaned and 20 sites have cleanups underway. The remaining three sites are either under investigation or enforcement action. Counties are encouraged to locate and clean all small tire sites through countywide cleanup activities.

Status	Number of Sites	Total Known Tires	Total Tires	Cleared Tires
Cleaned Up	342	7,921,557	94%	7,921,557
Under Clean Up	20	514,780	5%	131,733
Remaining Sites	2	18,000	1%	0
TOTAL	**364**	**8,454,337**	**100%**	**8,053,290**

The law requires the Division to first address nuisance tire sites that pose the greatest threat to public health and the environment. At the program's start, efforts and actions to clean top priority sites were developed and initiated as funds were available. As cleanup funds were received through quarterly distributions, additional priority sites were cleaned.

The section has established and implemented a specific cleanup plan for each known nuisance tire site. As new sites are discovered, prompt investigation leads to a cleanup plan for each site within 30 days. The plan is implemented as soon as possible to minimize potential threats to human health and the environment. The section is committed to the N.C. Big Sweep program, with reimbursements going to counties that request funds to dispose of scrap tires collected by the statewide event.

To date 181 nuisance tire sites were cleaned using STDA funds. Cost recovery efforts collected $413,896.74 from responsible parties in 10 of these sites. One site is under cost recovery action.

As a cost saving measure, minimum-security inmates have removed over 600,000 tires from nuisance sites. Counties that have used inmate labor in nuisance tire cleanups are: Anson, Bladen, Buncombe, Burke, Camden, Chatham, Chowan, Cleveland, Columbus, Craven, Davidson, Halifax, Harnett, Iredell, Lee, Moore, New Hanover, Northampton, Onslow, Perquimans, Richmond, Robeson, Rockingham, Rutherford, Stokes, Surry, Washington and Yadkin.

Scrap Tire Generation

The U.S. EPA standard to estimate scrap tire generation is one tire per person, per year.[4] The 2005 N.C. population was about 8.7 million, so it is estimated an equal number of tires were generated. This includes passenger, truck, and tires for special uses, such as off-road equipment and tractors. Counties report tires received in either tons or the number of tires. Tons can be converted to number of tires. A ton of tires consist of 100 passenger tires, 20 truck tires, or 4 off-road tires (tractors and other large off-road equipment). A more accurate method of converting tons reported to number of tires was utilized for this report, as it was for last year's report. This method results in a lower total number of tires disposed from prior years but a more accurate accounting for the three categories of tires.

In FY 05-06, counties reported receiving tires in three size categories: 87 percent passenger car tires, 11 percent heavy truck tires and 2 percent off-road tires. During FY 05-06 counties disposed of 7,028,095 tires (6,113,879 passenger, 741,643 heavy truck and 172,563 off-road). Comparing tire generation to population results in .81 scrap tires per person.

Tire Volume

All counties are required to provide a facility for scrap tire collection and to report on their management programs. A summary of this data is presented in the Appendix.

In FY 05-06, North Carolina businesses and individuals disposed of approximately 166,000 tons of tires. These tires were managed by county collection facilities and private processing/disposal facilities as follows:

142,563 tons	Managed by counties and shipped to three NC processing firms
1,377 tons	Managed by counties and shipped out-of-state
22,116 tons	Tires taken directly to processing firms (not managed by counties)
166,056 tons	**Total**

Counties reported receiving approximately 144,000 tons from N.C. scrap tire generators. The counties shipped about 143,000 tons to three private North Carolina recycling facilities; the remaining tons were shipped to out-of-state processors.

Three private N.C. processing firms received 143,000 tons from county tire programs and an additional 22,000 tons directly from disposers not participating in county tire programs. These may be individuals involved in privately-funded cleanups or tire dealers not participating in a county program.

The tire program's success is proven by the increase in the number of tires disposed during the past twelve years. Almost all disposed tires are being handled at regulated disposal facilities. However, since free disposal was implemented in 1994, a problem has emerged with illegal disposal of out-of-state tires at county collection sites. The Solid Waste Section estimates that counties spend about $600,000 per year to manage out-of-state tires that are inappropriately disposed as North Carolina tires.
This cost estimate is based on disposal costs in counties with tire volumes greater than 120 percent of the county population (1.2 tires per person). Some counties are regional retail centers or have other factors that cause them to receive an excess volume of tires.

[4] "Markets for Scrap Tires," 1991. U.S. EPA, Office of Solid Waste. EPA/530-SW-90-074A. Washington, DC.

The Section assists counties in avoiding fraudulent disposal of out-of-state tires. County efforts to deter disposal of out-of-state tires is an eligibility factor when awarding grants from the STDA to cover cost over-runs.

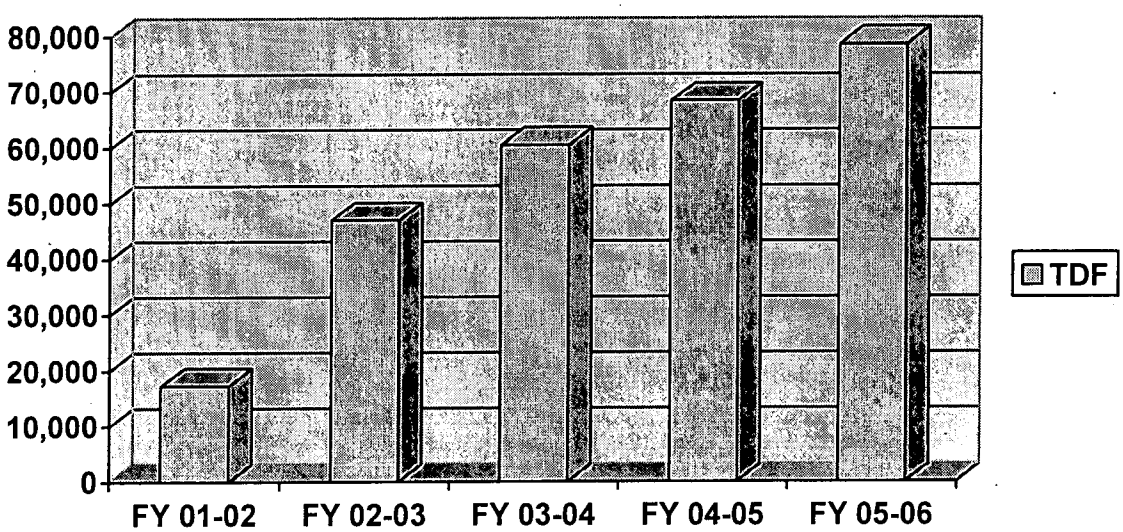
County Tire Disposal

There are 98 county programs, including one regional program [Carteret, Craven and Pamlico (CRSWMA)]. Counties reported spending a total of $11,041,479.85 for scrap tire disposal. The reported costs for scrap tire disposal varied greatly. Some counties only report disposal costs while other counties include associated costs, such as personnel or equipment. Counties with unusually low costs may stockpile tires during the year rather than sending them for processing. Some of the fluctuation is probably due to recordkeeping errors or county reporting errors. Also, some counties manage tires inefficiently. For example, counties that allow citizens to dispose tires in "green boxes" or at multiple recycling facilities incur increased labor costs to recover and load tires into trailers.

Tire disposal costs charged by processors are very competitive in N.C. North Carolina processors report that county contracts typically charge $70-$85 per ton, including transportation and trailer rental costs. Counties at a distance from processing facilities may pay as much as $85-$100 per ton.

Tire Recycling

In FY 05-06, 70% of tires received by the three North Carolina processing facilities were recycled. In order of weight recycled, the categories are tire derived fuel, civil engineering (including drain field material), crumb/ground rubber, retread/resale, and miscellaneous. The remaining tires go to the two permitted tire monofills in the state. The market for tire derived fuel (TDF) has seen strong growth in the last few years. Demand has increased from 17,304 tons in FY 01/02 to 78,474 tons in FY 05/06. While the recycling rate for scrap tires has continued to increase, the division actively seeks new opportunities for sustainable scrap tire recycling.



Addendum

Table 7 - COUNTY REPORTS OF TIRE DISPOSAL ACTIVITIES

CHAPTER 7 – Department of Transportation

RECYCLE/REUSE/REDUCE REPORT

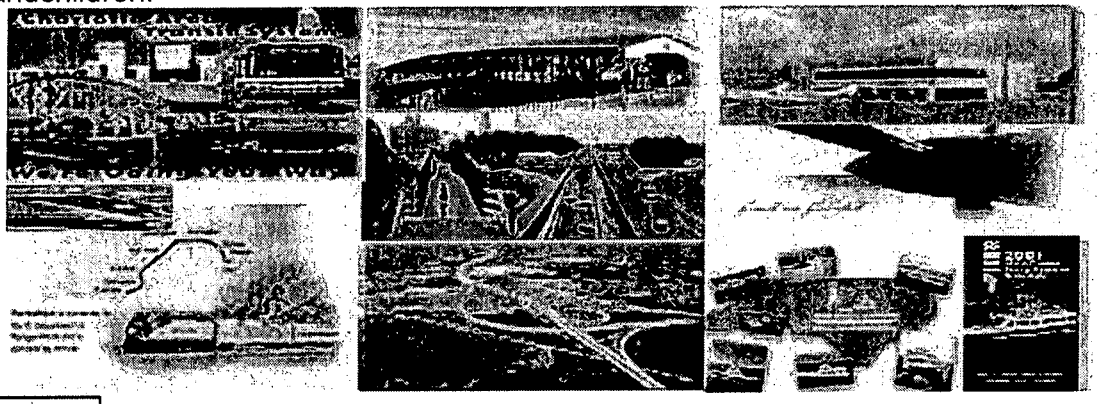
FISCAL YEAR 2005-2006

John L. Sharp
Waste Management Analyst
General Service Division

3 R PROGRAM - RECYCLE/REDUCE/REUSE

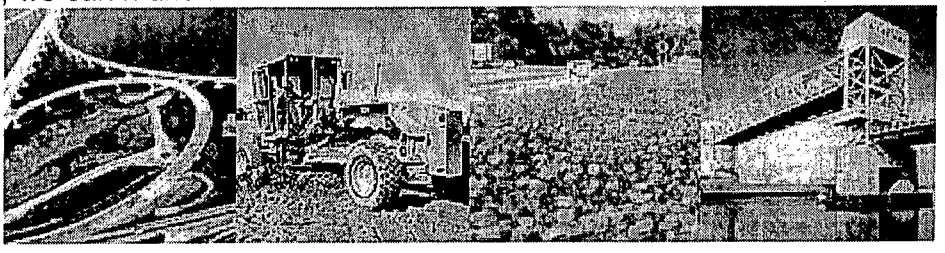
SPECIAL THANKS TO THE FOLLOWING FOR THEIR SUPPORT AND ASSISTANCE:

NCDOT SECRETARY LYNDO TIPPETT, Human beings are considered the "highest order" on earth. This title is more than an honor; it carries a special Responsibility. As living creatures, we have a moral obligation to do more than preserve our existing resources. We must set an example for the good of our successors—our children and grandchildren.



State Highway Administrator L. A. Sanderson, PE (Len), To achieve NCDOT's objective of preserving and enhancing natural, cultural and human resources while providing a safe and well-maintained interconnected transportation system requires the participation of each and every employee-

Together, we can make a difference.



NCDOT COMMISSIONER GEORGE TATUM- Together, we can make great strides in preserving our natural resources. These efforts to protect our environment will be rewarded by preservation of a quality life that will be enjoyed by generations to come.

NCDOT 2006 Paper Recycling Program Environmental Impact

4,637651 Gallons of Water Saved
2,719359 Kilowatt Hours of Energy Saved
253,460 Gallons of Oil Saved
11,339 Trees Saved
2,001 Cubic Yards of Landfill Space Saved

Recycle/ Waste Facts:

- North America has 8% of the world's population, consumes 1/3 of the world's resources, and produces ½ of the world's garbage.
- Annually, enough Energy is saved by recycling steel to supply North Carolina with almost a decade worth of electricity
- Americans throw away enough office and writing paper annually to build a wall 12 feet high stretching from Los Angeles to New York.
- American consumers and industry throw away enough aluminum in a year to rebuild our entire airplane commercial fleet every three months.
- The estimated 272 billion aluminum cans reclaimed during the 1980s saved 2 billion feet of Landfill space
- More than 20,000,000 Hershey's Kisses are wrapped each day, using 48,545 square miles of aluminum foil annually. All that foil is recyclable, but not many people realize it.
- Scrap steel reduces related water pollution, air pollution, and mining wastes. It takes four times as much Energy to make steel from virgin ore.
- 40% of all U.S. municipal solid waste consists of paper and paperboard products
- Each ton of recycled paper saves 17 trees
- Each ton of recycled paper saves over 3 cubic yards of landfill space
- Each ton of recycled paper requires 6953 fewer gallons of water to manufacture than virgin paper
- Each ton of recycled paper requires 4077 kWh less energy than virgin paper to produce
- Each ton of recycle paper saves 400 Gallons of oil
- Manufacturing with copper scrap saves an estimated 85% in energy costs
- Recycling generates jobs and revenue
- Rainforests are being cut down at the rate of 100 acres per minute!
- A single quart of motor oil, if disposed of improperly, can contaminate up to 2,000,000 gallons of fresh water.
- Motor oil never wears out, it just gets dirty. Oil can be recycled, re-refined and used again, reducing our reliance on imported.

NCDOT Annual 3R Program Report 2005-2006

PART I. Education On Waste Reduction And Recycling

Effective education is the key to a successful waste reduction program. Executive Order 156 requires state agencies to (a) educate employees about recycling and waste reduction to ensure participation, and (b) establish a network of volunteers or designees to help the agency's lead coordinator carry out the agency's waste reduction education programs.
In regard to the past fiscal year (July 1, 2005- June 30, 2006), please answer the following questions: Yes / No

1. Does NCDOT have top down support for a recycling program?
   Yes

2. Does NCDOT have a lead coordinator for waste reduction and recycling efforts?
   Yes

3. Does NCDOT have a waste reduction position, office, or program?
   Yes

4. Does NCDOT have an ongoing educational and promotional program for waste reduction and recycling?
   Yes

5. If yes, how was it communicated and how was information distributed?
   Majority of the information was communicated and distributed electronically by: Employee news letter -In The Loop, Email-Dist A, Web site http://www.ncdot.org/environment/3R, Special Event days- Earth Day/ America Recyclers Day, Management/Staff meetings

6. NCDOT routinely hosts members of the public at its facilities (highway rest stops/ conferences) Does NCDOT provide waste reduction and recycling opportunities for visitors?
   Yes

PART II. Source Reduction (Waste Prevention) of Waste

North Carolina places source reduction (waste prevention) and reuse at the top of the hierarchy of preferred methods for managing solid waste. Executive Order 156 requires state agencies to practice waste prevention whenever feasible.
In regard to the past fiscal year (July 1, 2005 - June 30, 2006), please answer the following questions: Yes / No

1. Did most of NCDOT employees practice one or more techniques for reducing waste at the source?
   Yes

2. Did NCDOT conduct solid waste assessments of the amount and types of solid waste at its facilities?
   No

3. If yes, please describe briefly:
Questions 4-7 relate to office paper waste reduction carried out in NCDOT facilities from July1, 2005 - June 30, 2006.

4. Did your facilities take action to reduce office paper (copy paper, letterhead, envelopes, and packaging) waste?
Yes

5. If yes, what percentage of your facilities took action to reduce office paper waste?
70%

6. Which techniques did your agency practice to reduce office paper waste? (Check all that apply.)
Yes / No
a. Eliminated unnecessary reports and reduced report size.
Yes
b. Eliminated unnecessary forms or converted to electronic format.
Yes
c. Made fewer copies.
Yes
d. Printed or copied documents on both sides of the paper.
Yes
e. Used electronic mail and voice mail.
Yes
f. Post announcements on bulletin boards or in break areas.
Yes

7. How much paper (tons) overall was reduced by your agency?
160 Tons

PART III. Recycling And Composting Information

1. PAPER: newspaper, cardboard, magazines, office paper, mixed paper, computer printout, telephone books, hardback books, etc.
667 tons

2. METAL: aluminum cans, steel cans, scrap metal, white goods, etc.
1233 tons

3. GLASS CONTAINERS: clear, brown, green, and mixed glass.
8 tons

4. PLASTIC: PETE (#1), HDPE (#2), six-pack rings (LDPE, or #4), mixed plastic, etc.
6 tons

5. ORGANIC MATERIALS: wooden pallets, other wood, yard waste, food scraps, used cooking grease, animal manure, etc.
1672 tons

6. OTHER MATERIALS: lead-acid batteries, commingled materials, textiles/fabrics, motor oil, tires, asphalt, etc.
10,552 tons

7. GRAND TOTAL POUNDS RECYCLED/COMPOSTED:
14,138 tons

PART IV. Solid Waste Disposal And Cost Information

Enter NCDOT solid waste disposal and cost information for July 1, 2005-June 30, 2006

1. Total tons of solid waste disposed by land filling or incineration
   39,421 tons

2. Total costs for solid waste collection and disposal
   $ 1,419,170.00

3. Cost per ton of solid waste collected and disposed
   $ 36 /ton

4. Total tons recycled or composted
   14,138 tons

5. Total solid waste collection and disposal costs avoided through recycling and composting
   $ 508,968

6. Total revenues from sale of recycled materials and compost products
   $ 144,000.00

CHAPTER 8 – Department of Administration

Environmentally Preferred Purchasing

The Department of Administration continues to promote the purchase and use of reusable, refillable, repairable, more durable, and less toxic supplies and products. As the Department progresses, more of these products are being added to statewide term contracts, agency specific term contracts, as well as awarded through open market bids. For more information visit the DOA's Web site: http://www.doa.state.nc.us/PandC/

Solicitations advertised by the Division To Comply With the Session Laws 1993 {G.S. 130A - 309.14(al)}

Presently, the bids advertised in the Division of Purchase and Contract contain a Recycling and Source Reduction paragraph in item #10 of Instructions to Bidders. When developing bid invitation language, requirements and specifications, purchasers are continuing to look at alternative methods and products, if such products result in waste reduction and their procurement is both practicable and cost-effective.

Recycling and Source Reduction information provided by the contractors on bids received during the 2005 to 2006 fiscal year indicate the sustainable features or criteria of those products. Table 1 lists the primary sustainable features of the intended use, manufacture or packaging of the awarded products. Table 2 lists the purchase awards by the type of bid for those commodities.

Table 1

Primary Sustainable Feature of Awarded Purchases	Number of Bids by Sustainable Criteria	Percentage Bids by Sustainable Criteria
Recyclable	581	32.7%
Recycled Content Packaging	196	11.0%
Recycled Content other than packaging and metals	127	7.1%
Recycled Content - Metals	99	5.6%
Other - Energy Efficient, Reusable , Refillable	21	1.2%
Not Applicable - Contractual Services	458	25.7%
Purchases Without Documented Sustainable Comments which may include non-reusable medical products	297	16.7%
Total Bids	1779	100.00%

Table 2

Commodity Purchase Awards by Bid Type	Number Awards by Bid Type	Percentage Awards by Bid Type
Agency RFP	303	17.0%
Contractual Services	22	1.2%
Convenience Contracts	283	15.9%
Open Market	612	34.4%
Quotes	161	9.1%
Term Contracts	53	3.0%
Waivers	345	19.4%
Total	1779	100.0%

NC E-Procurement @Your Service

NC E-Procurement @ Your Service is a user-friendly, Internet-based purchasing system that offers electronic purchase order processing and enhanced administrative functions to buyers and vendors, resulting in operational efficiencies and cost savings.

The program's goals and objectives reflect the State's "One North Carolina" vision outlined by Governor Michael Easley, as well as that of the sponsoring agencies - the Department of Administration's Division of Purchase & Contract, the Office of the State Controller, and the Office of Information Technology Services' Statewide Information Technology Procurement Office. As of December 2006, the enterprise-wide system has over 49,700 vendors registered and over 14,000 users from more than 241 entities across the State including state agencies, hospitals, institutions, community colleges, K-12 public schools, and local governments.

Another way that NC E-Procurement has made the interactions between government and business more intuitive is to create an on-line marketplace for informal bidding; this marketplace is known as eQuote. The eQuote system allows users to submit electronic requests for quotes to vendors, replacing cumbersome manual quoting processes involving phone, fax, or U.S. mail. Vendors respond with their quotes on-line and buyers view the auto-tabulated quotes, award the contract, and submit the purchase order. After the purchase order is issued, the vendors who responded to the eQuote are electronically notified of the award.

NC E-Procurement @ Your Service contributes to a sustainable environment by significant reduction in hard copy document reproduction (paper, printers and supplies) by the use of electronic business transactions and electronic documents.

Compliance Program
The Division of Purchase and Contract is now able to conduct Compliance Reviews utilizing the NC E-procurement system. Reviews are conducted for community colleges and state agencies. By conducting compliance reviews utilizing NC E-procurement, travel (fuel reduction) is significantly reduced as well as paper reduction.

IPS (Interactive Purchasing System) & Vendor Link NC
The Division of Purchase and Contract continues to promote opportunities for vendors to do business with the state through electronic advertisement of goods, services and design/construction in IPS. The entities using this system consist of state agencies, institutions, universities, community colleges, K-12 public schools, and local governments.

Vendor Link allows vendors to register to receive electronic notification of solicitations. Vendor Link had 18,019 registered vendors as if June 30, 2006. The system continues to grow with the addition of users increasing from 138 Entities with 467 users as of June 30, 2006. This is an increased user base of 10% for the Entities and 6% for the users, which posted 6,031 bids.

Open Market Awards

- Office Panel Systems - It is standard procedure to incorporate refurbished language in the bid document for refurbished panel systems.
- Food Product Packaging - Wooden pallets that cases of food are shipped on are exchanged. Also, all of the cardboard cases are recyclable.
- Food serving equipment purchased made from stainless steel that can be recycled at end of use
- Emergency bar lights for police cars specified the new LED lamps. These bar lights offer more functionality (light patterns other than available with strobe lamps), energy efficiency (reduced electrical load on the car's alternator and battery), and significantly decrease maintenance (long life solid state LED displays eliminates lamp replacement due to mechanical vibration). Secondary benefits may include increased life for the lead acid automotive battery and potentially decreased automotive fuel consumption.
- A new type of imager allows the user to locate untreated latent fingerprints from up to 15 feet away without the use of traditional fingerprint powders or chemicals on most non-porous surfaces. After determining an area of interest that area would be processed in the normal manner. Potentially, the processing powders and chemicals used may be reduced to find areas of interest for normal processing.

Statewide Term Contracts

As existing term contracts are re-bid and new term contracts are developed, the Division of Purchase and Contract continues to improve the contracts by offering a wider range of sustainable or environmentally friendly products. Examples of the improved sustainable features of these term contracts are listed below.

- **Air Conditioners, Room, 031A** - Items available through this contract were awarded based on the lowest energy efficiency cost, meeting specifications. The majority of the items awarded are Energy Star Compliant, containing recycled materials and packaging.

- **Domestic Appliances, 045A** - All refrigerators, washers and dishwashers are "Energy Star" qualified. This is a fairly stringent measurement of energy efficiency, which is monitored by the Department of Energy. The payoff is a more efficient appliance, which use less energy over the lifetime of the product.

- **Batteries, Storage, 060B** - Battery casings are made from recycled material (96%). Batteries are exchanged as a core and picked up by the vendor. In addition the contractor will pick up and properly dispose of junk batteries on quantities less than 20. Core (junk) batteries are considered to be an environmental hazard and are otherwise expensive to properly remove.

- **Oil Filters, 060C** - Allows for multipacking, which reduces the number of individual boxes for the filters. This helps reduce trash that would otherwise be generated.

- **Tire, Automotive, Recapping and Repairing, 060E** - The retread tire provided should be a premium retread that will provide optimum tire mileage/service and safety. Recycling of tires through retreading and repairing reduces the new purchases and disposal of tire casings.

- **Passenger Cars, 070A; Law Enforcement Vehicles, 070B; Trucks/Vans/Utility Vehicles, 070G** - Bids included an AFV (alternate fuel vehicle) category for each line item. Passenger cars were bid for both standard and alternate fuels, with only the AFV types awarded, including a gasoline /electric hybrid vehicle. Limited availability restricted award of AFV type Law Enforcement and Trucks/Vans/Utility Vehicles. According to the Steel Recycling Institute, 67.7% of a vehicle is steel or iron. Of that steel or iron, 26.6% is post consumer material. Therefore, 18% of a vehicle is made from post consumer recycled material.

- **Remanufactured Toner Cartridges, 207A** - Common use cartridges are remanufactured to equivalency with the original OEM performance. Fewer cartridges are added to the waste stream.

- **Coolers, Water, Electric, 225A** - Packaging, refrigerant and metal components may contain or are recyclable.

- **Large & Specialty Lamps, 285A** - Encourages the use of energy efficient fluorescent lamps and lists products that meet the Federal Energy Management Program (FEMP) recommendations. Some of the lamps contain up to 65% recycled content including glass and mercury. Some of the packaging contains 73% recycled content. Some of the lamps are low mercury (TCLP compliant), non-hazardous.

- **Ballasts, 285B** – Electronic ballasts are more energy efficient, supports variable illumination on demand and reduces electro magnetic radiation. A link is provided to FEMP that illustrates ROI for retrofitting with more energy efficient lamps and ballasts. Ballasts contain no PCB's and can be disposed of in the trash. Reduced form factor minimizes packaging and metal enclosure requirements.

- **Carpet, 360A** - Recycled content required is either (1) minimum 5% postconsumer content except that vinyl-backed and other similar hardbacked products contain 20% by weight of postconsumer recycled content, (2) minimum 15% by weight of recovered materials (both preconsumer and postconsumer), or (3) minimum of 25% by weight of recyclable content.

- **Paper, Computer and Labels, 395B** - This contract is limited to recycled computer paper and continuous stock labels most often used by the State.

- **Fuel, Propane (Tankwagon), 405A** - Metal components may contain recycled materials. Metal is recyclable.

- **Recycled Motor Oil, 405H, 405J** - State Surplus Property disposes of waste oil and antifreeze under contract.

- **Bio-Diesel Fuel, 405L** - B20 blended fuel contains 80% diesel fuel and 20% virgin soy or reprocessed vegetable oil. Approximately 1,959,715 gallons purchased with 391,943 gallons from recycled biomass reduces crude oil consumption.

- **Gasohol, 405M** - E-10 blended fuel contains 90% unleaded gasoline and 10% ethanol. Approximately 1,049,076 gallons were purchased with 104,907 gallons from ethanol.

- **Furniture, Metal, Folding Chairs, Tables, Storage Units, Wood Library Furniture, 420 - Furniture, Desks (Wood), Credenzas, Conference Tables, Etc. & Bookcases, Furniture, 425B & C** - Contractors support sustainability through different practices, Mechanical parts can be recycled or replaced – extending service of item. Packaging is recycled and recyclable. Products may be ground up into particleboard. Packaging may contain up to 40% post consumer waste and is reusable. Wood, plastic and metal contain recycled post consumer content and are recyclable.

- **Furniture, Chairs, Ergonomic, 425E** - Fabric, Chair Cushions may contain up to 100% post consumer recycled content. Packaging contains post consumer waste, is reusable and recyclable after use.

- **Lateral and Vertical Filing Cabinets, 425F & 425G** - Cabinets contains from 10% to 30% recycled content. Corrugated boxes have a minimum of 50% post consumer waste and are recyclable. Contractor will purchase back files at end of their use.

- **Storage, Combination Storage/Wardrobe and Wardrobe Cabinets, 425H** - Cabinets have a minimum of 10% recycled metals. Packaging contains post consumer waste, is reusable and recyclable after use.

- **Industrial, Medical and Specialty Gases, 430A** - Are delivered statewide in reusable cylinders and are exchanged when replacement cylinders are needed.

- **Disinfectants and Odor Counteractants, 435A** - Plastic bottles and shipping boxes are 100% recyclable. Plastic containers for deodorant cake can be recycled after cake evaporates totally.

- **External Defibrillators, 465B** - Defibrillators can be refurbished and packaging materials can be recycled.

- **Indoor And Outdoor Waste Receptacles, Food Prep Containers, Pails, and Related Items, 485F** - Most plastic products contain 15% to 20% post consumer recycled content. Packaging contains 10% post consumer recycled content. Some containers are sold to customers to assist with sustainability management. For example the aluminum can recycle bins support recycling procedures recommended to users. Metal parts contain recycled content.

- **Brooms, Mops, Brushes, and Other Cleaning Implements, 485G** - Products may contain up to 60% post consumer recycled content. Packaging may contain up to 40% post consumer recycled waste. All cotton mops are made of cotton waste. Shipping boxes are recyclable. Broom handles can be used as wooden dowels for multiple purposes; such as garden stakes, hanging banners in classroom, etc. Forty-five percent of broom material is biodegradable.

- **LED Vehicle Traffic Signal Modules, 550A** - Traffic signals employing the high efficiency light emitting diode (LED) technology consumes 90% less energy than conventional signals, while providing greater reliability, long-lasting, and low-maintenance performance. Signals are certified for ENERGY STAR for reduced energy consumption.

- **Material Handling Carts/Trucks, 560A** - Very few products are made from virgin steel. Products are not shipped in cartons.

- **Musical Instruments and Accessories, 580B** - New designs use recyclable plastics. Band instruments may be traded in to be reconditioned and re-sold. Donations of trade-in instruments to the Links Program for the needy promotes music education. Plastic and brass parts may be recycled for future part replacement. Cardboard and pallets are recyclable.

- **Calculators, 600A** - Packaging material may be recycled.

- **Dictation/Transcription Equipment, 600C** - Vendors use recycled items (approx. 10%) and are ISO 9000 compliant. Packaging contains from 60%-100% recycled content.

- **Office Supplies, 615A** - Contractors are required to the extent feasible and practical, to offer as many recycled products, including packaging, especially those having post-consumer waste content. Wherever possible and practical, such products should be identified as such.

- **Napkins, Bathroom Tissue, and Paper Towels, 640A** - Contains 100% recycled fiber, 40% post-consumer recycled fiber.

- **Office Paper, 645A** - Contains both 100% and 50% post consumer and chlorine free copy paper. Other recycled and virgin paper products including envelopes are supported.

- **Cameras, Digital & Film, 655A** - The metal camera bodies, plastic parts and packaging materials can be recycled. Contract also includes the digital cameras and electronic storage media that promote reduction, reuse, and recycling and reduced environmental impact. Soft copy images can be easily transmitted to distance locations. Chemicals used in manufacturing and processing of the film are eliminated. Typically only proofed images are printed. Electronic storage media has a long lifetime before replacement. Even when the images are printed, the user can decide if high cost paper and toner are required. Disposal of the images on paper has less environmental impact than the toxic metals contained in film.

- **Bags, Plastic, Trash, 655B** - May have up to 15% recycled content.

- **Laminators & Laminating Film, 665A** - Some of the film contains 5% post consumer content. Packaging contains 25%-80% post consumer content.

- **Ammunition, 680A** - Brass shell casings can be saved and recycled and others can be reloaded.

- **Wiping Cloths, 735A** - All items are second-hand textiles. Vendors resell waste instead of sending to landfills. All recycled textile rags can be sold to make paper products. All rags can be re-laundered.

- **Vending Machines And Money Changers, 740B** - Packaging, refrigerant and metal components may contain recycled content and are recyclable.

- **Markerboards, Tackboards and Accessories, 785B** - Metal and wood components contain recycled materials.

- **Teaching Equipment, Electricity/Electronics Courses, 924A** - Office paper, cardboard and metal enclosures have recycled content. Documentation provided in soft copy instead of hard copies printed materials.

- **E-85 Fuel** - Agency Specific Contract for use by Motor Fleet Management. E-85 blended fuel contains 15% unleaded gasoline and 85% ethanol. Fuel is used in the flex fuel vehicles compatible for E85 fuel. Approximately 272,318 gallons were purchased with 231,470 gallons from ethanol.

- **Electronic Equipment Recycling Services, 926A** - Assists agencies and local governments with CRT disposal prohibition and in diverting surplus or discarded electronic products from landfill disposal.

Items Aiding Waste Reduction Purchased By State Agencies Through Term Contracts and Open Market

The following items purchased by State agencies meet the criteria for aiding waste reduction by being reusable, refillable, repairable, more durable, and/or less toxic than their traditional counterparts:

Reusable
Digital Cameras (reduces need for film and chemicals)
Refrigerant Recovery System (filters reusable refrigerant)
Musical Instruments
Rechargeable Dry Cell Batteries
Recycled Carpet and Virgin Carpet
Recycled Paper
Recycled Content Furniture (not traditional wood)
Printers
Solvent Degreaser (reuses solvent)
Tire Recapping & Repairing Service
Uniforms, Vacuum Bags, Wiping Cloths

More Durable
Above-Ground Vaulted Fuel Storage Tanks
Classroom Furniture, Electronic Lamps & Ballasts
Vacuum Cleaners, Floor Polish, Grader Blades
Grader Slope Attachment, Kindergarten Furniture
Paint Brushes, Plastic Lumber, Mattresses
Plastic Tableware, Staplers
Vertical File Cabinets, Wood Case goods
Wood library furniture

Energy Star – Reduced Energy Consumption
Audio Visual System,
Changeable Message Signs – Solar Powered
Domestic Appliances
Lighting Fixtures,
Room Air Conditioners,
Sonography Equipment
Television & Video Equipment, Lamps
Traffic Signals – LED,
Ultrasound Scanner
Ultrasound Training Simulator Equipment
Warning Lights - Vehicles Safety
Water Coolers

Used - Automobiles and trucks

Refillable
Ammunition - Cartridge Refills
Batteries - Vehicle & Storage
Drums – Steel, Fire Extinguishers
Cylinders for Welding, Medical & Specialty Gases
Fuel Tanks, Liquid Hand Soap
Self-Contained Breathing Apparatus

Repairable
Defibrillators, Musical Instruments
Tire Recapping & Repairing Service

Refurbished/Rebuilt
Aircraft Engines, Ferry Engine Repair Parts
Medical Diagnostic Equipment & Instrumentation
Remanufactured Toner Cartridges for Laser
Scientific Equipment, Sewing Machines

Less Toxic
Alternative Fuel Vehicles, Correction Fluid
Dry Cell Batteries, Electronic Lamps & Ballasts, Fertilizers/Farm Chemicals, Inks for printing (using non-petroleum based inks) Instructional Art Materials, Markerboard Markers, Mattresses, Scientific Products (eliminating Freon), Refrigeration and A/C Equipment

Longer Lasting
Floor Maintenance Machine Batteries, Library Furniture, Aluminum Nuts and Bolts – non-rusting alloys, Fluorescent electronic ballasts permit longer lamp life

Recyclable
Commodity Packaging, Commodity Metal enclosures & parts, Plastics, Steel & Reinforced Concrete Pipe, Chain Link Fencing, Electrical Wire, Treated Lumber, Motor Oil – refined, HVAC & Refrigeration Equipment - Refrigerants

Washable - HVAC Filters Wiping Cloths

Appendices A-D
Of the
North Carolina
Solid Waste Management
Annual Report
July 1, 2005 – June 30, 2006

Contents

A-1 Public and Private Municipal Solid Waste and Construction & Demolition Landfills
A-2 Incineration Facilities
A-3 Private Industrial Landfills
A-4 Transfer Stations and Mixed Waste Processing Facilities
A-5 Tire Monofills
B County per Capita Rate
C Imports and Exports
D Municipal Solid Waste Landfill Capacity by Facility

(1) This does not include 73,911 tons from Mecklenburg County that were exported to the Fort Mill Transfer Station in South Carolina and then imported to a landfill in North Carolina.

(2) This does not including 77,217 tons from Mecklenburg County that was exported to the Fort Mill Transfer Station in South Carolina and imported back to landfills in North Carolina.

(3) This does not include 99,065 tons of Municipal Solid Waste from Mecklenburg County that was exported to the Fort Mill Transfer Station in South Carolina and then imported back into North Carolina to the BFI- Charlotte Motor Speedway Landfill. The Total also does not include an additional 16,847 tons of construction and demolition material from Mecklenburg County sent to the Fort Mill Transfer Station and imported back to North Carolina to the BFI- Lake Norman Construction and Demolition Landfill.

(4) This does not include 107,888 tons from Mecklenburg County that was exported to the Fort Mill Transfer station in South Carolina and then imported back into NC to the Charlotte Motor Speedway Landfill.

EXECUTIVE SUMMARY

In the 2005 General Assembly session, Senate Bill 1862 called for the General Assembly's Environmental Review Commission to conduct a study of the Nutrient Offset Fee Payment Program (NOFPP). The NOFPP is administered by the Ecosystem Enhancement Program (EEP), which can use the funds paid by excess emitters to construct nutrient controls within the river basin that offset the excess nutrients they emit. The objectives of this study include the following:

- Objective 1: Evaluate the sustainability of the program at the current fee of $11 per pound of nitrogen
- Objective 2: Develop a proposed fee based on the cost-effectiveness analysis
- Objective 3: Develop a formula for calculating the offset payment fee
- Objective 4: Assess the advantages and disadvantages of expanding the nutrient offset payments to other nutrients and additional areas of the state
- Objective 5: Evaluate the ability of public (other than the EEP) and private entities to provide nutrient offsets
- Objective 6: Develop a comprehensive review of potential nutrient mitigation efforts available

This study was contracted to RTI International in the spring of 2007. To assess the issues, RTI held meetings with all stakeholder groups and solicited best management practice (BMP) cost data from all available groups. The findings from the analysis are summarized below.

Because the type of offset projects undertaken by the EEP in the future significantly influences the financial analysis, three scenarios are evaluated for Objectives 1, 2, and 3.

- ***Scenario A: All Buffers***. The EEP implements exclusively riparian buffers on land obtained through conservation easements and purchased land. Based on RTI's assessment of the amount of land in the 50-foot buffer zone and projections of future competing demand for that land, this option should be viable for the foreseeable future (i.e., through 2020).
- ***Scenario B: Integrated Implementation***. In addition to buffers, the EEP pursues a number of stormwater wetland offset projects to target integrated environmental objectives. This results in higher costs per pound of nitrogen and phosphorous.
- ***Scenario C: All Stormwater Wetland Retrofit.*** The EEP does not undertake any buffer projects and instead installs all stormwater wetland projects, which again enables offset projects to be implemented closer in proximity (e.g., in local

watersheds) to where development is occurring, and again increasing the costs per pound of nitrogen and phosphorous.

E.1 Objective 1: Program Sustainability at $11 per Pound of Nitrogen

NOFPP program expenditures exceed revenue in the first year of the analysis for all three scenarios analyzed. The gap between offset fee revenue and program expenditures then widens with time as maintenance costs are incurred for projects initiated in previous years. In summary, given an $11/lb of nitrogen fee, the NOFPP program is currently unsustainable.

E.2 Objective 2: Proposed Fee Based on Cost-Effectiveness

We define cost-effectiveness as the offset fee that would be required for the NOFPP to be sustainable through the year 2020. The fixed offset fees for both river basins that yield a sustainable program through 2020 for each scenario are presented in Tables E-1 and E-2. Cost differences between the Neuse and Tar-Pamlico river basins are due to differences in land costs (design, construction, and maintenance costs are the same in the two river basins).

Table E-1. Cost-Effective Offset Fee for the Neuse River Basin

	Cost-Effective Offset Fee[a] ($/lb-30 N)	Cost-Effective Offset Fee ($/0.10 lb-30 P)
Scenario A	$25.77	$33.19
Scenario B	$43.94	$41.23
Scenario C	$94.80	$62.91

[a] Offset fee that allows the program to be sustainable through 2020.

Table E-2. Cost-Effective Offset Fee for the Tar-Pamlico River Basin

	Cost-Effective Offset Fee[a] ($/lb-30 N)	Cost-Effective Offset Fee ($/0.10 lb-30 P)
Scenario A	$19.70	$26.02
Scenario B	$39.40	$35.38
Scenario C	$90.21	$59.77

[a] Offset fee that allows the program to be sustainable through 2020.

E.3 Objective 3: Formula for Offset Payment Fee

The specification of the formula for the offset payment fee varies depending on the type of mitigation options pursued and the underlying rationale for pursuing them. For Scenarios A and C, we recommend the simple fixed cost-effective dollar per pound factors (presented in Table E-1 and Table E-2) with a 10% administrative surcharge. Both scenarios are implemented

through as a single BMP option; thus, there is minimal variation in NOFPP expenditures with respect to where the offset payments originate.

$$\text{Payment} = (\$/\text{lb})(\#\text{of lbs/year})(30 \text{ years})(1.1 \text{ AdminCosts})$$

Scenario B implements a mixture of buffers and stormwater wetlands. For this scenario we recommend incorporating the cost of the land being developed as a proxy for the type of mitigation project that would be needed to meet local environmental objectives.

$$\text{Payment} = [(\$/\text{lb})(\#\text{of lbs/year})(30 \text{ years})^* (\text{Total Land Cost } \$/14{,}000)\text{^(Exp)}^* (1.1 \text{ AdminCosts})$$

E.4 Objective 4: Expanding Nutrient Offset Payments

Other waterbodies in North Carolina, such as the Chowan River Basin, Jordan and Falls reservoirs, High Rock Lake, and other large reservoirs in the Catawba and Yadkin basins, could be considered candidates for extending the nutrient offset program. In terms of the potential extension of the program to nutrients besides nitrogen and phosphorus, RTI is not currently aware of any studies in North Carolina indicating that other nutrients (e.g., silica) should be considered.

E.5 Public versus Private Implementation

The EEP currently serves as the sole gateway for purchasing nutrient offsets in the Neuse and the Tar-Pamlico river basins. It receives payment for excess nutrients emitted by nonpoint sources, which it then uses to construct BMPs that will offset them. However, there are a wide range of alternative operational structures that could be developed, such as a market-style nutrient trading system.

Market-style structures can have significant advantages. In particular, the price paid by demanders of nutrient offsets would be determined by the interaction of market forces (supply and demand), which would ultimately ensure that the price these individuals pay for their excess nutrient loads will be enough to fund the BMP projects required to offset them. As a consequence, market-style structures will have great flexibility in the face of changes in supply (e.g., increasing costs of offsetting nutrients) and demand (e.g., increasing development driven by population growth). However, a regulatory body would be required to ensure that suppliers of nutrient offsets are generating the offsets they claim and to provide other regulation and oversight. If such a market-style structure were pursued, the EEP would be among the most well-

suited government entities for providing this supervision because of their past experience managing the NOFPP program.

The NOFPP seems well suited for market trading. That demand is sufficient to support such a structure is illustrated by the large amount of nutrient offsets already purchased under the program. In addition, the successful completion of several full-delivery projects under the current program illustrates the fact that private entities have the capabilities to generate the nutrient offset credits that would be required in such a market.

E.6 Mitigation Options Available

Current mitigation options being implemented in North Carolina primarily fall into the categories of riparian buffers, stormwater wetlands, bioretention ponds, and wet ponds. Additional mitigation projects identified include sand filters, underground sand filters, infiltration practices, and water quality swales. However, in general, these mitigation options are more costly.

E.7 Stakeholder Concerns

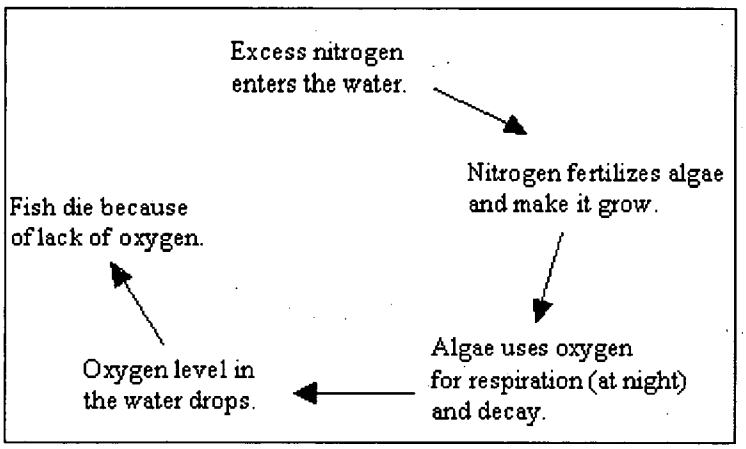
During our interviews with stakeholders, several shared the concerns that instituting higher nutrient offset fees could potentially have serious consequences for the pace and distribution of economic growth in the state of North Carolina. By raising the offset fee, one is also raising the cost of new development in the Neuse and Tar-Pamlico river basins. This could lead to people and firms locating in other parts of the state, slowing economic growth in areas affected by the NOFPP, or lead to less development overall, thus slowing growth for the entire state. Therefore, stakeholders urge policy makers to weigh the benefits of environmental protection against the potential costs to the state economy. In addition, stakeholders representing point sources, such as wastewater treatment facilities, expressed concern about the possibility that its members will need to use the NOFPP when they seek to expand their facilities to accommodate population growth, which would significantly increase their cost of service.

SECTION 1
HISTORICAL BACKGROUND

Nutrient pollution has been a concern in the Neuse River since the mid-1970s. By 1988, the entire Neuse River Basin had been classified as nutrient sensitive waters (NSW) by the Environmental Management Commission (EMC). This new classification led to more stringent nutrient limits for wastewater facilities and inspired a variety of other actions aimed at reducing nutrient discharges, such as a statewide ban on phosphate detergents (NCDWQ, 2002).

However, despite these initiatives, the Neuse River continued to face water quality problems. These problems came to a climax in the summer of 1995 when record rainfalls delivered a tremendous load of nitrogen into the river system. This excess nitrogen stimulated the growth of algae blooms and deprived hundreds of fish of the oxygen they needed to survive (see Figure 1-1).

Figure 1-1. Consequences of Excess Nitrogen in the Neuse River



Source: NCDWQ, 1998.

The General Assembly responded to the situation by passing House Bill 1339, which established the goal of reducing the amount of nitrogen delivered to the Neuse River Estuary by 30% over 5 years (NCDWQ, 1998). On December 11, 1997, the EMC followed this legislation with the adoption of the Nutrient Sensitive Waters Management Strategy, a collection of rules that outlined the nutrient loading limits for point and nonpoint sources, as well as other regulations that would be used to meet the legislature's reduction goal. This strategy was subsequently reviewed by the North Carolina Rules Review Commission and the General Assembly in its 1998 short session (NCDWQ, 2002a).

1.1 Nutrient Offset Fee Payment Program

Under the NSW Management Strategy, all new residential and commercial developments in the Neuse River Basin had to limit the amount of nitrogen released into the river to 3.6 pounds per acre per year. If a development failed to meet this limit, the development's owner had the option of either installing nutrient controls on the development site (also known as best management practices or BMPs) or voluntarily paying a specified fee to the North Carolina Wetland Restoration Fund as part of the Nutrient Offset Fee Payment Program (NOFPP). Table 1-1 provides an overview of the key rules.

Table 1-1. Pollutant Load Limits in the Neuse and Tar-Pamlico River Basins

River Basin	Rule
Neuse	The requirements in the Neuse Stormwater Rule 15A NCAC 2B.0235B for new developments require a 30% reduction in nitrogen loads, based on 1995 land use data, in nonurban areas of the Neuse River Basin and no net increase in the stormwater runoff volume generated by the 1-year, 24-hour storm.
Tar-Pamlico	The requirements in the Tar-Pamlico Stormwater Rule 15A NCAC 2B.0258 for new developments require a 30% reduction in nitrogen loads, based on predevelopment land use data, and no increase in phosphorus loads.

The Ecosystem Enhancement Program (EEP), which has administered the Wetland Restoration Fund under the Department of Environment and Natural Resources (DENR), would use the fees collected under this program to construct BMPs elsewhere in the river basin to offset the excess nutrients those developers emit (NCDWQ, 2006). It is important to note that, as the law and the rules are written, the EEP can construct the BMP anywhere in the Neuse River Basin as long as it prevents nutrients from reaching the Neuse River Estuary.

However, it should be noted that developers only had the option of using the NOFPP if they met certain requirements. These requirements differed based on whether the development was commercial or residential. If it was a residential development, the owner had to use (if necessary) on-site nutrient controls to reduce their nitrogen discharges to 6.0 pounds per acre per year before he/she was eligible to take advantage of the NOFPP. On the other hand, if the development was commercial, the owner had to use on-site BMPs to reduce nitrogen discharges to 10 pounds per acre per year before it was eligible to use the NOFPP.

The original offset fee paid by developers for excess nitrogen discharges was set in 1998 at a fixed rate of $11 per pound of nitrogen per year. However, this fee was estimated without the benefit of historical data for what offset mitigation projects would cost (NCDWQ, 2006).

1.2 Recent Changes to the Nutrient Offset Payment Program

In 2005, a series of amendments were proposed to the NSW Management Strategy. These amendments sought to expand the offset program to cover new river basins and nutrients; update the way nutrient offset payments are calculated to reflect the true and changing costs of mitigation, as well as to make pursuing projects closer to the location of environmental impact more feasible; and finally to reorganize and change the destination of nutrient offset payments from the Wetland Restoration Fund to the Riparian Buffer Restoration Fund.

First among the changes proposed by these amendments was that the offset payment program be expanded to the Tar-Pamlico River Basin to allow developers in that river basin the option of participating in the program in lieu of complying with the strict nutrient loading limits in the Tar-Pamlico NSW Rule (15A NCAC .0258) (NCDENR, 2005b).

However, there were several key differences between the offset payment program in the Neuse and the one proposed for the Tar-Pamlico. First, the nitrogen loading requirements were different in each river basin. The Neuse rules require that developers limit their nitrogen discharges to 3.6 pounds per acre per year, whereas the rules in the Tar-Pamlico region only require emitters to limit their nitrogen loading to 4.0 pounds per acre per year (NCDENR, 2005b).

Second, since the Tar-Pamlico NSW Rule also specifies limits for the amount of phosphorus developers can emit into the river basin (0.4 pounds per acre per year), the offset payment program in the Tar-Pamlico would provide developers with the option of paying an offset fee similar to the one paid for nitrogen in lieu of complying with the strict phosphorus limit.[1] According to these amendments, developers would be charged $45 per tenth of a pound of phosphorus per year (NCDENR, 2005b).

In addition to these changes, the 2005 amendments also proposed to change the methods and prices used to calculate a developer's total nutrient offset fee. First, the amendments would raise the price of loading nitrogen into the Neuse and Tar-Pamlico river basins from $11 per pound per year to $57 per pound per year. This new fee was intended to better reflect the true cost of mitigation and to provide the EEP with more flexibility as to the types of nutrient controls it could afford to pursue (NCDENR, 2005b).

[1] In cases where a developer wishes to use the nutrient offset payment option, but emissions of both nitrogen and phosphorus exceed mandatory limits, the developer would only be expected to pay the more expensive of the two fees. This procedure was established to avoid charging developers twice for the same nutrient emissions.

Second, the amendments proposed using a new formula for calculating the total fee that developers would have to pay to participate in the nutrient offset program. This new formula was intended to establish an automatic updating mechanism and incorporate the land costs associated with mitigation requirements to allow the EEP the flexibility of pursuing BMP projects closer to the point of impact. The proposed formula for nitrogen is included as follows (the formula for phosphorus is similar in structure) (NCDENR, 2005b):

Nitrogen Payment = [($/lb)(# of lbs/year)(30 years) + (Land Cost $/Ac) (1 Ac/35 Ac) (Devel. in Ac)] x (1.1 Ad Costs)

where

$/lb	=	the cost of mitigation in dollars per pound of nitrogen mitigation. As stated earlier, this fee was to be established at $57 per pound of nitrogen and $45 dollars per tenth of a pound of phosphorus by the proposed amendment. This fee would be updated annually based on the construction cost index, published in the *Engineering News Record.*
# of lbs/year	=	the number of pounds of nitrogen discharged each year for which mitigation is being requested.
Land Cost $/Ac	=	the current value of the property being developed as measured in dollars per acre. This value is based on the most recent county tax assessment.
1 Ac / 35 Ac	=	an adjustment factor, indicating that 1 acre of mitigation is required for every 35 acres of development.
Devel. in Ac	=	the overall size of the development, as measured in acres, for which mitigation is being requested.
1.1 Ad Costs	=	an adjustment factor used to reflect the administrative costs associated with the requested mitigation.

The final change proposed in the amendments was that the destination of nutrient offset payments from the NC Wetland Restoration Fund be changed to the Riparian Buffer Restoration Fund. This change was intended to provide the EEP with more flexibility in disposing of funds obtained from the nutrient offset program, because the projects that could be pursued under the Riparian Buffer Restoration Fund did not face the same restrictions as those that could be pursued under the NC Wetland Restoration fund (NCDENR, 2005b).

These changes proposed by the amendments became effective on March 1, 2006, during the 2005 short session of the North Carolina General Assembly (NCDWQ, 2006). However, later in the session, some of these changes were temporarily rescinded by Senate Bill 1862. This bill required that a) nutrient offset fees be temporarily lowered to $11 per pound of nitrogen and $11

per tenth of a pound of phosphorus, b) that a study of the nutrient offset payment be commissioned, and c) that payments made under the higher fee structure be refunded.

SECTION 2
NUTRIENT OFFSET PROGRAM ACTIVITIES TO DATE

Since the NOFPP's inception, the EEP has received $10,682,594 in fees ($11,670,996 in inflation-adjusted 2006 dollars) to offset 961,477 pounds of nitrogen and 391 pounds of phosphorus in the Neuse and Tar-Pamlico river basins. Table 2-1 provides nutrient offset payments into the program dating back to May 2001. In this section, we discuss the BMP projects EEP has installed to offset these nutrients and the methods used to implement them.

Table 2-1. Nutrient Offset Payments, May 2001 through February 2007

Year	Current-Year Dollars	Inflation Adjusted, 2006 Dollars
2001	$387,065[a]	$475,322[a]
2002	$1,375,443	$1,729,008
2003	$1,281,030	$1,528,702
2004	$1,540,816	$1,730,923
2005	$2,314,203	$2,423,003
2006	$2,938,989	$2,938,989
2007	$845,049[a]	$845,049[a]
TOTAL	**$10,682,594**	**$11,670,996**

[a] Partial year data.

Source: Provided by the EEP in March of 2007.

2.1 EEP Nutrient Offset Projects

To date, the EEP has initiated 14 BMPs in the Neuse River Basin that were funded by the NOFPP. According to the EEP's estimates, these projects account for more than 532,400 pounds of nitrogen and 36,500 pounds of phosphorus reduction. In 2006, a temporary hold was placed on starting new nutrient offset projects pending the results of the proposed amendments described in the previous section.

Thus far, 8 of the 14 projects pursued by the EEP have been riparian buffers. The remaining six projects are stormwater wetlands and other structural BMPs. Figure 2-1 graphically juxtaposes the locations of the nutrient offset projects the EEP has pursued to date with the origin of offset payments the NOFPP has received. As this figure illustrates, the majority of projects are located in Wake and Johnston counties. These counties also account for a sizeable portion of the offset payments received by the NOFPP.

Figure 2-1. Nutrient Offset Projects and Payments by County of Origin

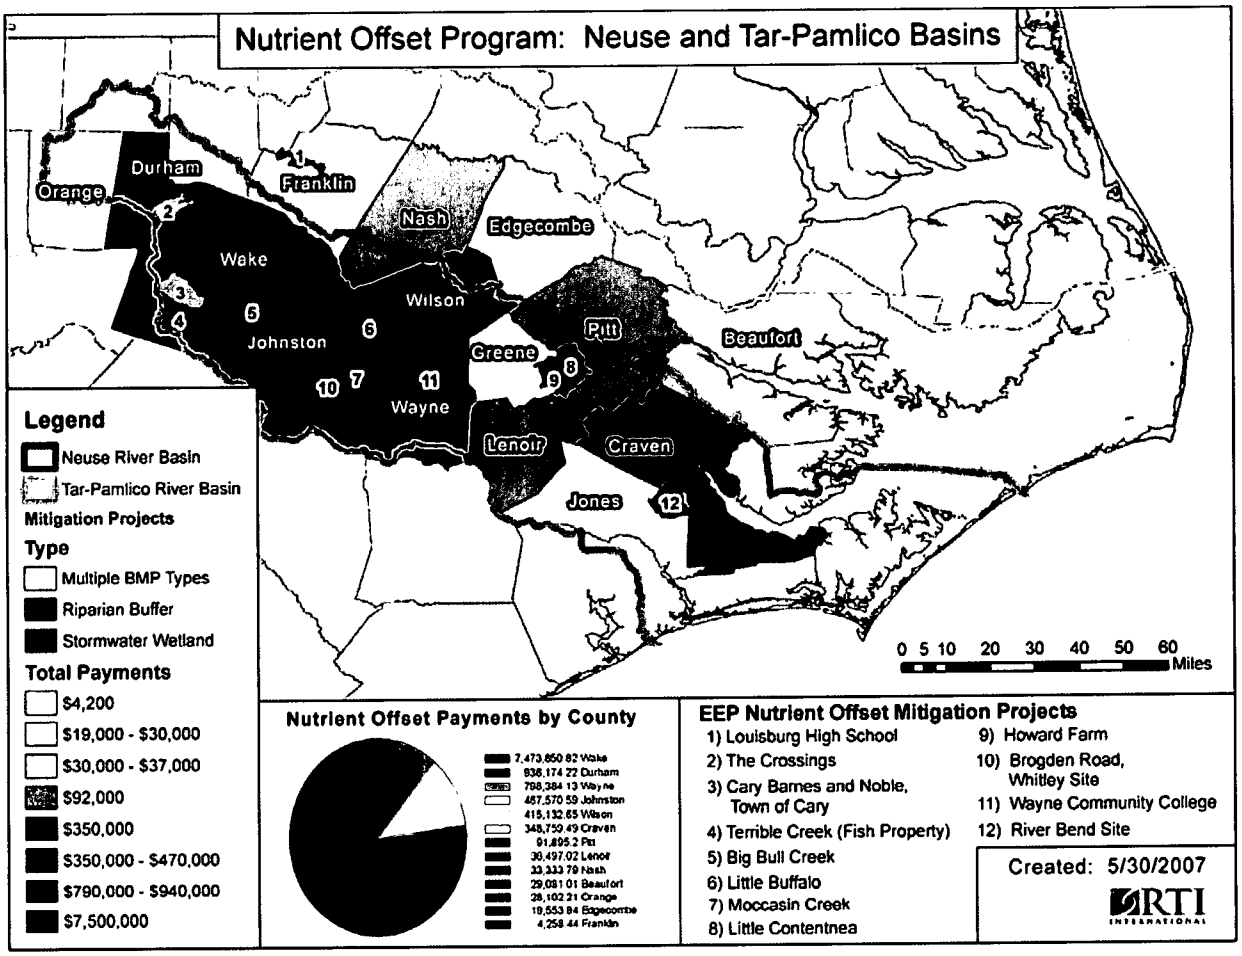


Table 2-2 summarizes specific information for each project initiated by the EEP. Included in this summary is the contract cost paid by the EEP and the pounds of nitrogen and phosphorus the EEP estimates that these projects offset over 30 years. By dividing the total cost for each project by the amount of nutrients it is believed to offset, we can calculate a dollars-per-pound-of-nutrient figure that can simplify comparisons between different projects. These calculations are reported in Table 2-3.

2.2 Project Design and Implementation Methods

The EEP uses two different methods for delivering these BMPs—design-bid-build and full delivery. Under the design-bid-build method, the EEP selects the mitigation site and type of BMP to be installed. Next, they contract with a private firm to design the project. Finally, they solicit bids from private contractors to construct the BMP and maintain it after its completion.

Table 2-2. EEP Nutrient Offset Mitigation Projects

Project Name	County	Type of Project	Stream Buffer (acreage)	Nitrogen Nutrient Reduction (pounds over 30 years)	Phosphorus Nutrient Reduction (pounds over 30 years)	Project Cost	Description	Consultant
Brogden Road	Johnston	Buffer project	15.00	34,096.50	2,196.00	420,000.00	Full delivery	Restoration Systems
Little Buffalo	Johnston	Buffer project	18.50	42,052.35	2,708.40	594,000.00	Full delivery	Restoration Systems
Big Bull Creek	Johnston	Buffer project	35.00	79,558.50	5,124.00	980,000.00	Full delivery	Restoration Systems
Terrible Creek Buffer (Fish Property)	Wake	Buffer project	45.60	103,653.36	6,675.84	29,555.50	Design only	Axiom
Whitley Site	Johnston	Buffer project	27.50	62,510.25	4,026.00	976,250.00	Full delivery	EBX
Moccasin Creek-Buffer	Johnston	Buffer project	20.20	45,916.62	2,957.28	427,815.80	Full delivery	Greene Environmental
Little Contentnea-Buffer	Greene	Buffer project	54.16	123,111.10	7,929.02	1,098,852.24	Full delivery	Greene Environmental
Howard Farm[a]	Greene	Buffer project	10.00	22,731.00	1,464.00	426,060.00	Full delivery	Land Management Group
BMP (River Bend Site)[b]	Craven	Stormwater wetland	0.00	5082	1560	58,275.00	Design, bid, build	NCSU
BMP (Town of Cary)	Wake	Multiple BMP Types	0.00	2820	450	400,950.00	Design, bid, build	Stantec
BMP (Wayne Community College)	Wayne	Stormwater wetland	0.00	4431	450	133,200.00	Design, bid, build	TetraTech
BMP (Cary Barnes and Noble)[b]	Wake	Multiple BMP Types	0.00	2820	510	$524,475	Design, bid, build	NCSU
The Crossings	Durham	Multiple BMP Types	0.00	2820	399	$435,350	Design bid, build	KO
Louisburg HS[b]	Franklin	Stormwater wetland	0.00	840	90	$63,500	Design, bid, build	NCSU

[a]Only portion of project funded with NOFPP. The reduction amounts listed are only those associated with what the NOFPP funded.

[b]Only portion of project costs reported. Other costs incurred as part of separate contracts.

Table 2-3. EEP Nutrient Offset Project Costs

Project Name	Restoration Practice	Project Cost ($/lb-30 N)[a]	Project Cost ($/0.10 lb-30 P)[b]
Brogden Road	Buffer project	$12.3	$19.1
Little Buffalo	Buffer project	$14.1	$21.9
Big Bull Creek	Buffer project	$12.3	$19.1
Terrible Creek Buffer (Fish Property)[c]	Buffer project	$0.3	$0.4
Whitley Site	Buffer project	$15.6	$24.2
Moccasin Creek-Buffer	Buffer project	$9.3	$14.5
Little Contentnea-Buffer	Buffer project	$ 8.9	$13.9
Howard Farm	Buffer project	$18.7	$29.1
BMP (River Bend Site)[c]	Stormwater wetland	$11.5	$3.7
BMP (Town of Cary)	Multiple BMP Types	$142.2	$89.1
BMP (Wayne Community College)	Stormwater wetland	$30.1	$29.6
BMP (Cary Barnes and Noble)[c]	Multiple BMP Types	$186.0	$102.8
The Crossings	Multiple BMP Types	$154.4	$109.1
Louisburg HS[c]	Stormwater wetland	$75.6	$70.6

[a] Cost per pound of nitrogen removed over 30 years.

[b] Cost per pound of phosphorus removed over 30 years.

[c] Does not report total cost.

Thus far, all of the structural stormwater BMP projects initiated by the EEP are being or have been delivered through the design-bid-build-process.

In full-delivery projects, the EEP plays a much less direct role in orchestrating the project. Using this method, the EEP first issues an RFP (request for project proposal) that indicates that it is looking for a contractor to construct a BMP in a certain river basin to offset a given amount of nutrients. Private construction firms identify potential sites and submit their project proposals to the EEP. The EEP then evaluates these proposals based on a number of criteria, such as total cost and whether the project fits with the EEP's overarching goal of improving watershed protection. As Table 2-2 indicates, almost 60% of the NOFPP BMPs have been full-delivery riparian buffer projects.

SECTION 3
BMP COST DATA

Any nutrient offset fee chosen by policy makers will ultimately have to cover the costs of pursuing the various BMPs required to offset the nutrient discharges of nonpoint sources. Therefore, understanding the costs of various BMP projects is essential and became the focus of RTI's data collection efforts. In this section, we describe the North Carolina BMP cost data collected for this study and the methods that were used to collect it.

3.1 Components of BMP Cost Data

For this study, we broke down the cost of constructing BMPs into four main cost components. The components include land, design, construction, and maintenance costs. The definition of each of these components is straightforward and similar for other types of construction projects.

- **Land** costs are incurred in obtaining access to or purchasing the land where the BMP will be placed.
- **Design costs** are the design and engineering fees. Design costs for a typical mitigation project are about 32% of construction costs (Schueler et al., in press), although design and engineering fees for stormwater retrofits requiring significant permitting efforts (e.g., retrofit projects requiring wetland permits) can run as high as 40%.
- **Construction** costs relate to the actual time, labor, capital, and materials used in designing and constructing the BMP.
- **Maintenance** costs are incurred in repairing, maintaining, and monitoring the BMP after it is constructed. For this analysis, we assumed a 30-year maintenance period, which corresponds to the offset fee formula.

An important distinction between these costs is that land, design, and construction costs are only incurred once in the life of the BMP, while maintenance costs will be incurred continually.

However, not all of the cost components may be relevant when calculating EEP offset expenditures. For example, land costs may not be incurred if public lands are available for pursuing mitigation projects. Maintenance costs may also not be relevant if local municipalities assume future maintenance responsibilities for offset projects. In the instances where land or maintenance activities are donated, we are not inferring that land opportunity costs or maintenance costs do not exist; they are just not incurred by the EEP and hence do not need to be covered by offset payments when assessing the fee structure needed to keep the NOFPP solvent.

In addition, it is also important to note that land costs may vary significantly based on the type of agreement involved. For example, costs are usually significantly lower when conservation easements are obtained as opposed to fee-simple purchases of land. Although the EEP has made outright purchases of land in the past, the vast majority of their projects are installed on land obtained through conservation easements. As a result, the remainder of this report exclusively deals with this form of agreement.

3.2 Identifying Stakeholders and their Concerns

The cost data collected by RTI were obtained from a wide range of stakeholder groups. To communicate the methods and objectives of this study and to facilitate data collection, several meetings with individual stakeholders were conducted:

- First stakeholder meeting at the Legislative Office Building, March 2, 2007
- Meeting with North Carolina Home Builder's Association (NCHBA), March 8, 2007
- Meeting with Restoration Systems, March 13, 2007
- Meeting with Environmental Defense Fund, March 14, 2007
- Meeting with the EEP, March 15, 2007
- Meeting with Neuse River Compliance Association, March 19, 2007
- Second meeting at the Legislative Office Building, May 7, 2007
- Meetings with county and city representatives, May, 2007

In this section, we report the comments and suggestions that these stakeholders offered on the general approach and purpose of our study.

3.2.1 First Stakeholder Meeting at the Legislative Office Building

The primary purpose of this meeting was for RTI to present the methodology it proposed for accomplishing the objectives of the study of the NOFPP. However, the meeting also proved to be an excellent way to establish contacts with stakeholders, because it was attended by different stakeholder groups including private firms affected by the NOFPP—such as members of the North Carolina Homebuilders Association and EEP contractors—as well as employees of government entities such as the EEP and the North Carolina Division of Water Quality (NCDWQ).

The main topic of discussion during this meeting was the scope of RTI's study and the purpose of the NOFPP in general. In particular, many individuals wondered whether it was appropriate for RTI to include land costs in the payment formula it was analyzing, because including them would only be relevant if BMPs had to be constructed close to the location of

impact. However, the answer to this question hinged on the policy decision of whether the purpose of the NOFPP is to reduce the amount of nutrients in the Neuse and Tar-Pamlico river basin estuaries at the lowest cost, or whether its goal is to protect watersheds. As a result, it was suggested that RTI look at multiple scenarios that would encompass the spectrum of plausible policies.

The topic of land costs was closely related to another concern expressed during the meeting—that the EEP was trying to pursue expensive stormwater wetland projects, when there was still plenty of land available for buffer projects. Once again, the answer to this question would depend on the NOFPP's ultimate goal.

3.2.2 Meeting with North Carolina Home Builders Association

The purpose of this meeting was for RTI to meet directly with members of the NCHBA, to listen to their concerns, and to approach them for information on the costs of constructing BMPs and the predicted value of land in the future. This meeting was primarily attended by developers and representatives of private contracting and engineering firms.

The conversation during this meeting covered a wide variety of topics. The issue of the ultimate goal of the NOFPP was revisited from the first stakeholders meeting, as was the question of which BMPs were most appropriate for the EEP to pursue. However, new concerns were also expressed. In particular, many of the attendees worried about the impact that higher fees would have on the future of development in the two river basins. Their concerns led them to suggest ways of lowering the overall cost faced by developers when complying with nutrient loading limits.

For example, one individual noted that BMP projects installed in developments offer more benefits than just offsetting nutrients. In fact, these projects reduce the amount of other pollutants that reach the river system and contribute to the amount of open space available in the development. Therefore, if developers could be compensated for the additional benefits generated by the BMPs they construct—for example, if their stormwater wetlands counted toward their open space requirements—this would significantly reduce the costs developers face when complying with nutrient loading limits.

The NCHBA submitted additional comments in an e-mail received on May 21 from Suzanne Harris, Vice President of Governmental Affairs. In this e-mail, the NCHBA expressed concern with including administration costs as a multiplier in the formulas RTI proposed for calculating nutrient offset fee. They suggested that the multiplier could be incorrect if there are

significant economies of scale (it becomes cheaper to manage more projects than a few). In this e-mail, NCHBA also expressed its support for reorganizing the NOFPP into a market-style trading program (as discussed in Section 5.2).

3.2.3 Meeting with Restoration Systems, LLC

Restoration Systems, LLC, is a private company that has constructed a variety of riparian buffer and wetland projects for the EEP. The purpose of the March 13th meeting was for RTI to obtain a better understanding of how private contractors operate under the NOFPP. Topics discussed included how potential project sites were selected and the various factors involved in constructing riparian buffers and wetlands.

In addition, the topic of expanding the private sector's role in the offset payment program was discussed. In particular, Restoration Systems recommended establishing a nutrient offset trading program in North Carolina. It was suggested that such a trading program, which linked suppliers of nutrient offsets like mitigation banks with nutrient emitters like private developers, would result in a variety of efficiencies over the current program, which uses the state to coordinate decisions between suppliers and consumers of nutrient offsets.

3.2.4 Meeting with Environmental Defense Fund

The purpose of this meeting was for the Environmental Defense Fund (EDF), represented by Joe Rudek, to express their opinions on the goals of RTI's study. In particular, EDF said that they hoped RTI paid adequate attention to BMPs other than riparian buffers, which have comprised the majority of nutrient offset projects thus far. Dr. Rudek said that other BMPs should be considered to allow the EEP the flexibility to pursue mitigation close to the location of environmental impact, which would not only achieve the NOFPP's goal of reducing nutrients in the estuary, but also work to protect local watersheds.

3.2.5 Meeting with the Ecosystem Enhancement Program

The purpose of this meeting was for RTI to obtain a better understanding of how the EEP administered the NOFPP. This meeting was attended by Suzanne Klimek, EEP Director of Operations, and other members of the EEP's staff.

As a result of this meeting, RTI was able to better understand what types of projects the EEP would like to pursue in coming years and the methods it uses to implement them (full delivery versus design-bid-build methods). In particular, RTI learned that the EEP would prefer to have more flexibility in the types of projects they pursue to allow them to better meet their broader goal of watershed protection as well as reducing nitrogen in the estuaries. In addition to

improving RTI's overall understanding of the NOFPP, Ms. Klimek and her staff provided RTI with data on nutrient offset payments dating back to 2001.

3.2.6 Meeting with Neuse River Compliance Association

The purpose of this meeting was for RTI to meet with representatives of the Neuse River Compliance Association (NRCA)—Cindy Finan, Haywood Phthisic, and Glenn Dunn. This organization represents point sources—such as wastewater treatment facilities operating in the Neuse River Basin.

To date, point sources have not used the NOFPP. However, during this meeting Ms. Finan and Mr. Phthisic expressed their concern that point sources will eventually have to use the NOFPP when they exhaust the technology options that have enabled them to avoid exceeding their current nutrient loading limits to date. According to Ms. Finan and her colleagues, when the original nutrient loading allocations were created, point sources given their nitrogen allocations based on their current National Pollutant Discharge Elimination System (NPDES) discharge permit with no reserve for growth. This becomes a problem when population growth demands that wastewater facilities and other point sources expand their operations, because NCDENR will not issue the necessary permit for an expansion unless the permittee can show (in advance) how they will accommodate its nitrogen loading levels over the next 30 years. If the permittee projects its nitrogen loading to exceed the original nitrogen loading allocation, they will either have to abandon the expansion or potentially purchase offsets through NOFPP.

The NRCA was not able to say when this possibility could occur. In 2006, nitrogen discharges by NRCA's members were 52% below state-mandated limits (NRCA, 2007). However, according to Ms. Finan, most of the NRCA's members are already pushing the limits of abatement technology—treating nitrogen in their wastewater well below the accepted Best Available Technology (BAT)—making it harder for them to accommodate future growth within the confines of their current nitrogen loading allocation. Therefore, according to Ms. Finan, it is possible that point sources could begin purchasing nutrient offsets from the NOFPP within the next few years.

3.2.7 Second Stakeholder Meeting at the Legislative Office Building

A second stakeholder meeting was held on May 7, 2007, so that RTI could present the preliminary findings of their study of the NOFPP. Individuals attending this meeting offered many excellent suggestions on how RTI could refine the results.

One of the major topics discussed during this meeting was the impact that the NOFPP could have on economic development. Several individuals, including representatives from Wayne County and the North Carolina Home Builders Association, remarked that nutrient offset fees would deter economic growth by making new construction projects more expensive to pursue. Although this is certainly a valid concern that policy makers will have to consider when determining where the fee should be set, an economic impact assessment was not included in the scope of this study.

A second issue related to these concerns is the question of whether predominantly rural areas would be subsidizing urban areas under higher fee structures that are intended to support more stormwater wetland projects. The reasoning underlying this concern is that rural counties may have to pay higher fees to support these stormwater wetland projects, even though those projects will most likely be installed in more urban counties where the environmental impacts are greatest.

In addition to questions of growth and equity, another issue that featured prominently during discussion was the fact that the Division of Water Quality potentially would not award nutrient offset credit to buffer projects pursued by the EEP unless they could ensure diffuse sheet flow across the buffer. In many cases, this would require the construction of concrete level spreaders. To address this concern, RTI said they would adjust their riparian buffer cost estimates by adding level spreader construction and maintenance costs to a certain percentage of projects (this issue is addressed in greater detail in Section 3.3.3).

Over the course of the meeting, several other important suggestions were made to refine RTI's results, including expanding the discussion of the role the private sector can play in administering the program, as well as the potential of market-based systems to set fee prices (looking into the Pennsylvania Nutrient Trading Program as an example of market-based nutrient trading); looking into Conservation Reserve Enhancement Program's experience with obtaining land for mitigation projects; considering the use of the purchase value of land rather than the tax-assessed value in RTI's basin-wide land cost estimates; reconsidering the inclusion of administration costs in RTI's proposals for offset fee formulas; and identifying other factors that could contribute to a reduction of available land for buffer projects over the next 20 years.

3.2.8 Meeting with Nash County and Rocky Mount City Planning Representatives

On May 11, 2007, RTI interviewed two representatives from Nash County: Nancy Nixon, County Planner, and Jonathan Boone, Public Works Director of the City of Rocky Mount. The purpose of this interview was to better understand Nash County's concerns about the NOFPP.

The primary issue discussed during this interview was that, if the fee became too high, the NOFPP would not be a viable alternative for developers in Nash County. They said they recognize that reducing the amount of nutrients in the estuary was a worthy goal and that they believed the NOFPP would allow the state government to construct larger BMP projects in better locations than would be available on the developing site. However, they worried that a fee that was too high would prevent many developers from seeing NOFPP as a viable alternative to constructing BMPs on site. This, they said, could potentially lead to slower economic growth in the county and the pursuit of less cost-effective mitigation practices.

An additional concern expressed by Ms. Nixon and Mr. Boone during this meeting was also voiced during the second stakeholders meeting— counties that are predominantly rural would be subsidizing urban counties under higher fee structures that are intended to support more stormwater wetland projects. As before, this concern is motivated by the fact that rural counties will have to pay higher fees to support these stormwater wetland projects, even though those projects will most likely be installed in more urban counties where the environmental impacts are greatest.

3.2.9 Meeting with Wayne County Representatives

On May 25, 2007, RTI interviewed County Manager Lee Smith to better understand Wayne County's concerns about the NOFPP. During this interview, the primary issue discussed was the consequences that the NOFPP could have on economic development in Wayne County. Mr. Smith explained that he was very much in favor of having an in-lieu fee system in place, but that environmental considerations must also be weighed against a desire for economic growth. Like several other stakeholders, he worried that significantly higher fees might result in slower economic growth in Wayne County and the entire river basin.

Following this line of reasoning, Mr. Smith discussed that higher nutrient offset fees could also lead to a redistribution of development throughout the state away from counties located in the Neuse River Basin. Firms that might usually locate in Wayne County, he said, might instead move to another county where nutrient offset fees were not charged, and this could possible lead to eutrofication in other watersheds. As a result, Mr. Smith recommended that a state-wide nutrient offset fee be adopted to improve North Carolina's overall water quality and to avoid problems associated with inequitable growth.

In addition to these concerns, Mr. Smith also stated that decreasing flow in the Neuse River resulting from increased water consumption could be a barrier to achieving the legislative goals of reducing nitrogen concentration in the estuaries. If water flow is reduced, he said, we

might see nitrogen concentration levels stabilize or possibly rise even if there was no net increase in nitrogen loading. He suggested a study was needed to investigate these issues.

3.3 BMP Cost Data for North Carolina

To determine the costs of constructing BMPs in North Carolina, RTI interviewed over 30 individuals in the private and public sectors. In this section, we describe the structure of these interviews, the type of BMPs for which data were eventually collected, and the cost data itself.

3.3.1 Description of Data Collection Method

In March and April of 2007, RTI approached 36 academics, private environmental engineering firms, and government agencies to request detailed cost information on BMP projects they had pursued in the state of North Carolina. Although each interview was unique, they all sought to obtain the following information:

- **A description of each BMP project itself.** Specifically, RTI asked for the year of construction for each BMP project, its geographic location, its size (in acres), drainage area (acres), the percentage of the drainage area that is impervious to rainfall, and a description of how the land surrounding the BMP was used (e.g., residential community, cattle grazing).
- **A detailed description of the costs involved in building each BMP project.** In particular, RTI asked that costs be broken down into the four categories described in Section 3.2—land, design, construction, and maintenance costs. During interviews with private firms, RTI also requested an estimate of the profit the firm received by doing the project (revenue over costs). We made this request to account for the overhead costs of conducting business, as well as the opportunity costs faced by the entrepreneur building the BMP. These elements are important because they will both ultimately be incorporated into the price charged by firms for installing BMPs.

RTI used the descriptions of individual BMP projects to estimate the total amount of nutrients each project would be expected to remove over its lifetime. This allowed RTI to express the cost information for that project in terms of dollars per pound of nitrogen ($/lb-N) and dollars per tenth of a pound of phosphorus ($/0.10 lb-P) offset, which is a measure of cost-effectiveness and applying the data to our financial analysis (explained in Section 4).

3.3.2 Description of Data and Sources

RTI collected detailed cost information for 45 separate BMP projects that have been constructed in North Carolina over the past 10 years. These projects were divided into four

groups based on BMP type: riparian buffers, stormwater wetlands, large bioretention areas,[2] and wetponds. A brief description of each BMP category follows.

- ***Riparian buffers:*** Strips of land covered in vegetation (such as trees, shrubs, or grass) and located between a potential pollutant source (such as an agricultural field) and a body of surface water. These buffers are designed to trap nonpoint source pollution, such as runoff from agricultural fields, and to prevent it from entering the body of water. (Osmond et al., 2002). Thus far, the EEP has only constructed forested buffer projects.
- ***Stormwater wetlands:*** Constructed wetlands that are heavily vegetated and contain a shallow amount of standing water. These structures remove nutrients by acting as a natural filter—as stormwater flows through the wetland, many of the nutrients it contains will either settle to the bottom or be absorbed through biological update (Wossink and Hunt, 2003).
- ***Large Bioretention Areas:*** A shallow depression in the landscape that is heavily vegetated. Stormwater is directed into the depression where nutrients will settle and be absorbed in the biological process (Wossink and Hunt, 2003).
- ***Wetponds:*** Runoff holding facilities that constantly contain standing water. Storm flows are held in the pond temporarily and then released to minimize large-scale flooding. Wetponds primarily remove nutrients from stormwater by allowing them to settle while the runoff resides in the pond (Wossink and Hunt, 2003).

Table 3-1 reports the number of projects included in each BMP type and the sources of cost data associated with each project. Although private-sector companies were often approached for information, the vast majority of detailed cost data collected was obtained from academic and government sources.

3.3.3 Adjusting Riparian Buffer Cost Estimates to Reflect the Cost of Level Spreaders

To be eligible for nutrient offset credit, riparian buffer projects must be able to guarantee that stormwater will flow evenly over the buffer. For nonagricultural BMPs, this will possibly require constructing concrete linear structures (called level spreaders) along the edge of the buffer in areas where physical characteristics of the land may increase the risk of concentrated water flow.

Since none of the buffer cost estimates collected by RTI included the cost of constructing and maintaining level spreaders, and it is likely that future buffer projects will have these structures, it was necessary to obtain additional data to adjust for these costs.

[2] Information was also collected for small bioretention retrofits, but we determined these mitigation projects are not applicable for EEP projects.

Table 3-1. Description of Data Obtained by RTI

BMP Type	Number of Projects	Data Source
Riparian buffers	8	Provided by private-sector firms that constructed riparian buffers for the EEP. These projects were primarily located in the Piedmont and inner Coastal Plain regions of the state.
Stormwater wetlands	17	Provided by academics in North Carolina State University's Water Quality and Stormwater Engineering Groups and engineers working for the city of Charlotte's Storm Water Services. These projects were scattered across the state but were primarily located in the state's Piedmont and Coastal Plain regions.
Large bioretention areas	12	Provided by academics in North Carolina State University's Water Quality and Stormwater Engineering Groups as well as individuals working for the North Carolina Department of Transportation and the town of Garner. These projects were scattered across the state but were primarily located in the state's Piedmont and Coastal Plain regions.
Wetponds	9	Provided by academics in North Carolina State University's Water Quality and Stormwater Engineering Groups. These projects were scattered across the state but were primarily located in the state's Piedmont and Coastal Plain regions.

First, RTI obtained construction cost estimates from the North Carolina Department of Transportation (DOT). Based on their experience with constructing "concrete wall" level spreaders, the DOT estimated that construction costs would average $60 per linear foot of level spreader. Second, based on discussions with the DOT, RTI estimated the cost of designing a level spreader by applying a standard design-to-cost ratio of 35%. This implies that level spreaders cost $21 per linear foot to design. Lastly, RTI interviewed several experts who estimated that properly maintaining a level spreader after construction would cost approximately $2 per linear foot per year.

Before we could use these data to adjust our original cost estimates, we then needed to 1) determine what portion of buffer projects would potentially require buffers and 2) approximately how long the average level spreader would be relative to the total length of the buffer.

To answer the first question, we assumed that agricultural land by its nature is relatively level and, hence, buffer projects on this land would not require level spreaders. Based on RTI's buffer availability analysis (discussed in Section 4.2.2), a conservative estimate of the portion of land associated with agriculture practices is approximately 45%.

The remaining 55% of potential buffer land would therefore currently be used for other purposes (e.g., grassland, pasture). Because it is impossible to predict exactly where the EEP will

be able to pursue most of their buffer projects, our analysis assumes that for 55% of future buffer projects level spreaders will be required.

The second question relates to the size (length) of level spreaders when needed. The length of any particular level spreader ultimately depends on the physical characteristics of the construction site. For example, a riparian buffer that is 4,000 feet long on hilly pastureland may require several level spreaders that sum to a total of 1,000 feet (25% of total length), while another site that is more amenable to diffuse water flow may only require several level spreaders that sum to a total of 400 feet (10% of total length). Because this is a prospective analysis, after discussions with experts, RTI made the conservative assumption that for future buffers requiring level spreaders, the total length of the spreaders would be 25 % of the project's total linear feet. The 25% level spreader assumption is used in the buffer cost estimate analysis throughout this report.

3.3.4 Total 30-Year Project Costs by BMP

Tables 3-2 and 3-3 summarize the average costs of installing different BMPs by cost category, as described in Section 3.2. To reflect the fact that land costs will differ by river basin, land and total costs are reported individually for the Neuse and Tar-Pamlico river basins. Values are expressed in both dollars per pound of nitrogen removed and dollars per pound of phosphorus removed.

Table 3-2. Mean Expenditures by BMP Cost Category for Nitrogen ($/lb-N per 30 year) in 2006 Dollars

BMP	Land Cost		Design Cost	Construction Cost	Present Value of 30-Year Maintenance Cost[a]	Total	
	Neuse	Tar-Pamlico				Neuse	Tar-Pamlico
Riparian buffers	$11.63[b]	$7.01	$1.95	$5.75	$2.04	$21.4	$16.8
Stormwater wetlands	$25.85[c]	$22.43	$14.38	$32.08	$9.68	$82.0	$78.6
Large bioretention areas	$71.18[c]	$61.77	$129.83	$329.69	$43.55	$574.3	$564.8
Wet Ponds	$43.94[c]	$38.13	$41.85	$130.79	$47.43	$264.0	$258.2

[a] Present value calculations use a discount rate of 5%.

[b] Based on average rural area land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.

[c] Based on average low-density urban land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.

Table 3-3. Mean Expenditures by BMP Cost Category for Phosphorus ($/0.10 lb-P per 30 year) in 2006 Dollars

BMP	Land Cost		Design Cost	Construction Cost	Present Value of 30-Year Maintenance Cost[a]	Total	
	Neuse	Tar-Pamlico				Neuse	Tar-Pamlico
Riparian buffers	$18.06[b]	$10.89	$3.03	$8.93	$3.17	$33.2	$26.0
Stormwater wetlands	$25.06[c]	$21.75	$10.71	$20.98	$8.91	$65.7	$62.3
Large bioretention areas	$46.96[c]	$40.75	$86.87	$221.30	$30.48	$385.6	$379.4
Wet Ponds	$23.29	$20.21	$28.12	$87.87	$26.08	$165.4	$162.3

[a] Present value calculations use a discount rate of 5%.

[b] Based on average rural area land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.

[c] Based on average low-density urban land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.

The total project cost for a BMP over 30 years is the sum of its one-time installation costs—which includes the purchase of the land as well as the design and construction of the BMP itself—and the present value of estimated maintenance costs over the next 30 years. Total project costs range from $21.4 per pound of nitrogen over 30 years for riparian buffers in the Neuse River Basin and $16.8 per pound of nitrogen in the Tar-Pamlico to $574 per pound of nitrogen over 30 years for large bioretention retrofits in the Neuse and $565 per pound of nitrogen over 30 years in the Tar-Pamlico. The differences in BMP costs across river basins are driven by differences in land prices.

Tables 3-4 and 3-5 report information on the mean, median, and range of total BMP project costs for each BMP type by river basin. These tables are intended to convey information on the distribution and variation of the cost information provided to RTI. As the tables indicate, the mean and median are very close for riparian buffers with relatively few extremes reported in its ranges for both river basins. This would indicate that there was not much variation in the information for riparian buffer costs. On the other hand, there are larger differences between the mean and the median costs for stormwater wetland, bioretention retrofits, and wetponds. The range of observations is also more spread out for these types of BMPs. This would indicate that there is a much greater degree of variability in the cost implementation.

Table 3-4. Distribution of Total 30-Year Project Costs by BMP for the Neuse River Basin in 2006 Dollars

	Dollars per Pound of Nitrogen			Dollars per Pound of Phosphorus		
BMP Category	Mean Total Project Cost (30-Year) ($/lb-N)	Median Total Project Cost (30-Year) ($/lb-N 30)	Range ($/lb-N 30)	Mean Total Project Cost (30-Year) ($/0.10 lb)	Median Total Project Cost (30 years) ($/0.10 lb)	Range ($/0.10 lb-P)
Riparian buffers	$21.4	$19.8	$16.8 to $30.9	$33.2	$30.7	$26.2 to $48.0
Stormwater wetlands	$82.0	$59.1	$26.0 to $155.1	$65.7	$37.0	$6.6 to $150.4
Large bioretention areas	$574.3	$514.6	$132.5 to $895.9	$385.6	$355.6	$87.4 to $591.0
Wetponds	$264.0	$240.90	$132.7 to $494.1	$165.4	$127.7	$70.3 to $261.9

Table 3-5. Distribution of Total 30-Year Project Costs by BMP for the Tar-Pamlico in 2006 Dollars

	Dollars per Pound of Nitrogen			Dollars per Pound of Phosphorus		
BMP Category	Mean Total Project Cost (30-Year) ($/lb-N)	Median Total Project Cost (30-Year) ($/lb-N)	Range ($/lb-N)	Mean Total Project Cost (30-Year) ($/0.10 lb-)	Median Total Project Cost (30 years) ($/0.10 lb-P)	Range ($/0.10 lb-P)
Riparian buffers	$16.8	$15.2	$12.2 to $26.3	$26.0	$23.6	$19.0 to $40.9
Stormwater wetland retrofit	$78.6	$59.1	$24.6 to $155.1	$62.3	$35.5	$5.3 to $150.4
Large bioretention retrofit	$564.8	$512.8	$132.5 to $881.0	$379.4	$355.6	$87.4 to $581.2
Wetponds	$258.2	$233.83	$125.6 to $491.4	$162.3	$124.0	$66.6 to $260.5

SECTION 4
FINANCIAL ANALYSIS (OBJECTIVES 1, 2, AND 3)

In this section, we discuss the financial analysis that underlies Objectives 1, 2, and 3 of the study. Because the type of offset projects pursued by the EEP in the future will significantly influence the financial analysis, we begin this section by defining three scenarios that are evaluated for each of the analysis Objectives 1, 2, and 3.

- ***Scenario A: All Buffers***. The EEP implements exclusively riparian buffers on land obtained primarily through conservation easements.
- ***Scenario B: Integrated Implementation***. In addition to buffers, the EEP pursues a number of stormwater wetland retrofit offset projects to target integrated environmental objectives. This would enables offset projects to be implemented closer in proximity (e.g., in local watersheds) to where development is occurring. This results in higher costs per pound of nitrogen and phosphorous.
- ***Scenario C: All Stormwater Wetlands.*** The EEP does not undertakes any buffer projects and instead installs all stormwater wetland projects. This implementation scenario is under consideration by the NCDWQ and would also increase the costs per pound of nitrogen and phosphorous.

Because of the prospective nature of the analysis, this section also defines and documents the trends used to adjust costs over time. These include

- forecasted demand for nutrient offsets,
- projected land costs and availability, and
- price indices for labor and materials.

This is followed by the financial calculations for Objectives 1, 2, and 3.

4.1 Implementation Scenarios

As shown in Tables 3-2 and 3-3 (Section 3.3), BMP costs vary greatly depending on the type of mitigation option employed. As a result, any analysis of program sustainability or offset payment formula design needs to be based on a detailed projection of the types of mitigation activities to be implemented.

To reflect the uncertainty in the types of mitigation options that may be implemented in the future, the financial analysis for this study was conducted relative to three different implementation scenarios that focus on buffers and stormwater wetlands. Based on the cost estimates presented in Tables 3-2 and 3-3, we assumed that large bioretention retrofits and wetponds are not viable options for BMPs because of their high cost. As a result, it is projected

that the EEP will likely pursue some mixture of the lower-cost buffers and stormwater wetland BMPs to meet the NOFFP's program objectives.

The three implementation scenarios shown in Table 4-1 are increasing in the average cost per pound of nitrogen and phosphorous offset by the EEP. This increased cost is primarily driven by an increased use of nonriparian buffer offset projects that are implemented to meet varying environmental objectives put forth by the EEP and NCDWQ. The specific BMP share distributions for each scenario are speculative. They are selected to provide insights into the potential range of costs the EEP might bear under different mission statements they may pursue as part of the NOFPP.

Table 4-1. Distribution of BMPs and Expenditures Incurred by the EEP

Scenario/BMP	BMP Share	Land Cost	Design Cost	Construction Cost	Maintenance Cost
Scenario A: All Buffers					
Riparian buffers	100%	√	√	√	√
Scenario B: Integrated Implementation					
Riparian buffers	70%	√	√	√	√
Stormwater wetlands[a]	5%		√	√	
Stormwater wetlands	25%	√	√	√	√
Scenario C: All Stormwater Wetlands					
Stormwater wetlands[a]	5%		√	√	
Stormwater wetlands	95%	√	√	√	√

√ = EEP assumes full cost.

[a] Local municipalities donate land and assume maintenance costs.

4.1.1 All Buffers

The all-buffer scenario is the lowest-cost scenario modeled. This scenario could be considered the most cost-effective way to meet the objectives of reducing nitrogen and phosphorous in the river basin estuaries. As discussed in Section 4.2.2, an all-buffer scenario would require buffer restoration on approximately 7% of the available buffer land in the Neuse River Basin and 1% of available buffer land in the Tar-Pamlico River Basin. Specific assumptions for this scenario include the following:

- Riparian buffers are the sole source of nutrient offsets, accounting for 100% of the total offsets demanded.
- The riparian buffer projects are implemented on land acquired through conservation easements or purchased by the EEP.

- All buffer projects are maintained by the EEP; hence, the EEP incurs maintenance costs over the 30-year life expectancy of the mitigation project.

4.1.2 Integrated Implementation

The EEP indicated that the current mix of offset projects has been strongly influenced by funding constraints of the existing offset payment structure. Thus, the integrated implementation scenario is intended to reflect a less-constrained world under which the EEP is able to pursue a wider range of mitigation options (beyond buffers) to achieve integrated environmental watershed objectives. Integrating projects conducted under the NOFPP into an overall water quality strategy could provide benefits beyond reduced nutrient loads in river estuaries such as improving water quality in local streams and rivers. Specific assumptions for this scenario include the following:

- Riparian buffers account for 70% of nutrient offsets.
- As in Scenario A, the riparian buffer projects are implemented on land acquired through conservation easements or purchased by the EEP.
- Stormwater wetland projects account for the remaining 30% of the nutrient offsets.
- The first 5% of the stormwater wetland projects are conducted on donated land, and local municipalities accept future maintenance responsibilities. Thus, the EEP does not incur land costs or maintenance costs associated with these projects.
- For the remaining 25% of the stormwater wetland projects, land must be purchased, and the EEP is responsible for maintenance over the 30 years of the project life expectancy.

4.1.3 All Stormwater Wetlands

Several stakeholder groups we spoke with expressed interest in the EEP conducting more offset mitigation projects in the regional areas where development is taking place. This approach has the benefit of contributing to the water quality of individual river/stream segments affected by development, in addition to the river estuary. In addition, the NCDWQ said that buffers might not be eligible for the NOFPP in the future because of concerns about effectiveness and long-term maintenance. To reflect these concerns, we included an all stormwater wetlands scenario. Specific assumptions for this scenario include the following:

- Stormwater wetlands account for 100% of nutrient offsets.
- As in Scenario B, the first 5% of the stormwater wetland projects are conducted on donated land, and local municipalities accept future maintenance responsibilities. Thus, the EEP does not incur land costs or maintenance costs associated with these projects.

- For the remaining 95% of the stormwater wetland projects, land must be purchased, and the EEP is responsible for maintenance over the 30 years of the project life expectancy.

4.2 Additional Data Used in RTI's Financial Analysis

In this section, we discuss the secondary data RTI used in conjunction with the BMP cost data described in Section 3 to study the sustainability of the NOFPP under a variety of different fee structures. These additional data include historical demand for nutrient offsets, geographic information system (GIS) assessment of land available for riparian buffer projects, GIS assessment of land costs in both river basins, and annual growth forecasts for each BMP cost component.

4.2.1 Historical and Forecasted Demand for Nutrient Offsets

Based on data RTI received from the EEP, the NOFPP has collected $10,508,435 in fees ($11,495,323 in inflation-adjusted 2006 dollars) to offset 954,433 pounds of nitrogen in the Neuse River Basin since May 2001. When these data are compared with population growth estimates for counties inside the river basin, a clear pattern emerges.

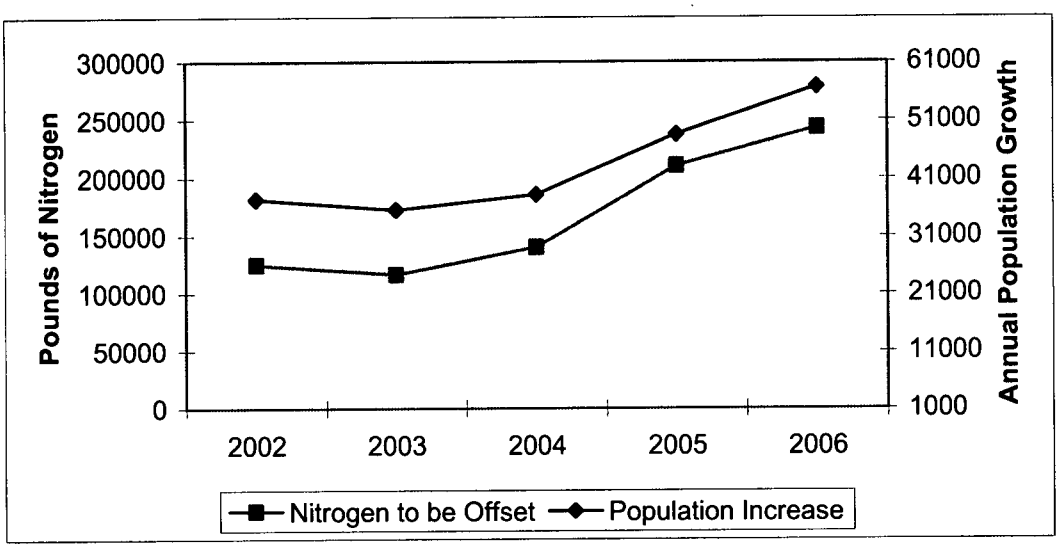
Figure 4-1 illustrates that the number of excess pounds of nitrogen needing to be offset by the NOFPP is closely correlated with population growth. This makes intuitive sense because excess nutrient loading is primarily generated through new development (both residential and commercial), which is itself in large part driven by population growth. Between 2002 and 2006, every new person entering the Neuse River Basin was associated with an average of 3.9 new pounds of nitrogen needing to be offset.[3] Using this pound-per-person ratio, we can project nutrient offset demand based on government population growth projections.

Assuming that this simple ratio stays constant into the future and applies for both river basins, RTI forecasts future demand for nitrogen offsets in the Neuse and Tar-Pamlico basins by using county population forecasts out to the year 2020.[4] For example, counties in the Neuse River Basin had a combined population of 2,151,298 in 2006, which is forecasted to increase to 2,739,453 by the year 2020. This implies a compound annual growth rate of approximately 1.6%. Therefore, RTI estimates that 38,498 new individuals will enter the Neuse River Basin in 2007, which will be associated with 148,731 pounds of excess nitrogen from new development.

[3] Because historical data for offsets are not available for the Tar-Pamlico river basin, the factor of 3.9 pounds of nitrogen per person is also used when projecting demand for the Tar-Pamlico river basin.

[4] In these calculations, RTI only included counties that had more than 5% of their areas located in the Neuse or Tar-Pamlico river basins.

Figure 4-1. Number of Pounds for Which the EEP Has Collected Nutrient Offset Payments and Population Growth in the Neuse River Basin: 2002–2006



Similar calculations were made for each year and each river basin and are presented in Tables 4-2 and 4-3.

4.2.2 Land Available for Riparian Buffer Restoration

As discussed in Section 2.1, the vast majority of nutrient offsets have been provided through the restoration of riparian buffers along the Neuse River and its tributaries. However, there is only a finite amount of land available for pursuing riparian buffer projects. Therefore, addressing the question of how much land is available for buffer restoration is critically important for assessing the viability of pursuing buffer projects in the future.

To determine the amount of land available for buffer restoration, RTI used three data sets: a HUC8 (8-digit hydrologic unit code) coverage for the Tar-Pamlico and Neuse river basins developed by the United States Geological Service (USGS), the USGS 1:24k-scale National Hydrography Dataset (NHD) dataset, and the 2001 National Land Cover Dataset (NLCD).

RTI combined these data with the desktop GIS program ArcMap to identify the total amount of potential buffer land in the Neuse and the Tar-Pamlico river basins. This was done by first using the data and software to identify the amount of land specifically within 50 feet of the centerline of each waterway within the Neuse and Tar-Pamlico river basins (HUC8 and NHD datasets), then to estimate the total amount of land within those areas by cover type using the NLCD 2001 dataset. The results of this analysis are presented in Table 4-4.

Table 4-2. Forecast of Nutrient Offset Demand for the Neuse River Basin from 2007 to 2020

Year	Estimated Cumulative Population	Population Increase Over Previous Year	Pounds Needing Offsets
2006	2,151,298		
2007	2,186,241	34,943	134,999
2008	2,221,752	35,511	137,192
2009	2,257,840	36,088	139,421
2010	2,294,514	36,674	141,685
2011	2,331,784	37,270	143,987
2012	2,369,659	37,875	146,325
2013	2,408,149	38,490	148,702
2014	2,447,265	39,115	151,117
2015	2,487,016	39,751	153,572
2016	2,527,412	40,397	156,067
2017	2,568,465	41,053	158,602
2018	2,610,184	41,719	161,178
2019	2,652,582	42,397	163,796
2020	2,695,667	43,086	166,456

RTI estimated that there are approximately 85,500 acres of land associated with the 50-foot buffer area surrounding either side of the waterways in the Neuse River Basin and 76,700 acres of land in the Tar-Pamlico.

Note that these estimates are larger than those implied by earlier analysis conducted by the NCDWQ. For example, in the "1998 Basin Wide Water Quality Plan," it was estimated that 3,443 miles of stream existed in the Neuse River Basin. This implies an estimate of 41,733 acres of land within the 50-foot buffer region that exists on both sides of these streams (approximately half of RTI's estimate).[5] The difference stems from RTI using a more detailed data set that includes more miles of stream (more smaller streams) than the one NCDWQ used.

[5] To replicate this calculation, remember that there are 5,280 linear feet in a mile, which implies that 18,179,040 linear feet of stream are associated with 3,443 miles. Multiplying this number by 100 (the size of the 50-foot buffer on either side of each stream) gives an estimate of the square feet of land in the buffer zone. Because there are 43,560 square feet in an acre, this implies a total of 41,733 acres of land in the Neuse River's 50-foot buffer zone.

Table 4-3. Forecast of Nutrient Offset Demand for Tar-Pamlico River Basin from 2007 to 2020

Year	Estimated Cumulative Population	Population Increase Over Previous Year	Pounds Needing Offsets
2006	772,264		
2007	778,460	6,196	23,938
2008	784,706	6,246	24,130
2009	791,002	6,296	24,323
2010	797,348	6,346	24,519
2011	803,746	6,397	24,715
2012	810,194	6,449	24,914
2013	816,695	6,500	25,113
2014	823,247	6,553	25,315
2015	829,852	6,605	25,518
2016	836,510	6,658	25,723
2017	843,222	6,712	25,929
2018	849,987	6,765	26,137
2019	856,807	6,820	26,347
2020	863,681	6,874	26,558

Table 4-4. Distribution of Land within 50 foot Buffer, by River Basin

Description	Neuse Area (acres)	Tar-Pamlico Area (acres)
Open water	10,973	8,756
Developed	5,040	2,980
Barren	552	682
Forest cover	24,748	21,486
Grassland, shrub, and pasture	8,384	8,146
Cultivated crops	7,349	9,732
Wetlands	39,459	33,666
Acres of Land	85,533	76,695
Total Acres (including Open Water)	96,507	85,452

The next step in RTI's analysis was to determine the amount of land that could potentially be used for installing riparian buffer projects (i.e., land physically fit for nutrient offset for riparian buffers). Based on conversations with the EEP, RTI assumed that land identified as being developed, barren, occupied by wetlands, or already covered by forest should not be considered eligible for buffer projects because land in these categories would either not support a forested riparian buffer (barren land), would not achieve additional nutrient offsets (land covered in forest is already acting as a buffer), or would not be available because of federal restrictions (no net wetland loss policy).[6] When land currently devoted to these uses is excluded from our estimates, we are left with a total of 15,734 acres of land available to sustain buffer projects in the Neuse River Basin and 17,880 acres of land able to sustain buffer projects in the Tar-Pamlico River Basin.

However, the current number of acres that could potentially host a riparian buffer does not reflect the amount of land that will *actually* be available for NOFPP buffer projects in the future. We must also take into account other interests competing for this land, in particular, buffer land demanded for other EEP programs and/or for urban development.

In addition to the NOFPP, the EEP administers other programs that will compete for land within the buffer region, such as their stream mitigation program. Currently, the EEP has a target of 53,396 linear feet of stream mitigation in the Neuse and 986 linear feet in the Tar-Pamlico through the year 2013. Assuming that this implied annual activity remains constant over time, we can estimate the EEP's stream mitigation target through the year 2020 (116,000 feet of stream mitigation in the Neuse and 2,000 feet in the Tar-Pamlico). Assuming that these projects restore 50 feet of buffer as part of each foot of mitigation, we can estimate the amount of acreage that these projects will require.[7] Based on RTI's calculations, the EEP's stream mitigation program will require 266 acres of buffer land in the Neuse River Basin and 5 acres of buffer land in the Tar-Pamlico River Basin through 2020.

---

[6] In 1996, Kristin Komines studied the land cover along streams within the Neuse River Basin. In this study, Komines classified land as either agricultural, developed, or forested. Based on her analysis, Komines determined that 81% of stream edges in her sample had forested buffer of at least 50 feet (Moreau et al., 2000). RTI's buffer analysis appears to be consistent with these findings. As illustrated in Table 4-4, RTI estimated that 75% of land in the 50-foot "buffer zone" of the Neuse River Basin is classified as either forest or wetland.

[7] To estimate the amount of buffer land that will be required for these mitigation projects, we multiply each linear foot by 100 (representing the 50 feet of buffer on either side of the stream that will be restored during the project). This calculation gives us the square-feet of buffer land that will be required for the stream mitigation program to reach its target; dividing this number by 43,560 (the number of square feet in a single acre) gives you the target in terms of acreage.

In addition to the EEP, developers will also be competing for land within the buffer strip as urbanization spreads through the Neuse River and Tar-Pamlico basins. According to the National Resource Inventory, from 1992 to 2003 the number of acres of cropland in North Carolina decreased from 5.96 million acres to 5.50 million acres (USDA, 2000 and 2007). This decrease of 446,000 acres over 11 years represents a 0.71% annual decrease in cropland due to cropland being converted into a variety of other uses, including urban development.

If we assume that this rate of loss reflecting urban development remains constant into the future and this rate of conversion applies for all land we have identified as viable for riparian buffers (not just cropland), we can estimate that 1,385 and 1,573 acres of current buffer land in the Neuse and Tar-Pamlico river basins will be converted to other land uses by the year 2020.[8]

When estimates of competing demand for buffer land are taken into account, we are left with approximately 14.7 thousand acres available for NOFPP buffer projects in the Neuse River Basin and 16.9 thousand acres in the Tar-Pamlico. Based on the nutrient loading projections presented in section 4.2.1, RTI predicts that 2.1 million pounds of nitrogen in the Neuse River Basin and 353 thousand pounds of nitrogen in the Tar-Pamlico will need to be offset through the year 2020. If all of this nutrient loading was offset with riparian buffer projects, RTI predicts (using EEP's estimate that one acre of buffer offsets 2,273 pounds of nitrogen on average) that this would require 925 acres of buffer in the Neuse and 155 acres of buffer in the Tar-Pamlico River Basins to be restored. This amounts to utilizing 7% of the total amount of buffer land in the Neuse River Basin and 1% of buffer land in the Tar-Pamlico River Basin that is potentially available for riparian buffer projects. These results are summarized in Table 4-5.

4.2.3 Land Costs

The land used by the EEP for constructing BMPs is frequently be obtained through conservation easements or purchased from current owners when public land is not available. To estimate the price per acre of land in the Neuse and Tar-Pamlico river basins, RTI obtained recent tax parcel GIS data from eight counties that made these data freely available through the Internet: Beaufort, Carteret, Craven, Dare, Edgecombe, Halifax, Johnston, and Wake counties. Tax assessment data were used for land costs because no actual sales data were available. In discussions with the Carolina Builders Association, they indicated that they were beginning to

[8] It should be noted that there are other competing interests that RTI was not able to quantify in their analysis, for example, buffer projects being pursued for the Department of Transportation. Another relevant point to keep in mind is that this some landowners may be unwilling to allow a buffer to be installed on their property. Therefore, the following analysis should be interpreted as an approximation of the amount of land available for riparian buffer projects.

Table 4-5. Summary of Available Buffer Analysis

	Neuse River Basin	Tar-Pamlico River Basin
Acres of land suitable for buffers	15,734	17,880
Acres required for EEP stream mitigation until 2020	266	5
Acres of agricultural land consumed by development	1,385	1,573
Acres of land potentially available for buffer	14,083	16,302
Buffer required by NOFPP	925	155
NOFPP percentage of available buffer land	7%	1%

create a North Carolina land cost database (because one did not exist), but that it would not be available for this study. In addition, several stakeholders indicated that tax assessment data were appropriate because it represented an average of conservation easements payment and purchased land costs.

These counties are divided by the U.S. Census Bureau into three distinct categories: high-density urban areas (such as cities), low-density urban areas (such as suburban areas), and rural areas (such as unincorporated areas). By dividing the total value of land in each category by the total number of acres in each category, RTI estimated a dollar per value for each category in each of the six counties.

RTI then applied this dollar per acre figure to other counties in the river basins, based on geographic characteristics. For example, Franklin County borders Wake County; therefore, it was assumed that it would have similar land values to other counties that border Wake such as Johnston County. Using this method, RTI calculated dollar per acre figures for all counties that had more than 5% of their land area in the Neuse or Tar-Pamlico River Basin. The results of this analysis are summarized in Table 4-6.

Table 4-6. Dollar per Acre Land Costs by Category and River Basin

Land Category	Neuse River Basin Dollars per Acre	Tar-Pamlico River Basin Dollars per Acre
High-density urban	$200,311	$123,961
Low-density urban	$145,498	$126,264
Rural areas	$19,139	$8,646

Rural area land costs are used to estimate costs for riparian buffers. Low-density urban land costs are used to estimate costs for stormwater wetlands.

4.2.4 Price Data Used in Forecasting Land, Design, Construction, and Maintenance Costs

In Section 3, costs were presented in 2006 dollars for three types of BMP projects (riparian buffers, stormwater wetlands, large bioretention areas and wet ponds) and broken down across four major cost categories (land, design, construction, and maintenance).

Although this information may reflect the current cost of doing these projects, it is likely that installation and maintenance costs will rise over time. We used secondary data to forecast how costs would change over the next 13 years for each cost category. The specific data sets used to determine growth rates for each cost component are discussed below.

- **Assessed Value of Locally Taxable Property in North Carolina.** Data were obtained from the N.C. Department of Revenue for the total assessed value of real property in unincorporated areas and municipalities of counties in the Neuse and Tar-Pamlico river basins for the years 1996 to 2005 (provided by the Policy Analysis and Statistics Division of the North Carolina Department of Revenue in April 2007). RTI computed a compound annual growth rate for unincorporated land of 3.6% in the Neuse River Basin and 3.5% in the Tar-Pamlico. RTI computed similar growth rates for the value of municipal land—3.9% in the Neuse River Basin and 3.7% in the Tar-Pamlico. RTI assumed that all riparian buffers would be constructed on land in unincorporated areas, while stormwater wetlands and bioretention areas would be constructed on land in municipalities. Therefore, RTI used both growth rates when projecting land costs into the future.
- **Producer Price Index for Architectural, Engineering and Other Related Services.** Data were obtained from the U.S. Bureau of Labor Statistics for the prices received by architectural and engineering firms for the services they performed (this does not include construction) from 1997 to 2006 (BLS, 2007). Because BMPs are typically designed by environmental engineering firms, RTI believed that this is the best index for estimating the speed at which design costs will rise over time. The average annual growth rate is approximately 2.1%.
- **Producer Price Index for Construction Machinery and Equipment**. Data were obtained from the U.S. Bureau of Labor Statistics for the prices charged by firms for the sale of construction machinery and equipment from 1977 to 2006 (BLS, 2007). Because construction of BMPs typically require the use of various types of machinery and equipment (particularly for stormwater wetlands), we believe that this price index is appropriate for forecasting BMP construction costs. The average annual growth rate is approximately 1.6%.
- **Employment Cost Index.** Data were obtained from the Federal Reserve Bank of St. Louis for the Employee Cost Index from 2001 to 2006 (FRED, 2007). After a BMP is installed, it must be maintained to ensure it remains useful through its potential life

time. It was RTI's understanding that the largest component of these maintenance costs was the time individual workers put in performing various maintenance tasks. Therefore, the employment cost index was used to adjust maintenance cost each year. The average annual growth rate is approximately 2.4%.

4.3 Objective 1: Program Sustainability at $11 per Pound of Nitrogen

To calculate the sustainability of the program at the current fixed fee of $11/lb of nitrogen, we generated a time series of offset fees (revenue) and mitigation project costs (expenses). As discussed in Section 4.2.1, annual offset fees increase over time in proportion to the projected growth in demand for nitrogen offsets.

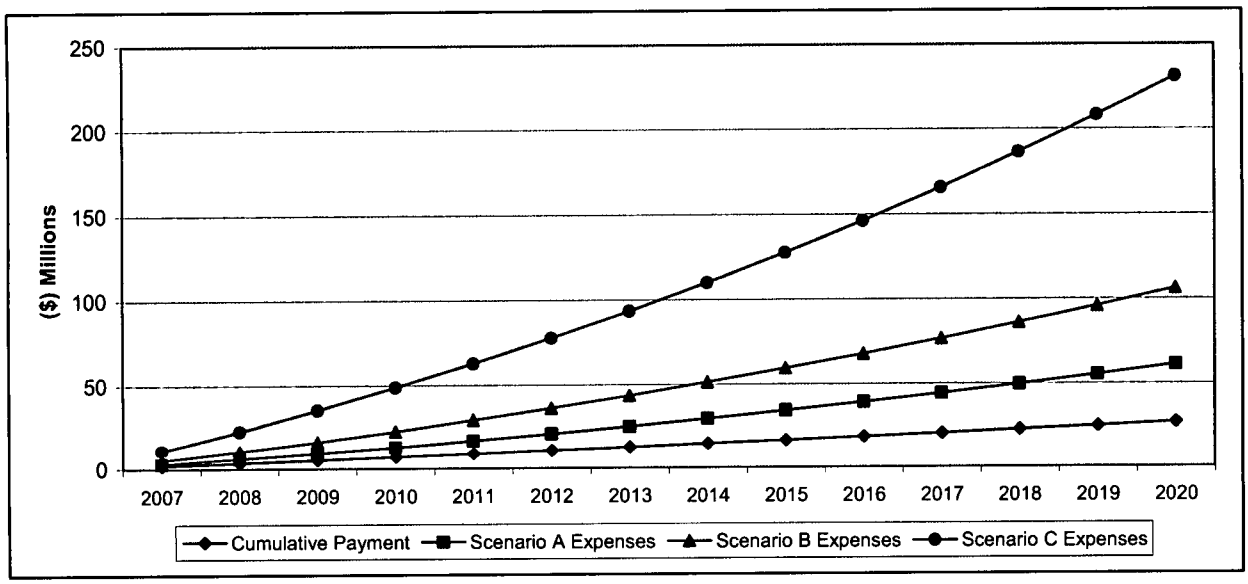
The analysis begins in 2007, and projects are assumed to be implemented in the same year as fees are paid. Thus, the program is always in balance in regard to offsets purchased and offsets implemented.

Table 4-7 and Figure 4-2 present the cumulative offset payment revenue stream and the cumulative NOFPP program expenses. Program expenses are presented for Scenarios A, B, and C. As the table and figure show, expenditures exceed revenue in the first year of the analysis for all three potential scenarios; and this deficit grows over time.

Table 4-7. Cumulative Offset Fee Revenue and NOFPP Mitigation Project Expenses

Year	Cumulative Payments	Scenario A Expenses	Scenario B Expenses	Scenario C Expenses
2007	$1,748,308	$2,962,207	$5,198,938	$11,210,910
2008	$3,522,850	$6,124,101	$10,715,511	$23,086,927
2009	$5,324,034	$9,496,141	$16,565,661	$35,661,105
2010	$7,152,275	$13,089,298	$22,766,084	$48,968,055
2011	$9,007,995	$16,915,072	$29,334,262	$63,044,017
2012	$10,891,623	$20,985,523	$36,288,503	$77,926,941
2013	$12,803,594	$25,244,846	$43,600,064	$93,656,559
2014	$14,744,350	$29,701,951	$51,285,976	$110,274,477
2015	$16,714,341	$34,366,176	$59,364,067	$127,824,257
2016	$18,714,024	$39,247,309	$67,853,001	$146,351,510
2017	$20,743,861	$44,355,611	$76,772,311	$165,903,993
2018	$22,804,325	$49,701,838	$86,142,450	$186,531,709
2019	$24,895,893	$55,297,267	$95,984,826	$208,287,012
2020	$27,019,052	$61,153,722	$106,321,851	$231,224,720

Figure 4-2. Cumulative Offset Fee Revenue and NOFPP Mitigation Project Expenses



In other words, given an $11/lb of nitrogen fee, the NOFPP program is currently unsustainable. This reflects the fact that the first-year costs (i.e., the sum of land, design, and construction) are more than $11/lb of nitrogen. The gap between revenue and average program expenditures only widens with time as maintenance costs are incurred for projects initiated in previous years. By year 2020, the program deficit for Scenario A is projected to be $61 million, the deficit for Scenario B is projected to be $106 million, and the deficit for Scenario C is projected to be $231 million.

4.4 Objective 2: Proposed Fee Based on Cost-Effectiveness

We define cost-effectiveness as the NOFPP being sustainable through the year 2020. That is to say, a cost-effective fee would be one that allows cumulative expenses to equal cumulative payments in the year 2020. This implies that the NOFPP will earn a surplus for several years, which will then be eaten up by deficits as maintenance costs from previously installed BMP projects accumulate. It is assumed that if the program can break even through 2020, at this point, the offset fee would be reassessed and adjusted. We looked at two fee structures for each river basin. The first is a fixed offset fee that does not change over time. The second is an offset fee that is tied to the construction price index and hence increases approximately 1% per year. Separate cost-effectiveness estimates for each of the three scenarios are provided for both the Neuse and Tar-Pamlico river basins.

4.4.1 Fixed Offset Fee

The cost-effective offset fee is determined by calculating the fee that will equate the cumulative fee revenue with program expenditures in the year 2020. The offset fees that yield a sustainable program through 2020 are presented by river basin in Tables 4-8 and 4-9. Figures 4-3 and 4-4 graph the time series of revenue and expenses. As discussed above, cumulative program expenses lag cumulative offset fee payments until they are equal in 2020.

Table 4-8. Cost-Effective Offset Fee for the Neuse River Basin

	Cost-Effective Offset Fee[a] ($/lb-30 N)	Cost-Effective Offset Fee[a] ($/0.10 lb-30 P)
Scenario A	$25.77	$33.19
Scenario B	$43.94	$41.23
Scenario C	$94.80	$62.91

[a] Offset fee that allows the program to be sustainable through 2020.

Figure 4-3. Cumulative Revenue and Expenses with Cost-Effective Nitrogen Offset Fees for the Neuse River Basin

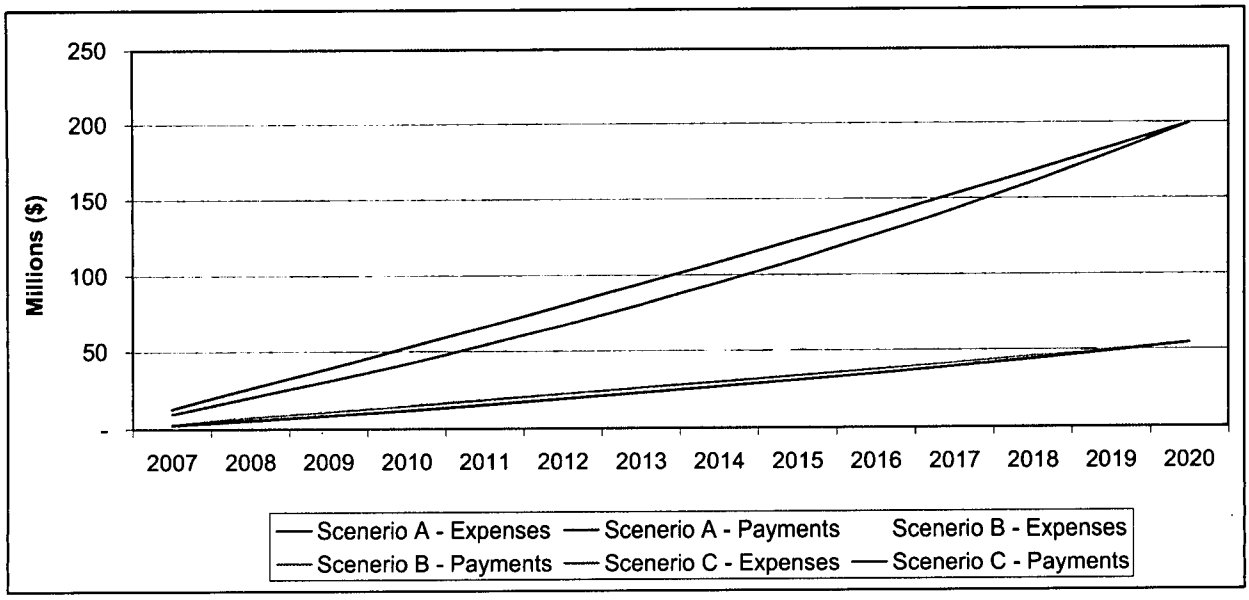


Table 4-9. Cost-Effective Offset Fee for the Tar-Pamlico River Basin

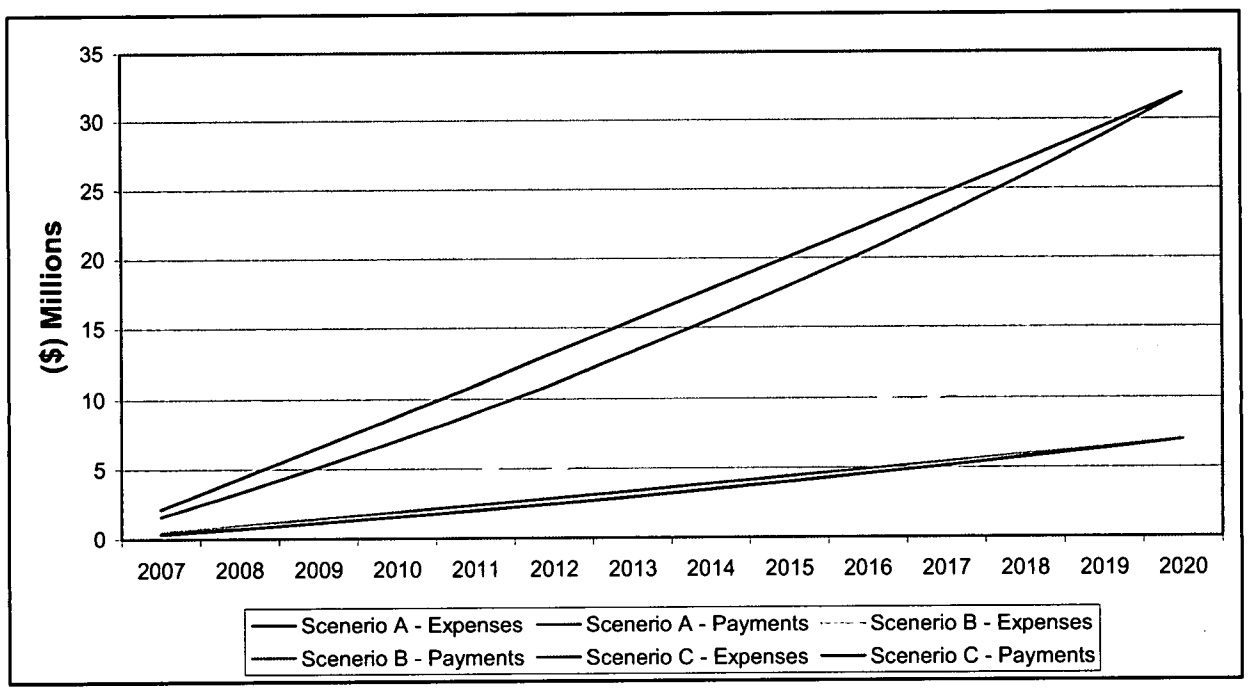
	Cost-Effective Offset Fee[a] ($/lb-30 N)	Cost-Effective Offset Fee[a] ($/0.10 lb-30 P)
Scenario A	$19.70	$26.02
Scenario B	$39.40	$35.38
Scenario C	$90.21	$59.77

[a] Offset fee that allows the program to be sustainable through 2020.

Figure 4-4. Cumulative Revenue and Expenses with Cost-Effective Nitrogen Offset Fees for the Tar-Pamlico River Basin



4.4.2 Offset Fee Program Administrative Costs

The offset fees collected to implement mitigation projects need to adequately cover not only the cost of designing and constructing a project but also the cost of administering the offset program itself. From the perspective of a mitigation project, program administration includes identifying and prioritizing potential mitigation projects and initiating those projects as offset fee payments are made. According to the proposed amendments discussed in Section 2, a 10% fee is added to each offset fee payment to cover the cost of administrating the offset fee program. This fee is intended to provide support for administrative (credit management, tracking payments, processing requests) and project delivery tasks (identifying sites, oversee implementation)

similar to other mitigation programs. EEP staff estimate 6% to 7% of their total program costs are for program administration.

Table 4-10 presents information about the typical components of a stormwater retrofit program. It is recommended that the information presented in Table 4-10 be used to determine if the 10% fee is sufficient to fund the administration of a stormwater retrofit program.

Table 4-10. Administrative Components of a Retrofit Program

Component	Key Tasks
Retrofit scoping	• Define retrofitting objectives • Translate objectives into performance criteria • Define preferred retrofit practices
Comparative subwatershed analysis	• Identify subwatersheds with greatest restoration potential
Desktop retrofit analysis	• Secure GIS and other mapping data • Conduct desktop search for retrofit sites • Prepare base maps for site investigations
Retrofit reconnaissance investigation	• Advanced preparation • Investigate and evaluate individual sites
Compile retrofit inventory	• Develop concept designs • Assemble retrofit inventory (e.g., compile list of potential projects)
Retrofit evaluation and ranking	• Neighborhood consultation • Develop screening/ranking criteria • Create priority project list
Subwatershed treatment analysis	• Compute pollutant removal benefits • Compare to retrofitting objectives
Contract and project management	• Obtain landowner approval • Secure permits and easements • Complete engineering analysis • Assemble final design package • Project management and contract administration
Project tracking and monitoring	• As-built inspection • Regular maintenance • Project tracking and monitoring

4.4.3 Adjusted Offset Fee

The cost-effective offset fee is determined by calculating the fee that will equate the cumulative fee revenue with the program expenditures in the year 2020, while also incorporating a factor to account for rising costs each year. The offset fees that yield a sustainable program

through 2020 are presented by river basin in Tables 4-11 and 4-12. Figures 4-5 and 4-6 graph the time series of revenue and expenses for both river basins.

Table 4-11. Adjusting Cost-Effective Offset Fee for the Neuse River Basin

	2007 Cost-Effective Offset Fee[a] ($/lb-N)	2020 Cost-Effective Offset Fee[a] ($/lb-N)
Scenario A	$23.13	$28.36
Scenario B	$39.44	$48.35
Scenario C	$85.10	$104.32

[a] Offset fee that allows the program to be sustainable through 2020.

Figure 4-5. Cumulative Revenue and Expenses with Adjusting Offset Fees for the Neuse River Basin

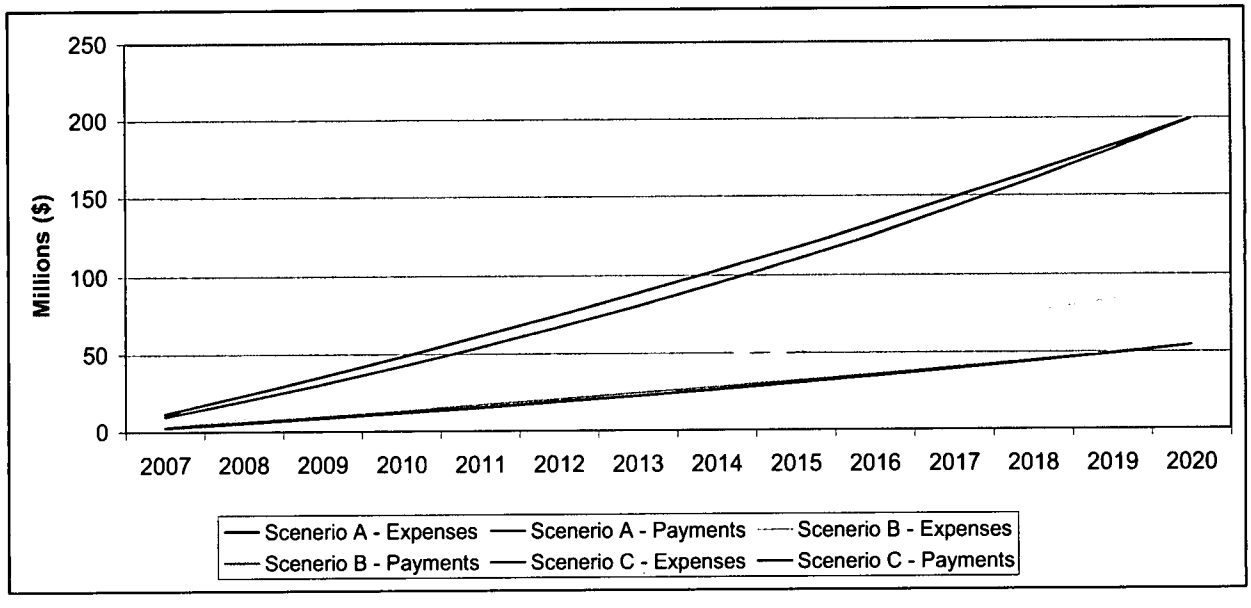


Table 4-12. Adjusting Cost-Effective Offset Fee for the Tar-Pamlico River Basin

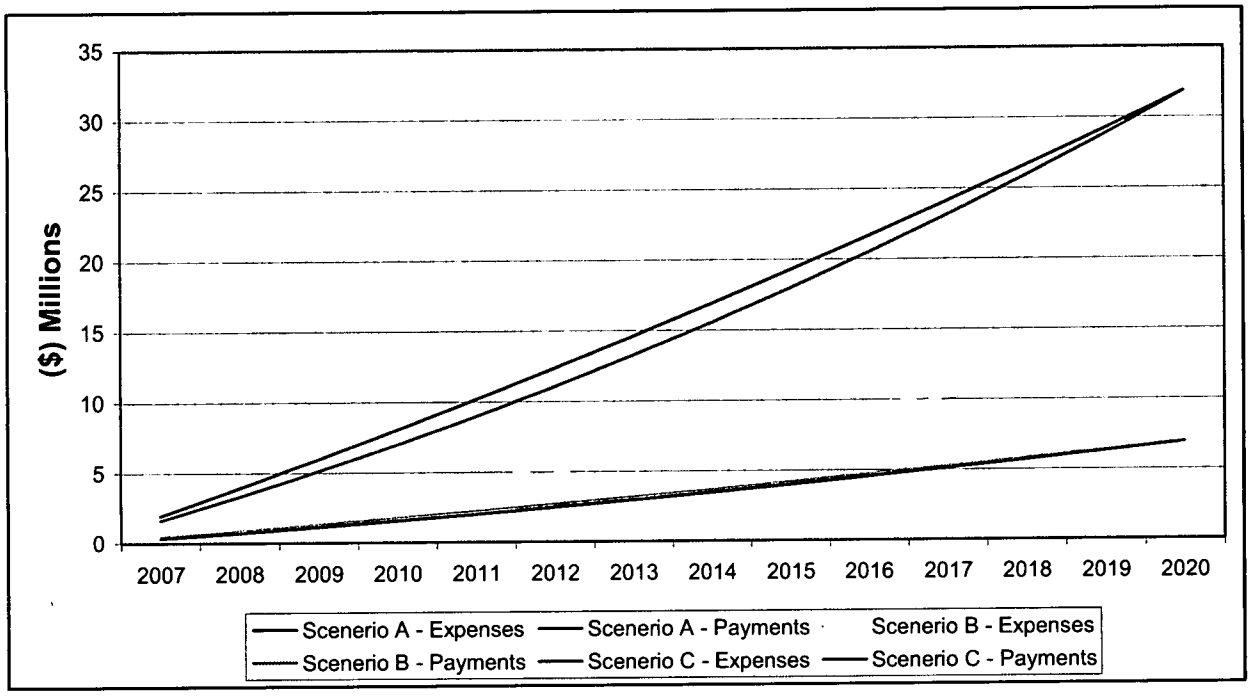
	2007 Cost-Effective Offset Fee[a] ($/lb-N)	2020 Cost-Effective Offset Fee[a] ($/lb-N)
Scenario A	$17.72	$21.72
Scenario B	$35.44	$43.45
Scenario C	$81.15	$99.48

[a] Offset fee that allows the program to be sustainable through 2020.

Figure 4-6. Cumulative Revenue and Expenses with Adjusting Offset Fees for the Tar-Pamlico River Basin



The results are very similar to those of the fixed offset fee presented in Section 4.4.2. The only difference is that, with an inflation adjustment factor, payments track more closely with expenditures. However, it is unclear if the added complexity of an indexed offset fee is warranted because the differences between the fixed and adjusted offset fees are minimal.

4.5 Objective 3: Formula for Offset Payment Fee

The offset fee formula that has been used to date is a flat fee in terms of dollars per pound (30 year), with a 10% surcharge added to cover EEP administrative costs. Section 4.4.2 discusses the activities covered by the 10% administrative surcharge.

It seems logical that the formula for the offset payment fee could vary depending on the type of mitigation options pursued (Scenario A, B, or C) and on the underlying rationale for pursuing them. The issue is should the type of development project being offset factor into the payment fee. For example, the proposed payment formula presented in Section 1 contains a land cost component intended to help fund mitigation projects in the specific areas where the development is taking place. If this is the EEP's and the NOFPP's mission, then this formulation seems reasonable. However, if the mission is to simply offset nutrients affecting the estuary,

incorporating land costs does not seem appropriate. Thus, we propose the following formulas for the three scenarios covered in this study.

Formula for Scenario A:

Neuse River Basin

Nitrogen Payment = ($25.77/lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)

Phosphorus Payment = ($33.19/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

Tar-Pamlico River Basin

Nitrogen Payment = ($19.70/lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)

Phosphorus Payment = ($26.02/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

Rationale: The only factor that directly affects the water quality in the estuaries is the number of pounds of nutrients needing to be offset. A simple formula incorporating the cost-effective $/lb for nitrogen and $/0.10 lb for phosphorus produces a revenue stream that would allow the EEP to meet its objective of protecting the estuary and be sustainable through 2020.

Formula for Scenario B:

Neuse River Basin

Nitrogen Payment = [($25.77/lb N)(#of lbs/year)(30 years)*
((Land Cost $ per acre/19,000)^(0.64))*(1.1 AdminCosts)

Phosphorus Payment = [($33.19/0.10 lb P)(#of 0.10 lbs/year)(30 years) *
((Land Cost $ per acre/19,000)^(0.31))*(1.1 AdminCosts)

Tar-Pamlico River Basin

Nitrogen Payment = [($19.70/lb N)(#of lbs/year)(30 years)*
((Land Cost $ per acre/9,000)^(0.58))*(1.1 AdminCosts)

Phosphorus Payment = [($26.02/0.10 lb P)(#of 0.10 lbs/year)(30 years) *
((Land Cost $ per acre/9,000)^(0.31))*(1.1 AdminCosts)

Rationale: Under this scenario, the intent is to provide sufficient funds so that mitigation projects can be placed close to the area of the development. This is accomplished by incorporating the land cost of the property being developed (in terms of dollars per acre) into the offset fee to generate sufficient funds to support flexibility when choosing mitigation options.

The land cost factor (Land Cost $ per acre/19,000)^(0.64)) is structured so that when development occurs in rural areas the offset fee matches the cost-effective fee for Scenario A

(buffers).[9] For example, when the land cost per acre is about $19,000, the formula generates a fee of $25.77 for nitrogen payments in the Neuse River Basin.[10]

$25.77 * ($19,000/19,000)^(0.64) = $25.77

The exponent applied to the land cost formula (^(0.64)) is calibrated so that when development occurs in low-density urban areas the offset fee matches the effective fee for Scenario C (stormwater wetlands). For example, when the land cost per acre is about $145,000, the formula generates a fee of approximately $95 for nitrogen payments in the Neuse River Basin.

$25.77 * ($145,000/19,000)^(0.64) = $95

Again, the advantage of this formula specification is that it generates lower offset fees for development occurring in rural areas. The disadvantage of this formula specification is that actual revenue will be uncertain because fees are a function of where future development will take place. However, the EEP could adjust its mixture of BMPs over time to reflect this reality.

Formula for Scenario C:

Neuse River Basin

Nitrogen Payment = ($94.80) /lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)

Phosphorus Payment = ($62.91/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

Tar-Pamlico River Basin

Nitrogen Payment = ($90.21) /lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)

Phosphorus Payment = ($59.77/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

Rationale: Under this scenario stormwater wetlands are always implemented. Thus, the location of the development (or the land cost per acre) has little impact on the cost of the BMPs. As a result, we recommend a simple formula specification similar to the one for Scenario A.

[9] Land costs as rounded off from Table 4-6.

[10] Note that when the land cost per acre is $19,000, the ratio becomes 1.0 and the exponent does not influence the calculation.

SECTION 5
PROGRAM IMPLEMENTATION (OBJECTIVES 4, 5, AND 6)

5.1 Objective 4

Any assessment of expanding nutrient offset payments to other parts of the state or to other nutrients needs to be based on a full cost-benefit assessment that weighs the economic costs of imposing environmental assessments of water quality issues. From an economic perspective, nutrient offset fees can distort regional development costs and, hence, lead to marginal shifts in development away from river basins that require fees to river basins that do not require them. However, estimating the magnitude of these economic impacts is beyond the scope of this study.

Therefore, in this analysis, we only consider the environmental impacts of excessive nutrient loading when assessing the need to expand nutrient offset payments to a particular water body. From this perspective, the environmental question that needs to be asked is whether nutrients are creating sufficient environmental damage to warrant regulation in the water body under consideration. We focus on describing the existing literature and published studies to provide insights on this issue.

5.1.1 The Chowan River Basin

Among the other water bodies in North Carolina that have experienced, and could be considered candidates for, geographic extension of the nutrient offset program is the Chowan River Basin (part of the Albemarle-Pamlico Estuarine system). The Chowan was the first basin in the state to be designated as NSW in 1979 because of the occurrence of nuisance algal blooms and fish kills. Forest and agriculture dominate the North Carolina portion of the Chowan River Basin. Management strategies have been adopted to reduce the discharge of nutrients from wastewater treatment plant (WWTP) dischargers and agricultural runoff. The latest basin-wide plan for the Chowan indicates that, although conditions have improved over the past several decades, eutrophiation remains a concern (NCDWQ, 2002b).

5.1.2 The New River Watershed

The New River watershed in Onslow County (part of the White Oak River Basin) is another potential candidate. The Upper New River watershed was designated as NSW in 1991 because of persistent algal blooms, fish kills, and low oxygen levels. The watershed above Jacksonville is used primarily for forestry and agriculture. At Jacksonville, the river widens into a broad, slow-moving tidal estuary. It eventually discharges to the Atlantic Ocean through a narrow opening called New River Inlet. The shallow depth and narrow inlet that restricts tidal

exchange contribute to the long flushing time (ranging from 8 to 187 days) and semilagoonal nature of this system (Ensign et al., 2004). These physical properties make this system sensitive to excess nutrients. In the late 1990s, the City of Jacksonville removed its WWTP discharge from the upper New River Estuary, and Camp Lejeune consolidated seven of its discharges into one tertiary WWTP. Since the removal of these nutrient effluent sources, documented reduction of nitrogen and phosphorous, 57% and 71% decreases respectively, has occurred (Mallin et al., 2005). However, nutrient inputs from point and nonpoint sources remain a concern (NCDWQ, 2007a).

5.1.3 The Jordan and Falls of the Neuse Reservoirs

The Jordan and Falls of the Neuse reservoirs were both designated as NSW in the 1980s; nutrient Total Maximum Daily Load (TMDL) implementation remains an active process for both watersheds (NCDWQ, 2005c; NCDWQ, 2007b). Jordan Reservoir is located in the Cape Fear River Basin in Chatham County south of Chapel Hill and Durham. A nutrient management strategy and TMDL were developed to satisfy NSW requirements and a federally mandated TMDL. Both the NSW and TMDL programs include the development of a calibrated nutrient response model to support a management strategy to control nutrients and meet the state's chlorophyll a standard. This model determined that point sources discharge 36% of the nitrogen and 17% of the phosphorous load, and nonpoint sources discharge 64% of the nitrogen and 83% of the phosphorous load to Jordan reservoir. The NCDWQ has drafted new rules for the nutrient management strategy for Jordan Reservoir. In March, 2007 the EMC approved these rules to be released for public comments (expected summer 2007). These proposed rules follow the framework of previous nutrient strategies for the Neuse and Tar-Pamlico river basins, but these new rules include stormwater requirements for all local governments in the watershed, local implementation of buffer rules, and a rule requiring local governments to achieve nutrient loading reductions from existing developed lands. A separate rule outlining a trading framework to maximize options for achieving more cost-effective reductions is also planned (NCDWQ, 2007b).

Falls of the Neuse Reservoir (Falls Lake) is located within the headwaters of the Neuse River Basin in Durham and Wake counties. Approximately 61% of the watershed is forested, 16% is in agriculture, and 17% is suburban and urban development. Currently, Falls Lake is not classified as impaired, but several upstream tributaries are classified as impaired (NCDWQ, 2002c). In 2005, NCDWQ initiated a field study and modeling plan for the development of a nutrient management strategy for the lake. This study established 13 stations designed to monitor

the water quality on Falls Lake. Results indicate a spatial trend with nutrients and chlorophyll a concentrations higher at the upstream stations and decreasing toward the dam (NCDWQ, 2007c).

5.1.4 High Rock Lake

High Rock Lake, located in Rowan and Davidson counties, is scheduled as the next large Piedmont reservoir for examination (Woolfolk, 2005,). Water quality concerns for High Rock Lake date back to the mid-1970s, and the need for nutrient reduction strategies to address problems due to accelerated eutrophication has been apparent since the mid-1990s. In the most recent assessment period (1999 to 2001), NCDWQ classified the lake as "impaired" based on high levels of nutrients, combined with chlorophyll a, turbidity, and percentage dissolved oxygen saturation in excess of state standards (NCDWQ 2003). A nutrient management strategy was implemented in 1998. In addition, new point sources are being restricted from certain portions of the lake, and TMDLs are being developed for some upstream tributaries. Strategies used to reduce concentrations in these watersheds will also help reduce nutrient and sediment loading to the upper portion of the basin and ultimately High Rock Lake. NCDWQ will continue to monitor the lake. Other large reservoirs in the Catawba and Yadkin basins, as well as other water supply reservoirs, could be considered as candidates for extending the nutrient offset program.

5.1.5 Streams and Rivers Experiencing Eutrophication

In addition to the lakes, reservoirs, and estuaries discussed previously; streams and rivers that experience excessive nutrients may also be targeted for the NOFPP if they become subject to nutrient loading limits. For example, the Rocky River in Chatham County downstream of the Rocky River Reservoir has been observed to have extensive algal mats during summer months at its confluence with the Deep River. Excessive nutrients from both agricultural and residential activities are thought to be potential sources of these algae (NCDWQ, 2005). If this is confirmed and nutrient loading limits are set, this river could be a potential candidate for extending the NOFPP.

However, more information on this and other streams needs to be gathered before it can be determined whether the NOFPP would be applicable in these waterbodies. An additional concern must also be stressed, that when we are looking at smaller rivers or streams, there may simply not be enough off-site mitigation opportunities to make the NOFPP a feasible or sustainable option.

5.2 Objective 5: Public versus Private Implementation

The EEP currently serves as the sole gateway for purchasing nutrient offsets in the Neuse and the Tar-Pamlico river basins. It receives payment for excess nutrients emitted by nonpoint

sources, which it then uses to construct BMPs that will offset them (either through the use of the full delivery or design-bid-build processes described in Section 2). However, a wide range of alternative operational structures could be developed, such as a market-style nutrient trading system.

A market in nutrient credits would operate similarly to the way markets in other commodities operate. Both types of markets facilitate the exchange of desired goods between willing buyers and sellers. In the case of nutrient markets, individuals or companies that find it too expensive to meet mandated nutrient loading caps would be willing to purchase "credits" from other individuals or companies that have reduced nutrient loading elsewhere in the river basin beyond the capped amount. As a result, the excess nutrient loading of the credit purchaser is "offset" by the nutrient reductions of credit supplier.

Adopting a market structure to mitigate pollutants has a variety of advantages that have been well documented in the literature. Of particular interest to this study is the idea that the price paid by purchasers of nutrient credits could be determined by the interaction of market forces (supply and demand) that would ultimately ensure that the price was enough to cover the full cost of installing the BMP projects required. As a consequence, market-style structures will have great flexibility in the face of changes in supply (e.g., increasing costs of offsetting nutrients) and demand (e.g., an increase in development driven by population growth).

The same market forces that drive prices to balance supply and demand will also direct offset payments toward BMP projects that provide the greatest amount of nutrient reduction at the lowest cost. In the context of the NOFPP, this could mean that the majority of funds would be directed toward installing riparian buffer projects in rural areas of the two river basins. However, if the goal of the NOFPP is broader, and includes protecting water quality in individual watersheds, then regulations may be required that dictate that nutrient offsets must be supplied within a certain distance of environmental impact (King and Kuch, 2003).

Nutrient trading markets would still require continued government supervision to ensure they operate as intended. In particular, a key role for regulators would be to "certify" that each nutrient credit will offset the amount of nutrients it claims to offset. This can be a concern because the effectiveness of the BMPs generating nutrient offsets will vary based on site-specific factors, the quality of their construction, and the level of maintenance over time (King and Kuch, 2003).

Many states are developing market-style trading programs. Most recently, the Commonwealth of Pennsylvania began implementing a nutrient trading market to achieve the nutrient reduction goals laid out in the 2000 Chesapeake Bay Agreement (PADEP, 2007). This system allows individuals to buy and sell nutrient credits, which have been certified by the Pennsylvania Department of Environmental Protection, over an online market called NutrientNet (PADEP, 2007). This program is structurally similar to what has been discussed and could be used as a model for North Carolina, if policy makers considered pursuing a market-based solution.

Generally, the NOFPP seems well suited for market-style nutrient trading. A problem faced by other trading markets in the past has been an insufficient demand for nutrient offset, which led to a low volume of trades. However, the frequent purchase of nutrient offsets under the current system demonstrates that should not be an issue for the NOFPP. Also, the successful completion of eight full-delivery projects under the current program illustrates the fact that private entities have the capabilities to generate nutrient offset credits that they could provide to individual buyers. However, as mentioned previously, government regulation and oversight would be required to ensure that the market operates as intended. If such a market-style structure were pursued, the EEP would be among the best suited government entities for providing this oversight given its past experience in managing the current program.

Below, Section 5.2.1 provides an overview of other nutrient offset programs outside North Carolina, and Section 5.2.2 provides an overview of several high-profile, nonnutrient environmental trading programs that demonstrate the potential effectiveness of a market-style structure.

5.2.1 Similar Water Quality Offset Programs (from Table 5-1)

RTI spoke with program administrators of seven water quality offset programs identified in other states as being similar to the NOFPP in North Carolina. Appendix A describes these programs. Based on these conversations, we summarize in Table 5-1 eight major task areas associated with developing and maintaining a fee-based offset program. These task areas include the following:

- Offset program administration
  - rule making
  - environmental analysis
  - pollution monitoring
  - offset fee management (i.e., collection and disbursement)

- Offset project development
  - site selection
  - engineering design
  - offset project construction
  - offset project ongoing operation and maintenance

Governments' role typically included program setup, offset rule making, and development of a water quality management plan. These programs typically required development firms to submit water management plans to the program office. The program staff also reported that they were responsible for determining offset fees to be assessed. Offset fees are then typically used to develop new or improved existing water quality offset projects. The state and county program officers in many cases reported having environmental engineers on staff to conduct environmental assessments to inform emissions control policies.

Water quality offset programs were also responsible for offset project planning. These programs conduct offset project site selection. They typically contract the construction of offset projects to private construction firms, but long-term operation and maintenance is the responsibility of the program office.

The State of Maine Storm Water Compensation Fund is the only offset program interviewed that did not maintain direct control over offset projects. Although the program office was responsible for offset fee collection, they release an RFP for offset projects in selected regions. The offset project funds are then awarded as grants to nonprofit entities (e.g., a town council, an individual, an environmental group) that submit the most effective long-term offset project proposal. The grantees are then typically responsible for design, construction, and long-term operation and maintenance of the offset project. This year, the program is shifting away from single-site project awards toward awarding offset project grants that would designate regional responsibility for water quality offset projects.

5.2.2 Federal Environmental Trading Programs

Trading programs have been created to address compliance and create voluntary markets for the purchase of emission reduction credits (ERCs) to offset greenhouse gas (GHG) emissions.

Key elements to a successful GHG offsets (cap and trade) program include the following:

- market demand (i.e., cap) requires regulatory body enforcement
- clear rules surrounding the creation and use of offsets that will ensure the integrity of emission reductions

Table 5-1. Water Quality Offset Fees from Other Programs around the United States

Locality and Program	Contact	Fee	Costs Covered by Fee						
			Design	Engineering	Permitting	Construction	Land Acquisition	Program Administration	Maintenance
Arlington County, VA, Watershed Management Fund	Arlington County Department of Environmental Services 703-228-3612	$2.50/sq ft of impervious area requiring mitigation	✓	✓	✓	✓			✓
Austin, TX, Urban Watershed Structural Control Fund	Department of Watershed Protection and Development Review 512-974-2501	Fee based on impervious area base fee for first 0-1 ac $32,000	✓	✓	✓	✓	✓		✓
Baltimore, MD, Critical Area Program	Department of Planning 410 396-5902	$35,000/lb of phosphorous	✓	✓	✓	✓		✓	✓
Fairfax County, VA, Uniform Pro Rata Share Program	Department of Public Works and Environmental Services 703-324-1720	Determined on case-by-case basis and based on impervious area	✓	✓	✓	✓	✓	✓	✓
Gwinnett County, GA, Stream Buffer Mitigation Bank	Gwinnett County Water Resources 678-518-6150	$23,000 per water quality unit	✓	✓		✓			
Henrico County, VA, Environmental Fund	Henrico County Department of Public Works 804-501-4396	$8,000/lb of phosphorous	✓	✓	✓	✓			✓
State of Maine Stormwater Compensation Fund	Maine Department of Environmental Protection 207-287-2116	$10,000/lb of phosphorous for lake sheds $20,000/lb of phosphorous for severely blooming lake	✓	✓	✓	✓			✓
State of Maryland Critical Area 10% Rule	Maryland Critical Area Commission 410-260-3460	Equivalent cost: $38,400/lb of phosphorous retrofit cost: $22,500/lb of phosphorous	✓	✓	✓	✓		✓	✓

- clear rules and standardized processes for creating offsets that ensure validity and environmental integrity of projects
- clear rules regarding use of offsets to meet caps

Compliance trading programs typically result from government enforcement of air quality standards that cap direct emissions, limiting industries' allowable emissions. Offset regulators reduce uncertainty and risk to market participants by providing clear rules and standardized processes for creating and using ERCs.

Governments must recognize offsets as a valid emission reduction option. State or federal recognition of offsets is typically preceded by the validation of offset projects to ensure they are truly offsetting GHG emissions. Limitations in measurement and validation methodologies constrain the universe of reductions that can satisfy the rules for offset creation. The following are examples of trading programs.

The SO_2 Emission Allowance is a cap-and-trade program created by EPA's Acid Rain Program, which falls under Title IV of the 1990 Clean Air Act Amendments and was established to achieve significant reductions in the emissions of sulfur dioxide (SO_2) and nitrogen oxide (NO_x), the primary causes of acid rain.

EPA allocates emission allowances to utility units, based on their historic fuel consumption (1985–1987) and a specific emissions rate. Each allowance permits a unit to emit 1 ton of SO_2 annually. EPA's role in allowance trading is to record allowance transfers that are used for compliance and to ensure at the end of the year that a source's emissions do not exceed the number of allowances it holds. To accomplish this, EPA maintains an Allowance Management System (AMS). Each affected utility source, corporation, group, or individual holding allowances has an account in the AMS.

EPA outsources the majority of the day-to-day operations of the SO_2 trading program. The private company, ICF Consulting, has supported EPA's Clean Air Markets Division (CAMD) on all their market-based air emissions controls programs (4/03 to 4/07). The contract is cost plus fixed fee for $21.6 million.

Perrin Quarles Associates (PQA), under contract by CAMD, developed the Emissions and Allowance Tracking System (EATS), a generic software application to support regulatory agencies and countries who adopt emissions trading approach to reduce air pollution emissions.

The Regional Clean Air Incentives Market (RECLAIM) was created by the South Coast Air Quality Management District (SCAQMD) in California, which is responsible for

operating the program. RECLAIM covers all of Los Angeles and Orange counties along with half of Riverside County. This program controls the amount of nitrogen oxide (NO_x) and sulfuric oxide (SO_x) released in a 1 credit-to-1 pound NO_x emitted ratio. RECLAIM trading credits, or RTCs, were issued at a zero-cost basis to all sources whose yearly emissions are greater than 4 tons (8,000 pounds) per year at the start of the program.

Brokerage firms have emerged from the private sector in response to facilities participating in the trading scheme that have credits to sell or that need to purchase credits. Brokerage companies provide a fee-based service to bring market participants together for effective trading.

The Chicago Carbon Exchange[11] (CCX) is a self-regulatory exchange that administers a voluntary, legally binding pilot program for reducing and trading GHG emissions in North America with participation from offset providers in Brazil.

The exchange comprises North American companies with direct GHG emissions from their facilities and companies with no direct emissions but that comply with CCX rules by offsetting emissions with a selection of business related activities.

CCX members with direct emissions have voluntarily agreed to reduce their emissions by 1% each year for 3 years beginning in 2003. The 1% is calculated relative to a 1998 to 2001 average. Members are expected to reduce net emissions to 4% below baseline levels by the end of 2006.

CCX offset projects include the following:

- methane destruction projects for landfills and livestock operations
- agricultural practices projects to implement alternative crop tilling practices and initiate grass cover planting in applicable regions
- forestry practices such as forestation and forest enrichment projects
- renewable energy projects through the displacement of carbon dioxide (CO_2) emissions by eligible renewable energy facilities

Auditing, verification, and market surveillance activities are outsourced to a financial regulatory service company, NASD, Inc. NASD conducts audits of member-company emissions and reviews offset project verification methodologies. CCX requires third-party verification of GHG offset project achievements by approved verification service providers.

[11] Information obtained from CCX Web site, www.chicagoclimatex.com.

SGS and EcoSecurities[12] are one example of a carbon offset verification service provider. They provide periodic monitoring of project implementation and verification and the quantification and certification of projected and achieved emission reductions.

Valid projects under the CCX are required to offset 12 million tons of carbon per year. Few offset projects of this size exist in the United States. As a result, private-sector aggregators have emerged to provide fee-based services to allow smaller incremental offset projects to be aggregated to a level that meets the CCX requirement for offset project status.

5.3 Objective 6: Mitigation Options Available

The final objective of this study was to conduct a comprehensive review of the types of potential nutrient mitigation projects available. To accomplish this, the Center for Watershed Protection compiled and analyzed national cost data for a variety of structural stormwater retrofit practices, including wet ponds, wetlands, bioretention areas, filtering practices, infiltration practices, and swales (Schueler et al., in press). This effort produced national average construction costs for a wide range of mitigation practices that were not available for projects based in North Carolina. Additional mitigation project identified include sand filters, underground sand filters, infiltration practices, and water quality swales.

Using North Carolina event-mean-concentrations (EMCs) obtained from the National Stormwater Quality Database (NSQD) and pollutant removal efficiencies listed in the North Carolina Department of Environment and Natural Resources' (NCDENR) Manual of Stormwater Best Management Practices, the average construction costs for stormwater retrofits are presented in Table 5-2. National cost data for the mitigation options included in the study scenarios are also included in Table 5-2 for comparison. The project costs presented in Table 5-2 include only the construction cost and associated design and engineering fees; however, as shown earlier, these are by far the largest components of structural stormwater mitigation projects.

[12] This link is an example of validation method but based in the UK—
http://www.eci.ox.ac.uk/research/biodiversity/linkcarbon.php.

Table 5-2. Nutrient Mitigation Project Costs[a]

Stormwater Retrofit Practice	Median Cost ($/lb-30 N)[b]	Range ($/lb-30 N)[b]	Median Cost ($/0.10 lb-30 P)[c]	Range ($/0.10lb-30 P)[c]
Wet ponds	$177	$88 to $317	$93	$47 to $168
Wetlands	$110	$55 to $198	$107	$53 to $192
Large bioretention areas	$265	$188 to $433	$174	$125 to $286
Small bioretention areas	$755	$628 to $1,007	$498	$415 to $664
Sand filters	$503	$403 to $553	$332	$266 to $365
Underground sand filters	$1,637	$705 to $1,887	$1,079	$465 to $1,245
Infiltration practices	$240	$160 to $368	—[d]	—[d]
Water quality swales	$550	$308 to $968	$466	$262 to $822

[a] Assumes design and engineering fees at 32% of construction cost.

[b] Cost per pound of nitrogen removed per year, in 2006 dollars.

[c] Cost per pound of phosphorus removed per year, in 2006 dollars.

[d] Not computable; pollutant removal benefits not defined within NCDENR, 2005a.

SECTION 6
CAVEATS AND FUTURE RESEARCH

The primary objective of this study was to assemble nutrient mitigation cost data to support an evaluation of the offset fees collected as part of the NOFPP. As part of the study, we developed several mitigation scenarios the EEP could implement in the future and estimated the cost-effective offset fees needed to keep the program solvent through 2020 for each scenario.

It was not the purpose of this project to recommend which of the three scenarios (or alternative possible scenarios) the EEP should pursue. That is a public policy decision that requires a more extensive environmental and economic benefit-cost analysis. However, our findings should serve as valuable inputs into the decision-making process.

As part of this study's analysis, we encountered several issues that may warrant further research. These relate to pollutant removal efficiencies, and EMCs and land use loading rates. These factors are used in calculating the offsets required of developers and the nutrients mitigated by the EEP. They support an important process indirectly underlying the formula for payments evaluated in this study because it is essential that pounds "in" (generated) equal pounds "out" (offset) by the NOFPP. These issues are discussed briefly below and in greater detail in Appendix B and Appendix C.

6.1 Pollutant Removal Efficiencies

Pollutant removal efficiencies for the NOFPP were obtained from the NCDENR Stormwater BMP Manual. However, a number of additional BMP performance studies have been published since the NCDENR Stormwater BMP Manual was created. For example, pollutant removal efficiencies are also available from the National Pollutant Removal Performance Database (NPRPD). The national data from the NPRPD generally confirm the BMP pollutant removal efficiencies presented in the NCDENR manual. However, some discrepancies do exist between North Carolina studies extracted from the NPRPD and the removal efficiencies reported in the NCDENR manual. These discrepancies include the suspended solids for all BMP types and nitrogen for infiltration practices. Because of the limited amount of North Carolina BMP data, further research is recommended to develop state-specific pollutant removal efficiencies.

6.2 Event-Mean-Concentrations (EMCs) and Land Use Loading Rates

EMCs are used to calculate predevelopment pollutant loads and (estimated acceptable background unit area nutrient load) and postdevelopment pollutant load (estimated unit nitrogen

and phosphorus loading rate per acre of impervious cover for new or existing development). The current North Carolina EMCs were based on early 1980s National Urban Runoff Program data and then updated in 2000 by CH2M Hill. We recommend considering adjusting current EMCs for total nitrogen (TN) and total phosphorus (TP) based on the more extensive National Stormwater Quality Database (NSQD) estimates. In North Carolina, there is a statistically significant difference between residential, nonresidential, and open space EMCs for TN. In comparison, for TP, no statistical difference exists between residential and nonresidential EMCs, but a significant difference does exist between these two land uses and open space. This provides justification for using different EMCs based on categories of land use.

APPENDIX A
DESCRIPTION OF OTHER NUTRIENT OFFSET PROGRAMS

A.1 Arlington County, VA

Arlington County requires stormwater treatment for all projects over 2,500 square feet that are covered by Virginia's Chesapeake Bay Preservation Ordinance. To comply with stormwater requirements, an applicant calculates the overall pollutant removal requirements for the site using a Stormwater Requirements Worksheet. On-site stormwater treatment is required for any impervious surfaces with which vehicles come into contact on the site, including but not limited to: parking areas; streets and roadways; loading docks; equipment, material, and waste storage areas; and vehicle fueling, washing, storage, maintenance, and repair areas. If the total pollutant removal requirements for the site cannot be met solely with on-site stormwater treatment, compliance can be achieved through approved combinations of additional on-site stormwater treatment for roofs, plazas, and other areas of the development site; on-site stormwater treatment for off-site areas, or a contribution to the County's Watershed Management Fund.

The Watershed Management Fund provides applicants with the option to contribute a fee-in-lieu program to comply with treatment requirements for nonvehicular areas. The intent of the hybrid on-site stormwater treatment practice/fee-in-lieu program is to recognize that most of the watershed impacts in Arlington County are due to the existing development already in the County. The Watershed Management Fund is used to address existing impacts through larger-scale watershed protection projects such as stream restoration, regional BMP retrofits, monitoring, and outreach and education. The contribution rate of $2.50 per impervious square foot of impact area only covers 40 to 60% of the total opportunity cost of BMP design, installation, and maintenance and is discounted to reflect the increased cost-effectiveness of watershed-scale solutions and the regional water quality from infill development in urban areas like Arlington.

A.2 Austin, TX, Urban Watershed Structural Control Fund

The City of Austin, TX, requires that, for all levels of impervious cover, projects in the designated urban watersheds must provide water quality controls when the cumulative total of both new and redeveloped impervious cover exceeds 5,000 square feet. The City provides a fee-in-lieu-of option to land developers as an alternative to providing on-site water quality improvement facilities in these urban watersheds. The fees are referred to as Urban Watersheds Structural Control Fund (UWSCF) fees and are based on a set of formulas from Appendix T of

the Environmental Criteria Manual. The UWSCF fee was first adopted in 1991 but has undergone several modifications since its inception. The goal of the fee is to approximate the cost of building a water quality control facility on a site including the cost of land that would be occupied by the facility.

The program works by having an applicant calculate the fees of three components of a site to come up with the final fee. The first component is the site impervious cover. The total impervious cover at a site, both redeveloped impervious cover and new impervious cover, is multiplied by a sliding scale of fees to calculate the total site impervious cover fee (Table A-1). The City then offers an incentive for redeveloping older properties by paying 75% of the fee for those areas of existing impervious cover on a site that is being redeveloped. The second component is a building fee based on the square footage and currently set at $0.10 per square foot. The third component is a site area fee that multiplies the site area in acres within the limits of construction of a project by $6,000 for commercial or multifamily development or $4,000 for single family and duplex development. Again, the City pays for 75% of this fee for those areas of existing impervious cover on a site that is being redeveloped. The City is currently reevaluating its redevelopment incentive and whether redevelopment should be treated just like new development.

Table A-1. Austin UWSCF Impervious Cover Charges

Area of Impervious Cover	Fee
0 to 1.00 acres	$32,000
1.01 to 2.00 acres	$18,000
2.01 to 10.00 acres	$11,000
10.01 to 20.00 acres	$8,000
20.01 acres or greater	$6,000

A.3 Baltimore, MD, Critical Area Program

The City of Baltimore is part of the larger Maryland Critical Area Program, and it developed their Critical Area Program with an associated offset fee program. The program actually has two offsets: a water quality offset fee with a current cost of $35,000/lb of phosphorous, and a buffer offset fee when stream buffer is removed that uses $2.50 a square foot as the current charge. Because of the highly urbanized nature of Baltimore, most of the offset fees are used for pavement removal or acquisition of parkland. The fee collected is allowed to be

used outside of the 1,000 foot Critical Area boundary, with the preference being to use the money in areas as close to the project as possible. Administration of the program is covered in the fee charged and is estimated to take about 5 to 10% of the total cost.

A.4 Fairfax County, VA

Fairfax County's program is called the Uniform Pro Rata Share Program. Fees under this program are based on the increase in impervious area and vary by watershed. The total fee for each watershed is based on master planning studies that identified a number of regional ponds as well as other flood control improvements (e.g., improved stream crossings) and the total potential impervious cover for each of the 30 major watersheds in Fairfax County. The total fee was divided by the projected increase in impervious area to determine the pro rata share by watershed. Fees vary from $1,784 per increase in impervious acre to $22,153 per increase in impervious acre, with an average of $5,469 per increase in impervious acre. The fees collected are placed into a watershed account and can only be expended for the established stormwater capital improvement projects in that watershed. The fees are recalculated every 6 months to account for changes in project costs and for addition and removal of projects as needed. Once a project is constructed, it remains in the program for 12 years to ensure maintenance.

A.5 Gwinnett County, GA, Stream Buffer Mitigation Bank

The Gwinnett County, GA, Stream Buffer Mitigation Bank Fund was established to provide for fee-in-lieu of mitigation for project sites where on-site mitigation of impacts to an existing stream buffer protection zone is not practical. The goal is to fund stream repair and restoration projects in watersheds that have the highest amount of stream degradation. The amount of mitigation necessary is determined by a water quality value calculation based on the proposed action in the stream buffer. Mitigation requirements can be satisfied by purchasing water quality values from the Gwinnett County Stream Buffer Mitigation Bank Fund.

The fee is based on the estimated cost of stream buffer restoration, and the in-lieu fee is currently set at $23,000 per water quality value unit. The methodology for developing the fee uses a water quality factor to determine the water quality value of a restored or preserved stream. The factor represents the functional value of the restored buffer to provide water quality protection for the stream and habitat enhancement for the stream biological community. Anecdotal evidence suggests that the current fee may be too low and does not cover the true cost of stream restoration of planting projects.

A.6 Henrico County, VA

Henrico County has an Environmental Fund that was established to accept fee-in-lieu contributions in instances where compliance with stormwater pollutant removal requirements is unachievable. The Environmental Fund provides a funding source for the water quality projects conducted within the county in the James River and Chickahominy River watersheds. The county uses the fee-in-lieu contributions to finance projects such as streambank stabilization, stream restoration, removal of stream obstructions, buffer establishment, regional BMPs, and constructed wetlands. Contribution to the Fund is based on a project's impervious percentages and the Watershed Management Area designation where the project is located. The contribution is based on a cost of $8,000.00 per pound of pollutant removal required to be achieved by the project. Pollutant loading and removal calculations are done in accordance with the simple method described in the Henrico County Environmental Program Manual.

Contributions to the Fund are based on a prorata share of the annual cost of providing equivalent pollutant removal projects over a normal year of development activity within the county. The current $8,000.00 per pound of pollutant removal requirement was derived from the annual cost of providing an equivalent level of pollutant removal based on a previous "site-by-site" approach. The current $8,000.00 per pound cost is based on older information and in need of review and adjustment to reflect changes in inflation and construction costs. The fee requirements can be reduced by providing forested stream protection area and energy dissipaters.

A.7 State of Maine

Maine's Stormwater Management Law authorizes the Department of Environmental Protection to accept a compensation fee in lieu of some of the phosphorus reduction required from projects located in lake watersheds identified as most at risk for development. The allowable per-acre phosphorus allocation for each lake most at risk is based on current water quality, potential for internal recycling of phosphorus, potential as a cold-water fishery, volume and flushing rate, and projected growth in the watershed. This allocation is used to determine phosphorus allocations for a project. Each project is required to incorporate phosphorus control measures that provide at least a 50% reduction in projected phosphorus export in stormwater runoff from the project site and may then opt to pay a compensation fee to provide the remaining phosphorus reduction necessary to meet the site's phosphorus allocation. The current rate is set at $10,000 per pound of annual algal-available phosphorus export.

The projects funded through the compensation fee-in-lieu are designed to provide long-term elimination or reduction of chronic phosphorus sources. The compensation project must be

located within the same lake watershed as the project for which the compensation fee is paid. Interviews suggest that the current fee does not fully cover retrofit construction costs, and they will be looking to revise the fee in the next year to be $20,000/lb of phosphorous. Interviews also suggest that a lesson learned is that it is better to have fees go directly to approved recipients at a more local level, rather than to a general state fund because it is difficult to dispense funds that come with greater levels of requirements for dispensing state-held funds.

A.8 State of Maryland Critical Area 10% Rule

The Maryland Chesapeake Bay Critical Area Protection Act (Critical Area Act) was enacted in 1984 to help reverse the deterioration of the Chesapeake Bay and the surrounding environment. The Act recognizes that the land immediately surrounding the Bays and their tributaries has the greatest potential to affect its water quality and wildlife habitats and designated all land within 1,000 feet of tidal waters or from the edge of tidal wetlands as "critical area." The criteria set forth in conjunction with the Critical Area Act require that any development or redevelopment within intensely developed areas (IDAs) be accompanied by practices to reduce water quality impacts associated with stormwater runoff to a level at least 10% below the load generated by the same site prior to development. IDAs are generally areas that were developed with residential, commercial, industrial, and institutional land uses at the time of the original critical area mapping and where relatively little natural habitat occurred. IDAs are also considered the preferred locations for future growth through redevelopment and/or new development.

When on-site treatment practices cannot meet the phosphorus load reductions in IDAs, then an offset fee can be paid as a last resort to meet requirements. The offset projects must be located within reasonable proximity to the Chesapeake Bay, Atlantic Coastal Bays, their tributaries and associated tidal wetlands, and preferably within the critical area itself. Funds are intended for use within the same watershed and to replace equivalent water quality improvement projects. In addition, any measure or practice that is used for an offset cannot be a measure that would have been required under existing laws, regulations, statutes, or permits. The current state guidance for calculating offset fees gives local municipalities two methodologies: an equivalent cost method for computing the cost of providing stormwater management on-site and a retrofit cost method that examines the cost to a local government to provide phosphorus treatment with a larger stormwater retrofit elsewhere in the community. The estimate using the equivalent cost method was done from a review of the actual costs of 73 stormwater treatment practices in the Mid-Atlantic region and was set at $38,400 including maintenance of the practice. The retrofit cost estimate was $22,500 including maintenance.

APPENDIX B
POLLUTANT REMOVAL EFFICIENCIES

Most stormwater management approaches rely heavily on the use of structural stormwater BMPs (e.g., structural stormwater controls) to mitigate the impacts of urbanization. This appendix reviews data on the ability of structural BMPs used in North Carolina to remove common stormwater pollutants.

B.1 Data Comparison

Table B-1 compares the pollutant removal efficiencies obtained from the NCDENR Stormwater BMP Manual with those obtained from the National Pollutant Removal Performance Database (NPRPD) (Winer, 2000). A number of additional BMP performance studies have been published since the NPRPD was created in 2000. As part of our research, we added these studies to the NPRPD and updated the pollutant removal efficiencies for each BMP (second column in Table B-1). North Carolina studies were then extracted from the NPRPD, and removal efficiencies were calculated (third column in Table B-1).

B.2 Findings

The updated national data from the NPRPD generally confirm the BMP pollutant removal efficiencies presented in the NCDENR manual. However, some discrepancies do exist between the North Carolina studies extracted from the NPRPD and the removal efficiencies reported in the NPRPD and NCDENR manual. These discrepancies include the suspended solids for all BMP types and nitrogen for infiltration practices (bolded numbers in the third column of Table B-1). For each North Carolina BMP type extracted from the NPRPD, the removal efficiencies are based on a small number of studies (fewer than five studies for each BMP type), and the reported removal rates are extremely variable (e.g., bioretention suspended solids and phosphorus removal range from –100% to 98% and –100% to 65%, respectively, while infiltration nitrogen removal ranges from 0% to 85%). This makes it difficult to draw any firm conclusions about the performance of these North Carolina BMPs and highlights the need for additional research.

Because of the limited amount of NC BMP data, further research is needed before state-specific pollutant removal efficiencies can be recommended. The current removal efficiencies in the NCDENR manual and the NPRDP are relatively comparable.

Table B-1. Comparison of North Carolina BMP Pollutant Removal Efficiencies to the Pollutant Removal Efficiencies Presented in the NCDENR Stormwater BMP Manual and the National Pollutant Removal Performance Database (NPRPD)

Pollutant	Stormwater BMP	NCDENR Manual (%)	National (%)	North Carolina (%)
Total suspended solids	Wet ponds	85	80	61[a]

	Open channels	20	56	N/A

[a] Fewer than five studies

Note: Numbers in **bold** represent the BMP removal efficiencies that appear to be different in North Carolina compared with the national data.

APPENDIX C
EVENT MEAN CONCENTRATIONS AND LAND USE LOADING RATES

The National Stormwater Quality Database (NSQD) includes stormwater pollutant concentration and land use loading rates from over 3,770 separate storm events from 66 agencies and National Pollutant Discharge Elimination (NPDES) Municipal Separate Storm Sewer System (MS4) municipalities from 17 states collected by the University of Alabama and CWP. CWP analyzed the NSQD version 1.1 to compare North Carolina and national EMCs derived for total nitrogen (TN), total phosphorus (TP), and total suspended solids (TSS). Statistical trends were examined for the EMCs based on land use, including residential, nonresidential, and open space. There were no database entries for different physiographic regions (i.e., coastal vs. piedmont).

Table C-1 provides the current and NSQD derived EMCs for North Carolina and nationally for comparison. Current EMCs were obtained from the NCDENR Stormwater BMP Manual.

Table C-1. Current and NSQD Event-Mean Concentrations

Parameter	Region	Current North Carolina EMCs (mg/L)	NSQD EMCs (mg/L)
Total Nitrogen			
	National		1.90

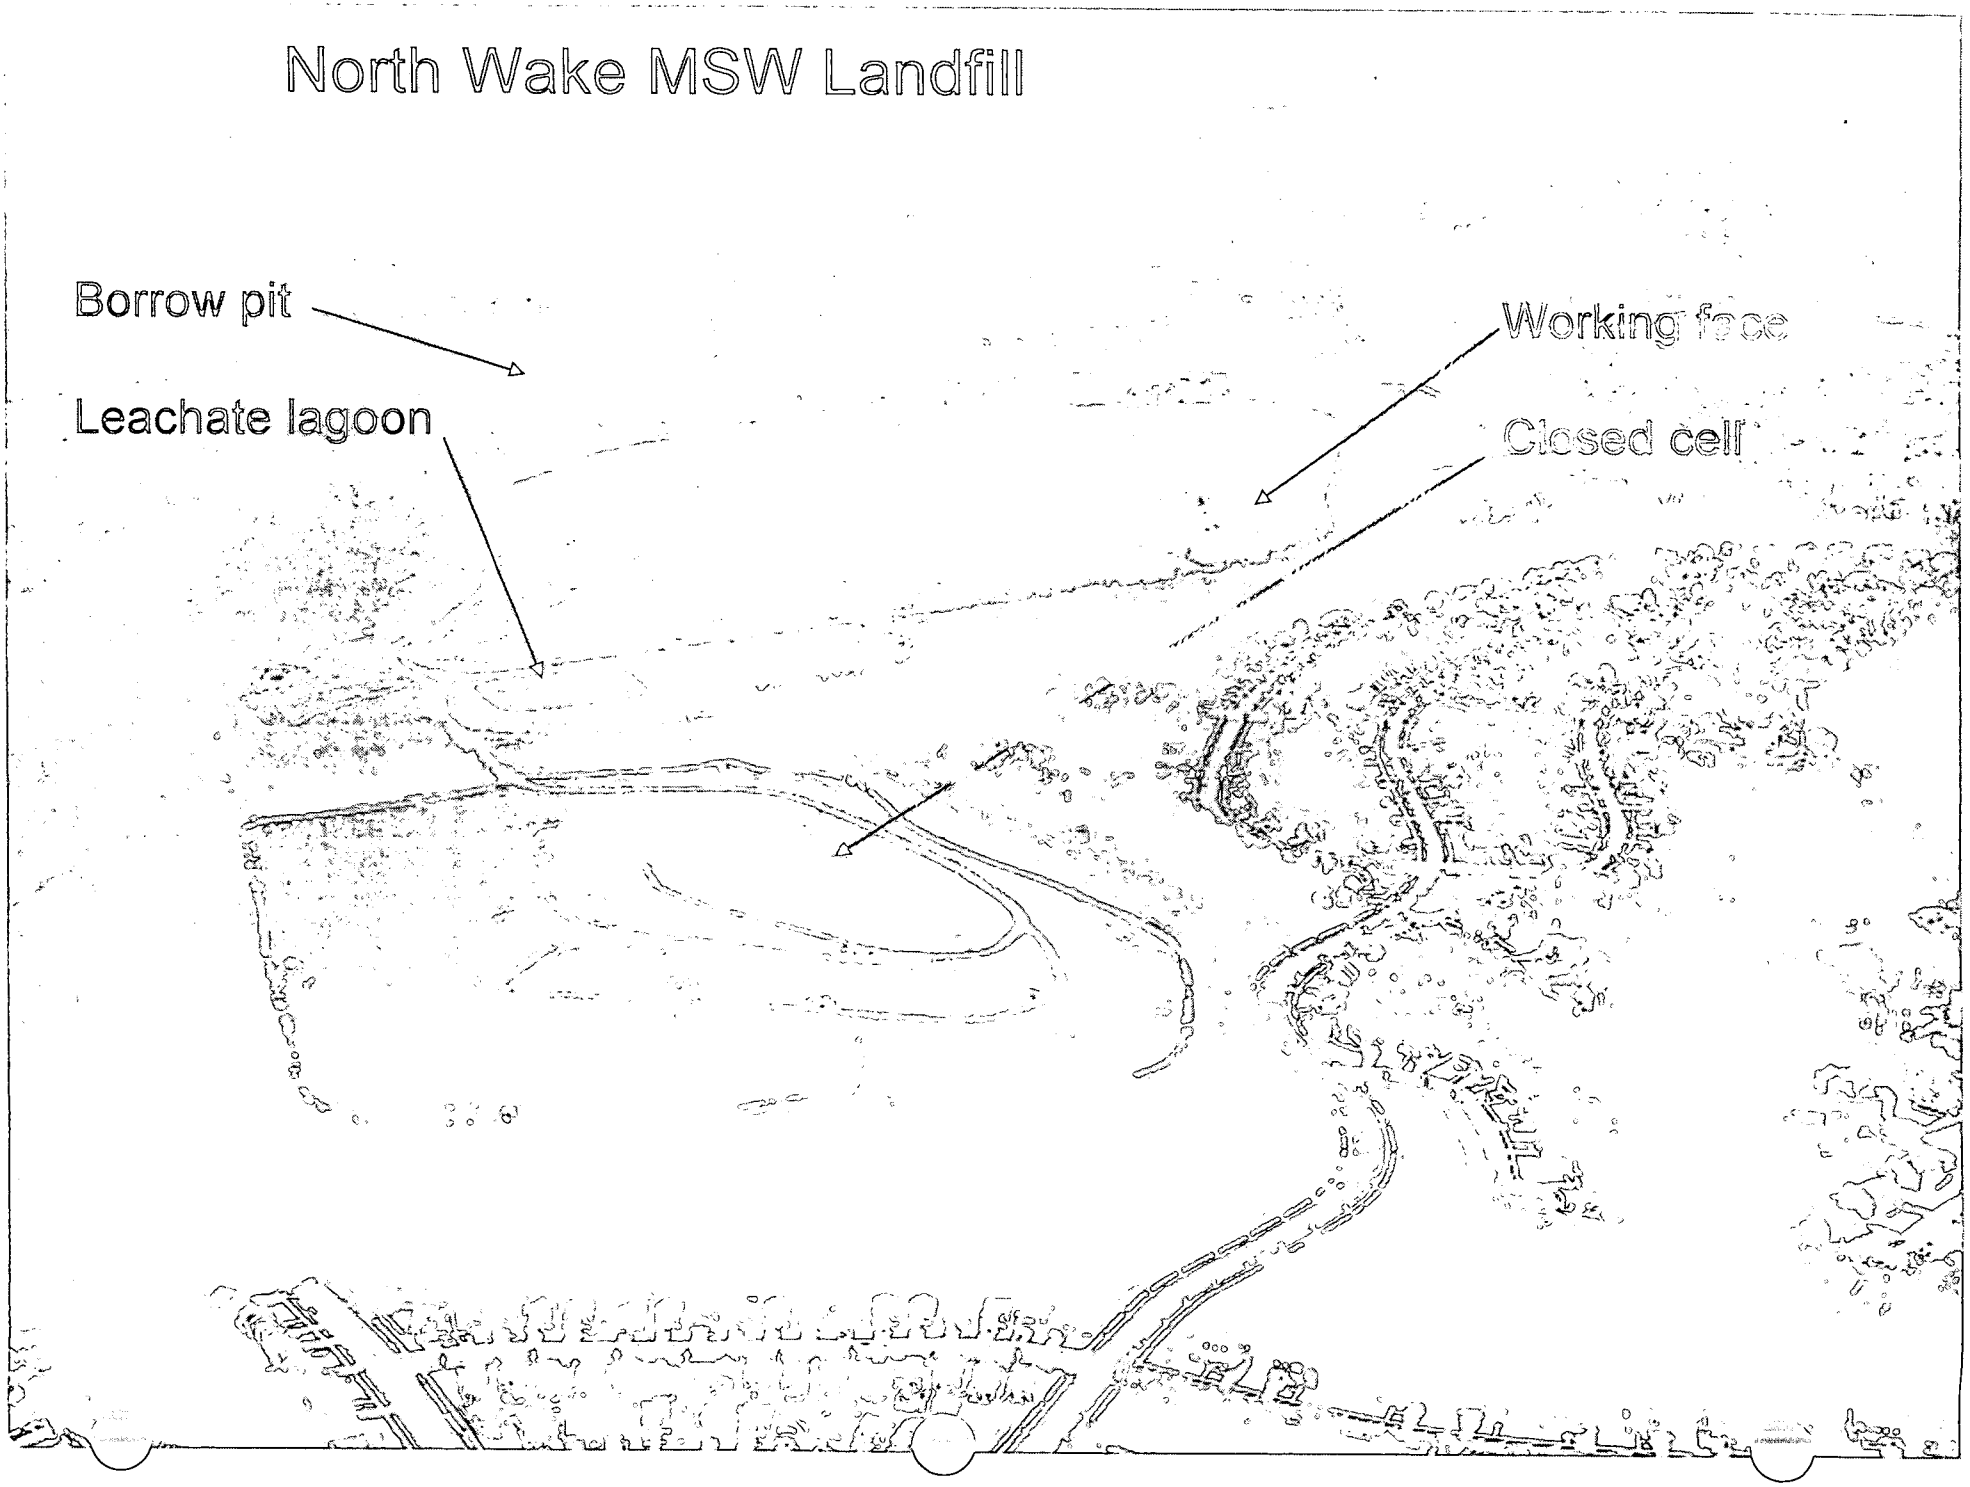
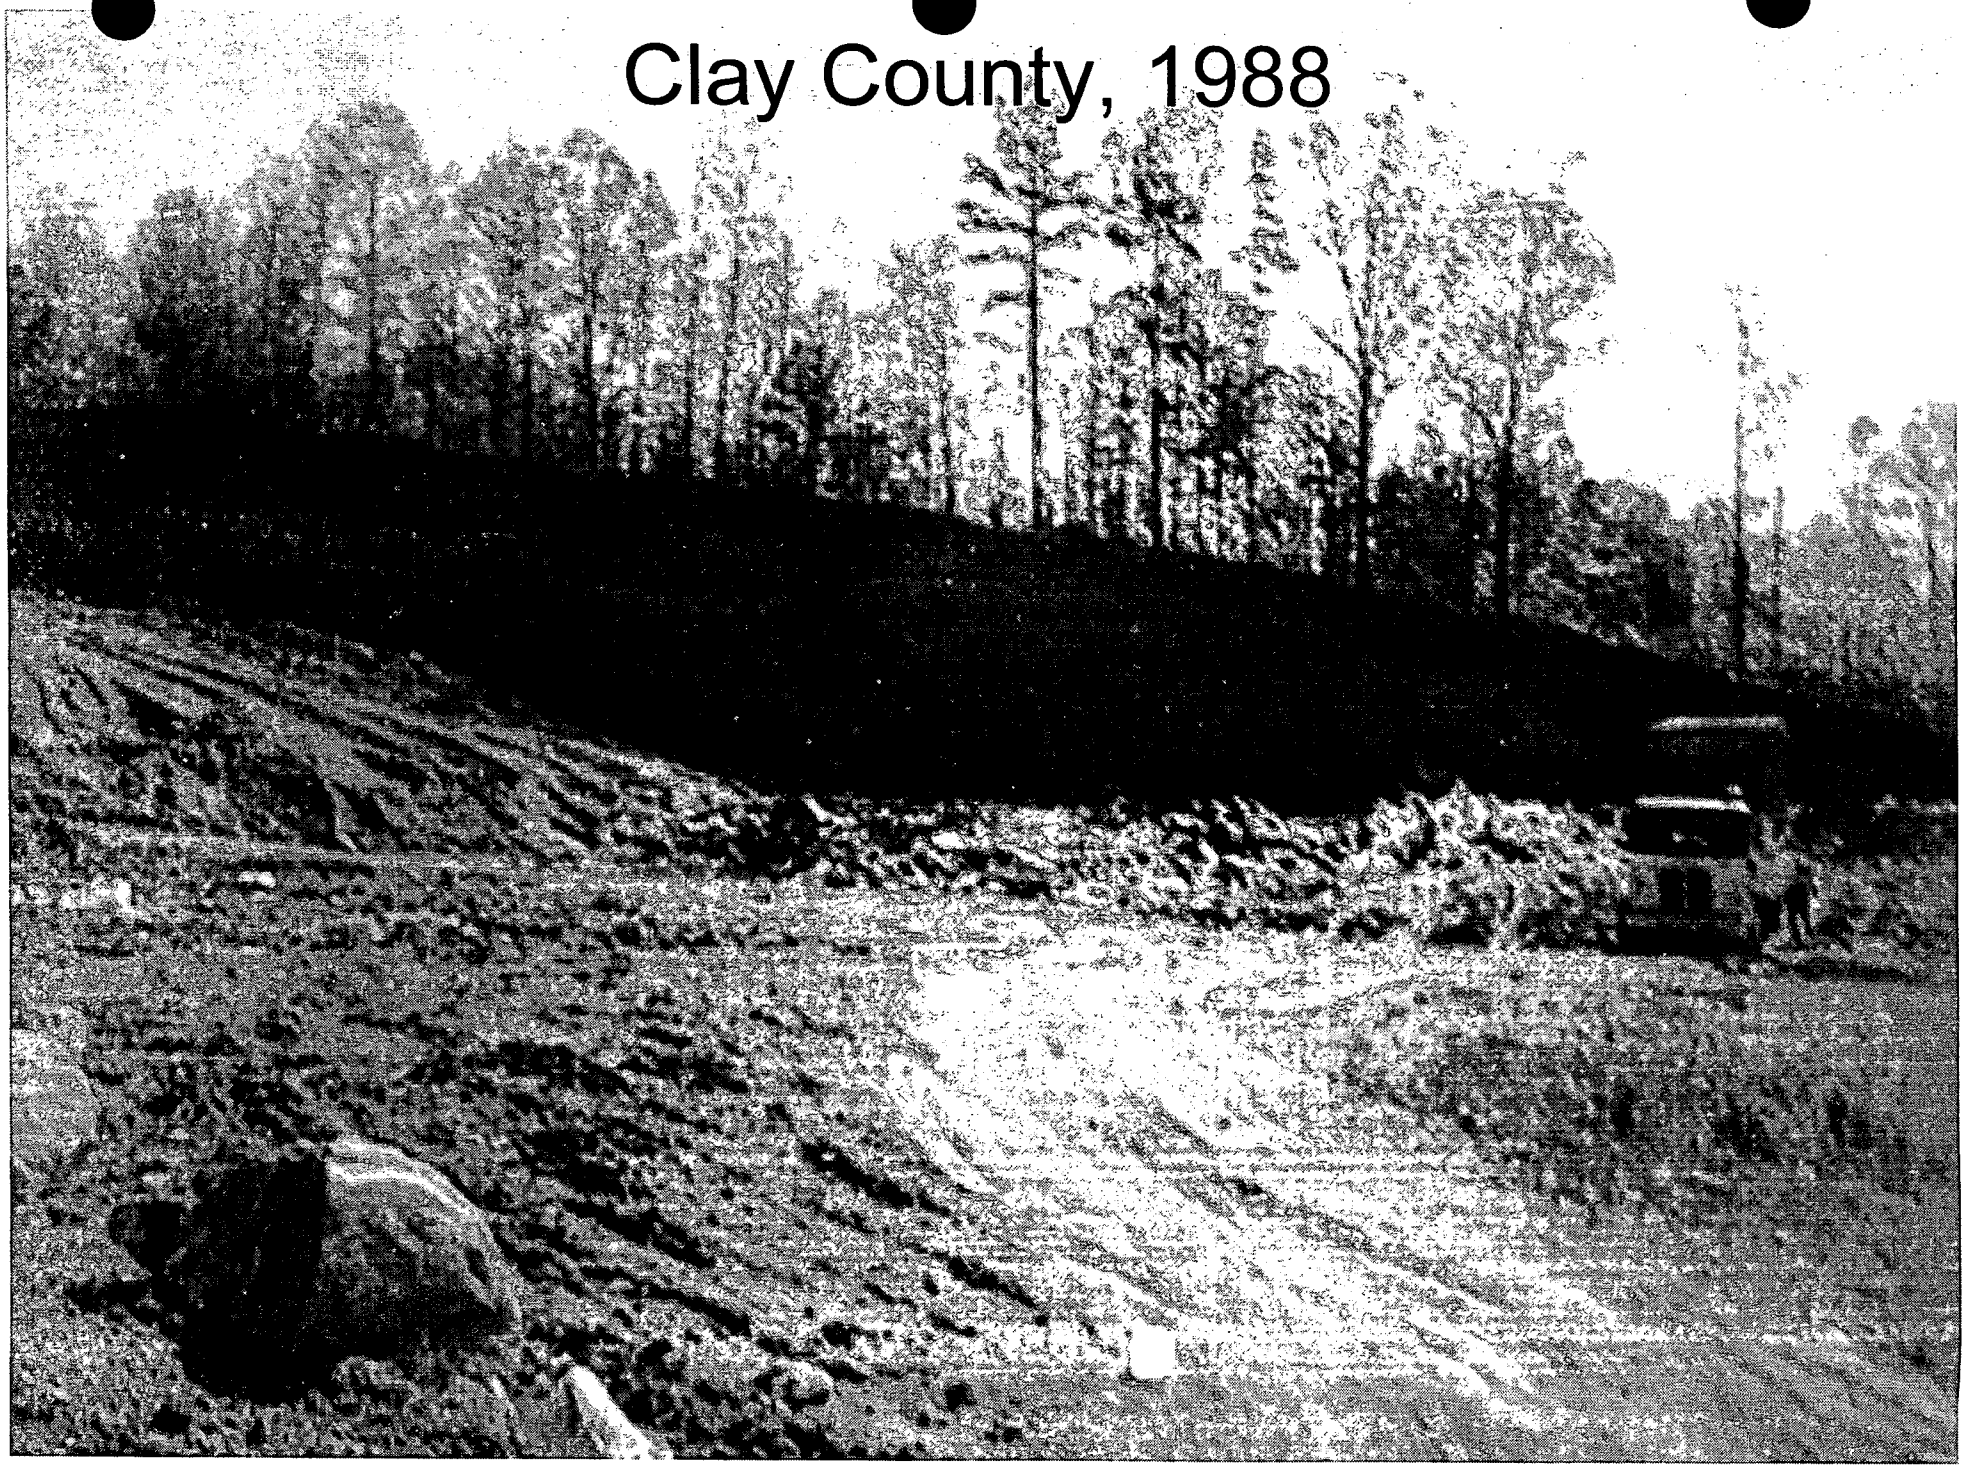
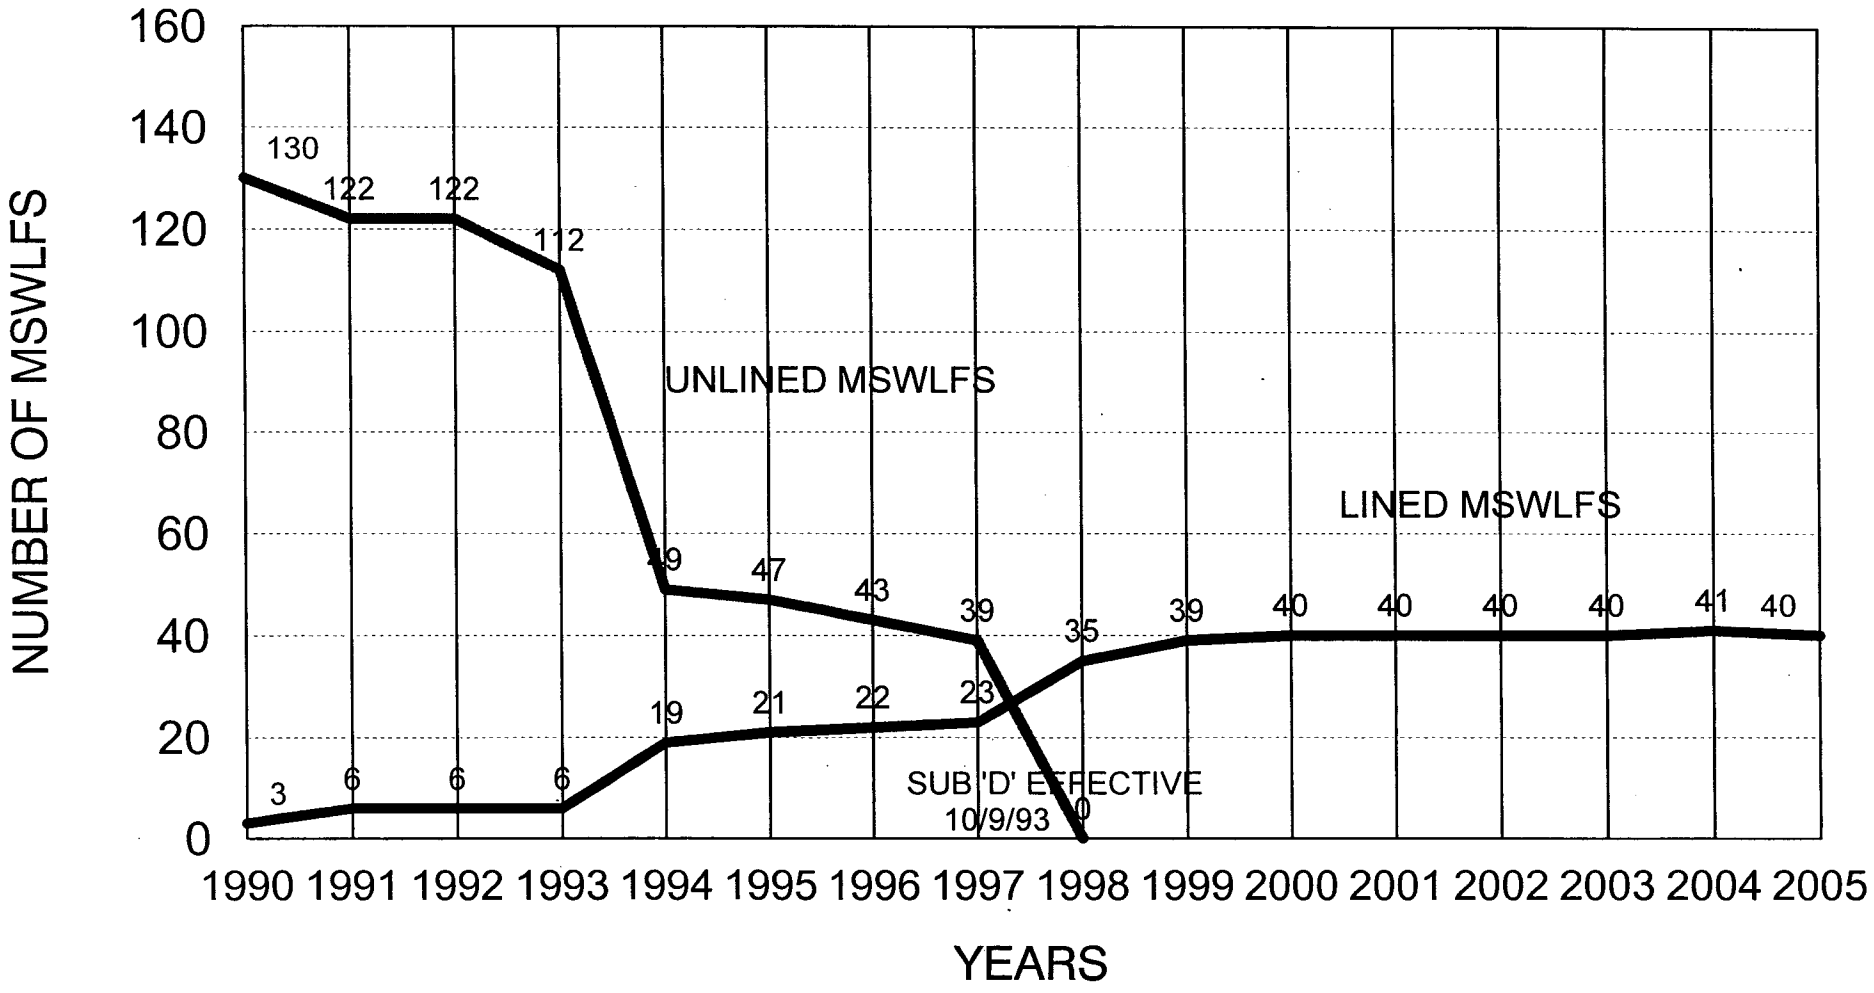
North Wake MSW Landfill



Clay County, 1988

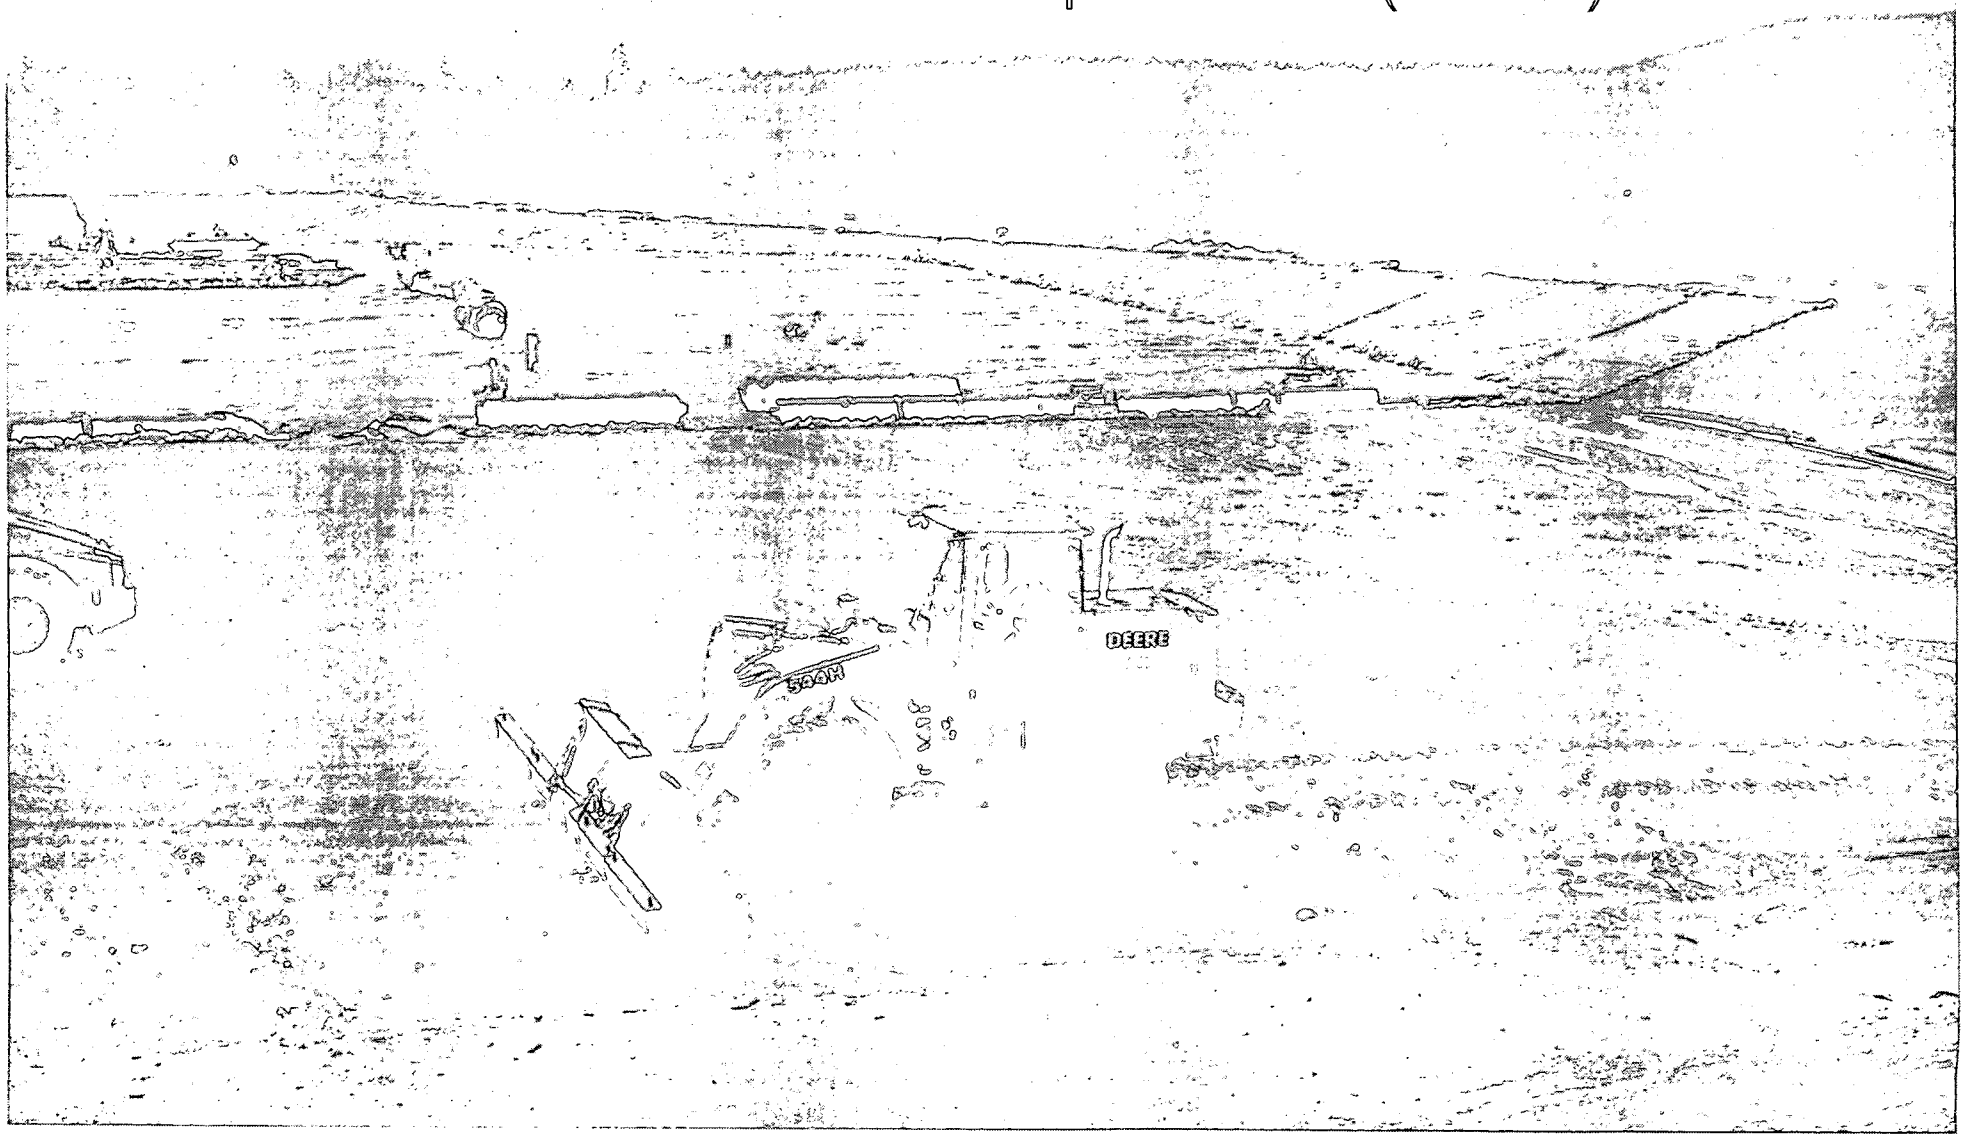


STATUS OF MSWLFS IN NORTH CAROLINA



State lined landfill requirements (the 98 rule)

Federal Sub-title D Landfill requirements (RCRA)

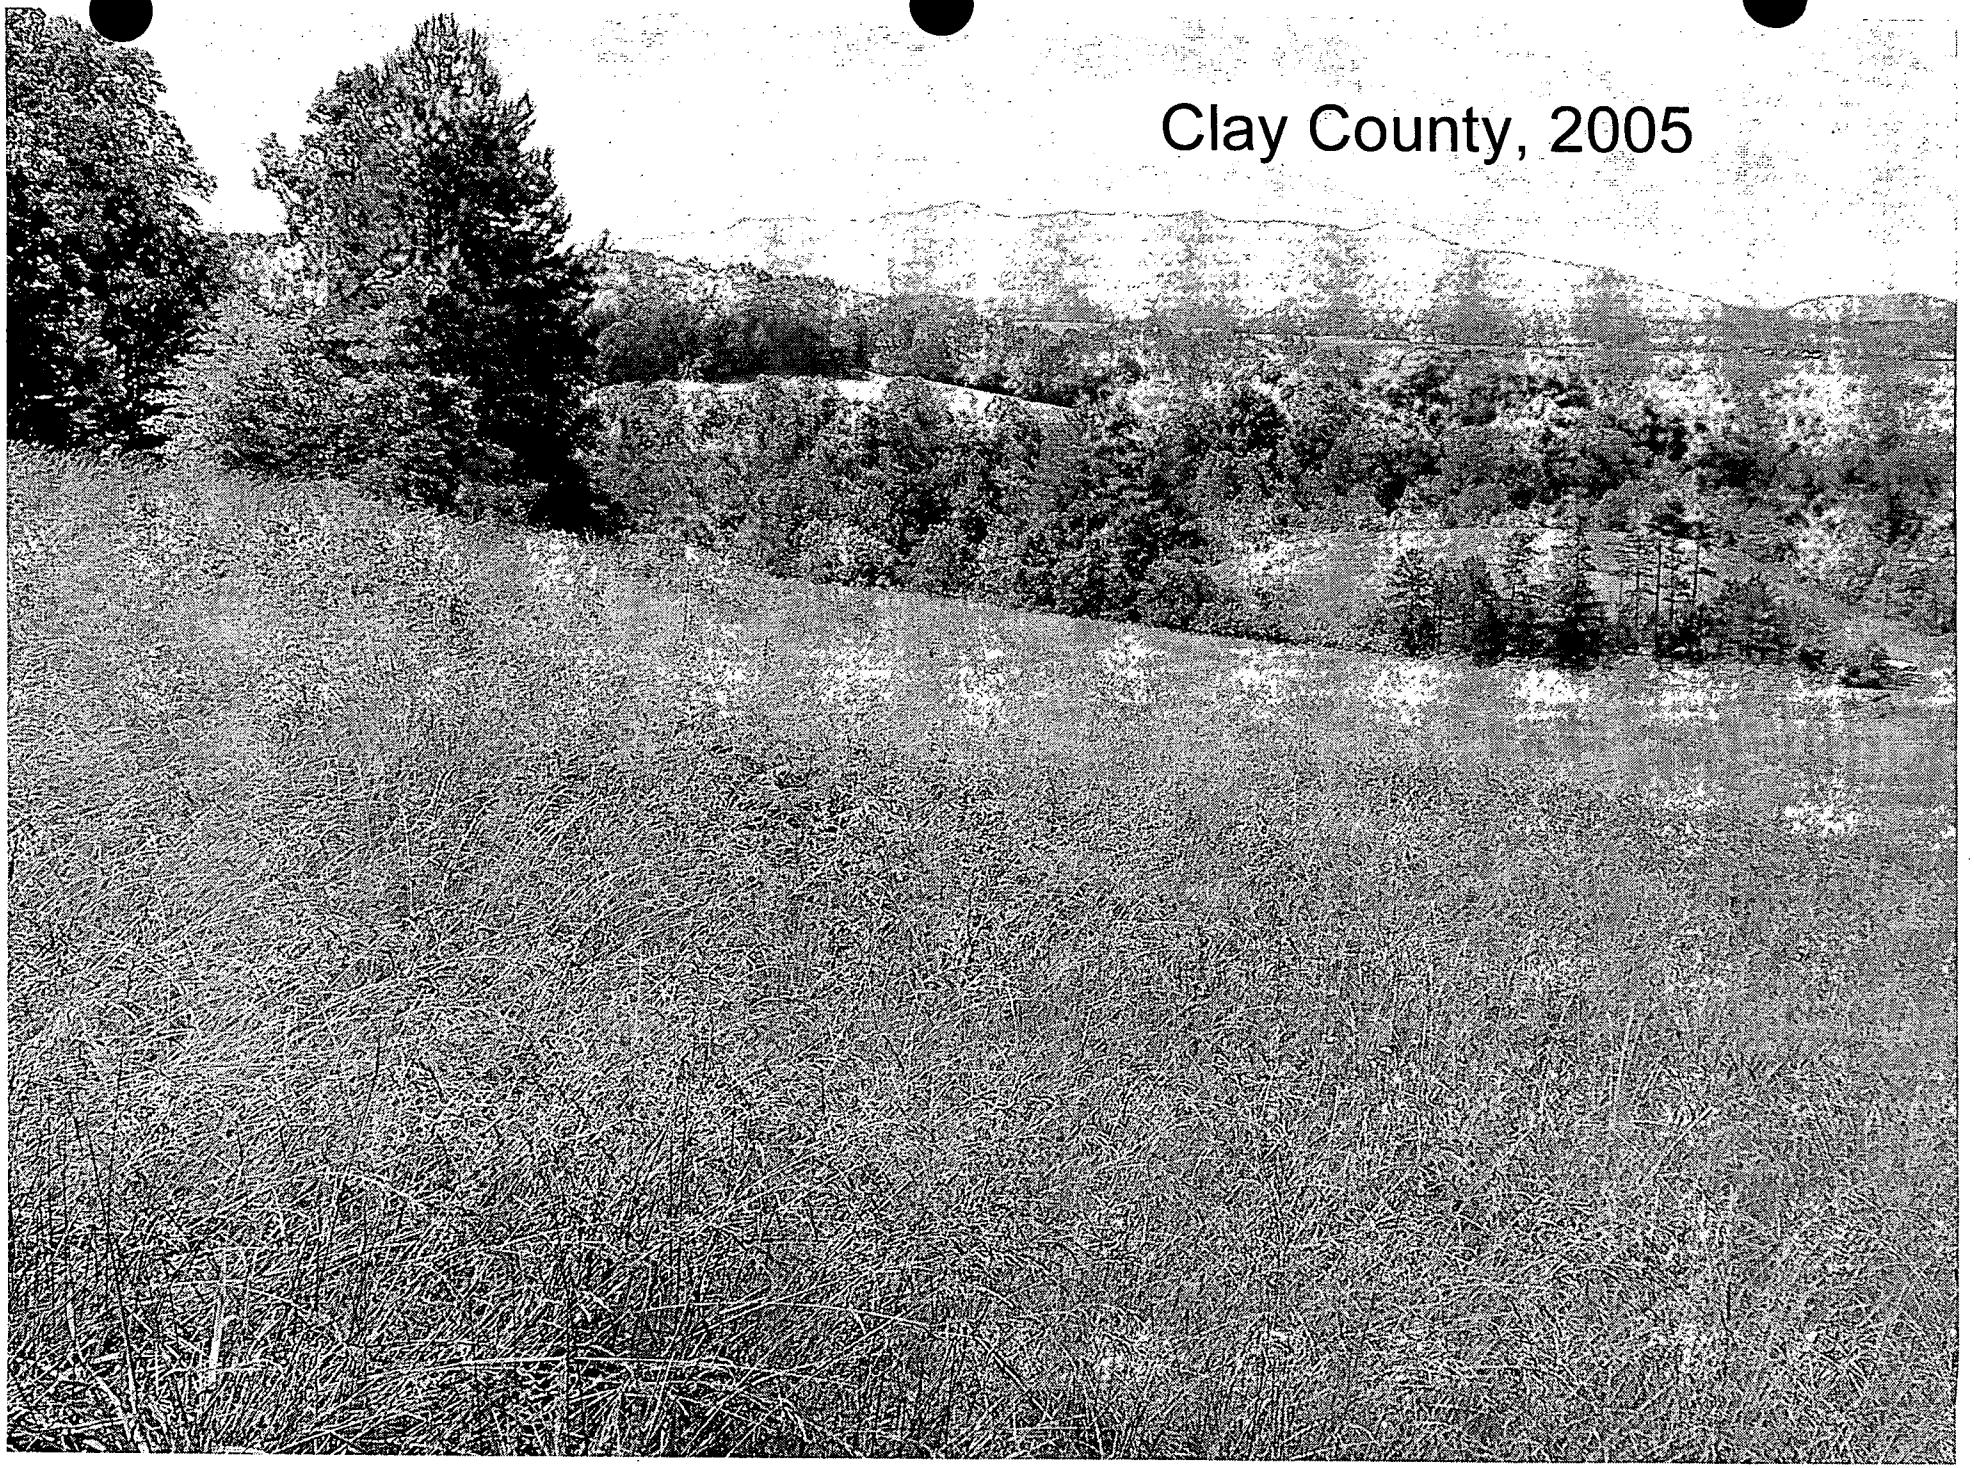


Solid Waste Management Act of 1989

Established:

- Reporting requirements
- Planning requirements
- Landfill bans
- New programs
- Set goals and policies

garbage barge from New York City



Clay County, 2005

Summary
Issue Identification

- Increasing amount of waste
- Use of new/different facilities
- State regulatory staffing reductions
- Mobility of waste/inter-state movement
- Large in-state regional facilities
- Landfill ownership transfer
- Capacity (distribution & lack of acceptance)
- New landfills proposed for primarily out-of state waste
- Landfills proposed in areas not previously anticipated
- Legacy of old landfills

Proposed legislation for 2007

1. Strengthen **financial/environmental qualifications** review
2. Strengthen **financial assurance** associated with landfill ownership
3. Clarify landfill **owner definition** and **ownership transfer** notification
4. Strengthen **state enforcement** measures
5. Improve/strengthen landfill requirements for the ***next generation*** of landfills
6. Improve/strengthen performance of **current landfills**
7. Require **environmental studies** for large facilities
8. Fund state regulatory **staff expansion** through permit fee
9. Fund **clean up of orphan landfills** through fee on solid waste disposal

*Landfill requirements based on: experience in North Carolina, new technologies, need to provide improved protections to the public

Solid Waste in North Carolina
The Future:

More of the Same

(Probably continue to have more and more waste)

Yet Very Different

(Probably become one of the nation's leading importers of waste)

Status of Recycling and Recycling Markets in North Carolina

Environmental Review Commission
6/11/2007

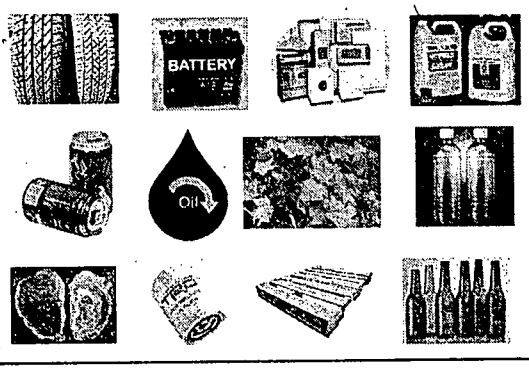
What is the goal?

Solid Waste Management

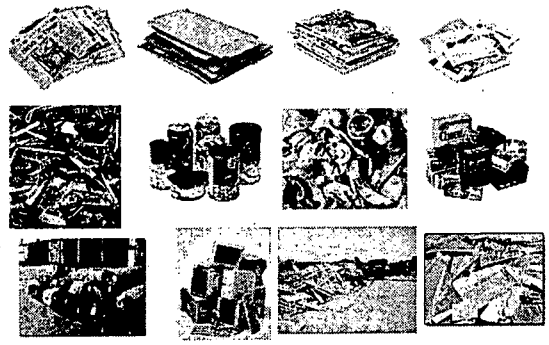
Versus

Materials Management

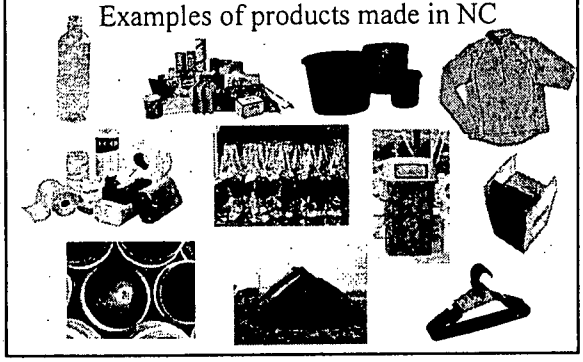
Which of these things are "waste?"



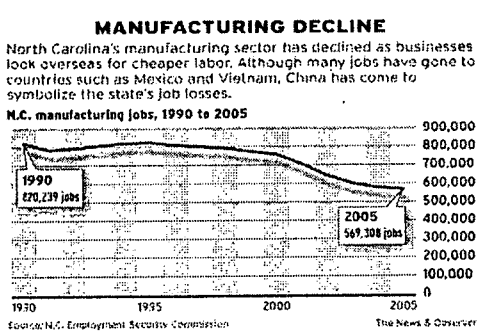
Which of these materials are "waste?"



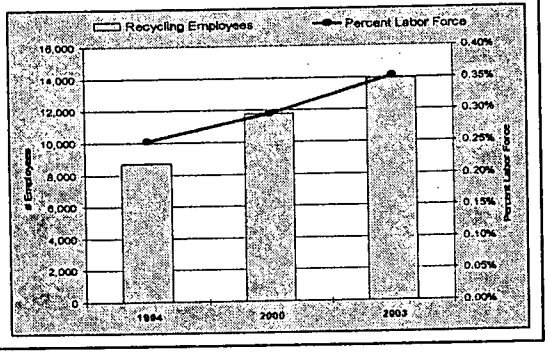
Recycling Essential to NC Manufacturers – Examples of products made in NC



Jobs



Growth in Recycling Jobs in NC



Examples of Recyclers in NC

- Nucor – largest recycler in the U.S.
- Envision Plastics – second largest HDPE recycler in the U.S.
- Union Gypsum – recycler of wallboard into soil products
- Brooks Contractors – turns food wastes and other organics into compost
- Synergy – recycler of wide range of electronics
- Curbside Management – fast growing small company providing curbside services in western NC
- Owens-Illinois – uses recycled glass to make new bottles

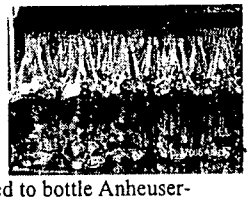
What's going to the landfill in NC?

- 87,000 tons of plastic bottles
- 50,000 tons of electronics
- 700,000 tons of wood and pallets
- 1.26 million tons of recyclable paper
- 200,000 tons of glass bottles
- 95,000 tons of aluminum and steel cans
- 300,000 tons of wallboard
- 1.2 million tons of food waste
- Etc.

Market value of disposed materials

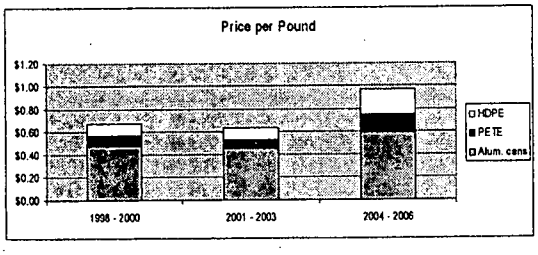
- Aluminum cans – over 25,000 tons disposed at a market value of ***$30 million/year.***
- Plastic bottles – 87,000 tons disposed at a market value of ***$40 million/year.***
- Paper – over 1.2 million tons disposed at a market value of ***$50 million/year.***

Glass recycling in NC



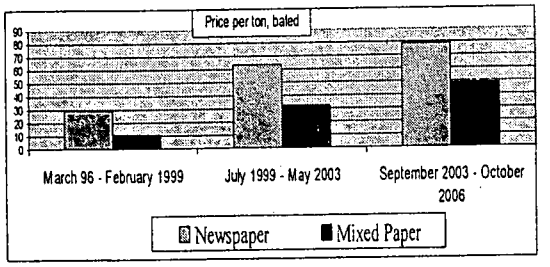
- Three glass plants in NC.
- Manufacturer containers used to bottle Anheuser-Busch and Miller products.
- Plants could use twice as much "cullet" as currently receiving.
- ABC Commission recycling requirements will increase cullet supply.
- Increase curbside and drop-off recovery will also increase supply.

Historical Prices on Container Materials



Recycling Market Prices since March 1996

Prices per ton received by major processors in NC from mills



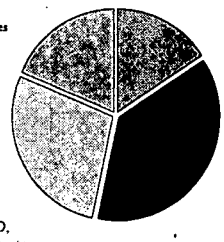
Local recycling programs

- Recycling rates growing slowly, huge potential.
- Communities that modernize programs see results:
  - Kernersville tonnage up 45%
  - Brevard recycling program cheaper than garbage collection and disposal
  - Wake Forest participation rates up to 97%
  - Raleigh tonnage up 30% in two years.
  - Chowan/Perquimans/Gates counties enjoying a $79/ton benefit for every additional ton recycled
- Local governments need motivation/incentives to improve programs.

Private recycling efforts

- Tremendous growth in private recycling sector.
- Commercial, industrial and C&D waste streams still contain large amounts of recyclables, for example.:
  - Over 150,000 tons per year of office paper
  - 300,000 tons per year of metal in the C&D waste stream
  - 60,000 to 100,000 tons of glass in bars and restaurants
  - 150,000 tons of compostable food waste in supermarkets per year.
- Generators, haulers, and recyclers need motivation/incentives to increase recycling.

North Carolina Waste Diversion Potential



Disposables
Diapers, fines and misc. organics, treated lumber, etc.

Traditional recyclables
Paper, bottles & Cans, etc.

Materials with some diversion potential
Furniture, Some C&D, some industrial waste, etc.

High Potential Materials
Wood waste, Food waste, electronics, some C&D, film plastics, etc.

With the right programs, incentives, and funding in place, over half of North Carolina's waste stream is divertable from disposal.

Best kind of policy approach for waste reduction

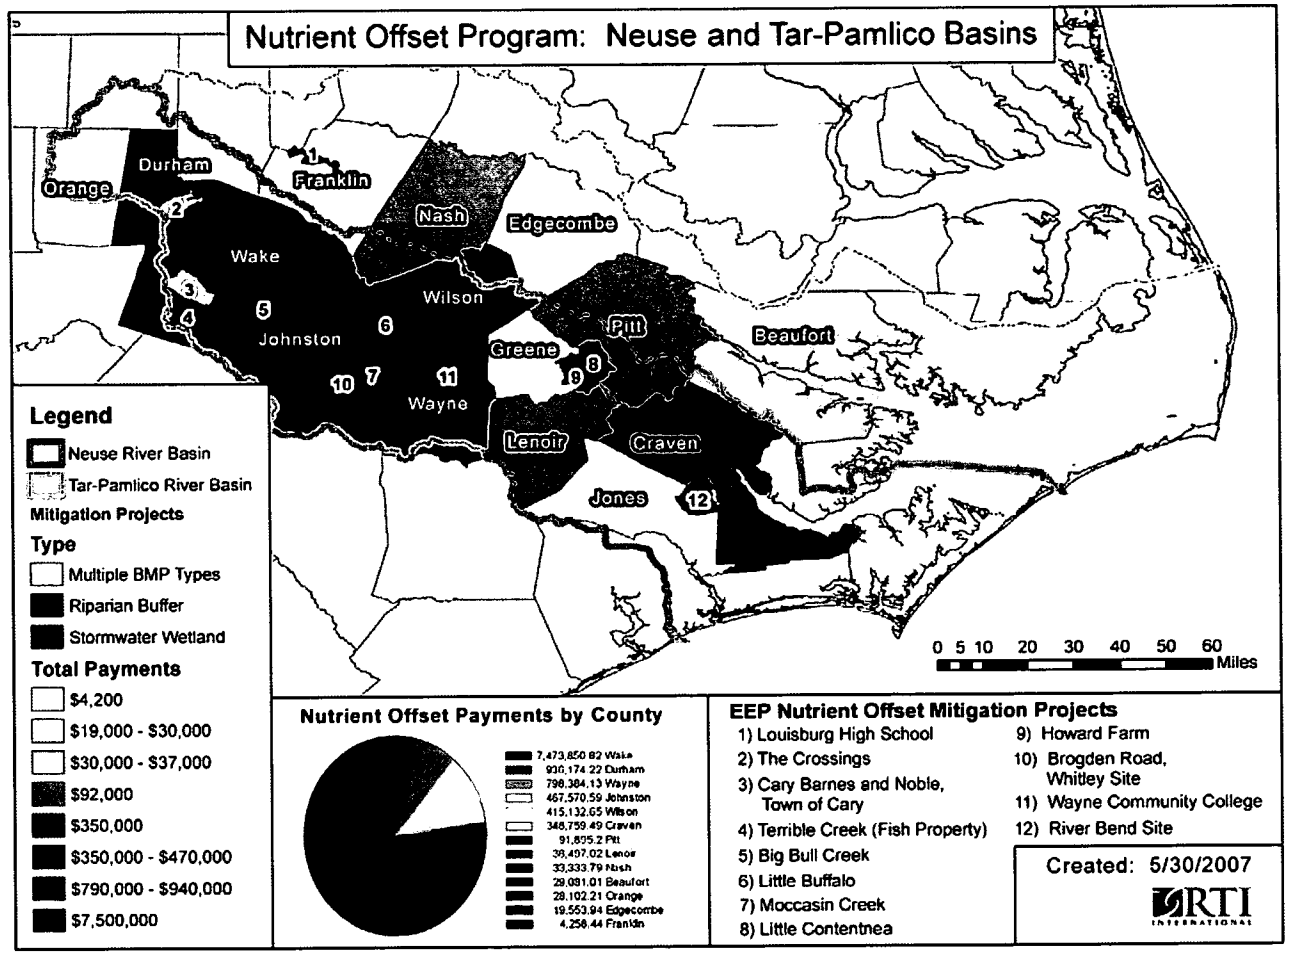
Presentation Outline

- Historical Background of Nutrient Offset Payment Program
- Discussion of 6 Project Objectives
- Financial Analysis Methods and Policy Scenarios
- RTI's Data Collection Efforts
- Findings are Recommendations for the Objectives
- Caveats and Future Research

Historical Background: The Nutrient Offset Payment Program

- Nutrient Offset Fee Payment Program (NOFPP): The NOFPP is administered by the Ecosystem Enhancement Program (EEP).
- Funds paid by excess dischargers are used to construct nutrient controls within the river basin that offset the excess nutrients they discharge.
- The majority of current NOFPP projects are riparian buffer restoration projects in the Neuse River Basin.

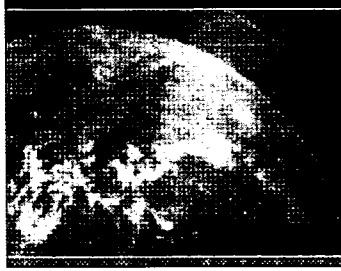
Historical Background: EEP Projects Pursued



RTI INTERNATIONAL

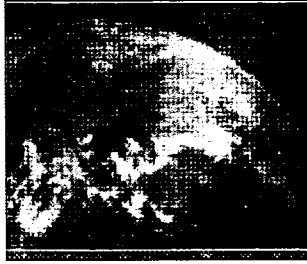
Historical Background: Proposed Amendments

- In 2006, several changes to the original 1998 payment rules were proposed to better reflect the true costs of mitigation and to expand the program to new river systems. These changes included the following:
  - Raising the nitrogen offset fee from $11 to $57 per pound per year,
  - Expanding the NOFPP to the Tar-Pamlico River Basin, and
  - Creating a nutrient offset program for phosphorous in the Tar-Pamlico River Basin.



Project Objectives

- The objectives of this study include the following:
  - Objective 1: Evaluate the sustainability of the program at the current fee of $11 per pound of nitrogen
  - Objective 2: Develop a proposed fee based on the cost-effectiveness analysis
  - Objective 3: Develop a formula for calculating the offset payment fee
  - Objective 4: Assess the advantages and disadvantages of expanding the nutrient offset payments to other nutrients and additional areas of the state
  - Objective 5: Evaluate the ability of public (other than the EEP) and private entities to provide nutrient offsets
  - Objective 6: Develop a comprehensive review of potential nutrient mitigation efforts available



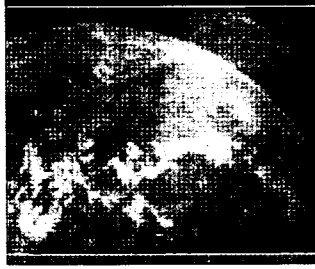
Financial Analysis: Description

Because of the cost differences across different projects, RTI needed to forecast the **distribution** of project types to be used in each of these analyses:

- ***Scenario A: All Buffers.*** The EEP implements exclusively riparian buffers on land obtained through conservation easements and purchased land.

  Scenario B: Integrated Implementation. In addition to buffers, the EEP pursues a number of stormwater wetland offset projects to target integrated environmental objectives. This results in higher costs per pound of nitrogen and phosphorous.

- ***Scenario C: All Stormwater Wetland Retrofit.*** The EEP does not undertake any buffer projects and instead installs all stormwater wetland projects, which again enables offset projects to be implemented closer in proximity (e.g., in local watersheds) to where development is occurring, and again increasing the costs per pound of nitrogen and phosphorous.



Financial Analysis: Potential Policy Scenarios

Scenario/BMP	BMP Share	Land Cost	Design Cost	Construction Cost	Maintenance Cost
Scenario A: All Buffers					
Riparian buffers	100%	√	√	√	√
Scenario B: Integrated Implementation					
Riparian buffers	70%	√	√	√	√
Stormwater wetlands[a]	5%		√	√	
Stormwater wetlands	25%	√	√	√	√
Scenario C: All Stormwater Wetlands					
Stormwater wetlands[a]	5%		√	√	
Stormwater wetlands	95%	√	√	√	√

√ = EEP assumes full cost.

[a] Local municipalities donate land and assume maintenance costs.

Data Collection: Description

- Any nutrient offset fee chosen by policy makers will ultimately have to cover the costs of pursuing the various BMPs required to offset the nutrient emissions of nonpoint sources.
- Therefore, understanding and obtaining cost data for various BMP projects became the focus of RTI's data collection efforts.
- RTI interviewed 37 stakeholders. Of those interviewed, 8 provided detailed BMP cost information.

Data Collection: Data Sources

BMP Type	Number of Projects	Data Sources
Riparian Buffers	8	Provided by private-sector firms that constructed riparian buffers for the EEP. These projects were primarily located in the Piedmont and inner Coastal Plain regions of the state.
Stormwater Wetlands	17	Provided by academics in North Carolina State University's Water Quality and Stormwater Engineering Groups and engineers working for the city of Charlotte's Storm Water Services. These projects were scattered across the state but were primarily located in the state's Piedmont and Coastal Plain regions.
Large Bioretention Areas	12	Provided by academics in North Carolina State University's Water Quality and Stormwater Engineering Groups as well as individuals working for the North Carolina Department of Transportation and the town of Garner. These projects were scattered across the state but were primarily located in the state's Piedmont and Coastal Plain regions.
Wetponds	9	Provided by academics in North Carolina State University's Water Quality and Stormwater Engineering Groups. These projects were scattered across the state but were primarily located in the state's Piedmont and Coastal Plain regions.

Data Collection: BMP Cost Components

- **Land** costs are incurred in obtaining access to or purchasing the land where the BMP will be placed.
- **Design costs** are fees associated with the designing and engineering the BMP. Design costs for a typical mitigation project are about 32% of construction costs
- **Construction** costs relate to the actual time, labor, capital, and materials used in designing and constructing the BMP; for example, the costs of constructing level spreaders on a riparian buffer.
- **Maintenance** costs are incurred in repairing, maintaining, and monitoring the BMP after it is constructed. For this analysis, we assumed a 30-year maintenance period, which corresponds to the offset fee formula.

Data Collection: BMP 30 year costs

Restoration Expenditures = Land costs +

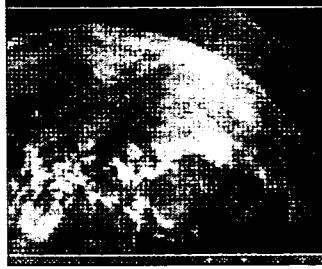
Installation costs +

Maintenance costs

Restoration Expenditures = One time costs +

$\sum$ (annual costs)

Restoration Expenditures = Present Value (costs)



Data Collection: BMP Cost Data Summary

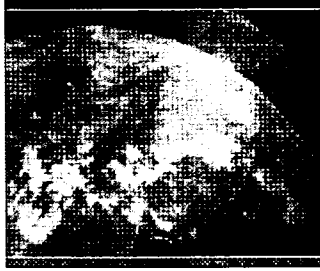
Mean Expenditures by BMP Cost Category ($/lb-N per 30 year)

BMP	Land Cost		Design Cost	Construction Cost	Present Value of 30-Year Maintenance Cost[a]	Total	
	Neuse	Tar-Pamlico				Neuse	Tar-Pamlico
Riparian buffers	$11.63[b]	$7.01	$1.95	$5.75	$2.04	$21.4	$16.8
Stormwater wetlands	$25.85[c]	$22.43	$14.38	$32.08	$9.68	$82.0	$78.6
Large bioretention areas	$71.18[c]	$61.77	$129.83	$329.69	$43.55	$574.3	$564.8
Wet Ponds	$43.94[c]	$38.13	$41.85	$130.79	$47.43	$264.0	$258.2

[a] Present value calculations use a discount rate of 5%.

[b] Based on average rural area land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.

[c] Based on average low-density urban land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.



Data Collection: BMP Cost Data Summary (cont.)

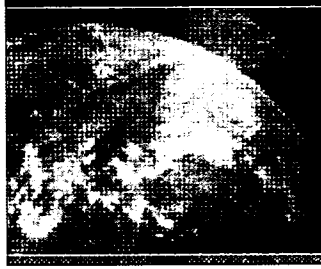
Mean Expenditures by BMP Cost Category ($/0.10 lb-P per 30 year)

BMP	Land Cost		Design Cost	Construction Cost	Present Value of 30-Year Maintenance Cost[a]	Total	
	Neuse	Tar-Pamlico				Neuse	Tar-Pamlico
Riparian buffers	$18.06[b]	$10.89	$3.03	$8.93	$3.17	$33.2	$26.0
Stormwater wetlands	$25.06[c]	$21.75	$10.71	$20.98	$8.91	$65.7	$62.3
Large bioretention areas	$46.96[c]	$40.75	$86.87	$221.30	$30.48	$385.6	$379.4
Wet Ponds	$23.29	$20.21	$28.12	$87.87	$26.08	$165.4	$162.3

[a] Present value calculations use a discount rate of 5%.

[b] Based on average rural area land price. Prices are slightly higher in the Neuse compared with the Tar-Pamlico.

[c] Based on average

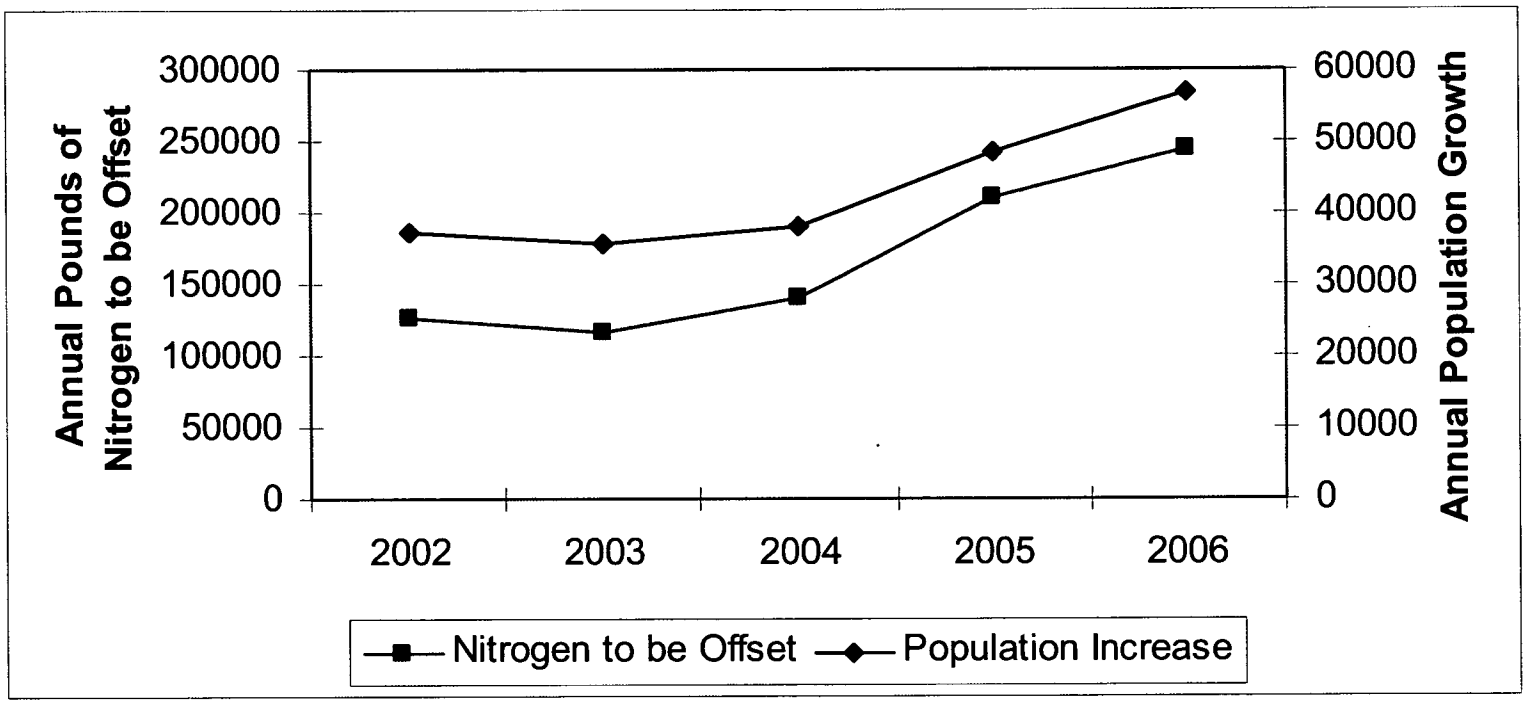


Data Collection: Additional Data Components

- In addition to the BMP cost data that RTI collected through stakeholder interviews, other data components were acquired to complete our financial analysis. These components included:
  - Forecasted demand for nutrient offsets
  - Amount of land available for riparian buffer projects
  - Estimated land costs in Neuse and Tar-Pamlico river basins ($/acre)
  - Estimate growth rates for land, design, construction, and maintenance costs

Data Collection: Forecasted Demand for Nutrient Offsets

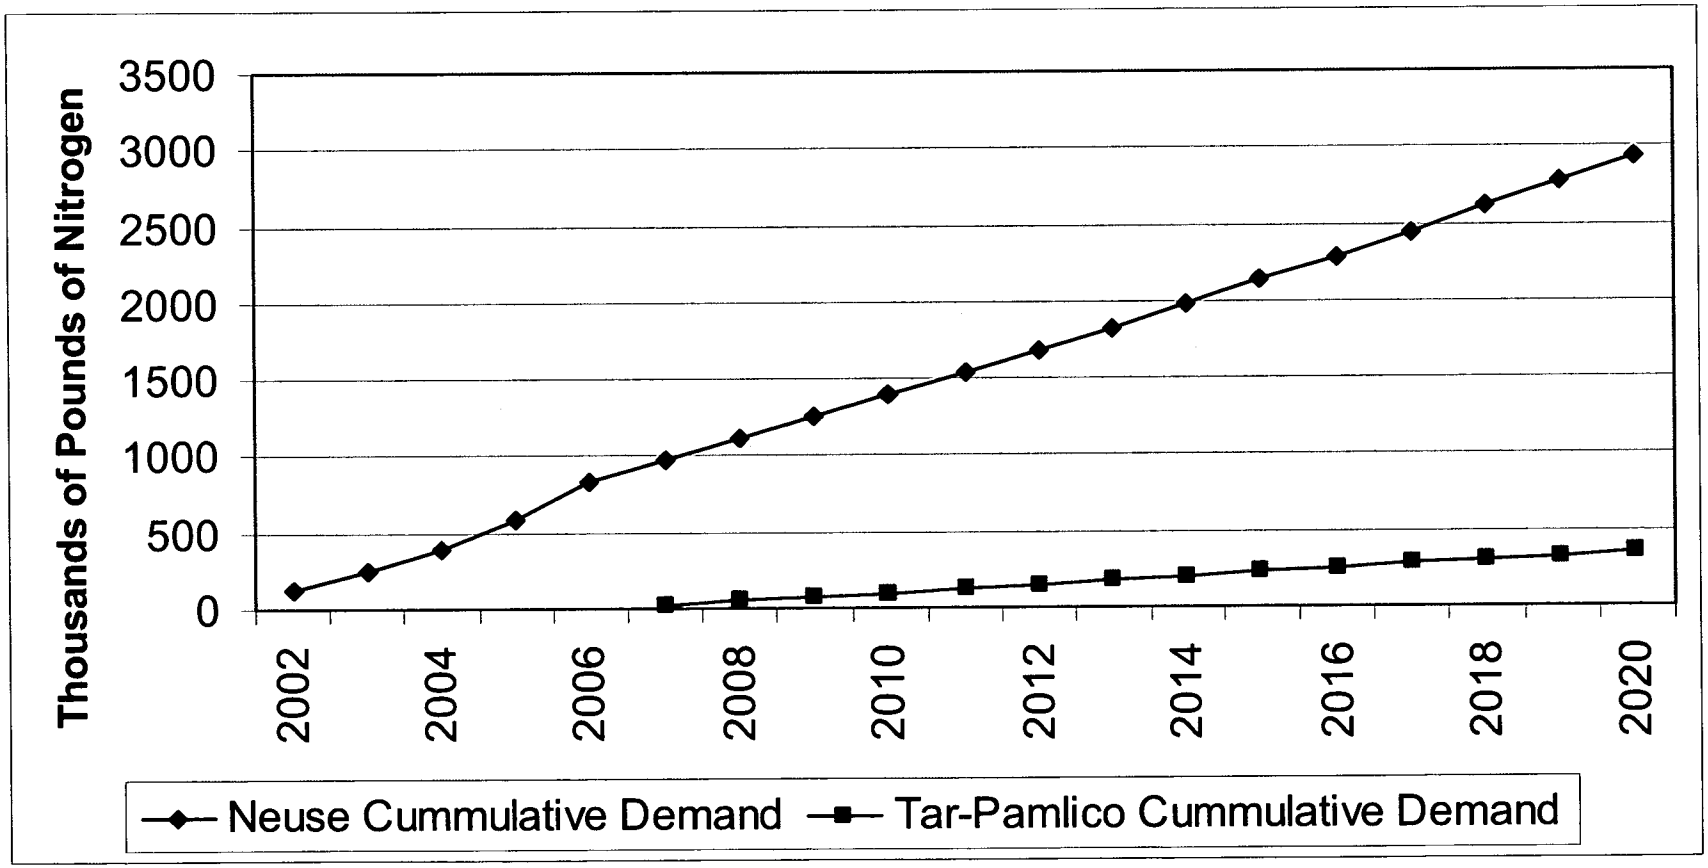
Nutrient Offset Demand and Annual Population Growth in the Neuse River Basin: 2002–2006



Between 2002 and 2006, every new person entering the Neuse River Basin was associated with an average of 3.9 new pounds of nitrogen needing to be offset.

Data Collection: Forecasted Nutrient Offset Demand (cont.)

Forecast of Cumulative Nitrogen Offset Demand in Neuse and Tar-Pamlico River Basins to 2020.



RTI INTERNATIONAL

Data Collection: Land Available for Riparian Buffer Projects

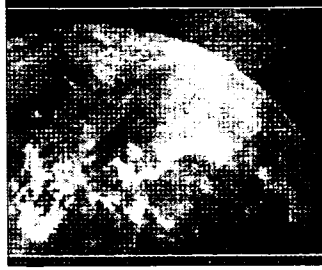
Distribution of Land within 50-Foot Buffer, by River Basin

Description	Neuse Area	Tar-Pamlico Area
Open Water	10,973	8,757
Developed	5,040	2,980
Barren	552	683
Forest Cover	24,748	21,486
Grassland	8,384	8,147
Cultivated Crops	7,349	9,733
Woody Wetlands	39,459	33,667
Acres of Land	85,533	76,695
Total Acres (including Open Water)	96,507	85,452

Data Collection: Riparian Buffer Analysis (cont.)

- By excluding forest, developed, wetland, and other types of land uses, RTI estimates that 18% of the land within the Neuse's 50-foot buffer is viable for potential riparian buffer projects.

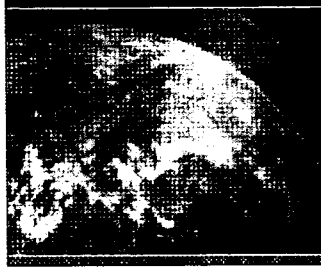
Land Cover Description	Neuse (Acres)	% of Total Land	Tar-Pam (Acres)	% of Total Land
Developed Land	5,040	6%	2,980	4%
Forest, Wetland, and Other	64,760	76%	55,836	73%
Potential Land for Buffers	**15,734**	**18%**	**17,880**	**23%**
Total Land	85,533	100%	76,659	100%



Data Collection: Riparian Buffer Analysis (cont.)

	Neuse River Basin	Tar-Pamlico River Basin
Acres of land suitable for buffers	15,734	17,880
Acres required for EEP stream mitigation until 2020	266	5
Acres of agricultural land consumed by development	1,385	1,573
Acres of land potentially available for buffer	14,083	16,302
Buffer required by NOFPP	925	155
NOFPP percentage of available buffer land	7%	1%

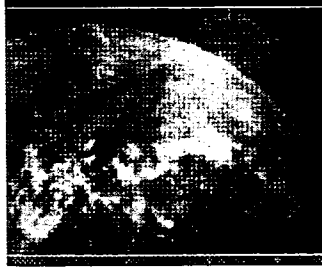
- RTI predicts that 2.1 million pounds of nitrogen in the Neuse River Basin and 353,000 pounds of nitrogen in the Tar-Pamlico will need to be offset through the year 2020.
- If all of this nutrient loading was offset using riparian buffers, RTI predicts (using EEP's estimate that 1 acre of buffer offsets 2,273 pounds of nitrogen on average) that this would require 925 acres of riparian buffer to be restored in the Neuse River Basin and 155 acres to be restored in the Tar-Pamlico.



Data Collection: Estimated Land Costs

Land Category	Neuse River Basin Dollars per Acre	Tar-Pamlico River Basin Dollars per Acre
High-density urban	$200,311	$123,961
Low-density urban	$145,498	$126,264
Rural areas	$19,139	$8,646

- RTI downloaded recent tax parcel GIS data from 8 counties that made these data freely available for download from the Internet: Beaufort, Carteret, Craven, Dare, Edgecombe, Halifax, Johnston, and Wake counties.
- Tax parcel data were used because no databases exist for actual sales data. Experts thought this was an appropriate proxy for a combination of conservation easements and purchases that would be used to implement the program in the future.



Data Collection: Annual Growth in Cost Components

RTI identified historical price data for several commodities linked to each cost category and used linear regression analysis to forecast growth in each time series to the year 2020.

Cost Component	Secondary Data	Source	Estimated Growth Rate	
			Neuse	Tar-Pam
Rural Land	Assessed Value of Taxable Real Property by County	NCDOR	**3.6%**	**3.5%**
Urban Land	Assessed Value of Taxable Real Property by County	NCDOR	**3.9%**	**3.7%**
Design	Architectural, engineering and related services price index	USBLS	**2.1%**	**2.1%**
Construction	Construction machinery manufacturing price index	USBLS	**1.6%**	**1.6%**
Maintenance	Employment Cost Index: Compensation: Private Industry Workers	FRED	**2.4%**	**2.4%**

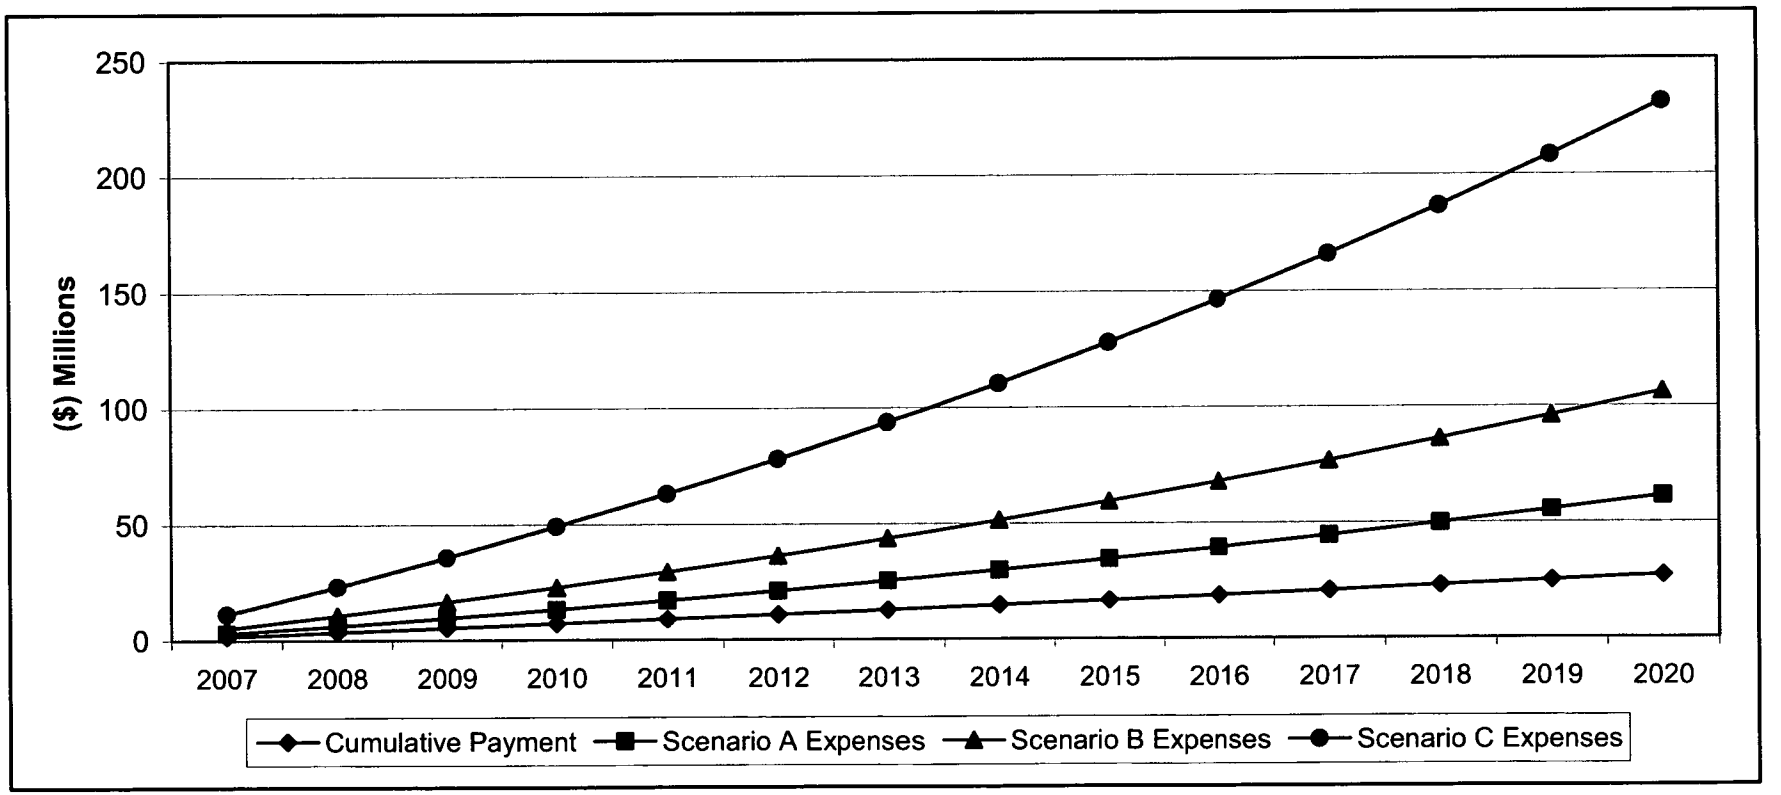
Objective 1: NOFPP Sustainability at Current Fee of $11/lb

NOFPP Cumulative Expenses Exceed Cumulative Payments in Both River Basins.

Year	Cumulative Payments	Scenario A Expenses	Scenario B Expenses	Scenario C Expenses
2007	$1,748,308	$2,962,207	$5,198,938	$11,210,910
2008	$3,522,850	$6,124,101	$10,715,511	$23,086,927
2009	$5,324,034	$9,496,141	$16,565,661	$35,661,105
2010	$7,152,275	$13,089,298	$22,766,084	$48,968,055
2011	$9,007,995	$16,915,072	$29,334,262	$63,044,017
2012	$10,891,623	$20,985,523	$36,288,503	$77,926,941
2013	$12,803,594	$25,244,846	$43,600,064	$93,656,559
2014	$14,744,350	$29,701,951	$51,285,976	$110,274,477
2015	$16,714,341	$34,366,176	$59,364,067	$127,824,257
2016	$18,714,024	$39,247,309	$67,853,001	$146,351,510
2017	$20,743,861	$44,355,611	$76,772,311	$165,903,993
2018	$22,804,325	$49,701,838	$86,142,450	$186,531,709
2019	$24,895,893	$55,297,267	$95,984,826	$208,287,012
2020	$27,019,052	$61,153,722	$106,321,851	$231,224,720

Objective 1: NOFPP Sustainability (cont.)

The costs of BMP construction and maintenance will exceed revenues from both river basins into the forecasted future.



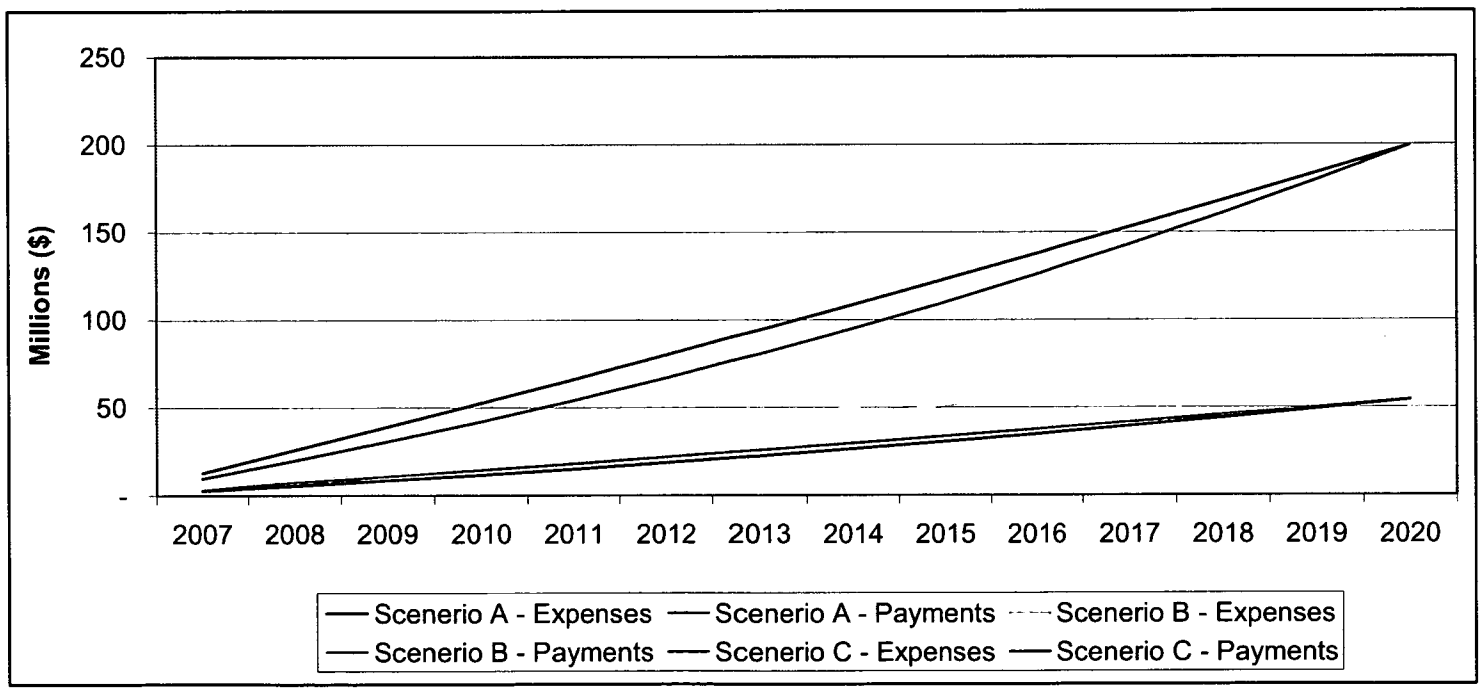
RTI INTERNATIONAL

Objective 2: Proposed Cost-Effective Fee

- RTI defines cost-effectiveness as the NOFPP being sustainable through the year 2020.
- Using the data previously discussed, RTI evaluated two types of fees against this criterion for each river basin.
  - A fixed-offset fee
  - A fee annually adjusted to conform with rising construction costs

Objective 2: Cost-Effective Fixed Fee (Neuse)

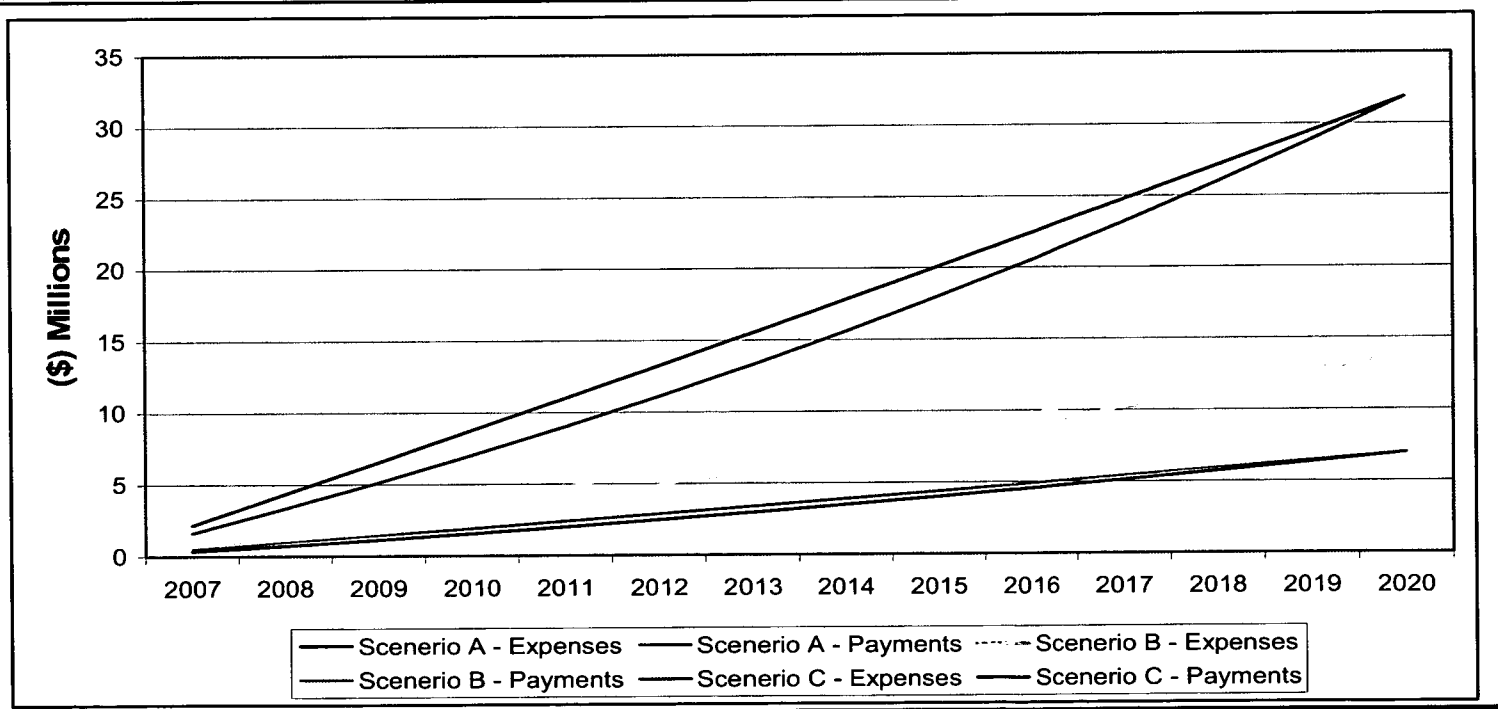
	Cost-Effective Offset Fee ($/lb-30 N)	Cost-Effective Offset Fee ($/0.10 lb-30 P)
Scenario A	$25.77	$33.19
Scenario B	$43.94	$41.23
Scenario C	$94.80	$62.91



RTI INTERNATIONAL

Objective 2: Cost-Effective Fixed Fee (Tar-Pam)

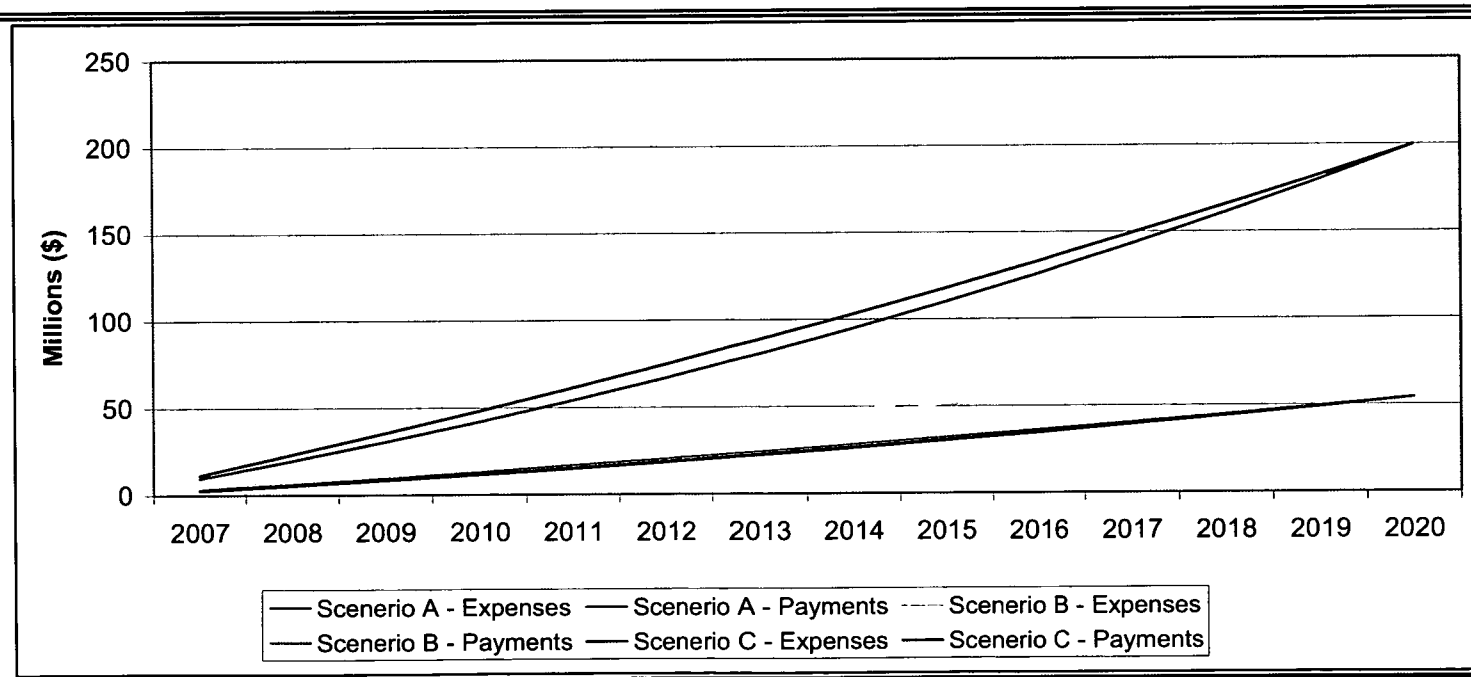
	Cost-Effective Offset Fee ($/lb-30 N)	Cost-Effective Offset Fee ($/0.10 lb-30 P)
Scenario A	$19.70	$26.02
Scenario B	$39.40	$35.38
Scenario C	$90.21	$59.77



RTI INTERNATIONAL

Objective 2: Cost-Effective Adjusted Fee (Neuse)

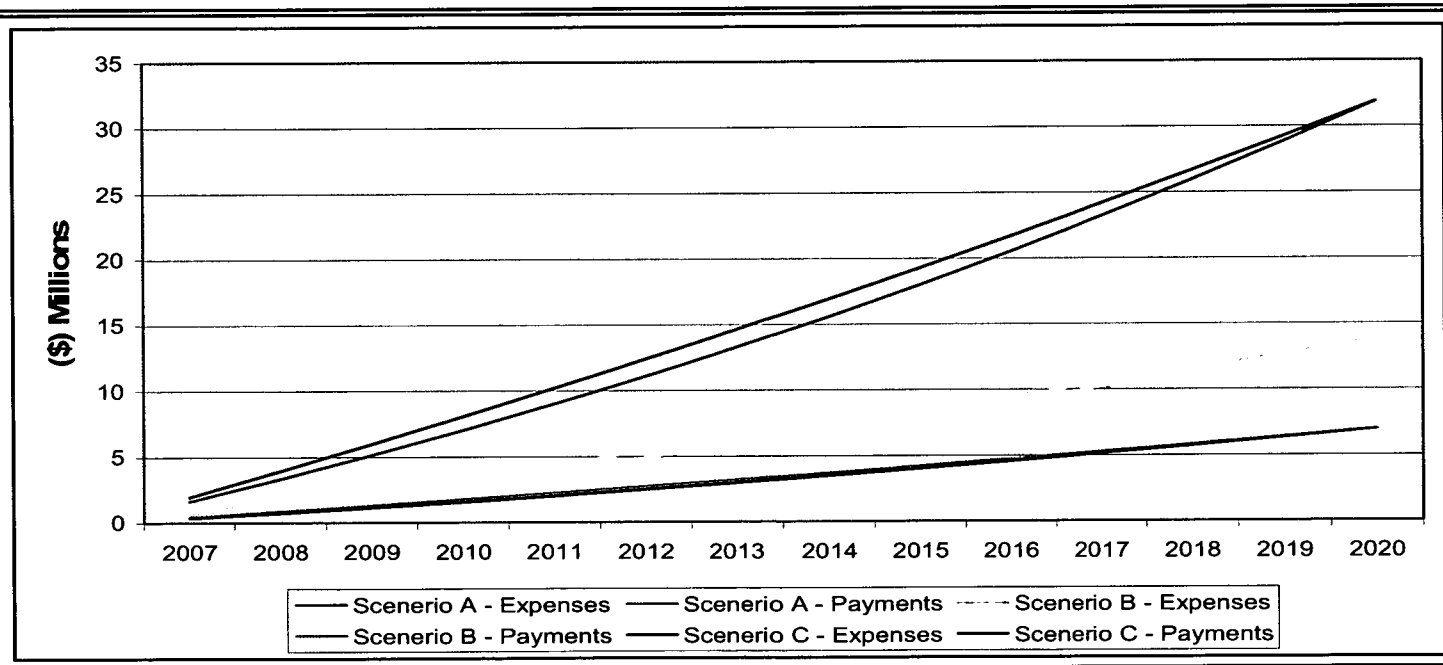
	2007 Cost-Effective Offset Fee ($/lb-N)	2020 Cost-Effective Offset Fee ($/lb-N)
Scenario A	$23.13	$28.36
Scenario B	$39.44	$48.35
Scenario C	$85.10	$104.32



RTI INTERNATIONAL

Objective 2:
Cost-Effective Adjusted Fee (Tar-Pam)

	2007 Cost-Effective Offset Fee ($/lb-N)	2020 Cost-Effective Offset Fee ($/lb-N)
Scenario A	$17.72	$21.72
Scenario B	$35.44	$43.45
Scenario C	$81.15	$99.48



Objective 3: Formulas for calculating the offset payments

- **Formula for Scenario A:**

  Neuse River Basin
  Nitrogen Payment = ($25.77/lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)
  Phosphorus Payment = ($33.19/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

  Tar-Pamlico River Basin
  Nitrogen Payment = ($19.70/lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)
  Phosphorus Payment = ($26.02/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

- **Rationale:** The only factor that directly affects the estuaries is the number of pounds of nutrients needing to be offset. A simple formula incorporating the cost-effective $/lb for nitrogen and $/0.10 lb for phosphorus produces a revenue stream that would allow the EEP to meet its objective of protecting the estuary and be sustainable through 2020.

Objective 3: Proposed Formulas (cont.)

- **Formula for Scenario B:**

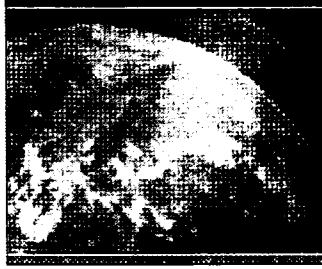
  Neuse River Basin
  Nitrogen Payment = [($25.77/lb N)(#of lbs/year)(30 years)*
  ((Land Cost $ per acre/19,000)^(0.64))*(1.1 AdminCosts)

  Phosphorus Payment = [($33.19/0.10 lb P)(#of 0.10 lbs/year)(30 years) *
  ((Land Cost $ per acre/19,000)^(0.31))*(1.1 AdminCosts)

  Tar-Pamlico River Basin
  Nitrogen Payment = [($19.70/lb N)(#of lbs/year)(30 years)*
  ((Land Cost $ per acre/9,000)^(0.58))*(1.1 AdminCosts)

  Phosphorus Payment = [($26.02/0.10 lb P)(#of 0.10 lbs/year)(30 years) *
  ((Land Cost $ per acre/9,000)^(0.31))*(1.1 AdminCosts)

- **Rationale**: Under this scenario, the intent is to provide sufficient funds so that mitigation projects can be placed close to the area of the development. This is accomplished by incorporating the land cost of the property being developed (in terms of dollars per acre) into the offset fee to generate sufficient funds to support flexibility when choosing mitigation options.



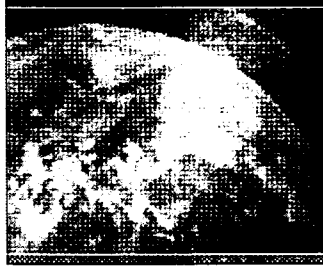
Objective 3: Proposed Formulas (cont.)

- **Formula for Scenario C:**

  Neuse River Basin
  Nitrogen Payment = ($94.80/lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)
  Phosphorus Payment = ($62.91/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

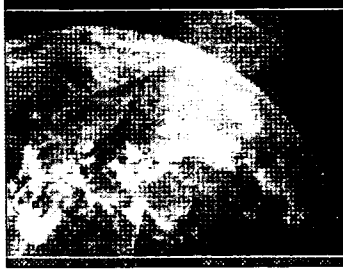
  Tar-Pamlico River Basin
  Nitrogen Payment = ($90.21/lb N)(#of lbs/year)(30 years)(1.1 AdminCosts)
  Phosphorus Payment = ($59.77/0.10 lb P)(#of lbs/year)(30 years)(1.1 AdminCosts)

- **Rationale:** Under this scenario, stormwater wetlands are always implemented. Thus, the location of the development (or the land cost per acre) has little impact on the cost of the BMPs. As a result, we recommend a simple formula specification similar to the one for Scenario A.



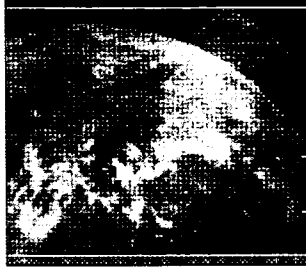
Objective 4: Expanding NOFPP

- Nutrient offset fees can distort regional development; however, these distortions are likely minor compared with economic and environmental consequences of excess nutrient loading.
- Environmental Question: For each river basin, are nutrients creating sufficient environmental damage that they need to be mitigated?
- A full benefit-cost analysis is beyond the scope of this study; thus, we focus on the existing literature and published studies to provide insights on this issue.



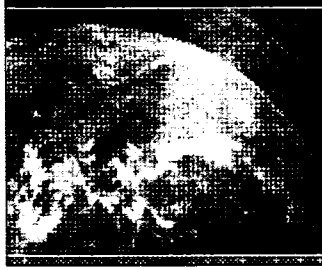
Objective 4: Expanding NOFPP (cont.)

- Other water bodies in North Carolina have historically experienced and continue to experience symptoms of human-induced eutrophication and could, therefore, be considered candidates for geographic extension of the nutrient offset program. These bodies include:
  - Chowan River Basin
  - Jordan and Falls Reservoirs
  - Catawba and Yadkin River Basins



Objective 5: Evaluate Alternative NOFPP Structures

- The EEP currently operates the NOFFP either through a design-bid-build or a full-delivery process. However, a wide range of alternative structures could be developed to implement a nutrient offset trading system.
- As part of this task we specifically investigated the feasibility of providing nutrient offsets through a regulated trading market.



Objective 5: Alternative Structures (cont.)

- There are many instances where federal and state governments have established trading systems (while maintaining regulatory oversight and supervision) to mitigate pollutants or protect wetlands.

- Examples of such programs include:
  - Tar Pamlico Point Nonpoint Source Trading Program
  - Pennsylvania Nutrient Trading Program
  - U.S. Environmental Protection Agency's (EPA's) SO_2 Emission Allowance
  - Regional Clean Air Incentives Market (RECLAIM)

Objective 5: Alternative Structures (cont.)

Given proper regulatory oversight and supervision …

The Nutrient Offset Program seems well suited for market trading.

Using a private-sector mitigation bank is a proven method for implementing market-based systems.

Private entities in the state have the capabilities to implement such a program.

We were not able to conduct a quantitative analysis, but there is no reason to expect there would be a degradation in cost-effectiveness or timeliness with a market-based system.

Objective 5: Advantages and Disadvantages of a Market-Based Nutrient Trading System

- Advantages
  - supply and demand intersect (i.e., they are in the same cost range)
  - would produce lowest cost
  - would capture changes in cost over time

- Disadvantages
  - more difficult to control placement of mitigation options
  - market may be too thin for regional/county-level markets
  - would not address integrated environmental or equity objectives

Objective 6: Review of Other Potential Mitigation Efforts

- The Center for Watershed Protection compiled and analyzed national cost data for a variety of structural stormwater retrofit practices, including wet ponds, wetlands, bioretention areas, filtering practices, infiltration practices, and swales.
- This effort produced national average construction costs for a wide range of mitigation practices that were not available for projects based in North Carolina. Additional mitigation projects identified include sand filters, underground sand filters, infiltration practices, and water quality swales.

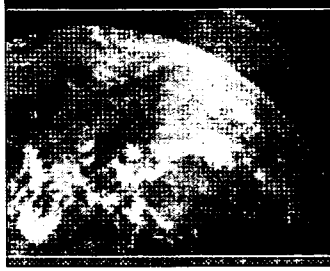
Objective 6: Review of Other Mitigation Efforts (cont.)

Stormwater Retrofit Practice	Median Cost ($/lb-30 N)[a]	Range ($/lb-30 N)[a]	Median Cost ($/0.10 lb-30 P)[b]	Range ($/0.10lb-30 P)[b]
Wet ponds	$177	$88 to $317	$93	$47 to $168
Wetlands	$110	$55 to $198	$107	$53 to $192
Large bioretention areas	$265	$188 to $433	$174	$125 to $286
Small bioretention areas	$755	$628 to $1,007	$498	$415 to $664
Sand filters	$503	$403 to $553	$332	$266 to $365
Underground sand filters	$1,637	$705 to $1,887	$1,079	$465 to $1,245
Infiltration practices	$240	$160 to $368	—[c]	—[c]
Water quality swales	$550	$308 to $968	$466	$262 to $822

[a] Cost per pound of nitrogen removed per year, in 2006 dollars.

[b] Cost per pound of phosphorus removed per year, in 2006 dollars.

[c] Not computable; pollutant removal benefits not defined within NCDENR, 2005a



Caveats and Future Research

- It was not the purpose of this project to recommend which of the three scenarios (or alternative possible scenarios) the EEP should pursue. That is a public policy decision that requires a more extensive environmental and economic benefit-cost analysis. However, our findings should serve as valuable inputs into the decision-making process.
- As part of this study's analysis, we encountered several issues that may warrant further research. These relate to
  - pollutant removal efficiencies and
  - event-mean-concentrations (EMCs) and land use loading rates.
  - These factors are used in calculating the offsets required of developers and the nutrients mitigated by the EEP.

MINUTES
Joint Meeting of the
ENVIRONMENTAL REVIEW COMMISSION
and the
JOINT LEGISLATIVE TRANSPORTATION OVERSIGHT COMMITTEE
11 June 2007

The Environmental Review Commission (ERC) met jointly with the Joint Legislative Transportation Oversight Committee (JLTOC) on Monday 11 June 2007 at 5:00 p.m. in Room 544 of the Legislative Office Building. Senator Clark Jenkins, Co-chair of the JLTOC, presided.

The following members of the JLTOC were present: Senators Jenkins, Hunt, Rand and Stevens; and Representatives Cole, Carney and Coates. The following members of the ERC were present: Senators Albertson and Clodfelter; and Representatives Gibson, Allen and Warren. Mr. George Givens, Commission Counsel; Mr. Jeffrey Hudson, Assistant Commission Counsel; Ms. Jennifer Mundt, Commission Analyst; Ms. Mariah Matheson, Research Assistant; and Dot Waugaman, Commission Clerk, were also present from ERC staff. Ms. Lisa Hollowell, Fiscal Analyst; Bob Weiss, Fiscal Analyst; and Giles Perry, Committee Counsel, were present from JLTOC staff.

On 6 June 2007, notice was sent to ERC members and interested parties via e-mail and regular mail. A copy of the notice is included in the attachments to these minutes as **Exhibit A**. Copies of the agenda for the meeting and visitor registration sheets are included in the attachments as **Exhibits B** and **C**.

Senator Jenkins called the meeting to order. He recognized Ms. Hollowell to introduce the presenter. Ms. Hollowell gave a synopsis of the history of the study to merge the Ecosystem Enhancement Program (EEP) and the Clean Water Management Trust Fund (CWMTF). The contract work was performed by Dye Management Group, Inc. The chairs have received an interim report and a draft final report and briefing from the firm. The final report and briefing was presented by Mr. Robert Cooney, Vice President of the firm (see **Exhibit D** for a copy of his PowerPoint presentation and **Exhibit E** for a copy of the Final Report and Recommendations). Senator Jenkins requested that committee and commission members hold their questions until the end of the report.

The highlights of the recommendations of the study include:

- A merger of the EEP and CWMTF is not recommended; instead programmatic synergies should be aggressively pursued
- The North Carolina Department of Transportation (NCDOT) and North Carolina Department of Environment and Natural Resources (NCDENR) must renegotiate the memorandum of agreement (MOA) with the United States Army Corps of Engineers to increase flexibility
- NCDOT and EEP must work together to manage surplus issues
- NCDOT and EEP should transition from advanced mitigation to just-in-time mitigation including two-phased TIP
- Implementation will require senior executive engagement from NCDOT and NCDENR

Representative Gibson asked how the just-in-time model fits into Region IV's interpretation of where we are now versus where we need to go. Mr. Cooney replied the preference would be to have advanced mitigation. The challenge is that advanced mitigation presents a need for a much more accurate level of planning. Representative Gibson then asked how to rectify the natural antagonistic relationship between DENR, whose job is to protect the environment, and DOT, whose job is to develop

roads and highways. Mr. Cooney replied that the just-in-time approach presumes that the mitigation would be in place at the time the permit is applied for. With the just-in-time approach, the mitigation would not be in place for five years with monitoring so it can be said the situation is fully functionally mitigated. The elements of advanced mitigation would be achieved with more information. Mitigation banking would be more reasonably expensed. The goal would be to move transportation projects ahead in an environmentally sensitive and fiscally responsible way. Mr. Cooney commented that at present the balance leans toward protecting the environment at the expense of fiscal constraints. It is hoped that by starting later there will not be as much surplus mitigation, which will result in being more fiscally conservative. Changes to the MOA with the U. S. Army Corps of Engineers will also help in that if there is surplus mitigation, it can be used to mitigate other areas within the same river basin, and DOT will not need to build as much mitigation. The Corps has been clear in discussions with the study team that they are open to the one-to-one concept, but want to be able to make the call at the time of permitting.

Representative Gibson asked how DENR and DOT could work together to achieve the just-in-time mitigation. Mr. Cooney replied that one of the requirements of being able to do that is the development of accurate forecasting tools by DOT. EEP today works with the forecasting they receive from DOT. Representative Gibson asked if private mitigation outside of experimentation is not feasible in the current model. Mr. Cooney commented Dye Management did not see much enthusiasm in the mitigation banking community coming into North Carolina. Currently, there are eight mitigation banks with fifteen sites in the state. Their suggestion for the pilot is to have EEP turn over responsibility in some areas where banks are functioning to the banks, and if that works, it will demonstrate that banking can be viable. The difficulty is that in North Carolina taking mitigation off the critical path of projects seems to work. It may cost more, but it works.

Representative Gibson asked if Dye Management had heard from DENR or DOT about what the pilot program would cost or what staff it would take for the transition. Mr. Cooney replied there are cost estimates for some of the recommendations in the report; however, they did not get estimates of how much staff it would take.

Representative Allen asked if Mr. Cooney believed it would be a good idea to allow CWMTF to provide compensatory mitigation. Mr. Cooney replied it would provide opportunities to leverage the total expenditure in terms of mitigation. There is a lot of resistance to that idea from current grantees of the program because they feel that any change to the CWMTF could take away from its intended purpose to provide grants for improving water quality in North Carolina. It would, however, open up a new method for mitigation. Representative Allen commented that she does not see how the change could be made without damaging the mission of the Fund.

Senator Jenkins said some of the interim reports discussed specifics, particularly the surplus inventory. In Division II, there is $100 million worth of land with no projects identified that needs to be divested. Another is the fact that the North Carolina Merger 01 process is the only one like it, and all the other states do it differently. Mr. Cooney said Florida has a process that is similar, called their Environmental Transportation Decision-Making Process, although their completion process is quicker than North Carolina's. With the Florida process, advice and input is sought at certain points in the process, while in North Carolina there are defined points at which they seek concurrence before moving to the next step.

Senator Jenkins said the proposed federal program would change the method and responsibility for providing necessary mitigation. Mr. Cooney responded that under the proposed federal rulemaking issued in June 2006, if adopted as stated, mitigation banks will take more responsibility for providing mitigation. One of the things the regulation would do is eliminate fee programs. The challenge in North Carolina is that there are only a few mitigation banks in the state. The short term solution in regard to mitigation banks might be that DOT would have to be responsible for doing its own mitigation again. Historically there has been a lot of tension in North Carolina between DOT and regulators concerning mitigation, tension that is not seen in other states. In Virginia and Georgia, the DOT takes responsibility for mitigation either by buying credits or by doing it. While some

projects missed contract letting dates for various reasons, those two states did not have the problem that has been present in North Carolina in the past.

Senator Jenkins commented that one of the reasons for the lack of private mitigation banker participation is that certain river basins have been carved out by EEP, resulting in a monopoly situation, somewhat restricting private mitigation bankers. Mr. Cooney replied that DOT is the sole source provider for 85 percent of mitigation needs, which means that 85 percent of the state is not available to the private banker. EEP will go to bankers as a source of credits, however, so they will occasionally sub work to a banker. Nationally, bankers put their effort into building banks where they think DOT will need credits, and in North Carolina, that is not currently an option. Senator Jenkins commented that the situation is one in which a state agency is creating a monopoly at the expense of what private business is willing to do. He added that he believes that situation needs to be addressed. Mr. Cooney said that circumstance led to the recommendation for the mitigation banking pilot. The consultants believe the pilot program might open the door for mitigation banks to return to the state.

Representative Gibson asked if there was any investigation into the qualitative aspects of the mitigation and survivability. Mr. Cooney replied they did talk to the stakeholders about their thoughts on that. There appeared to be greater comfort from regulators in the Division of Water Quality about the quality of the mitigation that is coming out of EEP versus the quality of mitigation done when DOT was responsible for the program, but there is no statistical validation of that, and there is no baseline data to determine the answer. Representative Gibson commented that it is important to maintain the quality of mitigation. He added that it was probably the concern for quality that began the EEP, thereby putting private mitigation banking up against public. EEP being in charge of making qualitative judgments and being in competition with private bankers is a problem that requires a solution. Senator Jenkins commented that in today's economic climate, the state cannot be spending money on something that reaps no benefit.

The meeting adjourned at 6:00 p.m.

Representative Pryor Gibson, Co-Chair, ERC

Senator Charlie Albertson, Co-Chair, ERC

Dot Waugaman, Commission Clerk

Senator Daniel Clodfelter, Co-Chair, ERC

Senator Clark Jenkins, Co-Chair, JLTOC, Presiding

Representative Nelson Cole, Co-Chair, JLTOC

RE: **Notice of Commission Meetings**
Additional Information

COMMISSION MEETINGS:

The Environmental Review Commission (ERC) will meet at 3:00 p.m. on Monday 11 June 2007 in Room 544 of the Legislative Office Building in Raleigh. The purpose of this meeting is to receive and review the following:

1. The Annual Report on Solid Waste Management (G.S. 130A-309.06(c)).

2. The Final Report on Costs Associated with Providing Nutrient Controls that are Adequate to Offset Point Source and Nonpoint Source Discharges of Nitrogen and other Nutrients (Nutrient Offset Payments) prepared by Research Triangle Institute, International pursuant to S.L. 2006-215, as amended by S.L. 2006-218 and Section 5.3 of S.L. 2006-255.

The Environmental Review Commission (ERC) and the Joint Legislative Transportation Oversight Committee will meet at 5:00 p.m. on Monday 11 June 2007 in Room 544 of the Legislative Office Building in Raleigh. The purpose of this meeting is to receive and review:

1. The Final Report and recommendations on the Merger of the Ecosystem Enhancement Program and the Clean Water Management Trust Fund prepared by Dye Management Group pursuant to Section 16 of Part XVI of S.L.2006-248.

No public staff meeting will be held in connection with this meeting.

ADDITIONAL INFORMATION:
If you have questions related to the Commission, you may contact the Commission Counsel or other Commission staff at (919) 733-2578.

General Assembly of North Carolina
State Legislative Building
Raleigh, North Carolina

JOINT MEETING
Environmental Review Commission
Joint Legislative Transportation Oversight Committee

AGENDA
5:00 p.m. Monday 11 June 2007
Room 544 Legislative Office Building
Raleigh, North Carolina

1. Call to order
   Senator S. Clark Jenkins, Presiding

2. Introductory remarks by Cochairs
   Senator S. Clark Jenkins
   Representative Nelson Cole

   Senator Charles W. Albertson
   Senator Daniel G. Clodfelter
   Representative Pryor A. Gibson

3. Report and explanation of agenda items
   Lisa Hollowell, Fiscal Analyst
   George F. Givens, Commission Counsel

4. Final Report and recommendations by Dye Management Group on the Merger of the Ecosystem Enhancement Program and the Clean Water Management Trust Fund pursuant to Section 16 of Part XVI of S.L.2006-248.
   Robert Cooney, Vice-President
   Dye Management Group, Inc.

5. Discussion and announcements

6. Adjourn

Ecosystem Enhancement Program

cleanwater MANAGEMENT TRUST FUND

North Carolina General Assembly

Study of the Merger of Ecosystem Enhancement Program & Clean Water Management Trust Fund

Final Briefing

June 2007

DYE MANAGEMENT GROUP, INC.

EXHIBIT D

Highlights

- Merger of EEP and CWMTF not recommended; instead aggressively pursue programmatic synergies
- NCDOT and NCDENR must renegotiate EEP MOA to increase flexibility
- NCDOT and EEP must work together to manage surplus issues
- NCDOT and EEP should transition from advanced mitigation to just-in-time mitigation including two-phased TIP
- Implementation will require senior executive engagement from NCDOT and NCDENR

2

Agenda

- Study context
- Study scope and approach
- Summary of findings
- Key recommendations
- Implementation timelines and responsibilities

3

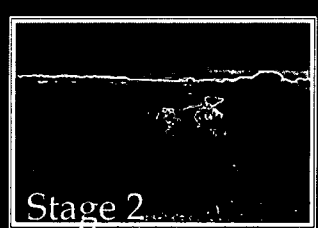
Regulatory Framework

- §401 and § 404 of Clean Water Act established basis for regulations requiring permits and mitigation as a condition of a permit when impacting "waters of the United States"
- Companion North Carolina statues and regulations for "waters of the State"
  - EPA,U.S. Army Corp of Engineers and DWQ have lead responsibility

4

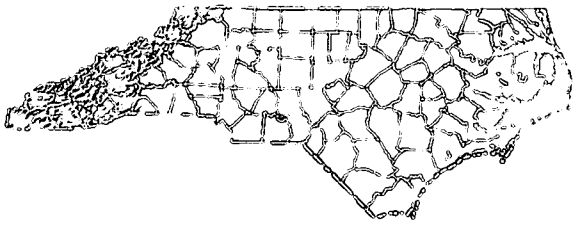
What is Mitigation?

- Goal is "no net loss"
- Minimum requirement is 1:1, but may be done at higher ratios to provide insurance against failure or to compensate for off-site/out-of-kind replacement
  - In North Carolina, mitigation is traditionally done in the same USGS eight-digit "cataloguing unit" as the impact



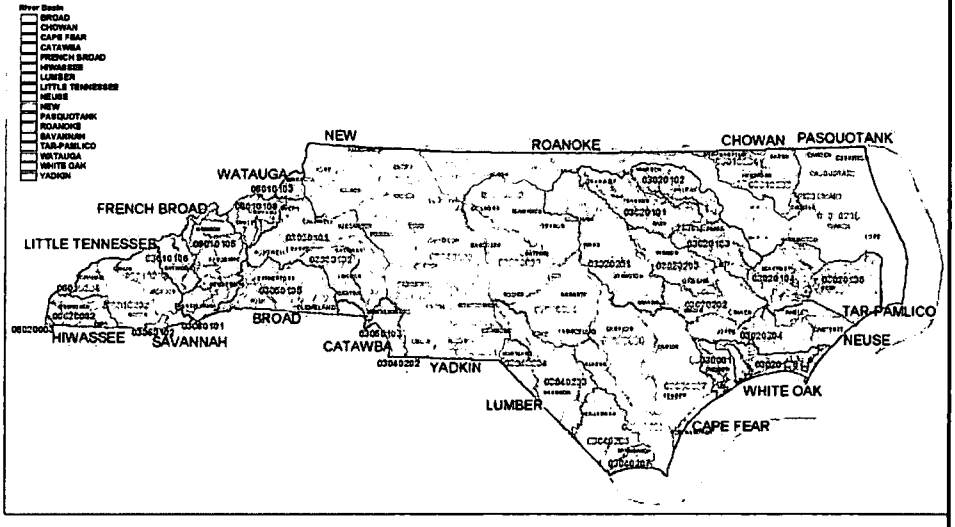
North Carolina

- Contains 5.7 million acres of wetlands, 95% of this in the coastal plan region of the state
- 93 natural heritage aquatic areas of national concern and state significance
- 70% of rare and endangered species in the state are wetland dependent



6

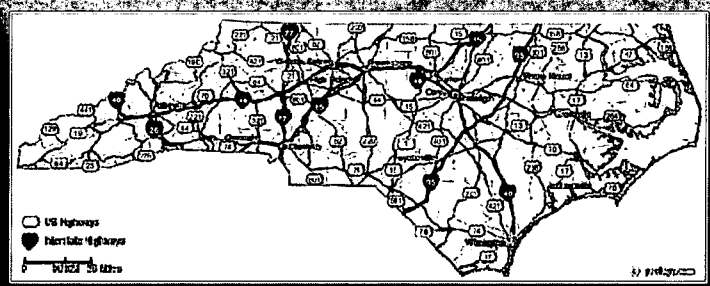
Cataloging Units Across River Basins



7

North Carolina Highway Trust Fund

- Adopted in 1989 and included:
  - Completion of the Intrastate Highway System, a 3,600 mile network of four-lane highways
  - Construction of urban loops



8

Mitigation Prior to 2003

- NCDOT managed own mitigation program
  - Mitigation was project specific
  - A large number of projects delayed due to mitigation
    - Increased cost of construction
    - Impacted NCDOT credibility with stakeholders
- State established the Wetlands Restoration Program (WRP) as an in-lieu fee program

9

Ecosystem Enhancement Program

- Advanced mitigation
- Programmatic watershed based approach
- Mitigation required to be in 8-digit cataloguing unit
- Seven year build-out leveraging high quality preservation lands to start-up

Payne Dairy (Jumping Run Creek) stream restoration site

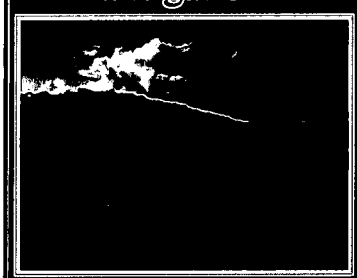
Aerial shot of the site prior to construction

Photo showing the relocated and more sinuous channel

10

Clean Water Management Trust Fund

- Established by the legislature in 1996
- Voluntary grants based program
- Five program areas
- Not allowed to provide compensatory mitigation



Wastewater: Lake Fontana

Stormwater/Restoration: Wilson Bay

Acquisitions: Chimney Rock

11

Study Background (1 of 2)

- As the EEP ramped up a number of questions were raised by various policy-makers and other stakeholders:
  - Overall cost effectiveness of EEP
  - Appropriateness of EEP's mission/goals/objectives
  - Whether requiring mitigation within a specific 8-digit cataloguing unit was creating operational complexities and significantly increasing the cost of mitigation for NCDOT
  - Practicality of delivering advanced mitigation given the lack of stability in NCDOT's "demand forecast"

12

Study Background (2 of 2)

- Questions were also raised about potential synergies between the EEP and the CWMTF:
  - Potential of removing the restriction on the CWMTF participating in compensatory mitigation
  - Allowing some CWMTF or other state funded projects be applied as mitigation credits for transportation projects
  - Opportunities to work with regulators in certain cases to utilize non-traditional mitigation approaches for projects

13

Study Scope (1 of 2)

- Review current organizational structure and key work processes of EEP and CWMTF
- Compare EEP's processes with NCDOT's mitigation program
- Assess potential role of mitigation banks
- Review practices in peer states and assess applicability
- Assess impact of proposed federal rule making on EEP
- Develop an inventory of acquisitions/credits to assess the extent of the mitigation surplus

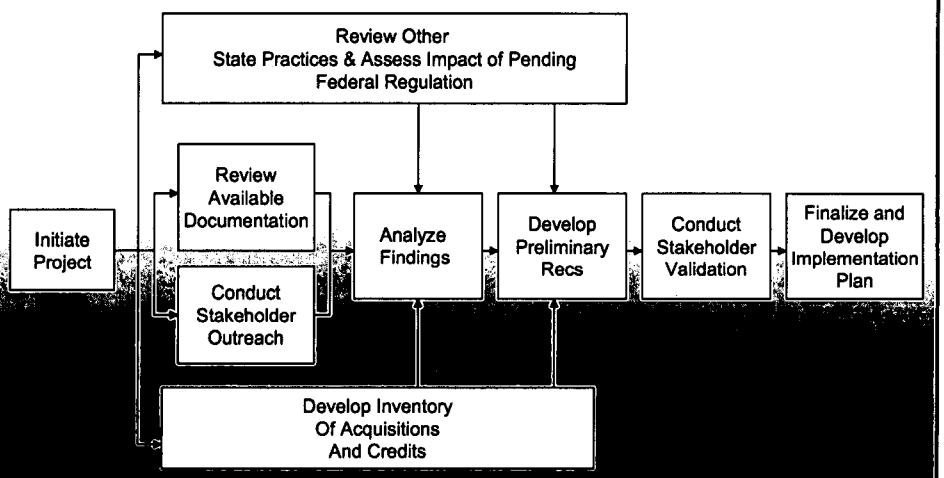
14

Study Scope (2 of 2)

- Conduct an alternatives analysis of potential organizational models:
  - Status quo
  - Status quo with modifications designed to achieve efficiencies and promote enhanced programmatic synergies between EEP and CWMTF
  - Merger of EEP and CWMTF programs
  - Returning responsibility for mitigation to NCDOT
  - Implementing a private mitigation banking model

15

Project Approach



16

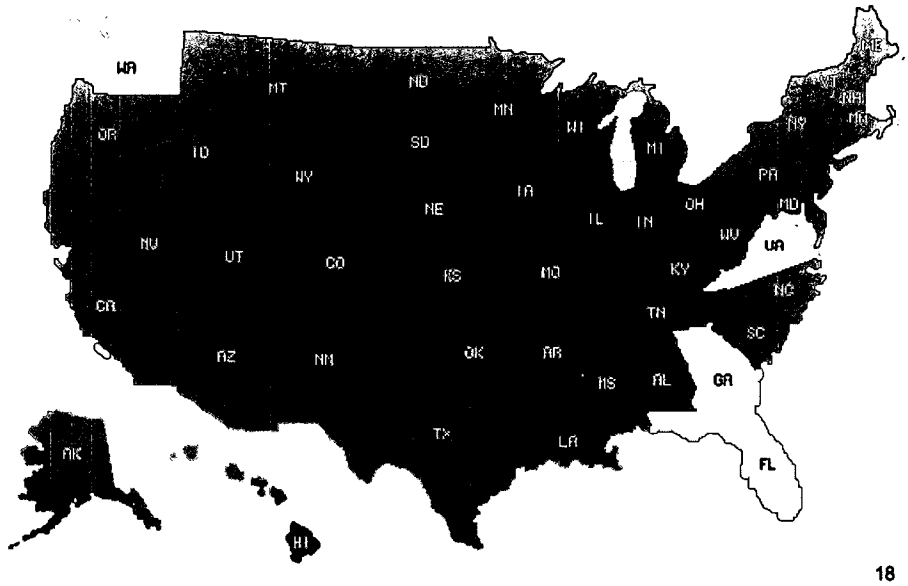
State Property Office	1
Private mitigation bankers	2
Total Interviews:	**41**

17

Review of Peer States



18

Summary of Findings (1 of 8)

- No permit has been delayed for mitigation since the initiation of the EEP:
  - Mitigation has been removed from the critical path for obtaining permits and letting highway construction projects
  - NCDOT has avoided at least $6.5 million in potential construction cost increases due to delayed lettings

19

Summary of Findings (2 of 8)

- There are is a fundamental disconnect in EEP's strategy/approach:
  - Inability to accurately predict needs in order to have the right amount of mitigation in the ground in the right place five years ahead of the project being let

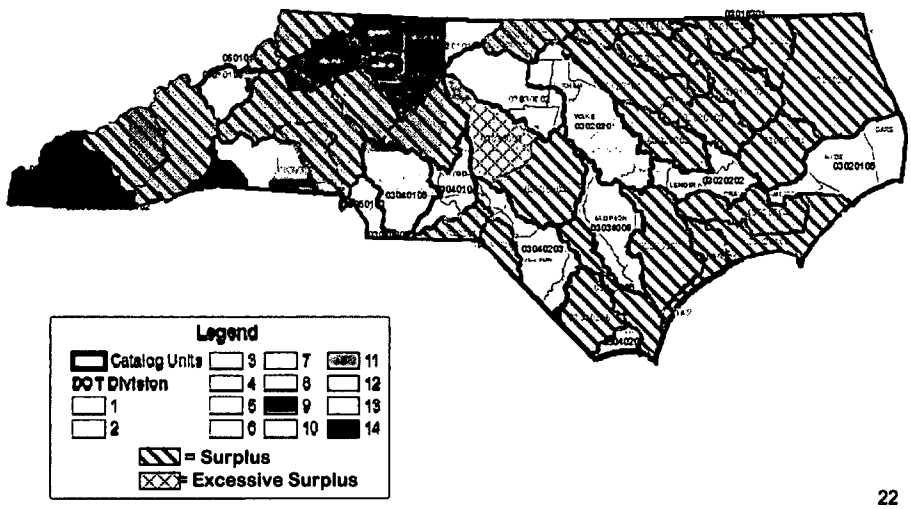
20

Summary of Findings (3 of 8)

- There will likely be a surplus of mitigation in a number of cataloguing units as a result of:
  - Volatility in the TIP
  - Inexperience in forecasting mitigation requirements on the part of NCDOT
  - Lack of any flexibility to apply credits outside the cataloguing unit being impacted
  - An overly aggressive program on the part of both NCDOT and the EEP to acquire high-quality preservation lands; to date, approximately $100 million has been spent to acquire high-quality preservation lands

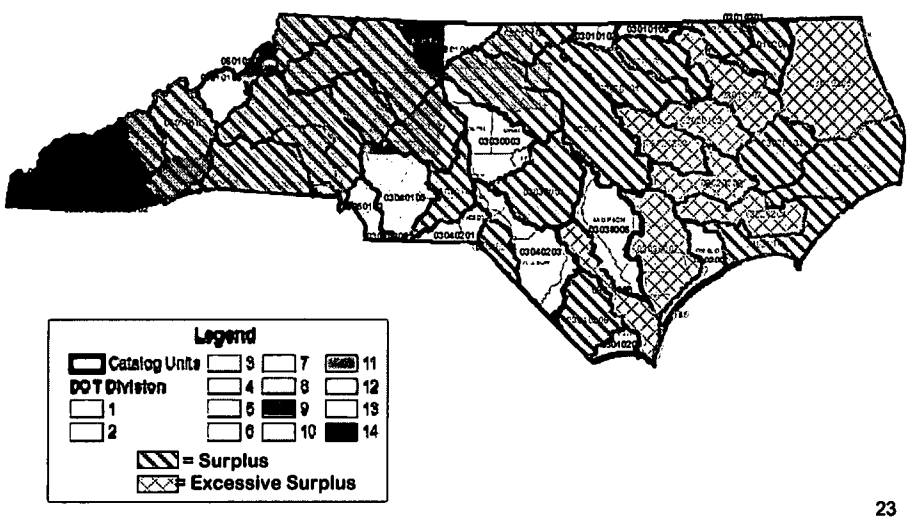
21

Stream Restoration Mitigation Projection Surplus – June 2010



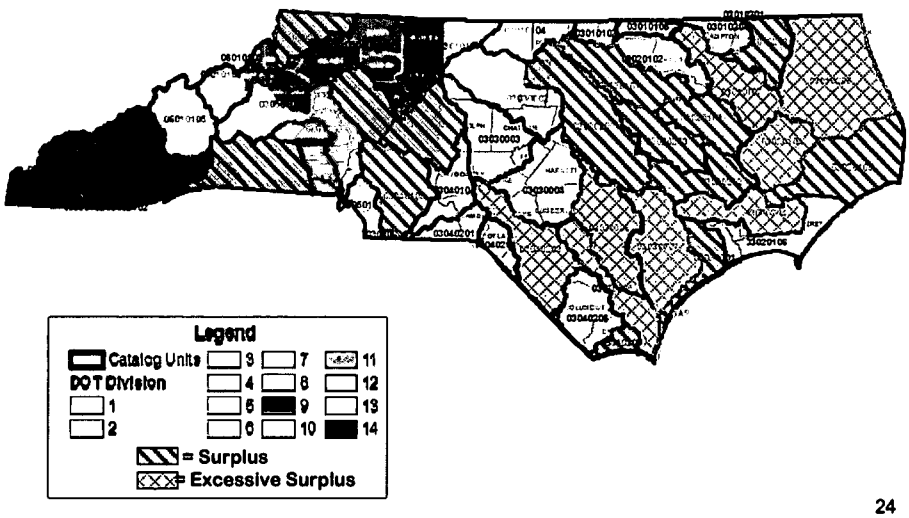
22

Riparian Restoration Mitigation Projection Surplus – June 2010



23

Nonriparian Restoration Projection Surplus – June 2010



24

Summary of Findings (4 of 8)

- EEP is recognized nationally as a model program; however, there are no states actively trying to replicate an EEP-like program for a variety of reasons.
  - Number and degree of maturity of mitigation banks in many states
  - Extensive organizational change management required to implement an EEP-like program
  - Implementation cost
  - Uncertainty concerning the impact of the proposed federal mitigation rules

25

Summary of Findings (5 of 8)

- Draft of proposed federal mitigation banking rules would eliminate in-lieu fee programs:
  - Likely cause substantial restructuring of the EEP
  - Responsibility for mitigation could be transferred back to NCDOT
  - EEP is well respected by regulators at the federal level and a number of comments on the proposed rule voiced support for EEP-like programs
  - Reasonable likelihood that the final rule will allow programs similar to the EEP to continue

26

Summary of Findings (6 of 8)

- Several of our peer states make extensive use of mitigation banks for transportation projects; however, mitigation banks have traditionally not been very strong in North Carolina:
  - Very narrow definition of service area (cataloguing unit)
  - Banks not economical in some areas due to limited demands for services
  - State-sponsored "competition"

27

Summary of Findings (7 of 8)

- EEP and the CWMTF have worked together:
  - EEP buying "projects" from CWMTF
  - Partnering on land acquisitions
- There are also a number of other potential programmatic synergies:
  - Working together to address the surplus issue
  - Partnering on functional mitigation and out-of-the-box mitigation projects
  - Integrating EEP's watershed planning process with CWMTF's application and selection process

28

Summary of Findings (8 of 8)

- Lack of integration between the state's various water resources planning processes:
  - EEP's watershed planning
  - DWQ's basin-wide planning
  - No clear list of priority projects from these planning efforts
  - No linking of these plans/priorities into the CWMTF application process
- EEP and CWMTF using two different site stewardship approaches

29

Key Recommendations (1 of 7)

- There are limited benefits to merging EEP and CWMTF:
  - Different organizational focuses: voluntary grants program vs. compensatory mitigation
  - CWMTF is a grantor agency; EEP is a delivery organization
  - Significant risk in terms of achieving stakeholder buy-in and cultural change

30

Key Recommendations (2 of 7)

- While the organizations should remain independent, programmatic synergies between EEP and CWMTF should be aggressively pursued
- The EEP should be formally linked into all state land acquisitions to ensure mitigation $$ have first chance to fund potential acquisition opportunities

31

Key Recommendations (3 of 7)

- NCDOT and NCDENR should work with the U.S. Army Corps of Engineers to negotiate changes to the MOA to provide added flexibility:
  - Ability to utilize applicable, surplus credits within the same river basin rather than constructing additional mitigation
  - Clear statement of direction that mitigation ratios will be reduced in situations where mitigation is in the ground and functional at the time of impact

32

Key Recommendations (4 of 7)

- Immediate implementation of a surplus action plan:
  - Confirmation of identified surplus in various cataloguing units
  - Review of HQP and other sites to determine if all uplands are required
  - Action strategy for each property including sale of the property if that is most appropriate
  - Partnership between EEP and CWMTF for selected projects – possible target of 20% of CWMTF funds for this purpose

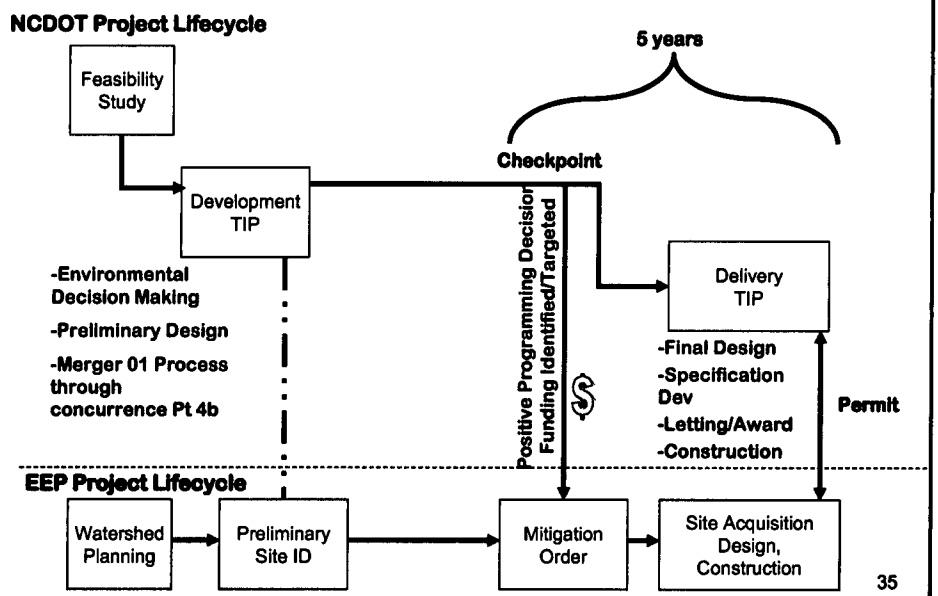
33

Key Recommendations (5 of 7)

- Move from an advanced mitigation model to a just-in-time mitigation model:
  - NCDOT should implement a two-phased TIP with a development TIP and a delivery TIP
  - Mitigation would be ordered at time a project is programmed into the delivery TIP
  - NCDOT would pay EEP on a per-credit fee basis when mitigation is ordered

34

Just-in-time Mitigation



35

Key Recommendations (6 of 7)

- EEP and CWMTF should partner on pilot projects for functional mitigation and out-of-the-box mitigation
- EEP should initiate a three-year mitigation banking pilot in multiple watersheds
- NCDENR should work with EEP and CWMTF to establish a single stewardship approach for both organizations

36

Key Recommendations (7 of 7)

- NCDENR should improve the integration and overall value proposition of its various water resource planning processes by:
  - Improving integration of the EEP's watershed planning with DWQ's basin-wide planning process
  - Strengthening the end products resulting from the watershed planning process to define specific priority projects
  - Linking CWMTF's grant application/selection process more closely to the basin wide and watershed plans and the identified priority projects

37

Implementation Plan

- A number of elements are time sensitive:
  - Changes to the MOA
  - Surplus action plan
- Others will require staged-transition plans:
  - Shift to just-in-time mitigation
- Effective implementation will require:
  - Senior executive engagement
  - On-going coordination between EEP, CWMTF, NCDENR management and NCDOT

38

Implementation Timeline

NCDOT & DENR | EEP & CWMTF | CWMTF
NCDOT & EEP | NCDOT | EEP

	2007				2008				2009				2010				2011			
	Spring	Summer	Fall	Winter	Spring	Summer	Fall	Winter	Spring	Summer	Fall	Winter	Spring	Summer	Fall	Winter	Spring	Summer	Fall	Winter
Modify MOA																				
Identify actual surplus																				
Implement partnership to help manage surplus																				
Initiate functional mitigation pilot project																				
Evaluate options for water resource planning process & implement proposed improvements to watershed planning/CWMTF processes																				
Complete design & deploy 2 stage TIP																				
Implement & deploy web-based grants tracking application software																				
Design and implement CWMTF outcome measurement and reporting process																				
Implement EEP project delivery process improvements																				
Conduct a review to achieve standardization between EEP and CWMTF																				
Initiate the EEP/CWMTF out-of-the-box mitigation pilot project																				
Transition to a just-in-time mitigation approach based on the programming of a project into the delivery TIP																				
Transition to a per fee credit basis for NCDOT acquisition of mitigation credits																				

Recap

- Merger of EEP and CWMTF not recommended; instead aggressively pursue programmatic synergies
- NCDOT and NCDENR must renegotiate EEP MOA to increase flexibility
- NCDOT and EEP must work together to mange surplus issues
- NCDOT and EEP should transition from advanced mitigation to just-in-time mitigation including two-phased TIP
- Implementation will require senior executive engagement from NCDOT and NCDENR

Executive Summary

Section 16 of Part XVI of Session Law 2206-248, House Bill 1723 directed the Environmental Review Commission and the Joint Legislative Transportation Oversight Committee to jointly study the merger of the organizational functions of the Ecosystem Enhancement Program (EEP) and the Clean Water Management Trust Fund (CWMTF). The North Carolina General Assembly engaged Dye Management Group, Inc. to conduct this study. This report documents the result of this study.

Based on the study, the merger of the EEP and the CWMTF is not recommended. However, there are opportunities for a number of programmatic synergies between the EEP and the CWMTF, which should be initiated. In addition, the study also identified a number of policy changes and process improvements to improve the overall efficiency and effectiveness of EEP operations and the interrelationship between EEP and the North Carolina Department of Transportation (NCDOT).

A. Study Overview

In 1989, the North Carolina General Assembly passed the Highway Trust Fund Act, initiating a significant transportation construction program. The increase in impacts to aquatic resources resulting from the highway construction program also resulted in a substantial increase in compensatory mitigation requirements for the North Carolina Department of Transportation (NCDOT) under §401 and §404 of the Clean Water Act.

During the 1990s, NCDOT typically addressed the mitigation required to obtain permits from the United States Army Corps of Engineers (USACE) and the North Carolina Division of Water Quality (DWQ) at the time of the permit application. Permit applications were made within the year prior to the proposed date for letting the transportation project (selection of a construction contractor) and initiating the construction phase of a project. As part of the permit application process, NCDOT discussed mitigation requirements, the acceptable location for this mitigation, and the details concerning the construction of this mitigation with regulators. NCDOT developed detailed mitigation plans for each project and USACE and DWQ staff reviewed these plans thoroughly prior to issuing the appropriate permits. This process was relatively ineffective, and an estimated 40% of projects requiring mitigation were delayed for several months or several years because of permit issues related to mitigation. These delays increased the cost of constructing the projects and created a loss of confidence in NCDOT by its numerous stakeholders.

Because of these problems with mitigation, the North Carolina Board of Transportation and NCDOT initially established its own internal advanced mitigation program, with the goal of having mitigation in place at the time a project was actually let to construction. Then in 2001, an interagency team recommended that the responsibility for providing mitigation be

transferred to a new agency within the Department of Environment and Natural Resources (NCDENR). This agency, to be known as the Ecosystem Enhancement Program, would provide advanced mitigation to meet the needs of NCDOT as well as take over responsibility for the in-lieu-fee program, which was then housed in the Wetlands Restoration Program (WRP).

The cornerstone of the EEP is a detailed watershed-planning process that is designed to identify high-quality, cost-effective mitigation projects that will also contribute to watershed improvement and protection and open space preservation. The EEP provides a programmatic approach to providing in-ground, functioning compensatory mitigation for the majority of permitted impacts in advance of the loss of aquatic resources.

The EEP develops mitigation sites and/or acquires mitigation credits from mitigation banks to meet NCDOT mitigation requirements based on demand forecasts provided by NCDOT. The Memorandum of Agreement (MOA) between NCDOT, NCDENR and USACE, which established the EEP, specifies that this mitigation will be implemented within the same eight-digit United States Geologic Survey (USGS) cataloguing unit in which the impact occurred. EEP uses a number of techniques to identify appropriate mitigation sites including its watershed planning process, which it conducts at various levels of detail in the different river basins across the state based on the anticipated level of needs in the cataloguing units within the river basin. .

To help jumpstart the EEP and immediately remove mitigation from the critical path for obtaining a permit and initiating construction of transportation projects, EEP was initially given additional flexibility in the way that mitigation was provided. This included allowing the EEP to utilize high-quality preservation lands in higher ratios than is normally allowed to meet 100% of permit requirements, with the understanding that the required wetland and stream restoration would be developed by the end of the transition period. The goal was that, at the end of a seven-year ramp-up period, the EEP would begin to have the actual restoration projects in the ground, with successful monitoring complete, in advance of the letting of the construction project at which point half of the high quality preservation lands would then be released for future use within the designated ecoregion.

While the EEP is focused on providing mitigation, North Carolina's Clean Water Management Trust Fund (CWMTF) has a broader mission of preserving and enhancing water quality within the state of North Carolina. Established by the General Assembly in 1996, CWMTF helps local governments, state agencies, and conservation non-profit groups finance projects to protect and restore surface water quality. Since 1996, as result of on-going appropriations from the General Assembly, CWMTF has awarded 943 grants for a total of $711.5 million. CWMTF provides grants to:

- Enhance or restore degraded waters.
- Protect unpolluted waters.
- Contribute toward a network of riparian buffer and greenways for environmental, educational, and recreational benefits.

CWMTF projects include improvements to wastewater treatment and collection systems; storm water management; wetlands, riparian buffer, and stream restoration; and the acquisition of buffers, floodplains, wetlands, and greenways. CWMTF's enabling legislation specifically restricts it from providing compensatory mitigation.

Beginning in 2004 and continuing into 2005 and 2006, as the EEP program ramped up and acquisition and restoration activities were initiated, a number of questions were raised about the actual cost of the EEP and whether the cost of its operation will provide the anticipated payback in terms of helping to expedite the letting of transportation projects. In addition, there were other operational questions raised as well, including whether the MOA stipulation to require mitigation within a specific cataloguing unit was creating operational complexities for the EEP and thus significantly increasing the cost of mitigation for NCDOT.

At the same time, there were also questions raised by a number of policy makers about whether there may be potential synergies between the EEP and the CWMTF that the state was not taking full advantage of, given some of the overlap in the missions of these two agencies. Some policy makers, for example, questioned whether the prohibition on the CWMTF participating in compensatory mitigation should be re-assessed. Removing the restriction on the CWMTF participating in compensatory mitigation could allow some of the riparian buffer, wetland and stream restoration projects funded by the state through the CWMTF to then be applied as mitigation credits for transportation projects. Likewise, some policymakers believed that there could be opportunities to work with regulators in certain cases to utilize non-traditional mitigation approaches for projects such as repairing a failing wastewater treatment plant downstream in an area being impacted by a transportation project.

In response to these issues and others, this study was initiated. The scope of the study included conducting a detailed review of the current organizational structure and key work processes of both the EEP and the CWMTF programs, comparing the EEP processes with the previous NCDOT mitigation program and assessing the potential role of mitigation banks in North Carolina. In addition, the study team was asked to review practices in other peer states and assess their applicability to North Carolina, assess the impact of proposed federal rule making on the EEP, and develop an inventory of acquisitions and credits to assess whether there is a surplus of mitigation credits in some areas of the state. The team also conducted a detailed alternatives analysis of five (5) potential models for both better integrating the EEP and the CWMTF and providing mitigation in North Carolina. These alternatives included:

- The status quo in which the EEP and the CWMTF are independent programs.
- The status quo with modifications designed to improve the efficiency of the current program environment and promote enhanced programmatic synergies between the EEP and the CWMTF.
- A merger of the EEP and the CWMTF programs.
- Returning responsibility for mitigation for transportation projects to NCDOT.

- Implementing a private mitigation banking model to the extent practical.

As part of this study effort, the team conducted a significant stakeholder outreach effort, including conducting more than 40 detailed interviews and executing follow-up work sessions with various stakeholders to review findings and potential recommendations.

B. Summary of Key Findings

Highlights of some of the key findings from this study include the following:

- The NCDOT mitigation program was not effective in meeting its program objectives, with more than 40% of permits requiring mitigation delayed for various lengths of time.
- No permit has been delayed for mitigation since the initiation of the EEP, resulting in cost avoidance to NCDOT of at least $6.5 million in potential construction cost increases due to delayed lettings.
- Based on NCDOT's demand forecast, there will be a surplus of mitigation in a number of cataloguing units. This surplus is the result of a number of factors, which include volatility in the transportation improvement program (TIP), inexperience in forecasting mitigation requirements on the part of NCDOT, the lack of any flexibility to apply credits outside the cataloguing unit being impacted, and an overly aggressive program on the part of both NCDOT and the EEP to acquire high-quality preservation lands.
- Based on NCDOT's demand forecast, there will be a surplus of mitigation in a number of cataloguing units. This surplus is the result of a number of factors, which include volatility in the transportation improvement program (TIP); inexperience in forecasting mitigation requirements on the part of NCDOT; decreases in actual mitigation requirements after mitigation was acquired based on the initial higher forecast;.the lack of any flexibility to apply credits outside the cataloguing unit being impacted, and an overly aggressive program on the part of NCDOT and EEP to acquire high-quality preservation lands.
- The genesis of this surplus issue pre-dates the EEP. It started with the NCDOT's advance mitigation program and the department's efforts to acquire high-quality preservation lands.
- Between the EEP and NCDOT, more than $78 million has been spent to acquire high-quality preservation lands. However, some of this land is uplands, and, based on discussions with various stakeholders, portions of these properties may be logical candidates for sale.
- The EEP is recognized nationally as a model program; however, there are no states actively trying to replicate the EEP program for a variety of reasons. These reasons include the number and the degree of maturity of mitigation banks in many states, the organizational change and management effort required to implement an EEP-like

program, the cost of implementing the program, and uncertainty concerning the impact of the proposed federal mitigation rules on an EEP-like program.

- The proposed federal mitigation banking rules, as initially written in draft form, would eliminate in-lieu fee programs. This would likely cause substantial restructuring of the EEP and how it provides mitigation for permittees, including the NCDOT. In many cases, responsibility for mitigation would be transferred back to NCDOT. If this were to occur, NCDOT would need to utilize mitigation banks and/or implement project specific mitigation. However, the EEP is well respected by regulators at the federal level and a number of comments on the proposed rule voiced support for EEP-like programs =. Thus, it is our sense that there is a reasonable likelihood that the final rule will allow programs similar to the EEP to continue.
- Several of the peer states surveyed as part of the study make more extensive use of mitigation banks to meet their mitigation requirements for transportation projects; however, mitigation banks have traditionally not been very strong in North Carolina. Some of the reasons for this are the very narrow definition of service area (cataloguing unit) and the fact that banks would not be economically viable due to limited demands for services in some areas of the state.
- There are a number of ways in which the EEP and the CWMTF already work together today. However, we believe there are a number of potential additional programmatic synergies between the two organizations, including working together to address the surplus issue, partnering on functional mitigation and out-of-the-box mitigation projects, and more tightly integrating the EEP's watershed planning process with the CWMTF's application and selection process.

C. Summary of Major Recommendations

Some of the major recommendations from the study include the following:

- Our analysis suggests that there are limited benefits to merging the EEP and the CWMTF. While both agencies are focused on creating positive environmental outcomes, the EEP is responsible for delivering a compensatory mitigation program based in a fairly structured, regulatory environment. The CWMTF, on the other hand, is responsible for managing a voluntary program with a substantially larger scope. Likewise, while the EEP is a delivery organization that manages the restoration of streams and wetlands, the CWMTF is a grantor agency that provides funding to other organizations that actually design and implement projects. In addition, there would be significant risk in terms of stakeholder buy-in and cultural change between the two organizations.
- While we do not recommend an actual merger of the two organizations, we believe that there are a number of programmatic synergies between the EEP and the CWMTF that should be aggressively pursued. These programmatic synergies include:
  - Ensuring that the EEP is engaged in all state land acquisitions in order to utilize mitigation dollars as the first source of funding for any acquisitions by the state

in an area where there is a need for mitigation credits and the property being acquired would be eligible for mitigation credits.

- Linking the two organizations more closely through tighter integration of the EEP's watershed planning process with the CWMTF's grant application and selection process.
- Developing a partnership between the EEP and the CWMTF to provide a mechanism to help other state agencies, local governments, or land trusts acquire the mitigation lands that may be declared as surplus.
- Developing a partnership between the EEP and the CWMTF to jointly pursue functional replacement projects and a pilot of an out-of-the-box mitigation project.

- In addition, the General Assembly should consider removing the prohibition on the CWMTF participating in compensatory mitigation. Having the option to utilize CWMTF monies for compensatory mitigation would provide the state additional flexibility and provide the potential for better leveraging the state's scare financial resources. It also may allow the CWMTF and the EEP to work together more effectively in the future on functional mitigation and out-of-the-box mitigation initiatives.
- NCDOT and NCDENR, as the state's two agency partners in the MOA, should work with USACE to negotiate changes to the MOA to provide for the flexibility to utilize applicable, surplus credits between cataloguing units a within the same river basin.
- NCDOT and NCDENR should also renegotiate the MOA to include a clear statement of direction that mitigation ratios may be reduced in situations where mitigation is in the ground and functional at the time of impact. This will substantially reduce the amount of mitigation needed over the long term and result in significant savings for the state.
- NCDOT and the EEP should complete identification of surplus properties and develop an action plan for each property including sale of the property if that is most appropriate.
- NCDOT should improve the quality of the demand forecast for mitigation by implementing a two-phased Transportation Improvement Program (TIP). This two-phased TIP would include a development TIP that contains projects from the feasibility study, environmental planning and preliminary design stages of the project delivery life cycle, and a delivery TIP consisting of projects that are in final design, letting preparation, and the construction phases of the project delivery life cycle. A comprehensive review and sign-off process would be required to program a project into the delivery TIP.
- NCDOT and the EEP should shift from the current advanced mitigation approach to more of a just-in-time mitigation approach, wherein mitigation is ordered and work initiated well in advance of starting construction but only at a point where there is a firm commitment by NCDOT that the transportation project will actually be done. This will allow the actual requirements for mitigation to be more clearly understood

because most of the collaborative decision-making in the department's Merger 01 process will have been completed.

- NCDOT should shift from compensating the EEP on an expense reimbursement methodology to a per-credit fee basis when the department begins ordering mitigation at the time a project is programmed for construction. We believe that this recommendation should be implemented as the current build-out of mitigation is completed and the just-in-time mitigation approach based on the two-phased TIP is initiated.
- The EEP should strengthen and further integrate its watershed planning process with other functional areas by:
  - Improving integration of the EEP's watershed planning with DWQ's basin-wide planning process.
  - Strengthening the end products resulting from the watershed planning process to define specific priority projects.
  - Linking the CWMTF grant application process more closely to watershed plans.
- The EEP and the CWMTF should partner on pilot projects for functional mitigation and out-of-the-box mitigation.
- The EEP should initiate a three-year mitigation banking pilot in multiple watersheds.

In preparing a proposed timeline for implementing these recommendations, the study team attempted to clearly delineate between short- and longer-term recommendations. Short-term recommendations include renegotiating elements of the MOA to obtain additional flexibility and better manage the surplus of mitigation. These recommendations must be addressed immediately, as time is of the essence. Then, there are a number of other recommendations that can be implemented over the next two years, while some recommendations have a logical transition point three to four years in the future, as the current EEP mitigation build-out begins to level off.

Integral to the implementation of a number of the shorter-term recommendations, such as renegotiating the MOA to obtain additional flexibility, will be the involvement of the senior executives of NCDENR and NCDOT. We believe that not only support but active hands-on involvement at the secretary level will be required to execute on a number of these recommendations.

I. Study Introduction

Section 16 of Part XVI of Session Law 2206-248, House Bill 1723 directed the Environmental Review Commission and the Joint Legislative Transportation Oversight Committee to jointly study the merger of the organizational functions of the Ecosystem Enhancement Program (EEP) and the Clean Water Management Trust Fund (CWMTF). The North Carolina General Assembly selected Dye Management Group, Inc., along with our teaming partners, the Environmental Law Institute and SEPI Engineering, to conduct this study. This report documents the key findings and recommendations of this study.

This chapter provides background on the study scope and objectives. It also outlines our project approach and research methodology. The remaining sections of this report define the programmatic environment and regulatory framework in North Carolina, describe mitigation practices and strategies in other states, and compare these practices to North Carolina's. The report also provides an overview of current federal regulations and the potential impact of anticipated regulatory changes at the federal level, presents an analysis of various organizational and programmatic alternatives for both integrating EEP and CWMTF and providing mitigation, describes our findings and recommendations, and provides a proposed transition plan for implementing the various recommendations.

A. Study Background

The Federal Water Pollution Control Act (or The Clean Water Act), enacted in 1972, provides the basis in §401 and §404 for federal and state requirements that all permittees, including state departments of transportation and other government agencies, as well as private individuals and organizations, to mitigate impacts to streams and wetlands that are "waters of the United States." In addition, the state of North Carolina adopted rules in 2001 regulating impacts to so-called "isolated waters" that fall outside the jurisdiction of the federal Clean Water Act. With a goal of maintaining nutrient reduction functions, North Carolina has also adopted Nutrient Offset Program in the Neuse and Tar-Pamlico river basins and rules protecting riparian buffers within the Neuse, Catawba, and Tar-Pamlico river basins.

Primary responsibility for the administering the federal program rests with the United States Army Corp of Engineers (USACE), based in part on policies and guidelines established by the United States Environmental Protection Agency (EPA). The primary responsibility for administering the state program in North Carolina rests with the Division of Water Quality (DWQ) of the North Carolina Department of Environment and Natural Resources (NCDENR).

The goal of the 404 program is no net loss. To achieve this policy of no net loss, regulators require permittees to go through a three-step mitigation sequence, of which the third step is

compensation for acres lost to the permitted impact. Federal policy recommends that permittees provide a minimum of 1 to 1 acreage replacement for compensatory mitigation. For example, if one acre of wetlands were being impacted by a proposed transportation or other development project, the permit applicant would be required to restore one acre of the same type of wetland. In many instances, permittees may be required to mitigate at a higher ratio in order to provide some insurance against failure of mitigation, or to compensate for a temporal loss of function.

Federal policies dictate a preference that mitigation is typically provided in the watershed as the permitted impact, typically within the same hydrologic cataloguing unit (HUC). Hydrologic cataloguing units are defined by the United States Geological Survey (USGS), which has divided and sub-divided the nation into successively smaller hydrologic units that are classified into four levels: regions, sub-regions, accounting units, and cataloguing units. The eight-digit cataloguing unit is a geographic area representing part or all of a surface drainage basin, a combination of drainage basins, or a distinct hydrologic feature. There are 2,264 cataloguing units in the United States. North Carolina has 54 HUCs or cataloguing units within its 17 river basins.

In 1989, the North Carolina General Assembly passed the Highway Trust Fund Act, initiating a significant transportation construction program, including seven outer loops and four-lane divided highways for towns with populations greater than 50,000. The increase in highway construction conducted under the program also resulted in a substantial increase in the amount of compensatory mitigation required for the North Carolina Department of Transportation (NCDOT), especially given that North Carolina is 17% wetlands.

During the 1990s, NCDOT typically addressed the mitigation required to obtain permits from the USACE and DWQ at the time of the permit application. Permit applications were made within the year prior to the proposed date for letting the transportation project (selection of a construction contractor) and initiating the construction phase of a project.

As part of the permit application process, NCDOT discussed mitigation requirements, the acceptable location for this mitigation, and the details concerning the construction of this mitigation with regulators. NCDOT developed detailed mitigation plans for each project, and USACE and DWQ staff reviewed these plans in detail prior to issuing the appropriate permits.

NCDOT typically provided mitigation on-site or as near the site as possible. NCDOT usually took responsibility for providing the mitigation, either by designing the mitigation in-house or with consultant engineers and then contracting for construction of the mitigation. On occasion, NCDOT purchased mitigation credits from mitigation bankers. DOT also developed mitigation banks by contracting with private firms to sponsor the bank, to develop qualifying mitigation in advance of the need, based on their assumptions about the market for mitigation requirements, and then make these "credits" available for purchase by impactors to use to satisfy the mitigation requirements of regulators.

Because the discussion of mitigation requirements was occurring between NCDOT and the regulatory staff of the USACE and DWQ for the first time when the permit application was

submitted, the process of reviewing the detailed mitigation plans and obtaining approval for the proposed mitigation became a critical path activity to initiate construction of transportation projects. As a result, a large number of projects were delayed due to permits not being obtained in time because of the inability to reach consensus on mitigation requirements between NCDOT, USACE, Division of Coastal Management (DCM) and DWQ and obtain regulatory approval of NCDOT's proposed mitigation plans for a project. NCDOT has estimated that up to 40% of projects requiring mitigation were delayed, with these delays ranging from several months to a number of years.

In response to these delays, NCDOT and its Board of Transportation began an effort in the mid 1990s to identify mitigation needs for projects earlier and begin to secure advance mitigation. Advance mitigation refers to having acceptable mitigation in place and functioning prior to the request to use this mitigation to meet the requirements of a specific permit application.

NCDOT identified its anticipated mitigation requirements based on analysis of upcoming projects in its Transportation Improvement Program (TIP). It began trying to secure the anticipated mitigation through a number of approaches, including selecting sites and beginning to construct mitigation while a transportation project was still in the preconstruction phase, purchasing a number of high-quality preservation lands to provide part of the required mitigation for future projects, and purchasing available credits from mitigation bankers.

However, significant volatility within the TIP has limited the success of the NCDOT advanced mitigation program. The priority and sequencing of projects within the TIP would change frequently for any number of reasons. Some of these reasons included various delays in the NCDOT project development process; changes in the relative priority of different projects by NCDOT board members, legislators and local officials; other issues raised by regulators besides mitigation as part of the permitting process; and continuous shifting between various potential funding sources proposed for use on a project.

The result of these changes in the TIP would be imbalances in the inventory of advanced mitigation. Mitigation would be developed in one HUC for a project, which was delayed or deferred creating at least a short-term surplus of mitigation in that cataloguing unit. At the same time, mitigation would not be available in another cataloguing unit for a project whose priority had been moved up and for which planning for advance mitigation had not been initiated. Quite often, this would again lead to a delay in the letting of this project. Both of these outcomes represented significant cost impacts to NCDOT: in the first case, the cost of developing potentially unneeded mitigation, and in the second case, the costs associated with delays in the start of construction for a project for which the required mitigation was not available.

In addition, there were also a number of questions around organization mission and focus concerning NCDOT's mitigation program. Environmental specialists on staff at NCDOT coordinated NCDOT's mitigation program; however, the core mission of NCDOT is transportation focused: the safe and efficient movement of people and goods. This mission is principally achieved through planning, designing, building, and operating the state's

transportation infrastructure. The acquisition of high-quality preservation lands and the planning, design, and construction of stream and wetlands restoration projects was at best an adjunct to this core mission, necessitated by the requirement to provide mitigation to obtain permits for the department's transportation projects.

In response to the challenges NCDOT was having in providing mitigation, NCDOT, NCDENR, and the USACE worked together to establish the Ecosystem Enhancement Program (EEP). NCDOT, NCDENR, and the USACE signed a Memorandum of Agreement (MOA) providing the framework for this program in July of 2003.

A primary responsibility of EEP, which is housed within NCDENR, is to administer an in-lieu fee program to provide required mitigation for NCDOT projects in advance of the start of construction projects and the loss of the aquatic resource to be impacted by these projects.

An in-lieu fee program is an agreement between a regulatory agency (state, federal, or local) and a single sponsor, generally a public agency or non-profit organization. According to the USACE, "in-lieu fee mitigation occurs in circumstances where a permittee provides funds to an in-lieu fee sponsor instead of either completing project-specific mitigation or purchasing credits from a wetland mitigation bank approved under the Banking Guidance."[1]

Under an in-lieu fee agreement, the mitigation sponsor collects funds from one organization or a number of organizations who are required to conduct compensatory mitigation required under §404 or another state or local wetland regulatory program. The sponsor may use the funds pooled from multiple permittees to create one or a number of sites under the authority of the agreement to satisfy the permittees' required mitigation. In-lieu fee mitigation is typically categorized as mitigation conducted after permitted impacts have occurred; however, the goal of the EEP program for NCDOT is specifically to provide mitigation in advance of the anticipated impacts.

The cornerstone of the EEP is a detailed watershed-planning process that is designed to identify high-quality, cost-effective mitigation projects that will also contribute to watershed improvement and protection and open space preservation. The EEP provides a programmatic approach to providing in-ground, functioning compensatory mitigation for the majority of permitted impacts in advance of the loss of aquatic resources.

The EEP develops mitigation sites and/or acquires mitigation credits from mitigation banks to meet NCDOT mitigation requirements, based on demand forecasts provided by NCDOT about anticipated mitigation requirements and the proposed letting dates for these projects in NCDOT's TIP. The MOA specifies that this mitigation will be implemented within the

---

[1] US Department of the Army, US Environmental Protection Agency, US Department of Interior, and US Department of Commerce. *Federal Guidance on the Use of In-lieu fee Arrangements for Compensatory Mitigation under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act.* 2000.

same HUC that the impact occurred. The appropriate sites for implementing the required mitigation are intended to be identified through river basin and detailed watershed plans that the EEP develops. The EEP develops its mitigation projects through one of three approaches: purchase from a bank, design/bid/build and full delivery. Under the design/bid/build approach, the EEP contracts separately with engineering firms for design and then contracts with a construction firm for the actual restoration project. Under the full delivery approach, the EEP effectively purchases credits in one or more watersheds from a private delivery provider who is responsible for site selection, design, and construction, according to standards and specifications developed by the EEP.

To help jump-start the EEP and immediately remove mitigation from the critical path for obtaining a permit for and initiating construction of transportation projects, the MOA provided the EEP with additional flexibility in the way that mitigation was provided. This included initially allowing the EEP to utilize high-quality preservation lands in higher ratios than is normally allowed EEP to utilize high-quality preservation to meet 100% of permit requirements, with the understanding that the required wetland and stream restoration would be developed by the end of the transition period. The goal was that, at the end of a seven-year ramp-up period, the EEP would begin to have the actual restoration projects in the ground, with successful monitoring complete, in advance of the letting of the construction project at which point ½ of the HQP is released for future use in the ecoregion.

In addition to its responsibilities to provide mitigation for NCDOT, EEP also manages the state's in-lieu fee program for non-NCDOT mitigation needs, which was formerly the Wetlands Restoration Program (WRP) that was established in 1996. The EEP also manages a nutrient offset program that provides dischargers and developers in three river basins with the option to purchase credits instead of conducting their own mitigation to offset discharge of wastewater and other effluents into state waters.

While the EEP is focused on providing mitigation, North Carolina's Clean Water Management Trust Fund (CWMTF) has a broader mission of preserving and enhancing water quality within the state of North Carolina. Established by the General Assembly in 1996, CWMTF helps local governments, state agencies, and conservation non-profit groups to finance projects in order to protect and restore surface water quality. Since 1996, as result of on-going appropriations from the General Assembly, CWMTF has awarded 943 grants for a total of $711.5 million. CWMTF provides grants to:

- Enhance or restore degraded waters.
- Protect unpolluted waters.
- Contribute toward a network of riparian buffer and greenways for environmental, educational, and recreational benefits.

CWMTF projects include improvements to wastewater treatment and collection systems; storm water management; wetlands, riparian buffer and stream restoration; and the acquisition of buffers, floodplains, wetlands, and greenways. CWMTF's enabling legislation specifically restricts it from providing compensatory mitigation.

B. Study Scope and Objectives

Beginning in 2004 and continuing into 2005 and 2006 as the EEP program ramped up and acquisition and restoration activities were initiated, a number of questions were raised about the actual cost of the EEP and whether the cost of its operation will provide the anticipated payback in terms of helping to expedite the letting of transportation projects. In addition, there were other operational questions raised as well, including whether the MOA stipulation to require mitigation within a specific HUC or cataloguing unit was creating operational complexities for the EEP and thus significantly increasing the cost of mitigation for NCDOT.

At the same time, there were also questions raised by a number of policymakers about whether there may be potential synergies between the EEP and the CWMTF that the state was not taking full advantage of, given some of the overlap in the missions of these two agencies. Some policymakers, for example, questioned whether the prohibition on the CWMTF participating in compensatory mitigation should be re-assessed. Removing the restriction on the CWMTF participating in compensatory mitigation could allow some of the riparian buffer, wetland, and stream restoration projects funded by the state through the CWMTF to then be applied as mitigation credits for transportation projects. Likewise, some policymakers believed that there could be opportunities to work with regulators in certain cases to utilize non-traditional mitigation approaches for projects, such as repairing a failing wastewater treatment plant downstream from a proposed transportation project. These types of proposed "out of the box" mitigation approaches could provide additional points of synergy between the EEP as the agency responsible for mitigation and the wider range of water quality initiatives typically funded by the CWMTF.

In addition, there have been recent changes in the leadership and management of the CWMTF, with a new board chairperson taking office and a search underway for a new executive director. Thus, given that this is a transition time at the CWMTF, it was also thought that this might be an appropriate point at which to further explore and execute on potential synergies between the two organizations.

In response to these issues and others, the North Carolina General Assembly enacted Section 16 of Part XVI of Session Law 2006-248, House Bill 1723, which directed the Environmental Review Commission and the Joint Legislative Transportation Oversight Committee to jointly study the merger of the organizational functions of the EEP and the CWMTF. The General Assembly then engaged Dye Management Group, Inc. to conduct this study.

The scope of this study includes the following objectives and tasks:

- Conducting a detail review of the current organizational structure and key work processes of both the EEP and the CWMTF programs.
- Comparing the current EEP processes with mitigation processes utilized by NCDOT prior to the creation of the EEP.

- Reviewing the current state of the mitigation banking industry in North Carolina and assessing the feasibility of using mitigation banks to provide all or some of the mitigation credits required for NCDOT projects.
- Reviewing practices in other peer states in regards to providing mitigation for transportation projects.
- Reviewing proposed or anticipated federal rule-making on compensatory mitigation and assessing the impact of this rule-making on the EEP.
- Assessing based on the information developed during the study the feasibility of merging the EEP and the CWMTF.
- Analyzing multiple organizational models and programmatic approaches for providing mitigation for transportation projects.
- Developing and documenting an inventory of acquisitions and credits, including identifying assets acquired by NCDOT prior to the initiation of the EEP.
- Utilizing this inventory of acquisitions and credits to identify the extent of the surplus of mitigation credits in some areas of the state and developing recommendations on how to address this surplus.
- Recommending appropriate strategies to address the delivery of mitigation in North Carolina and providing an implementation plan with suggested timing and sequencing for any recommendations.

C. Research Questions

In designing our project approach for this study, Dye Management Group, Inc. identified a number of potential research questions that were then used as a general framework for identifying and evaluating the various alternatives for delivering a cost-effective mitigation program for transportation projects in North Carolina. Some of these research questions included:

- Is the EEP program helping to reduce or eliminate the previous delays in obtaining permits for transportation projects in North Carolina?
- How much more effective is the EEP program than the previous NCDOT mitigation program in terms of expediting delivery of transportation projects?
- Based on the current and future projected cost of the EEP program, what is the return on investment (if any) based on the extent to which the EEP can help NCDOT to expedite the letting of transportation processes, thus allowing projects to be let sooner and presumably at a lower construction cost?
- What are the potential operational synergies between the EEP and the CWMTF? Are these synergies compelling enough to merge the two programs?
- What would be the cost of merging the EEP and the CWMTF programs?

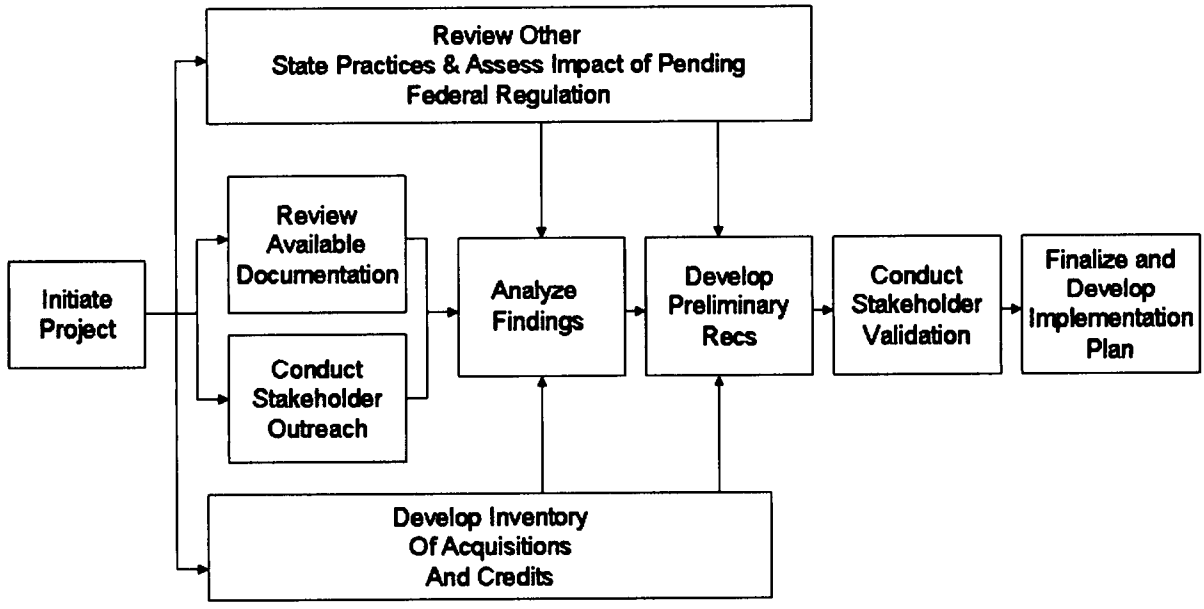
- What are the risks to merging the EEP and the CWMTF, and which mitigation strategies can be implemented to manage these risks?
- How would the merger of the CWMTF and the EEP affect the ability of NCDOT mitigation projects to effectively implement recognized compensatory mitigation recommendations and to meet prescribed ecological goals and standards?
- How does the cost of operating the EEP compare with the use of private mitigation bankers? Which approach is more cost-effective?
- Is the service delivery of the EEP program a candidate for outsourcing, given that there are mitigation bankers who specialize in performing this banking function as their core businesses?

D. Project Approach and Research Methodology

Dye Management Group, Inc.'s project approach and research methodology was specifically designed to address the research questions listed above. Our project approach extensively leveraged the experience and intellectual capital of our team members to allow completion of the project within an approximate 20-week time frame.

Exhibit I-I illustrates our project approach. The individual elements or phases of this approach are then described in further detail below.

Exhibit I-I: Project Approach for EEP/CWMTF Merger Study



1. Initiate project.

This stage involved conducting an initiation meeting with legislative staff and finalizing the detailed work plan and schedule for conducting the study. As part of this phase, the study team also identified key points of contact with the EEP, the CWMTF, and the NCDOT. The team also identified other key stakeholders with the USACE, EPA, the Federal Highway Administration (FHWA) and other organizations within the scope of the study.

2. Review available documentation.

The study team reviewed a wide range of program documentation, enabling legislation and other appropriate literature. Examples of documentation reviewed by the team include:

- The MOA that established the framework and policies for the EEP as well as supporting state legislation.
- The legislation establishing the CWMTF.
- Policy and procedure manuals developed by the EEP for a range of business processes, including watershed planning and the design/bid/build and full delivery procurement processes.
- The CWMTF's application and grant selection process.
- Available documentation on the NCDOT mitigation program prior to the initiation of the EEP.
- Documentation on NCDENR's stewardship program for providing ongoing monitoring and maintenance of mitigation sites, following the initial implementation and monitoring period when restoration is completed.

3. Conduct stakeholder outreach.

Our project approach incorporated considerable stakeholder outreach to ensure that various views on issues were known and available to the research team members and that any potential risks or issues surrounding potential recommendations were understood early in the process. A total of 41 interviews were conducted with a range of stakeholders including management, staff, board members, and grantees of the CWMTF; management and staff and a number of private sector partners of the EEP; appropriate NCDOT management and staff; NCDENR senior management; state and federal regulatory agency staff; FHWA division staff; private mitigation bankers; and environmental advocacy groups. Exhibit I-II illustrates an inventory of the interviews conducted by the research team by type of stakeholder.

Exhibit I-II: Inventory of Interviews by Stakeholder Type

Stakeholder Group	Interviews
CWMTF management and staff	4
CWMTF board members	2
CWMTF grantees	2
EEP management and staff	8
NCDENR senior management	1
State regulatory agency staff	1
Federal regulatory agency staff	5
NCDOT Board members, management and staff	7
FHWA Division staff	4
EEP on-call consultants/contractors/full delivery providers	3
Environmental Advocacy Organization	1
State Property Office	1
Private mitigation bankers	2
Total interviews:	**41**

4. Review other state practices.

The study team conducted detailed reviews of mitigation practices in four other states: Florida, Georgia, Virginia, and Washington. Florida, Georgia, and Virginia were selected due to their geographical proximity to North Carolina and the fact that, like North Carolina, they are experiencing rapid growth. Washington State was selected due to its legislatively mandated focus on functional replacement and the Washington State Department of Transportation's efforts to implement a watershed planning process that has some similarities to the process utilized by the EEP.

5. Assess impact of pending federal regulations.

The study team reviewed in detail and assessed the potential impact on the EEP of several pending federal regulatory efforts. This included:

- The March 2006 proposed rule-making from USACE and EPA on compensatory mitigation.
- The National Mitigation Action Plan, originally released in draft form in 2002, which has among its objectives an increased emphasis on watershed planning.
- The impact of the Supreme Court decision in 2006 in Rapanos v. United States and Carabell v. U.S. Army Corps of Engineers ("Rapanos/Carabell"), which casts doubt as to whether some waters, particularly tributaries, wetlands, ditches,

and non-perennial streams, fall within federal jurisdiction under the Clean Water Act.

6. Develop inventory of acquisitions and credits.

The study team collected and analyzed a number of data sets from NCDOT and EEP to develop a current snapshot of the inventory of acquisitions and credits. The data sets incorporated in this analysis include:

- High-quality preservation land acquisitions by NCDOT prior to EEP.
- Mitigation developed or acquired by NCDOT prior to EEP and the method of acquisition/development.
- High-quality preservation land acquisitions by EEP.
- Mitigation developed or acquired by EEP and the method of acquisition/development.
- The current NCDOT TIP and the projection of future mitigation needs based on the TIP.
- The anticipated surplus or gap in mitigation credits by cataloguing unit based on NCDOT's projected needs.

This detailed inventory of acquisitions and credits is included as Appendix A through G of this report.

7. Analyze findings.

In this phase, the team developed and documented a number of findings based on the data collected in the previous phases. This includes findings related to the operations of the EEP and the CWMTF, the surplus of credits in some watersheds, the relationship between the EEP and NCDOT, and the potential for greater organizational and programmatic synergies between the EEP and the CWMTF.

A critical part of this analysis process was the identification and detailed analysis of several alternative approaches for providing compensatory mitigation in North Carolina and for achieving programmatic synergies between the EEP and the CWMTF. The study team analyzed the following alternatives:

- The status quo in which the EEP and the CWMTF are separate programs, with the EEP carrying responsibility for providing compensatory mitigation for transportation projects.
- Maintaining the status quo organizationally with a range of policy changes and process improvements to streamline individual program operations and achieve greater programmatic synergies between the EEP and the CWMTF where appropriate.

- Merger of the EEP and the CWMTF.
- Return of responsibility for mitigation to NCDOT.
- Implementation of a privatized mitigation banking model.

8. Develop preliminary recommendations.

Based on the findings, the study team then developed a series of preliminary recommendations to address these findings. The team developed recommendations to address a number of issue areas identified in the study, including:

- The organizational and programmatic relationships between the EEP and the CWMTF.
- Steps to strengthen the relationships between the EEP and NCDOT.
- Specific policy changes and process improvement recommendations for the EEP.
- Process improvement changes at NCDOT to improve the quality of its demand forecast and to foster an improved working relationship with the EEP.
- Specific policy changes, process improvement, and technology recommendations for the CWMTF.

9. Conduct stakeholder validation.

In this phase, structured briefings on findings and preliminary recommendations were initially conducted with the co-chairs of Joint Transportation and Environmental Review and legislative staff to provide preliminary feedback to sponsors on the direction of the study. With the approval of the study sponsors, the study team then conducted structured briefings with appropriate management and staff of the EEP, the CWMTF, and NCDOT, and representatives of the USACE to validate our findings and obtain feedback on our proposed recommendations.

10. Finalize recommendations and develop implementation plan.

Based on feedback from the validation sessions, recommendations were adjusted if appropriate and an implementation plan was developed to provide guidance to the study sponsors and stakeholders on the relative timing and sequence for implementing the recommendations from the study. The findings and recommendations from the study were then incorporated into an initial and final draft of this report, and several presentations of study results were presented in different forums.

The remaining sections of this report document the study context and the findings and recommendations of this study in greater detail. These sections include:

Section II. North Carolina Programmatic Overview – This section provides an overview of the regulatory framework that establishes the requirements for mitigation for transportation

projects. It also provides an overview of the program objectives, scope, and operations of the EEP and the CWMTF. Likewise, it provides an overview of mitigation banking and describes the role of mitigation banking historically in North Carolina.

Section III. Other State Practices – This section describes compensatory mitigation practices for transportation projects in other peer states and assesses the applicability of practices used in these states to North Carolina.

Section IV. Potential Changes in Federal Regulatory Environment – This section discusses anticipated changes in federal guidance regulations and the potential impact of these regulatory changes on the operation of the EEP program.

Section V. Key Findings – This section provides an overview of the key findings of the study. This includes findings related to the operations of the EEP and the CWMTF, the analysis of the inventory of acquisitions and credits, the nature of the relationship between the EEP and the NCDOT, and the extent of current and potential organizational and programmatic synergies between the EEP and the CWMTF.

Section VI. Analysis of Organizational and Programmatic Alternatives – This section then presents an analysis of different organizational and programmatic approaches for more closely linking the EEP and the CWMFT as well as providing mitigation for transportation projects in North Carolina.

Section VII. Recommendations – Based on our findings and the organizational analysis, this section outlines a number of recommendations. This includes recommendations concerning the organizational and programmatic relationships between the EEP and the CWMTF, steps to strengthen the relationships between the EEP and the NCDOT, and specific policy changes (process improvement and technology recommendations) for both the EEP and the CWMTF.

Section VIII. Implementation Plan – This section presents a proposed implementation plan that provides a recommended timeline and sequencing for adopting the study recommendations.

Appendices- Appendix A through Appendix G provide the details of the inventory of acquisitions and credits developed by the study team.

II. North Carolina Programmatic Overview

This section provides an overview of the regulatory framework that governs compensatory mitigation and discusses the various types of compensatory mitigation. It then provides an overview of the EEP objectives and the acquisition methods utilized by the EEP to provide mitigation, as well as an overview of mitigation banking and the role mitigation banking plays in North Carolina. Finally, it provides an overview of the CWMTF program.

A. Regulatory and Policy Context for Compensatory Mitigation

1. Federal regulation under the Clean Water Act.

The primary source of federal regulatory jurisdiction over wetlands is the Federal Water Pollution Control Act, or the Clean Water Act (CWA).[2] The CWA was established to restore and maintain the chemical, physical, and biological integrity of the nation's waters, including wetlands. The CWA section that established the wetlands regulatory program, §404, was enacted in 1972. Since that time, §404 has evolved into the major federal program regulating activities to the nation's aquatic resources, including wetlands. Primary responsibility for administering the §404 permitting program lies with the U.S. Army Corps of Engineers ("USACE"). Additionally, the U.S. Environmental Protection Agency (EPA) is responsible for establishing the environmental guidelines, or §404(b)(1) guidelines, that the USACE must use to evaluate the impact of proposed projects when making permit determinations. EPA also has the authority to veto permits approved by the USACE under §404(c). Other federal agencies, such as the U.S. Fish and Wildlife Service (FWS), Natural Resources Conservation Service (NRCS), and the National Marine Fisheries Service (NMFS), have the opportunity to review and comment upon USACE permit decisions.

The §404(b)(1) guidelines, binding rules established by EPA,[3] set in motion the process—referred to as the "practical alternatives analysis"—that the USACE must undertake before issuing a §404 permit to fill a wetland.[4] A 1990 Memorandum of Agreement between the Department of the Army and EPA ("1990 MOA") establishes a three-part process—or sequencing guidelines—to help guide compensatory mitigation decisions for individual (or "standard") permits and clarifies the protocol

[2] Federal Water Pollution Control Act, 33 U.S.C. §§1251-1387.

[4] 40 C.F.R. §230.10(d).

for determining the type and level of mitigation required under the §404(b)(1) guidelines. The sequencing steps are: (1) avoidance of adverse impacts to the aquatic ecosystem; (2) minimization of adverse impacts through project modifications and permit conditions, if impacts cannot be avoided; and, finally, (3) compensatory mitigation for unavoidable adverse impacts that remain after all appropriate and practicable minimization has been required.[5] In other words, before a §404 permit can be issued, the USACE must determine if there is a practicable alternative that avoids impacts to wetlands. If unavoidable, impacts must be minimized. Finally, any resulting unavoidable impacts must then be mitigated.

The 1990 MOA also states that for wetlands, the USACE will "strive to achieve a goal of no overall net loss of values and functions."[6] The no-net-loss policy has become the guiding principle for much of the federal wetlands program.

State regulation under The Clean Water Act

The Clean Water Act also provides a mechanism for states to certify federal permits or licenses, including §404 permits, for conformity with state water quality provisions. Under CWA §401(a)(1), applicants to the §404 program must "provide the licensing or permitting agency a certification from the state in which the discharge originates or will originate..." Furthermore, "no license or permit shall be granted until the certification required by this section has been obtained or has been waived ... [or] has been denied by the state...."[7]

In North Carolina, this "§401 certification" provides the regulatory basis for a statewide wetland permitting program.[8] Any actions that require a federal permit, license, or approval that results in a discharge into "waters of the state," including §404 dredge and fill permits and nationwide permits, require the state's certification that proposed actions are consistent with North Carolina's water quality standards for "waters of the state." Additionally, in 2001, the state adopted similar rules pertaining

[8] North Carolina also has a coastal permitting program, but this by and large does not require mitigation and applies only to the coastal zone.

to discharges into so-called "isolated waters" that fall outside of the jurisdiction of the Clean Water Act.[9]

The North Carolina Department of Environmental and Natural Resources (NCDENR) Division of Water Quality (DWQ) administers the §401 program. Authorized activities and exemptions are listed in the regulations. State regulations also describe the required application process, public notice and public hearing procedures, and application review and decision-making. Finally, the state has adopted its own mitigation requirements for authorized impacts.[10]

Under the federal Coastal Zone Management Act and the state Coastal Area Management Act, NCDENR's Division of Coastal Management (DCM) is the primary authority for state coastal resources, including wetlands. DCM issues permits for regulated activities and performs consistency calls on all federal permits issued in the North Carolina's 20 coastal counties.

2. State regulation of buffers.

With a goal of maintaining nutrient reduction functions, North Carolina has adopted the Nutrient Offset Program for the Neuse and Tar-Pamlico river basins and rules protecting riparian buffers within the Neuse, Catawba, Tar-Pamlico river basins and a portion of the Cape Fear.

The Nutrient Offset Program mandates nutrient reduction projects to offset exports related primarily to development activities in the Neuse and Tar-Pamlico River Basins, and along with the Buffer Rules are regulated by NCDENR's DWQ, although local governments that have been determined to meet state criteria may also assume authority to implement the buffer rules within their jurisdictions.

The Buffer Rules are designed to protect and maintain buffers for all areas within 50 feet of intermittent or perennial streams, lakes, ponds, or estuaries. Ditches, ephemeral streams, and wetlands are not jurisdictional under the state buffer rules.[11] Designated buffer areas are divided into two zones: Zone One, the inner 30 feet, is to remain undisturbed (with some exceptions); Zone Two, the outer 20 feet, must remain vegetated (with some exceptions). Specific activities are identified in the rule as "exempt," "allowable," "allowable with mitigation," or "prohibited."[12] Buffer

[11] N.C. ADMIN. CODE tit.15A § 02B.0233.
[12] Examples of "exempt" activities include driveway and utility crossings of certain sizes through Zone One, and grading and re-vegetation in Zone Two. "Allowable" and "allowable with mitigation" activities require review by the division and include activities such as new ponds in drainage ways and water crossings.

mitigation rules define the application process and compensation requirements for activities identified as "allowable with mitigation."

B. Compensatory Mitigation Mechanisms

1. Mitigation methods.

Compensatory mitigation may be accomplished through four principal methods: (1) restoration, or the re-establishment of wetland and/or other aquatic resource characteristics and function(s) at a site where they have ceased to exist or exist in a substantially degraded state; (2) creation, or the establishment of a wetland or other aquatic resource where one did not formerly exist; (3) enhancement, or activities conducted in existing wetlands or other aquatic resources that increase one or more aquatic functions; or, in exceptional circumstances, (4) preservation, or the protection of ecologically important wetlands or other aquatic resources in perpetuity through the implementation of appropriate legal and physical mechanisms. Preservation may include protection of upland areas adjacent to wetlands as necessary to ensure protection and/or enhancement of the aquatic ecosystem. Because regulatory programs operate under the goal of "no net loss," preservation is generally less preferable because it does not result in a gain of wetland acres and functions. This method is often used only in conjunction with other mitigation methods.

2. Replacement of acres and functions.

Mitigation replacement ratios, also known as debiting or compensation ratios, are the "proportional requirements for replacing wetlands that are permitted for fill."[13] These ratios establish the number of acres that a permittee is required to replace, given the number of acres impacted. Federal policy recommends that permittees provide a minimum of 1 to 1 acreage replacement for compensatory mitigation. However, establishing a consistent mitigation ratio facilitates the adequate and appropriate replacement of lost wetland acreage and functions. The location, wetland type, and compensation method of the mitigation wetland can influence the ratio. For example, mitigation replacement ratios are often "tailored" to guide compensatory mitigation to particular geographic areas, to discourage impacts to particular wetland types or to large wetlands, and to discourage out-of-kind mitigation. Permittees compensating outside of the watershed of the impact may be required to compensate at higher ratios.

Replacement ratios may also be expressed as "credit ratios," which establish the number of credits (as opposed to acres) that a permittee is required to purchase in order to provide compensation for the permitted impact. Credits are a standard unit of

measurement for quantifying the net gain in wetland acreage or function that results from wetland restoration, enhancement, creation, or preservation that may be used to compensate for permitted impacts.

Although the 1990 MOA between EPA and the USACE articulates a national goal of "no overall net loss of values and functions," it also acknowledges the difficulty inherent in measuring and therefore replacing functions and values. As a result, the no-net-loss goal is often referred to in terms of acres and functions rather than values and functions, despite the fact that existing federal guidance encourages reliance on functional assessment methods in determining impacts and required mitigation for aquatic resources.

However, North Carolina has already taken a proactive approach toward advancing functional assessment, with the recent development of the North Carolina Wetlands Assessment Method (NC WAM), which provides a field method to determine the level of function of a wetland relative to a reference condition (where available). If adopted, NC WAM could be used toward mitigation planning and tracking functional replacement across the state. It should be noted that the state is also currently working on the NC Stream Assessment Method (NC SAM), although it will not be released for comment until 2008.

3. Compensatory mitigation "site" and "kind".

There are three primary mechanisms supported by the EPA and the USACE for permittees to meet their compensatory mitigation obligations. These are: (1) permittee-responsible mitigation; (2) purchasing credits from a mitigation bank; or (3) making a payment to an approved in-lieu fee mitigation sponsor. The federal agencies have issued a variety of guidance documents and a proposed rule to address the effectiveness of these different forms of mitigation. Compensatory mitigation performed on or adjacent to the development site is referred to as on-site mitigation. Alternatives to on-site mitigation include wetland mitigation banking, in-lieu fee mitigation, and project-specific off-site mitigation.

In-kind compensation is restoration, creation, enhancement, or preservation of wetlands similar to those being impacted (e.g., replacing forested wetlands with forested wetlands); out-of-kind compensation is restoration, creation, enhancement, or preservation of wetlands that provide different functions than those of wetlands being adversely affected by a project (e.g., replacing forested wetlands with open water wetlands).[14] Traditionally, regulatory agencies have preferred in-kind compensatory mitigation over out-of-kind mitigation; however, in cases where out-of-kind

[14] National Research Council. 2001. *Compensating for Wetland Losses under the Clean Water Act*. Washington, DC: National Academy Press

compensation is determined to be "practicable and environmentally preferable to in-kind compensation,"[15] exceptions may be determined on a project-by-project basis.

C. Mitigation Requirements in North Carolina

Federal compensatory mitigation requirements and preferences are described collectively among the §404(b)(1) guidelines, 1990 MOA, the U.S. Army Corps of Engineers Regulatory Guidance Letter No. 02-2, and guidance documents such as the 1995 *Federal Guidance for the Establishment, Use and Operation of Mitigation Banks* and 2000 *Federal Guidance on the Use of In-Lieu Fee Arrangements for Compensatory Mitigation under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act.*[16] Collectively, these documents describe regulatory requirements, guidelines, and preferences pertaining to mitigation methods, site/kind replacement, replacement ratios, and bank and in-lieu fee operations, among other criteria.

The state's water quality certification regulations also outline acceptable forms of compensatory mitigation for unavoidable losses of wetlands that are considered "waters of the state." State and federal regulators coordinate on permitting activities, and mitigation required under CWA §404 generally constitutes mitigation under state rules, unless USACE-required mitigation fails to meet state criteria. State requirements include, among other specified criteria: jurisdictional constraints; preferences for mitigation method (in order of preference: restoration, creation, enhancement, and finally, preservation); ratio requirements; and site/kind preferences, including a specified preference for the site of mitigation with respect to the river basin, physiographic province, and/or water supply watershed of the impact. The regulations also state a preference for mitigation through the state mitigation program over individual permittee-responsible mitigation.[17]

It should be noted that North Carolina does have stream mitigation guidelines that differ from the state's wetland mitigation guidelines. The NCDENR DWQ created the joint federal-state guidelines in conjunction with the U.S. Army Corps of Engineers - Wilmington District, U.S. Environmental Protection Agency - Region IV, U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS), and the North Carolina Wildlife Resources Commission. The guidelines account for the

[16] The USACE and EPA have also issued a proposed rule pertaining to compensatory mitigation, but the revised rule has not yet been issued.

[17] N.C. ADMIN. CODE tit.15A § 02H.0506 *et seq.*; N.C. ADMIN. CODE tit.15A § 02H .1305 *et seq.*

differences in impacts to fluvial systems and generally apply to non-tidal waters.[18] All mitigation providers must follow the stream mitigation guidelines to achieve mitigation credit.

North Carolina's Buffer Rules for the Neuse, Catawba, and Tar-Pamlico and portions of the Cape Fear river basins also describe mitigation requirements for regulated impacts to delineated buffer zones. Regulations outline mitigation site requirements, ratios, and permitted mitigation methods, which include payment to the Riparian Buffer Restoration Fund, donation of property, or restoration or enhancement of a non-forested riparian buffer. The rules also provide procedural guidelines for restoring or enhancing buffers, determining the amount of payment to the buffer fund, and determining the amount, location, and character of any donated property.[19]

D. North Carolina's Ecosystem Enhancement Program (EEP)

1. Program background.

The North Carolina General Assembly passed legislation in 1996 to create the Wetland Restoration Program (WRP), a state in-lieu fee program.[20] The program was designed to improve the permitting process and ecological effectiveness of compensatory mitigation by developing watershed-based restoration plans and ensuring that mitigation would be conducted in an ecosystem context. In 1998, the North Carolina Department of Environment and Natural Resources (NCDENR) entered into a Memorandum of Understanding with the U.S. Army Corps of Engineers that established operational guidelines for the WRP.

As a result of continued delays in acquiring permits for transportation projects because of problems with mitigation, in the summer of 2001, an interagency task force was organized to examine the procedures of NCDOT, NCDENR, and the USACE as they related to permitting transportation projects and associated wetland and stream mitigation. The task force found inefficiencies in the processes of the departments in developing suitable compensatory mitigation and recommended a new, innovative approach. The interagency task force recommended that North Carolina address the challenge of implementing the rapid expansion of its transportation infrastructure with environmental protection by making the state's environmental agency, not its transportation agency, responsible for providing required mitigation to compensate for the unavoidable impacts of transportation projects.

[19] N.C. ADMIN. CODE tit.15A §§ 02B .0242 *et seq.*, .0244 *et seq.*, and .0260 *et seq.*

[20] N.C. GEN. STAT. § 143-214.9 (2005).

In July 2003, the NCDENR entered into a Memorandum of Agreement (MOA) with the USACE and NCDOT to create the Ecosystem Enhancement Program, effectively replacing the WRP. The EEP, housed within the NCDENR, not only incorporated the functions of the former WRP, but also began administering a separate program that conducts mitigation exclusively for impacts resulting from NCDOT activities.

The cornerstone of the EEP is a detailed watershed-planning process that is designed to identify high-quality, cost-effective mitigation projects that will also contribute to watershed improvement and protection and open space preservation. The EEP provides a programmatic approach to providing in-ground, functioning compensatory mitigation for the majority of permitted impacts in advance of the loss of aquatic resources. The EEP sponsors four distinct in-lieu-fee programs, each with separate authorizing instruments and financial accounts:

- Stream and Wetland In-Lieu-Fee Program (formerly the Wetland Restoration Program), which provides mitigation, as appropriate, for impacts resulting from §404 permits, §401 water quality certifications, and/or Coastal Area Management Act permits (with the exception of most NCDOT permits). The program operates according to the 1998 Memorandum of Understanding Between the North Carolina Department of Environment and Natural Resources and the United States Army Corps of Engineers, Wilmington District and rules set out in the North Carolina Administrative Code (NCAC) (Title 15A, Subchapter 02R).
- Stream and Wetland In-Lieu Fee Program for NCDOT, which provides off-site mitigation exclusively for impacts resulting from NCDOT activities. The program operates according to the 2003 Memorandum of Agreement among the North Carolina Department of Environment and Natural Resources and North Carolina Department of Transportation and the United States Army Corps of Engineers, Wilmington District. NCDOT provides advance funding to the EEP through an approved biennial budget. Funding mechanisms are detailed in the 2004 Memorandum of Agreement Between the North Carolina Department of Environment and Natural Resources and the North Carolina Department of Transportation.
- Riparian Buffer In-Lieu Fee Program, which provides mitigation for impacts resulting from activities permitted under the state's riparian buffer rules in the Neuse, Tar-Pamlico, and Catawba River Basins as well as a portion of the Cape Fear River Basin. The program operates according to rules described in the NCAC (Title 15A, Subchapter 02B §§ .0242, .0243, .0244, .0250, and .0259).
- Nutrient Offset In-Lieu Fee Program, which provides nutrient reduction projects to offset exports related primarily to development activities in the Neuse and Tar-Pamlico River Basins (15A NCAC 02B §§ .0234 and 02B .0235). The program operates according to rules described in the NCAC (Title 15A, Subchapter 02B § .0240).

The MOA creating the EEP specified the legal authorities and responsibilities for NCDOT, NCDENR, and the USACE Wilmington District. The MOA essentially

provides the regulatory framework for the EEP's operations. In addition, a memorandum of agreement was established between NCDOT and NCDENR to further delineate the EEP's business processes. Today, educating NCDOT staff and other stakeholders about the roles and responsibilities of the EEP remains an ongoing effort.

Two advisory groups were formed to guide the EEP's operations. The Program Assessment and Consistency Group (PACG) consists of federal and state agency officials and technical professionals who review policy decisions made by the EEP management, address ongoing issues affecting the EEP's operations, evaluate program accomplishments, issues, and opportunities and help to manage required interagency process improvements. In this regard, the PACG's role is somewhat similar to the role of a mitigation banking review team (MBRT) in a traditional mitigation bank.

The Liaison Council comprises non-governmental mitigation stakeholders. The council provides recommendations on the EEP's structure, mission, and operations, and is briefed on the status of the program approximately three times a year.

The proposal to establish the EEP coincided with North Carolina Governor Mike Easley's directive to improve the overall environmental ethic of NCDOT and to strengthen communication and collaboration between NCDOT and the federal and state resource agencies it works with in implementing transportation projects. As a result, senior executives within NCDOT and NCDENR and the Wilmington district of the USACE supported the EEP concept from its inception. Today, most of the stakeholders that were interviewed by the study team assert that without this senior level buy-in and support, the significant changes required of and created by the EEP would not have been possible.

The programmatic framework and timetable to establish the EEP was developed in six weeks. FHWA provided $500,000 in initial seed money to create an EEP policies and procedures manual and begin development of a comprehensive information management system. The implementation of this management system is scheduled for the fall of 2007. To date, NCDOT has reimbursed EEP more than $175 million in compensation for mitigation provided or under development.

To help jumpstart the EEP and immediately remove mitigation from the critical path for obtaining a permit and initiating construction of transportation projects, EEP was initially given additional flexibility in the way that mitigation was provided. This included allowing the EEP to utilize high-quality preservation (HQP) lands in higher ratios, with the understanding that the required wetland and stream mitigation would be developed over a seven-year period. The goal was that, at the end of a seven-year ramp-up period, the EEP would have the actual mitigation in the ground in advance of the letting of the construction project.

This was accomplished by allowing EEP to apply HQP credits to meet the restoration requirement component of the mitigation. The remaining portion (the restoration equivalent portion) could also be used to meet mitigation requirements (this portion

was already allowed and still allowed). By allowing EEP to use HQP at a 10:1 ratio to cover a permit's requirement during the transition period, it is saying that the EEP can apply HQP to cover the entire portion of the permit's requirements --half to cover the restoration and half to cover the restoration equivalent. This ensures that the total number of credits are applied to cover the permit requirements. However, EEP still has to meet the restoration requirement by the end of the transition period.

When EEP applies restoration credits to meet the restoration requirement in the permits, any HQP applied to cover these restoration requirements would be refunded. In one way, this was helpful as preservation can be acquired more quickly than other forms of mitigation. One the other hand, it was quasi punitive in that EEP was procuring 1.5 times the amount of mitigation needed to cover the permits. However, the refunded credits will become part of the advanced mitigation that EEP is required to develop under the MOA.

2. Approaches utilized by the EEP to procure mitigation.

NCDOT annually provides the EEP with an updated mitigation demand forecast. This forecast is based on NCDOT's estimate of its mitigation requirements for projects scheduled for letting in the department's Transportation Improvement Program (TIP). EEP utilizes this demand forecast to determine the required types of mitigation as well as where and when the different types of mitigation will be needed. When the EEP determines that it will not have sufficient inventory to meet mitigation requirements, it then acquires the necessary mitigation through one or a combination of several different mechanisms. Mitigation mechanisms that the EEP has utilized to date include:

- Transfer of assets from NCDOT.
- Purchase of credits from private mitigation banks.
- Purchase of high-quality preservation lands.
- Purchasing projects from the CWMTF.
- Developing required mitigation through a design-bid-build process.
- Developing required mitigation through a full delivery process.

In addition, the EEP is evaluating the use of the design-build method and has proposed a pilot of this method on a project in the near future.

Each of these procurement methods are described briefly below.

(1) Transfer of assets from NCDOT.

Upon the initiation of the EEP, a process was developed to transfer the management of all mitigation projects under development by NCDOT to the EEP. These projects were typically transferred at the next logical milestone step in the project development

process. For example, if a project was currently in design, the design phase was managed to completion by NCDOT and then transferred to the EEP for the initiation of the construction phase.

(2) Purchase of credits from private mitigation banks.

Under this approach, the EEP purchases needed mitigation credits from an existing mitigation bank when available and practicable from a cost perspective.

(3) Purchase of high-quality preservation lands.

To meet the mitigation needs during the initial transition period, the EEP has acquired a number of high-quality preservation lands. The MOA allows the EEP to use higher ratios of these lands for mitigation during the start-up of the program, as long as the appropriate stream and wetlands restoration credits are developed within the first seven years of the program. In several situations (for example, the acquisition of Dupont Forest), the CWMTF participated in funding the acquisition of the property. This is a good example of an existing synergy point between the EEP and the CWMTF. In this situation, NCDOT, through the EEP, would receive mitigation credit for the acquisition of the high-quality preservation lands, commensurate with its share of the funding for the acquisition.

(4) Purchasing projects from the CWMTF.

The EEP has, on a few occasions, purchased projects outright from the CWMTF. This is a second example of an existing synergy between the two programs. This type of situation occurs when EEP requires mitigation in a cataloguing unit but has no existing credits available. The CWMTF, however, has provided funds to a grantee within the cataloguing unit to develop a stream restoration project. In this scenario, the EEP contacts the grantee to see if the grantee would be interested in letting the EEP buy out the grantee's project and take responsibility for completing the project. If the grantee is willing, the EEP then works with the CWMTF to buy out CWMTF's interest in the project. This is accomplished by the EEP compensating the CWMTF for its full project costs, including the amount of funding given to the grantee and the administrative cost associated with reviewing the application and managing the grant. Under this scenario, the EEP takes responsibility for completing the project and for monitoring the site according to specific regulatory requirements. The grantee has no role in completing the project. The grantee may have access to the site depending on the specific project arrangements and the conditions specified in the conservation easement.

The CWMTF staff currently develops this buy-out estimate and presents a recommendation to the CWMTF board for approval. Because this type of project buy-out arrangement has now been executed a few times, the CWMTF has now developed a clear methodology for calculating the administrative costs and determining the buy-out amount that EEP is required to pay.

It is not clear if this cost methodology results in the EEP paying more than it would have paid had it purchased a conservation easement from a property owner itself originally and then constructed the project itself. What is clear is that under this approach the EEP is reimbursing the CWMTF for the full extent of its investment in a project to comply with the CWMTF's statutory prohibition on mitigation, thus freeing up the funds from a project purchased by EEP to be utilized on additional grant(s). From an e EEP perspective, the EEP is paying an amount reasonably commensurate with what it would have paid had it constructed the project itself.

(5) Developing required mitigation through a design-bid-build process.

For mitigation under development by the EEP, the program is currently using one of two methods: design-bid-build or full delivery. Under design-bid-build, EEP secures the property through the State Property Office, then contracts for mitigation implementation in a multi-step contracting process that involves completing design, and then contracting through the State Construction Office for a construction firm to build the restoration project. The typical steps in this process are as follows:

1. The EEP uses an on-call contract of engineering firms to select a firm to perform site design. EEP's current on-call contract has approximately 20 firms, with contract caps of $750,000 per firm. Work is rotated through the firms, with an effort to balance work between the firms, while attempting where possible to leverage specialized expertise that one firm or another may have when it is required for a particular project.

2. An EEP Project Manager uses the EEP project Atlas, produced in the watershed plan that identifies priority sites for a restoration project, to gauge the interest of the property owners and screen the feasibility of conducting a restoration project on the site. If it appears feasible to develop a project on the site, EEP staff, will conduct follow-up discussions with the property owner(s) to confirm their interest in selling either all or a part of their property or allowing a conservation easement on their property (depending on the specific property need for a particular mitigation project).

3. When a willing seller has been identified and the site's feasibility has been confirmed through the initial screening process, the EEP engages the State Property Office to assist with obtaining an option on the property. This option commits the property owner to agree to sell to the State of North Carolina pending the successful completion of design activities. The option is then recorded against the property in order to protect the investment the EEP will make in designing the restoration project (typically in the range of $150,000 – $200,000).

4. To expedite this process, the acquisition of mitigation easements has been exempted from the requirement to obtain pre-approval for this acquisition from the Council of State or the General Assembly's Joint Committee on Government Operations (GovOpps). Instead, the State Property Office reports

monthly to the Secretary of the Department of Administration on any mitigation-related acquisitions. These reports are then provided to the Council of State and GovOpps.

5. Because NCDOT will seek reimbursement from FHWA for the federal share of the project, the EEP and the State Property Office are required to follow the federal Uniform Act when acquiring any property for NCDOT mitigation, which is designed to ensure that a property owner receives "just compensation" for the acquisition of his property. Just compensation is typically based on the fair market value for the property in question based on an appraisal, but it can sometimes be adjusted based on other factors. This fair market value is normally developed based on the property's value for its intended purpose (i.e., agriculture, etc.). Oftentimes, this creates a disconnect with a property owner who sees its intended purpose for the proposed transaction with the EEP as a mitigation site. If the property owner's parcel is one of the few meeting the technical needs of the EEP in a given watershed, this may give the property owner the expectation that the property is worth considerably more to the state than it will be valued at in the appraisal when assessed for its intended purpose.

6. In addition to the federal Uniform Act requirements, the EEP is also required to comply with state law that requires North Carolina state agencies to be careful stewards of the public funds in the acquisition of property. This requirement limits the extent to which EEP can offer a price above fair market value in order to close on the property. Finally, unlike with the acquisition of right-of-way for a transportation project, the state has no authority to use its powers of eminent domain to obtain property for a mitigation site. It is dependent upon being able to identify a willing seller and negotiating an agreeable price that is consistent with applicable federal and state statues and regulations.

7. The engineering firm then performs a detailed design for the site. In some situations, this design process will suggest changes in the size of the site needed for the restoration project. In a few cases, issues will also surface during the design process that suggest that the site is not a good candidate for a mitigation project and the project will be cancelled and, if appropriate, re-started at the site selection step.

8. Once design is completed, the EEP will exercise its option on the site and then take bids for the construction phase of the project. The construction project is let through the State Construction Office and is awarded to the successful contractor on a low bid basis.

9. The EEP typically retains the engineering firm that performed the design work to provide construction management services during the construction phase. In some cases, a second engineering consulting firm could be assigned these responsibilities.

10. The design firm, as part of their scope, is required to perform site monitoring for the first year after construction is completed. Monitoring for years two through five is contracted out separately.

The design-bid-build process typically takes approximately three to three and a half years to put mitigation in place from project initiation. This includes approximately one year for site selection, one to one and half years for site design and one year for construction.

(6) Developing required mitigation through the full delivery process.

The second method the EEP is currently using to develop mitigation is the full delivery process. In this approach, the EEP purchases credits from one or more private sector partners based on needs that the EEP identifies in one or more cataloguing units. While this process is essentially the acquisition of land and the associated services required to design and construct the mitigation on the selected site, the full delivery method is procured based on the concept that the EEP is acquiring a product or "widget" – an acceptable mitigation credit. . By acquiring a "product", EEP is allowed to manage the request for proposal (RFP) process and procure from the full delivery providers through the Division of Purchasing and Services who coordinates the award through the Department of Administration. The full delivery process typically involves the following steps:

1. The EEP identifies mitigation requirements that it would like to fulfill through the full delivery process.

2. The EEP develops and issues an RFP for its full delivery requirements.

3. Full delivery vendors identify potential sites within the candidate watersheds. While potential vendors may use EEP's watershed plans, our interviews with full delivery providers suggest that these firms are more likely to utilize their own geographic information system (GIS) based data analysis tools to identify technically viable sites, The full delivery providers then engage experienced real estate acquisition staff who are properly incentivized based on closing the sale of the property and winning the RFP to identify willing sellers and obtain options on properties.

4. The full delivery provider has more flexibility than the EEP does in the design-bid-build process when obtaining the property. If appropriate, the full delivery provider can offer the property owner more than fair market value for a particular site. The main constraint is the full delivery provider must factor this higher land cost into determining its overall fixed price bid and ultimately the low bidder will be selected out of the various proposals deemed technically qualified.

5. The full delivery vendor submits their proposal.

6. The EEP evaluates the full delivery proposals using a two-step process. The EEP first identifies proposals that it feels are technically viable. The EEP conducts this technical evaluation by reviewing proposals and conducting site visits of the proposed mitigation sites.

7. The EEP then opens the cost proposals of only those proposals deemed technically qualified. The EEP selects bidder based on cost, technical merit, and project size match to requested mitigation. .

8. The full delivery provider then executes its option on the properties included in its proposal. In completing the acquisition of the property, the full delivery provider works with the State Property Office to ensure that a conversation easement deeded to the state is properly recorded and filed with the appropriate county register of deeds.

9. The EEP compensates the full-delivery vendor at a series of predefined milestones throughout the life of the project. The acquisition of the site and the transfer of ownership interest in the site to the state is one of these predefined milestones.

10. The full delivery provider completes design and construction activities and delivers the completed "mitigation credits" to the EEP.

11. The full delivery provider performs monitoring of the site for the first five years after the completion of construction.

The full delivery process has been utilized extensively by the EEP during the initial build-out of the program. It is generally accepted that the full delivery approach is most appropriate in watersheds with greater mitigation needs since this technique lends itself to building larger single projects versus a number of smaller projects.

Because of the turnkey nature of the full delivery process, the EEP provides less oversight and management for the full delivery process than the design-bid-build process. This has caused some concern on the part of regulators who have asked the EEP to begin to take a more proactive role in monitoring and overseeing the execution of full delivery projects.

(7) Design-Build.

The EEP has recently proposed to pilot a design-build procurement approach. This approach has been utilized on some NCDOT projects in North Carolina in recent years. It is generally regarded to be an effective tool for reducing the elapsed time to complete a project versus the traditional design-bid-build approach because it has a single contractor selection step, after a firm has completed 30% design, which is then bid-on. It also allows in some situations for some design and construction activities to be performed in parallel where this is appropriate versus the inherent sequential process of design-bid-build where all design activities must be completed as a critical

path item before a specification can be prepared, a contract let and a contractor awarded the project.

Typically, the design-build process would involve some initial design activities to identify enough about the project to develop the specification to procure a design-build contractor. The selected design-bid contractor would then complete design and construct the project. In transportation projects, the design-bid contractor is selected on a qualifications based selection and then the price for completing the project is negotiated with the team scoring highest technically.

For the EEP, the design-build approach would likely involve the use of its existing on-call contractors to produce the 30% design, to be used for selection of the design-build contractor who would perform design, construct the mitigation and likely monitor the mitigation for the initial five years.

There are some questions concerning the approach EEP would utilize to procure the design-build approach. If it was determined that the final product, as in the full delivery process, is a "credit", a two step selection process could probably be utilized in which technically viable proposals are identified and then the costs are opened for only those proposals meeting the technical requirements, with the lowest bidder awarded the contract.

Alternatively, the EEP could use the more traditional qualifications based selection approach. However, this would require the support and involvement of the Department of Administration, unless the EEP was given the statutory authority by the General Assembly to conduct its own design-build process. NCDOT currently has this statutory authority.

E. Mitigation Banking

This section provides a brief overview of mitigation banking and describes the role that mitigation banking has played to date in North Carolina.

1. Mitigation bank defined.

A mitigation bank is a site where wetlands and/or other aquatic resources are restored, created, enhanced, or in exceptional circumstances, preserved expressly for the purpose of providing compensatory mitigation in advance of authorized impacts to similar resources. For purposes of compensating for impacts to waters and wetlands

regulated under Section §404, use of a mitigation bank may only be authorized when the impacts are unavoidable.[21]

The roots of mitigation banking date back to the 1960s and grew in importance with the Clean Water Act in 1972 and the Endangered Species Act of 1973. In 1988, President George Bush announced a Domestic Policy Council calling for "no net loss" of wetlands. Later, President Clinton endorsed this policy identifying mitigation banks as a viable option for compensating for wetland impacts. A federal guidance implementing the Clinton Administration's Wetland Plan was published outlining strict procedures and policies to ensure that wetland functions and values are preserved and defining mitigation banking as an appropriate approach for "preserving, enhancing, restoring or creating habitat to compensate for unavoidable wetland impacts."[22]

Each mitigation bank that is established must be supported by a formal, written banking instrument, prepared by an attorney and developed in coordination with the state's Mitigation Banking Review Team (MBRT). Generally, mitigation banks must be functioning in accordance with the success criteria for each particular bank prior to the withdrawal of credits.

The following are the minimum requirements used by a Mitigation Bank Review Team (MBRT) during its initial evaluation of all mitigation bank proposals:[23]

- The proposed bank will improve the ecological conditions of the regional watershed.
- The bank has the capacity to provide viable and sustainable ecological and hydrological functions for the proposed mitigation bank service area.
- It can be effectively managed in perpetuity.
- Construction of the bank will not destroy or degrade areas with high ecological value.
- The bank has a high probability of meeting the prescribed success criteria.
- It has the capability to meet the requirements of all other applicable federal and state laws.
- Adjacent land uses will not adversely affect the perpetual viability of the mitigation bank.

[23] http://www.saw.usace.army.mil/wetlands/Mitigation/mitbanks.html#Find%20a%20Bank!

- The bank sponsor has the capacity to meet prescribed financial responsibility requirements.

2. Role of mitigation banking in North Carolina.

Mitigation banking has not traditionally played a key role in mitigation in North Carolina. In comparison with many peer states, North Carolina has a small number of banks, although it is not uncommon for states to contain few or zero mitigation banks. Currently, there are eight active banks and three active umbrella banks (containing a total of five sites).[24]

In discussions with mitigation bankers in North Carolina and in other states, several reasons were given for the limited role that mitigation banking has played in North Carolina to date. The most significant reason is the strict service area definitions used in North Carolina. The geographic service area (GSA) of a bank is the designated area wherein a bank can reasonably be expected to provide appropriate compensation for impacts to wetland or other aquatic resources. The GSA for wetland mitigation banks in North Carolina is the eight-digit cataloguing unit (CU) or HUC within which the particular bank site is located.[25] There could be some potential for a bank to work outside its HUC but this on an exception basis at the discretion of the regulator. In some other states, for example Alabama and South Carolina, there are banks with comparatively larger service areas, ranging from several river basins to the whole state in the case of one South Carolina mitigation bank.

In addition, with the establishment of the WRP and then the EEP, it could be argued that mitigation bankers are now put in the position of having to compete against a state agency that is operating as a monopoly should they choose to enter the market in North Carolina. One Virginia banker we interviewed as part of this study, for example, stated that state-dominated management of contracts and sales in North Carolina might limit the number of entrepreneurs willing to enter the market.[26]

The EEP. However, does work with mitigation banks whenever possible. As noted in Section II.D.2, the EEP has bought credits from mitigation banks in the past and expects to utilize this as an acquisition approach whenever it is feasible in the future.

F. Clean Water Management Trust Fund

North Carolina's open spaces and natural resources have become increasingly threatened by development pressures. Between 1982 and 1997, the state witnessed an 88 percent increase

---

[26] Personal Interview with Brent Fults, Earthsource Solutions, Inc., May 3, 2007.

in its lands defined as urban areas, as well as an increasing conversion rate for forest, farm and rural lands. This trend, coupled with an expected 26 percent growth in the state's population, have motivated the creation of a variety of initiatives to preserve North Carolina's open spaces, aquatic resources, wildlife, and habitats.[27]

The North Carolina Clean Water Management Trust Fund (CWMTF) was established by the General Assembly in 1996 to provide grant funding for water protection and restoration projects to local governments, state agencies, and non-profit conservation organizations.[28] The CWMTF authorizing legislation directs CWMTF-funded projects to address "water pollution problems and focus on upgrading surface water, eliminating pollution, and protecting and conserving unpolluted surface waters, including urban drinking water supplies." The CWMTF's enabling legislation specifically prohibits it from funding compensatory mitigation.

The General Assembly also intended "that moneys from the Fund also be used to build a network of riparian buffers and greenways for environmental, educational, and recreational benefits." Likewise, legislators hoped that "the results of these efforts [would] also be beneficial to wildlife and marine fisheries habitats."[29] Between 1996 and 2005, the CWMTF helped protect over 317,529 acres of land and 3,612 miles of riparian buffers.[30]

The CWMTF is an independent state agency housed within NCDENR for administrative purposes.[31] A 21-member Board of Trustees appointed by the Governor and General Assembly reviews grant applications and makes funding decisions.[32] The Commissioner of Agriculture, Chair of the Wildlife Resources Commission, Secretary of NCDENR, and Secretary of the Department of Commerce comprise the CWMTF's Advisory Council, which advises the Board of Trustees on CWMTF allocations.[33]

1. Program funding.

Appropriations from the North Carolina General Assembly fund the CWMTF. CWMTF appropriations are submitted to the General Assembly in the Governor's budget as a yearly line item. Since its launch in 1996, program funding has increased

[31] N.C. GEN. STAT. Art. 18 § 113A-255.
[32] Board members must be knowledgeable in one of the following areas: acquisition and management of natural areas; conservation and restoration of water quality; wildlife and fisheries habitats and resources; or environmental management. N.C. GEN. STAT. Art. 18 § 113A-255.
[33] N.C. GEN. STAT. Art. 18 § 113A-259.

to $100 million annually. Between 1996 and 2005, the CWMTF awarded 781 grants for a total of $595.8 million.[34] State agencies, local governments (or other political subdivisions of the state), and non-profit conservation organizations are eligible for CWMTF grants.[35] The Board of Trustees recommends, but does not require, matching funds to receive a CWMTF grant.[36]

2. Types of projects.

The CWMTF provides grants to:

- Enhance or restore degraded waters.
- Protect unpolluted waters.
- Contribute toward a network of riparian buffers and greenways for environmental, educational, and recreational benefits.

Types of projects funded by the CWMTF include:

- Improvements to wastewater treatment and collection systems.
- Stormwater management.
- Repair of septic tanks and removal of straight pipes.
- Wetlands, riparian buffer and stream restoration.
- Acquisition of buffers, floodplains, wetlands, and greenways.
- Agricultural best management practices.

CWMTF has usually used a twice-yearly application cycle but has just transitioned to a single annual application cycle. For the recently completed grants application cycle (March 2007), CWMTF has received applications for projects totaling $155 million.

3. Grant evaluation.

CWMTF grants are evaluated according to criteria drafted by the Board of Trustees with input from the CWMTF staff, other state agencies, and stakeholders. The grant evaluation criteria are delineated by project type and revised annually. Proposals are scored according to their contribution toward achieving the primary objectives of the Fund, which include: restoration of degraded waters or protection of unpolluted water;

targeted areas; special significance of waters; preservation of waters with special uses; contribution to ecological networks; consistency with NCDENR - Division of Water Quality's Basinwide Plans; measurable and enduring outcomes; innovative procedures or technologies; development of riparian greenways; public education; and leverage of matching resources, among other criteria.[37] Applicants typically provide project data, and the CWMTF field staff perform site visits for each project proposal.

[37] *Id.*

III. Other State Practices

The study team conducted detailed reviews of mitigation practices in four other states: Florida, Georgia, Virginia, and Washington. Florida, Georgia and Virginia were selected due to their geographical proximity to North Carolina and the fact that, like North Carolina, they are experiencing rapid growth. Washington State was selected due to its legislatively mandated focus on functional replacement and the Washington State Department of Transportation's efforts to implement a watershed planning process that has some similarities to the process utilized by the EEP.

This section documents the results of our research on other state practices. It includes a comparison of North Carolina with the other states that we reviewed, a discussion of the role of mitigation banking in these other states and an overview of several best management practices in regards to mitigation. It also provides some perspective on why these and other states have not actively pursued implementation of an EEP-like program in their states.

A. Comparing North Carolina with Other Peer States

Comparing mitigation practices in North Carolina to those in other states provides some context for an assessment of the state's current practice, as well as alternative mitigation scenarios. For this study, we chose to examine mitigation practices in Florida, Georgia, Virginia, and Washington. Although every state promulgates different permitting requirements, faces different regulatory challenges, and contains different types and amounts of aquatic resources, these states do share some common characteristics with North Carolina, including regions of fast growth and high transportation demand, state regulatory requirements in addition to CWA §404, and/or an abundance of aquatic resources.

Exhibit III-I below highlights key points of comparison for North Carolina and the other selected states and is followed by additional discussion of several of these points.

Exhibit III-I: Comparing Mitigation Practices in Peer States

Selected Mitigation Practice	*NC*	*FL*	*GA*	*VA*	*WA*
Programs requiring compensatory mitigation	404, 401/water quality, buffers, nutrient offset buffers	404, state "Environmental Resource Permits"	404	404, 401/water quality, tidal wetland	404, 401/water quality
Watershed-based mitigation planning/ implementation	NCEEP conducts a two-tiered, detailed watershed-planning process	Water Management Districts conduct regional planning	No	No	WSDOT "continually tries" to develop a discrete approach to watershed-based mitigation planning
Watershed-based siting requirement	2003 MOA requires mitigation within 8-digit CU	State statute requires mitigation within drainage basin; if not, permittee must conduct cumulative impacts analysis	Mitigation required within 8-digit CU, or in adjacent watershed if no mitigation opportunities available	Mitigation required within 8-digit CU, or in adjacent watershed if no mitigation opportunities available	None - proposed mitigation projects are evaluated on a case-by-case basis
• **# of 8-digit CUs** • **(avg. sq. miles/CU)**	• 58 • (928)	• N/A • (N/A)	• 52 • (1143)	• 53 • (807)	• 73 • (977)
Estimated annual DOT mitigation needs ***(Note: units reported vary across states)***	64,112 stream credits 9.0 riparian credits 51 non-riparian credits 0.5 coastal marsh credits 60.5 TOTAL wetland credits	In FY06, 2200 acres of mitigation for 104 acres of impact	667 wetland credits*, 31,513 linear feet of stream **credits ≠ acres. Rather, credits are based on function.*	Over next 6 years, VADOT projects 39,000 linear feet of stream, 130 acres non-tidal wetlands, 15 acres tidal wetlands	~20 to 50 acres

Selected Mitigation Practice	*NC*	*FL*	*GA*	*VA*	*WA*
Advance mitigation for DOT impacts	Yes	Yes	Yes, when bank credits are used (~90% of the time)	Yes, when bank credits are used (~90% of the time)	Not generally
DOT utilization of banks	N/A	~40% (DOT required by statute to purchase bank credits whenever available)	~90%	~90%	~12%
# of banks established within state, as of Dec. 2005 ***** Key: A-A = Approved-Active; A-S = Approved-Soldout; A-I = Approved-Inactive for other reason; P = Pending as of Dec. 2005; U = Umbrella Bank (i.e., may contain multiple sites)***	• A-A: 8 • A-S: 1 • A-I = 1 • P = 6 • U, A-A: 3 • U, P: 1	• A-A: 51 • A-S: 2 • P: 2	• A-A: 43 • A-S: 2 • P: 29 • U, A-A: 1	• A-A: 29 • A-S: 2 • P: 16 • U, A-A: 7 • U, A-I: 1 • U, P: 1	• A-A: 3 • A-S: 1 • P: 4 • U, A-A: 1 • U, A-I: 3 • U, P: 3
DOT project delays experienced as a result of mitigation requirements	No delays since initiation of the EEP	Yes, "occasionally"	Yes, "unable to estimate how often"	Yes, "very few, if any…less than 1% of the time"	Yes, "occasionally"

B. Utilization of Mitigation Banks

North Carolina has very few established banks and historically has not had a well-developed banking industry. According to ELI's 2005 inventory of banks, the state had eight active banks and three active umbrella banks (containing a total of five sites).[38] Furthermore, some portions of the state likely would not support a viable banking industry due to the small number and size of aquatic resource impacts.

[38] Environmental Law Institute, 2005 Status Report on Compensatory Mitigation in the United States, *available at:* http://www2.eli.org/wmb/index.htm (April 2006).

Florida, Georgia, and Virginia each utilize banking to a much greater degree. With 43 active banks as of 2005, Georgia's banking industry is very well established, and credits are available in many watersheds across the state.[39] The Georgia Department of Transportation (GDOT) has established its own banks, and prefers to use GDOT bank credits when available.[40]

Virginia also has a strong banking industry, with 29 active banks and seven active umbrella banks (containing a total of 12 sites) established across the state.[41] The Virginia Department of Transportation (VDOT) has established several of its own banks, but prefers to use private banking credits when available. VDOT officials have expressed that they do not want to be "in the mitigation business" and would prefer to purchase 100 percent of its required mitigation credits from private bankers if possible; however, certain regions of the state do not maintain a viable banking industry, and in those regions, VDOT has relied on its own banks for mitigation.[42]

Florida maintains one of the country's oldest and most active banking industries, with 51 active banks operating in the state.[43] State statute requires the consideration of mitigation banking for transportation impacts, if available;[44] however, some regions of the state have no active banks or have banks that have sold out of credits. In those cases, the regional Water Management District (WMD) often conducts project-specific mitigation. In cases where the WMD cannot identify a suitable project, the Florida Department of Transportation (FDOT) will conduct its own project-specific mitigation. In these cases, the Florida Department of Protection or a regional WMD still assumes long-term management of the site.[45]

Conversely, the State of Washington has very few established banks (three active banks and one active umbrella bank containing two sites), and the Washington State Department of Transportation (WSDOT) conducts most of its mitigation on a project-by-project basis. Like North Carolina, many regions of the state would likely not support a banking industry due to a lack of development in those areas.[46] Washington's regulatory structure may also discourage mitigation bankers from entering the state's industry. One banker reported that local jurisdictions' involvement in creating and using banks may hinder growth of the

banking industry because they often do not favor mitigation banks or use other mitigation programs.[47] In addition, service areas, established by regulatory agencies, do not often appear large enough to support bank operations.[48]

C. Overview of Selected Best Practices

The federal agencies have issued a variety of guidance documents to improve the effectiveness of compensatory mitigation, including the 1990 Mitigation Memorandum of Agreement,[49] the 1995 *Federal Guidance for the Establishment, Use and Operation of Mitigation Banks*,[50] the 2000 *Federal Guidance on the Use of In-Lieu Fee Arrangements for Compensatory Mitigation under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act*,[51] and the U.S. Army Corps of Engineers' Regulatory Guidance Letter No. 02-2.[52,53] These documents collectively describe multiple required and preferred practices for compensatory mitigation. Among others, mitigation preferences include advance mitigation, or compensatory mitigation provided in advance of project impacts, thereby reducing the temporal loss of wetland acreage or functions; and watershed-based mitigation, or mitigation that addresses the specific resource needs of particular watersheds, ideally within the context of a comprehensive watershed plan.

Using a programmatic approach to mitigation planning, both North Carolina and Florida generally achieve advance mitigation for state department of transportation impacts. Although Virginia and Georgia do not use the same programmatic approach, in theory, the utilization of bank credits provides advance mitigation because they are established prior to

(October 31, 2000).
[52] U.S. Army Corps of Engineers. Regulatory Guidance Letter No. 02-2. (December 24, 2002).
[53] In March 2006, EPA and the USACE issued a proposed rule on compensatory mitigation that sets out to establish "to an extent that is feasible and practical, equivalent standards for all forms of compensatory mitigation." *See:* Compensatory Mitigation for Losses of Aquatic Resources, 71 Fed. Reg. 15,520 (2006) (to be codified at 33 C.F.R. pt. 325 and 332, and 40 C.F.R. pt. 230) (proposed Mar. 28, 2006). p. 15,521. However, as of May 2007, the revised rule has not yet been issued and is not expected to be finalized for several weeks or months.

the occurrence of permitted impacts.[54] Thus, for the 90 percent of state department of transportation impacts compensated with banks in those states, advance mitigation is likely achieved. Without a prevalence of banks or a programmatic approach to mitigation similar to that of North Carolina, the State of Washington does not uniformly achieve advance mitigation. Similarly, state departments of transportation in Florida, Virginia, and Washington reported occasional project delays as a result of mitigation associated with project permits, while Georgia reported some delays but was unable to estimate the frequency of delays due to problems with mitigation.[55]

With a programmatic approach to mitigation, watershed-based planning is achieved to a higher degree in North Carolina and Florida. Both states conduct planning to identify priority projects. In North Carolina watershed planning efforts are funded by its "customers;" in other words, NCDOT funds the majority of the planning as the agency's largest customer, while private consumers of the EEP's other in-lieu fee programs (wetlands and streams, buffers, and nutrients) fund the remaining portion of planning costs. Similarly, in Florida, the mitigation planning costs are incorporated into the fee paid to the WMD per acre of mitigation. These costs cover both mitigation planning and implementation.[56]

Georgia and Virginia, which rely heavily on the use of mitigation banks, have no established watershed-based mitigation planning initiative. In Washington, after the state legislature instructed regulatory agencies to authorize "innovative mitigation measures that are timed, designed, and located in a manner to provide equal or better biological functions and values compared to traditional on-site, in-kind mitigation proposals,"[57] WSDOT has attempted to develop a watershed-based mitigation planning process, but, to date, still conducts project-specific mitigation, of which the mitigation 'site' and 'kind' are negotiated on a case-by-case basis with regulators.[58]

Four of the five states examined achieve mitigation within demarcated watershed boundaries the majority of the time, if not 100 percent of the time. In North Carolina, the EEP's MOA requires mitigation to be sited within the same 8-digit cataloguing unit.[59] In Virginia, although state regulations build in flexibility for siting by stating a preference for on-site mitigation,[60] Virginia regulators report that mitigation is always achieved within the

same 8-digit cataloguing unit.[61] Georgia regulators typically require mitigation within the same 8-digit cataloguing unit as the permitted impact, but may negotiate siting in an adjacent watershed if no mitigation opportunities are available within the same unit of the impact—some 5 percent of permitted projects.[62] Florida laws tie mitigation siting to drainage basins by requiring a cumulative impact analysis for any mitigation proposed outside the basin of the permitted impact. However, once the cumulative impact analysis has been conducted, permittees may still choose to implement mitigation outside the basin of the permitted impact, and may work with regulators to identify suitable options. Because the size of the drainage basin varies greatly across the state, some of Florida's WMDs may allow mitigation outside the drainage basin more often than others.[63] Finally, Washington has no state regulatory tie to mitigation siting within the watershed, and WSDOT projects are negotiated on a case-by-case basis.[64]

D. Why Haven't Other States Adopted EEP-like Programs?

North Carolina's EEP has been recognized nationally both as a model for achieving high-quality compensatory mitigation and as a coordinating body among state and federal regulatory agencies and permittees, including NCDOT. In addition to providing advance mitigation and conducting watershed-based mitigation planning, the EEP also implements the following "best practices" with respect to environmental outcomes:

- Providing the USACE with information in advance on the schedule for implementation of mitigation projects.
- Assessing the ecological suitability of sites for achieving the goal and objectives of compensatory mitigation.
- Using funds collected by the program for replacing wetland functions and values and not to finance non-mitigation programs and priorities.
- Specifying a schedule for conducting the activities that will provide compensatory mitigation.
- Requiring mitigation sites to be protected in perpetuity.

[61] Personal Interview with Allison Dunaway, Virginia Department of Environmental Quality, May 2, 2007.
[62] Personal Interview with Mike Ruth, April 23, 2007.
[63] Florida operates on a system of "drainage basins." Basins are set by rule and determined by the regional WMDs. Boundaries are based on a combination of U.S. Geological Survey hydrologic units, regional planning areas, hydrologic engineering (e.g. canals), and/or other factors. The size varies greatly, particularly from WMD to WMD. For example, South Florida WMD has hundreds of basins, mostly due to the high number of engineered water structures, other WMDs have less than ten, which are based largely on watershed units. Personal Interview with Connie Bersok, Florida Department of Environmental Protection, April 9, 2007.
[64] Person Interview with Gretchen Lux, Washington Department of Ecology, April 20, 2007.

- Accomplishing site protection using appropriate real estate arrangements.
- Conducting regular monitoring to document funds received, impacts permitted, how funds are disbursed, types of projects funded, etc.
- Specifying requirements for monitoring (i.e., specific parameters to be monitored).
- Specifying a geographic service area (i.e., the 8-digit cataloguing unit).
- Providing provisions for remedial actions and responsibilities (i.e., a contingency fund).
- Providing financial, technical, and legal provisions for long-term management and maintenance; and utilizes accounting procedures to track payments received from permittees.[65]

However, to date, no other state has established a program similar to that of the EEP. This begs the question—if the EEP is a national model, why are other states not doing it? Many state officials reported that, although the EEP serves as an interesting model, their current state practices, which developed under much different circumstances, are meeting the mitigation needs of the state adequately. Furthermore, generating the momentum and political will to support such a program seems a doubtful prospect.[66] In Florida in particular, the state is already achieving watershed planning and advance mitigation with their current model.[67] Others reported that an EEP-like program would require funding and manpower that is simply not available.[68]

Some state officials were favorable towards the idea of establishing an EEP-like program within their states, as it would allow for the state to guarantee high quality mitigation, provide a programmatic approach to watershed planning, and provide stability towards planning and siting implementation, which may sometimes be a contentious and difficult process.[69]

A recent article published by Ecosystem Marketplace, an online newsletter that covers ecosystem service markets, echoes these insights. Contributors argue that states with robust

banking markets may not have a need for the EEP model and that aligning agency and private goals and interests to initiate such a program is difficult. The article also suggests that financing future mitigation may be difficult for state departments of transportation and that the proposed rulemaking, which would have substantial impacts to EEP's operation as currently written,[70] lends uncertainty to establishing such a program. However, EEP's watershed planning, prioritization of projects, and clear performance measures are desirable from many stakeholder perspectives, and contributors also indicate that EEP's status as young program suggests it may be too early to judge how replicable it may be for other states.[71]

---

[70] In March 2006, EPA and the USACE issued a proposed rule on compensatory mitigation that sets out to establish "to an extent that is feasible and practical, equivalent standards for all forms of compensatory mitigation." *See:* Compensatory Mitigation for Losses of Aquatic Resources, Fed. Reg. 15,520 (2006) (to be codified at 33 C.F.R. pt. 325 and 332, and 40 C.F.R. pt. 230) (proposed Mar. 28, 2006). p. 15,521. However, as of May 2007, the revised rule has not yet been issued and is not expected to be finalized for several weeks or months.

IV. Impact of Potential Changes in Federal Regulatory Environment

This section discusses anticipated changes in the federal 404 program and the potential impact of these changes on the operation of the EEP. Specifically, the study team conducted a detailed review and assessment of the potential impact on the EEP of several pending federal actions, including:

- The March 2006 proposed rulemaking from USACE and EPA on compensatory mitigation.
- The 2002 National Mitigation Action Plan, which has among its objectives an increased emphasis on watershed planning.
- The impact of the 2006 Supreme Court decision in *Rapanos v. United States* and *Carabell v. U.S. Army Corps of Engineers* ("*Rapanos/Carabell*"), which casts doubt as to whether some waters, particularly tributaries, wetlands, ditches, and non-perennial streams, fall within federal jurisdiction under the Clean Water Act.

Each of these items is discussed in further detail below.

A. The Proposed Mitigation Rule

In March 2006, the U.S. Environmental Protection Agency (EPA) and U.S. Army Corps of Engineers ("USACE") issued a proposed rule on compensatory mitigation that sets out to establish "to an extent that is feasible and practical, equivalent standards for all forms of compensatory mitigation."[72] In brief, the rule as written in March 2006 includes the following measures, among others:

- Establishes standards and criteria for all mitigation methods (except in-lieu fee mitigation, which it proposes to eliminate altogether).
- Affirms mitigation sequencing (avoidance, minimization and compensatory mitigation).
- Requires the watershed approach to compensatory mitigation.
- Prescribes standards for choosing appropriate mitigation, including site selection, "in-kind" replacement, replacement ratios, the use of banks, the use of preservation, and buffer mitigation.

[72] Compensatory Mitigation for Losses of Aquatic Resources, 71 Fed. Reg. 15,520 (2006) (to be codified at 33 C.F.R. pt. 325 and 332, and 40 C.F.R. pt. 230) (proposed Mar. 28, 2006). p. 15,521.

- Sets administrative requirements and performance standards.
- Addresses mitigation banking establishment and credit withdrawal.
- Eliminates in-lieu fee (ILF) mitigation as an option for providing compensatory mitigation.[73]

As written, the proposed rule would have significant effects on the EEP.[74] First, abolishing ILF as a mitigation option would prohibit the EEP from offering this option to private individuals and public agencies seeking mitigation, including NCDOT. These parties would then either conduct the mitigation themselves or purchase bank credits where available. Because the state has many regions with no operating banks, flexibility for permittees would be greatly reduced.[75]

Secondly, the proposed rules do not authorize a programmatic approach to mitigation, except through umbrella banking instruments. Whereas the EEP's current approach allows the state to offer watershed-based mitigation planning and implementation, re-organizing into an umbrella bank would lessen the efficiency of the current program's operations by requiring an additional level of regulatory oversight involving the review and approval of each restoration project by an interagency review team.[76]

In addition, NCDOT may experience increased costs and delays as banking instruments and projects undergo regulatory review processes. Furthermore, eliminating ILF reduces mitigation options for NCDOT impacts.[77] Finally, at least initially, the state's lack of mitigation banks would likely return the burden of conducting mitigation to NCDOT, a model that has been widely recognized as both inefficient and ineffective.

[77] Letter from Michael F. Easley, Governor, State of North Carolina, to Benjamin H. Grumbles, Assistant Administrator, U.S. Environmental Protection Agency, and John Paul Woodley, Jr., Assistant Secretary of the Army (Civil Works) (June 30, 2006) (*available at* http://www.nceep.net/pages/Federal_Rule_Response_Combined.pdf).

However, the proposed rule also states that the agencies are "seeking comment on alternative approaches that would retain in-lieu fee programs as a separate category of mitigation with somewhat different requirements."[78] The comment period ended in June 2006. The USACE and EPA received dozens of comments from multiple agencies and organizations across the country, including a response from the State of North Carolina.[79] As of May 2007, the USACE and EPA have examined and synthesized comments, but have not yet agreed to any revisions, partially due to delays from other developments at the federal level, such as the *Rapanos/Carabell* Supreme Court decision (please refer to Section IV.C below) and re-issuance of the USACE Nationwide Permits.

The agencies will conduct the process of considering and incorporating comments over the next several weeks or months; thus, at the time of this writing, it is difficult to predict the definite effects of the rule on mitigation in North Carolina. However, because the EEP is hailed nationally as a model and held in high esteem by USACE and EPA regulators both at the regional and national levels, there exists a realistic possibility that rule revisions would allow the EEP to continue its current operation to a high degree.

B. The National Mitigation Action Plan

In response to various critiques of the effectiveness of wetland compensatory mitigation in the United States, EPA, USACE, and the Departments of Agriculture, Commerce, Interior, and Transportation released the National Wetlands Mitigation Action Plan in 2002. The plan includes 17 tasks designed to improve the ecological performance and results of compensatory mitigation, including the creation of federal guidance on "site and "kind" replacement, as well as compensatory mitigation in a watershed context. Originally planned for completion in 2005, the proposed rule and other pressing federal tasks, such as re-issuance of the 2007 Nationwide Permits, have delayed implementation of some of the action items. However, the plan is still regarded as a priority by federal agencies, and several of the action items are planned for completion once the mitigation rule and other pressing federal tasks have been completed.[80]

Although the plan is effectively "on hold" as of May 2007, it still warrants discussion for purposes of this study due to its strong focus on watershed-based mitigation. Together with the proposed rule, which also emphasizes watershed-based mitigation, the Plan indicates

[78] Compensatory Mitigation for Losses of Aquatic Resources, 71 Fed. Reg. 15,520 (2006) (to be codified at 33 C.F.R. pt. 325 and 332, and 40 C.F.R. pt. 230) (proposed Mar. 28, 2006). p. 15,521.

[79] Letter from Michael F. Easley, Governor, State of North Carolina, to Benjamin H. Grumbles, Assistant Administrator, U.S. Environmental Protection Agency, and John Paul Woodley, Jr., Assistant Secretary of the Army (Civil Works) (June 30, 2006) (*available at* http://www.nceep.net/pages/Federal_Rule_Response_Combined.pdf).

[80] National Mitigation Action Plan Interagency Workgroup, National Mitigation Action Plan, *available at:* http://www.mitigationactionplan.gov/ (June 2006).

that momentum towards watershed-based mitigation is growing nationally. North Carolina has historically been on the leading edge of this approach and is one of the first programs in the nation to adopt a discrete watershed planning process for wetland and stream compensatory mitigation for impacts authorized under Clean Water Act §404 and the state water quality laws. Thus, it is likely that future federal guidance will continue to support the state's direction in terms of utilization of a watershed-based planning process.

C. Rapanos v. United States and Carabell v. U.S. Army Corps of Engineers

On June 19, the Supreme Court rendered a fractured decision in *Rapanos v. United States* and *Carabell v. U.S. Army Corps of Engineers* ("*Rapanos/Carabell*"). The Court divided 4-1-4 in a decision that throws a heavy burden back on the lower courts, federal and state regulators, and citizen and watershed groups. Four justices, led by Justice Antonin Scalia, concluded in a "plurality" opinion that the Clean Water Act only protects continuously flowing open waters plus wetlands that have a "continuous surface connection" with such flowing waters. As such, the opinion cast doubt as to whether some waters, particularly tributaries, wetlands, ditches, and non-perennial streams, fall within federal jurisdiction. The fifth justice forming the majority for decision, Justice Anthony Kennedy, disagreed with the plurality reasoning, but nevertheless joined in sending the cases back to the lower court. Justice Kennedy wrote that any particular tributary or wetland that is not itself navigable must be demonstrated on a case-by-case basis to have a "significant nexus" to waters that are "navigable-in-fact." Critically, Justice Kennedy noted that the necessary nexus need not be a hydrologic connection, but can be based on some other chemical, physical, or biological relationship. Given the split decision, Justice Kennedy's opinion controls the likely scope of jurisdiction for the Clean Water Act for at least the next several years.

The full extent and impact of *Rapanos/Carabell* has not yet been fully revealed. Questions abound as to what constitutes "Waters of the United States" and how to determine a "significant nexus" with traditionally navigable waters. The USACE and EPA have each issued memos suspending enforcement and regulatory activities until they sort out what jurisdiction they believe they have. Federal guidance pertaining to the decision is expected to be released soon. However, many lower courts are already relying on the decision to determine federal jurisdiction.

While the prospect of case-by-case determinations of Clean Water Act jurisdiction will put heavy burden on federal regulators, effects in North Carolina may be minimized because state jurisdiction over "waters of the state" does not rely on federal jurisdiction. In 2001, the state adopted legislation specifically protecting so-called "isolated wetlands" that may fall outside federal jurisdiction. State rules, adopted in reaction to the *Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers (SWANCC)* decision that cast doubt on federal jurisdiction over some intrastate isolated wetlands, would presumably also

apply to waters that may be excluded from federal jurisdiction as a result of *Rapanos/Carabell.*[81] The isolated wetlands rules state that "[i]f the U.S. Army Corps of Engineers or Natural Resources Conservation Service determine that a particular water is isolated and not regulated under Section 404 of the Clean Water Act, then discharges to that water shall be covered by [these rules]."[82] In addition, a 2002 North Carolina Court of Appeals decision made clear that "waters of the state" includes wetlands, ruling that the state had authority to adopt regulations protecting wetlands. Because the North Carolina Supreme Court declined to hear the case, the decision is final in North Carolina.[83]

V. Key Findings

This section outlines a number of key findings identified by the study team. These findings include observations about the efficiency and effectiveness of the operations of the EEP and the CWMTF and an analysis of the causes and extent of the surplus of mitigation credits in some watersheds. Other findings include challenges and opportunities in regards to the relationship between the EEP and NCDOT and the extent of organizational and programmatic synergies between the EEP and the CWMTF.

For ease of presentation, our findings have been categorized as follows:

- Overall efficiency and effectiveness of the original NCDOT mitigation program and the EEP.
- Analysis of the inventory of acquisitions and credits.
- Efficiency and effectiveness of the EEP's watershed-based planning process.
- Effectiveness of the EEP's project delivery practices.
- On-going challenges in the organizational relationships between NCDOT and the EEP and FHWA.
- Extent of programmatic integration between the EEP and the CWMTF.
- Efficiency and effectiveness of the CWMTF's operations.

A. Overall Efficiency and Effectiveness of the Original NCDOT Mitigation Program and the EEP

This subsection presents our findings in regard to the overall efficiency and effectiveness of both the NCDOT mitigation program that was in place prior to the start of EEP and the EEP itself. Findings in this regard include:

- The NCDOT mitigation program was not effective; however, there is no doubt that learning was obtained through this program that has benefited the EEP.
- No permit has been delayed for mitigation since the initiation of the EEP, resulting in significant cost avoidance in terms of increased construction costs for NCDOT.
- The EEP has a strong focus on continuous process improvement.
- The EEP is recognized nationally as a model program.
- The EEP has credibility issues among some policy-makers in the state.

Each of these findings are described in further detail below.

1. The NCDOT mitigation program was not effective in meeting its program objectives; however, there is no doubt that learning was obtained through this program that has benefited the EEP.

NCDOT operated its own mitigation program until 2003. NCDOT utilized several different techniques to provide mitigation. NCDOT utilized project specific on-site mitigation, purchased credits from banks and established its own banks under contract with private-sector providers.

Under this program, it is estimated that approximately 40% of projects requiring mitigation experienced delays in their letting dates based on the inability to obtain a permit because of mitigation. These delays resulted in increases in the overall cost of constructing projects and affected the credibility of NCDOT with numerous policy-makers and the public when it could not meet its planned commitments to let projects.

As NCDOT management and the Board of Transportation realized the impact of delays due to mitigation, the department initiated an advance mitigation program. This program encountered a number of difficulties. One of these difficulties was the learning curve of the staff and consultants engaged by the department in terms of how to implement an advanced mitigation program. A second key difficulty was the frequent changes in priorities in the TIP.

The EEP was initiated just at the point in time where the department was likely beginning to get some of the benefit of the experience being gained by its staff. It is widely believed by stakeholders at NCDOT and the EEP that these lessons learned were beneficial to the EEP in the start-up of its operations.

2. No permit has been delayed for mitigation since the initiation of the EEP, resulting in cost savings to NCDOT of at least $6.5 million.

Whereas up to 40% of projects requiring mitigation were delayed prior to the inception of the EEP, no projects have been delayed because of mitigation since the start of the EEP. This represents a cost avoidance in terms of increased construction costs of about $6.5 million for NCDOT based on the following assumptions:

- Based on information provided by the NCDOT Fiscal section, since the inception of the EEP, approximately $1,285,297,173 worth of projects requiring some form of mitigation have been let to construction.
- Assuming 40% of these projects would have been delayed for an average of four (4) months under the previous NCDOT mitigation program, this represents a $5.3 million savings in avoidance of increased construction costs based on a 3.8% average annual change in the Federal-Aid Highway Construction Price Index since 1990. In addition, using the average annual change since 1990 is a very conservative approach since there has in reality been much more volatility in this index since the initiation of the EEP in 2003.

3. The EEP has a strong focus on continuous process improvement.

The EEP has leveraged its position as a start-up to emphasize defining and implementing standardized processes and procedures. FHWA provided the EEP with a seed grant of $500,000 to help jump start its organizational development. This effort has been led by a highly competent, hard-working staff that today continues to have continuous process improvement as a core organization value and maintains a strong focus on streamlining processes and identifying and resolving bottlenecks in its operations.

4. The EEP is recognized nationally as a model program.

EEP is highly regarded by regulatory agency staff in North Carolina and at the federal level and has been recognized nationally as an innovative and model program. It has won numerous national awards from various organizations including:

- Recognition of NCDOT and NCDENR in 2003 by the Federal Highway Administration for outstanding environmental stewardship.
- Designation of EEP by FHWA as one of 15 exemplary ecosystem initiatives nationwide.
- A national award for innovation in 2003 from the National Association of Development Organizations.
- Being selected in April 2005 by the National Association of Environmental Professionals for their National Environmental Excellence Award.
- Receiving designation in August 2005 as one of the top new initiatives in state government from the national Council of State Governments.

5. The EEP has credibility issues among some policy-makers in the state.

While the EEP has been well received nationally, the program has a number of communication and credibility issues among some policy-makers in North Carolina. At the core of these concerns are issues such as:

- The 2003 MOA establishing the EEP prohibits applying "surplus" credits between watersheds (cataloguing units), which has led to the perception that NCDOT may in effect be paying twice for the same mitigation.
- Because the cost of mitigation is now more clearly understood, concerns have arisen about the cost of providing mitigation. Under the prior NCDOT program, the cost of mitigation was buried in the total cost of constructing the project. In addition, the cost of mitigation on a per acre and per linear foot basis is also clearly increasing, with this increase more pronounced in urban areas.

- EEP communication strategies and outreach to stakeholders has not been as effective as it could be in addressing these concerns of various policy makers and other stakeholders.

B. Analysis of the Inventory of Acquisitions and Credits

This subsection summarizes key findings from the analysis of the inventory of acquisitions and credits. These findings include:

- The EEP drives its internal business planning from NCDOT's demand forecast based on the TIP; this continues to have a certain amount of volatility.
- NCDOT is becoming more accurate with estimating their mitigation needs.
- There is limited flexibility in the MOA in terms of being able to apply mitigation outside of the cataloguing unit of the permitted impact.
- The EEP was designed based on two key assumptions that are no longer to proving to be true: an increasing construction program and an increasing need for mitigation. This may be contributing to over-building of mitigation.
- There are apparent surpluses in mitigation credits in some watersheds.
- Acquisition of high quality preservation lands by NCDOT and the EEP account for a significant portion of the surplus issue.
- The genesis of the surplus issue predates the initiation of the EEP.

Each of these findings are discussed in greater detail below.

1. The EEP drives its internal business planning from NCDOT's demand forecast based on the TIP; this continues to have a certain amount of volatility.

Volatility/changes in the TIP continue to be an issue. These changes in the TIP are based on a number of factors (i.e., funding constraints, changes in policy maker priorities, etc.) and create a lack of predictability in NCDOT's demand forecast and increase the risk of the EEP developing mitigation that will not be needed.

2. NCDOT is becoming more accurate at estimating their mitigation needs.

NCDOT staff are becoming more precise in terms of developing estimates of the mitigation that will be required. This is likely both the result of more experience in developing estimates and an increased sensitivity within NCDOT about the cost impact of incorrect estimates. The new NCDOT accounting methodology that initially allocates the cost of mitigation (regardless of what project the mitigation may be used for ultimately) to the NCDOT division in which the mitigation is physically resident is also increasing management awareness and attention on the need for accurate estimates.

3. There is limited flexibility in the MOA in terms of being able to apply mitigation outside of the cataloguing unit of the permitted impact.

While the regulations express a preference to performing mitigation in the cataloguing unit of the permitted impact, the MOA operates at a more stringent standard, specifically requiring mitigation in the same eight-digit cataloguing unit in which the impact occurred. This MOA stipulation removes the flexibility NCDOT had to negotiate for some flexibility on a case-by-case basis at the time of applying for the permit.

There are some exceptions to this policy. It should be noted that EEP can still request at the permit application stage the ability to use other CUs, thought this is not normally done in practice. Likewise, regulatory agencies have enacted a policy for the Catawba 03 cataloguing unit that allows for adjacent CU usage. In addition the, Carbonton project has the ability to utilize the adjacent CU to meet its mitigation requirements.

4. The EEP was designed based on two key assumptions that are no longer proving to be true: an increasing construction program and an increasing need for mitigation. This may be contributing to over-building of mitigation if these changed assumptions are not properly reflected in NCDOT's estimates of mitigation requirements.

The NCDOT construction program is not growing in size annually as it did in the late 1990s and the early part of this decade. By definition, this means there will be less need for mitigation. At the same time, better project design from other streamlining initiatives (Merger01, etc.) may be resulting in less mitigation need (i.e., impacts avoided and/or minimized to a greater degree mean less need for compensatory mitigation).

5. There are apparent surpluses in mitigation credits in some watersheds.

Our analysis of the inventory of acquisitions and credits suggest that there is now or will be surpluses in mitigation credits in some watersheds. Surplus credits are those that currently show no forecasted need, which is different from securing excess credits at this point in time to meet forecasted needs and achieve "ahead of impact" goals. The detailed documentation of this inventory, which was constructed by the study team with the help of data provided by NCDOT and the EEP is provided in Appendix A through Appendix G of this report. Some examples of this surplus include:

- As illustrated in Appendix G, by June 2010 (Year 7 of the MOA), the EEP will have met NCDOT's forecasted needs and achieved MOA goals of having completed mitigation projects available ahead of impacts in 43 of the 54 CU's.

- By June 2013 (Year 10 of the MOA), the EEP will have instituted sufficient mitigation in 22 of the 54 hydrologic units in North Carolina (please refer to Appendix G). This means that the EEP will meet or slightly exceed NCDOT's mitigation projections for permitting needs for that mitigation type. Based on the data and notwithstanding credits needed to permit MOA Year 11 (July 2013 to June 2014), Year 12 (July 2014 to June 2015), Year 13 (July 2015 to June 2016), Year 14 (July 2016 to July 2017) and Year 15 (July 2017 to June 2018), there are:
  - Two basins that will have over 30,000 mitigation equivalents of stream
  - Seven basins that will have over 100 mitigation equivalents of riparian wetlands
  - Six basins that will have over 100 mitigation equivalents of non-riparian wetlands
  - Seven basins that will have over 100 mitigation equivalents of riparian wetlands

These thresholds for "significant surplus" were chosen based on the judgment of the study team that the surplus mitigation represented an amount of mitigation that was more than would likely be utilized by a significant new location project within a cataloguing unit.

The geographic location of these "significant surpluses" by cataloguing unit and NCDOT division are presented in Exhibit V-1 through V-III. Exhibit V-1 illustrates the significant surplus for stream restoration; Exhibit V-2 presents this information for riparian wetlands and Exhibit V-3 presents this information for non-riparian wetlands. Excessive surplus was defined at 30,000 feet for stream and 100 acres for wetlands.

- A review was conducted of the NCDOT mitigation transfers to the EEP and the EEP acquired sites against the June 2013 (Year 10 of the MOA) 'surplus.' There are likely some basins, particularly in the Neuse, Cape Fear and Pasquotank, that have 'surplus' mitigation due to NCDOT transfers. A correlation exists here although there are two basins with a surplus that are influenced by EEP acquired sites. Additionally, EEP does not actually know which sites will be used for mitigation until the Section 404/401 permit requirements are due.

The target information provided by EEP for 2013 (Year 10 of the MOA) is in mitigation equivalents. This equivalent is an estimate because the Section 404/401 permit requirements usually require two mitigation credits for each acre/foot of impact; there are some cases when the mitigation credit is one for one.

Exhibit V-1: Stream Restoration Mitigation Projected Surplus – une 2010

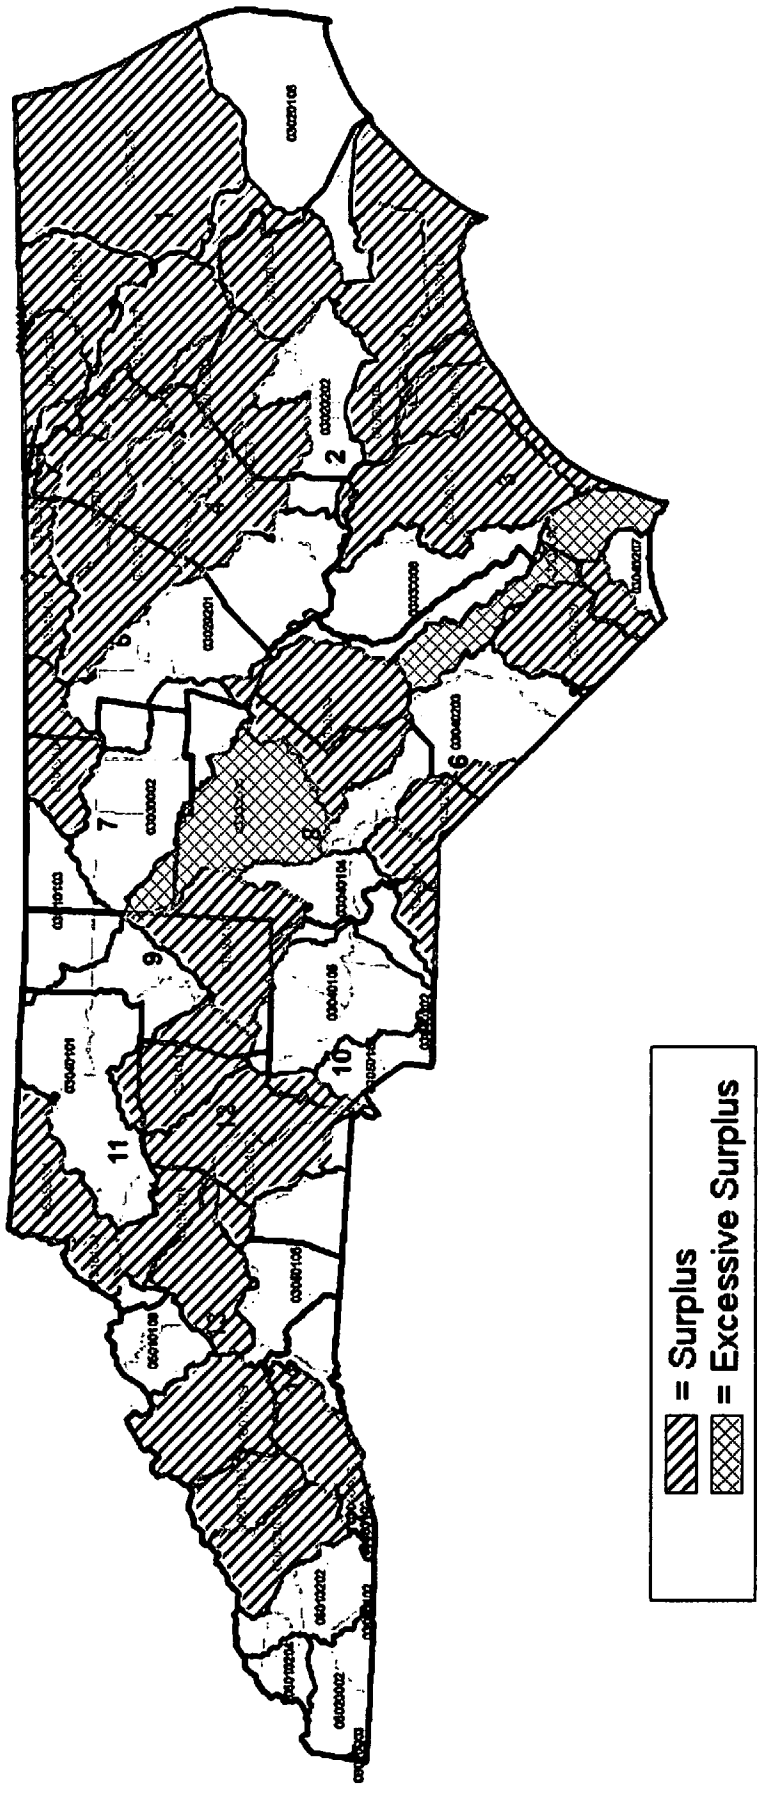

Exhibit V-2: Riparian Restoration Mitigation Projected Surplus – une 2010

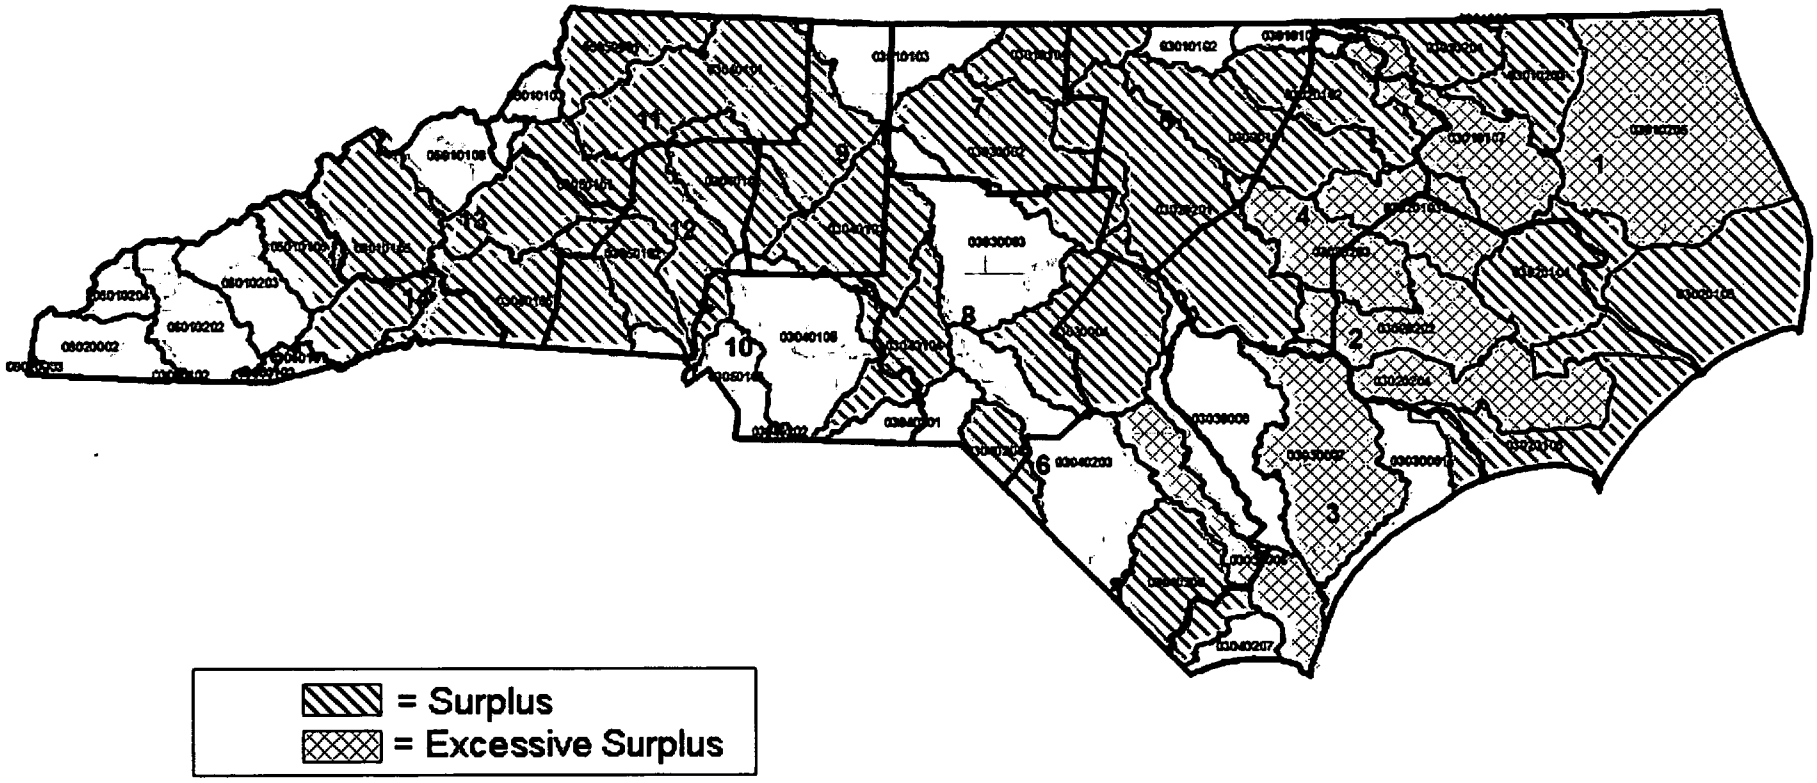

Exhibit V-3: Nonriparian Restoration Projected Surplus – une 2010

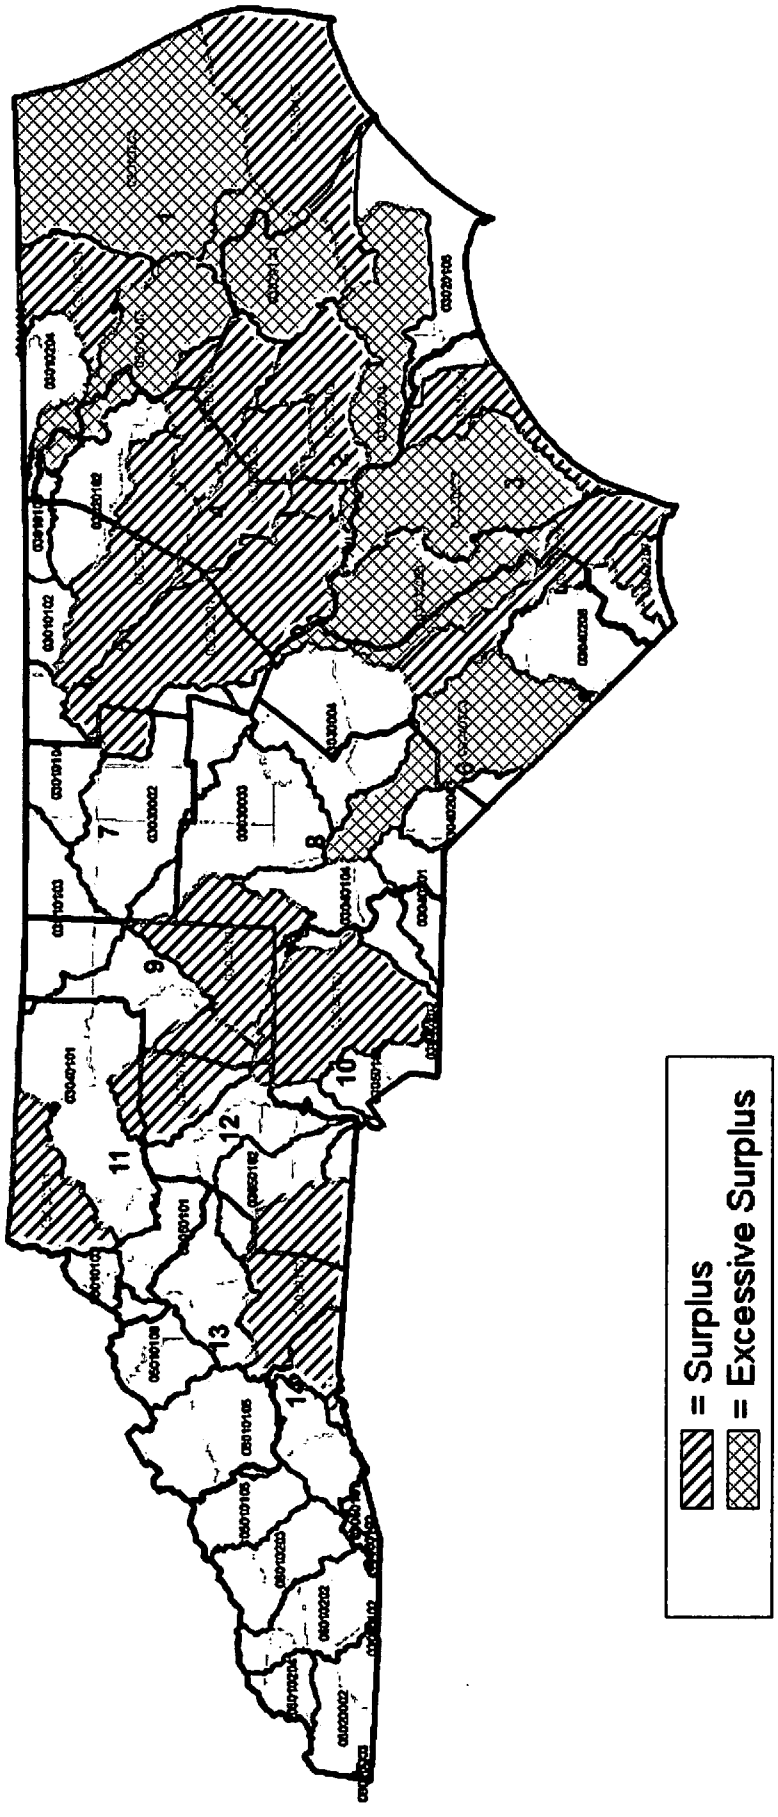


6. Acquisition of high quality preservation lands by NCDOT and the EEP account for a significant portion of the surplus issue.

As illustrated in Appendix A, high quality preservation (HQP) land costs total over $78 million between the EEP and NCDOT acquisitions. 2.1 miles of the stream tracts include uplands. . It is possible that these uplands could be re-sold and added back to the tax base; this would reduce the money spent to acquire the high quality preservation and enable more funding of transportation and/or other projects. Additional survey and mitigation work would be required to locate the buffers, create a new plat (hold mitigation in fee simple or conservation easement) to sub-divide the tract, appraise the sub-divided tract(s) and then sell the land.

7. The genesis of the surplus issue predates the initiation of the EEP.

The start of the surplus issue predates the initiation of the EEP. Upon realizing the number of permits (40% plus) that were being delayed for mitigation, the Board of Transportation and NCDOT began its own advance mitigation program in the late 1990s. However, because of extensive volatility in the TIP, limited experience in estimating mitigation requirements and a lack of experience in properly planning and executing an advance mitigation program, the NCDOT program was largely ineffective. The result was the acquisition of mitigation in a number of cataloguing units where it was not actually needed and, in some cases, a shortage of mitigation where it was actually needed.

Of special interest in this regard is NCDOT's investment in high quality mitigation lands. NCDOT, based on figures provided by NCDOT's Fiscal section (the cost numbers provided the EEP are slightly different) has invested over $39 million in high quality preservation lands. These tracts and their purchase price as reported by NCDOT are illustrated in Exhibit V-4 below.

Exhibit V-4: Inventory of NCDOT High Quality Preservation Acquisitions

Acquisition Name	Ecoregion	Amount Paid Per NCDOT Fiscal
Roquist Pocosin	Northern Outer Coastal Plain	4,135,465.14
Haw River State Park	Central Piedmont	424,592.00
White Pines/Newton	Central Piedmont	170,000.00
Davis Tract/Yadkin	Central Piedmont	241,938.00
Eno River /Poplar River	Central Piedmont	534,000.00
Eno River State Park	Central Piedmont	2,318,400.00
Duke Forest/Haw River	Central Piedmont	3,025,000.00
Little Mountain	Central Piedmont	4,180,000.00
Allen Site	Central Piedmont	565,000.00

Acquisition Name	Ecoregion	Amount Paid Per NCDOT Fiscal
Lone Mountain	Southern Piedmont	773,000.00
Rankin Tract	Southern Piedmont	3,213,095.00
Mingo Tract	Northern Mountains	7,500,000.00
South Fork of the New River	Northern Mountains	777,000.00
Lost Bridge Tract	Southern Mountains	511,600.00
Needmore Tract	Southern Mountains	7,500,000.00
Dupont Forest Site	Southwestern Mountains	4,000,000.00
Total Acquisition Cost:		**$39,869,090.14**

8. The EEP does transfer credits between the NCDOT program and the in lieu fee program. This has allowed surplus NCDOT mitigation credits to be sold to the in lieu fee program.

The EEP does sell surplus NCDOT credits to the in lieu fee (ILF) program when surplus NCDOT credits are available in cataloguing units where the ILF program has needs There has been over $13 million in surplus credits purchased by the ILF program from the NCDOT programs since this "buy sell" program was initiated in March 2005. This has generated substantial savings in the cost of mitigation to NCDOT. Similarly, the NCDOT MOA program has been able to purchase surplus credits from the ILF program which has decreased the number of new mitigation projects which are necessary. This has also created additional savings.

9. NCDOT has not allowed EEP to sell any surplus high quality preservation (HQP) land credits.

EEP has requested NCDOT to allow HQP surplus credits to be sold to the ILF program. To date, however, NCDOT has elected not to sell surplus HQP. This represents a missing revenue stream for NCDOT. It would also be a method to decrease the HQP surplus.

C. Efficiency and Effectiveness of the EEP's Watershed-Based Planning Process

This subsection describes a number of findings related to watershed planning. These findings include:

- Potential disconnects between the outputs from the watershed planning process and the actual site selection process.

- Limited synergy between DWQ's basin-wide planning process and the watershed planning process.
- Limited integration between the EEP's watershed planning process and the CWMTF's grant application and selection process.

Each of these findings are described in further detail below.

1. Potential disconnects between the outputs from the watershed planning process and the actual site selection process.

The EEP is intended to be a programmatic approach to mitigation based on a strong, proactive, watershed-based planning approach. However, the connection between the needs and opportunities defined by the watershed planning process and the realities of site selection, which involve the need to identify a willing seller, are not always evident, particularly in the full delivery model.

Watershed plans, where available, do assist with site selection. As of May 3, 2007, the EEP's Watershed Planning and Project Implementation section had delivered 31 projects identified through the local watershed plans. Furthermore, EEP's Operational Strategic Plan includes 59 additional projects identified through the local watershed planning process to be implemented over the next five years.

However, interviews with stakeholders who contract with EEP to perform design-bid-build activities suggest that the value of these plans is limited by the need to identify individuals who are willing to do business with EEP, independent of candidate sites and opportunities that may be identified by the watershed plan.

Furthermore, based on our interviews, watershed plans do not appear to be extensively utilized by full delivery providers to drive their site selection activities, even though proposers are awarded bonus points during technical evaluation when they propose projects in targeted watersheds as identified in the plans. Private sector providers who are bidding on full delivery projects utilize their own internal GIS-based tools and site selection specialists to identify and engage willing sellers. Given that the full delivery process represents the largest portion of EEP's procurement activity currently (66%), this could potentially lead to the development of mitigation sites that have little correlation to the needs identified in the watershed plans. In addition, the full delivery contracting process requires the EEP to select the lowest cost proposal deemed technically qualified. While targeted watersheds are part of the criteria in the technical evaluation, there is no explicit requirement that a full delivery provider's site must be rated highly in the local watershed plans.

2. Limited synergy between DWQ's basin-wide planning process and the EEP watershed planning process.

The EEP prepares detailed watershed-based mitigation plans for selected watersheds, while DWQ prepares basin-wide plans to help identify impaired waters. Basin-wide

water quality planning is a watershed-based approach designed to support restoring and protecting the quality of North Carolina's surface waters. Basin-wide water quality plans are prepared by DWQ for each of the 17 major river basins in the state every five years.

These concurrent water quality planning initiatives are intended to build from and share data with each other. DWQ's basin wide plans feed data and information on 303(d) (impared waters) information to EEP for use in the EEP CU screening process, and EEP plans provide detailed data from river basin restoration plans and local watershed plans back to DWQ for incorporation into DWQ basin wide plans.

However, EEP and DWQ plans do not follow the same schedule due to EEP needing river basin restoration and local watershed planning information based on NCDOT's forecasted impacts. To ensure synergy and cooperation, EEP planners and DWQ staff meet throughout the year to share data, review each others plans, participate in each others public and stakeholder meetings, and also meet twice a year to discuss participation and additional improvements.

While the coordination between EEP and DWQ on these water resource planning processes was not a primary focus of this study, the team believes that there is some obvious overlap between these two planning processes and that additional study would be appropriate to identify opportunities for economies of scale, shared staffing and other potential effiencies between these two planning processes. In addition, there are also other water resource planning processes that should be included in any detailed study of linkages and potential efficiency and economy of scale opportunities across the state's water resource planning efforts. These include the river basin plans prepared by the Division of Water Resources and other planning efforts performed by the Public Water Supply Section in Environmental Health.

3. Limited integration between the EEP's watershed planning process and the CWMTF's grant application and selection process.

There is limited integration between the EEP's detailed watershed plans and the CWMTF's grant application and selection process. Grant applicants receive bonus points on their application if their project is in an area that has a watershed plan. However, there is no specific linkage between the needs identified in the plan and the scope of the proposed application. No bonus points, for example, are given for identifying a project that addresses specific needs identified as the highest priorities in the watershed plans.

D. Effectiveness of the EEP's Project Delivery Practices

This section describes our findings related to the EEP's project delivery practices including:

- The EEP needs the capability to utilize a variety of procurement methods

- There is the potential for unintended competition between EEP and its full delivery providers
- A lower than desired cap on the on-call contracts could be affecting EEP's ability to utilize the most experienced technical resources
- The EEP's project management staff are continuing to come up the learning curve, although there continue to be gaps in project management skills and interdisciplinary experience

Each of these items are described in further detail below.

1. The EEP needs the capability to utilize a variety of procurement methods.

The EEP currently utilizes both the design-bid-build and full delivery methods and EEP is investigating the feasibility of piloting a design-bid procurement approach. Our analysis suggests that this range of delivery methods is required in order to address different types and sizes of projects that the EEP is required to deliver. Full delivery is most appropriate for larger projects, for example for a cataloguing unit with a significant amount of anticipated needs that could be addressed by one or two large projects. On the other hand, design-bid-build may be more appropriate for smaller projects where a full delivery provider might not be able to achieve their desired economies of scale.

Based on data provided by EEP, design-bid-build appears to be a more cost effective approach. Exhibit V-5 illustrates a comparison of the cost of full-delivery and design-bid-build projects completed to date. This comparison is based on 104 full-delivery projects and 45 design-bid-build projects.

Exhibit V-5: Cost Comparison between Full-Delivery and Design-Bid-Build

	Rural		Urban	
Credit Type	Full Delivery	Design-Bid-Build	Full Delivery	Design-Bid- Build
Stream ($/Stream Credit)	$264	$220	N/A	$314
Riparian Wetlands ($/wetland credit)	$38,802	$14,564	N/A	$43,569
Non-Riparian Wet	$17,845	N/A	N/A	N/A

The EEP has been utilizing the full delivery model more often as it ramps up the program since full delivery generally has a more compressed project delivery timeline than design-bid-build from project initiation to the start of construction. However, the EEP has indicated that it plans to make greater use of design-bid-build in the future. Likewise, the regulatory agencies have asked the EEP to provide additional oversight and management on the full delivery projects.

2. There is the potential for unintended competition between the EEP and its full delivery providers.

In situations where the EEP is conducting design-bid-build projects and full delivery projects in the same cataloguing unit, the EEP may be in effect competing against itself for particular sites. This puts the EEP at a disadvantage in its design-bid-build process, since it is constrained in the offers that it can make to property owners by the federal Uniform Act and state law. Full delivery providers, on the other hand, have the potential for pricing the land more aggressively to close the deal and then making adjustments elsewhere in their bid to offset the increased price they paid for the land.

Likewise, several stakeholders also identified to us a concern that in some cases the EEP excludes certain geographic areas when releasing a full delivery RFP where the EEP has already been working with property owners in these areas. The EEP excludes these geographic areas in an attempt to avoid or reduce competition between EEP and its own full delivery providers. This could put the property owner of a site reserved by the EEP, however, at a disadvantage in comparison with their neighbors who may have more flexibility in negotiating with the full delivery provider.

3. A lower than desired contract ceiling on the on-call contracts could be affecting EEP's ability to utilize the most experienced technical resources.

The EEP needs to be sure that it has access to the strongest technical resources and expertise possible for completing its design-bid-build work. The current contracting approach in which 20 firms have contracts capped at $750,000 is laudable for opening up the process to a larger number of firms. However, the contract ceiling may be affecting the EEP's ability to gain access to key technical resources. This current approach has allowed the EEP to spread the work out more uniformly. However, because the most specialized technical expertise is not necessarily uniformly distributed among all of the firms, this approach can limit the EEP's ability to obtain specialized technical expertise if a consultant's firm has reached or is about to reach its contract maximum.

4. EEP's project management staff are continuing to come up the learning curve, though there continue to be gaps in project management skills and interdisciplinary experience.

Discussions with a variety of stakeholders suggest that the EEP's project managers are continuing to grow professionally and gain experience incrementally with each project that they work on. However, there were two gaps in the knowledge of EEP staff identified by a number of different types of stakeholders:

- The extent of the project management and contract management skills of EEP Project Managers.
- The limited interdisciplinary experience and perspective of the EEP project mangers. This is typically the result of having worked in only one area such as stream design before becoming a project manager and thus having less experience about the roles and responsibilities of other team members and when to engage these team members on a project. This issue may be further exacerbated by the fact the EEP project staff do not normally perform work themselves, but instead act in a management or oversight capacity. Without having regular hands-on experience, it may be difficult for this staff to fully appreciate all of the activities being performed by the consultant staff they are supervising.

E. Organizational relationships between NCDOT, EEP and FHWA

This subsection discusses findings concerning the organizational relationship between NCDOT and the EEP and NCDOT and FHWA as it pertains to the EEP. Specifically, this section addresses the following:

- Misalignment in expectations between staff at NCDOT and the EEP concerning the relative roles and responsibilities of the two organizations.
- Delays in NCDOT submitting the initial billing to FHWA for the federal share of the cost of the EEP program.

Each of these findings is described in further detail below.

1. Misalignment in expectations between staff at NCDOT and the EEP concerning the relative roles and responsibilities of the two organizations.

While the executive management of NCDOT and NCDENR may be aligned on the relative roles and responsibilities of NCDOT and the EEP in defining the requirements for and delivering compensatory mitigation for transportation projects, there are clear organizational disconnects between individuals at the management and staff level at

NCDOT and the EEP about the role and responsibilities of the respective organizations. Some specific examples include:

- The EEP views itself as an independent entity responsible for providing permit requirements through build to order mitigation credits for NCDOT. In effect, the EEP plays the role of a contract manufacturer. A number of staff at NCDOT, on the other hand, view the EEP as simply a supplier and want to provide the same level of management oversight to the EEP as they do to engineering consultants or construction contractors.
- The current cost recovery billing methodology in which NCDOT advances the EEP funds each quarter and the EEP submits a bill at the end of the quarter reinforces this supplier relationship by providing, as is appropriate when the relationship is based on a cost recovery methodology, an extensive amount of detail concerning the EEP's operations. We were given several examples where through this detailed invoicing process NCDOT staff became aware of significant organizational changes made by the EEP that the NCDOT staff had not otherwise been informed about, such as the opening of the Asheville field office.
- There is some confusion on the part of NCDOT staff as to the point at which the EEP takes over the responsibility for and the risk of delivering the mitigation. This legal transfer of responsibility takes place at the time NCDOT identifies on its permit application that it will be using the EEP to provide the mitigation and the EEP agrees to accept this responsibility.

The tri-party MOA states that "At the time of issuance, the USACE will copy all permits or authorizations requiring utilization of the EEP program, issued to NCDOT to NCDENR EEP. Within 5 days of receipt of that permit, NCDENR will notify the USACE that NCDENR, and not the NCDOT, is responsible for providing the compensatory mitigation required by the permit, and will take all actions necessary to complete implementation of the compensatory mitigation required by such permit or authorization (p. 12), However, there is not a transfer of money and a clean "receipt" provided by the EEP to NCDOT as there is when the EEP accepts responsibility for providing mitigation for a permittee in the in-lieu fee program since NCDOT has been in effect funding the subject mitigation on an as incurred basis throughout the development process.

2. Delays in NCDOT submitting the initial billing to FHWA for the federal share of the cost of the EEP program.

The North Carolina Division Office of FHWA has been an enthusiastic supporter of EEP since its inception. As mentioned previously, the office provided a $500,000 start-up grant and has assigned a staff member as a liaison to EEP on a near full-time basis. NCDOT, as of the time of this report, however, has not yet submitted a request for federal reimbursement for the federal participating charges related to the EEP. The primary reason for this appears to be challenges that NCDOT has faced internally in

developing a methodology for allocating the costs of the EEP program to specific projects or specific divisions since the boundaries for various cataloguing units do not necessarily correspond with the boundaries for NCDOT divisions. In addition, it has required a significant effort to obtain consensus among NCDOT division engineers about this methodology.

While we recognize that NCDOT consistently receives every federal transportation dollar it is eligible for and thus has not left any money on the table because of not billing FHWA for its share of the EEP program, there is some risk in waiting too along to submit the initial bill and then addressing any business process or operational concerns that could arise through this billing process. Changes in process that might be dictated based on concerns raised by FHWA should be identified as soon as possible; as it stands, it will be now be several years following the initiation of the program before NCDOT will be seeking any reimbursement for EEP costs.

F. Programmatic Integration Between the EEP and the CWMTF

This subsection describes findings concerning the existing programmatic integration between the EEP and the CWMTF. Findings in this regard include:

- The EEP and the CWMTF have worked together in the past and continue to work together in a number of ways.
- The EEP and the CWMTF are currently implementing different strategies for site maintenance and stewardship.
- There are a number of differences in key forms used by the EEP and the CWMTF, which can lead to confusion among property owners.

Each of these items is discussed in further detail below.

1. There are a number of existing program synergies between the EEP and the CWMTF.

The EEP and the CWMTF have worked together previously on a number of initiatives. These touch points include:

- CWMTF's application for a stream restoration project requires documentation that the project has been previously submitted tothe EEP for consideration and been turned down.
- The CWMTF staff has participated on the EEP's High Quality Preservation technical team.
- The EEP EEP has bought "projects" from the CWMTF when a mitigation requirement arose in a cataloguing unit where the EEP did not have sufficient inventory but a CWMTF grantee had a project underway that could qualify for mitigation credit. Under this process, the EEP, if the CWMTF grantee is willing,

reimburses the CWMTF for the full cost of its role in the project including funds paid to the grantee and the administrative costs associated with processing the application and managing the grant.

As an example, the EEP and CWMTF have collaborated on the Trout Cove Branch restoration site, Hiwassee watershed, Clay County. The Hiwassee Watershed Coalition collaborated with EEP and CWMTF. EEP reimbursed CWMTF for CWMTF funds spent on the property. Hiwassee Watershed Coalition was awarded the funds from the reimbursement for use on new projects in the watershed. The EEP took responsibility for the management of the site and ongoing monitoring.

There are also several pending partnerships at the time of this report. EEP will only reimburse CWMTF for their expenditures on these sites if the projects prove environmentally and economically feasible. These pending partnerships include:

Exhibit V-6: Pending EEP/CWMTF Partnerships

Project	Watershed	County
Tessentee Farm	Little Tennessee	Macon
Ramah Creek	Catawba	Mecklenburg
Ripshin Branch	New	Ashe
Lewis Creek	French Broad	Henderson
Collins Tract	Dare	Pasquotank
Hanson Aggregates	Cape Fear	Chatham

- The CWMTF has partnered with NCDOT and the EEP on purchases of some of the high quality preservation lands. In terms of this process, the CWMTF has raised some concerns about the lack of visibility around how the mitigation credits from these acquisitions are being applied and whether the EEP is utilizing more mitigation credits than they should be entitled to based on the funds pooled from the different sources to complete the land acquisition. In response to this concern, the CWMTF and the EEP have suggested that in the future they would like to see these acquisitions broken into distinct parcels based on funding source. It is anticipated that this would alleviate some of the confusion around the accounting for the mitigation credits from these acquisitions.

2. The EEP and the CWMTF are currently implementing different strategies for site maintenance and stewardship.

While the CWMTF participated in the task force to define NCDENR's site maintenance and stewardship program, the Board of the CWMTF chose to initiate its own stewardship program and as of now is not participating in the NCDENR program. CWMTF implements its program by setting aside money on the front-end from the

grant application; while NCDENR has chosen to implement its program on a pay as you go basis.

3. There are a number of differences in key forms used by EEP and CWMTF, which can lead to some confusion among property owners.

Conservation easements and other documents from the two programs often have key differences. While some of these differences can clearly be attributed to differences in program scope and in some case tighter restrictions on activities that can be carried out in a conversation easement that is being used for mitigation, several stakeholders reported that these differences create confusion among property owners. From the perspective of a property owner who is doing work with both organizations, these differences are confusing since the property owner is in both cases doing business with the State of North Carolina.

G. Efficiency and Effectiveness of the CWMTF Operations

This subsection summarizes key findings concerning the effectiveness of the CWMTF operations. These findings include:

- Limited performance measurement/validation of projected benefits from the CWMTF grants.
- Minimal management systems are in place to support a program the size of the CWMTF.

Each of these items is discussed in detail below.

1. Limited performance measurement/validation of projected benefits from the CWMTF grants.

The CWMTF has no structured process for following-up on individual projects at defined intervals following implementation to evaluate the extent to which these projects met or are meeting the goals and objectives that the grantee proposed to achieve in their application. The lessons learned from these reviews could then be fed back into the grants selection process to produce improved grants applications going forward.

2. Minimal management systems are in place to support a program the size of the CWMTF.

The CWMTF has minimal management systems to support it as its program size continues to grow. This creates a risk of increased difficulty in sharing information among staff and creates the potential to create inherent inefficiencies in back room processes.

The CWMTF currently has a paper-based application process. In addition, while it has a customized server-based grants tracking system, it is only using a small part of the functionality that is available within this system. Not all staff regularly use the system or keep the information in the system up to date. In addition, the grants accounting process is being performed on stand-alone spreadsheets instead of taking advantage of capabilities that appear to be available in this in-house system.

VI. Analysis of Organizational and Programmatic Alternatives

This section provides an analysis of several different organizational and programmatic models for providing mitigation in North Carolina and for promoting integration where appropriate between the EEP and the CWMTF. The study team analyzed the following approaches:

- The status quo in which the EEP and the CWMTF are independent programs.
- Modifications to the status quo designed to improve the efficiency of the current program environment and promote enhanced programmatic synergies between the EEP and the CWMTF.
- Merger of the EEP and the CWMTF programs.
- Returning responsibility for mitigation for transportation projects to NCDOT.
- Implementing a private mitigation banking model to the extent practical.

The initial subsection of this chapter provides an overview of the evaluation criteria utilized to analyze each proposed approach. The remaining subsections document the analysis of each proposed approach.

A. Evaluation Criteria

The study team analyzed each of the proposed organizational and programmatic alternatives based on the following criteria:

- Capability to meet various programmatic goals and objectives including:
  - Providing NCDOT with required mitigation in advance of the target construction project letting date.
  - Providing high quality mitigation to fully compensate for the impacts of transportation projects on the state's aquatic resources.
  - Supporting non-NCDOT mitigation needs currently provided for by the in-lieu fee program.
  - Supporting the nutrient offset program.
  - Meeting the CWMTF's program goals to improve the overall quality of North Carolina's aquatic resources.
- Ability to effectively address issues with North Carolina's current program approach as identified and documented in Section V above.
- Cost of implementation of the proposed alternative.

- Risks associated with implementation of the proposed alternative.
- Anticipated benefits from each alternative.
- Impact of potential future developments (i.e., federal regulations, etc.).
- Consistency with best practices and guidance.

B. The Status Quo in Which the EEP and the CWMTF Are Independent Programs

This alternative involves maintaining the status quo in which the EEP and the CWMTF are separate programs, with limited program level communication and coordination between the two organizations. Under this alternative, there are limited linkages between the EEP's watershed planning process and the CWMTF's application recruitment and selection process. Likewise, in this alternative, the EEP continues to work with NCDOT on a cost recovery basis in a modified customer-supplier relationship. Because of the nature of this alternative, there are no anticipated implementation costs. The relative advantages and disadvantages of this model are outlined below.

1. Advantages.

The advantages of the status quo alternative include the following:

- Under the current EEP program, mitigation has been removed from the critical path for the delivery of transportation projects.
- The removal of mitigation from the critical path has provided cost savings in constructing transportation projects by enabling these projects to be let on schedule versus encountering cost increases because of a delay in the letting date for a project.
- The EEP's approach to mitigation is planned and programmatic based versus the more reactive mitigation approach under a project-specific mitigation model.
- This programmatic approach provides the potential for higher quality mitigation and improved environmental outcomes through a watershed-based planning approach to mitigation.
- Under this alternative, mitigation is implemented by an environmental agency instead of a transportation agency.
- NCDOT is able to better focus on its core mission of planning, designing, building, and maintaining transportation infrastructure versus having to develop expertise in the design, implementation and on-going stewardship of compensatory mitigation.
- There is extensive buy-in by the environmental resource agencies and other environmental stakeholders for the current approach in which the EEP is housed within NCDENR.

- There is also extensive buy-in by environmental stakeholders to the separate organizational structures for the EEP and the CWMTF, with a clear separation of responsibilities between the EEP's compensatory mitigation program and the CWMTF's broader voluntary grant-based program.

2. Disadvantages.

The disadvantages of the status quo alternative are as follows:

- The current structure of the EEP MOA provides limited flexibility to apply credits outside of an eight-digit cataloguing unit.
- NCDOT perceives that it has limited control over the cost of mitigation, something that is a significant expense item within its transportation project delivery process.
- There is some concern over the effectiveness of the existing watershed-based planning process given that there is not always an apparent linkage between site selection and the outcomes of the watershed planning process, especially in the case of the EEP's full delivery projects.
- There are limited linkages between the EEP's watershed planning process, DWQ's basin-wide planning process, and the CWMTF's application and grantee selection processes.
- There is a surplus of mitigation in some cataloguing units; this leads to concerns by some policy-makers about the cost effectiveness of the current approach.

C. Modifications to the Status Quo Designed to Improve the Efficiency of the Current Environment and Promote Enhanced Programmatic Synergies Between the EEP and the CWMTF

This alternative would maintain the EEP and the CWMTF as separate programs and independent organizations. However, a number of steps would be taken to improve cross-program coordination and drive programmatic linkages. Likewise, additional steps would be taken to strengthen the partnership between NCDOT and the EEP. This alternative would include the following process improvements:

- Negotiating additional flexibility into the MOA to allow the use of available mitigation credits within a river basin in situations where there are not sufficient credits in a specific cataloguing unit but there is an anticipated surplus of credits elsewhere in the same river basin.
- Negotiating a 1:1 ratio at the time of permit issuance where there is mitigation that is in the ground and deemed to be fully functional at the time of impact. Additional feet or acres may be then applied to other permitted projects with similar mitigation needs (e.g. site and kind). Over time, this will reduce the amount of mitigation that must be

implemented and substantially reduce the cost to the state of implementing compensatory mitigation.

- Establishing procedures to ensure that the EEP is involved in any potential acquisition of environmentally sensitive land by the state in order to utilize mitigation dollars as the first source of funding for any acquisitions by the state in an area where there is a need for mitigation credits and the property being acquired would be eligible for mitigation credits.
- Modifying the CWMTF's enabling legislation to provide the flexibility to use CWMTF grant funds for compensatory mitigation in some situations.
- Partnering with the CWMTF to help state or local governments or land trusts acquire any property identified by the EEP and NCDOT as surplus and a candidate to be divested.
- More effectively integrating the EEP's watershed planning process with the river basin planning process currently performed by DWQ. One alternative for accomplishing this would be by creating a joint planning group that addresses the planning needs of both organizations.
- Enhancing the watershed planning process to develop a concrete set of recommended projects to address the needs identified in the plan and to share the needs identified and the proposed projects to address these needs in the watershed plans with mitigation providers and potential CWMTF grantees.
- Involving the CWMTF in the watershed planning process and in the definition of this list of proposed projects; CWMTF would then "market" these potential projects to prospective grantees as suggested or recommended projects to be considered for submission.
- Modifying the CWMTF grant selection process to provide additional weight through substantial bonus points to prospective grantees who are proposing to address high priority needs and/or targeted projects as identified in the watershed plans.
- Increasing the emphasis on functional mitigation versus the traditional acres and feet approach and leveraging the watershed plans to implement this strategy.
- Working with regulators to establish multiple out-of-the-box mitigation pilots and tightly linking these programs to the high priority projects identified in the watershed plans.
- Implementation of a two-stage Transportation Improvement Program (TIP) including a development component that would include projects in the planning and initial design stages and a delivery component for projects in final design, letting preparation, and construction.
- Migrating from the current advanced mitigation approach to a "just-in-time" mitigation approach in which NCDOT would order mitigation from the EEP at the time it programs a project into its delivery TIP. The EEP would use information in the development TIP to target site selection activities but would not acquire an option on a

parcel or begin design activities until the project is programmed by NCDOT for construction.

- Transitioning to a per credit based fee approach for NCDOT to acquire mitigation from the EEP as the current build-out phase of the EEP program levels out.

The estimated cost of implementing this alternative is in the range of $400,000 - $500,000. This cost estimate includes:

- Any contracted assistance that may be required to design and implement an approach to more closely align the river basin and watershed planning processes and link the watershed planning process with the CWMTF grant application and selection process.
- Any support required to implement changes in processes and procedures based on additional flexibility in the MOA.
- Consulting support required to implement the two-staged TIP and manage the determination of surplus property and the sale of these parcels.

This alternative should not result in additional operational costs to DWQ and/or USACE as the EEP program would continue to act as a single point-of-contact for the regulatory community.

While we have not specifically quantified the benefits from this alternative, it is anticipated that the benefits would more than offset the costs of implementing this alternative. Anticipated benefits would include:

- Reduced costs for delivering mitigation through greater flexibility within the MOA to apply surplus mitigation within a river basin.
- Reduced costs for developing mitigation through the application of lower ratios for mitigation that is fully functional at the time of permit issuance.
- Reduced costs for developing mitigation going forward through improved forecasting of mitigation requirements.
- Potential revenue for NCDOT from the transfer of surplus EEP assets to other organizations through a partnership with the CWMTF.
- Improved environmental outcomes through more effective targeting of traditional in-kind mitigation, functional mitigation and out-of-the-box mitigation by tighter linkages to watershed planning.

The relative advantages and disadvantages of this model are outlined below.

1. Advantages.

Advantages of the modified status quo model include:

- Mitigation would remain off the critical path for the delivery of transportation projects.

- The overall cost of delivering mitigation would be reduced through additional flexibility to utilize surplus credits in one cataloguing unit in another cataloguing unit within the same river basin.
- The state would have additional flexibility in terms of acquiring mitigation through existing funding sources by having the option of utilizing CWMTF projects which meet or could meet the criteria for eligibility for mitigation credit.
- The cost of mitigation would also be reduced by the agreement of the MOA signatories to apply lower mitigation ratios at the time of permit issuance where mitigation is in the ground and fully functional in advance of the start of construction of the transportation project.
- The mitigation deployed under this model would be programmatic in nature and would be much more tightly integrated with the watershed planning process.
- The watershed planning process would be more fully aligned and integrated with DWQ's basin-wide planning process and CWMTF's grants application and selection process.
- The value received from the basin-wide and watershed planning processes would increase as these planning processes are used to help define and guide functional mitigation and out-of-the-box mitigation programs. Implementation of non-traditional mitigation approaches will also provide additional opportunities for the EEP and the CWMTF to partner in delivering projects, with the potential for significant environmental outcomes.
- The legal transfer of responsibility for mitigation from NCDOT to EEP will be more clear through the payment of a per-credit fee in which NCDOT would essentially receive a receipt for its payment similar to that obtained by customers of the in-lieu fee program today.
- The forecast of future mitigation requirements will improve through the implementation of a two-step transportation delivery program. Under this two-step program, projects are only programmed for final design and construction after enough design has been done to fully understand the scope of the project; define the project's mitigation requirements; estimate with improved precision the anticipated costs to develop the project including construction, right-of-way, mitigation and other costs; and identify the risks to successful delivery of the project.

2. Disadvantages.

Disadvantages of this modified status-quo alternative include the following:

- Re-negotiation of key aspects of the existing EEP MOA will be required. It is anticipated that this renegotiation will require significant involvement from senior executives (most likely at the Secretary level) of NCDOT and NCDENR and the Colonel of the Wilmington District of USACE.

- The transition from an advanced mitigation model to a just-in-time delivery model for mitigation introduces some risk that a project could be delayed because mitigation is not available. This approach will require tighter management and monitoring by the EEP of its project delivery process. This risk should be offset somewhat by the experience the EEP and its delivery partners are beginning to gain. This additional experience should help to make the EEP's project delivery schedules more predictable as the program matures.
- The transition from the current cost recovery approach to a per-credit fee would have to be carefully staged and managed to reduce unintended financial impacts to either NCDOT or the EEP. It is believed that this transition can take effect as the EEP program moves from its build-out phase to a more constant annual level of work in the future.
- Negotiation of ratios, flexibility of mitigation "site" and "kind," and advance mitigation could result in a temporal and spatial loss of aquatic resource function within affected watersheds.
- Measuring the functions and values of functional replacement and "out of the box" mitigation (as opposed to easily quantified replacement of acres and feet) presently remains a difficult and imprecise task and may pose a tough sell with regulatory agencies.
- Any modification of the CWMTF's current prohibition on participating in compensatory modification is likely to face opposition from environmental advocacy groups and potentially from current or former CWMTF grantees. These organizations would be concerned that removal of the CWMTF's prohibition on participating in compensatory mitigation would cause the CWMTF to select projects which would be eligible for mitigation credit at the expense of other types of projects. These organizations would also be concerned that the net impact would be less total dollars spent on environmental projects in North Carolina annually.

D. Merger of the CWMTF and the EEP

This alternative involves the organizational merger of the CWMTF and the EEP programs. For purposes of our analysis, we assumed that this merger would involve the integration of the EEP program within the CWMTF organization. While the EEP currently has significantly more employees than the CWMTF, our rationale for merging the EEP into the CWMTF was based on the benefits of providing programmatic oversight and accountability through an independent board. Such a merger would facilitate definition and implementation of a number of potential programmatic synergies such as a tighter linkage of the CWMTF application process to the EEP watershed plans and additional partnering between the EEP and the CWMTF on functional replacement and out-of-the-box mitigation strategies.

This alternative would have a number of risks and challenges associated with it. First, it would require some modification of the enabling legislation for the CWMTF to establish the merger of the organization and to clearly define the two distinct responsibilities of the

merged organization: (1) compensatory mitigation and (2) management of voluntary grant based programs to enhance and preserve the quality of aquatic resources in North Carolina. Second, a number of policies and procedures would need to be adjusted to reflect merging the EEP program, which is currently an administrative program within NCDENR, to be under the direction of the CWMTF board. Third, it would also require substantial education of the stakeholder community and the customers of both of the current programs on the benefits of the merger. Fourth, it would require modifications to the MOA to recognize the merged organization. Finally, steps would be required to ensure that the current program objectives of the CWMTF are preserved and protected as the merged organization also begins to focus on compensatory mitigation.

The estimated one-time implementation costs for executing this alternative are in the range of $200,000 - $300,000. This would include consolidation and relocation of staff, development of revised policies and procedures for the merged organization, negotiations on the modification of the MOA, and a communication program for EEP and CWMTF customers and other stakeholders in the environmental and transportation communities.

This alternative should not result in additional costs to DWQ and/or USACE as the EEP program within the merged organization would continue to act as a single point-of-contact for the regulatory community.

The relative advantages and disadvantages of this alternative are outlined below.

1. Advantages.

The anticipated advantages of the merger of the EEP and the CWMTF include:

- The EEP and the CWMTF are both environmental agencies. As such, they have similar high-level organizational goals and missions with respect to environmental outcomes.
- A consolidated organization will allow for easier achievement of programmatic synergies between the EEP and the CWMTF.
- There is the potential for improved environmental outcomes by pooling resources between the two programs.
- There is an opportunity in a consolidated organization to more closely link the CWMTF grant programs with the needs and goals identified by the watershed planning process.
- There is some potential for administrative efficiencies if the two organizations are merged; however, these efficiencies are not likely to be too significant since both organizations already rely on NCDENR for functions such as accounting, finance, and human resource management.

2. Disadvantages.

Disadvantages of the merger of the EEP and the CWMTF include:

- The EEP and the CWMTF have different delivery approaches (i.e., designer/implementer vs. grantor).
- There is limited enthusiasm among the regulatory community for a merger based on concerns over commingling funding between the EEP's compensatory mitigation program that is based on a clearly defined and strict regulatory framework and the more flexible, voluntary CWMTF program. These regulatory concerns could create difficulty in negotiating any changes to the MOA necessary to implement the consolidation of the two programs.
- There is a potential for subsidizing NCDOT mitigation with CWMTF dollars, which is not currently the legislative intent of the CWMTF program.
- Stakeholders have concerns about how the divergent governance of the two programs will be integrated post-merger.
- The CWMTF customers have concerns about unintended negative impacts to the current CWMTF program because of the impact of integrating the EEP's compensatory mitigation program.

E. Returning Responsibility for Mitigation for Transportation Projects to NCDOT

This alternative involves the transfer of responsibility for mitigation associated with transportation projects back to NCDOT. An EEP-like organization would likely remain in place to provide an in-lieu fee program, as well as to manage the nutrient program.

This alternative would be similar to the way mitigation was performed prior to the start of the EEP. NCDOT would have complete responsibility for conducting mitigation and would likely negotiate the mitigation on a project-by-project basis as part of the permitting process. Under this scenario, NCDOT would seek to provide advanced mitigation to the extent possible. To accomplish this would require improved forecasting of both project delivery schedules and mitigation requirements for each project.

NCDOT would likely provide mitigation through a combination of approaches. This would include on-site, project specific mitigation; the use of advanced mitigation developed through both design-bid-build and full delivery approaches; the development of their own mitigation banks; and the use of private mitigation banks.

The implementation of this alternative would require the transfer of environment specialist staff between EEP and NCDOT. The cost to implement this alternative including shifting of resources, adjustment of policies and procedures and other steps is estimated to be in the range of $250,000 to $300,000.

This alternative could also result in additional costs to DWQ and/or USACE as coordination would be required by these regulatory agencies with various NCDOT staff and potentially some mitigation bankers whereas the EEP program today acts as a single point-of-contact for the regulatory community.

The relative advantages and disadvantages of this alternative are outlined below.

1. Advantages.

The anticipated advantages of returning the responsibility for mitigation to NCDOT include:

- NCDOT would have direct control over mitigation expenses.
- NCDOT would have clear accountability for the timely delivery of mitigation, as well as full responsibility for managing the costs associated with delivering this mitigation.
- There would potentially be more flexibility in applying mitigation outside the impacted cataloguing unit than is currently possible under the EEP MOA through project level negotiation of issues between NCDOT staff and DWQ and USACE regulatory staff.

2. Disadvantages.

Disadvantages of returning the responsibility for mitigation to NCDOT include:

- Abandoning the EEP model and returning responsibility to NCDOT would be a difficult sell with environmental resource agencies that prefer NCDENR as an environmental agency having responsibility for mitigation program delivery.
- There is substantial risk of mitigation again becoming project focused and reactive versus the current programmatic approach. This could potentially result in a reduction in mitigation quality.
- There is a significant risk of putting mitigation back on the project delivery critical path.
- Some form of an EEP-like organization will still be needed to support the in-lieu fee and nutrient programs.

F. Implementing a Private Mitigation Banking Model to the Extent Practical

This alternative involves the implementation of a private mitigation banking model to meet NCDOT's needs for compensatory mitigation. This mitigation banking model would also likely address some private sector mitigation needs to the extent practical.

It is envisioned that mitigation banks would be appropriate in some watersheds where market demands are sufficient to make more than one bank commercially viable. Other watersheds, however, may not be commercially viable for private mitigation banks and/or might only have one bank enter the market. In these situations, NCDOT, as is the case in Virginia and Georgia, would have to either act as the "bank of last resort" or utilize on-site, project specific mitigation.

Under this alternative, an EEP-like organization would also likely be maintained, with an in-lieu fee program to meet the needs of the private sector that cannot be met by a bank due to either the small size of the need and/or the lack of a viable bank in the impacted cataloguing unit. This EEP-like organization would also likely continue to manage the nutrient offset program. EEP could also maintain responsibility for watershed planning though it is not clear exactly if or how these watershed plans could be effectively linked to the site selection of private mitigation banks. As an alternative, watershed planning could be folded into the DWQ unit that currently performs basin level planning.

A key criterion to successfully implementing a mitigation banking program would be some flexibility in the definition of the service areas for a mitigation bank. Defining the river basin versus the cataloguing unit as the service area for a mitigation bank, for example, would likely reduce some of the current barriers to entry for private mitigation bankers in North Carolina and improve the overall business case for investing in developing a mitigation bank in North Carolina.

The EEP program would continue as currently structured during a transition period of three to five years as mitigation banks come on-line in various watersheds, with responsibility for any gaps in service transitioned to NCDOT. The cost to the state of implementing a mitigation banking program is estimated to be in the range of $150,000 to $200,000, with the primary cost being development and on-going management of the transition plan including the shifting of some resources from the EEP to NCDOT to oversee the transportation mitigation program.

It is estimated that the adoption of a private mitigation banking alternative would result in a net reduction in headcount of approximately 30 staff. Some of the existing staff would be shifted to NCDOT and others to DWQ's basin-wide planning function, with some staff remaining within the EEP to manage delivery of the in-lieu fee and nutrient programs. The estimated cost savings from this alternative would be approximately $2,250,000 (based on an average fully loaded salary of $75,000 per employee).

This alternative would likely result in additional operational costs to DWQ and/or USACE as additional staff could be required to coordinate with multiple mitigation bankers and NCDOT versus the EEP program acting as a single point-of-contact for the regulatory community.

The relative advantages and disadvantages of this alternative are outlined below.

1. Advantages.

Anticipated advantages of a mitigation banking alternative include:

- There is the potential for improved accountability by tying responsibility for timely delivery and quality of mitigation to the payment of banking fees.
- Competition between mitigation bankers could lead to cost reductions in some watersheds.

2. Disadvantages.

Disadvantages of a mitigation banking alternative include:

- There is limited enthusiasm for the private mitigation banking model among regulators who have achieved operational efficiencies of their own under the EEP model by having the EEP as a single point of contact for mitigation issues.
- There are concerns among environmental stakeholders about how much emphasis would be placed on watershed planning under a mitigation banking model.
- Private mitigation banks would not be commercially viable in all watersheds, thus requiring NCDOT to develop its own mitigation banks or on-site mitigation and/or to utilize a scaled-down EEP program to provide this mitigation.
- There is a potential for an increase in the cost of mitigation in some watersheds where only one bank enters the market and/or where NCDOT or a scaled-down EEP must act as the bank of last resort.
- An EEP-like organization would still be required to provide some functions (i.e., the in-lieu fee program for watersheds where mitigation banks do not become viable and the nutrient program).

VII. Recommendations

This section outlines a number of recommendations based on the findings documented earlier in this report and the results of the analysis of various organizational and programmatic alternatives. This includes recommendations concerning the organizational and programmatic relationships between the EEP and the CWMTF, steps to strengthen the relationships between the EEP and NCDOT and specific policy changes, process improvements, and technology recommendations for both the EEP and the CWMTF.

For ease of presentation, our findings have been organized into the following subsections:

- Organizational structure.
- Surplus management.
- NCDOT/EEP partnership.
- Watershed planning.
- Functional mitigation and out-of-the-box mitigation.
- Private mitigation banking.
- EEP project delivery processes.
- CWMTF operations.
- Other recommendations.

A. Organizational Structure

This subsection presents our recommendations concerning the organizational structure of EEP and CWMTF. Our recommendations in this regard include:

- The EEP and the CWMTF should remain separate organizations.
- An acquisition review process should be established which actively involves EEP in reviewing each acquisition to assess the applicability of utilizing any proposed state land acquisition for mitigation credit.
- The General Assembly should consider removing the prohibition on CWMTF participating in compensatory mitigation.
- Additional effort should be made to leverage programmatic synergies between the EEP and the CWMTF.

These recommendations are outlined in further detail below.

1. The EEP and the CWMTF should remain separate organizations.

Our analysis suggests that there are limited benefits to merging the EEP and the CWMTF. While both agencies are focused on creating positive environmental outcomes, the EEP is responsible for delivering a compensatory mitigation program based in a fairly structured regulatory environment. The CWMTF, on the other hand, is responsible for managing a voluntary program with a substantially larger scope. Likewise, while the EEP is a delivery organization who manages the restoration of streams and wetlands, the CWMTF is a grantor agency that provides funding to other organizations that actually design and implement projects.

Similarly, there would be significant risk in terms of stakeholder buy-in and cultural change between the two organizations. The regulatory agencies who work with the EEP (DWQ and USACE) have expressed concerns about mixing compensatory mitigation with the CWMTF's voluntary program. These concerns represent a risk to implementing the merger because it would likely require modifications to the MOA to establish the merged organization.

At the same time, the CWMTF grantees whom we interviewed for this study expressed concerns about the CWMTF's core mission being affected by the integration of a compensatory mitigation program. In addition, there are a number of organizational change issues that would need to be addressed in terms of merging an agency with an independent board (CWMTF) with an agency that operates as an administrative unit with NCDENR (EEP).

2. An acquisition review process should be established which actively involves EEP in reviewing each acquisition to assess the applicability of utilizing any proposed state land acquisition for mitigation credit.

DENR should take the lead in establishing an acquisition review procedure that actively involves EEP in order to ensure that the EEP is engaged in all state land acquisitions. This will allow mitigation dollars to always be utilized as the first source of funding for any acquisitions by the state in an area where there is a need for mitigation credits and the property being acquired would be eligible for mitigation credits.

3. The General Assembly should consider removing the prohibition on CWMTF participating in compensatory mitigation.

In addition, the General Assembly should consider removing the prohibition on the CWMTF participating in compensatory mitigation. Having the option to utilize CWMTF monies for compensatory mitigation would provide the state additional flexibility and provide the potential to better leverage the state's scare financial resources. It also may allow the CWMTF and the EEP to work together more effectively in the future on land acquisitions, functional mitigation and out-of-the-box mitigation initiatives.

The elimination of the prohibition on the CWMTF participating in compensatory mitigation must be carefully balanced so as to not unduly impact the existing voluntary grants based program and/or to unfairly weigh the selection of projects in any way towards projects which are candidates for mitigation credit. To minimize the impact to the existing CWMTF program through removal of the prohibition on compensatory mitigation, it is suggested that the statue be modified to allow EEP to utilize for mitigation credit projects selected through the normal CWMTF application selection process that are determined to be eligible for mitigation credit and in a cataloguing unit where mitigation is needed. Projects would not be given additional consideration or any "bonus points" in the CWMTF grant selection process for their value as a mitigation site.

In situations where the EEP identifies that a CWMTF project could be utilized as a mitigation site, the EEP would be responsible for paying any incremental costs for the project associated with making the site meet regulatory requirements as a mitigation site. This represents a change from the current situation where the EEP buys the project from CWMTF, fully reimbursing the CWMTF for any costs incurred by the CWMTF related to the project and then takes over responsibility for completing the project and monitoring the site. This approach represents a savings to the state in that the EEP would fund only the additional incremental versus paying for the full cost of the project.

It is important to understand that not all preservation or restoration projects funded by the CWMTF would likely be eligible for mitigation credit. Currently, CWMTF projects are entirely developed as the result of applications being submitted by interested parties. While these projects are designed to achieve specific environmental outcomes, they are not always performed within the tight regulatory standards and specifications that are required of mitigation projects.

Mitigation required for permitted impacts to aquatic resources must follow a set of regulatory requirements that are prescribed at the time of permit issuance. In addition to meeting project requirements for mitigation method, size, location, design, and permanent protection, permittees must also:

- Monitor and periodically report on the performance, or "success" of a project in meeting ecological goals and criteria. Performance criteria are often expressed as "performance standards" that measure ecological functions or physical properties, e.g., attainment of the appropriate wetland hydrology, percent coverage of appropriate vegetation, and/or percent species composition. Permittees are typically required to report annually for a set period of time, e.g., five years (although requirements will vary depending on the project).
- Provide contingency funds as assurance in the event of project failure, which may require repair or remediation in order to meet prescribed performance standards.
- Provide for long-term management and maintenance of the mitigation project (i.e., beyond the reporting period). This entails ensuring the long-term

performance of mitigation sites by identifying an entity (e.g., a land trust or state agency) that will be responsible for providing maintenance services and by providing funds to cover costs associated with long-term maintenance services and/or contingency/remediation funds.

Likewise, any modification of the CWMTF's current prohibition on participating in compensatory mitigation is likely to face opposition from environmental advocacy groups and potentially from current or former CWMTF grantees. These organizations would be concerned that removal of the CWMTF's prohibition on participating in compensatory mitigation would cause the CWMTF to select projects which would be eligible for mitigation credit at the expense of other types of projects. These organizations would also be concerned that the net impact would be less total dollars spent on environmental projects in North Carolina annually.

An example of how this recommendation would work is presented below.

Example:

CWMTF awards a $500,000 grant to a land trust to perform a stream restoration project. During the project, EEP identifies a need for stream restoration credit in the same cataloguing unit where the land trust is performing the project under the CWMTF grant.

Current situation: With the grantees concurrence, the EEP buys the project from the CWMTF. The EEP refunds the CWMTF $500,000 plus CWMTF's administrative costs.

Recommended approach: The EEP would be responsible for any incremental costs associated with the restoration site. This would include cost of monitoring for five years per regulatory requirements and any other site-specific costs.

4. Additional effort should be made to leverage programmatic synergies between the EEP and the CWMTF.

While we do not recommend an actual merger of the two organizations, we believe that there are a number of programmatic synergies between the EEP and the CWMTF that should be aggressively pursued. Our recommendation represents an adaptation of the status quo model with programmatic synergies and process improvements outlined in Section VI.C. These programmatic synergies include:

- Linking the two organizations more closely through tighter integration of the EEP's watershed planning process with the CWMTF's grant application and selection process (please refer to Section VII.D.3). We envision this to include an active marketing of priority projects identified in an enhanced watershed planning process to potential CWMTF grantees in order to encourage these priority projects to be pursued. This recommendation would also involve a revision of the CWMTF application scoring process to award substantial bonus

points for grantees proposing either to implement a priority project identified in the watershed plans or to otherwise address a high priority need identified in a watershed plan.

- Developing a partnership between EEP and CWMTF to provide a mechanism to help other state agencies, local governments, or land trusts acquire EEP mitigation lands that may be declared as surplus (please refer to Section VII.B.4).
- Developing a partnership between EEP and CWMTF to jointly pursue functional replacement projects and a pilot of an out-of-the-box mitigation project (please refer to Section VII.E.2).

B. Surplus Management

This subsection presents our recommendations concerning the steps required to manage the current surplus of mitigation credits in some watersheds. Specifically, we recommend the following actions:

- Negotiate flexibility to utilize existing credits within different cataloguing units in the same river basin.
- Modify the MOA to incorporate a statement of direction that mitigation ratios will be reduced at the time of permit issuance in appropriate situations where mitigation is in the ground and functional.
- Identify the surplus credits and create an action plan for each parcel identified as surplus.
- Develop a partnership between the EEP and the CWMTF to facilitate acquisition of surplus properties.

Each of these recommendations is discussed in further detail below.

1. Negotiate flexibility to utilize existing credits within different cataloguing units in the same river basin.

NCDOT and NCDENR, as the state's two agency partners in the MOA, should work with USACE to negotiate changes to the MOA to provide for the flexibility to utilize credits in one cataloguing unit that have been determined to likely be surplus in other cataloguing units in the same river basin where there is a need for credits. This application of surplus credits, when available, should always be a prerequisite to constructing or acquiring new credits.

We believe such a modification to the MOA would be consistent with the experience we found in our surveys of practices in other states with a strong preference for having mitigation in the same watershed/cataloguing unit, but the regulator has flexibility to address situations on a case-by-case basis. In these other states, we found that mitigation is still placed in the same cataloguing unit as the impact the vast majority of

the time. We believe this would still be the case at the overall program level in North Carolina, even with the establishment of this additional flexibility for addressing the surplus mitigation.

This recommended strategy provides an essential element of flexibility to allow the three partners in the MOA to apply a level of cost containment, with minimal impact to the EEP's overall environmental stewardship goals. However, it should be noted that this approach contains some added risk for the state since regulatory staff indicate that this flexibility may also affect timely permitting if, at the time of the proposed impact, mitigation is evaluated as not meeting regulatory requirements.

The EEP staff has developed similar proposals to this recommendation in the past but there has been limited follow-up by executive management. We believe this recommendation is crucial and that it will require active involvement at the executive level at NCDENR and NCDOT in order to work with the USACE to affect its implementation. We would strongly recommend that the Secretary of NCDENR and the Secretary of NCDOT meet to agree on language that is acceptable to the two state agency partners and then personally meet with the Colonel of the Wilmington district of USACE to negotiate this item.

2. Modify the MOA to incorporate a statement of direction that mitigation ratios will be reduced in appropriate situations where mitigation is in the ground and functional.

During the course of this study, informal discussions with regulators suggested that in many situations they would likely be comfortable in reducing mitigation ratios (to either 1:1 or closer to 1:1) based on the advance mitigation actually being in the ground and functioning at the time of permit issuance. Such a strategy would present an opportunity to significantly reduce the amount of mitigation that would have to be developed and acquired in the future and consequently reduce the overall cost of providing mitigation for transportation projects on a go-forward basis.

We would recommend that as an extension of the negotiation on additional flexibility in the MOA for surplus credits that NCDENR and NCDOT also seek agreement from USACE to modify the MOA to stipulate that it is the stated intention of the three parties to the MOA that mitigation ratios will be reduced to 1:1 when the mitigation is in the ground and functioning, with some discretion for the regulator to apply this directive on a case by case basis at the time of the permit.

Codifying this directional statement in the MOA now versus just implementing this direction at some point in the future is critical. Having this as a statement of direction now will allow the EEP to build this assumption into its business planning. This will likely result in the EEP needing to develop less mitigation in future years, thus reducing the total cost of mitigation in North Carolina. If instead these ratios are just changed at some point in the future, it is quite likely that more mitigation will be

constructed now and in the next five to eight years than is actually needed, in effect adding to the surplus of mitigation.

3. Identify surplus credits and create an action plan for each parcel identified as surplus.

The EEP and NCDOT should work together to identify and designate actual surplus credits based on a review of the best available information from the TIP and other resources on when/if various projects may be constructed. In conducting this analysis, we recommend the following steps:

- NCDOT should carefully review and assess the projects in the TIP and adjust the proposed timing and amount of mitigation required. Any projects that NCDOT anticipates will not actually be built and/or built within a reasonable time frame (for example, eight years) should be removed from the analysis.
- The EEP should update their operational plan and forecast of mitigation requirements based on the updated NCDOT analysis and the anticipated impact of the recommendations above on additional flexibility for using surplus credits and the reduction in ratios for mitigation that is in the ground and functioning.
- As part of analyzing the surplus, the EEP should then consider the anticipated forecast of needs for the in lieu fee program for the next three years in each cataloguing unit and any opportunities to apply NCDOT surplus mitigation to the anticipated in lieu fee needs should be taken into consideration as part of identifying what property is actually surplus. This market forecast should be based on anticipated growth and development in each cataloguing unit and the historical orders that have been placed for mitigation in each cataloguing unit.
- The EEP should then look at existing properties to identify cases where, while the property is being used for mitigation and/or it is anticipated to be needed in the future there may be surplus parcels within the property (i.e., parcels where uplands were acquired as part of an acquisition of a property for stream restoration, etc.). While it may be appropriate to retain some of these uplands as buffers, it is believed that a number of parcels may be candidates to be identified as surplus. To complete this step will likely require detailed analysis of individual properties, including site visits.
- NCDOT and EEP should explore opportunities to sell high-quality preservation lands to the in-lieu fee program.
- The EEP should then develop a list of properties (surplus mitigation or excess parcels) that appears to be surplus for final review by the existing interagency team chartered to look at this issue. In preparing this list, EEP should identify any properties where there are special issues that will need to be considered. For example, the Croatian Banks site is a mitigation bank, so proposed decisions on this site will need to be negotiated with the Mitigation Banking Review Team and changes made to the banking instrument as required.

- The interagency team should then make a specific recommendation on each property on the list for action by NCDENR and NCDOT executive management. In making this final recommendation, it is important that the team consider whether each "surplus" property is in the best interest of the state for the property to be sold. If there is a chance that a transportation project requiring mitigation would be built in the next 10 to 15 years in a given area, careful consideration should be given to disposing of the asset. In the future, it may be very difficult to procure the same kind of acres and feet again, and the cost of acquiring and developing the mitigation in the future will likely be substantially higher than what was either originally paid for the property or its selling price. The opportunity to obtain some immediate term revenue should be carefully weighed against the cost of obtaining the same mitigation at some point in the future.

The EEP has had an interagency team addressing this surplus issue for some time. The work of this group as outlined in this recommendation needs to be moved to completion. Again, we would expect that the completion of this recommendation will require direct involvement by the Secretary of NCDENR and the Secretary of NCDOT, and we would urge that the secretaries and their senior staff engage on this issue and drive it to closure by the end of calendar year 2007.

4. Develop a partnership between the EEP and the CWMTF to facilitate acquisition of the surplus properties.

The CWMTF should partner with the EEP and NCDOT to create a program to allow other state agencies, local governments and land trusts to purchase "surplus" mitigation property. Such a program would provide a win/win situation by preserving these mitigation lands for use for environmentally sensitive purposes, while at the same time returning some funds back to NCDOT in the near-term for use in funding transportation projects. In some situations, as part of the sale, it may be appropriate to stipulate that the land trust or acquiring agency be asked to agree to give EEP an option to purchase the entire property back or potentially a conservation easement within the parcel at fair market value if it is needed in the future for compensatory mitigation. If the EEP actually exercises this option, it would essentially be buying the CWMTF out of the project as it has done in similar situations in the past.

To implement this recommendation, the following steps would be required:

- As part of the appropriation process, the General Assembly would need to stipulate that a set percentage of the CWMTF's grant funds (a minimum of 15% to a maximum of 20% is suggested) be utilized to allow eligible grantees to acquire mitigation land declared to be surplus by the EEP and NCDOT.
- The General Assembly would also need to specifically stipulate that the funds raised through the sale of this property would be transferred to the Highway Fund versus being placed into the General Fund.

C. NCDOT/EEP Partnership

This subsection presents our recommendations for strengthening the partnership between the EEP and NCDOT. These recommendations include:

- Improve the quality of the demand forecast for mitigation by implementing a two-phased Transportation Improvement Program (TIP).
- Shift from advanced mitigation to a just-in-time mitigation approach.
- Transition from an expense reimbursement methodology to a per credit fee basis.
- Initiation by NCDOT of regular billing of FHWA for the federal share of the cost of the EEP.
- Development by the EEP of a more effective management scorecard and strengthening of the EEP's overall communication outreach.

Each of these recommendations is discussed in further detail below.

1. Improve the quality of the demand forecast for mitigation by implementing a two-phased Transportation Improvement Program (TIP).

The study team recommends that NCDOT improve the quality of the demand forecast for mitigation by implementing a two-phase TIP consisting of:

- A development TIP, that contains projects that are in the feasibility study, environmental planning, and preliminary design stages of the project delivery life cycle.
- A delivery TIP consisting of projects that are in final design, letting preparation and the construction phases of the project delivery life cycle.

This two-phased TIP would require a proactive decision point prior to programming the project for construction (i.e., adding it to the delivery TIP). This decision point would require a review of project scope, an analysis of project costs including the cost of providing mitigation, and an assessment of project risk. An affirmative decision would then be required by a multi-disciplinary senior management team, after reviewing these factors to program the project for construction and to target a proposed letting date (based on both the expected availability of funding and the anticipated time required to complete design). Concurrence on this recommendation by the Board of Transportation would also be required.

The objective of the recommendation is to change NCDOT's current project delivery process so that NCDOT does not commit to delivery timelines, costs, and scope until a higher level of project development has been completed. The recommendation establishes a development component of the TIP that involves more planning and environmental screening. This process change would not advance projects into the

delivery TIP until there was agreement on the likely environmental conditions to be addressed and the mitigation and design approach to address them. The intent of the recommendation is to establish the delivery TIP as a multi-year (perhaps five-year), financially feasible project delivery plan. The plan would be annually updated and provide the delivery commitment that NCDOT and elements of the state resource agencies' performance is managed against. Once projects are in the delivery TIP, their scope, schedule, and budget would be very carefully managed and controlled.

The adoption of a two-phased TIP would substantially improve the demand forecast for mitigation by allowing NCDOT to place its order for mitigation only for projects it really intends to build because it has a solid understanding of the costs, the planned timeline for completing and letting the project, and defined funding sources. Also, because the forecast is being provided later in the project process, the estimate of required mitigation will be more precise and should take into consideration adjustments made through the Merger 01 process.

In addition to the benefits in terms of improving the forecast for mitigation, a two-phased TIP provides a tremendous amount of other benefits to NCDOT in terms of focusing department efforts on those projects that are ready to be built (those in the delivery TIP), weeding out marginal projects through the positive checkpoint to program the project for construction, and generally increasing the predictability of the project delivery process.

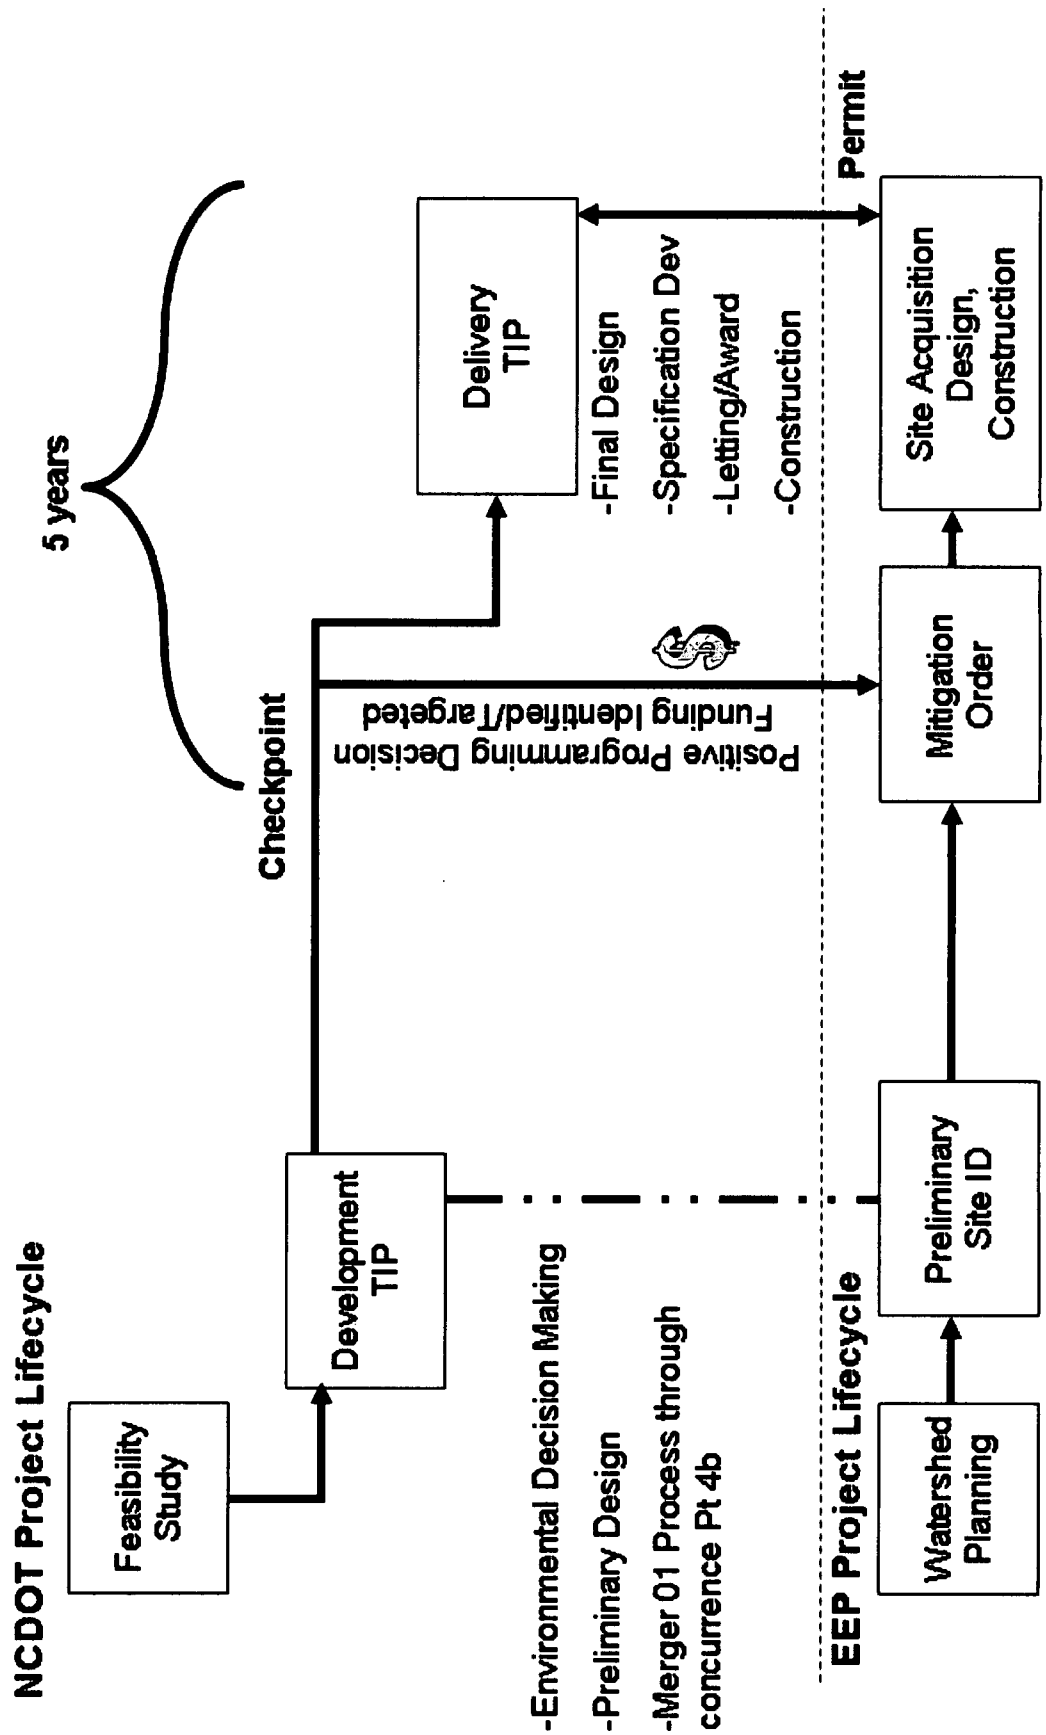
2. Shift from advanced mitigation to a just-in-time mitigation approach.

NCDOT and the EEP should shift from the current advanced mitigation approach to more of a just-in-time mitigation approach, where mitigation is ordered and work is initiated well in advance of starting construction, but only at a point where there is a firm commitment by NCDOT that the transportation project will actually be executed and where the actual requirements for mitigation are more clearly understood, because most of the collaborative decision-making in the Merger 01 process has been completed.

It is our recommendation that NCDOT should order mitigation only when a project is programmed into the delivery TIP (essentially no earlier than at the time of the completion of the draft environmental document). This will provide an improved understanding of the real needs for mitigation, a higher certainty that a project will be built, and a forecast of when it will be built.

Exhibit VII-1 illustrates the activities incorporated into the proposed two-phases of the TIP and outlines the relative timing and dependencies between the transportation lifecycle and the EEP's project lifecycle for implementing required mitigation.

Exhibit VII-1: ust-In-Time Mitigation



This approach would generally allow for approximately five years of project development time for EEP to implement the necessary mitigation. This time frame is on the outer limits of the general timeline it currently takes for EEP to complete a design-bid-build project (four and a half to five years) and a much longer time frame than it normally takes to complete a full delivery project. In addition, it is not unreasonable to expect EEP to be able to shorten the time required to complete design-bid-build projects by six months to a year, as it matures this delivery approach and both EEP and consultant staff gain more experience in delivering under this model.

Because this recommendation reduces the time the EEP will have to implement the required mitigation, we recognize that this presents a small increase in risk. However, we believe this is more than offset by the greater certainty that the transportation project will actually be built and the increased predictability the EEP will have about the mitigation actually required for the project. In addition, to mitigate against the risk of a reduced timeline, the EEP can perform some initial site selection activities as an extension of its watershed planning efforts for projects that are advancing through the development phase of the TIP.

3. Transition from an expense reimbursement methodology to a per – credit-fee basis.

NCDOT should shift from compensating the EEP on an expense reimbursement methodology to a per-credit fee basis when mitigation is ordered at the time the project is programmed for construction. We believe that this recommendation should be implemented as the current build-out of mitigation is completed and the just-in-time mitigation approach based on the two-phased TIP is initiated. However, this transition from the current cost recovery approach to a per-credit-fee basis will have to be carefully staged and managed to reduce unintended financial impacts to either NCDOT or the EEP. In addition, a rate-setting process with a procedure for annual adjustments to the rate schedule will need to be defined and incorporated within the MOA. This rate schedule could also potentially be tied to the rate schedule for the in-lieu fee program.

This per-credit-fee basis is similar in concept to the payment made at the time mitigation is ordered by participants in the in-lieu fee program. In the case of the in-lieu fee program, customers receive a receipt at the time of payment that represents a legal commitment on the part of the EEP to provide the required mitigation and a transfer of responsibility for providing this mitigation from the permit applicant to the EEP. The adoption of a per-credit-fee approach would in effect create this same clean, clear, and legal transfer of responsibility for mitigation from NCDOT to EEP at a defined snapshot point in time. It would also simplify the ongoing internal NCDOT accounting for mitigation costs (i.e., the per-credit cost would be billed directly to the project ordering the mitigation) and would simplify federal-aid billing, as the cost could be billed to FHWA at the time the expense is incurred by NCDOT.

This approach may not reduce the cost to NCDOT of acquiring the specific mitigation required for an individual project. We believe, however, that this approach will contribute to reducing the total cost of the overall mitigation program on a go forward basis. It will ensure that payment is made for mitigation credits which are specifically required for a project that is programmed for construction based on a refined estimate of the mitigation needed. In addition, this payment will be made only at the time the EEP actually begins work to acquire the needed mitigation.

4. Initiation by NCDOT of regular billing of FHWA for the federal share of the cost of the EEP.

While the study team recognizes that NCDOT is maximizing its federal transportation funds, there is some risk of failing to submit timely billings, especially for a program that is innovative in nature, such as the EEP, and that by consequence does not have a track record of established precedent for addressing billing issues that may arise.

5. Development by the EEP of a more effective management scorecard and strengthening of its overall communications outreach.

The EEP should develop an executive-level management scorecard that summarizes the status of the EEP program against a number of key metrics. EEP senior management should then utilize this management scorecard as the basis for regularly scheduled meetings with key stakeholder groups such as Environmental Review, Joint Transportation, the Environmental Management Commission and the Board of Transportation. The EEP's senior management should also make an effort to reach these stakeholders periodically in informal settings and on a 1:1 basis as required to address specific issues and concerns of individual stakeholders.

D. Watershed Planning

This subsection presents our recommendations concerning the strengthening of the watershed planning process. Our recommendations in this area include:

- Improve integration of the EEP's watershed planning with DWQ's basin-wide planning.
- Strengthen the end products resulting from the watershed planning process to define specific priority projects.
- Link the CWMTF grant application process more closely to watershed plans.

1. Improve integration of watershed planning with basin-wide planning.

Currently, DWQ conducts basin-wide planning, while EEP conducts watershed planning at the basin level and the produces more detailed.plans for specific cataloguing units where the anticipated level of impacts in a cataloguing unit merit the

time and cost of developing the detailed plan. These detailed watershed plans are then utilized as a one of several tools in site selection for mitigation projects required within a particular cataloguing unit.

The study team believes that there should be tighter linkages between these two separate planning processes being conducted by two different units with NCDENR. At the same time, we recognize that the EEP's watershed planning process is also one of its site selection tools.. This makes the issue of merging the two planning processes organizationally more complicated.

However, this issue was not a primary subject of this study, and thus, we believe that additional study is warranted by NCDENR management to investigate the feasibility of various approaches for enhancing the integration between these two planning processes. As part of this effort, the study team has identified a potential alternative:

- Establishment of a multi-disciplinary water resources planning group that, like the transportation planning organizations within state transportation agencies, would have responsibility for all water resource planning in North Carolina. This function would incorporate the basin planning be performed within DWQ and the watershed planning performed today within the EEP. This group could be partially funded by the EEP (watershed planning is funded today as an extension of the cost of implementing mitigation) and partially by a budgetary allocation from the General Assembly for water resources planning.

2. Strengthen the end-products from the watershed planning process to define specific priority projects.

This recommendation involves strengthening the watershed planning process to better articulate needs to the full delivery providers. This might include releasing a list of specific projects to meet needs identified in the watershed plans, including cost estimates and suggested timing and sequencing for these projects. This would create for water resources, in effect, an equivalent to the list of potential projects developed during the transportation planning process that provide a defined list of needs and a suggested list of priority projects that form the basis for projects to be included in the TIP. This "water improvement program" for each watershed would then be reviewed with various stakeholders and could also be integrated into the CWMTF grant application and selection process as described in Section VII.D.3 below.

3. Link the CWMTF grant application process more closely to watershed plans.

This recommendation involves integrating the CWMTF in the watershed planning process and in the definition of the list of proposed capital projects within each watershed. The CWMTF would then market these potential projects to prospective grantees in order to encourage applicants to pursue one or more of these high-priority projects. This recommendation would also involve modifying the CWMTF grant

selection process to provide additional weight through substantial bonus points to prospective grantees who are proposing to address high-priority needs and/or the targeted capital projects as identified in the enhanced watershed plans.

Implementation of this recommendation would create additional synergy between the two programs. It would also help to address concerns on the part of some stakeholders about the quality or environmental value of some projects awarded by the CWMTF.

E. Functional Mitigation and Out-of-the-Box Mitigation

This subsection provides our recommendations concerning functional mitigation and out-of-the-box mitigation. "Functional mitigation" or "functional replacement" refers to mitigating or replacing the *functions* lost as a result of a permitted impact to a wetland or stream (as opposed to mitigating or replacing the lost *acreage*). Functions are the services that the resource provides, e.g., water purification, protection from flooding, and habitat for fish and wildlife are common services provided by wetlands.

These recommendations include the following:

- Engage the EEP and the CWMTF as partners in at least two pilot functional mitigation projects.
- Create a partnership between the EEP and the CWMTF to work with the regulatory agencies to develop a pilot of an out-of-the-box mitigation project.

Each of these recommendations is described in further detail below.

1. Engage the EEP and the CWMTF as partners in at least two pilot functional mitigation projects.

The EEP is currently working on several functional mitigation initiatives. We recommend that the EEP engage the CWMTF as a partner in at least two pilot functional mitigation projects. We believe that the integration of the CWMTF as a partner in these projects may allow the EEP, by combining EEP's funds with funding through CWMTF, to implement additional elements within a project, such as some best management practices for which regulatory agencies would not typically allow mitigation credit. In this scenario, the involvement of CWMTF would allow the project to achieve enhanced environmental outcomes.

A key element in this recommendation will be the application of the North Carolina Wetlands Assessment Method (NC WAM), which provides a field method to determine the level of function of a wetland relative to a reference condition (where available). If adopted, NC WAM could be used toward mitigation planning and tracking functional replacement across the state. North Carolina is also currently working on the North Carolina Stream Assessment Method (NC SAM), although it will not be released for comment until 2008. NC SAM, when completed, will also play a key role in the full implementation of this recommendation.

2. Create a partnership between the EEP and the CWMTF to work with the regulatory agencies to develop a pilot of an out-of-the-box mitigation project.

The EEP and the CWMTF should develop a partnership for purposes of working with the regulatory agencies (i.e., USACE, DWQ, EPA) to develop a pilot of an out-of-the-box mitigation project. This project would seek to innovate on a pilot basis the application of non-traditional mitigation (i.e., replacement of a waste water plant, etc.), with the EEP and the CWMTF partnering together on the project and the EEP receiving mitigation credits based on its share of the funding, as determined through a methodology agreed to by the regulatory agencies.

The study team recognizes that this recommendation may be a difficult sell with the regulatory agencies. However, we believe it is appropriate to pursue this recommendation for a number of reasons:

- The proposed project is simply a pilot to demonstrate the efficacy of the concept and identify issues and opportunities surrounding this type of strategy.
- The application of innovative mitigation would be a direct result of needs identified in the watershed plans and as such represents the next natural progression in the integration of watershed planning into the mitigation process.
- The use of out-of-the-box mitigation approaches increases the opportunities for the EEP and the CWMTF to partner together to achieve enhanced environmental outcomes.
- The EEP is recognized nationally as both a model and an innovative program. As such, it is an appropriate choice for a learning lab to demonstrate and evaluate the application of innovative approaches.

F. Private Mitigation Banking

The EEP should implement a private mitigation banking pilot program to further evaluate the role that mitigation banking can play in providing mitigation credits for transportation projects in North Carolina. It is recommended that this pilot program be initiated in at least two watersheds for three years, with one cataloguing unit being a watershed with significant demand and the second watershed being one where less demand is anticipated and that might not be typically thought of as conducive to mitigation banking. This pilot program can take one or both of the following forms:

1. Implementation of a "modified full delivery program."

In this approach, the EEP would select one or more firms to act as their "mitigation bank" in a given watershed. EEP would agree to work exclusively with these firms and to purchase from them all credits needed in the specific watersheds for a three-

year period. Credits would be purchased at a rate schedule established as part of the contract negotiation.

Unlike in the current full delivery program, the provider would be compensated only upon delivery of the actual credit. The selected full delivery providers would be provided with the updated demand forecast on a regular basis and given the watershed plans. They would be expected to link their mitigation sites to the watershed plans to the extent practical.

A primary advantage of this approach is that it would allow a mitigation banking model to be simulated, but this could be executed and evaluated in a framework in which EEP maintains management control, thus reducing the risk of delaying the delivery of needed mitigation.

2. Transfer of responsibility to private mitigation banks.

In this approach, the EEP could exit from one or more watersheds where private mitigation banks are already in place or in development and essentially contract with these banks to provide all of the necessary credits in the particular watershed for the next three years. In this scenario, during the pilot period, the EEP could remain the single point of contact, with the EEP obtaining credits from the various banks based on the needs defined by NCDOT. Or alternatively, NCDOT could work directly with one or more mitigation banks for its needs in the watersheds which EEP has transitioned out of.

The study team believes this recommendation has a number of important benefits including:

- Expanding the use of mitigation banking within the overall EEP model is consistent with the sprit and intent of the anticipated federal rule-making that is expected, even with potential modifications from the draft rule, to place an increased emphasis on the role of mitigation banking nationally.
- Providing an opportunity for the mitigation banking community to demonstrate the expanded role they could play in providing needed credits for mitigation in North Carolina in a lower-risk pilot environment.

G. EEP Project Delivery Processes

This subsection describes recommendations related to the EEP's project delivery processes. These recommendations include:

- Avoid using the design-bid-build and full delivery processes within the same cataloguing unit.
- Increase the maximum contract amounts of the on-call engineering contracts.
- Initiate a design-build pilot.

- Strengthen internal EEP project management skills and processes.

Each of these recommendations is described in further detail below.

1. Avoid using the design-bid-build and the full delivery processes within the same cataloguing unit.

The EEP should avoid using the design-bid-build and full delivery processes within the same cataloguing unit. This should be executed only as an exception process with the approval of the Director of the EEP and upon consultation with the PAC/G.

This will allow the EEP to avoid conflicts in which the EEP competes against itself for mitigation sites by recruiting engineering firms in the design-bid-build process to search for sites in a watershed while the EEP has initiated an RFP for full delivery services in that watershed and the potential full delivery providers are also negotiating for mitigation sites. Likewise, the EEP will also avoid situations where it may disadvantage a property owner whom it has been working with by excluding a person's property from potential selection and acquisition by a full service delivery provider.

2. Increase the maximum contract amounts of the on-call engineering contracts.

The maximum contract amounts on the on-call engineering contracts should be increased from $750,000 to a minimum of $2 million per contractor. This will help the EEP to ensure that it has access to the strongest technical resources and expertise possible for completing its design-bid-build work. We would encourage the EEP to continue to spread the work over as many firms as possible, as it does today; at the same time, we want the EEP to have the flexibility to retain specific, experienced technical specialists when it is essential to completing a particular project assignment.

3. Initiate a design-build pilot.

The EEP should proceed to initiate the design-build pilot as currently planned. It should then evaluate the effectiveness of this delivery method and assess whether it should utilize this approach as a regular part of its delivery model and, if so, determine the types of project for which the design-build would be most suited.

4. Strengthen the EEP's project management processes and skills.

The EEP should implement enhanced project management procedures and processes based on the Project Management Institute's (PMI) Project Management Book of Knowledge or PMBOK ™. The EEP should also implement a project management training program, including a requirement for all project managers to obtain PMI certification within three years.

H. CWMTF Operations

This subsection describes recommendations related to the CWMTF's internal operations. These include:

- Implement a post-grant outcome measurement and tracking process.
- Implement an electronic application process linked to an enhanced grants accounting/grants management software package.

Both of these recommendations are discussed in further detail below.

1. Implement a post-grant outcome measurement and tracking process.

This recommendation involves the CWMTF implementing a structured process for following up on individual projects at intervals of three and five years following implementation, in order to assess and report on the extent to which these projects met or are meeting the goals and objectives that the grantee proposed to achieve in its application. The lessons learned from these reviews should then be fed back into the grants selection process and used to provide input to potential future applicants who are proposing similar goals and objectives on new projects. The results of this outcome measurement process can also be used as a screen to assess the viability of goals outlined by past applicants in their new applications, based on how well the applicant met his proposed goals and objectives from prior projects.

2. Implement a web-based application process linked to an enhanced grants accounting/grants management software package.

The CWMF should implement a web-based grants application process to the extent practical (some materials may require transmission via hard copy). Based on reviewing the outcome of the implementation of similar web-based functionality in other organizations, this Internet-based functionality will both streamline the application process for grantees and reduce the administrative burden on the CWMTF.

This web-based application process should be built on or integrated with the CWMTF's existing grants-tracking software. The use of this grants-tracking application should also be expanded. Based on an initial review of the application, it appears to have the basic functionality usually found in a grants management application. The CWMTF should roll out this application for use by all staff. It should also migrate the grants accounting functions to this software application, as opposed to using the existing spreadsheet tools.

In addition to these recommendations concerning aspects of the CWMTF operations, there are several other recommendations that involve coordination and collaboration between EEP and CWMTF. These recommendations have been discussed in detail elsewhere in this chapter but have been itemized here for ease of reference. These recommendations included:

- The General Assembly should consider removing the prohibition on CWMTF participating in compensatory mitigation. (please refer to Section VII.A.3)
- Linking EEP's watershed planning process with the CWMTF's grant application and selection process (please refer to Section VII.D.3). We envision this to include an active marketing of priority projects identified in an enhanced watershed planning process to potential CWMTF grantees in order to encourage these priority projects to be pursued. This recommendation would also involve a revision of the CWMTF application scoring process to award substantial bonus points for grantees proposing either to implement a priority project identified in the watershed plans or to otherwise address a high priority need identified in a watershed plan.
- Developing a partnership between EEP and CWMTF to provide a mechanism to help other state agencies, local governments, or land trusts acquire EEP mitigation lands that may be declared as surplus (please refer to Section VII.B.4).
- Developing a partnership between EEP and CWMTF to jointly pursue functional replacement projects and a pilot of an out-of-the-box mitigation project (please refer to Section VII.E.2).

I. Other Recommendations

Two additional recommendations relate to standardizing the monitoring and stewardship processes and establishing common document templates between the EEP and the CWMTF. First, we would recommend that the EEP and the CWMTF, along with other appropriate parties with NCDENR, re-engage in discussions to find a common approach to performing site stewardship versus having two different approaches. Second, we would suggest that the EEP and the CWMTF collaborate with the State Property Office in reviewing various forms, such as conservation easements, in an effort to achieve as much commonality as is possible, given that the programs have different types of restrictions on which activities can or cannot be performed within a conservation easement.

VIII. Implementation Plan

This section presents Dye Management Group, Inc.'s suggested timeline and sequencing for implementation of the recommendations. In preparing this timeline, the study team has attempted to clearly delineate between recommendations, such as renegotiating elements of the MOA to obtain additional flexibility and managing the surplus, which must be addressed immediately, and other recommendations that can be implemented either over the next two years and/or that have a logical transition point as the current mitigation build-out begins to level off.

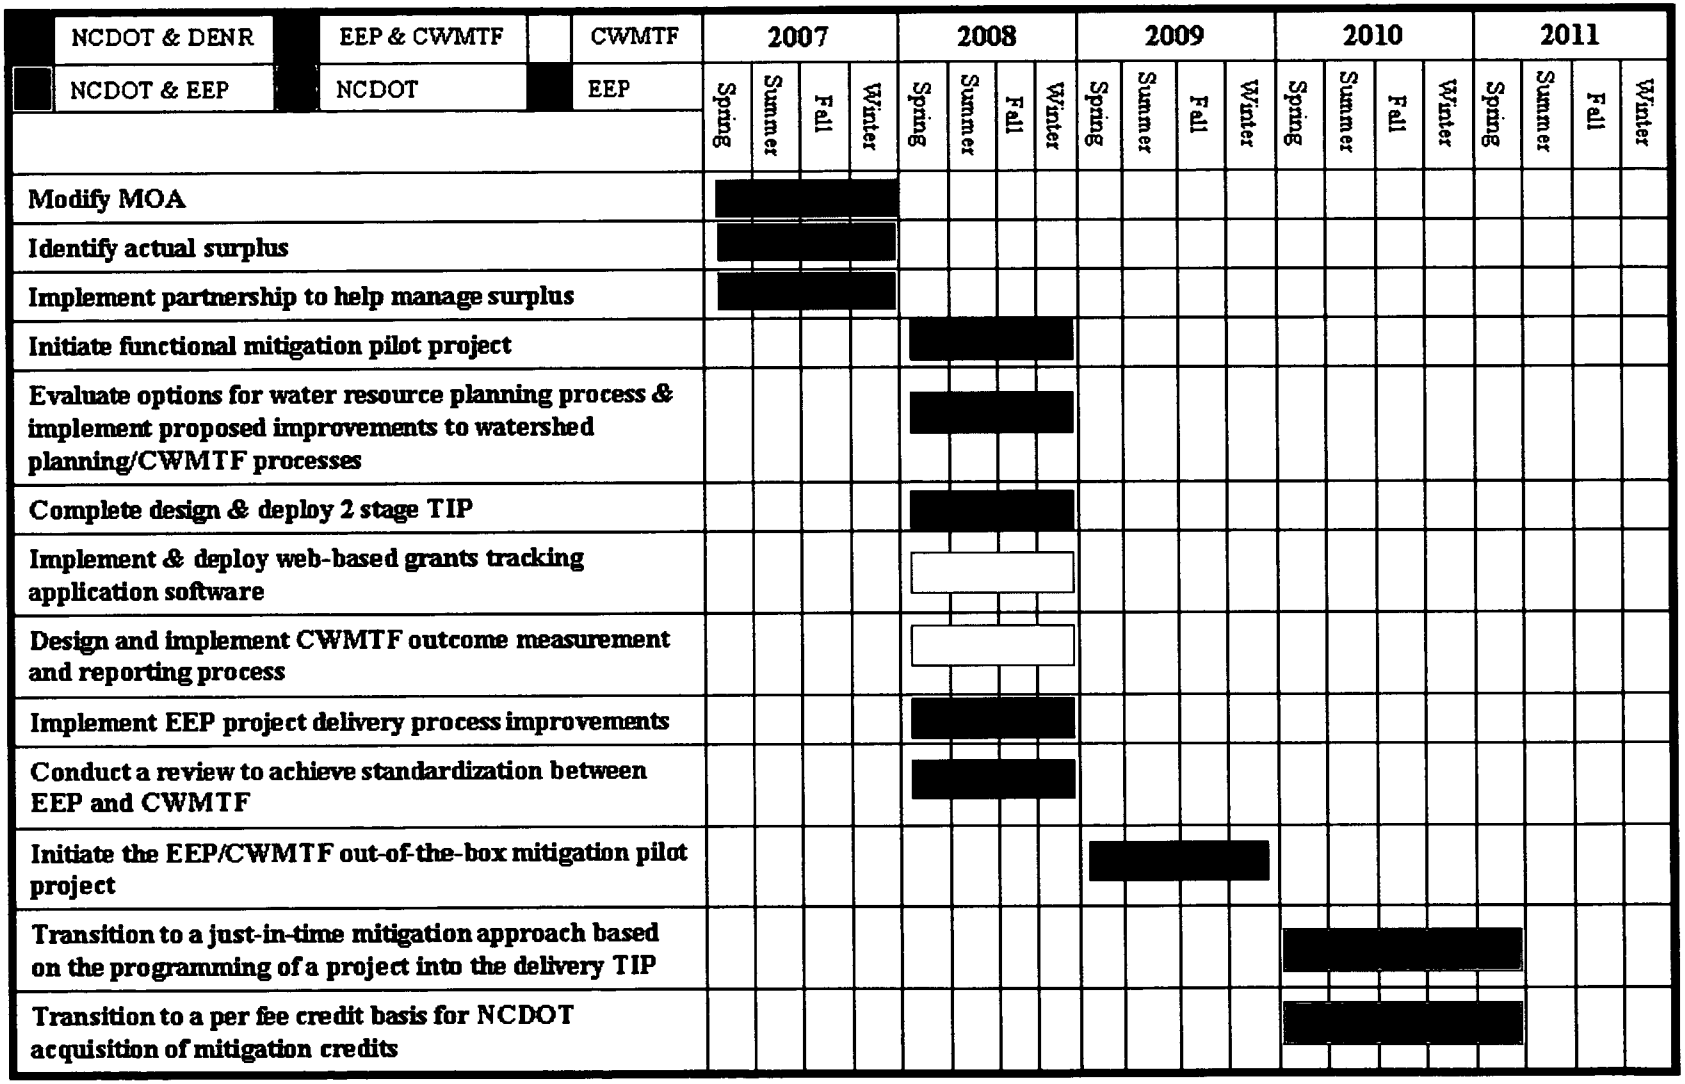
Exhibit VIII-1 provides a graphical illustration of the timeline and sequencing of our proposed recommendations. It also provides a color-coded designation of the various agencies who have ownership for implementing the different recommendations.

It is important to note that implementation of these recommendations will require:

- Ongoing senior executive engagement from the NCDOT and NCDENR management team.
- Ongoing coordination between EEP, CWMTF, NCDENR management and NCDOT
- Stakeholder support and buy-in including from the USACE and DWQ, as well as from various environmental advocacy organizations.

The specific timing for different recommendations and the rationale for this timing are discussed below.

Exhibit VIII-1: Implementation Timeline



A. Recommendations Targeted for Completion by the End of December 2007

Dye Management Group, Inc. believes that, given the extensive build-out of mitigation that is occurring, the timing for addressing recommendations related to managing the surplus and taking steps to reduce the likelihood of similar problems in the future is essential. It is critical that by the end of this calendar year, the following steps will have been accomplished:

- Modification of the MOA to provide additional flexibility in utilizing surplus credits in one cataloguing unit in other cataloguing units within the same river basin.
- Modification of the MOA to include a direction statement on lower ratios for mitigation that is in place.
- Identifying the actual surplus property, defining a plan for each property identified as surplus, and beginning the process of disposing of any assets that are to be sold.
- Implementing the partnership between EEP and CWMTF to provide a mechanism for selling surplus property.
- Establishing an acquisition review process should be established which actively involves EEP in reviewing each acquisition to assess the applicability of utilizing any proposed state land acquisition for mitigation credit.

To fully implement these recommendations, we believe that executive level involvement by the secretary of NCDENR, the secretary of NCDOT and the colonel in charge of the Wilmington district of the USACE will be required to renegotiate the MOA, and that executive leadership from NCDENR and NCDOT will also be required to address the existing surplus.

Likewise, it is suggested that these additional recommendations be implemented this calendar year:

- Initiation of regular billing of FHWA by NCDOT for the federal share of the cost of EEP should occur by the end of this calendar year.
- Development by EEP of a more effective summary management report and strengthening of the overall communication outreach.

B. Recommendations Targeted for Completion within 12 to 18 Months (December 2008)

Dye Management Group, Inc. would recommend targeting these recommendations for either implementation or, in the case of pilot projects, initiation by the end of 2008. These activities include:

- Initiating the EEP/CWMTF functional mitigation pilot project.

- Initiating the mitigation banking pilot project.
- Evaluating options for further integrating the various water resource planning processes.
- Implementing proposed improvements to the outputs from the watershed planning process and strengthening linkages with the CWMTF application process.
- Completing design and deploying the two-stage TIP.
- Implementing the web-based grants application functionality for the CWMTF and deploying the full capabilities of the CWMTF grants tracking software.
- Designing and beginning implementation of an outcome measurement and reporting process for the CWMTF.
- Implementing the various process improvements recommended for EEP's project delivery processes, including initiation of project management training, modification of contract ceilings, and initiation of a design-build pilot project.
- Conducting additional discussions and assessing approaches for standardizing stewardship processes across the EEP and the CWMTF.
- Conducting a review of various forms and templates to achieve standardization between the EEP and the CWMTF to the extent possible.

C. Recommendations Targeted for Completion within 24 to 30 Months (by December 2009)

Dye Management Group, Inc. would recommend targeting the following recommendation for initiation by the end of 2009:

- Initiating of the EEP/CWMTF out-of-the-box mitigation project. It is believed that this type of lead time will be necessary to present the concept to and gain buy-in from the various regulatory agencies, including likely discussions with Washington-based policy staff of EPA and USACE.
- Removing the prohibition on the CWMTF participating in mitigation and in place of the outright prohibition establishing a cap on the percentage of CWMTF funding which can be utilized for mitigation. This recommendation would require a statutory change by the General Assembly. CWMTF would then need to update its operational procedures to implement this change in policy direction. Likewise, this change would require planning and executing a structured communications program on the reasons for and benefits of this change. This communication program should be targeted to all impacted stakeholders.

D. Recommendations Targeted for Completion within Approximately 36 to 48 months (by June 2011)

Dye Management Group, Inc. would anticipate targeting these recommendations for approximately 36 to 48 months out (June 2011) because they are dependent on the deployment of the two-stage TIP by NCDOT. In addition, these changes will be best accomplished at a point at which the EEP's delivery of mitigation is beginning to level out. These recommendations include:

- Transition to a just-in-time mitigation approach based on the programming of a project into the delivery TIP.
- Transition to a per-credit-fee basis for NCDOT's acquisition of mitigation credits.

Appendix A: High Quality Preservation Mitigation Sites

The NCDOT and EEP purchased several tracts of land as part of the "high-quality preservation" component of mitigation projects per the MOA. Appendix A identifies the tracts of land purchased for the "high-quality preservation" effort as of May 11, 2007. An effort was made to reconcile the lists from NCDOT and EEP; however, the name given to the tract may have been changed during the purchase and/or use of credits from the site. Two sites in the list have been identified as having other mitigation value in addition to their high-quality preservation values.

Exhibit A-1: High Quality Preservation Mitigation Sites (as of 5/11/2007) – Sorted by River Basin - CU

Site Name	County	River Basin	CU	Purchasing Agency	Estimated Cost	Preservation Only?
Canal Branch (Bishop)	Anson	Yadkin	03040105	EEP	$315,560	Yes
Elks Shoals	Ashe	New	05050001	EEP	$164,606	Yes
New River Heights	Ashe	New	05050001	EEP	$381,818	Yes
Roanoke River (Cashie)	Bertie	Roanoke	03010107	EEP	$715,000	Yes
Roquist Pocosin	Bertie	Roanoke	03010107	NCDOT	$4,135,465	No
Juniper Creek IP	Brunswick	Lumber	03040206	EEP	Under Contract	Yes
Sandy Mush I & II	Buncombe/Madison	French Broad	06010105	EEP	$9,222,000	No
White Creek (Linville)	Burke	Catawba	03050101	EEP	$1,150,000	Yes
Dutch Buffalo Creek (Walker)	Cabarrus	Yadkin	03040105	EEP	$134,684	Yes
Dutch Buffalo Creek (Wickliff)	Cabarrus	Yadkin	03040105	EEP	$10,936	Yes
Mingo Tract	Caldwell	Yadkin	03040101	NCDOT	$7,533,713	Yes
Country Line Creek (Mackovich)	Caswell	Roanoke	03010104	EEP	$243,000	Yes
Hyco Lake (Bessemer)	Caswell	Roanoke	03010104	EEP	$1,002,276	Yes
Haw River (Duke Forest)	Chatham	Cape Fear	03030002	NCDOT	$2,343,000	Yes
Deep Creek (Hanson)	Chatham	Cape Fear	03030003	EEP	Under Contract	Yes
White Pines/Newton Tract	Chatham	Cape Fear	03030003	NCDOT	$170,000	Yes
Chowan River (Harrell)	Chowan	Chowan	03010203	EEP	$102,600	Yes
Broad River Greenway	Cleveland	Broad	03050105	NCDOT	Not Available	Yes
Juniper Creek IP	Columbus	Lumber	03040206	EEP	Under Contract	Yes
Big Pond Bay	Cumberland	Cape Fear	03030006	EEP	$33,333	Yes
Rhodes Pond	Cumberland	Cape Fear	03030006	NCDOT	Not Available	Yes
Davis (Yadkin River)	Davie	Yadkin	03040101	NCDOT	$241,938	Yes
Flat River (Treyburn)	Durham	Neuse	03020201	EEP	$1,843,662	Yes
Stevens Pennys Bend	Durham	Neuse	03020201	EEP	$934,200	Yes
Fishing Creek (Hall)	Edgecombe	Tar-Pamlico	03020102	EEP	$763,768	Yes
IP Lower Fishing Creek 2	Edgecombe	Tar-Pamlico	03020102	EEP	Under Contract	Yes
Allen Site	Franklin	Tar-Pamlico	03020101	NCDOT	$528,273	Yes
Cypress Creek (Langley)	Franklin	Tar-Pamlico	03020101	EEP	$148,368	Yes
Harris*	Franklin	Tar-Pamlico	03020101	NCDOT	Not Available	Yes
Little Shocco (Senter)	Franklin	Tar-Pamlico	03020101	EEP	$145,535	Yes
Swift Creek (Harper Sandy)	Franklin	Tar-Pamlico	03020101	EEP	$99,324	Yes
Swift Creek (O'Neal-Sandy)	Franklin	Tar-Pamlico	03020101	EEP	$66,600	Yes
Cedar Creek (Perry)	Franklin	Tar-Pamlico	03020102	EEP	$552,299	Yes
Fishing Creek (Gold Mine)	Franklin	Tar-Pamlico	03020102	EEP	Under Contract	Yes

Site Name	County	River Basin	CU	Purchasing Agency	Estimated Cost	Preservation Only?
Fishing Creek (Sturgis)	Franklin	Tar-Pamlico	03020102	EEP	$48,578	Yes
Little Shocco (Tomlinson)	Franklin	Tar-Pamlico	03020102	EEP	$233,850	Yes
Little Shocco (Wheless)	Franklin	Tar-Pamlico	03020102	EEP	$52,668	Yes
Sandy Creek (A & P Timber)	Franklin	Tar-Pamlico	03020102	EEP	$66,564	Yes
Sandy Creek (Faulkner)	Franklin	Tar-Pamlico	03020102	EEP	$73,058	Yes
Sandy Creek (Mullen)	Franklin	Tar-Pamlico	03020102	EEP	$84,453	Yes
Sandy Creek (Parrish)	Franklin	Tar-Pamlico	03020102	EEP	$113,652	Yes
Sandy Creek (Young)	Franklin	Tar-Pamlico	03020102	EEP	$157,806	Yes
Shocco (Alston Tracts 1-3)	Franklin	Tar-Pamlico	03020102	EEP	$1,271,832	Yes
Shocco (Capps)	Franklin	Tar-Pamlico	03020102	EEP	$77,506	Yes
Shocco Creek (Gupton)	Franklin	Tar-Pamlico	03020102	EEP	$602,828	Yes
Tar River (Hodges)	Franklin	Tar-Pamlico	03020102	EEP	$150,120	Yes
Little Shocco (O'Neal)	Franklin/Warren	Tar-Pamlico	03020102	EEP	$93,636	Yes
Rankin Gaston	Gaston	Catawba	03050101	NCDOT	$3,187,622	Yes
Tar River (Guthrie)	Granville	Tar-Pamlico	03020101	EEP	$442,160	Yes
Tar River (MacNair)	Granville	Tar-Pamlico	03020101	EEP	$716,152	Yes
Tucker (Daniels 1)	Granville	Tar-Pamlico	03020101	EEP	$72,596	Yes
Tucker (Daniels 2)	Granville	Tar-Pamlico	03020101	EEP	$8,951	Yes
Fishing Creek (Slaughter)	Granville	Tar-Pamlico	03020102	EEP	$126,900	Yes

Appendix B: Transfer from NCDOT Mitigation Program

Prior to the creation of the Ecosystem Enhancement Program (EEP), the North Carolina Department of Transportation and North Carolina Wetland Restoration Program (pre-cursor to EEP) divided the state of North Carolina into watershed catalog units of responsibility to provide compensatory mitigation for NCDOT Transportation Improvement Program (TIP) projects. Appendix B summarizes the mitigation generated by the NCDOT and transferred over to EEP to use for its projects. Appendix B sorts the mitigation by: river basin name; eight-digit catalog unit (CU) within the river basin; project type for how the mitigation was generated [traditional Design-Bid-Build (DBB), Full Delivery (FD) or Mitigation Bank (MB)]; and, mitigation type (stream restoration, stream enhancement, etc.). The available mitigation has been calculated by project type for the river basin and by river basin. Please note that this appendix only illustrates the river basins and catalog units that displayed activity.

Appendix C: Transfer from NCDOT Mitigation Program (Summary per Subtotal)

Appendix C provides data on the NCDOT mitigation program transfer to the EEP. Appendix C summarizes mitigation the mitigation transferred: per river basin and project type, total mitigation transferred by project type; total mitigation for each river basin for all project types; and, a total of mitigation transferred to EEP from NCDOT.

Exhibit C-1: Transfer from NCDOT Mitigation Program (Net Available as of Feb 2007)

Appendix D: EEP Available Credits (Tier 1 Sites, Excluding NCDOT Transfers) as of February 22, 2007

Appendix D summarizes the available mitigation generated by the Ecosystem Enhancement Program as of February 22, 2007. The available mitigation is presented by: river basin and eight-digit catalog unit (CU) and project type for how the mitigation was generated [traditional Design-Bid-Build (DBB), Full Delivery (FD) or Mitigation Bank (MB)]; and mitigation type (stream restoration, stream enhancement, etc.).

Appendix E: EEP Available Credits (Tier 1 Sites, Excluding NCDOT Transfers) as of February 22, 2007 per Basin Subtotal

Appendix E summarizes all the mitigation credits available to the Ecosystem Enhancement Program and noted indiscriminate of the mitigation source. The mitigation credit is noted by river basin and project delivery type for how the mitigation was generated [traditional Design-Bid-Build (DBB), Full Delivery (FD) or Mitigation Bank (MB)]; and mitigation type (stream restoration, stream enhancement, etc.).

Exhibit E-1: EEP Available Credits (Tier 1 Sites, excluding NCDOT Transfers) – as of February 22, 2007

Appendix F: Anticipated NCDOT Impacts

Each February, the NCDOT submits its revised impacts to wetlands and streams for the Transportation Improvement Program. The projected impacts are divided by MOA year (fiscal year) for the impacts and then divided into the river basin of the impacts, the hydrologic unit where the impacts will occur, and the type of impact (stream, riparian wetland, non-riparian wetland and coastal marsh). For Year 10 (July 2012 to June 2013), the EEP did not have the complete impact data. Additionally, the impact data for Years 11 (July 2013 to June 2014), Year 12 (July 2014 to June 2015), Year 13 (July 2015 to June 2016), Year 14 (July 2016 to July 2017) and Year 15 (July 2017 to June 2018) of the MOA have not been identified. The EEP must institute impacts for: Year 11 (July 2013 to June 2014) and Year 13 (July 2015 to June 2016) by the end of Year 8 (June 2011); Year 12 (July 2014 to June 2015) and Year 14 (July 2016 to July 2017) by Year 9 (June 2012); and, Year 15 (July 2017 to June 2018) by Year 10 (June 2013). EEP provides NCDOT's mitigation in advance, and the MOA signed by NCDOT, NCDENR and USACE states :impacts for Year 11 (July 2013 to June 2014) and 13 (July 2015 to June 2016) must have mitigation instituted by the end of Year 8 (June 2011); impacts for Year 12 (July 2014 to June 2015) and Year 14 (July 2016 to July 2017) must have mitigation instituted by the end of Year 9 (June 2012); and, impacts for Year 15 (July 2017 to June 2018) must have mitigation instituted by the end of by Year 10 (June 2013).

Appendix G: EEP Targets and Surplus Identified from June 2007 to June 2013

Using the NCDOT impacts data, the EEP makes projections of the mitigation 'targets' (i.e., mitigation needed) for a particular river basin catalog unit (CU). According to the February 2007 data that EEP provided to Dye Management, Appendix G shows the potential surplus mitigation that EEP will have generated by the end of June 2013 (end of Year 10 in the MOA) as it will have met the current expected NCDOT impact needs through Year 10. EEP will have more than instituted sufficient mitigation by the end of Year 10 (June 2013) for basins with positive numbers in the 'potential surplus' column for that mitigation type. This means that EEP will more than meet NCDOT's mitigation projections for permitting needs for that mitigation type. However, EEP must also provide for NCDOT permitting needs for Year 11 (July 2013 to June 2014), Year 12 (July 2014 to June 2015), Year 13 (July 2015 to June 2016), Year 14 (July 2016 to July 2017) and Year 15 (July 2017 to June 2018) by Year 10 (ending June 30, 2013). At the time EEP provided this information to Dye Management, the wetland and stream impacts for permitting needs for Years 11, 12, 13, 14 and 15 had not been identified, and the Year 10 data was limited. Therefore, the mitigation may not in fact be "surplus."

Exhibit G-1: 'Surplus' by une 30, 2010 (Year 7)

As of February 2007 data EEP provided to Dye Management, EEP will have more than instituted sufficient mitigation at Year 10 (ending June 30, 2013) for basins with positive numbers in "potential surplus" column for that mitigation type to meet NCDOT's mitigation projections for permitting needs for that mitigation type. However, EEP must also provide for NCDOT permitting needs for Years 11, 12, 13, 14 and 15 by Year 10 (ending June 30, 2013). At the time EEP sent this spreadsheet to EEP, the wetland and stream impacts for permitting needs for Years 11, 12, 13, 14 and 15 have not been identified, and the Year 10 data is limited. Therefore, the mitigation may not in fact be "surplus"

MINUTES
ENVIRONMENTAL REVIEW COMMISSION
October 31, 2007

The Environmental Review Commission met Wednesday, October 31, 2007 at 9:30 a.m. in Room 544 of the Legislative Office Building. Co-Chairperson Charlie Albertson presided.

Members present were Co-Chairperson Albertson, Co-Chairperson Lucy Allen, Co-Co-Chairperson Pryor Gibson, Senator Stan Bingham, Senator Katie Dorsett, Senator James Forrester, Representative Pricey Harrison, Senator Eleanor Kinnaird, Representative Ruth Samuelson, Senator A.B. Swindell, Representative Edith Warren and Senator David Weinstein. Staff present were Commission Counsel George Givens, Assistant Counsel Jeffery Hudson, Assistant Counsel Jennifer McGinnis, Commission Analyst Jennifer Mundt, Research Assistant Mariah Matheson and Commission Clerk Jessica Kozma Bennett.

A meeting notice was distributed to staff, members and outside parties via regular mail and electronically and is included as an attachment in these minutes as **Exhibit A**. A reminder was sent electronically on October 29. The meeting agenda and visitor's registration sheets are attachments to these minutes and referred as **Exhibit B** and **Exhibit C**.

Co-Chairperson Albertson called the meeting to order at 9:35 a.m. and welcomed members after dealing with technical issues with the microphones. Senator Albertson then called on Commission Counsel Givens to introduce members to the staff, give the history and review current agenda of the Commission. After giving an introduction of staff and Commission history, Mr. Givens welcomed new members to the Commission, Reps. Samuelson and Womble and explained "read only" items passed to members.

Mr. Givens said the meeting would focus primarily on drought issues and added that the Commission is tasked with studying the following two issues related to solid waste: the franchising of solid waste facilities and the transportation of solid was by barges. The Commission has previously worked with both issues. Mr. Givens stated that a consultant may be retained by the Commission through the University of North Carolina at Chapel Hill's School of Government, and suggested to the Commission that Commission staff be allowed to have scoping sessions in order to develop a contract to study water resources allocation. After announcing November 27 as the date of the next meeting, Mr. Givens asked for visitors to sign in and for Commission members to fill out their reimbursement forms. Mr. Givens also noted Commission staff held a planning meeting Thursday, October 19.

Mr. Givens walked the Commission through several distributed items, including a packet of "read only" reports and a list of "Studies to be Conducted by the Environmental Review Commission" (**Exhibits D and E**). An interim manual with authorizing

legislation, membership contact information and summaries of ratified environmental and natural resources legislation was also distributed to members **(Exhibit F).**

Co-Chairperson Albertson then called on members for comments. Co-Chairperson Allen said the meeting planning was excellent and that she had received good comments on the planning of the meeting. Co-Chairperson Gibson said he suspected some issues would exceed allotted times and that water issues needed to be addressed with "realistic solutions."

Dr. David Moreau, Chairman of the Environment Management Commission, was recognized by the Co-Chairperson to report on the commission's activities from January to October of this year. Three reports were distributed to members, and are **Exhibits G, H and I** in the attachments (reports are from May, July and October of this year). Also distributed was a "Stormwater Management Program Annual Report" (**Exhibit J**).

An outline of Dr. Moreau's presentation is also included in the attachment and is marked **Exhibit K.**

Senator Weinstein asked Dr. Moreau what plans were adopted in the event that the current drought continues or worsens. Dr. Moreau said there was "adequate" authority to address issues and noted that although restricting outdoor use of water may bring a 25 percent reduction in consumption, there still is no way to control water usage in individual homes. Senator Weinstein followed up and asked what would happen if the lakes completely dried up. Dr. Moreau replied that water managers play a game against nature, and that managers face the current problem of getting timely information of what the actual risks cities are facing. He continued saying that if a municipality has 100 days of water that city is in "good shape." Down below a 60 day supply, he said, is troublesome.

Representative Allen suggested that there needs to be one comprehensive body to work with issues regarding the drought.

Co-Chairperson Albertson then recognized Thomas Reeder of the North Carolina Department of Environment and Natural Resources (NCDENR) to address implementation of stormwater runoff rules and programs. A report distributed to members is in the attachments and is marked as **Exhibit L.** Mr. Reeder told the Commission a recently compiled report given to members was created because stormwater is the number one water quality problem in North Carolina. He stated that coastal counties have had more issues with stormwater control and the existing coastal rules regarding stormwater management have proven to be less effective.

In Mr. Reeder's presentation, members saw two slides of a coastal creek, one taken in 1988 and another taken in 2005. He explained to members that the shellfish beds died out between the dates of the two photographs. Saying that the only environmental stressor in the area was low density residential development, he added that residential development was usually not a tremendous stressor. Concluding his presentation, Mr. Reeder said that 1100 acres of shellfish beds are lost to stormwater runoff, that existing rules are old and outdated, that rules differing between the State's municipalities were inconsistent and that the coastal areas needed better stormwater protections.

Mr. Reeder continued saying that the EMC had implemented a program where the State assists with an individual municipality's stormwater programs. Co-Chairperson Albertson called for questions from Commission members. Representative Allen asked of the relationship between drainage in upper basins and pollution problems. Mr. Reeder

replied that there was not a connection. Co-Chairperson Albertson said that there was not enough battle when changing rules on the coast. Mr. Givens suggested there may be a way to work on the problem during the next long session.

Co-Chairperson Albertson recognized Mr. Jim D. Simons, State geologist and Director of Land Resources for DENR to discuss the report on the Implementation of the Sedimentation Pollution Control Act of 1973. Mr. Simons opened his presentation (see **Exhibit M** in the attachments) noting that progress had occurred this year and that there were revised guidelines for erosion controls. These guidelines are online, he continued, and measures are "showing up in the field." He continued saying that four new county programs were implemented over the last year in Caldwell, Iredell, Lincoln, and Henderson counties.

Mr. Simons continued saying that the drought had affected sedimentation programs because the lack of rain has a negative effect on vegetation. Co-Chairperson Albertson asked if there were questions from Commission members. With little discussion, Co-Chairperson Albertson thanked Mr. Simon and recognized Dr. Ryan Boyles, Associate State Climatologist for the State Climate Office at North Carolina State University. Beginning his presentation (See **Exhibit N** in the attachments), Dr. Boyles explained to the Commission that the State had endured exceptional conditions with both the lack of rain and the extreme heat. In his presentation, Dr. Boyles noted that in April water reservoirs were full and that his presentation would show the evolution of the drought.

Continuing on, Dr. Boyles explained to the Commission that a typical North Carolina summer had weather pressure systems passing from Bermuda through the State. However, this summer the pressure that typically flows across North Carolina instead arrived in Texas, creating massive flooding this summer in many parts Texas. Dr. Boyles noted that weather patterns are difficult to predict unless in a close timeframe and that summer conditions are more difficult to chart than winter patterns.

Regarding winter weather patterns for the state, Dr. Boyles said that the effects of La Nina would make for a winter drier than usual and through next spring below average rainfall is expected.

Points noted during Dr. Boyle's presentation were that rainfall should be expected to be less than normal in the near future, eliminating water deficits would take 30 to 45 inches and that indicators appeared to be drier than normal. He added that problems could about next summer resulting from the current lack of precipitation but the State would see some recovery. Albeit, though, not a full recovery, he said. Co-Chairperson Albertson asked for questions and comments by the Commission. Representative Gibson asked to explain how rainfall is predicted for a season. Dr. Boyles said that precipitation is a 33/33/33 slide and the bell curve of the slide for the next summer is shifted to the dry side. Representative Gibson followed up asking if the jet stream predictions from La Nina would create warmer than usual temperatures. Dr. Boyles said that predictions would lean to the warm side but he did not have the same confidence in this forecast as with the precipitation forecast.

Co-Chairperson Albertson said that better water conservation was needed. Following, Representative Harrison asked Dr. Boyles to explain La Nina, which Dr. Boyles explained that La Nina is cooler than normal sea-surface temperatures in central and eastern tropical Pacific Ocean and impacts global weather patterns.

Mr. Givens asked Dr. Boyles to explain the prediction for a "big" year of hurricanes. Mr. Boyles said he did not "put any weight" in hurricane predictions. Senator Kinnaird commented that many hurricanes were predicted for the Carolina coast but instead veered southward. Senator Albertson thanked Dr. Boyles and recognized Mr. J. Wayne Munden, Head of Technical Services Branch for Public Water Supply Section of NCDENR to explain the State's water shortage tier system.

Mr. Munden opened his presentation and explained that the tier system was implemented in 2002 and measures the drought's effects on water systems. He continued saying that tiers are determined by regional engineers who closely watch water resources.

A document entitled "Description of Tiered Water Supply Systems" was distributed to Commission members and is an attachment to the minutes, marked **Exhibit O.**

Senator Swindell asked what happens to wildlife living close to and rely on water reservoirs. Co-Chairperson Allen asked if Mr. Munden knew how much water was pumped from streams into ponds in North Carolina. Mr. Munden replied that he did not have such information. Representative Harrison told the Commission that a city council member in her district told her that the days of supply heard often it the media did not mean exactly calendar days. Mr. Munden explained that the supply days cited were based on an average day of use, noting that a year ago Raleigh used 70 or 80 million gallons a day, but now, in the wake of water restrictions that use has dropped to 50 to 60 million gallons a day. Hence, the city supply for water may be extended from what it would have been one year ago. He added that the city determines water volume and percentage of remaining water.

Mr. Givens asked if a tier system was devised in North Carolina, which Mr. Munden acknowledged it did. Co-Chairperson Albertson thanked Mr. Munden.

Mr. Franklin Freeman, Governor Mike Easley's Senior Assistant for Governmental Affairs was recognized by Co-Chairperson Albertson to deliver the Governor's report to the Commission. Mr. Freeman began by noting that the drought was worse than a prior significant drought that occurred in the 1950s. The Governor's office, he said, responded to the early drought in Western North Carolina by having regular meetings to monitor its severity. In May, he continued, the Governor's office asked State agencies to conserve water by stopping any non-essential water use. Because of this, State cars were no longer washed and ornamental watering ceased. The drought continued moving east, he said, and by August 23 the State as a whole had gone into drought. As the drought worsened, he said, an agricultural disaster was called by the United States Department of Agriculture.

Mr. Freeman then explained that federal grants may be available for farms and smaller agricultural businesses, but that the grants are dependent on pending legislation in Congress. To date, he continued, there is no grant money to assist farmers covering losses. Mr. Freeman said that if a pending Iraqi funding bill passes, the grant money would also pass. He then revisited the timeline of the Governors' actions regarding the drought, saying that on September 7 the Governor's office sent a letter to all local officials requesting they activate local shortage response plans and implement steps for conservation. He continued that the Governor's office then requested enactment of further restrictions such as banning outdoor watering.

As of last week, Mr. Freeman reported the Governor's office challenged all citizens to cut water usage by 50 percent. If the drought worsens and continues, the Governor's office may move toward a disaster declaration. Consequences of the Governor's actions included raising our emergency response listing to Level 3, DENR creating a list of local systems including their water needs and options, and the creation of a database to track water systems on a daily and weekly basis. Local officials were also called to implement shortage plans, and DENR and local systems are working with the Department of Commerce and each other, Mr. Freeman reported.

Co-Chairperson Albertson called for questions from members. Senator Forrester asked if power plants were major water users, which Mr. Freeman replied they were but that the Governor's office talked with members of the Utility Commission and collaboration between the state and local utilities had successfully helped in conservation efforts.

Senator Bingham asked if the State required water-smart items such as low-flow showerheads in new residential construction. Mr. Freeman said he did not know.

Co-Chairperson Gibson as what, if projections hold true, would the State do to prepare for further drought; he followed asking what the legislature needed to do to prepare for the drought. He then commented that he did not feel confident in assistance from the federal government.

Mr. Freeman replied that educating residents of the State was important, and reiterated that when the drought reaches a point compromising public health or public safety the Governor would declare a disaster. Mr. Freeman continued saying he was hopeful current efforts would encourage cities and counties to ratchet down on customers, adding that the people of North Carolina would never have had an experience like this in memory. Co-Chairperson Gibson asked what consequences would happen to the State's business, especially agribusiness. He then asked that Mr. Freeman "paint a financial picture for our appropriations brothers and sisters."

Mr. Freeman replied that North Carolina was not alone in the drought, and that financial experts were needed to answer questions regarding its financial impact.

Commission Counsel Givens asked if there is legal authority to place mandatory limits on usage and did the State have to wait to have that authority. Mr. Freeman answered that he did think a wait for that authority would be necessary, and that the Governor does not have the power to ration water. However, he humorously added, the Governor does have the authority to close forests and woodlands to hunting during a drought.

Counsel Givens then asked if the Governor's office was working to develop a body of regulation, which Mr. Freeman replied that the office was working with several coordinated groups. He continued saying that there is a need to provide statewide connectivity. Representative Warren said she felt the state was far from achieving that, which Mr. Freeman agreed.

Co-Chairperson Gibson asked if the Governor could declare a disaster from a health and safety standpoint, did that empower him to do some things from an economic standpoint. Mr. Freeman said that any budgetary shortfalls the Governor has the authority to manage and move money to keep the budget balanced. A balanced budget is required by North Carolina statutes.

Mr. Freeman continued saying that the State Budget Office is working to monitor whether revenue was "slipping" on a weekly basis.

Counsel Givens commented that the State could do this until an emergency situation. He added that a judgment call needs to be made before getting to this point.

Senator Dorsett asked if there were any "creative" ways of bringing water into the State. Mr. Freeman responded that he was not aware of any new ways to bring water into North Carolina and that water laws to do so were complicated. Senator Dorsett followed up by questioning why there should not be, questioning also whether the State's Congressional delegation should be approached as well as opening conversations about solving the drought with other states. Mr. Freeman agreed that conversations with other states should ensue.

Senator Bingham readdressed the issue of water-smart items in new construction, adding that there were presently no concerns with new construction. Co-Chairperson Albertson said that he thought this should be a wake up call for each of us with the projected growth of North Carolina.

The presiding chairperson then called on Stephanie G. McGarrah, Assistant Secretary for Policy, Research and Strategic Planning for the State Department of Commerce. Ms. McGarrah was called out of sequence with the agenda due to the meeting moving slightly ahead of schedule.

Ms. McGarrah was called to report on the Status of the Commerce and Economic Task Force and she opened reporting that the task force had contacted 50 large water users across North Carolina. She continued saying that the group is currently in the process of contacting more facilities. Working with these large companies, she added, many companies have begun conservation efforts and have also given their employees additional information to conserve both at work and at home. She then noted that all county economic organizations were working to inform businesses of the drought, and that there were five State agencies working on the task force.

Co-Chairperson Albertson called for questions. Co-Chairperson Gibson asked if there could be one State-offered resource for businesses suffering from the drought, continuing there are more than 200,000 businesses in North Carolina that do not know if they are eligible for assistance. He lastly questioned if there was a database to track such information. Ms. McGarrah said that the Commerce Service Center is able to put people in contact with State agency officials dealing with the drought issue. Going through the center, she continued, puts callers in touch with Commerce, DENR and other agencies.

The meeting was recessed at 12 noon for a 45 minute lunch break.

The meeting reconvened at 12:59 p.m. Co-Chairperson Albertson recognized Department of Agriculture and Consumer Services Commissioner Steve Troxler. Commissioner Troxler began immediately discussing drought's impact on agriculture, noting that there were significant drops in production due to the drought as and a late frost that occurred earlier this year. He told the Commission that tobacco had weathered better than other crops but tobacco was still down 90 pounds per acre yield. Drought and high temperatures were to blame he continued, and poor quality is the result of blistering heat and no water to quell the dryness. The green industry, which includes tree farmers, nurseries, landscaping companies among others, experienced an $8.6 billon impact due to the drought. Revenues among the green industry, he reported, were down 40 percent and

the green labor force was also down 40 percent. Economic consequences of the drought would trickle down through business, he said.

A hand out prepared by the Commissioner's office was distributed to Commission members and is in the attachments as **Exhibit P.**

Another of the Commissioner's concerns from the drought is the impact on life stock growers, noting that meat production had already dropped 45 percent lower than in previous years. He said he feared that some herders would get out of the industry because of the drought. Up to $80 million dollars are lost due to the drought, he said, and currently there is decreased activity at cattle markets.

Commissioner Troxler continued his comments sharing what his Department had accomplished so far in dealing with the drought's consequences. For one, DACS website is now tailored with information for visitors to help deal with the drought, he reported. He continued saying that the Department had received funding from the Golden Leaf Foundation to assist growers with hay and "alternative costs," including transportation. The Commissioner also reported that an Ag Partners Program was formed to also offset costs of bringing hay to North Carolina. He said the Department will do an assessment on how many types of forage moved into North Carolina and that increased demand of hay resulting from drought conditions will affect cattle prices.

Lastly, Commissioner Troxler noted that agriculture in North Carolina had suffered three strikes: drought, record temperatures, and an early year frost. Put together, he said, the impact was just as devastating as a major hurricane.

Co-Chairperson Albertson called for questions from the Commission and Senator Bingham asked whether farmers who have already paid for fertilizers could possibly go bankrupt. Commissioner Troxler answered that it takes six months to a year for disaster money to show up at for a farmer. Farmers, he said, are pushed to manage risk before risky weather happens. He ended his response by stating that farmers unable to get through current conditions could potentially lose their businesses. The Commissioner ended his presentation pointing out that farms were equally as dry of water as municipalities.

Co-Chairperson Albertson recognized Robin W. Smith, Assistant Secretary for Environmental in DENR. Ms. Smith began her report discussing how local governments were responding to the drought, and included policy gaps between government bodies and the overall policy for local governments as well as the State.

A handout distributed to Commission members is in the attachments and is marked **Exhibit Q.**

She explained to the Commission several aspects of how statutes relate to local governments. Local governments are largely responsible to create and enforce drought restrictions, she said, and the State does have a role but only when in an emergency. Before an emergency arises the State serves local governments in an advisory, non-regulatory role. Water plans have to be updated every five years, and those updates have to include current and projected use, where water sources are and how those sources would meet increasing or decreasing demand. DENR, she continued, receives and reviews plans in conflicts such as a situation where two municipalities use the same water source. To clarify: water supply plans are for public water systems and investor-owned utilities with more than 1000 users. When in a drought, local governments make decisions on conservation and there currently is no clear way for the State to enforce

requirements. Also, according to Ms Smith, there is no way for the State to penalize local governments that ignore drought issues or even compel local governments to implement conservation measures.

But, she added, after the 2002 drought, Co-Chairperson Albertson amended statues to include a water shortage response plan in their utilities water plans. Local water plans then are compiled and become the State's water plan. In a drought, individual local governments make decisions about what levels of water conservation are necessary. Also in response to the 2002 drought, the Environmental Management Commission adopted rules for local conservation standards. Those rules are in place in case a local government does not adopt their own rules.

Co-Chairperson Albertson asked if local governments were required to have a plan, which Ms. Smith answered that they were required to have a Water Shortage Response Plan. If they do not have a plan, she said, there is a basic set of rules set by the State for that government to follow. Noting that droughts of different levels affect water systems in different ways, because of those differences local governments can better address their own needs and varying levels of vulnerability. Such vulnerability comes from several conditions beyond water levels, for example, where a municipality may draw their water varies and could yield different conditions.

Ms. Smith continued saying that the current drought concern will continue at least through the spring. She then explained the Drought Management Advisory Council, telling the Commission that the Council keeps up with weekly drought map charts, noting changes from week to week. Weekly meetings began in August. Council stakeholders include the National Weather Service, U. S. Geological Survey and State agencies. Ms. Smith noted that the Council had access to "a lot of expertise." She continued saying that DENR works with water systems with the most significant levels of risk, including Siler City and Rocky Mount, both classified as Tier 1 water systems and are in inter-connection projects to assist their extremely low water reserves. DENR staff works with the water-compromised municipalities to find the quickest and least expensive way to meet water needs. Lastly, Ms. Smith explained that the Council has weekly telephone calls with the Army Corps of Engineers and utility companies to discuss the drought. She closed saying that her Department "was busy but not in a regulatory way."

Reiterating what she and previous speakers said, Ms. Smith said the State had no authority lest the Governor declare an emergency. The Governor, she continued, has tried to increase the frequency of his message, saying that there is a statewide problem and residents of North Carolina as well as local governments need to look out for their neighbors. She said the Governor is offering local governments lots of encouragement in the event the winter fulfills its dry predictions. Cities and counties, she added, have responded positively.

Some consequences of the State and local government relationship, Smith said, have created gaps. Local decisions are driven by local conditions, she said, and that an area not afflicted by the drought may not be as quick to issue restrictions in the wake of a statewide drought. That there are no consistent statewide thresholds between municipalities, counties and regions is another issue. Watering restrictions may not be issued by region, for example, because there is no authority to do so. And this is, she said, even if several municipalities within that region are suffering from drought. Another issue is that because of current statutes, water conservation is limited to being treated as a

drought response and not for ongoing conservation. A component of this issue is the lack of regulation for privately used wells. That few water systems have fee structures encouraging conservation is another issue that could potentially be dealt with, she continued. Lastly, Ms. Smith commented that agricultural water users have to report water usage to the state but only after crossing a one million gallon threshold. Ms. Smith said the threshold was too high. The industrial threshold, she noted, is only 100,000 gallons and with such a high threshold is it difficult to accurately determine how much water is needed for farms.

Co-Chairperson Albertson asked if there were any changes that could be made. Ms. Smith said there is a need to decide what the right relationship is between State and local governments when in a time of drought. She stated that people are surprised that the State doesn't get real time reporting on water levels. Co-Chairperson Albertson asked about people putting in wells, and Ms. Smith said she believed more wells are being drilled in this drought compared to the drought of 2002.

Co-Chairperson Albertson asked whether more wells would continue to be drilled as the drought continued. Ms. Smith replied that she would not be surprised but also noted that several wells had gone dry this year.

Co-Chairperson Albertson recognized Senator Swindell who said that for several years he was a part of the Roanoke River Basin Bi-State Commission and that initially the Commission had several "great" meetings. However, he continued, the Commission was not meeting as before, and Senator Swindell encouraged the Department to contact authorities in Virginia to become active again. Counsel Givens said that the Catawba /Wateree River Basin Advisory Commission was the most active, and that South Carolina authorities asked to participate in the Yadkin/Pee Dee River Basin Advisory Commission. Counsel Givens stated it was difficult to get appointees in place and that in some cases it takes three to four years to get a Commission in place, up, and running. Senator Swindell commented that the Commission began "like a ball of fire" and that the Commission needed to be vigorous about having groups meet regularly. Counsel Givens said that this was an issue the Environmental Review Commission could look at and that legislative appointments were easier to create than non-legislative appointments.

Representative Harrison asked whether private wells should be part of water planning at the State level, and whether there was a lack of statutory authority to do so. Ms. Smith replied that there is a question about managing wells in a regulatory program. Representative Harrison followed up asking if there is any regulation to discourage wildlife extinction due to drought. Ms. Smith answered saying major federal impoundments and hydro-managed systems have mandatory release guarantees to provide a minimum flow for aquatic life. Smaller systems, however, have seen streams and ponds dry up. Representative Harrison asked if this related to only endangered species. Ms. Smith answered that it related to all wildlife concerned.

Representative Harrison followed up again saying she heard that utilities were responsible for 80 percent of water consumption. Counsel Givens commented that regarding a study of an Interbasin Transfer Bill, it would be recommended that allocation of surface waters would include all surface waters that come from groundwater. Authorizing legislation would allow the State to do that, he continued, but there would be property rights issues with private wells on private lots.

Representative Bingham said that in his district recently several poultry farms were formed, and that he heard nearby wells had depleted as a result. Ms. Smith replied that any operation requiring significant water would look at the water source in advance. However, she did say it could happen giving an example of two dry wells in Greensboro whose water was depleted from usage by a nearby golf course.

Representative Gibson asked if anything had happened with a water lawsuit in South Carolina. Ms. Smith replied that the case has been appealed to the South Carolina Supreme Court. The court has asked North Carolina to answer its complaint over a decision by the Environmental Management Commission to allow the Charlotte suburban communities of Concord and Kannapolis an additional 10 million gallons a day from its water source: the Catawba River basin. South Carolina's complaint alleges that North Carolina acted so despite South Carolina's consumption of water from the same water basin. The State's answer to the Supreme Court is requested in a month after the State asked for an extension. Representative Gibson followed up asking how the State can measure new well drilling. Ms. Smith said that a well permitting program was adopted in the 2006 session, but its effective date is not until July 1, 2008. She added that some local governments have their own independent well permitting programs.

Representative Gibson again followed up saying there is "no consistent threshold, no consistent approach, no ability to assess significant risk," and asked whether DENR is asking for additional authority to address these issues. Ms. Smith replied that is an issue that the Legislature needs to review, and whether there is currently enough authority for the State to successfully deal with local governments in a drought that affects safety and public health. Representative Gibson said he realized that we were heading for hundreds of hours of mediation in the future. Lastly, he asked Counsel Givens when the Water Resources Study would be complete, and if there was a timeline of what's coming from the study. Counsel Givens said that he did not have a date but would look into finding a date.

Representative Allen was recognized and said that the sooner staff was authorized to hold scoping meetings the sooner such reports would be underway.

Co-Chairperson Albertson recognized Jeffrey Hughes but before his presentation began Counsel Givens asked to discuss Representative Allen's previous remark. Counsel Givens noted that Representative Allen had recognized that staff needed to have approval to hold scoping sessions. A motion subsequently followed.

Representative Allen moved that the counsel be authorized to receive public comment on the scope and direction of allocation of water resources that the Commission is directed to undertake by Section 1 of S.L. 2007-518. The motion passed unanimously and Mr. Hughes began his report.

A hands-on report entitled "Water Pricing and the Drought" was distributed to members and is included in these minutes as **Exhibit R.**

Mr. Hughes said that local governments have wide latitudes in pricing water and sewer, and that modifying water and sewer rates is much easier than modifying tax rates. Because of this, he continued, local governments can use prices to encourage types of behavior. As revenue drops, he said, many local governments will have to raise water rates. Investor owned utilities are different from governments, whereas such utilities have to receive approval for rate increases from the Utilities Commission.

Mr. Hughes continued saying there were handicaps for local governments. There is a tremendous pressure on utilities, he said, and that the strong leadership the Governor has taken has helped local governments prepare to increase rates. Another obstacle is that infrastructure is highly capital intensive: if usage drops 30 percent, revenue drops 30 percent. However, expenditures remain the same and capital investments suffer. Another obstacle is that stemming from public pressure, many utilities operate a very slim margin. When a public utility is noted in the media for having too much money in the bank public outcry automatically ensues. But this, Mr. Hughes said, is the time for utilities to have a "rainy" day fund. Unfortunately, he said, most do not. Mr. Hughes continued his presentation noting variables in water supply and demand. Some homes particularly in suburban areas can use as many as 15 to 30 thousand gallons of water in one month's time. This consumption can be easily cut to between five and ten thousand, he said.

Mr. Hughes walked the Commission through a map called "Rate Structures and Pricing Signals in North Carolina" **(See Exhibit R).** The map shows consumption compared to price in municipalities across North Carolina. Historically, he said, utilities that give block rates or decreased prices also had higher consumption. He also noted what he considered a misconception: that having low water rates made for successful management of the utility. A water manager "wears water on their sleeve," he said. He continued saying that one would see mixed success no matter what people pay for water.

Local governments in North Carolina take in $1.8 billon a year in water revenues, Mr. Hughes said, continuing that pricing water was not an exact science. Saying that water consumption was not like purchasing a typical grocery item such as iced cream, rather, people are disconnected from understanding their own water consumption as well as the consumption of their respective municipality's water system. Also disconnected from understanding their water usage are those who pay for water through paying rent and those receiving water from wells. People also, he said, will receive their water bill and may not look at the bill again for weeks, until actually paying the bill. Even then, seldom are consumers given enough information to understand their personal consumption on their bill.

Mr. Hughes then presented options for utilities in the future. In the short term, he said, a positive option is to track water usage, which he said typically is not done by public utilities. The town of Cary, he said, has taken the lead in informing its residents of their water consumption. Once a consumer is educated on water usage, responses can be targeted. Consumers have a better chance of cutting discretionary use when educated on how much they are using. He does not, he continued, suggest using a block rate pricing structure. Lower rates, he said, often led to higher consumption and an inability to improve or add infrastructure. Mr. Hughes also suggested to the Commission that public utilities also set up stabilization funds to create and maintain a healthy fund balance. He added that public utilities would likely have to raise rates to offset revenue declines stemming from the drought.

Co-Chairperson Albertson asked Commission members for questions. Senator Swindell commented to the Commission of his concern to treat business fairly. Senator Swindell noted that the largest employer in Rocky Mount is also a large water user. He continued saying that he was also concerned about rate increases and how they would affect the elderly.

Mr. Hughes replied saying that when dealing with large industries there are ways to lower consumption. When working with an industry that uses 100,000 gallons, for example, one way for that company to conserve is cutting discretionary use. One benefit for the utility is that companies typically have a consistent rate of service for that industry, so any water infrastructure is well measured as well as revenues from the company. Because the industry uses a consistent amount of water compared to households, of which water consumption fluctuates because of seasons and other reasons, proportionately serving the household is more expensive than the company for the utility. He noted an industry in Rocky Mount that implemented a conservation program and now has a 25 percent reduction in usage by reusing treated water. Mr. Hughes also said that relief funds could be created to assist those economically unable to pay an increased water bill.

Co-Chairperson Albertson thanked Mr. Hughes and recognized Kimberly S. Hibbard, Associate General Counsel for the North Carolina League of Municipalities. Ms. Hibbard gave a five-minute report and began her report noting that most water systems are city- or county-owned. League representatives are trying to assist municipal officials to make informed decisions and stay in contact with pertinent contacts. In October, she said, League representatives met with agents from DENR as well as representatives from cities with a Tier 1 drought rating. The League is also creating partnerships to appropriately deal with the drought, and have had open discussions about what water supplies are available.

Eighty percent of the State's municipalities are under some kind of water restrictions, Ms. Hibbard said, and overall the League is pleased with consumers' responses. After a recent rain quelled fears among consumers, local governments realized—as the wake of the drought was far from gone—that long-term efforts were necessary. Some municipalities were responding positively to restrictions. In Charlotte, she noted, water consumption is down 25 percent.

Ms. Hibbard continued saying that towns with adequate water supply are still under restrictions because they may be called on to supply other areas. She noted that Burlington has placed restrictions and that Wilson is helping Rocky Mount supplement its water supply.

Co-Chairperson Albertson thanked Ms. Hibbard and recognized Mr. Paul Meyer, Assistant General Counsel for the North Carolina Association of County Commissioners. Mr. Meyer began noting that counties were also in the water business like municipalities, but held no where near as many public utilities as municipalities. Half the counties in North Carolina have placed water restrictions, he continued, with mandatory restrictions in the west and central North Carolina and volunteer restrictions in the less embattled east. County planners are preparing for worst-case scenarios and are looking for new water sources, Mr. Meyer said. He followed saying it was difficult to enforce restrictions as there is now no way to stop what people consume inside their homes.

Commenting on wells, Mr. Meyer said that counties are unable to regulate, and that under current statutes there is no authority over or restrictions against drilling new wells. Co-Chairperson Albertson thanked Mr. Meyer and then recognized Mr. Gary Hunt, Director of the Division of Pollution Prevention and Environmental Assistance with DENR.

Mr. Hunt began his report saying he wanted to end the day's meeting on an "up" note discussing positive conservation efforts. Citing his prior experience with the 2002 drought, Mr. Hunt began explaining the 2002 Hydro- Alluvial Cycle, where many conservation efforts successfully led to lower water usage among businesses during and after the drought. He then explained a photograph of workers in a Spaghettio production plant racing Spaghettios across a floor powered by the pressure of two-inch hoses to show reckless waste of water. He continued saying that his Division works with larger businesses to show how water use can be reduced through water audits and working cooperatively between the Division and the business.

A handout was distributed for this report and is contained in the attachments as **Exhibit S.**

Mr. Hunt continued saying that business can set up better maintenance procedures for immediate reductions in water usage, including checking for leaky plumbing, reminding workers to shut down unused pipes, hoses, etc., and noted that in working with some companies he had found some water lines running all day—everyday—despite that the company was not using the water continuously. He then noted companies are taking a larger interest in reused water, and that some companies are working with other companies to take the waste of one for reuse at another. There are issues with piping, he said, but ended his comment saying he felt it would work.

A Stewardship Initiative among high-water using companies has successfully grown since its onset, and more than 100 companies now participated with a savings of 1 billon gallons so far. Mr. Hunt then said that companies realize conserving water reduces costs but also has less impact on the environment.

Mr. Hunt's Division is also having meetings across the State, he continued, and is working with the Commerce Department to help the State's largest water users to conserve. Hits to his website have increased tremendously, he said, and Water Conservation Teams are in place and offering training with companies.

Lastly he noted that a Water Reduction Partner Program had expanded to 37 counties, and as an example said that Bumcombe County had in place a conservation measure where if a company does not employ conservation measures they pay a higher rate for water. Through the program more than 200 audits were completed for companies with a total savings of 219 gallons. The program is expanding, and the Triangle J Council of Governments had recently started participating in the program.

Co-Chairperson Albertson than recognized Ms. Erica Peterson, Executive Vice President and Chief Executive Officer of the North Carolina AgriBusiness Council, Inc. Ms. Peterson began her report thanking the Commission for the "lengthy discussion" and saying that the drought was a critical issue for agribusiness. She then said that agriculture is the State's largest business with $68 billon in revenue and employing 20 percent of the State's workers.

Ms. Peterson continued that she would focus her discussion on the consumer product side, and said that many agribusinesses are required to use a certain amount of water, creating water waste. She said that was the reverse of what she had heard in the day's discussion, and said she understood that many standards for water usage had to do with consumer safety and sanitation. But many of the rules were written years ago, she continued, and perhaps needed looking at again.

Citing a different example, Ms. Peterson said she knew of a company that was told by their water-providing municipality that the company had to successfully employ a 25 percent water reduction. The company did, and the municipality then ordered a 50 percent reduction. The company then had to haul 70 truckloads of water in a day to meet its production demands as well as those demands placed on it by the municipality, and release the water into the local reservoir only to have to draw the water back into the plant. This forced the company to pay for hauling the water in and then pay the municipality for consumption of water not produced by the municipality. She concluded her report noting that drought issues now needed to be looked at from a "regional perspective" and that the State will have continued water problems as its population grows.

Co-Chairperson Albertson called for questions and hearing none recognized Ms. Louise R. Hodges, President of the Green Industry Council. A document produced by the Green Industry Council was passed to Commission members and is marked as **Exhibit T** in the attachments.

Before Ms. Hodges began her report Commission Counsel Givens told the Commission that 10 to 12 other groups were invited to give comments and some had submitted written statements. Those statements, he continued, are distributed and are now part of the public record for the meeting. **(See Exhibits U, V, W)**

Ms. Hodges began her report defining the industry, saying the green industry included nursery, landscaping, lawn maintenance, arborists, Christmas tree and golf course businesses and has a yearly State revenue of $8.6 billon and roughly 151,000 employees. But the drought, she continued, had taken its toll: creating a 40 percent loss in revenue and a 30 percent layoff in employees. She said that the industry was a steward of conservation, and that the industry was very much in support of year-round water conservations. Anecdotally she added over-watering was common and in her experience replacing 95 percent of sod her business replaced was overly watered.

She continued saying she hoped for collaboration with the State for educational and certification programs. She also said that she had spoken with a water official in Greensboro who said that handheld shrubbery watering only accounted for two percent of that municipalities' water consumption.

She closed her report and Co-Chairperson Albertson asked of questions. Representative Harrison thanked staff for a "great" agenda. Co-Chairperson Albertson then adjourned the meeting at 2:40 p.m.

Notice of Planning Meeting
Schedule of Future Meetings
Meetings of Interested Parties (605 Working Groups)
Additional Information

COMMISSION MEETING:

The Environmental Review Commission (Commission) will meet at 9:30 a.m. Wednesday October 31 2007 in Room 544 of the Legislative Office Building in Raleigh.

At this meeting, the Commission will begin or continue studies for which the Commission is responsible, hear reports from State agencies, discuss topics to be considered at future meetings, and attend to other matters. Listed below are potential agenda topics for this meeting and for future meetings. More specific information regarding the agenda for the 31 October meeting of the Commission will be developed at the staff planning meeting discussed below. Commission Staff may publish a revised notice/draft agenda following the staff planning meeting if circumstances permit.

STUDIES

1) Issues related to the franchise of solid waste management facilities by units of local government. (S.L. 2007-550, Sec. 18)

2) Issues related to the transportation of solid waste by rail or barge, including the extent to which regulation of the transportation of solid waste by rail or barge may be preempted by federal law. (S.L. 2007-550, Sec. 18)

3) Issues related to the use of pervious surfaces for vehicle parking areas, including associated costs, impact to the environment of stormwater runoff, and practices of other states with regard to stormwater best management practices. (S.L. 2007-323, Sec. 6.22.(b))

4) Allocation of surface water resources and their availability and maintenance in the State, including issues related to the transfer of water from one river basin to another, the withdrawal of water for consumptive use, and the accuracy and tolerance of equipment used to measure the flow of water transferred from one river basin to another river basin. (S.L. 2007-518, Sec. 1.(a))

5) Preparation of a revised map entitled "Major River Basins and Sub-basins in North Carolina" as a recommended replacement for the map referenced in G.S. 143-215.22G. The revised map shall define the extent to which any river basin that encompasses any river that flows from another state into North Carolina or that flows from North Carolina into another state extends into an adjacent state. (S.L. 2007-518, Sec. 1.(b))

REPORTS *(Report due dates are indicated in parentheses)*

General/Miscellaneous:

6) Quarterly report on the activities of the Environmental Management Commission (G.S. 143B-282(b)) *(15 April, 15 July, and 15 October)*

7) Report by the Community Conservation Assistance Program Advisory Committee on the findings of its program review (S.L. 2006-78, Sec. 5) *(31 March 2007)*

8) Annual report on the One-Stop Permit Assistance Program on the number of environmental permits that took more than 90 days to issue or deny, types of permits, reasons for extended processing time, and how the time used to issue or deny the permits compared with projected time provided to the applicant by DENR *(1 October)*

9) Annual report on the findings and recommendations on the success of the express permit and certification review program (G.S. 143B-279.13(c)) *(1 March)*

10) Interim Report on the findings and recommendations of the Legislative Commission on Global Climate Change (S.L. 2006-79) *(15 January 2007)*

11) Annual report on litter enforcement, prevention, and removal efforts (G.S. 147-12(b)) *(1 March)*

Air Quality:

12) Final report on the costs and benefits of reducing emissions of NOx, particulate matter, and greenhouse gases from motor vehicles in the State and consideration of standards adopted in other states. (S.L. 2006-248, Sec. 43) *(1 April 2007)*

13) Annual report on implementation of S.L. 2002-4 (Clean Smokestacks Act) (S.L. 2002-4, Sec. 14) *(1 June)*

14) Annual report on the desirability of requiring and the feasibility of obtaining reductions in emissions of NOx and SO_2 beyond those required by the Clean Smokestacks Act (S.L. 2002-4, Sec. 11) *(1 September)*

15) Annual report on development and implementation of a plan to reduce vehicle miles traveled by State employees and vehicle emissions resulting from job-related travel, including commuting to and from work (G.S. 143-215.107C(d)) *(1 October)*

16) Annual report on development and implementation of a plan to reduce vehicle miles traveled by private sector employees and vehicle emissions resulting from job-related travel, including commuting to and from work (G.S. 143-215.107C(e)) *(1 October)*

Coastal Management:

17) Annual report on the progress in developing and implementing the Coastal Habitat Protection Plans and reports on the completion or substantial revision of each draft Coastal Habitat Protection Plan (G.S. 143B-279.8(e) and G.S. 143B-279.8(f)) *(1 September)*

18) Annual report by the Coastal Resources Commission evaluating the impacts on water quality and other environmental impacts from new urban waterfront area development (S.L. 2004-117, Sec. 4) *(1 October)*

Hazardous Waste Management:

19) Annual report on the Inactive Hazardous Sites Program (G.S. 130A-310.10) *(1 October)*

20) Annual report on implementation of the Resident Inspectors Program at commercial hazardous waste facilities (G.S. 130A-295.02(m)) *(1 October)*

21) Report of Superfund cost share fund expenditures for cleanup of sites on the National Priorities List (S.L. 1999-237(15.6)(b)) *(Floating, within 30 days of expenditure)*

22) Annual report on the North Carolina Hazardous Waste Management Plan (G.S. 130A-294(i)) *(1 October)*

23) Annual report on the Effectiveness of the Brownfields Property Reuse Act (G.S. 130A-310.40) *(1 October)*

Land Resources:

24) Annual report on the cost of implementing the Mining Act of 1971 (G.S. 74-54.1(c)) *(1 September)*

25) Annual report on implementation of the Sedimentation Pollution Control Act of 1973 (G.S. 113A-67) *(1 October)*

Parks and Recreation / Land Conservation:

26) Parks and Recreation Trust Fund Annual Report, Fiscal Year 2006-2007 (G.S. 113-44.15(c)) *(1 October)*

27) North Carolina Natural Heritage Trust Fund Award Report, Fiscal Year 2005-2006 (G.S. 113-77.9(e)) *(Semi-annually, within 30 days of each revision)*

28) Annual report on progress towards attaining the State's goal of protecting one million acres of farmland, open space, and conservation lands (G.S. 113A-241(c)) *(1 October)*

29) Annual report on implementation of the Conservation Easements Program and inventory of all conservation easements held by DENR (G.S. 113A-235(c)) *(1 October)*

30) Annual report on the activities of the North Carolina Agricultural Development and Farmland Preservation Trust Fund and Advisory Committee, the agriculture easements purchased, and agricultural projects funded during the previous year. (S.L. 2007-495, Sec. 23 *(May 1)*

Water Quality:

31) Interim report on the pilot program to streamline the process for the issuance of an improvement permit or an authorization to construct for an on-site subsurface wastewater system in certain counties by authorizing local health departments, authorized agents of DENR, and licensed soil scientists to complete soil and site evaluations in participating counties. (S.L. 2006-136, Sec. 3) *(October 1)*

32) Annual report on permitting and inspecting animal waste management systems/Animal Waste Compliance Report (G.S. 143-215.10M) *(1 October)*

33) Semiannual report on the pilot program for inspection of animal waste management systems including a comparison of the costs of conducting operations reviews and inspections under the pilot program with the costs of conducting operations and inspections under G.S. 143-215.10D and G.S. 143-215.10F *(15 October)*

34) Annual report on the compliance/enforcement of water quality laws for facilities that discharge into surface waters (G.S. 143-215.9A) *(1 October)*

35) Annual report on the Wastewater Discharge Elimination Program (S.L. 2001-452, Sec. 2.9) *(15 October)*

36) Annual report on Basinwide Water Quality Management Plans (G.S. 143-215.8B) *(1 October)*

37) Annual report on the Dry-Cleaning Solvent Cleanup Program (G.S. 143-215.104U) *(1 October)*

38) Annual report on the status of leaking petroleum underground storage tanks, the State cleanup funds, and the Groundwater Protection Loan Fund (G.S. 143-215.94M) *(1 September)*

39) Annual report by the Roanoke River Basin Bi-State Commission (G.S. 77-98) *(1 October)*

40) Annual report by the Yadkin-Pee Dee River Basin Advisory Commission (G.S. 77-117) *(1 October)*

41) Annual report on the implementation of stormwater rules and programs (G.S. 143-214.7(e)) *(1 October)*

42) Annual report by the Catawba/Wateree River Basin Advisory Commission and the Yadkin/Pee Dee River Basin Advisory Commission (G.S. 77-117) *(1 October)*

43) Annual report on the Environmental Management Commission's progress in developing and implementing nutrient management strategies for certain water supply reservoirs. (S.L. 2005-190, Sec. 4)

Water Quantity:

44) Annual report on the progress of water supply planning (G.S. 143-355(n)) *(1 September)*

45) Annual report by the Drought Management Advisory Council, including a review of drought advisories issued by the Council and any recommendations to improve coordination among local, State, and federal agencies; public water systems; and water users to improve the management and mitigation of the harmful effects of drought (G.S. 143-355.1(g)) *(1 October)*

PLANNING MEETING:

To facilitate development of the agenda for the 31 October meeting of the Commission, to begin planning for subsequent meetings of the Commission, and to receive input from interested persons regarding the work of the Commission, the Commission Counsel will hold an informal planning meeting at **10:00 a.m. on Thursday 18 October 2007 in Room 605 of the Legislative Office Building**. Persons who wish to participate in the development of the agenda for meetings of the Commission, or who are interested in any matter before the Commission, are invited to attend.

SCHEDULE OF FUTURE MEETINGS:

Below is a schedule of meetings of the Environmental Review Commission for October 2007 through May 2008. **This schedule is tentative and subject to adjustment.** For planning purposes, however, please reserve these dates. This schedule may be modified to allow for out-of-town business meetings or site visits and in the event that it becomes necessary to cancel a scheduled meeting due to hazardous weather conditions.

Please note the following:

1. Meetings of the Commission normally begin at 9:30 a.m., include a lunch break, and run until mid-afternoon. Please plan on meeting from 9:30 a.m. until at least 3:30 p.m. Meetings of the Commission are open to the public.

2. Staff planning meetings normally begin at 10:00 a.m. and adjourn by noon. Staff planning meetings are informal and are open to the public. Commission members are not expected to attend these meetings.

3. The 2008 Regular Session is scheduled to begin at 12:00 noon on Tuesday 13 May 2008. The Commission may meet shortly after the beginning of the session to complete ongoing work and to consider any legislative proposals and recommendations and may meet at other times during the legislative session.

Commission Meeting	Location	Staff Planning Meeting	Location
Wednesday 31 October 2007	544 LOB	Thursday 18 October 2007	605 LOB
Tuesday 27 November 2007	544 LOB	Thursday 15 November 2007	605 LOB
Wednesday 19 December 2007	544 LOB	Wednesday 5 December 2007	605 LOB
Wednesday 23 January 2008	544 LOB	Friday 11 January 2008	605 LOB
Thursday 14 February 2008	544 LOB	Tuesday 5 February 2008	605 LOB
Tuesday 18 March 2008	544 LOB	Friday 7 March 2008	605 LOB
Thursday 10 April 2008	544 LOB	Friday 28 March 2008	605 LOB
Friday 9 May 2008	544 LOB	Tuesday 29 April 2008	605 LOB
Wednesday 14 May 2008	544 LOB		

MEETINGS OF INTERESTED PARTIES (605 WORKING GROUPS):

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

Underground Storage Tank Working Group
10:00 a.m. Friday 12 October 2007 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

If you have questions related to the Commission, please feel free to contact the Commission Counsel or other Commission staff at (919) 733-2578.

AGENDA

9:30 a.m. Wednesday 31 October 2007
Room 544 Legislative Office Building
Raleigh, North Carolina

1. Call to order
   Senator Charles W. Albertson, Presiding

2. Introductory remarks by Cochairs. *(5 minutes)*
   Senator Charles W. Albertson
   Senator Daniel G. Clodfelter
   Representative Lucy T. Allen
   Representative Pryor A. Gibson

3. Report to the Commission and explanation of agenda items. *(20 minutes)*
   George F. Givens, Commission Counsel

4. Quarterly reports by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress for the period of January 2007 through October 2007 (G.S. 143B-282(b)). *(45 minutes)*
   David H. Moreau, Chairman
   Environmental Management Commission

5. Report by the Department of Environment and Natural Resources (DENR) regarding the implementation of stormwater runoff rules and programs (G.S. 143-214.7(e) and 15A NCAC 02H .1005). *(30 minutes)*
   Thomas A. Reeder, Chief
   Wetlands and Stormwater Branch, Surface Water Quality Section,
   Division of Water Quality, DENR

6. Report on the implementation of the Sedimentation Pollution Control Act of 1973 (G.S. 113A-67). (*20 minutes*)
   Jim D. Simons, State Geologist and
   Director, Division of Land Resources, DENR

7. Discussion of issues related to drought.

   a. Current conditions and outlook. *(10 minutes)*
      Ryan P. Boyles, Associate State Climatologist
      State Climate Office, North Carolina State University

   b. Explanation of drought terminology. *(5 minutes)*
      J. Wayne Munden, Head
      Technical Services Branch, Public Water Supply Section,
      Division of Environmental Health, DENR

   c. Report from the Governor. *(15 minutes)*
      Franklin E. Freeman, Senior Assistant for Governmental Affairs
      Office of the Governor

LUNCH BREAK *– Estimated for 12:00 p.m. to 12:45 p.m.*

   d. Report from the Commissioner of Agriculture. *(15 minutes)*
      Steven W. Troxler, Commissioner
      Department of Agriculture and Consumer Services

   e. Status on the Economic Task Force. *(10 minutes)*
      Stephanie G. McGarrah, Assistant Secretary for Policy, Research and Strategic Planning
      Department of Commerce

   f. Discussion of the powers and duties of State government agencies to respond to the drought. *(30 minutes)*
      Robin W. Smith, Assistant Secretary for Environmental Protection
      DENR

   g. Discussion on water rate structures and the drought: rate restructuring, revenue vulnerability, and the impact of water rates on water conservation across the State. *(20 minutes)*
      Jeffrey A. Hughes, Director
      Environmental Finance Center, School of Government, University of North Carolina at Chapel Hill

   h. Update from the North Carolina League of Municipalities. *(10 minutes)*
      Kimberly S. Hibbard, Associate General Counsel
      North Carolina League of Municipalities

   i. Update from the North Carolina Association of County Commissioners. *(10 minutes)*
      Paul A. Meyer, Assistant General Counsel
      North Carolina Association of County Commissioners

j. A discussion of available conservation measures. *(10 minutes)*
Gary E. Hunt, Director
Division of Pollution Prevention and Environmental Assistance, DENR

k. Comments by interested parties. *(Limited to 5 minutes each)*

i. Erica U. Peterson, Executive Vice President and Chief Executive Officer
North Carolina AgriBusiness Council, Inc.

ii. Louise R. Hodges, President
Green Industry Council

8. Commission discussion and announcements

9. Adjourn

SCHEDULE OF FUTURE MEETINGS:

Below is a schedule of meetings of the Commission for November 2007 through May 2008. This schedule is tentative and subject to adjustment.

To facilitate development of the agenda for meetings of the Commission and to receive input from interested persons regarding the future work of the Commission, the Commission Counsel holds informal public planning meetings for staff and interested parties. The schedule of these meetings is also set out below.

Commission Meeting	Location	Staff Planning Meeting	Location
Tuesday 27 November 2007	544 LOB	Thursday 15 November 2007	605 LOB
Wednesday 19 December 2007	544 LOB	Wednesday 5 December 2007	605 LOB
Wednesday 23 January 2008	544 LOB	Friday 11 January 2008	605 LOB
Thursday 14 February 2008	544 LOB	Tuesday 5 February 2008	605 LOB
Tuesday 18 March 2008	544 LOB	Friday 7 March 2008	605 LOB
Thursday 10 April 2008	544 LOB	Friday 28 March 2008	605 LOB
Friday 9 May 2008	544 LOB	Tuesday 29 April 2008	605 LOB
Wednesday 14 May 2008	544 LOB		

MEETINGS OF INTERESTED PARTIES (605 WORKING GROUPS):

The Commission Counsel will hold meetings of interested parties on specific topics as indicated below:

Underground Storage Tank Working Group
10:00 a.m. Friday 9 November 2007 – 605 Legislative Office Building

ADDITIONAL INFORMATION:

Persons having questions about the Commission meeting or other matters related to the Commission may contact Commission Counsel or other Commission staff at (919) 733-2578 or may visit the Commission's website at

RE: **Reminder of Commission Meeting**
Schedule of Future Meetings
Meetings of Interested Parties (605 Working Groups)
Additional Information

COMMISSION MEETING:

You are reminded that the Environmental Review Commission (Commission) will meet at 9:30 a.m. Wednesday October 31 2007 in Room 544 of the Legislative Office Building in Raleigh. Due to the anticipated length of this meeting, we have scheduled a 45 minute lunch break.

The agenda for this meeting will consist of:

1) The report of the Commission Counsel, including consideration of studies for which the Commission is responsible and other matters. *(20 minutes)*

2) Quarterly reports by the Environmental Management Commission (EMC) as to its operations, activities, programs, and progress for the period of January 2007 through October 2007 (G.S. 143B-282(b)). *(45 minutes)*

3) Report by the Department of Environment and Natural Resources (DENR) regarding the implementation of stormwater runoff rules and programs, including a report on the amendment of the Coastal Stormwater Rule (G.S. 143-214.7(e) and 15A NCAC 02H.1005). *(30 minutes)*

4) Report on the implementation of the Sedimentation Pollution Control Act of 1973 (G.S. 113A-67). (*20 minutes*)

5) Discussion of issues related to drought. *(Approximately 2 hours and 30 minutes)*

a. Current conditions and outlook.

b. Explanation of drought terminology.

c. Report from the Governor.

d. Report from the Commissioner of Agriculture.

e. Status on the Economic Task Force.

f. Discussion of the powers and duties of State government agencies to respond to the drought.

g. Discussion on water rate restructuring.

h. Update from the North Carolina League of Municipalities.

i. Update from the North Carolina Association of County Commissioners.

j. A discussion of available conservation measures.

SCHEDULE OF FUTURE MEETINGS:

MEMORANDUM

To: Members of the Environmental Review Commission
From: Jennifer Mundt, Commission Analyst
Re: Reports to the Commission

The following reports have been submitted by the Department of Environment and Natural Resources (DENR) to the Environmental Review Commission (Commission) since the last reports distribution on 11 June 2007. These reports are designated as a read only and are attached to this memorandum:

1) Report by the Community Conservation Assistance Program Advisory Committee on the findings of its program review. 31 March 2007. Authority: S.L. 2006-78, Sec. 5.

2) Final report on the costs and benefits of reducing emissions of NOx, particulate matter, and greenhouse gases from motor vehicles in the State and consideration of standards adopted in other states. 1 April 2007. Authority: S.L. 2006-248, Sec. 43.

3) Annual report on the cost of implementing the Mining Act of 1971. 1 September 2007. Statutory Authority: G.S. 74-54.1(c).

4) Annual report by the Department of Transportation on the development and implementation of a plan to reduce vehicle miles traveled by State employees and private sector employees and related vehicle emissions resulting from job-related travel, including commuting to and from work. 1 October 2006. Statutory Authority: G.S. 143.215.107C(d) and G.S. 143.215.107C(e).

The following reports have been submitted by the Environmental Management Commission (EMC) to the Commission and will be distributed in connection with today's ***Agenda Item #4:***

1) Quarterly report by the EMC as to its operations, activities, programs, and progress during the previous quarter. 15 April 2007. Statutory Authority: G.S. 143B-282(b).

2) Quarterly report by the EMC as to its operations, activities, programs, and progress during the previous quarter. 15 July 2007. Statutory Authority: G.S. 143B-282(b).

3) Quarterly report by the EMC as to its operations, activities, programs, and progress during the previous quarter. 15 October 2007. Statutory Authority: G.S. 143B-282(b).

The following reports have been submitted by the Department of Environment and Natural Resources to the Commission and will be distributed in connection with today's agenda as follows:

1) Annual report on the implementation of stormwater rules and programs. 1 October 2007. Statutory Authority: G.S. 143-214.7(e). ***Agenda Item #5***

2) Annual report on implementation of the Sedimentation Pollution Control Act of 1973. 1 October 2007. Statutory Authority: G.S. 113A-67. ***Agenda Item #6***

3) Annual report on the progress of water supply planning. 1 September 2007. Statutory Authority: G.S. 143-355(n). ***Agenda Item #7***

4) Annual report by the Drought Management Advisory Council, including a review of drought advisories issued by the Council and any recommendations to improve coordination among local, State, and federal agencies; public water systems; and water users to improve the management and mitigation of the harmful effects of drought. 1 October 2007. Statutory Authority: G.S. 143-355.1(g). ***Agenda Item #7***

The following reports have been received since the last reports distribution on 11 June 2007 and are being held for distribution either as read-only or for presentation at a future meeting of the Commission. If you would like a copy of one of these reports in advance of the next meeting, please contact Jennifer Mundt at (919) 733-2578 or jennifermu@ncleg.net for assistance.

1) *Final Report on the Costs and Benefits of Reducing Emissions of Oxides of Nitrogen, Particulate Matter, and Greenhouse Gases from Motor Vehicles in this State.* 1 April 2007. Authority: S.L. 2006-248, Sec. 43.

2) *Annual Report on the Implementation of S.L. 2002-4 (Clean Smokestacks Act).* 1 June 2007. Authority: S.L. 2002-4, Sec. 14.

3) *Annual report on the Parks and Recreation Trust Fund, Fiscal Year 2006-2007.* 1 October. Statutory Authority: G.S. 113-44.15(c).

4) *Semi-Annual Report on the Pilot Program for Inspection of Animal Waste Management Systems.* 15 April 2007. Authority: S.L. 2003-340, Sec. 6.2.

5) *Annual Report and Recommendations on the One-Stop Permit Assistance Program.* 1 October 2006. Statutory Authority: G.S. 143B-279.12.

6) *Annual Report on Litter Enforcement, Prevention, and Removal Efforts.* 1 March 2007. S.L. 2006-79, Sec. 15.

7) *2006 Annual Report NC Million Acre Initiative.* 1 October 2007. Statutory Authority: G.S. 113A-241(c))

Please contact George Givens, Jeff Hudson, Jennifer McGinnis, Jennifer Mundt, or Mariah Matheson at (919) 733-2578 if you have any questions or comments.

Division of Soil and Water Conservation

Michael F. Easley, Governor
William G. Ross Jr., Secretary
Manly S. Wilder, Director

TO: Senator Charles Albertson
Senator Dan Clodfelter
Representative Pryor Gibson
Chairs, Environmental Review Commission

FROM: Manly S. Wilder
Director, Division of Soil and Water Conservation
Chair, Community Conservation Assistance Program Advisory Committee

DATE: Friday, March 30, 2007

RE: Annual Report on Community Conservation Assistance Program

The Community Conservation Assistance Program (CCAP) was established through Session Law 2006-78. The program was authorized, but no funds were appropriated. As required by the legislation, a CCAP Advisory Committee was established to review the program prior to implementation and expenditure of any program funds. The legislation also requires the CCAP Advisory Committee to report the findings of its program review to the Speaker of the House of Representatives, the President Pro Tempore of the Senate, the Chairs of the Appropriations Committees of the Senate and House of Representatives, the Director of the Fiscal Research Division of the Legislative Services Office, and the Environmental Review Commission no later than March 31, 2007.

If you have any questions regarding this report, please contact me at (919) 715-6097.

COMMUNITY CONSERVATION ASSISTANCE PROGRAM
SL 2006-78

Status Report
March 30, 2007

As required by the enacting legislation, the Community Conservation Assistance Program Advisory Committee held meetings on Aug. 22, 2006, Dec. 13, 2006, and Feb. 28, 2007. A fourth meeting of the committee is scheduled for April 11, 2007. In addition, the N.C. Soil and Water Conservation Commission received updates on the program's progress at their bi-monthly meetings.

Under the guidelines of SL 2006-78, the Community Conservation Advisory Committee is comprised as listed below:

- Director of the Division of Soil and Water Conservation shall serve as chair.
- President of the N.C. Association of Soil and Water Conservation Districts or his designee.
- Director of the Cooperative Extension Service at N.C. State University or the director's designee.
- Executive director of the N.C. Association of County Commissioners or the executive director's designee.
- Executive director of the N.C. League of Municipalities or the executive director's designee.
- State conservationist of the Natural Resources Conservation Service, USDA, or the state conservationist's designee.
- Executive director of the N.C. Wildlife Resources Commission or the executive director's designee.
- President of the N.C. Conservation District Employees Association or the president's designee.
- President of the N.C. Association of Resource Conservation and Development Councils or the president's designee.
- Director of the Division of Water Quality or the director's designee.
- Director of the Division of Forest Resources or the director's designee.
- Director of the Division of Land Resources or the director's designee.
- Director of the Division of Coastal Management or the director's designee.
- Director of the Division of Water Resources or the director's designee.
- President of the Carolinas Land Improvement Contractors Association or the president's designee.

The following actions have been taken to implement the Community Conservation Assistance Program:

1. The advisory committee was provided with the need and background for the program by local soil and water conservation districts and the N.C. Association of Soil and Water Conservation Districts.

2. To prepare for project implementation, 14 best management practices, or BMPs, have been developed, reviewed by the N.C. Soil and Water Conservation Commission's technical review committee and approved by the commission. Additional BMPs are being developed for approval.

3. The Division of Soil and Water Conservation is preparing an implementation plan modeled after the N.C. Agriculture Cost Share Program.

4. The Community Conservation Assistance Program Advisory Committee and the N.C. Soil and Water Conservation Commission are preparing preliminary draft rules for review. Ryke Longest, special deputy attorney general and counsel to the commission, is assisting with rule development. It is expected that draft rules for the program will be presented to the N.C. Soil and Water Conservation Commission at their May 16, 2007, meeting.

5. The Division of Soil and Water Conservation is working with N.C. State University and will hold four technical training sessions across the state based on the approved BMPs.

6. Public outreach materials have been developed to help implement the program statewide.

At this time, legislation has been proposed in both the N.C. Senate and House of Representatives to fund the Community Conservation Assistance Program.

It is expected that approval for any rules may take several months to complete. As soon as the advisory committee reviews the draft rules, they will conduct a detailed analysis of how the rules will be implemented. Upon completion, this analysis will be submitted for your review.

NCDENR
North Carolina Department of Environment and Natural Resources
Division of Air Quality

chael F. Easley, Governor

William G. Ross, Jr., Secretary
B. Keith Overcash, P.E., Director

April 5, 2007

MEMORANDUM

TO: Senator Dan Clodfelter, Co-Chair
Representative Pryor Gibson, Co-Chair
Senator Charlie Albertson, Co-Chair

FROM: for Keith Overcash, Division Director

Re: Submittal of final report, "Study of Costs and Benefits of Reducing Emissions of Oxides of Nitrogen, Particulate Matter, and Greenhouse Gases from Motor Vehicles"

Session Law 2006-248 Section 43 requires the Division of Air Quality to study the costs and benefits of reducing emissions of oxides of nitrogen, particulate matter, and greenhouse gases from motor vehicles. The attached final report evaluates the desirability and air quality benefits of adopting motor vehicle emissions standards adopted in other states. If you have specific questions or comments, please contact Mike Abraczinskas at (919) 715-3743.

Study of Costs and Benefits of Reducing Emissions of Oxides of Nitrogen, Particulate Matter, and Greenhouse Gases from Motor Vehicles

Final Report to the Environmental Review Commission and the Legislative Commission on Global Climate Change

April 5, 2007

The Requirement: Excerpted from SESSION LAW 2006-248, HOUSE BILL 1723

PART XLIII. DIVISION OF AIR QUALITY STUDY OF COSTS AND BENEFITS OF REDUCING EMISSIONS OF OXIDES OF NITROGEN, PARTICULATE MATTER, AND GREENHOUSE GASES FROM MOTOR VEHICLES. (S.B, 1006 – Clodfelter)

SECTION 43. The Division of Air Quality of the Department of Environment and Natural Resources shall study the costs and benefits of reducing emissions of oxides of nitrogen, particulate matter, and greenhouse gases from motor vehicles in this State. In particular, the Division shall evaluate the desirability and air quality benefits of adopting motor vehicle emissions standards adopted in other states. The Division of Air Quality shall submit an interim report on its findings and recommendations, including any legislative proposals, no later than January 15, 2007 and shall submit a final report no later than April 1, 2007 to the Environmental Review Commission and the Legislative Commission on Global Climate Change.

Purpose

The objective of this report is to summarize the estimated emissions benefits of adopting the California Low-Emission Vehicle II (CA LEV-II) standard in North Carolina (NC). The emissions benefits analysis includes an examination of nitrogen oxides (NOx), volatile organic carbons (VOCs), fine particles (PM2.5) and carbon dioxide (CO2). Using air quality modeling sensitivities recently conducted by the North Carolina Division of Air Quality (NCDAQ), potential ozone benefits were also estimated. Additional data was collected and analyzed to better understand the costs associated with implementing a CA LEV-II program in North Carolina.

Background

The United States Environmental Protection Agency (USEPA) has adopted national motor vehicle and fuel standards which include the Tier 2 vehicle and gasoline standard (phase-in began in 2004), and the heavy-duty diesel vehicle and fuel standard (phase-in begins in 2006 with the release of the model year 2007 heavy-duty diesel vehicles and low sulfur diesel fuel).

Beyond the federal standards, North Carolina has expanded its Inspection and Maintenance (I/M) program, which covers 48 of the State's 100 counties, to ensure that vehicle emission controls are properly working.

The federal Clean Air Act (CAA) provides the framework for regulating emissions from on-road mobile sources. The CAA set the first federal vehicle emission standards. However, because California already had vehicle emission standards when this occurred, the CAA authorized California (and only California) to continue setting its own vehicle emission standards. Therefore all new vehicles sold in the United States (U.S.) are subject to emission standards set by either the federal government or the State of California. Other states have the option to adopt the California vehicle emission standards in lieu of the federal standards. This authority was granted under Section 177 of the CAA. Section 177 also guarantees the automakers that they will not have to meet more than two regulatory regimes by explicitly prohibiting any requirements that result in a "third vehicle".

Overview of Federal Tier 2 and California LEV-II Programs

Federal Tier 2 vehicle and gasoline standards and the CA LEV-II program were each effective with model year 2004 vehicles. Both regulations set emission standards for light-duty vehicles such as passenger cars, trucks, and sport utility vehicles. Both programs are phased in over several years and become progressively more stringent providing significant emission reductions from evaporative and exhaust motor vehicle activity. The auto manufacturers have flexibility in how they meet the annual fleet average emissions standards. Tier 2 and CA LEV-II programs have the following differences:

- Federal Tier 2 program requires all light-duty fleet averages to meet the NOx standard of 0.07 grams per mile phased-in between years 2004 and 2009. CA LEV-II fleet average standards are based on non-methane organic gases (NMOG), also referred to as hydrocarbons (HC) or VOCs.
- CA LEV-II program requires a portion of the light-duty fleet to be "zero-emission vehicles" (ZEVs) which originally mandated the electric ZEVs. This requirement has been changed to allow partial credit for vehicles with advanced technologies and fall in the categories of Partial ZEVs (PZEVs) or advance technology partial ZEVs (AT-PZEVs).
- The evaporative requirements of the CA LEV-II standard appear to be more stringent than the Tier 2 standard, however the Tier 2 evaporative standard provides for evaporative system durability which USEPA indicates make the Tier 2 evaporative requirements identical to that of the CA LEV-II requirements. Additionally, in February 2006, the USEPA proposed rules that codify the approach that manufacturers are already taking for 50-state evaporative systems. The proposal requires implementation of the "California equivalent" evaporative emission standards in 2009 for lighter vehicles and 2010 for the heavier vehicles.

On-Road Mobile Source Emissions – NOx and VOC

The NCDAQ conducted a technical modeling analysis study in 2006 to begin to understand the emissions benefits of adopting CA LEV-II in North Carolina. The emissions benefits analysis included a comparison of statewide on-road mobile source NOx and VOC emissions resulting from the current federal level of control (Tier 2), and from the CA LEV-II level of control. It should be noted that the emission differences were calculated in context of the entire on-road mobile source emissions inventory. This method for comparison enabled the NCDAQ to apply the knowledge gathered in emissions/air quality modeling studies to assess the air quality (ozone) benefits that might result from the CA LEV-II emissions benefits. The details of the technical modeling study including the approach, methods and data used in estimating the benefits are described in the attached Technical Support Document "*Analysis of the California Low Emission Vehicle II Standards in NC.*" Also attached is the power point presentation given by Brock M. Nicholson, P.E., Deputy Director of the NCDAQ to the Environmental Review Commission (ERC) on May 3, 2006.

As can be seen in Table 1, the statewide NOx and VOC emissions from adopting a CA LEV-II program are lower relative to the Federal Tier 2 level of control. CA LEV-II was assumed to begin in NC in the year 2010 in this analysis. Emissions were estimated for the years 2010, 2020 and 2030. As CA LEV-II vehicles make up a more significant portion of the overall vehicle fleet with time, the CA LEV-II standards show an increasing emissions benefit (i.e., on a percentage basis) over time relative to the Tier 2 level of control.

Table 1. CA LEV-II Reductions Compared to Federal Tier 2: Entire Fleet

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

Figure 1 below presents the North Carolina statewide on-road mobile source NOx emissions inventory with a Tier 2 control program for years 2004, 2010, 2020, and 2030 (blue line), and also with a CA LEV-II control program for years 2010, 2020, and 2030 (magenta line). Figure 2 is a similar graph for VOC emissions. (It should be noted that the NOx and VOC emission estimates with a Tier 2 control program, assume there are no CA LEV-II compliant vehicles in North Carolina already. While NCDAQ does not have any official data, informal surveys have shown there are North Carolinians already driving CA LEV-II compliant vehicles. Therefore, the emission benefits of the CA LEV-II program shown in Table 1 and Figures 1 and 2 are likely over-estimated.)

Also noteworthy, these figures illustrate the significant reductions in on-road mobile emissions, regardless of the control program, expected over time in North Carolina. These reductions will occur despite significant estimated increases in VMT (see Figure 3).

Figure 1. Estimated NOx Emissions – Federal Tier2 vs. CA LEV-II

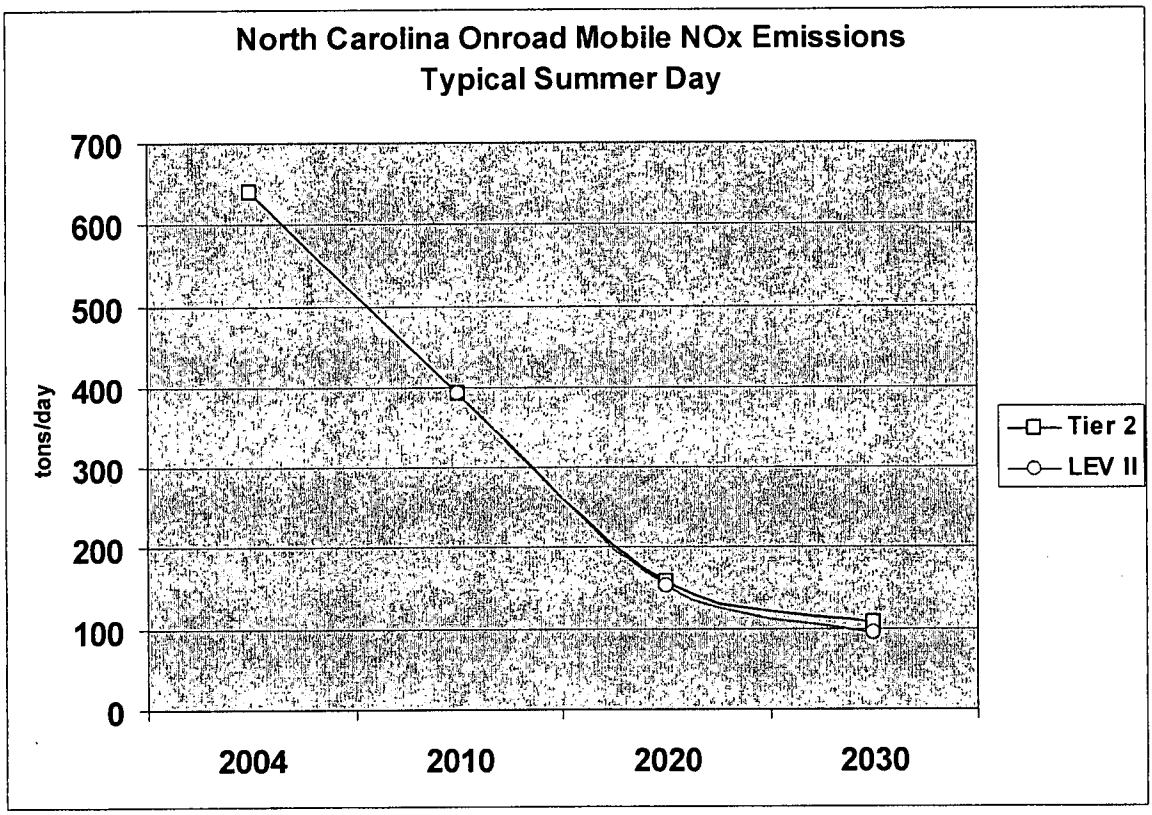

Figure 2. Estimated VOC Emissions – Federal Tier2 vs. CA LEV-II

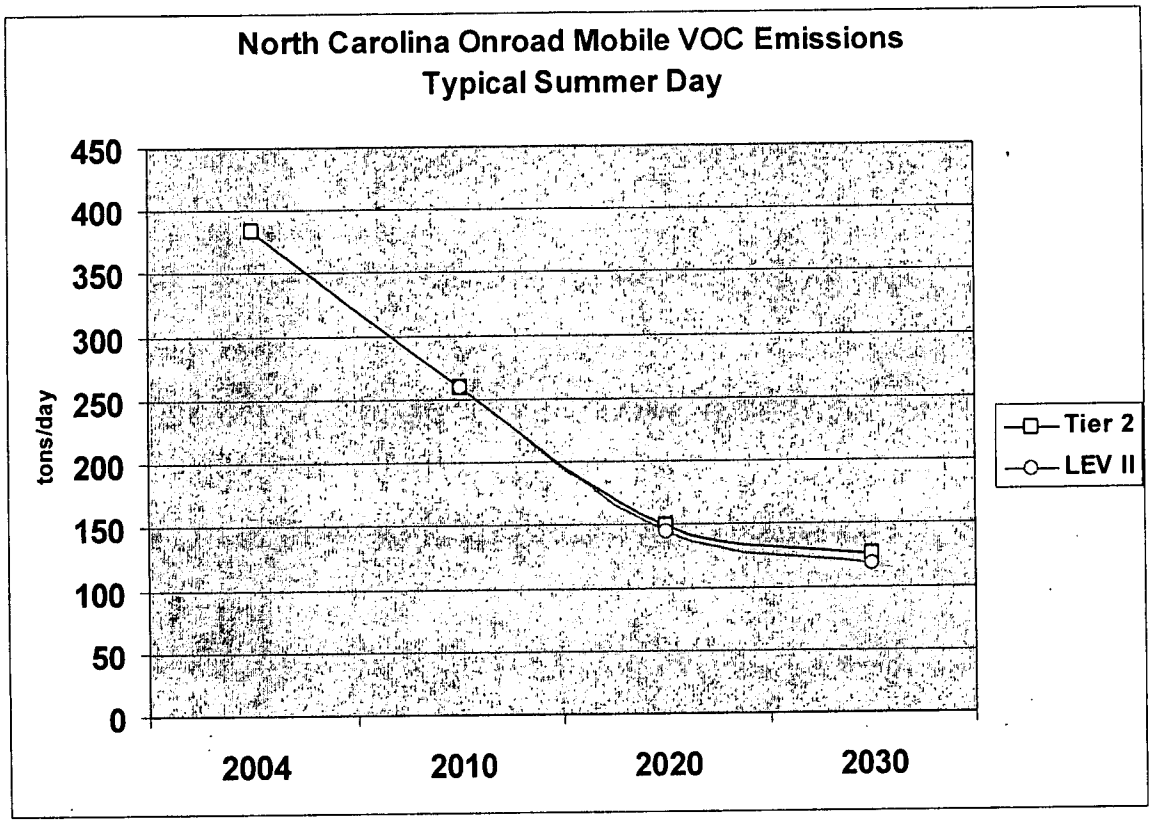

Figure 3. Estimated Vehicle Miles Traveled

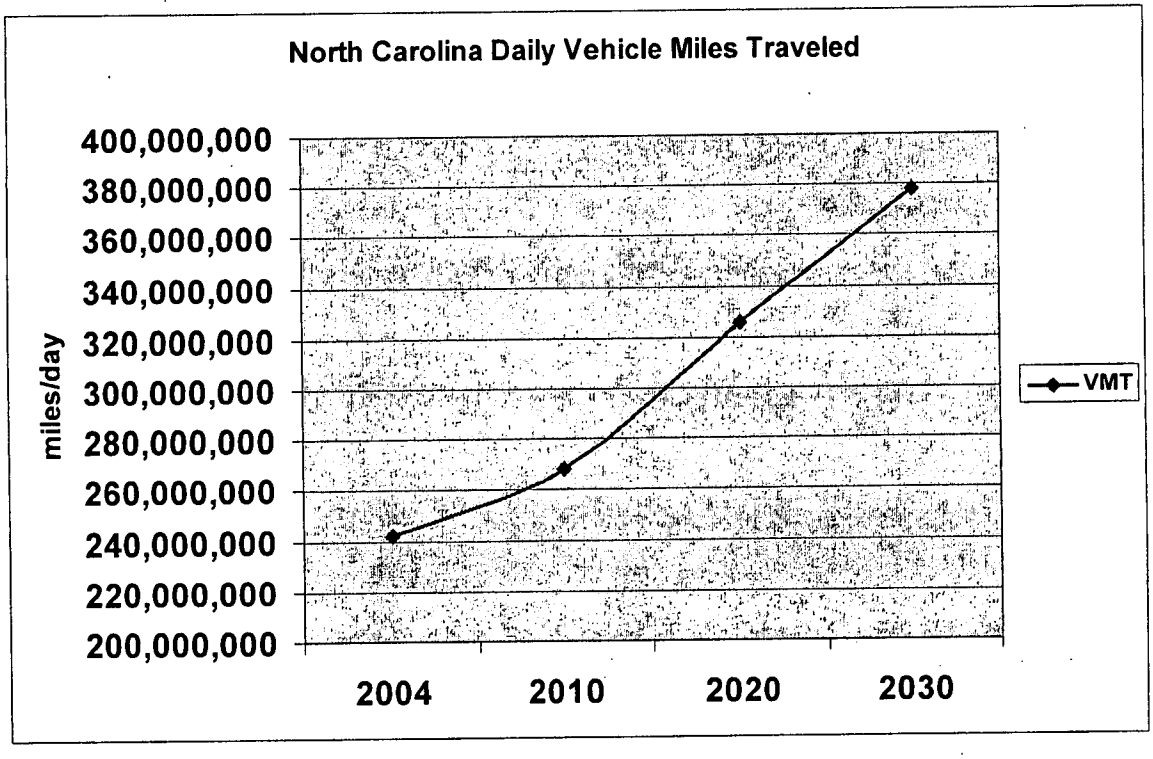

Particulate Matter

Particle pollution (also known as "particulate matter") is a mixture of tiny solids and liquid droplets suspended in air. Airborne particles are the main ingredient in haze, smoke and airborne dust. Particles less than 2.5 micrometers in diameter are called "fine" particles or "PM2.5", and are of special concern because they can penetrate deeply into the lungs.

Potential particulate matter emissions impacts were not specifically evaluated in the NCDAQ modeling study for several reasons. First, based on North Carolina's 2002 PM2.5 emissions inventory, on-road mobile sources only contribute approximately 5% to the total statewide PM2.5 emissions inventory. Secondly, a study of North Carolina's vehicle registration database suggests only 0.3% of the light duty vehicles registered in NC are diesels. This is important because the PM2.5 vehicle standards are for all practical purposes only relevant to diesels, since gas vehicles easily meet the standards. Therefore the most relevant impact of adopting the CA LEV-II program might be on the sales of diesel vehicles themselves. However, major vehicle manufacturers have recently indicated their intention to develop light duty diesel vehicles that meet the CA LEV-II requirements. Overall, the impacts to particulate matter emissions would be negligible if NC adopts the CA LEV-II program.

Greenhouse Gases – Status of Pavely

The Pavley requirements of the CA LEV-II standards are designed specifically to reduce greenhouse gases (GHG) from light duty vehicles. Named after California Assembly woman Fran Pavely, it became California law in 2002, and pending a waiver from USEPA, takes effect in model year 2009. If granted the Pavely waiver from USEPA, all states that have adopted the CA LEV-II standards would automatically be subject to the Pavely component of the standard. If USEPA does not grant the waiver to California, the decision may be challenged in the Federal Court of Appeals in Washington DC.

NCDAQ is aware of several court cases involving the CA LEV-II standards and specifically the Pavely requirements in California, Vermont and Rhode Island. The Pavely requirements must survive the lawsuits and get the waiver from USEPA to be "available" to North Carolina. A decision by the Supreme Court on April 2, 2007 in Massachusetts et. al v. USEPA could have a significant impact on the issuance of such a waiver from USEPA to California. A summary of this Supreme Court decision, provided by the National Association of Clean Air Agencies (NACAA), is included with summaries of the pending cases below.

The Supreme Court issued its opinion in *Massachusetts et al v. USEPA* on April 2, 2007, concluding that USEPA has the authority to regulate greenhouse gases from new vehicles. In a 5-4 decision, the Court determined that USEPA has statutory authority to regulate greenhouse gases from new motor vehicles. Finding at the outset that the state and environmental group appellants had standing to raise the issue, the Court went on to state that "greenhouse gases fit well within the [Clean Air] Act's capacious definition of 'air pollutant.'" The Court noted that "regulating motor-vehicle emissions may not by

itself reverse global warming, [but] it does not follow that the Court lacks jurisdiction to decide whether USEPA has a duty to take steps to slow or reduce it." Moreover, USEPA's argument that it is the Department of Transportation's (DOT's) job to tighten mileage standards was rejected by the Court, which stated that DOT's mandate to promote energy efficiency does not "license USEPA to shirk its duty to protect public 'health' and 'welfare.'" Remanding the case to USEPA to "ground its reasons for action or inaction in the statute," the Court stated that USEPA can avoid promulgating regulations only if it determines that greenhouse gases do not contribute to climate change. So far, the Court stated, the agency had provided only a "laundry list of reasons not to regulate including the existence of voluntary Executive Branch programs." The appellants included: Massachusetts, California, Connecticut, Illinois, Maine, New Jersey, New Mexico, New York, Oregon, Rhode Island, Vermont, Washington, the District of Columbia, American Samoa, New York City, and Baltimore, as well as numerous environmental groups.

In California, auto industry filed a lawsuit under the California Environmental Quality Act (CEQA) challenging the Pavely requirements directly. The plaintiffs challenges are procedural, although should the plaintiff prevail, the rules could be nullified in California, which could undercut the rules in all other states that have adopted them. Recently, the federal district court judge threw out two of the auto industry's five claims against the Pavely regulations. No decisions have been issued on the other three claims.

In Maine, the Alliance of Automobile Manufacturers filed a lawsuit against the Maine Board of Environmental Protection asking that Maine's rules be stayed. The court rejected the claim on two grounds: First, Maine state law does not allow a court to issue a stay in a challenge to a rulemaking proceeding. Second, even if the court could issue a stay, the plaintiff had not demonstrated that it would suffer irreparable injury, because: 1) the rules cannot be implemented until a waiver is issued by USEPA and 2) the rules do not go into effect until 2009 anyway. Later, the case was dismissed without prejudice (meaning they can file again within one year) because they filed under the wrong administrative provisions.

In Vermont, the auto industry filed a lawsuit in federal court in November 2005. Since then, the state moved the court to dismiss the case claiming the case was not ripe. On November 30, 2006 the District Court denied the state's motion to dismiss finding that the "purely legal questions raised in this lawsuit are as well determined now as later" despite the uncertainty as to whether a determination will even be necessary given the pending EPA waiver.

Finally, in Rhode Island, the Association of International Automobile Manufacturers filed suit on February 13, 2006 in federal district court asking the court for a declaratory judgment that the Rhode Island regulations violate federal law and a preliminary injunction enjoining Rhode Island from implementing or enforcing the regulation. They also claimed that because California has not obtained a waiver for Pavely, the Clean Air Act expressly prohibits the Rhode Island from adopting and enforcing the regulations.

On April 6, 2006 the state filed a motion to dismiss claiming the case was not ripe for judicial review. The Court has not ruled on this motion.

Greenhouse Gases – Potential Emissions Benefits

The GHG emissions addressed by Pavely focus mostly on carbon dioxide (CO_2), but also include methane (CH_4), nitrous oxide (N_2O), and hydrofluorocarbon (HFC) 134a reductions as well. The purpose of the Pavely requirement is to "achieve the maximum feasible and cost effective reduction in GHG emissions from motor vehicles." The standard will require that tailpipe GHG emissions from new vehicles be reduced by 22 percent by the 2012 model year and 30 percent by the 2016 model year.

California and other opt-in states expect that automobile manufacturers will apply technological improvements to meet the Pavley requirements. Specific measures identified include discrete variable valve lift, dual cam phasing, turbo charging with engine downsizing, automated manual transmissions and cam-less valve actuation.

Costs of Vehicles

The initial purchase price of a new vehicle could increase if North Carolina adopts California's vehicle emissions standards. However, these advanced vehicles, especially those meeting the Pavely requirement, are likely to be more fuel efficient, producing savings to the consumer in fuel costs. The anticipated costs have been studied by several organizations including California's Air Resources Board (CARB). These cost ranges are summarized below.

The State of Oregon recently estimated that the CA LEV-II program would increase average vehicle cost $115 to $271. These estimates – based on a CARB Staff report (http://www.arb.ca.gov/regact/zev2003/isor.pdf) - were based on the incremental costs of ZEVs, PZEVs and AT-PZEVs in 2012.

The average fleetwide incremental costs associated with the Pavley requirement over the 2009 to 2016 phase-in period, as estimated by CARB, are as high as $1,000 per vehicle as shown in Table 2 below. CARB also found this initial increase in purchase price to be more than offset by reduced operating costs. Using the average increase in vehicle prices associated with the fully phased-in regulation (2016), and an assumed fuel price of $1.74 per gallon, CARB calculated that the increased vehicle payment minus the reduction in operating cost would result in a monthly savings of about $3.50 to $7.00. At today's higher fuel prices, the monthly savings increase.

Table 2. Potential Vehicle Cost Increase due to Pavely

Tier	Year	Average cost of control	
		PC/LDT1 (Passenger cars and small trucks/SUVs)	LDT2 (Large trucks/SUVs)
Near-term	2009	$17	$36
	2010	$58	$85
	2011	$230	$176
	2012	$367	$277
Mid-term	2013	$504	$434
	2014	$609	$581
	2015	$836	$804
	2016	$1,064	$1,029

(from: http://www.arb.ca.gov/regact/grnhsgas/fsor.pdf, pg 11)

California's Pavely emissions standards are required by law to achieve maximum feasible and cost effective GHG emissions reductions without reducing vehicle weight or banning the sale of any vehicle category such as sport utility vehicles or light duty trucks. Therefore, the estimated costs represent the cost of applying additional technology to the kinds of vehicles known today to achieve emission reductions.

During California's rulemaking process, the auto industry commented that the Pavely requirement of CA LEV-II standard would not produce an overall savings to consumers. The industry's position was based on a study by Sierra Research, which concluded that the average per-vehicle cost of technology required to comply with Pavely was $3,000 per vehicle. The report also concluded the lifetime gasoline savings would average about 1,000 gallons. CARB's response to these comments was that Sierra's research rejected promising and cost-effective emerging engine technologies as elements of a GHG regulatory compliance strategy. CARB also noted the industry assumed the use of expensive aluminum body structures and assigned higher estimated costs for vehicle components than CARB thought was appropriate. (see http://www.arb.ca.gov/regact/grnhsgas/fsor.pdf, pg 168)

Conclusions

The CA LEV-II program (assuming statewide implementation in 2010) could provide NOx reductions on the order of 0.1% in 2010, 4% in 2020 and 10% in 2030 and VOC reductions of 0.1% in 2010, 3% in 2020 and 6% in 2030 as compared to the Federal Tier 2 program already in place. It should be noted that in 2030, the estimated 10% on-road mobile NOx reduction is equivalent to only 10 tons/day of NOx reduced statewide. This is because of the overall on-road mobile NOx emissions are significantly lower by that time due primarily to the Federal Tier 2 program. NCDAQ has estimated this additional level of NOx reduction, due to CA LEV-II in these future years, will not significantly impact North Carolina's ability to attain the National Ambient Air Quality Standard for 8-hr ozone. The CA LEV-II program would have an insignificant impact on particulate matter emissions from vehicles. Greenhouse gas emissions from light duty vehicles could be reduced by an estimated 22 percent by the 2012 model year and 30 percent by

the 2016 model year if Pavely survives several lawsuits and if California is granted a waiver from USEPA.

Costs associated with the CA LEV-II program vary depending on how the program is structured. Increased costs from $115 to $271 per vehicle have been estimated for CA LEV-II vehicles. If Pavely becomes part of the program, cost increases could be as high as an additional $1,000 per vehicle. Additionally, NCDAQ has estimated that moderate staffing implications could result from enforcement of CA LEV-II and from the impact to tasks such as transportation conformity, SIP modeling and emission inventories.

On-road mobile source emissions presented herein were generated specifically to analyze the *relative differences* between the Federal Tier 2 and CA LEV-II standards.

Executive Summary

Introduction

The North Carolina Division of Air Quality (NCDAQ) conducted a technical emissions benefit analysis and air quality sensitivity study to evaluate whether reduced emissions from passenger cars and light-duty trucks by adoption of California Low Emission Vehicle II standards (CA LEV-II) would be realized as compared to the current Federal Tier 2 standards program.

The United States Environmental Protection Agency (USEPA) has adopted national motor vehicle and fuel standards which include the Tier 2 vehicle and gasoline standard (phase-in began in 2004), and the heavy-duty diesel vehicle and fuel standard (phase-in begins in 2006 with the release of the model year 2007 heavy-duty diesel vehicles and low sulfur diesel fuel). Beyond the federal standards, North Carolina has expanded its Inspection and Maintenance (I/M) program, which covers 48 of the State's 100 counties, to ensure that vehicle emission controls are properly working.

The federal Clean Air Act (CAA) provides the framework for regulating emissions from on-road mobile sources. The CAA set the first federal vehicle emission standards. However, because California already had vehicle emission standards when this occurred, the CAA authorized California (and only California) to continue setting its own vehicle emission standards. Therefore all new vehicles sold in the United States (U.S.) are subject to emission standards set by either the federal government or the State of California. Other states have the option to adopt the California standards in lieu of the federal standards. This authority was granted under Section 177 of the CAA. Section 177 also guarantees the automakers that they will not have to meet more than two regulatory regimes by explicitly prohibiting any requirements that result in a "third vehicle".

Overview of Federal Tier 2 and California LEV-II Programs

Federal Tier 2 vehicle and gasoline standards and the CA LEV-II program were each effective with model year 2004 vehicles. Both regulations set emission standards for light-duty vehicles such as passenger cars, trucks, and sport utility vehicles, which are programmed to phase in over several years and become progressively more stringent. Both programs provide significant emission reductions from evaporative and exhaust motor vehicle activity. The auto manufacturers have flexibility in how they meet the annual fleet average emissions standards. Tier 2 and CA LEV-II programs have the following differences:

Federal Tier 2 program requires all light-duty fleet averages to meet the Nitrogen Oxides (NOx) standard of 0.07 grams per mile phased-in between years 2004 and 2009. CA LEV-II fleet average standards are based on non-methane organic gases (NMOG), also referred to as hydrocarbons (HC) or volatile organic carbons (VOCs).
CA LEV-II program requires a portion of the light-duty fleet to be "zero-emission vehicles" (ZEVs) which originally mandated the electric ZEVs. This requirement has been changed to allow partial credit for vehicles with advanced technologies and fall in the categories of Partial ZEVs (PZEVs) or advance technology partial ZEVs (AT-PZEVs).

The evaporative requirements of the CA LEV-II standard appear to be lower than the Tier 2 standard, however the Tier 2 evaporative standard provides for evaporative system durability which USEPA indicates make the Tier 2 evaporative requirements identical to that of the CA LEV-II requirements.

Overview of Mobile Source Emissions

On-road mobile source emissions make up a significant portion of the total statewide NOx emissions. For 2002, this sector comprised approximately 45% of the North Carolina NOx inventory. This analysis looked at both NOx and VOCs emissions for all of North Carolina for a typical summer weekday. The impacts on future year ozone concentrations also were estimated. NOx and VOC emissions are both ozone precursor compounds however NOx controls are of particular importance for addressing higher 8 hour ozone levels in North Carolina due to the abundance of VOC from biogenic (natural) sources.

USEPA's MOBILE6.2 emission factor model was used to generate NOx and VOC emission factors for both regulatory scenarios, adoption of CA LEV-II starting in 2009 and the status quo of the federal Tier 2 program. The most current state and region specific data was applied including speeds, fuel parameters, vehicle age distribution and vehicle mix and ambient temperature. Motor vehicle activity - defined as vehicle miles traveled (VMT) - was matched with emission factors resulting in a typical summer day VOC and NOx emissions inventory. After a baseline mobile inventory was developed assuming purely a federal Tier 2 program in effect starting in 2004, future years mobile inventories for 2010, 2020, and 2030 were compared to this baseline inventory. The year 2004 was chosen because it represents the start year of the federal Tier 2 program. Then, the same future year mobile inventories were developed using CA LEV-II assumptions and compared to the existing Tier 2 results. Table ES-1 below shows the percent NOx and VOC emissions reduction expected if CA LEV-II standards were implemented in 2010.

Table ES-1. CA LEV-II Reductions Compared to Federal Tier 2: On-Road Mobile Emissions

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

Between 2004 and 2030 North Carolina will realize significant reductions in the on-road NOx mobile emissions on the order of 83%. This is primarily due to fleet turnover and the ongoing Federal Tier 2 program. It is noteworthy to mention that the reductions in NOx emissions are occurring even as the daily VMT (dVMT) is expected to increase by 57 %. See Figures ES-1 and ES-2 below for the inverse trend in NOx emissions for the onroad mobile sector emissions and how daily VMT is expected to grow in the future.

Figure ES-1. Estimated NOx Emissions – Federal Tier 2 vs. CA LEV-II

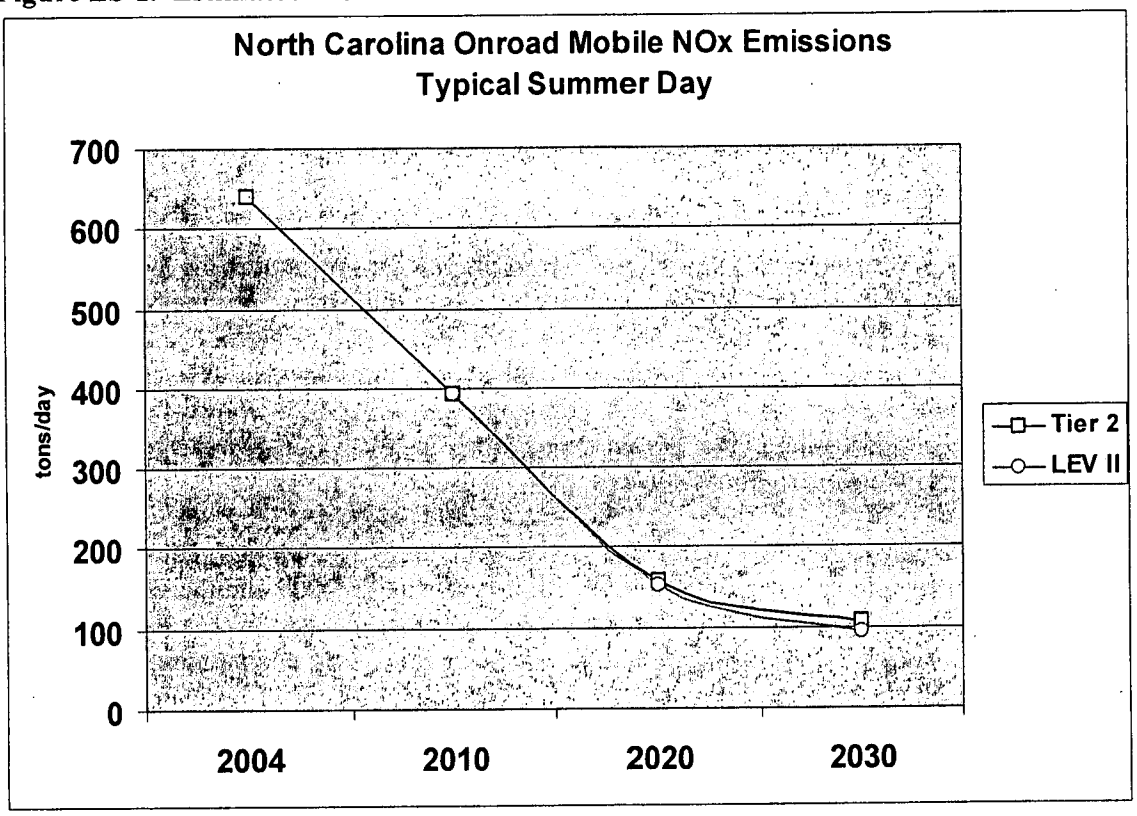

Figure ES-2. Estimated Vehicle Miles Traveled

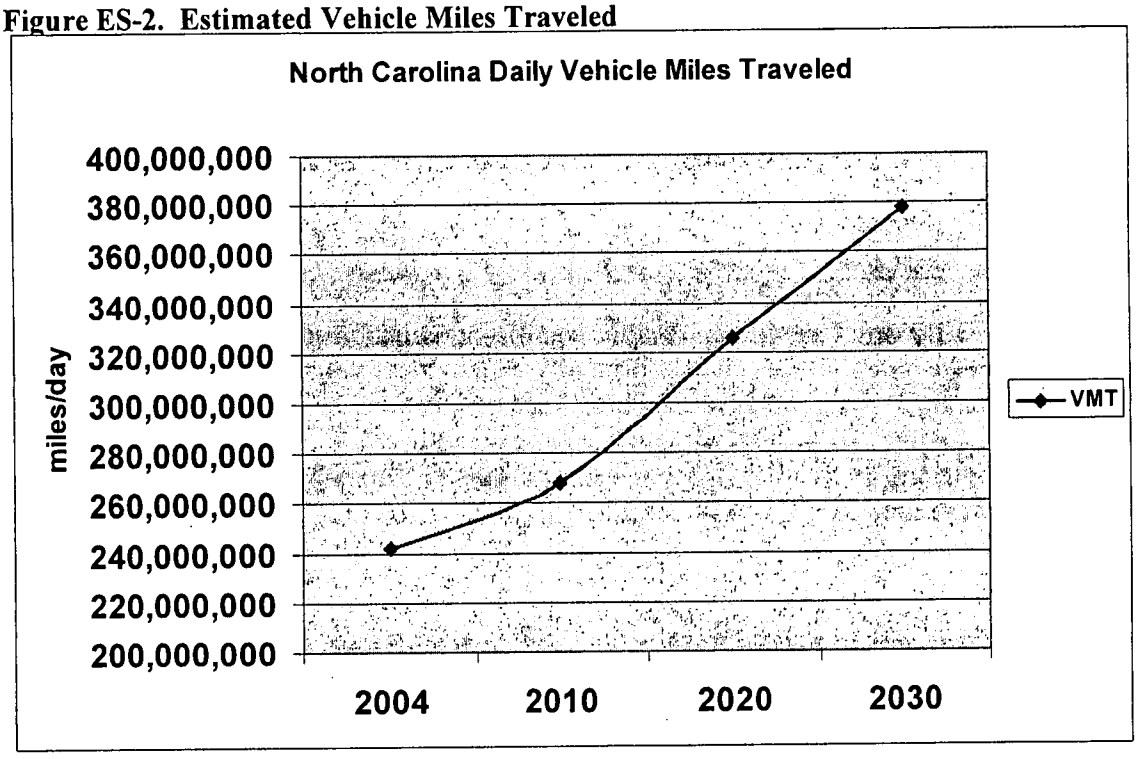

Overview of Air Quality Impacts – Ozone Sensitivity

During the development of the 8-hour ozone State Implementation Plans (SIP) for North Carolina's nonattainment areas, the NCDAQ conducted several air quality modeling sensitivities to evaluate potential NOx control strategies to help reduce future year ozone concentrations. The emissions sensitivity used in this analysis reduced on-road mobile source NOx emissions in the Metrolina (Greater Charlotte area) 8-hour ozone nonattainment area by 10% from year 2009 emission levels. The Metrolina region was chosen because they currently show the highest ozone concentrations in North Carolina.

Results of the air quality model simulations indicated that a 10% NOx reduction in 2009 for on-road mobile source emissions was equivalent to a 10 ton/day reduction in the Metrolina region. The 10 ton/day on-road NOx reduction was then compared back to the "baseline" year 2009 emissions that included only the current federal Tier 2 level of control. Therefore these results would suggest that an additional 10% NOx reduction would basically lower the 8-hour ozone concentrations anywhere between 0.1 and 1.0 parts per billion (ppb) in year 2009.

DAQ next assessed the ozone benefits in future year 2020 with the CA LEV-II program implementation in year of 2010. The year 2020 would afford a significant fleet turnover for CA LEV-II vehicles with NOx emissions reduction on the order of 4%. A 4% NOx reduction equates to 1 ton/day in 2020 and lower 8 hour ozone levels by 0.1 ppb in the Metrolina region.

Summary of Air Quality Impacts

For the Metrolina Area...

- 2009 on-road mobile NOx ~ 100 tons/day (w/ Tier 2)
- 2020 on-road mobile NOx ~ 25 tons/day (w/Tier 2)

If a 10% NOx reduction = 10 tons/day in 2009 = 1 ppb maximum ozone benefit

Then a 4% NOx reduction = 1 ton/day in 2020 = 0.1 ppb maximum ozone benefit

DAQ concluded the 4% on-road mobile NOx reduction in year 2020 due to a CA LEV-II program would have a very limited impact on maximum 8-hour ozone.

Overview of CA LEV-II Fleet Analysis and Enforcement

Any state adopting the CA LEV-II regulation is not required to enforce measures associated with tracking vehicle sales or registration data (each auto manufacturers must comply with the fleet average NMOG emissions values). As a qualitative measure, DAQ compared several fleet demographic parameters of California versus North Carolina's fleets to estimate whether "fleet average" enforcement is critical to the program. When looking at the applicable vehicles in each state based on gross vehicle weights (GVW), North Carolina has 11% more passenger cars, 7%

fewer light-duty trucks (under 6,001 lbs.) and 6% fewer light-duty trucks (6,001-8,500 lbs.) than in California.

The second fleet demographic is vehicle age distribution expressed as a percent based on the number of vehicle within a vehicle class and model year. North Carolina has a slightly lower percentage of 1 and 2 year old passenger cars than California and equal percentages of 3-year-old passenger cars. North Carolina has a greater percentage of 4 through 12 year old passenger cars and fewer 13 to 25 year olds. Generally fleets weighted towards newer vehicles will more quickly benefit from a control program due to the acceleration toward a newer fleet.

Finally, a comparison of the fraction of VMT driven by each vehicle class in 2010 was analyzed based on USEPA guidance. California light-duty gasoline car and truck owners are projected to drive their vehicles slightly more than North Carolinians in year 2010.

Overview of Qualitative Assessment of Enforcement Options

If one generally assumes passenger vehicles are cleaner emitting vehicles than light-duty trucks, and newer vehicles generally emit less than older vehicles, then one can qualitatively assert that the light-duty gasoline vehicle fleet registered in North Carolina is cleaner than California's registered light-duty gasoline vehicle fleet. This data (i.e., especially the greater percentage of passenger cars) may be an indicator that a fleet average requirement will not be difficult to meet in North Carolina and thus a "simple certification" enforcement program might result in similar benefits, while requiring fewer state resources.

Overview of Staffing and Enforcement Resources

NCDAQ contacted several state air quality agencies including Washington State Department of Ecology, Air Quality Program to better understand staffing needs associated with implementing and enforcing a CA LEV-II program. Washington indicated both New York and Massachusetts have staffs at 2 to 3 people (not full time) on CA LEV-II tasks.

The primary point of enforcement/compliance would likely be the State's Division of Motor Vehicles (DMV) with the air quality agency staff conducting audits, monitoring program effectiveness, handling public outreach, registration, and vehicle availability issues.

Another possible resource concern considered by NCDAQ is the impact to existing tasks such as transportation conformity, SIP modeling and emission inventories. Due to more complicated mobile source emission estimation techniques involved with a CA LEV-II program, there is some concern that timelines on these core tasks could be lengthened.

Conclusions

The CA LEV-II program (assuming statewide implementation in 2010) could provide NOx reductions on the order of 0.1% in 2010, 4% in 2020 and 10% in 2030 and VOC reductions of 0.1% in 2010, 3% in 2020 and 6% in 2030 as compared to the Federal Tier 2 program already in place. It should be noted that in 2030, the estimated 10% on-road mobile NOx reduction is

equivalent to only 10 tons/day of NOx reduced statewide. This is because of the overall on-road mobile NOx emissions are significantly lower by that time. NCDAQ has estimated this level of NOx reduction in these future years will impact North Carolina's ability to attain the National Ambient Air Quality Standard for 8-hr ozone insignificantly. Additionally, moderate staffing implications could result from enforcement of CA LEV-II and from the impact to tasks such as transportation conformity, SIP modeling and emission inventories.

1. Description of Project

1.1 Purpose

The objective of this project was to estimate the emissions benefits of adopting California Low-Emission Vehicle II (CA LEV-II) standards in North Carolina (NC), as compared to the Federal Tier 2 standards already in effect. Using air quality modeling sensitivities recently conducted by the North Carolina Division of Air Quality (NCDAQ), potential ozone benefits were also estimated. Additional data was collected and analyzed to better understand the impact of implementing a fleet averaging enforcement option.

1.2 Background

On-road mobile source emissions make up a significant portion of the total statewide Nitrogen Oxides (NOx) emissions. For example, in year 2002, the NCDAQ estimated that 45% of North Carolina's NOx emissions came from on-road mobile sources. NOx and volatile organic compounds (VOC) are critical ozone precursors. Because of the generally warm and moist climate of North Carolina, vegetation abounds in many forms, and forests naturally cover much of the state. This "biogenic" sector is the most abundant source of VOCs in North Carolina and accounts for approximately 90% of the total VOCs statewide. The overwhelming abundance of biogenic VOCs makes the majority of North Carolina a NO_x limited environment for the formation of ozone. Therefore, reductions of only NOx emissions are targeted in North Carolina when aiming to reduce ozone.

Federal, State and local control programs have been implemented to help control NOx emissions from on-road mobile sources. At the state level, North Carolina has expanded its Inspection and Maintenance (I/M) program. The program now covers 48 of the State's 100 counties to ensure that vehicle emission controls are properly working.

At the federal level, the United States Environmental Protection Agency (USEPA) has adopted national motor vehicle and fuel standards. The most recent standards adopted by USEPA include the Tier 2 vehicle and gasoline standard (phase-in began in 2004)[1], and the heavy-duty diesel vehicle and fuel standard (phase-in begins in 2006 with the release of the model year 2007 heavy-duty diesel vehicles and low sulfur diesel fuel)[2].

The federal Clean Air Act (CAA) provides the framework for regulating emissions from on-road mobile sources. The CAA set the first federal vehicle emission standards. However, because California already had vehicle emission standards when this occurred, the CAA authorized California (and only California) to continue setting its own vehicle emission standards. Therefore all new vehicles sold in the United States (U.S.) are subject to emission standards set by either the federal government or the State of California. Other states have the option to adopt the California standards in lieu of the federal standards. This authority was granted under Section 177 of the CAA. Section 177 also guarantees the automakers that they will not have to meet more than two regulatory regimes by explicitly prohibiting any requirements that result in a "third vehicle".

1.3 Description of the Federal Tier 2 and California LEV-II Programs

USEPA's Tier 2 vehicle and gasoline standards, adopted in December 1999, took effect beginning with model year 2004 vehicles. Meanwhile, around the same time, the California Air Resources Board (CARB) amended their Low-Emission Vehicle (LEV) regulations to a more stringent program known as the California Low-Emission Vehicle Standard (CA LEV-II)[3]. Like Tier 2, CA LEV-II took effect beginning with model year 2004 vehicles. Both the Tier 2 and CA LEV-II regulations set emission standards for light-duty vehicles such as passenger cars, trucks, and sport utility vehicles. Both the Tier 2 and CA LEV-II standards become progressively more stringent with time and both classify vehicle types into several different groupings, setting emission standards for each grouping.

Significant emission reductions are realized from both the Tier 2 and CA LEV-II programs. The emissions are reduced through exhaust and evaporative emission standards and annual fleet average emission standards. Ultimately, auto manufacturers are given the flexibility to produce vehicles that emit both more and less than the fleet average, as long as the mathematical average is within the fleet limit.

There are several important differences between the Tier 2 and CA LEV-II programs. The federal Tier 2 program requires a total light-duty fleet NOx standard of 0.07 grams per mile, which is phased-in between years 2004 and 2009. In contrast, the CA LEV-II fleet average standards are based on non-methane organic gases (NMOG), also generally referred to as hydrocarbons (HC) or VOCs. A summary of the CA LEV-II exhaust emission standards can be found in Table 1.3-1.

Another important feature of the CA LEV-II program that differs from the Tier 2 program is the advanced technology vehicle component. This component requires a portion of the light-duty fleet to be "zero-emission vehicles" (ZEVs). Originally designed to mandate the introduction of electric ZEVs, California's ZEV requirement has been changed to allow credit for a variety of advanced automobile technologies. Partial ZEVs (PZEVs) and advance technology partial ZEVs (AT-PZEVs) meet the ZEV zero emissions evaporative standards, the individual vehicle exhaust standards, and the extended warranty and durability requirements. The ZEV component of the CA LEV-II program is discussed further in Section 2.3.3.

Finally, the evaporative requirements of the CA LEV-II standard appear to be lower than the Tier 2 standard. However, the test procedures used to determine compliance with the Tier 2 evaporative requirement has a provision requiring that evaporative system durability be demonstrated on fuels containing the maximum allowable alcohol levels, because the permeability of system components is increased with these fuels. Manufacturers are thus held to a tighter standard of durability under Tier 2, and they have indicated to USEPA that the emission control hardware required to meet the Tier 2 evaporative requirements is identical to that needed to meet the CA LEV-II requirements. NCDAQ assumed the evaporative requirements of the Tier 2 and CA LEV-II standards to be the same in this analysis.

1.4 Emission Factors

Emission factors used in this study were generated using USEPA's MOBILE6.2 model[4]. MOBILE6.2 was designed by USEPA to address a wide variety of air pollution modeling needs. The model calculates emission factors under various conditions effecting in-use emission levels (e.g., ambient temperatures, average traffic speeds) as specified by the modeler. MOBILE models have been used by USEPA to evaluate highway mobile source control strategies; by states, local and regional planning agencies to develop emission inventories and control strategies for State Implementation Plans (SIPs) under the CAA; by metropolitan planning organizations and state transportation departments for transportation planning and conformity analysis; by academic and industry investigators conducting research; and in developing environmental impact statements. Special input files and guidance were used in MOBILE6.2 to model the CA LEV-II standards. This is described in greater detail in Section 2.

Table 1.3-1 CA LEV-II Emissions Standards[3]

LEV II Exhaust Mass Emission Standards for New 2004 and Subsequent Model LEVs, ULEVs, and SULEVs in the Passenger Car, Light-Duty Truck and Medium-Duty Vehicle Classes							
Vehicle Type	*Durability Vehicle Basis (mi)*	*Vehicle Emission Category*	*NMOG (g/mi)*	*Carbon Monoxide (g/mi)*	*Oxides of Nitrogen (g/mi)*	*Formaldehyde (mg/mi)*	*Particulates (g/mi)*

		ULEV	0.167	7.3	0.4	21	0.06
		SULEV	0.117	3.7	0.2	10	0.06

1.5 Evaluation Years

In order to evaluate the emissions benefits of adopting a CA LEV-II program over time, several years were evaluated. Baseline emissions were estimated for years 2004, 2010, 2020, and 2030 for the Tier 2 program. Emissions were estimated for years 2010, 2020, and 2030 for the CA LEV-II program. The year 2004 was picked because it represents the start year of the Tier 2 program. The year 2010 was chosen because it is assumed in this analysis to be the earliest possible start date of a CA LEV-II program in NC. The basis for determining the earliest possible start date is a requirement that manufacturers be given a two year "lead-time." This means states cannot enforce such standards until model years beginning two years after the date of adoption. "Model year" actually begins on January 2nd, of the previous calendar year. In other words, in order for a state to adopt CA LEV-II for model year 2010, the state must adopt those standards two years before January 2, 2009 (i.e., prior to January 2, 2007).

Years 2020 and 2030 were picked based on the availability of local mobile model input data, such as future projected speeds and vehicle miles traveled (VMT).

1.6 Pollutants Addressed and Spatial/Temporal Resolution

On-road mobile emissions of NOx and VOCs were estimated for the entire state of North Carolina for a typical summer weekday. The impacts on future year ozone concentrations also were estimated. This is discussed further in Section 4 and 5.

2. Approximation of CA LEV-II Standard Using MOBILE6.2

2.1 General Approach

All vehicles manufactured in the U.S. are subject to either the Federal Tier 2 or the CA LEV-II standard and as discussed earlier, states other than California have the option to adopt the CA LEV-II program in lieu of the federal standards. However, states other than California do not have the option to use the California mobile emissions model, EMFAC[5]. In order to estimate the emissions benefits of adopting CA LEV-II standards in North Carolina, the only mobile emissions modeling tool available is USEPA's MOBILE6.2. The emissions standard default for light-duty vehicles in MOBILE6.2 is the Tier 2 standard. The upcoming sections detail the approximation of the CA LEV-II program in USEPA's MOBILE6.2 model and the methodology used by NCDAQ to estimate the emissions benefits of adopting a CA LEV-II program in North Carolina.

2.2 Vehicles Subject to the CA LEV-II Standard

The CA LEV-II standard is applicable to light-duty vehicles (i.e., passenger cars), light-duty trucks up to 8,500 lbs gross vehicle weight rating (GVW), and medium-duty vehicles that are up to 14,000 lbs GVW. Because terminology about truck weight classes can be very confusing, the best way to refer to vehicle classifications is by their actual weight. In this emission analysis, NCDAQ applied CA LEV-II to only passenger cars and light-duty trucks up to 8,500 lbs GVW. The population of medium-duty trucks between 8,500 lbs and 14,000 lbs in North Carolina is very small; therefore, the impact of adopting CA LEV-II for that

vehicle class would be minimal. Light-duty vehicle classes that NCDAQ applied the CA LEV-II program, in the emissions analysis defined by USEPA, are:

LDGV - light-duty gasoline vehicles (passenger cars)
LDGT1 – trucks up to 6,000 lbs GVW + 3,750 LVW
LDGT2 – trucks up to 6,000 lbs GVW + 3,751 LVW-5,750 LVW
LDGT3 – trucks between 6,001 lbs-8,500 lbs GVW + 3,751 LVW-5,750 LVW
LDGT4 – trucks between 6,001 lbs-8,500 lbs GVW + > 5,750 LVW

where GVW = maximum fully loaded vehicle weight,
LVW = nominal empty vehicle weight + 300 lbs.

2.3 Methodology: Modeling CA LEV-II using MOBILE6.2

As stated earlier, the default emission standards in MOBILE6.2 is the Federal Tier 2 standard. In order to simulate the CA LEV-II standard, NCDAQ consulted with USEPA Region IV, the USEPA Office of Transportation, and Air Quality (OTAQ). USEPA OTAQ provided much appreciated technical support during the design phases of this project, including a revised guidance document[6] that outlines the auxiliary files necessary to approximate the CA LEV-II program in MOBILE6.2. These auxiliary files were developed by OTAQ in consultation with CARB. The additional files are:

LEVIIPH.d – phase-in percentages by exhaust certification bin, vehicle class and pollutant. NCDAQ used this file as provided by USEPA OTAQ.

LEVIIEVP.d – phase-in percentages for evaporative standards by vehicle class. NCDAQ used this file as provided by USEPA OTAQ.

LEVIIST.d – the 50,000 mile standard levels by exhaust certification bin, vehicle class and pollutant. NCDAQ used this file as provided by USEPA OTAQ.

LEVII94.d – establishes the percentage of zero emitting exhaust vehicles. NCDAQ used this file as provided by USEPA OTAQ.

In conjunction with the above auxiliary files, analysis of the CA LEV-II program in MOBILE6.2 must be performed using these four commands:

T2 EXH PHASE-IN, which provides phase-in percentages by exhaust certification bin, vehicle class, and pollutant (corresponds with the LEVIIPH.d input file).

T2 CERT, which defines the 50,000 mile standard levels by exhaust certification bin, vehicle class, and pollutant (corresponds with the LEVIIST.d input file).

T2 EVAP PHASE-IN, which provides phase-in percentages for evaporative standards by vehicle class (corresponds with the LEVIIEVP.D input file).

94+ LDG IMP, which is used only to establish the fraction of ZEVs (corresponds with the LEVII94.D).

One complicating issue associated with modeling the CA LEV-II program in MOBILE6.2 is the inability to alter the start year. Working around this model limitation requires a significant post-process of the model output to "reconstruct" composite emission factors.

Implementing the post-processing technique required NCDAQ to apply the DATABASE OUTPUT commands in MOBILE6.2. This allows the user to obtain the most disaggregated output from the model. Emission factors per emission type (e.g. running exhaust, starting exhaust and evaporative), per facility type (e.g. freeway, arterial, local, ramp, none), per model year, and per pollutant were generated. This reconstruction technique was developed and successfully tested for a "Tier 2 only" approach where the post-processed emission factor matched the composite emission factor from MOBILE6.2 descriptive output.

Generally, in order to model the impacts of implementing a CA LEV-II program in year 2010 as accurately as possible, emission factors were generated for model year vehicles prior to year 2009 with Tier 2 level of control applied (noting the Tier 2 level of control would only apply to model years 2004-2009 vehicles). Those were combined with the emission factors for model year 2010 vehicles with CA LEV-II level of control applied. This method was applied to generate a composite year 2010 emission factor for each of the light-duty vehicle classes. Please see Appendix A for a detailed representation of the emission factor reconstruction post-process methodology applied by NCDAQ.

The reconstructed composite emission factors for each of the light-duty vehicle classes were combined with the emission factors from the vehicle classes not impacted by a CA LEV-II program and the VMT fraction to get the final composite NOx and VOC emission factors for each facility or roadway scenario. This data is shown in Appendix B. Comparable sets of tables with the Tier 2 emission factors are provided in Appendix C.

NCDAQ took advantage of several opportunities to implement "efficiencies" into the complex post-processing effort. One of those was modeling the State of North Carolina in four sections: Raleigh-Durham, Charlotte-Gastonia, other areas with an I/M program, and other areas without an I/M program. This was done to simply reduce the number of model input and output files to process while still taking advantage of local data sets, such as vehicle age distributions and VMT fractions in the Raleigh-Durham and Charlotte-Gastonia areas. An additional efficiency implemented was the use of weight-average speeds to limit the facilities or road types that needed to be modeled. Rural interstates, urban interstates, and other roads were the three facilities modeled. VMT was aggregated into similar groupings. This is explained further in Section 2.3.1.6.

The MOBILE6.2 input parameters used in this study represent North Carolina's "latest planning assumptions" and are the most up-to-date data available (as of March 2006) from the North Carolina Department of Transportation (NCDOT) and the NCDAQ. This North Carolina specific data was used for the following MOBILE6.2 input parameters: speeds,

VMT fractions, Reid vapor pressure, vehicle age distribution, temperatures, inspection, and maintenance program. These input parameters and others, are discussed below.

2.3.1 MOBILE6.2 Input Parameters

2.3.1.1 Evaluation Month

MOBILE6.2 can calculate emission factors that represent a January 1st or July 1st fleet age. Emissions for this project were calculated with the July 1st setting.

2.3.1.2 Vehicle Age Distribution

The vehicle age distribution comes from annual registration data for North Carolina from the NCDOT. For this analysis the data was generated from 2004. The NCDOT provided the latest available count data based on the number of vehicle types per year from 1974 through 2004. Vehicles greater than 25 years old were combined and included as the 25th model year. NCDAQ converted the data provided by the NCDOT into the MOBILE6.2 model format using a conversion utility. The count data provided by the NCDOT was converted to fractions by dividing each count per vehicle type per year by the total number of vehicles in that classification for all years. For example, the number of 2004 light-duty vehicles was divided by the total number of light-duty vehicles for all years. Comparisons of North Carolina and California vehicle age distributions are provided in Section 5.2.

2.3.1.3 Vehicle Miles Traveled Fractions

The vehicle miles traveled fractions (i.e., VMT fraction or VMT mix) refer to the percentage of different vehicle types on each of the Federal Highway Administration road types. It is critical when estimating mobile emissions in an area, to use data that accurately reflects vehicle types traveling on each different road types. The North Carolina Highway Performance Monitoring System (HPMS) information that was used to generate the statewide VMT fractions was based on years 1999 through 2001 length based counts. This is the latest North Carolina statewide count information available. The raw count information was processed consistent with USEPA methods and guidance[7] for each year in the analysis. Comparisons of the North Carolina and California VMT fractions are provided in Section 5.3

2.3.1.4 Temperatures

For this analysis, an average July 2005 minimum and maximum temperature was calculated from data at five Automated Surface Observing System (ASOS) sites as shown in Table 2.3-1 below. The overall average minimum and maximum temperatures were used in all MOBILE6.2 input files.

Table 2.3-1 July 2005 Average Minimum and Maximum Temperatures[8]

	Average Maximum	Average Minimum
Asheville	83.2	65.5
Charlotte	89.0	70.1
Greensboro	88.2	71.5
Raleigh	92.9	71.6
Wilmington	90.1	74.5
Overall Average	**88.7**	**70.6**

2.3.1.5 Vehicle Inspection and Maintenance (I/M) Program

As discussed earlier, North Carolina has implemented a vehicle emissions inspection program, onboard diagnostics (OBDII) in 48 counties. This program covers all light-duty gasoline powered vehicles that are model year 1996 and newer. The program was phased-in to include a total of 48 counties between July 2002 and January 2006. Therefore, the years 2010, 2020, and 2030, MOBILE6.2 model runs in this analysis; incorporate all of the appropriate I/M program parameters in the 48 counties. The OBDII compliance rate used in the MOBILE6.2 input files is 95 percent. In addition to applying the appropriate I/M commands in MOBILE6.2, NCDAQ applied anti-tampering commands. This statewide program ensures that emission control equipment on any vehicle model year of 1968 and newer has not been altered.

2.3.1.6 Speed Assumptions

Emissions from motor vehicles vary with the manner in which the vehicle is operated. Vehicles traveling at 65 miles per hour (mph) emit a very different mix of pollutants than the car traveling at low speeds. Average daily annual speeds were used in this analysis for each road type. The speeds were obtained from NCDOT. The speeds for the areas other than Raleigh-Durham and Charlotte-Gastonia areas are assumed to be the Wake County off-peak speeds. This assumption is consistent with what has been recommended by NCDOT in past efforts to develop statewide mobile source emission inventories.

In the Raleigh-Durham and Charlotte-Gastonia areas, for the years 2010, 2020, and 2030 average speeds were calculated for urban and rural interstates. The speeds used in the averaging are based upon the latest available information from local travel demand models. The "other roads" speeds for the entire state represent a VMT weighted average of the non-interstate speeds from the Wake County off-peak data sets for the years 2010, 2020, and 2030. Tables 2.3-2 through 2.3-4 provide a summary of the speeds used in this analysis.

Table 2.3-2 2010 Speeds

	Rural Interstate	Urban Interstate	Other Roads
Charlotte-Gastonia	53	51	46
Raleigh-Durham	53	51	46
Other Areas	66	61	46

Table 2.3-3 2020 Speeds

	Rural Interstate	Urban Interstate	Other Roads
Charlotte-Gastonia	53	51	45
Raleigh-Durham	53	51	45
Other Areas	62	62	45

Table 2.3-4 2030 Speeds

	Rural Interstate	Urban Interstate	Other Roads
Charlotte-Gastonia	49	48	44
Raleigh-Durham	49	48	44
Other Areas	61	61	44

2.3.1.7 Reid Vapor Pressure (RVP)

Reid Vapor Pressure reflects a gasoline's volatility. Lower RVP leads to lower VOC emissions from gasoline handling and lowers vapor losses from motor vehicles. North Carolina rules require lower RVP gasoline in the most urbanized areas of the state during the summer. Therefore, an RVP of 7.8 pounds per square inch (psi) was applied in this analysis for the Raleigh-Durham and Charlotte-Gastonia areas. Due to the input file grouping explained earlier in Section 2.3, an RVP of 9.0 was applied for the "other areas."

2.3.2 Vehicle Miles Traveled

In order to calculate emissions from on-road mobile sources, emission factors were developed as discussed throughout this document. The emission factors were then multiplied by an activity level, which is average weekday vehicle miles traveled (VMT). The VMT used in this analysis was derived from the latest county-by-county HPMS data available from NCDOT. The future years were projected using a growth rate from a linear regression completed on the last 10 years of HPMS data. The same VMT was used in the generation of emissions for the Tier 2 program as the CA LEV-II program. The county specific VMT used in this analysis is provided in Appendix D for years 2010, 2020, and 2030.

2.3.3 CA LEV-II Phase-in Schedule

As mentioned earlier in Section 2.3, USEPA OTAQ provided MOBILE6.2 auxiliary files necessary to approximate the phase-in CA LEV-II program. This file represents California's

assumptions on how manufacturers would meet the fleet average standards. This is the latest available CA LEV-II phase-in schedule in MOBILE6.2 format from USEPA OTAQ.

2.3.4 Zero Emissions Vehicle (ZEV) component

The CA LEV-II standards include a zero-emission vehicle (ZEV) component. This is considered an "option" for states wishing to "opt-in" to the CA LEV-II standards. Originally designed to mandate the introduction of electric ZEVs, California's ZEV program has been changed to allow credit for a variety of advanced automobile technologies besides electric vehicles. Partial ZEVs (PZEVs) and advance technology partial ZEVs (AT-PZEVs) meet the ZEV zero emissions evaporative standards, the individual vehicle exhaust standards, and the extended warranty and durability requirements.

Generally, California's basic ZEV rule requires that a manufacturer's annual sales of light-duty vehicles must consist of a percentage of ZEVs. This requirement first applied only as a percentage of passenger cars and LDT1 trucks. This is referred to as the ZEV baseline. The ZEV baseline was applied by NCDAQ in this analysis using USEPA's latest available MOBILE6.2 ready (levii94.d) auxiliary file.

CARB recognized the ZEV requirement would be difficult to meet and established a review by a technical panel every two years. The ZEV baseline has since been expanded to include LDT2 trucks to be phased in on a later schedule. Due to the fact that ZEV technology has not developed as quickly as California had hoped, they have added flexible ways to meet the requirement. Those flexibilities are discussed elsewhere[3].

3. Results: Emissions Benefits

3.1 NOx and VOC Benefits

To begin to understand the emissions benefits of adopting CA LEV-II in North Carolina, the NCDAQ applied the approach, methods and data summarized in previous sections. The emissions benefits analysis included a comparison of statewide on-road mobile source NOx and VOC emissions resulting from the current federal level of control (Tier 2), and from the CA LEV-II level of control. It should be noted that the emission differences were calculated in context of the entire on-road mobile source emissions inventory. This method for comparison enabled the NCDAQ to apply the knowledge gathered in emissions/air quality modeling studies to assess the air quality (ozone) benefits that might result from the CA LEV-II emissions benefits. The air quality benefits analysis is presented in Section 4.

As can be seen in Table 3.1-1, the statewide NOx and VOC emissions from adopting a CA LEV-II program are lower relative to the Federal Tier 2 level of control. As discussed previously, the earliest CA LEV-II can begin is in the year 2010. Since it will take time for the CA LEV-II vehicles to become a significant portion of the overall vehicle fleet, the CA LEV-II standards show an increasing emissions benefit (i.e., on a percentage basis) over time relative to the Tier 2 level of control.

Table 3.1-1. CA LEV-II Reductions Compared to Federal Tier 2: Entire Fleet

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

Figure 3.1-1 below presents the North Carolina statewide on-road mobile source NOx emissions inventory with a Tier 2 control program for years 2004, 2010, 2020, and 2030 (blue line), and also with a CA LEV-II control program for years 2010, 2020, and 2030 (magenta line). Figure 3.1-2 is a similar graph for VOC emissions. (It should be noted that the NOx and VOC emission estimates with a Tier 2 control program, assume there are no CA LEV-II compliant vehicles in North Carolina already. While NCDAQ does not have any official data, informal surveys have shown there are North Carolinians already driving CA LEV-II compliant vehicles. Therefore, the emission benefits of the CA LEV-II program shown in Table 3.1.1 and Figures 3.1-1 and 3.1-2 are likely over-estimated.)

Also noteworthy, these figures illustrate the tremendous reductions in on-road mobile emissions, regardless of the control program, expected over time in North Carolina. These reductions will occur despite significant estimated increases in VMT (see Figure 3.1-3).

Figure 3.1-1. Estimated NOx Emissions – Federal Tier2 vs. CA LEV-II

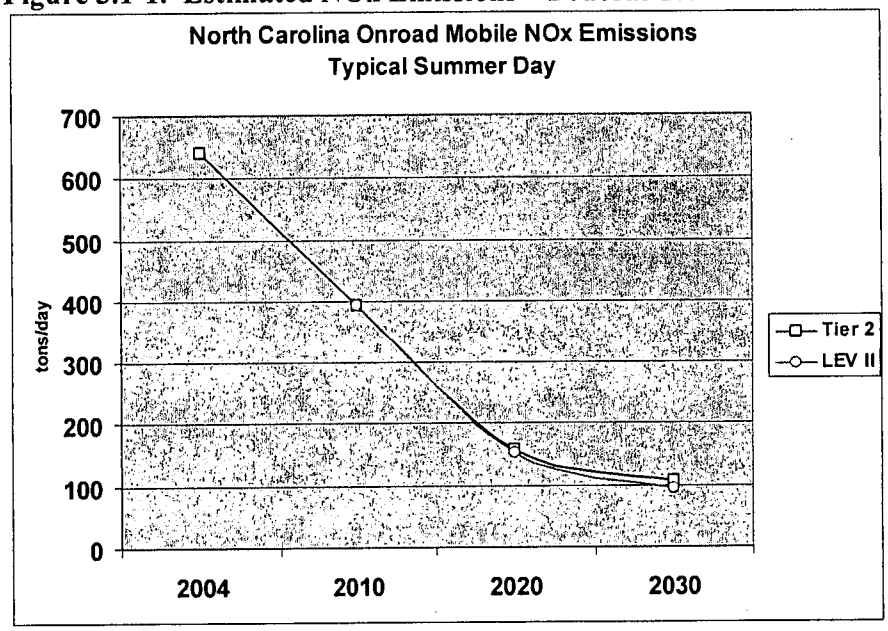

Figure 3.1-2. Estimated VOC Emissions – Federal Tier2 vs. CA LEV-II

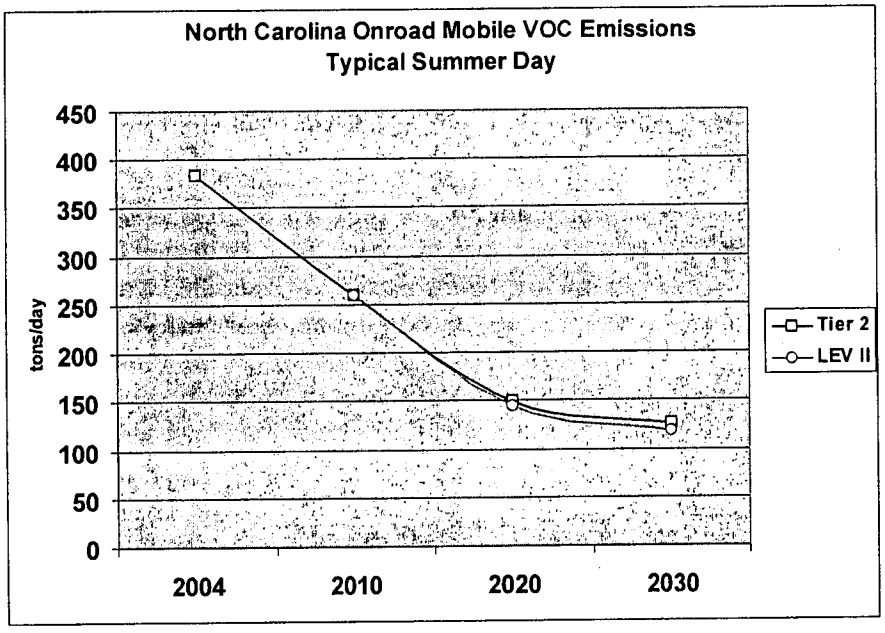

Figure 3.1-3. Estimated Vehicle Miles Traveled

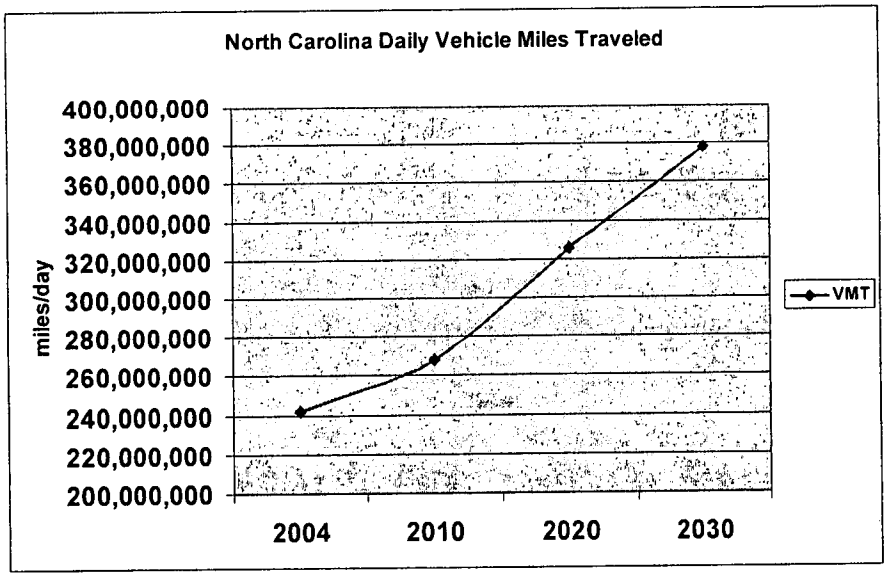


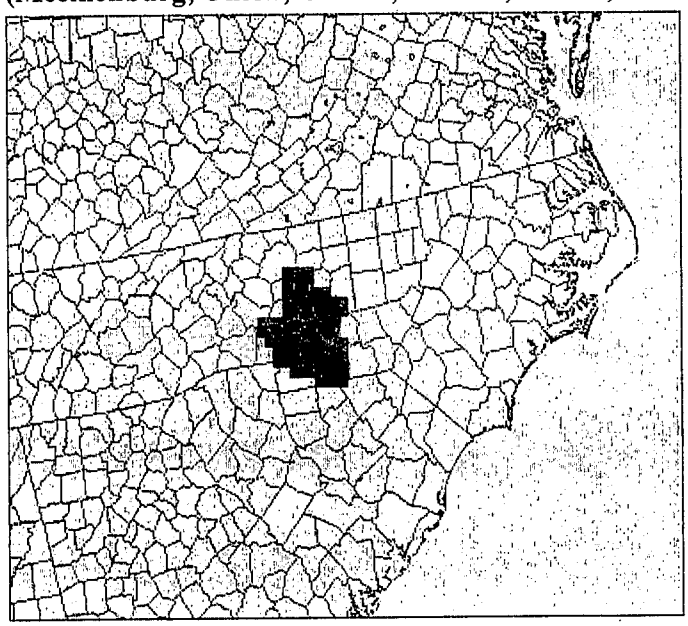
4. Results: Air Quality Impacts

4.1 Ozone Sensitivities

During the development of the 8-hour ozone SIPs for North Carolina's nonattainment areas, the NCDAQ conducted a number of modeling sensitivity tests to better understand how targeted emission reductions would impact future ozone concentrations. The modeling system used in this analysis consisted of three components: 1) the Penn State University/National Center for Atmospheric Research (PSU/NCAR) Mesoscale Model (MM5 version 3.6.1+)[9]; 2) the Sparse Matrix Operator Kernel Emissions Modeling System (SMOKE version 2.1)[10]; and, 3) the Community Multiscale Air Quality model (CMAQ version 4.4)[11,12]. Model configurations, input data, and modeling methods were consistent with those suggested by USEPA in "Guidance on the Use of Models and Other Analyses in Attainment Demonstrations for the 8-hour Ozone NAAQS" [13].

The emissions sensitivities were calculated by taking the difference between two air quality modeling simulations; one with "baseline" emissions and another with reduced emission inputs. This method is known in the modeling community as the "brute force" method[14]. Brute force sensitivity analyses have been widely used to better understand source/receptor relationships and aid in the design of control strategies for ozone[15]. The emissions sensitivity used in this analysis reduces on-road mobile source NOx emissions in the Metrolina 8-hour ozone nonattainment area, by 10% from year 2009 emission levels. The Metrolina nonattainment area was chosen because they currently have the highest ozone design values in North Carolina. The counties included in the emissions sensitivity modeling are shown in Figure 4.1-1.

Figure 4.1-1. North Carolina Counties included in the Metrolina Sensitivity (Mecklenburg, Union, Gaston, Lincoln, Iredell, Cabarrus and Rowan)



The 10% NOx reduction applied to the year 2009 on-road mobile source emissions is equivalent to a 10 ton/day reduction in this region. Again, this is a 10%, or 10 ton/day, on-road mobile source NOx reduction from the "baseline" year 2009 emissions that include the Tier 2 level of control. Air quality modeling results indicated this additional 10% NOx reduction resulted in lowering 8-hour ozone concentrations anywhere between 0.1 and 1.0 parts per billion (ppb) in year 2009. Only one of the seven modeled days resulted in changes in the maximum 8-hour ozone concentration, yielding a result as high as 1.0 ppb. This is shown in Figure 4.1-2. Only two of the seven modeled days resulted in changes as high as 0.5 ppb.

Using the CA LEV-II emission benefits analysis discussed in Section 3 above, NCDAQ assessed the 8-hour ozone benefits in year 2020, assuming a CA LEV-II program was implemented starting in year 2010. NCDAQ chose to analyze year 2020 to allow for a significant portion of the fleet to be CA LEV-II vehicles. As noted in Table 3.1-1 above, a 4% reduction of on-road mobile NOx emissions would be expected in year 2020 due to a CA LEV-II program. NCDAQ assumed the maximum ozone benefit shown in the year 2009 Metrolina sensitivity in estimating the year 2020 ozone impacts due to CA LEV-II, as shown in Table 4.1-1 below.

Table 4.1-1. Summary of Air Quality Impacts

For the Metrolina Area...

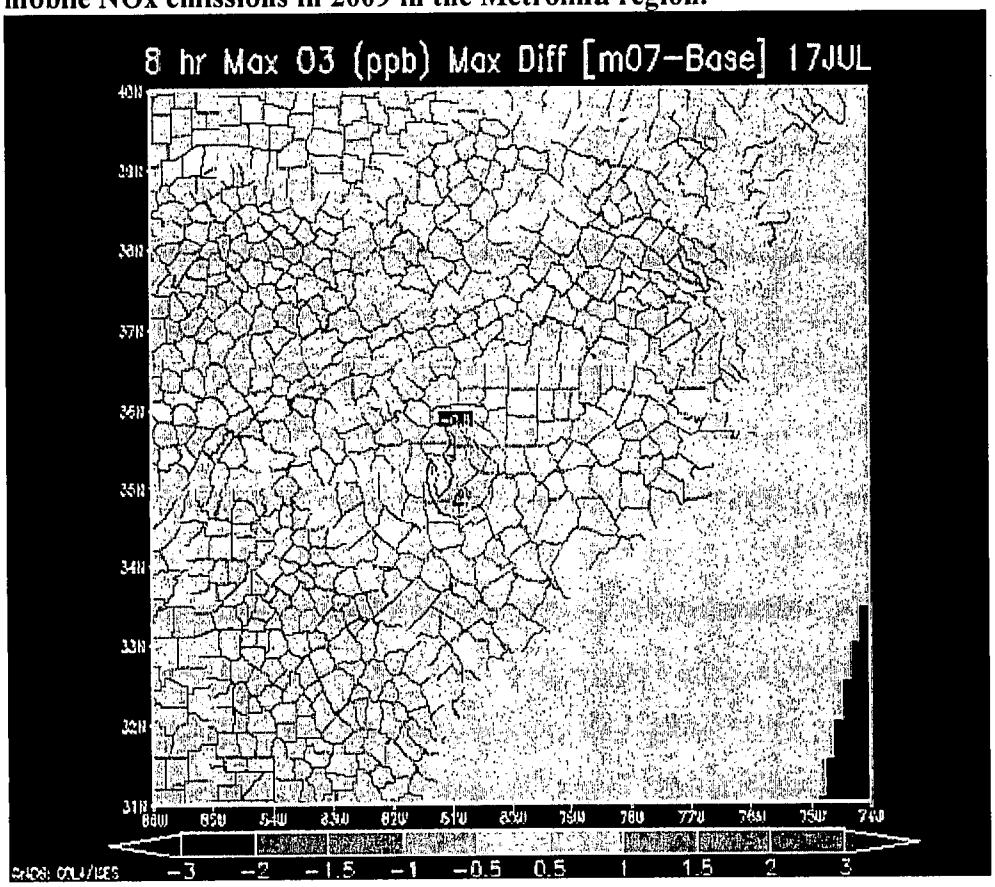
- 2009 on-road mobile NOx ~ 100 tons/day (w/ Tier 2)
- 2020 on-road mobile NOx ~ 25 tons/day (w/Tier 2)

If a 10% NOx reduction = 10 tons/day in 2009 = 1 ppb maximum ozone benefit

Then a 4% NOx reduction = 1 ton/day in 2020 = 0.1 ppb maximum ozone benefit

NCDAQ concluded the 4% on-road mobile NOx reduction in year 2020 due to a CA LEV-II program would have a very small impact on maximum 8-hour ozone concentrations (i.e., less than 0.1 ppb) in the Metrolina area. NCDAQ estimates the impact would be even less in areas where future projected ozone concentrations will be even lower.

Figure 4.1-2. Maximum 8-hour ozone reductions due to a 10% reduction of on-road mobile NOx emissions in 2009 in the Metrolina region.



5. CA LEV-II Enforcement Options – Fleet Analysis

One of the challenges put forth to NCDAQ was to assess the benefit of enforcing a fleet average requirement for the CA LEV-II control program versus simply requiring that all light-duty vehicles sold in North Carolina would have to be California certified (e.g., simple certification). A state adopting the CA LEV-II regulation is not required to undertake the additional activities associated with vehicle sales or registration enforcement.

A fleet average requirement would provide auto manufacturers the flexibility to produce vehicles that emit both more and less than the fleet average as long as their mathematical average is within the fleet average limit. This would mean state officials would work with auto manufacturers to calculate a fleet average NMOG value and check it against the applicable limits set in the rule. Details on how to offset "debits" or exceedances of the fleet average limit are discussed elsewhere[3].

While this analysis does not quantify the benefits of adopting a CA LEV-II program in North Carolina, with and without fleet averaging enforcement, several metrics were generated to

better understand North Carolina's fleet demographics and how it compares to California's fleet of light-duty vehicles. This analysis of the fleet information helped NCDAQ make some qualitative estimates on whether enforcement of a fleet average option would be needed in North Carolina.

5.1 . Fleet Comparisons (NC vs. CA)

5.1.1 Fleet Composition

Figure 5.1-1 presents a simple comparison of California's fleet per vehicle type versus the North Carolina fleet composition[16,17]. The fleet was binned into the 5 MOBILE5 vehicle classification bins for simplicity. Table 5.1-1 provides the mapping from MOBILE5 vehicle bins to MOBILE6.2 and a detailed description of vehicle weights that fall into each category. Several noteworthy fleet differences are immediately shown. North Carolina has about 11% more light-duty gasoline vehicles (i.e., passenger cars) than California, 7% fewer light-duty gasoline trucks 1 (i.e., pickup trucks and SUVs under 6,001 lbs. gross vehicle weight rating), and 6% fewer light-duty gasoline trucks 2 (i.e., pickup trucks and SUVs between 6,001-8,500 lbs gross vehicle weight rating).

Figure 5.1-1. NC and CA Composition of Fleet per Vehicle Type[16,17]

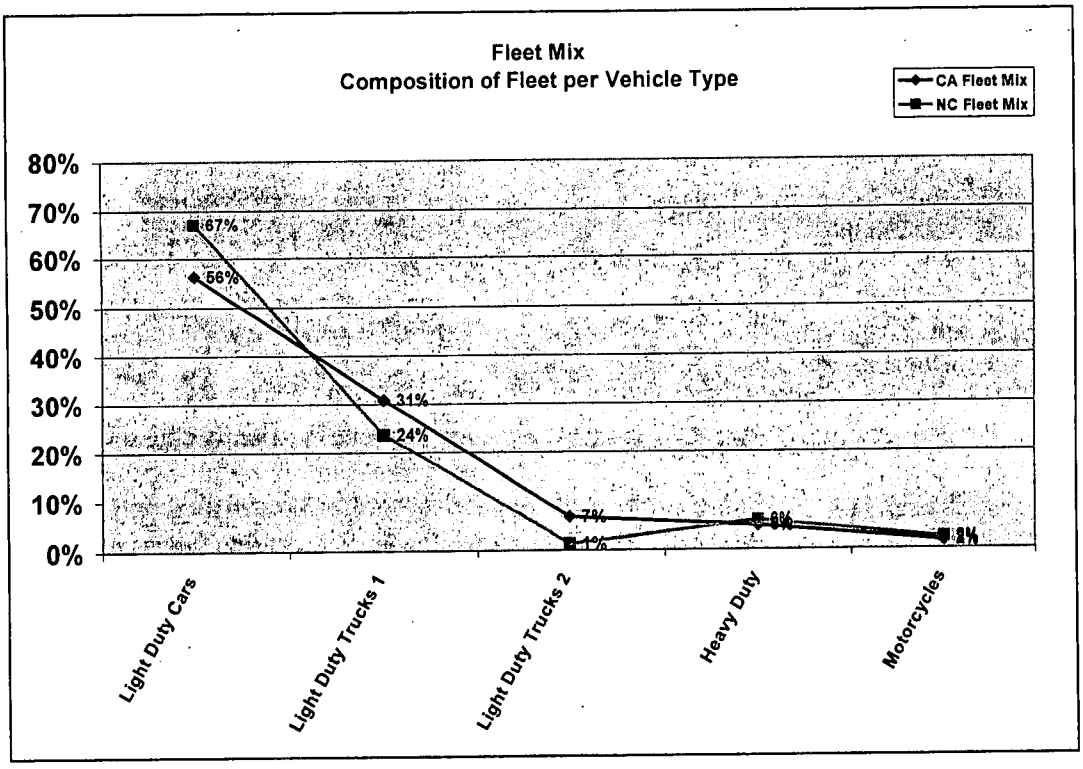


Table 5.1-1. Description of MOBILE5 and MOBILE6.2 Vehicle Classifications

MOBILE5	MOBILE6.2	Description
Light-Duty Cars	LDV	Light-Duty Vehicles (Passenger cars)
Light-Duty Trucks 1	LDT1	Light-Duty Trucks 1 (0-6,000 lbs. GVWR, 0-3750 lbs. LVW)
	LDT2	Light Duty Trucks 2 (0-6,001 lbs. GVWR, 3751-5750 lbs. LVW)
Light-Duty Trucks 2	LDT3	Light Duty Trucks 3 (6,001-8500 lbs. GVWR, 0-5750 lbs. ALVW)
	LDT4	Light Duty Trucks 4 (6,001-8500 lbs. GVWR, >5750 lbs. ALVW)
Heavy Duty Vehicles	HDV2B	Class 2b Heavy Duty Vehicles (8501-10,000 lbs. GVWR)
	HDV3	Class 3 Heavy Duty Vehicles (10,001-14,000 lbs. GVWR)
	HDV4	Class 4 Heavy Duty Vehicles (14,001-16,000 lbs. GVWR)
	HDV5	Class 5 Heavy Duty Vehicles (16,001-19,500 lbs. GVWR)
	HDV6	Class 6 Heavy Duty Vehicles (19,501-26,000 lbs. GVWR)
	HDV7	Class 7 Heavy Duty Vehicles (26,001-33,000 lbs. GVWR)
	HDV8A	Class 8a Heavy Duty Vehicles (33,001-60,000 lbs. GVWR)
	HDV8B	Class 8b Heavy Duty Vehicles (>60,000 lbs. GVWR)
	HDBS	School Buses
	HDBT	Transit and Urban Buses
Motorcycles	MC	Motorcycles (All)

5.1.2 Vehicle Age Distribution Comparison

Since light-duty gasoline vehicles (i.e., passenger cars) make up about two-thirds of North Carolina's registered fleet, NCDAQ examined the age of that vehicle class in North Carolina and California. Figure 5.1-2 shows the percent by age for passenger cars. While there is a slightly greater percentage of 1 and 2 year old passenger cars in California and equal percentages of 3 year old passenger cars, North Carolina has a greater percentage of 4 to 12 year old passenger cars and fewer 13 to 25 year olds. The yellow line on the graph represents a subset of the North Carolina statewide data for the Charlotte-Gastonia area. This subset indicates a much newer fleet of passenger vehicles in those counties. This is not unexpected however, due to Charlotte being the largest urban area in North Carolina. Generally, fleets weighted towards newer vehicles will result in quicker realization of control program benefits because of faster fleet turnover, even though the long-term benefits will be similar.

5.1.3 VMT Fraction Comparison

Finally, NCDAQ processed the California and North Carolina fleet demographic data to determine the fraction of VMT by vehicle class for the year 2010. This is often referred to as the VMT mix or VMT fraction. The methods used in determining the VMT fractions are consistent with USEPA guidance[7]. As shown in Figure 5.1-3, California light-duty gasoline car and truck owners are projected to drive their vehicles slightly more than North Carolinians in year 2010. Generally, however, there is not a great difference in the VMT fractions when using USEPA's methodology.

Figure 5.1-2. Light Duty Gasoline Vehicles, Percent by Age, NC and CA

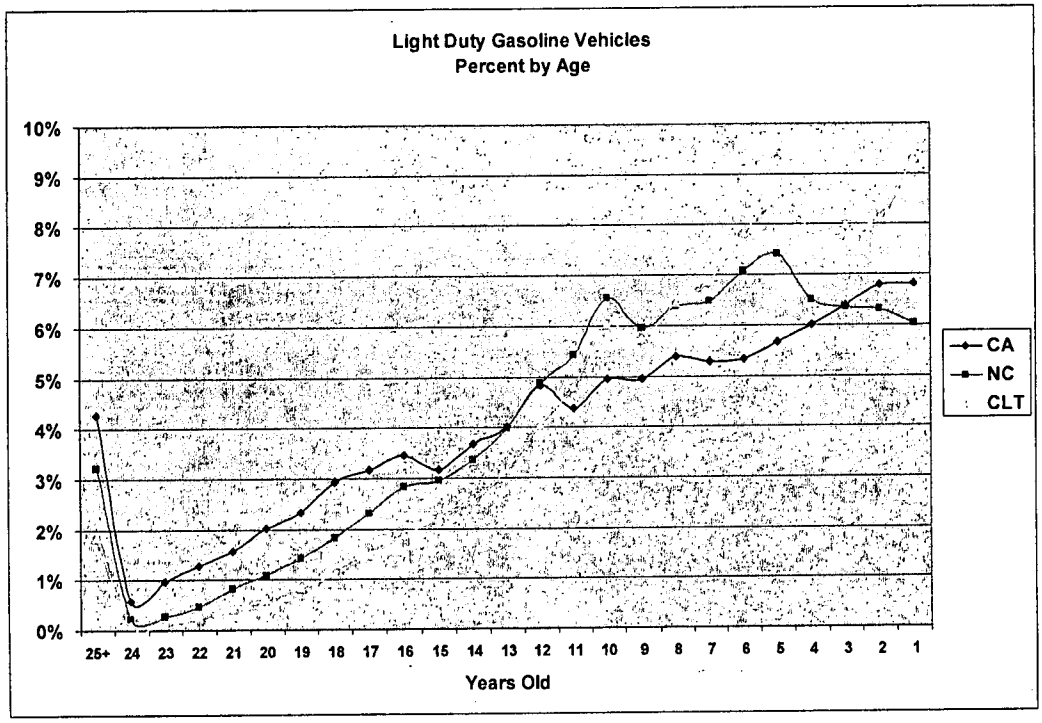

Figure 5.1-3. Percent of VMT per Vehicle

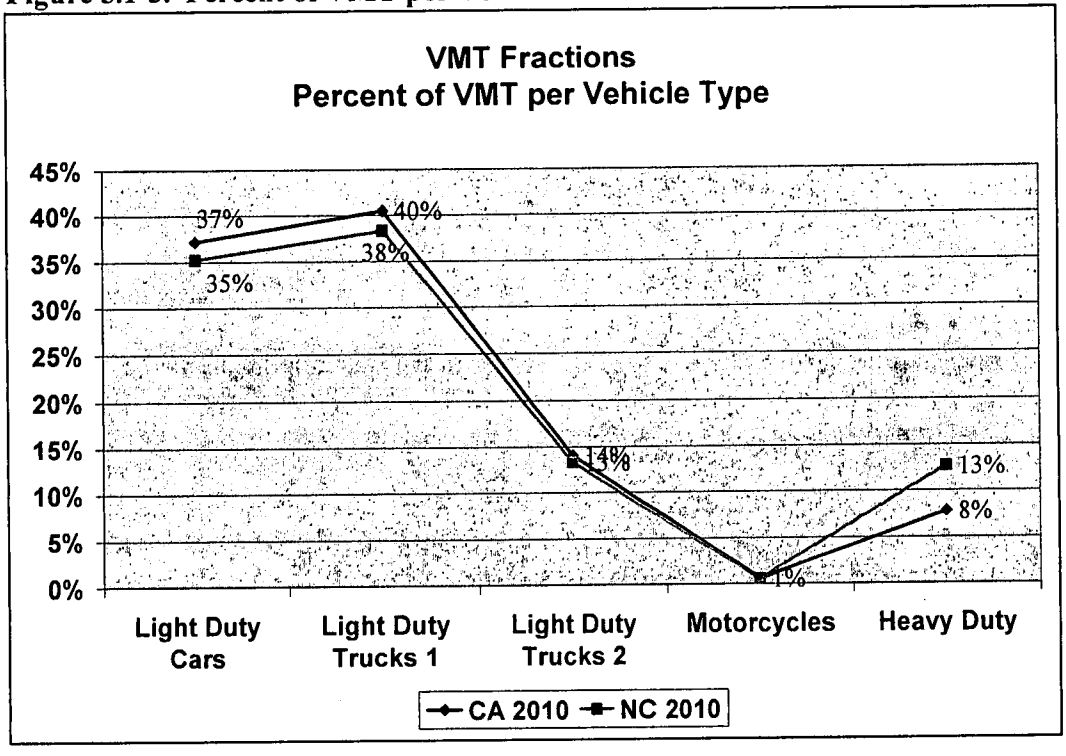

5.2 Qualitative Assessment of Enforcement Options

Based on the data summarized in Section 5.1 above, if one generally assumes passenger vehicles are cleaner emitting vehicles than light-duty trucks, and newer vehicles generally emit less than older vehicles, then one can qualitatively assert that the light-duty gasoline vehicle fleet registered in North Carolina is cleaner than California's registered light-duty gasoline vehicle fleet. This data (i.e., especially the greater percentage of passenger cars) may be an indicator that a fleet average requirement will not be difficult to meet in North Carolina and thus a "simple certification" enforcement program might result in similar benefits, while requiring fewer state resources. However, it should be noted that historical fleet demographic data would not necessarily represent future demographics, which will be impacted by short-term economic trends, long-term trends in vehicle longevity and use, and other factors such as fuel costs.

6. Staff Resource Needs

6.1 Enforcement at DMV and NCDAQ

NCDAQ collected information on state air quality agency staffing needs associated with implementing and enforcing a CA LEV-II program. Discussions with the Washington State Department of Ecology, Air Quality Program[18] revealed they had recently spoken with other states that had already adopted CA LEV-II programs to better understand staff resource needs. Washington indicated both New York and Massachusetts have staffs of two to three people (not completely full time) on CA LEV-II.

The primary point of enforcement/compliance for a CA LEV-II program would most likely be the State's Division of Motor Vehicles (DMV), while the air quality agency staff would perform audits, monitor performance of the program, handle public outreach, registration, and vehicle availability issues.

6.2 Impacts to Existing Tasks at NCDAQ

Another possible resource concern, considered by NCDAQ is the impact to existing tasks, such as transportation conformity, SIP modeling, and emission inventories. Due to the more complicated mobile source emission estimation techniques involved with a CA LEV-II program, there is some concern that timelines on these core tasks could be lengthened. This would not only impact NCDAQ, but the other groups involved in the transportation conformity process as well, such as local air quality agencies, metropolitan planning organizations, and rural planning organizations.

NCDAQ Analysis of CA LEV-II Vehicle Emissions Standards

Presented to the Environmental Review Commission

May 3, 2006

Brock M. Nicholson, P.E.
Deputy Director, NCDAQ

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Outline

- Air Quality in North Carolina
- Review of Vehicle Standards
- CA LEV-II Project
- CA LEV-II vs. Federal Tier 2
  - NOx and VOC emissions benefits
  - Projected impacts on ambient air quality
- Fleet Averaging
  - Comparison of CA and NC fleets
- Resources
- Options/Next Steps

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality - Ozone

- All* areas of NC are attaining the 8-hr ozone standard except the Charlotte area
  *Triangle status pending USEPA approval
- Recall... NOx + VOC + sunlight = ozone
- NOx
  - precursor pollutant of concern in NC
  - majority of VOCs come from natural sources
- On-road mobile sources contribute significantly to the total NOx emissions in NC

North Carolina Department of Environment and Natural Resources
Division of Air Quality

VOC emissions

Typical Summer Weekday

Division of Air Quality

Vehicle Emissions Standards in the US

- Federal – Currently "Tier 2"
  - Adopted in 1999
  - Phased in 2004-2010
  - Fleet Average Requirement for NOx
  - Covers all States
  - Federal Clean Air Act (CAA) Section 209(a) "preempts" states from establishing separate standards
- California – Currently "CA LEV-II"
  - CAA Section 209(b) exempts California from the Sec 209(a) preemption
  - However, CA must obtain a waiver from USEPA for state standards to be effective
    - CA standards must be equal to or more stringent than the Federal standards
  - Fleet Average Requirement for VOC

Objective of this Analysis

- Estimate the NOx and VOC emissions benefits of adopting California Vehicle Emission Standards (CA LEV-II) in NC
- Apply knowledge from recent 8-hour ozone modeling studies to estimate the impacts of adopting CA LEV-II
- Compare the NC and CA vehicle fleet and age distributions to assess the need for "fleet averaging"
- Estimate State staffing resources needed if NC adopts CA LEV-II

North Carolina Department of Environment and Natural Resources
Division of Air Quality

CA LEV-II vs. Federal Tier 2

- CA LEV-II program starts with model year 2010 vehicles
- CA LEV-II emissions estimates include:
  - Fleet averaging enforcement
  - Zero Emitting Vehicle (ZEV) component
  - Phase-in percentages by exhaust certification bin
    - Provided by USEPA in MOBILE6.2 ready format
      - Represents the California Air Resources Board (CARB) phase-in schedule
      - It represents an estimate of the mix of vehicles that manufacturers will distribute to meet the fleet average standard

CA LEV-II vs. Federal Tier 2

Emission estimates were developed using:

- USEPA motor vehicle emissions model (MOBILE6.2)
- USEPA mobile modeling guidance
- NC specific input data including:
  - Vehicle mix, vehicle age distribution, vehicle miles traveled (VMT), speeds, Inspection/Maintenance Programs (I/M), fuels, temperatures
- Federal Tier 2 estimates for 2004, 2010, 2020 and 2030
- CA LEV-II estimates for 2010, 2020 and 2030

Methods: USEPA Technical Guidance on the Use of MOBILE 6.2 for Emission Inventory Preparation, August 2004

North Carolina Department of Environment and Natural Resources

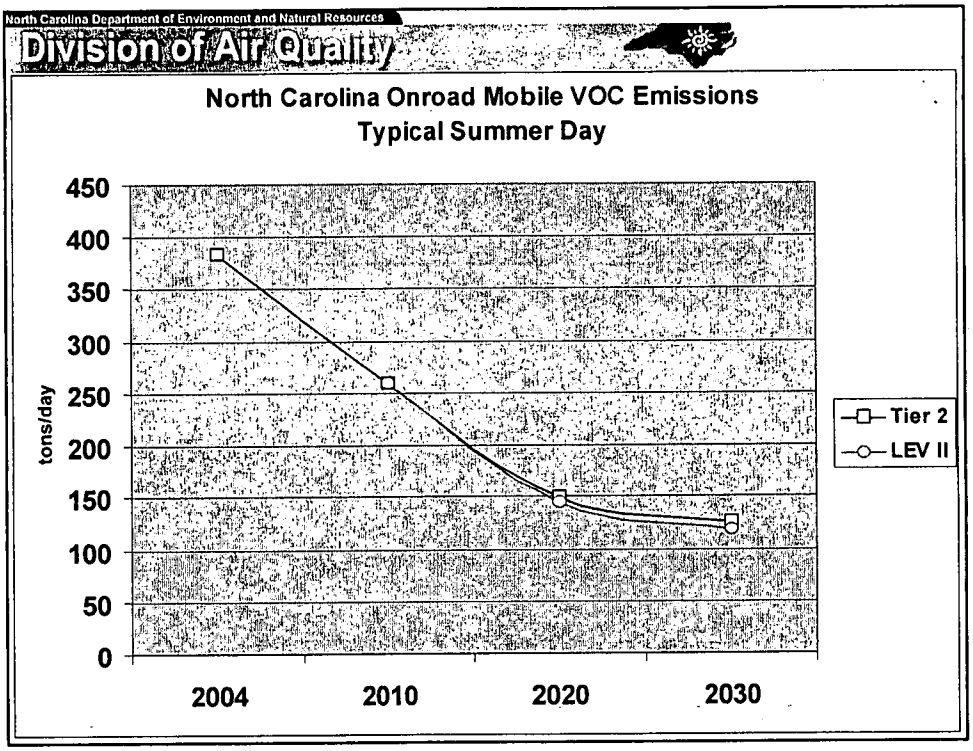
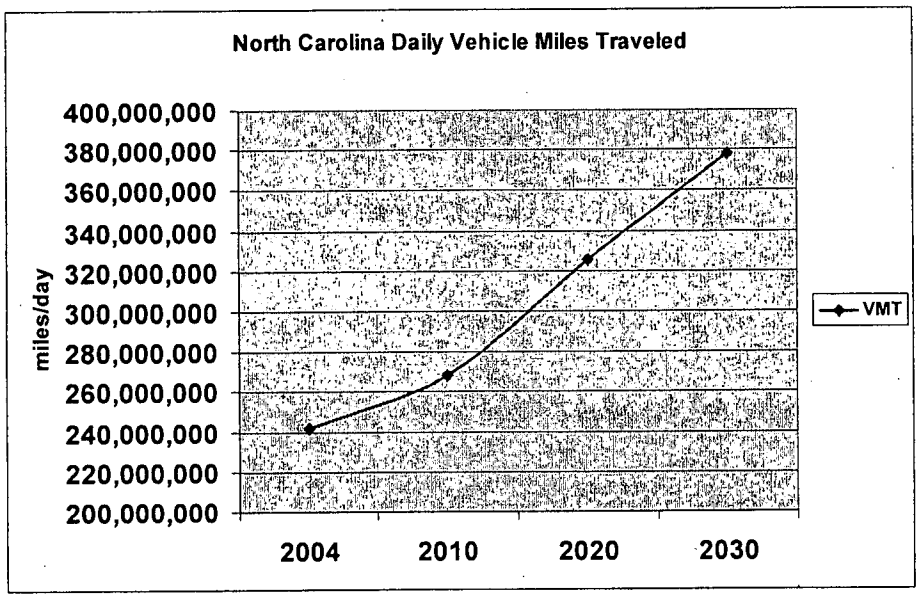
North Carolina Department of Environment and Natural Resources

Division of Air Quality



North Carolina Department of Environment and Natural Resources

Division of Air Quality



CA LEV-II vs. Federal Tier 2

Emissions Reductions Summary

- On-road mobile sources only
- CA LEV-II Program in NC starting with model year 2010

	2010	2020	2030
NOx	0.1%	4%	10%
VOC	0.1%	3%	6%

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality Modeling

- During NCDAQ's current SIP modeling...

  Air Quality modeling sensitivities were performed by NCDAQ to assess the impacts of *additional* future year NOx emissions reductions from on-road mobile sources

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality Modeling

Future year (2009) NOx emissions from on-road mobile sources were reduced by 10% in the following counties:

Mecklenburg

Union

Gaston

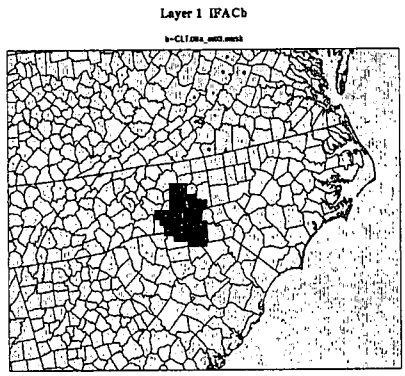
Lincoln

Iredell

Cabarrus

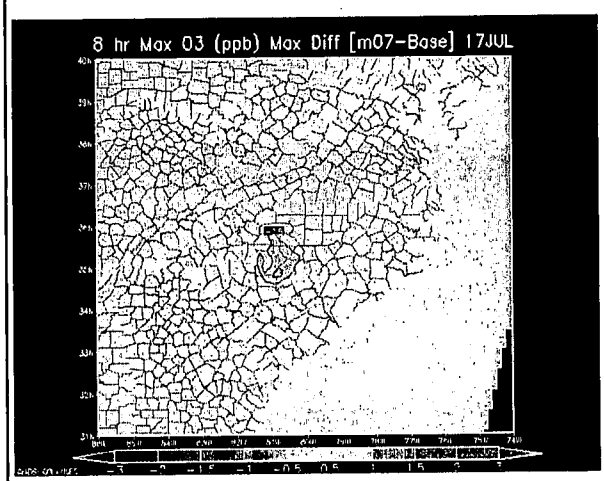
Rowan

The 10% NOx reduction in 2009 is equivalent to ~10 tons/day in this region



North Carolina Department of Environment and Natural Resources
Division of Air Quality

Air Quality Modeling



- 10 tons/day on-road mobile NOx reduction across the Metrolina area resulted in lowering 8-hour ozone concentrations by 0.1 to 1.0 ppb in 2009
- Only 1 of the 7 modeled days resulted in changes as high as 1.0 ppb (shown)
- Only 2 of the 7 modeled days resulted in changes as high as 0.5 ppb

Air Quality Modeling

For the Metrolina area...

2009 on-road mobile NOx ~ 100 tons/day (w/ Tier 2)

2020 on-road mobile NOx ~ 25 tons/day (w/ Tier 2)

If...

- 10% = 10 tons/day NOx in 2009 = 1 ppb max benefit

Then..

- 4 % = 1 ton/day NOx in 2020 = 0.1 ppb max benefit

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Fleet Characteristics

- Comparison of the NC and CA vehicle fleets
  - Composition
  - Age distributions
- Assess the value of "fleet averaging" enforcement

North Carolina Department of Environment and Natural Resources

Division of Air Quality

Staff Resources

- DAQ and DMV
  - DMV: Primary point of enforcement
  - DAQ: Audits, monitor performance of program, public outreach and troubleshoot registration issues
- Fleet average enforcement
  - *Potential* State staffing requirements with fleet average enforcement
    - Washington, 1.5 full time employees (FTEs)
    - New York, 2-3 people (not full time)
    - Massachusetts, 2-3 people (not full time)
  - Potential duties of DAQ Employees
    - Enforce compliance of fleet average requirement
    - Work with manufacturers / dealers and public on vehicle model availability issues

Source: NCDAQ, Washington State Department of Ecology-Air Quality Program

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Staff Resource Impacts

- Existing Tasks:
  - Transportation conformity, SIP modeling and emissions inventories would require more time and resources due to more complicated mobile sources emissions estimation techniques
  - This would also impact Local Air Quality Agencies, Metropolitan Planning Organizations and Rural Planning Organizations involved in the transportation conformity process

Source: NCDAQ, Washington State Department of Ecology-Air Quality Program

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Summary

- CA LEV-II benefits relative to Federal Tier II in future years:
  - NOx emissions would be reduced by 0.1%, 4% and 10% in 2010, 2020 and 2030, respectively
  - VOC emissions would be reduced by 0.1%, 3% and 6% in 2010, 2020 and 2030, respectively
  - Air Quality benefits: Less than 0.1 ppb ozone reduction in 2020

North Carolina Department of Environment and Natural Resources
Division of Air Quality

Summary - continued

- Air Quality: Ozone concentrations would change *less than* 0.1 ppb in 2020
- Vehicle fleet age: NC currently has a newer fleet of light duty vehicles (passenger cars) than California
- Vehicle population: NC has a greater number of light duty vehicles (passenger cars) and fewer light duty trucks (including SUVs) than California
- Implementation Resources: Other States suggest 1-2 employees needed for enforcement of fleet average requirements
- Implications for ongoing DAQ activities: More complicated emission estimation techniques would lengthen NCDAQ timelines for transportation conformity, SIP modeling and emission inventories

Department of Environment and Natural Resources

Division of Water Resources

STATUS REPORT TO THE GENERAL ASSEMBLY

ON

WATER SUPPLY PLANNING

SEPTEMBER 1, 2006 THROUGH AUGUST 31, 2007

Assuring a sustainable future water supply for North Carolina is the primary mission of the Division of Water Resources (DWR or the Division). To carry out this responsibility, the Division administers several monitoring, planning and regulatory programs.

DWR, in partnership with the US Geological Survey, monitors the availability of water across the state by means of a network of monitoring wells and stream gages. DWR receives and maintains water use data from the mandatory registration of large water withdrawals.

DWR assists community water systems with the preparation of Local Water Supply Plans and prepares the North Carolina Water Supply Plan. In partnership with local governments and other water users, the Division is in the process of preparing long term water supply plans for each river basin to assure the sustainability of future water supplies.

DWR issues permits for water withdrawals in designated capacity use areas, manages applications for certification of interbasin transfers of surface water, and is the lead agency for the Department of Environment and Natural Resources in the relicensing of hydropower projects.

This status report provides an update on these water supply programs and on other related Division activities.

Water Availability Monitoring

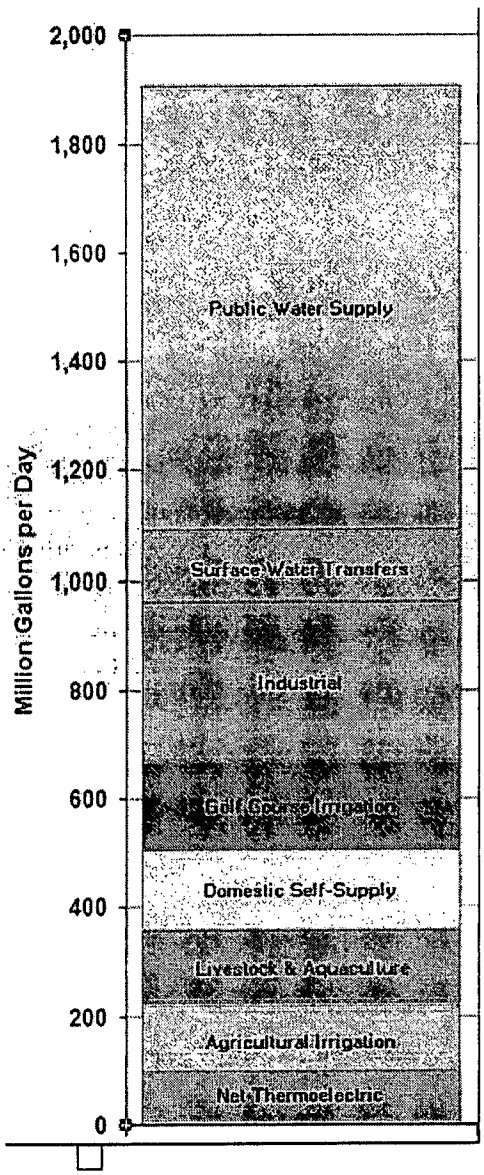
The Division maintains ground water and surface water monitoring networks both directly and in partnership with federal agencies. The data from these networks provide essential information on the condition of water resources throughout the state. North Carolina cooperates with the United States Geological Survey to maintain stream gage sites with real time data collection capabilities. Also, the Division maintains a large network of ground water monitoring wells. Data from these wells are collected quarterly. About fifty percent of these wells have data recorders that collect daily water level data. To improve the accessibility and usefulness of this data for water resource management, the Division has recently joined with the State Climate Office at NC State University, the US Army Corps of Engineers, the United States Geological Survey and others to develop a uniform database to store and disseminate water resources data.

In recent years, with the support of the General Assembly, the Division has expanded the monitoring well network in the Coastal Plain region, an area where ground water resources are being stressed by over-pumping. Twelve new wells at three monitoring stations were added over the last year to aid in management of the regional aquifer systems. The Division will expand the monitoring well network as funds permit to improve data for ground water management.

Changes to the funding formula for the monitoring stations operated cooperatively with the United States Geological Survey have resulted in the discontinuance of data

collection at some monitoring sites. Maintenance of near-real time data reporting in the monitoring system will require additional funds in the near future to upgrade existing equipment.

Water Use Monitoring
2005 Estimated
Water Withdrawals in North Carolina



The graph above shows estimated current water withdrawals by the major groups of water users compiled from data collected and estimated by Division of Water Resources and by the U.S. Geological Survey.

Knowing how much water is being withdrawn by water users across the state is vital information for effective water resources planning. Currently, water use data are collected through several programs. Units of local government that provide water to the public and other large community water systems submit water use information at least every five years in their Local Water Supply Plans. Large self-supplied water users report water use data every five years under the water withdrawal registration program. This program requires non-agricultural facilities that withdraw 100,000 gallons per day or more and agricultural operations that withdraw one million gallons per day or more to register their withdrawals and to periodically report withdrawal data to the Division.

Additional reporting requirements apply in the fifteen counties of the Central Coastal Plain Capacity Use Area. Permitted water users submit water use data to the Division monthly. Others that withdraw 10,000 gallons per day or more must annually report monthly water use.

The five year pattern of updates under the local water supply planning and water withdrawal registration programs leaves significant gaps in our historical water use data. Final adoption in March 2007 of new rules governing water use during droughts will help to fill some of these gaps. As part of these rules, beginning in 2008, water systems that have to prepare a Local Water Supply Plan under G.S. 143-355(l) and water withdrawers that have to register under G.S. 143-215.22H must report

water use data to the Division annually. To simplify the reporting process, DWR will have an online reporting program available so water systems can submit their data electronically.

Local Water Supply Plans

The General Assembly established a water supply planning program under General Statutes 143-355(l) and (m) to assure the availability of adequate supplies of good quality water to protect the public health and to support desirable economic growth. Local Water Supply Plans are required from units of local government that supply or plan to supply water to the public and from other community water systems that regularly serve 1,000 or more service connections or 3,000 or more individuals.

Local Water Supply Plans describe current water use and future water needs and assess the water system's ability to meet those needs. The plans must be adopted by the water system's local governing board and be updated at least every five years. The Division of Water Resources is responsible for reviewing Local Water Supply Plans for completeness and consistency.

The plans provide a valuable source of data for all local and regional water supply planning. Information from the local plans is available on the Division's web site www.ncwater.org. The 2002 Local Water Supply Plans are the most recent statewide updates. Of the 620 water systems from whom we expected to receive an updated plan we got draft plans from 526 by the end of 2006.

During the period covered by this report DWR began the process of staggering the submissions of Local Water Supply Plans. As a first step in the transition to staggering local plan submissions, the Division requested updated local plans from the 114 water systems that get their water from the Neuse and Roanoke river basins. Because of the statutory requirement for five-year updating, water systems in the other river basins are required to update their local plans in early 2008 based on conditions in 2007. Beginning in 2009 staggered updating will resume so that water systems in two to four of the major river basins will be updating their Local Water Supply Plans each year. Local Water Supply Plans are accessible from the Division's website at www.ncwater.org.

A revised online reporting program has simplified local plan submission for many water systems. Of the 106 water systems that had submitted their 2006 plans by August 14th, 100 of them did so online while only 6 submitted paper forms. Online submissions simplify the process, aid database development and provide the opportunity for realtime technical assistance from Division staff during plan preparation.

Session Law 2003-387, which expanded the scope of water systems required to prepare a Local Water Supply Plan, also added the requirement that water systems include a description of how they will respond to drought and other water shortage emergencies. Rules governing water use during droughts, which became effective on March 19, 2007, provide guidance on what should be included in these Water Shortage Response Plans. In addition, the rules include default water shortage response actions that must be taken by water systems that do not have a written Water Shortage Response Plan in place when the NC Drought Management Advisory Council designates their region as suffering from Extreme or Exceptional Drought conditions. Of the water systems that submitted a 2006 local plan, 75

percent included a Water Shortage Response Plan. Division staff members provide assistance with developing Water Shortage Response Plans.

North Carolina Water Supply Plan (NCWSP)

The Division uses the information from the LWSPs and other sources to develop the North Carolina Water Supply Plan (NCWSP), mandated by G.S. 143-355(m). The NCWSP presents a summary of water use by major river basin and identifies areas of concern where water availability or conflicts between users may limit the ability to meet water demands.

The 2001 NCWSP is available on the Division's web site at www.ncwater.org. The plan is based on information from the 1992 and 1997 LWSPs and 1999 water withdrawal registrations submitted pursuant to General Statute 143-215.22H. No changes were made to this document during the period covered by this report. The NCWSP will be updated to reflect information in the River Basin Water Supply Plans discussed in the next section.

River Basin Water Supply Plans

To further the legislative goal of assuring the availability of adequate supplies of water, the Division of Water Resources is developing a River Basin Water Supply Plan for each of the major river basins in the state. River basin water supply planning is a tool to support sustainable management of our river basins. This program will provide reliable, quantitative methods to plan for sustainable water use and an objective basis for management and regulatory decisions.

The River Basin Water Supply Plans provide a basin analysis of estimated future water supply demands, using a computer-based hydrologic model that characterizes water flow in a basin. The hydrologic models provide a tool to analyze the effects of future water withdrawals and wastewater discharges over the range of high and low river flows that have occurred in the basin. By projecting water needs to 2050 and evaluating these future demands with a hydrologic model, we will be able to identify areas where supplies may not be adequate to meet projected demands and where potential water use conflicts may occur. The River Basin Water Supply Plans and associated hydrologic models will give the Division, local governments and other water users a reliable, quantitative framework within which to plan for sustainable and cost-effective water sources to meet future needs.

The Division developed a Cape Fear River Basin Water Supply Plan in 2002 in conjunction with analysis of allocations of water supply storage in B. Everett Jordan Lake. This model has been updated with the technical and financial support of water users in the basin that have recognized the value of the model as a water supply planning tool. The Division has begun work to update the plan and will be meeting with basin stakeholders in October to solicit their input and support.

Hydrologic models were constructed for the Catawba and Yadkin river basins in conjunction with the relicensing of the hydropower projects on these rivers. The Division worked closely with stakeholders and with the utility companies in these basins to estimate long-term water supply needs that were then included in the modeling of management options for the future. These analyses formed the basis of settlement agreements and license applications submitted to the Federal Energy Regulatory Commission. Hydrologic models for the Neuse, Roanoke and Tar-Pamilico river basins are in the initial stages of development.

Data from the River Basin Water Supply Plans will be available to the Division of Water Quality for use in the development of their Basinwide Water Quality Plans.

Water Use During Droughts

Session Law 2002-167 (House Bill 1215) required the Environmental Management Commission (EMC) to develop administrative rules establishing minimum standards and practices for water use during drought and water emergencies. The Division coordinated the effort to develop these rules that became effective in March 2007. The rules establish minimum criteria for how a wide variety of water users are expected to prepare for and manage water use during droughts and other water shortage emergencies. To provide important drought management data, the rules require municipal and large community water systems to annually report water use data to the Division. Other large water withdrawers such as industries, power plants and agricultural operations also have to report annual water use data. This reporting requirement will provide the Division and the NC Drought Management Advisory Council with crucial information to assist drought response activities.

Central Coastal Plain Capacity Use Area

Rules creating the Central Coastal Plain Capacity Use Area (CCPCUA) and establishing a water withdrawal permitting system became effective August 1, 2002. The rules were fashioned to gradually reduce withdrawals from the endangered Black Creek and Upper Cape Fear aquifers in the fifteen designated counties. The rules require stepped reductions in withdrawals from the endangered aquifers over a sixteen-year transition period and encourage the development of alternative sustainable sources of water. Anyone wishing to withdraw more than 100,000 gallons a day of ground water must apply for and receive a permit from the Division of Water Resources. As of August 27, 2007, there were a total of 205 permitted users in the Central Coastal Plain Capacity Use Area. At that time there were ten applications for new permits and renewals under review.

The CCPCUA rules provide an initial six-year period for systems to develop plans to adjust water withdrawals and develop alternative sources. Affected water withdrawers are required to make reductions in water use from the impacted aquifers by August 2008 to meet the first of three reduction thresholds. Public water supply systems have made significant progress toward meeting these goals through development of regional water authorities and other water sharing arrangements. In addition, a new surface water intake is under development on the Neuse River in Lenoir County. Additional information on the Central Coastal Plain Capacity Use Area and the associated rules can be found on the Division's website at www.ncwater.org.

Southern Coastal Plain Capacity Use Investigation

In December 2002, the Water Allocation Committee of the EMC asked the Division to conduct a capacity use investigation of the Southern Coastal Plain area surrounding Bladen County. The study determined that there are areas in the region where ground water levels are declining due to overpumping.

The monitoring well network in this region is sparse and new wells need to be added to effectively monitor the area. Water users in Scotland, Robeson, Hoke, Bladen and Sampson counties are cooperating on studies to identify long-term water supply solutions for the region. One study shows that water users in Scotland, Hoke and western Robeson counties

can likely meet predictable demand from existing sources without causing significant reductions in ground water levels. More monitoring is needed in this area to understand how much water could be available to provide for unexpected demands such as a new industrial facility or increased agricultural irrigation.

Water users in Sampson, Bladen and eastern Robeson counties are investigating the development of a surface water treatment plant using water from the Cape Fear River to reduce ground water withdrawals from the underlying confined aquifers. The proposed intake and water treatment plant will supply water to Smithfield Foods and to some of the surrounding water systems that currently use the same impacted aquifer. The number of communities that will be connected to the new surface water supply has not been finalized.

The Lumber River Council of Governments (LRCOG) is coordinating these water supply planning activities as required by an agreement signed by the EMC, DWR and LRCOG to improve management of regional water sources. The Southern Coastal Plain Capacity Use Investigation report is available on the Division's website at www.ncwater.org.

Interbasin Transfer Certifications Many communities in North Carolina are located on or near the high ground that creates the divides between river basins. Other communities are located in the headwaters of river basins where the limited water supply availability has proven to be inadequate as the economy and population of the state has grown. In these situations, municipal water systems may need to move water between river basins. Carefully regulated interbasin transfers can be the most practical, economical and environmentally sound way to provide water and sewer service to the residents of some communities and to support the growth of the State's economy. However, the Surface Water Transfer Act must be applied in a way that will assure that the economy and resources of the source river basin are protected.

Initiating new transfers or increasing existing transfers of surface water between legislatively defined river basins is regulated by General Statute 143-215.22I. The river basin boundaries established by this statute are defined in G.S. 143-215.22G and its associated map that has been filed with the Secretary of State.

Anyone wishing to initiate a transfer of two million gallons of water a day, to increase a transfer permitted under relevant statutes prior to July 1, 1993, or to increase a transfer above their system's capacity to transfer water on July 1, 1993, such that the new transfer would be more than two million gallons a day, must obtain permission from the Environmental Management Commission.

G.S. 143-215.22G provides a list of potential impacts in the source and receiving basins that must be considered by the EMC in determining whether or not to grant a certificate. The process requires an environmental analysis and provides opportunities for public comment. If the EMC concludes, based on the findings of fact, that the benefits outweigh the detriments a certificate is issued for a specific volume of water and will include provisions to mitigate detriments. The EMC can issue a certificate for a volume other than that requested and can attach conditions to the certificate.

While many communities move water between river basins, prior to 2007 there have only been three Interbasin Transfer Certificates issued under the current legislation. Charlotte Mecklenburg Utilities has a certificate to transfer up to 33 million gallons per day from the Catawba River to the Rocky River basin. Cary, Apex, Morrisville, and Wake County jointly hold a certificate to transfer up to 24 million gallons per day from the Haw River basin to the Neuse River basin. The Piedmont Triad Regional Water Authority was issued a certificate to transfer up to 30.5 million gallons per day from the Deep River to the Haw River and Yadkin River basins.

In March 2007 the Environmental Management Commission issued an Interbasin Transfer Certificate to the Cities of Concord and Kannapolis to transfer up to 10 million gallons per day from the Catawba River Basin and 10 million gallons per day from the Yadkin River Basin to the Rocky River Basin. This decision is being challenged under the Administrative Procedures Act.

Interbasin Transfer Requests

The Greenville Utilities Commission is working with several neighboring communities to develop a regional solution to replace ground water currently being pumped from the regulated aquifers in the Central Coastal Plain Capacity Use Area. Sharing surface water to reduce ground water withdrawals will require an IBT certificate. Water systems pumping water from the regulated aquifers face an August 2008 deadline to reduce their ground water withdrawals from those aquifers.

Hydropower Facility Relicensing

The Federal Energy Regulatory Commission (FERC) licenses non-federal hydroelectric generation projects on navigable waterways. The licenses, issued for 30 to 50 years, govern how the hydroelectric projects are managed and therefore how the rivers on which they are located are affected. Upon expiration of an existing license, the licensee has to apply for a new license in order to continue operating the project. Five years prior to the expiration date of an existing license, the licensee has to file a Notice of Intent to apply for a new license. The license application is filed 24 months before the expiration of the existing license. The three years between filing the Notice of Intent and the filing of the license

application are used to compile the data needed to evaluate the impacts of a project on regional resources and to draft the application and requested provisions of the new license.

Three major projects in the Nantahala and Tuckasegee river basins have license applications that are under review by FERC. Also, three projects that include most of the major reservoirs on the Catawba and Yadkin-Pee Dee Rivers in North Carolina have licenses that expire in 2008. The licensee's applications for new licenses are currently under review and environmental analysis by FERC. DWR has worked closely with the licensees to ensure that water supply issues are given due consideration in the relicensing process. Development of river basin water supply plans for the Catawba-Wateree and Yadkin-Pee Dee river basins has been greatly facilitated by the computer models developed in conjunction with the relicensing process. In the Catawba-Wateree River Basin, the licensee funded an independent study of future water use in North Carolina and South Carolina through 2058. The results of this study were used in the analysis of alternative operating scenarios.

MEMORANDUM

To: The Honorable Pryor Gibson, Co-Chair, Environmental Review Commission
The Honorable Daniel Clodfelter, Co-Chair, Environmental Review Commission
The Honorable Charles Albertson, Co-Chair, Environmental Review Commission
The Honorable Lucy Allen, Co-Chair, Environmental Review Commission

From: William G. Ross, Jr. WGR

Subject: Annual Mining Permit Fee Use Report

G. S. 74.54.1 (c) of The Mining Act of 1971 requires the Department of Environment and Natural Resources to report annually to the Environmental Review Commission on the mining permit fees collected and use in implementing the state's mining program.

Attached is this year's report. If you have any questions, please contact Jim Simons, Director of the Division of Land Resources at 733-3833.

Cc. Ms. Elizabeth Self
Ms. Robin Smith
Ms. Kristin Walker

MINING PERMITTING PROGRAM

Fiscal Year 2006-2007

1. Monies Collected

Total fee monies of $56,127.00 were collected during fiscal year 2006-2007.

2. Monies Expended

Salaries and Benefits	$47,202.00
Purchased Services	$10,072.00
Supplies	$175.00
Other Expenses & Adjustments	$1670.00
Intragovernmental Transfer	$8.00
Total	$59,127.00

One position, an assistant mining specialist, was funded this year to assist in application review and permit issuance.

The General Assembly passed the authorization during the 2007 session to raise the mining permit fees effective August 1 to fund five additional mine inspector positions. Mine permitting activity, particularly permit renewals, is cyclic in nature because of the large number of permits issued when the program was just starting and the 10-year life of the many permits. It is anticipated that the increased revenue from the mining permit fee increase will fund one additional position this fall, and one or two additional positions in the spring of 2008.

The value of the additional mining field positions is two-fold. First, it will significantly increase the compliance monitoring effort for the permitted operations and reduce the number of the mines operating illegally without a mining permit. Secondly, the increased mining effort will help expedite mine permit application reviews by expediting field office reviews of the proposed mine sites.

Annual Report on Progress Toward SB 953 Goals

By the N.C. Department of Transportation, Public Transportation Division

ssion Law 1999-328, The Ambient Air Quality Improvement Act, established statewide goals for reducing the growth of vehicle miles traveled (VMT) in the state. The legislation directed the N.C. Department of Transportation to develop a plan to reduce VMT growth by 25 percent by July 1, 2009, focusing on job-related travel.

In April 2004, Secretary Tippett announced the completion of the Statewide Transportation Demand Management Plan. The plan was the culmination of work guided by a panel appointed by Governor Easley. From this work, guidelines were developed.

The goal of transportation demand management (TDM) is to focus on efforts to reduce demand for roadway space by influencing travel choices and the amount and timing of travel. TDM aims to encourage more walking, cycling, use of public transit, carpooling and telecommuting.

In 2004, NCDOT officially initiated funding to local TDM programs, awarding 50 percent of their administrative costs. Prior to that time, the department gave similar support for vanpool programs at Charlotte Area Transit System, Triangle Transit Authority and Piedmont Authority for Regional Transportation. New TDM programs joining that trio of systems were Cape Fear Breeze in Wilmington, University of North Carolina at Chapel Hill, N.C. State University, SmartCommute @ RTP and the City of Asheville.

Savings Resulting from the Use of Transit, Vanpools and Carpools from 2000 to 2007

1,130,419,575 = VMT

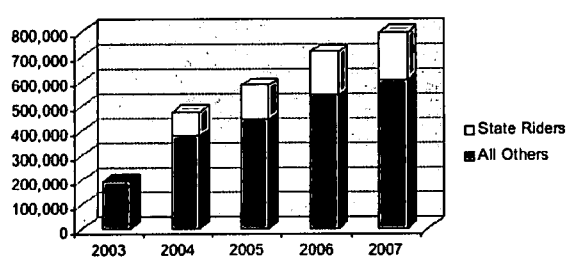
5,632,000 lbs. (2,816 tons) = NO_x

GoPass On the Go

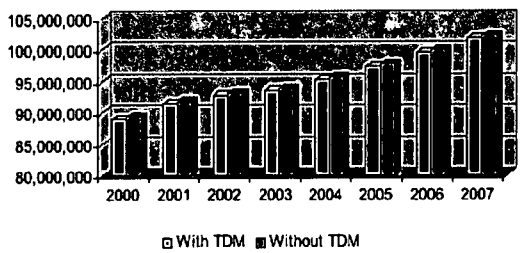
Capital Area Transit (CAT) in Raleigh introduced a fare-free program, now known as GoPass, in September 2002 for students and staff at N.C. State University. One year later, state and city employees began enjoying the benefit and were followed in fiscal year 2004-05 by Wake County workers and in 2005-06 by Meredith College students and staff. State employee ridership has increased 95 percent and total ridership has increased 212 percent over five years.

Following the success of CAT, Triangle Transit Authority began its GoPass program for state employees in October 2005 and has met with phenomenal success.

CAT GoPass Ridership



Daily Commuter Vehicle Miles Traveled

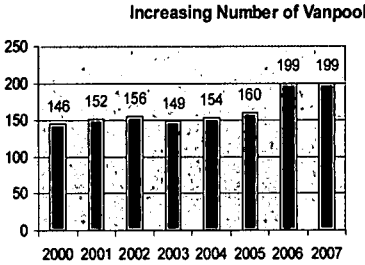


24% Reduction in Growth of Daily Commuter VMT

From 2000 to 2007, with commuter trips being accommodated in carpools, vanpools and transit, daily commuter VMT increased by 12,811,040 VMT. From 2000 to 2007, with commuter trips not being accommodated in these alternative modes, daily commuter VMT would have increased by 15,908,080 VMT, representing a 24 percent reduction in projected growth of commuter VMT.

More Vanpools, Carpools On the Road in North Carolina

Increasing Number of Vanpools



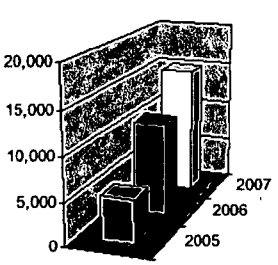
Vanpools and people interested in carpooling are increasing.

Between 2000 and 2007, the number of vanpools in North Carolina increased more than 27 percent. Vanpool programs are operated by the Charlotte Area Transit System, the Triangle Transit Authority, the Piedmont Authority for Regional Transportation and NCDOT, which contracts for service for the rural vanpool program.

The number of registrants in Share The Ride NC, the statewide Web-based rideshare matching program, grew 190 percent between 2005 and 2007.

Growth in Share The Ride NC Registrants

SHARE THE RIDE NC



North Carolina's Transportation Demand Management Programs

Program	Program Description

ASHEVILLE, CITY OF

The City of Asheville implemented its Blue Ridge Commuter Connections in FY 2006. The purpose of the program is to reduce emissions and congestion in the Asheville area by decreasing the number of single-occupant vehicles for commuter traffic into and around the city. The goals of the program for FY 2008 are to promote the Best Workplaces for Commuters Program, promote the Web-based rideshare matching software program ShareTheRideNC.org, investigate the Zipcar Program for downtown Asheville, design and promote a Commuter Club program, hire an intern to set up a commuter challenge for the 2008 Strive Not to Drive campaign, develop a TDM Web site with links to adjacent county Web sites, form a group of business leaders and government officials to provide input and guidance on the TDM work plan, and work closely with the French Broad River MPO and the local transit agency to locate park-and-ride lots.

CHARLOTTE, CITY OF

The City of Charlotte will continue to provide and promote alternate ways of commuting to the citizens who live and work in or near the Charlotte-Mecklenburg region. Activities to be undertaken in FY 2008 include promoting the Best Workplace for Commuters Program, expanding the mini-vanpool program, conducting transportation fairs to increase awareness of various transportation alternatives, increasing usage of the Charlotte Area Transit System (CATS) by bicycle riders, increasing Employee Transportation Coordinator membership, and increasing the use of vanpools in the Charlotte region. In addition, the TDM program will continue to advertise and utilize the Web-based rideshare matching program ShareTheRideNC.org for Mecklenburg County and surrounding counties. ~ The TDM program is housed at CATS and currently leases 78 vans. During FY 2006, it provided approximately 244,800 passenger trips on 80 vans, which averaged 89 miles per day, saving more than 21 million vehicle miles of travel.

N.C. STATE UNIVERSITY

The Transportation Department at N.C. State University implements travel demand management measures to maintain air quality and improve mobility options for the campus. Activities to be undertaken during FY 2008 include administering the U-Pass program; promoting the Wolftrails program and Web site through promotional items, articles in employee publications, the Technician newspaper, quarterly newsletters and brochures; participating in a spring promotional event in conjunction with Earth Day as well as Employee Appreciation Day to increase awareness of transportation options and register persons in the Web-based rideshare matching program; conducting an annual transportation survey to track commuter behavior; participating in the SmartCommute Challenge; assisting Triangle Council of Governments and other coalition partners in promoting/recruiting Best Workplaces for Commuters members; and conducting presentations to university employees to explain commute options supported by the university. NCSU will also work with TTA on the ReDefine Travel campaign to increase ridesharing and transit usage among students.

PIEDMONT AUTHORITY FOR REGIONAL TRANSPORTATION

PART receives financial support from the Cities of Greensboro, High Point and Winston-Salem. The goal of PART's Commuter Services Program is to increase the use of alternative transportation in the region by providing individuals and employers with information on transit, carpooling, vanpooling, park-and-ride lots and the Emergency Ride Home Program. PART will initiate a new hire pass program in the airport hub area and develop TDM initiatives for students at universities and colleges in the area. It will also participate in job fairs to market PART services, including the PART Express Bus service between High Point, Greensboro and Winston-Salem, and advertise the Web-based rideshare matching program ShareTheRideNC.org. It partnered with two other agencies to administer the first annual Triad Commuter Challenge and is expanding the coverage of the Emergency Ride Home Program to cover all alternative commuters instead of just vanpoolers. In addition, it will be developing a Best Workplaces for Commuters campaign. ~ PART currently leases 35 vans. During FY 2006, PART provided approximately 211,680 passenger trips on 28 vans, which averaged 64 miles each day and saved 6.7 million vehicle miles of travel.

RESEARCH TRIANGLE REGIONAL PUBLIC TRANSPORTATION AUTHORITY

TTA will continue to manage and operate the Triangle Area Rideshare Program which offers rideshare matching services, guaranteed ride home, van leasing for vanpools, and transit and park-and-ride information to employees and the general public in the three-county (Durham, Orange and Wake) and the greater Triangle area. Additional activities to be undertaken during FY 2008 include administering the statewide Web-based rideshare matching program ShareTheRideNC.org, providing assistance to employers in becoming designated as Best Workplaces for Commuters, organizing the SmartCommute Challenge, conducting Lunch and Learn events, distributing new hire packets to area employers, administering the employee commuter survey for the Durham Trip Reduction Ordinance, and promoting ridesharing and transit on campuses with the ReDefine Travel campaign. TTA will also continue promoting the GoTriangle.org Web site, which provides trip-planning information. ~ TTA currently leases 61 vans. During FY 2006, TTA provided approximately 398,602 passenger trips on 65 vans, which averaged 70 miles each day, saving 12.9 million vehicle miles of travel.

North Carolina's Transportation Demand Management Programs

Program	Program Description

SMARTCOMMUTE @ RTP

SmartCommute@rtp
The Research Triangle Park

This transportation management association, funded by the Research and Production Service Districts of Durham and Wake counties, will continue a transportation demand management program in the Research Triangle Park area with the overall goal of increasing the percentage of RTP employees using commute alternatives. Activities to be undertaken during FY 2008 include participating in the SmartCommute Challenge to encourage employees to try commute alternatives, hiring an intern to assist with the SmartCommute Challenge and on-site events, working with TTA on the Triangle Region Best Workplaces for Commuters Program, providing temporary subsidies for vanpools and transit passes for new riders of SmartCommute member employers, participating in outreach events including commuter fairs and Earth Day events, being a resource for non-SmartCommute member employers, and providing leadership and administrative support for the SmartCommute @ RTP Committee.

UNIVERSITY OF NORTH CAROLINA AT CHAPEL HILL

The Commuter Alternatives Program (CAP) at the University of North Carolina at Chapel Hill promotes TDM by providing information and incentives to those who do not purchase a university parking permit. CAP markets the commuter options of park-and-ride lots, transit, vanpools, carpools, walking and bicycling. Activities to be undertaken in FY 2008 include distributing CAP brochures throughout the university and nearby student apartment complexes; participating in the ReDefine Travel campaign to encourage student ridesharing, bicycling and walking; advertising university-subsidized TTA bus passes and vanpool rider fares; holding open houses with Chapel Hill Transit, TTA and Zipcar; promoting additional bus services including point-to-point shuttles; increasing marketing and assessment of the Zipcar program; and advertising the statewide rideshare matching program ShareTheRideNC.org as well as the regional trip planning program GoTriangle.org.

WILMINGTON, CITY OF

CAPE FEAR Breeze
Transportation Choices

The City of Wilmington will continue the Cape Fear Breeze Transportation Demand Management Program. The purpose of the program is to develop and promote alternatives to single-occupant vehicle use for target groups, including employers and employees, visitors and the general public. Activities to be undertaken during FY 2008 include promoting the Way2Go Club, a Web site that captures data regarding the usage of alternative modes; conducting the Second Annual Cape Fear Breeze Commuter Challenge to encourage employers, employees and the general public to take advantage of alternative methods of transportation; working with UNC-Wilmington to implement a faculty carpooling program and formalize an emergency ride home program; working with New Hanover County to implement a transit pass program as well as implement preferential carpool permits and an emergency ride home program; and promoting registration in the ShareTheRideNC.org database by creating customized employer page log-ins for new employees and registering employees using laptops during all outreach events. In addition, the program will promote the Best Workplaces for Commuters Program to employers in the region and continue to coordinate with the New Hanover Transportation Services and the Wilmington Transit Authority.

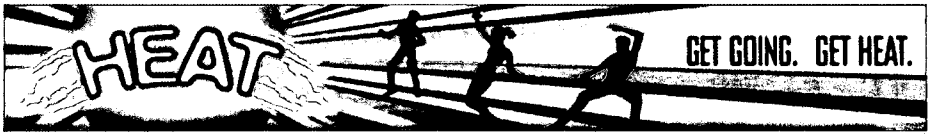
Survey Documents Success In Commute Trip Reduction

An annual Durham County employer survey has found that more employees are making commuter trips by modes other than single-occupant vehicles. In FY 2007, the figure had climbed to 17.5 percent of total commuters from 15.6 percent the previous year and 13.4 percent in 2004-05.

Sixty-eight employers, representing 67,944 employees, completed the survey administered by the Triangle Transit Authority as a part of the Durham Commute Trip Reduction Ordinance.

The program was instituted in 2000 for employers with 100 or more employees.

Mode shifts reported in the survey resulted in a reduction of an additional 50,000 vehicle miles per day, or 12.5 million vehicle miles per year.



Greensboro Students Cool It with HEAT

Since its inauguration in August 2006, Greensboro's Higher Education Area Transit (HEAT) has served over 130,000 passengers, all students enrolled in one of eight major colleges and universities in Greensboro and Jamestown. Students ride for free.

Participating schools are Bennett College, Elon University School of Law, Greensboro College, Guilford College, Guilford Technical Community College (GTCC Jamestown and Greensboro campuses), North Carolina A&T State University and the University of North Carolina at Greensboro.

HEAT, supported primarily by federal and state grants, is a partnership among the Greensboro Transit Authority, the City of Greensboro and the participating schools. More than 40 similar transportation programs for institutions of higher learning are operating around the country. HEAT decreases demand for on-campus parking, enhances air quality in Greensboro and the Triad region and reduces dependence on private vehicles for local transportation needs.

Employers Claim BWC Distinction

The Best Workplaces for Commuters (BWC) Program is a public/ private partnership that publicly recognizes employers whose outstanding commuter benefits meet the U.S. Environmental Protection Agency's National Standard of Excellence to reduce traffic and air pollution and improve health and the quality of life for commuters. The focus of the program is to increase the number of employer-based transportation programs aimed at reducing vehicle miles traveled and air pollution by identifying innovative solutions to commuter needs.

North Carolina's 58 BWC employers represent more than 91,000 employees. Six employers are located in Asheville and Charlotte, and the remaining 52 BWC employers are based in the Triangle. The state has the distinction of having more BWC state agencies – 19 – than any other state. Triangle J Council of Governments administers the Triangle BWC Program.

LYNX Is Coming

The Charlotte Area Transit System's LYNX Blue Line will initiate service Nov. 26. North Carolina's first light rail system will run 9.6 miles from Uptown Charlotte to Interstate 485/ South Boulevard. The first full year average daily ridership is projected to be 9,100. By 2025, ridership is expected to double.

More Commuters Taking the Challenge

A commuter challenge is a campaign designed to increase general public awareness of alternate commuting options through aggressive marketing and employer site visits. Campaigns have shown that about 10 percent of employees who try a commute alternative will make it a regular practice. Currently four TDM programs sponsor commuter challenges: Cape Fear Breeze, SmartCommute @ RTP, Triangle Transit Authority (TTA) and Piedmont Authority for Regional Transportation (PART). TDM programs at Charlotte Area Transit System, University of North Carolina at Chapel Hill, N.C. State University and the City of Asheville are expected to launch their campaigns in 2008.

Cape Fear Breeze conducted its first campaign in April with 298 participants. PART's first effort, Triad Commute Challenge, began May 1 and continued through Aug. 31 with more than 1,000 participants.

SmartCommute and TTA sponsored a Triangle-wide SmartCommute Challenge in 2005 and 2006. The 12,780 participants in 2006 saved 2.3 million commuting miles – the equivalent of 92 trips around the world and almost five trips to the moon.

PART Growing Its Service

The Piedmont Authority for Regional Transportation continues to expand in a 10-county area. Among its services are express buses connecting points in Winston-Salem, High Point and Greensboro and linking the Triad to points along U.S. 421 on the Mountaineer Express; Surry County; and UNC Hospitals, Duke University Medical Center and nearby medical facilities.

N.C. Public Transportation Serves 56 Million Passengers in 2006

NCDOT's Public Transportation Division is getting North Carolinians where they want to go with 101 transit systems statewide, including 83 in rural areas, 16 in urban areas and two serving urban regional areas in the Triangle and Triad. These systems provided more than 56 million passenger trips in FY 2006, operated over 2,600 vehicles and traveled 72 million miles of revenue service. Ridership in 2006 increased nearly 11 percent over 2005. Since 2001, transit ridership has increased 39 percent.

Public Transportation Passengers

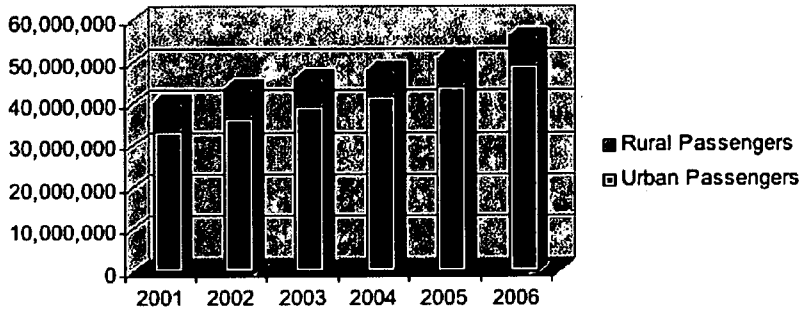

Exhibit E

2007-2008 Interim

Studies to be Conducted by the Environmental Review Commission

Organized by topics: air quality, coastal issues, environmental health, fishing, general, hazardous substances, land quality, parks and conservation, solid waste, water quality, water quantity, wetlands

Solid Waste

ERC (with the assistance of the Dept of Justice)	Report To/ Authority	Report Due
Shall study issues related to the franchise of solid waste management facilities by units of local govt and (with DOJ) study issues related to transportation of solid waste by rail or barge	General Assembly S.L. 2007-550, Sec. 18	2008 Regular Session

Water Quality

ERC	Report To/ Authority	Report Due
May study issues related to use of pervious surfaces for vehicle parking areas, including associated costs, impact of stormwater runoff, practices of other states	2008 General Assembly SL 2007-323, Sec 6.22.(b)	upon its reconvening

Water resources

Division of Water Resources, DENR in consultation with ERC	Report To/ Authority	Report Due
Shall, in consultation with the ERC, prepare a revised map entitled "Major River Basins and Sub-basins in NC" as a replacement for the map referenced in G.S. 143-215.22G. ERC shall recommend a revised map and amended definition of "river basin"	General Assembly S.L. 2007-518, Sec. 1.(b)	2008 Regular Session

ERC, with assistance from DENR	Report To/ Authority	Report Due
Shall study the allocation of surface water resources and their availablity and maintenance in the State	2008 General Assembly 2007-518, Sec. 1.(a)	Interim: may (2008 General Assembly) Final: shall (2009 General Assembly)

Referred to:

March 26, 2007

A BILL TO BE ENTITLED

AN ACT TO PROVIDE FOR STUDIES BY THE LEGISLATIVE RESEARCH COMMISSION, STATUTORY OVERSIGHT COMMITTEES AND COMMISSIONS, AND OTHER AGENCIES, COMMITTEES, AND COMMISSIONS.

The General Assembly of North Carolina enacts:

PART I. TITLE

SECTION 1. This act shall be known as "The Studies Act of 2007."

PART II. LEGISLATIVE RESEARCH COMMISSION

SECTION 2.1. The Legislative Research Commission may study the topics listed below. When applicable, the bill or resolution that originally proposed the issue or study and the name of the sponsor are listed. Unless otherwise specified, the listed bill or resolution refers to the measure introduced in the 2007 General Assembly. The Commission may consider the original bill or resolution in determining the nature, scope, and aspects of the study. The following groupings are for reference only:

(1) Criminal Law Issues:
  a. Grand Juries (S.B. 1130 – Clodfelter)
  b. Littering (S.B. 1202 – Jacumin)
  c. Expunctions (H.B. 88 – Moore)
  d. Sex offender registration (H.B. 224 – Goforth, Ray)
  e. Prerelease HIV Testing of All DOC Inmates (H. B. 1898 – Farmer-Butterfield, Wright, Womble)
  f. Illegal drug use (H.B. 2005 – Stam, Allred)

(2) State/Local Government Employee Issues:

(9) How the combined occupancy and sales tax rates in North Carolina compare with rates in other states that have a comparably ranked tourism industry.

(10) The advantages and disadvantages of establishing a uniform system for occupancy taxes and whether that system, in whole or in part, should be incorporated into the statutes.

SECTION 7.7. Sale and Use Tax and Out of State Purchases (H.B. 1994 – Stam, Allred) – The Committee may study and examine, with the appropriate agencies of neighboring states and taxpayer groups, issues associated with cross-border transactions where property is purchased in one state and used in another state. The Committee may examine the economic effects on retailers in North Carolina that make cross-border deliveries of merchandise and may recommend possible actions that might be taken to address the avoidance of sales and use tax by retailers and purchasers located near State lines and to improve compliance with, or recommend changes to, existing State laws. The Committee may also consider changes that would ease the burden on retailers that deal with cross-border issues and ways to ensure that North Carolina retailers are not placed at a disadvantage in comparison to retailers in surrounding states.

SECTION 7.8. Franchise Laws for Farm and Industrial Equipment Dealers (Cotham, Lewis) – The Committee may study issues related to franchise laws for farm and industrial equipment dealers.

SECTION 7.9. Property Tax Exclusion for Disabled Veterans (H.B. 486-McGee, Holliman, J. Harrell, Pate) – The Committee may study issues related to the granting a property tax exclusion for disabled veterans.

SECTION 7.10. Renewable Energy Tax Credit – The Committee may study issues related to the implementation of G.S. 105-129.16G – Credit for donating funds to a nonprofit organization to enable the nonprofit to acquire renewable energy property.

PART VIII. ENVIRONMENTAL REVIEW COMMISSION STUDIES

SECTION 8.1. The Environmental Review Commission may study the topics listed in this Part and report its findings, together with any recommended legislation, to the 2008 Regular Session of the 2007 General Assembly upon its convening.

SECTION 8.2. North Carolina Petroleum Underground Storage Tank Program (S.B. 1146 – Hoyle) – The Commission may study the North Carolina petroleum underground storage tank program and the problems of returning to use sites impacted by leaking underground storage tanks. If the Committee undertakes the study, the following issues shall be examined:

(1) The role of "risk-based corrective action" in protecting both public health and the environment.

(2) An assessment of whether DENR has fully utilized risk-based corrective action in the program to date and whether implements could be made to fully utilize existing financial resources in the future.

(3) An assessment of the pace of cleanup "closures", and the DENR's experience with issuing letters of "no further action required" including whether contamination is being addressed promptly and impacted parcels being made eligible for desired commercial transactions that follow appropriate remediation.

(4) An assessment of fair and equitable funding needs facing the State and the tank owning segment with an examination of solvency issues experienced in the present or expected in the future.

(5) An examination and survey of other states to determine "model solutions" to address the challenges of financing environmental cleanups following a tank release and the expedited return of impacted parcels to needed and normal real estate commerce.

SECTION 8.3. Interstate Compact To Mediate Water Supply Issues (S.B. 1360 – Allran; H.B. 960 – Gillespie, Church, Hilton, R. Warren) – The Committee may study the need to negotiate an interstate compact with adjoining states that have a river basin that drains into or from North Carolina to mediate and cooperatively resolve water supply disputes that may arise from interbasin transfers and consumptive water uses in river basins that are shared by North Carolina and those states.

SECTION 8.4. Mountain Resources (Queen) – The Committee may study:

(1) Threats to important mountain resources, such as the Great Smoky Mountains National Park, the Blue Ridge Parkway, the Appalachian Trail, Mt. Mitchell, Lake James, Hickory Nut Gorge, and Gorges State Park, and the consequences to those resources of present trends and land-use practices in the mountains.

(2) Research and information from North Carolina and other states and jurisdictions regarding state and regional approaches to coordinating provision of infrastructure for the protection of mountain resources, and the efforts to encourage quality growth to protect those resources.

(3) Strategies or tools that would be helpful to address pressures on important mountain resources and whether and how those strategies and tools should be implemented to protect important mountain resources.

(4) Determine whether tools and strategies that could be used to protect important mountain resources could be applied to protect other resources in the mountains of North Carolina, including, but not limited to, groundwater, mountain streams, steep slopes and ridgelines, natural heritage areas, recognized historic areas or sites, and farmland.

SECTION 8.5. Replacement of Incandescent Lamps (H.B. 838 – Harrison, Fisher) – The Commission shall study the feasibility and desirability of phasing out the use of various types of general service incandescent lamps and replacing them with more energy efficient forms of lighting. As a part of this study, the Commission shall consider the extent to which practical and cost-effective alternative forms of lighting, including energy efficient incandescent lighting, are available and the short- and long-term costs and benefits of replacing general service incandescent lamps with more

energy efficient forms of lighting. The Commission shall report its findings and recommendations, including any legislative proposals, to the 2008 Regular Session of the General Assembly.

SECTION 8.6. Far mers "Cap-and-Trade" Program For Greenhouse Gas (GHG) Emissions (H.B. 962 – Faison, Hill) – The Commission may study the feasibility and advisability of extending credits to the business of farming in the same manner that credits are extended to other businesses in the event North Carolina enacts or adopts by rule a market-based "Cap-and-Trade" program for greenhouse gas (GHG) emissions. As used in this section, a "Cap-and-Trade" program is any program that places a limit, the cap, on the total amount of GHG emissions that is allowed under the specific target for GHG emissions set by the State, allocates GHG emissions as credits to individual businesses so that the total credits allocated equal the cap, and allows businesses to bank credits for the future or to buy and sell credits based on whether a particular business reduced or increased its GHG emissions in a given year and the value of the credits in the marketplace. In its study, the Commission may consider all of the following:

(1) How farmers can monitor GHG emissions.

(2) What the anticipated costs are to farmers to participate in a "Cap-and-Trade" program for GHG emissions, including the costs of monitoring GHG emissions, satisfying reporting requirements, and any other costs.

(3) How farmers can reduce GHG emissions on a farm.

(4) How farmers can increase their farms' ability to act as "carbon sinks," that is, utilize the carbon-absorbing abilities of plants and trees to remove carbon dioxide from the atmosphere.

(5) If farms can act as "carbon sinks" under subdivision (4) of this section, whether the removal of carbon dioxide from the atmosphere should receive some market value under the State's "Cap-and-Trade" program.

(6) How much farmers are likely to increase their annual incomes by participating as businesses in a "Cap-and-Trade" program for GHG emissions.

(7) Any other issues the Commission considers relevant to this topic.

SECTION 8.7. Increase The Recycling Of Glass And Plastic Containers. (H.B. 1394 – Tolson, Wray, Crawford, Farmer-Butterfield) – The Commission may study ways in which the recycling of glass and plastic containers can be increased and ways in which the availability of recycled glass or plastic containers can be increased for use as batch material for the manufacturing of glass and plastic containers, and the Commission may include in this study an evaluation of the effectiveness of North Carolina recycling practices for glass and plastic and compare them to the recycling practices of other states. In its study, the Commission also may consider all of the following:

(1) Whether any businesses in North Carolina use recycled glass or plastic containers as batch material for the manufacturing of glass or plastic containers.

(2) Whether any businesses identified under subdivision (1) of this section receive adequate supplies of recycled glass or plastic containers for their manufacturing processes.

(3) Where the recycled glass or plastic containers used by any businesses identified under subdivision (1) of this section come from and how far the recycled glass or plastic containers are transported to the businesses.

(4) Whether glass and plastic containers that are discarded in North Carolina are processed and recycled so as to benefit North Carolina businesses.

(5) Whether glass and plastic containers that are discarded in North Carolina are processed and recycled in keeping with the State's solid waste management policy and the forty percent (40%) municipal solid waste reduction goal established by the State under G.S. 130A-309.04.

(6) Any other issues the Commission considers relevant to this topic.

SECTION 8.8. Study Methods Of Disposing Of Wastewater At Municipal Wastewater Treatment Systems (H.B. 1809 – Tucker, Grady, Cleveland) – The Commission may study current methods of disposing of wastewater at municipal wastewater treatment facilities, as defined in G.S. 143-215.6D, and may study the feasibility and desirability of municipal wastewater treatment facilities employing other methods of disposing of wastewater. In its study, the Commission may consider all of the following:

(1) Whether the current practice of land application of wastewater at any municipal wastewater treatment facilities requires too much land to be practicable in the long term.

(2) Whether the current practice of land application of wastewater at municipal wastewater treatment facilities is better suited to certain parts of the State or to areas of certain geological or topographical conditions.

(3) Whether there are any alternative methods of disposing of wastewater at municipal wastewater treatment systems and the costs and benefits of employing any such alternative methods either on a statewide basis or in any specific area of the State.

(4) Subject to Section 2 of this act, any other issues the Commission considers relevant to this topic.

(5) The study authorized by this section shall not address any issues regarding animal waste management systems, as defined in G.S. 143-215.10B, at swine farms, as defined in G.S. 106-802, or the land application of wastewater associated with animal waste, as defined in G.S. 143-215.10B.

SECTION 8.9. Study Use of State Gamelands along Northeast Cape Fear River and Burgaw Creek for Education and Recreation (S.B. 780 – Soles; H.B. 926 – Justice) –The Commission may study issues related to the desirability and feasibility of adapting the use of a tract of State-owned land, located in the Southeastern part of the

State on the Northeast Cape Fear River and the Burgaw Creek that is currently State gamelands, to showcase the natural environment of Southeastern North Carolina, provide environmental education opportunities for youth and adults, and provide recreational opportunities for outdoor enthusiasts. This tract is approximately 776 acres located approximately three miles east of the Town of Burgaw and consists of creek swamp, ridges, and a planted pine plantation. In particular, the Commission may consider:

(1) The desirability and feasibility of establishing hiking trails on this land.

(2) The desirability and feasibility of constructing a launch site on this land that fronts the Burgaw Creek for canoes and kayaks, thereby providing a venue for canoeing and kayaking on the Cape Fear River and Burgaw Creek for the public.

(3) The environmental educational opportunities that are available for the public at the bottomland swamps, pine plantation, and other wetlands located on this land.

(4) The potential for developing at the pineland plantation a demonstration forest to showcase best forest management practices.

(5) The potential for restricting the current use of this land as State gamelands so that the use as gamelands would be compatible with recreational, educational, and environmental uses.

(6) The potential for paying the costs, in whole or in part, of adapting the use of this land to recreational, educational, and environmental uses from the sale of timber from the pine plantation located on this land.

(7) Other possible funding sources than the funding source under subdivision (6) of this section for the costs of adapting the use of this land to recreational, educational, and environmental uses.

(8) Any other issues the Commission considers to be pertinent to its study.

SECTION 8.10. Artificial Slope Construction in Mountainous Areas (H.B. 1756 – Rapp, Haire, Fisher) – The Commission with the assistance of the Department of Environment and Natural Resources, may study issues related to safe artificial slope construction in mountainous areas. The Commission may specifically study the need for and advisability of establishing minimum statewide management requirements for safe artificial slope construction in mountainous areas of the State. The Commission may also consider issues related to the recordation of natural hazards; environmental permit conditions and limitations and land-use restrictions associated with real property located in mountainous and other areas of the State; and disclosure to prospective purchasers of real property of those hazards, conditions, and restrictions. If the Commission undertakes this study, it shall hold at least two meetings related to this in the western region of the State.

SECTION 8.11. Discarded Consumer Electronics (H.B. 1777 – Gibson) – The Commission may study issues surrounding the management of discarded consumers' desktop and notebook computers, computer monitors, computer display devices, and televisions for which a manufacturer cannot be identified or for which the

manufacturer is no longer in business and has no successor in interest. When conducting this study, the Commission may ascertain, by number of units, weight, or volume, how much of this consumer computer and television equipment has been discarded in North Carolina and may determine the threat to the environment these components of the waste stream pose. No later than May 1, 2008, the Commission shall report its findings and recommendations, including any administrative or legislative proposals, on the most efficient and economically practicable means of recovering, reusing, recycling, or disposing of these components of the waste stream.

SECTION 8.12. Ban Use of DECA Flame Retardant (Harrison) – The Commission may study issues related to banning the use of DECA flame retardant.

SECTION 8.13. Wind Permitting (Harrison) – The Commission may study methods for implementing a state level permitting system and siting requirements for commercial-scale wind energy systems that will ensure that wind energy systems are sited in an orderly manner compatible with environmental preservation, sustainable development, and the efficient use of resources. In undertaking the study, the Commission may consider procedures for environmental review of commercial-scale wind energy systems, and standards necessary to minimize impacts in the following areas: noise, visual, environmental, sensitive habitats, wildlife, public health, safety. The Commission may form a technical advisory committee to include representatives from various stakeholder groups to assist in conducting this study.

SECTION 8.14. Phase Out Lagoon and Sprayfield Systems (H.B. 1822 – Jones, Harrison) – The Commission may study issues related to phasing out lagoon and sprayfield systems.

SECTION 8.15. Hazard Disclosures in Coastal Real Estate Transactions (H.B. 1628) – The Commission may study issues related to hazard disclosures in coastal real estate transactions.

SECTION 8.16. No Mining Sand From Tidal Inlet/Delta. (H.B. 1832 – Harrison) – The Commission may study issues related to mining sand from tidal inlets and delta areas.

SECTION 8.17. Energy, Job Creation, and Venture Capital (H.B. 2028 – Brubaker, Wainwright, Daughtridge) – The Commission may study issued related to energy, job creation, and venture capital.

PART IX. JOINT LEGISLATIVE OVERSIGHT COMMITTEE ON MENTAL HEALTH, DEVELOPMENTAL DISABILITIES, AND SUBSTANCE ABUSE SERVICES STUDIES

SECTION 9.1. The Joint Legislative Oversight Committee on Mental Health, Developmental Disabilities, and Substance Abuse Services may study the topics listed in this Part and report its findings, together with any recommended legislation, to the 2008 Regular Session of the 2007 General Assembly upon its convening.

SECTION 9.2. Facilities That Provide Housing For Adults With Mental Illness In The Same Location With Adults Without Mental Illness (S.B. 1266 – Nesbitt; H.B. 691 – Insko) – The Committee may study and identify rules and laws that are

SECTION 97. The listing of the original bill or resolution in this act is for reference purposes only and shall not be deemed to have incorporated by reference any of the substantive provisions contained in the original bill or resolution.

PART XCVIII. EFFECTIVE DATE AND APPLICABILITY

SECTION 98. Except as otherwise specifically provided, this act is effective when it becomes law. If a study is authorized both in this act and in the Current Operations and Capital Improvements Appropriations Act of 2007, the study shall be implemented in accordance with the Current Operations and Capital Improvements Appropriations Act of 2007 as ratified.

A BILL TO BE ENTITLED

AN ACT TO PROVIDE FOR STUDIES BY THE LEGISLATIVE RESEARCH COMMISSION, STATUTORY OVERSIGHT COMMITTEES AND COMMISSIONS, AND OTHER AGENCIES, COMMITTEES, AND COMMISSIONS.

The General Assembly of North Carolina enacts:

PART I. TITLE

SECTION 1. This act shall be known as "The Studies Act of 2007."

PART II. LEGISLATIVE RESEARCH COMMISSION

SECTION 2.1. The Legislative Research Commission may study the topics listed below. When applicable, the bill or resolution that originally proposed the issue or study and the name of the sponsor are listed. Unless otherwise specified, the listed bill or resolution refers to the measure introduced in the 2007 General Assembly. The Commission may consider the original bill or resolution in determining the nature, scope, and aspects of the study. The following groupings are for reference only:

(1) Criminal Law Issues:
  a. Grand Juries (S.B.1130 – Clodfelter)
  b. Execution/Severely Mentally Disabled Defendants (S.B. 1075 – Kinnaird)
  c. Littering (S.B. 1202 – Jacumin)

(2) State/Local Government Employee Issues:
  a. Expenses and Financing of Parking Decks for State Employees (Rand)

(3) Health and Human Services Issues:
  a. Store-Based Retail Health Clinics (Forrester)

(3) Any other item the Committee finds relevant to this study.

SECTION 7.5. New Market Tax Credit (S.B. 1160 – Hoyle) – The Committee may study a State new market tax credit to complement the federal tax credit.

SECTION 7.6. Earned Income Tax Credit – The Committee may study earned income tax credit participation rates in North Carolina and other states.

PART VIII. ENVIRONMENTAL REVIEW COMMISSION STUDIES

SECTION 8.1. The Environmental Review Commission may study the topics listed in this Part and report its findings, together with any recommended legislation, to the 2008 Session of the General Assembly upon its convening.

SECTION 8.2. North Carolina Petroleum Underground Storage Tank Program (S.B. 1146 – Hoyle) – The Commission may study the North Carolina petroleum underground storage tank program and the problems of returning to use sites impacted by leaking underground storage tanks. If the Committee undertakes the study, the following issues shall be examined:

(1) The role of "risk-based corrective action" in protecting both public health and the environment.

(2) An assessment of whether DENR has fully utilized risk-based corrective action in the program to date and whether implements could be made to fully utilize existing financial resources in the future.

(3) An assessment of the pace of cleanup "closures", and the DENR's experience with issuing letters of "no further action required" including whether contamination is being addressed promptly and impacted parcels being made eligible for desired commercial transactions that follow appropriate remediation.

(4) An assessment of fair and equitable funding needs facing the State and the tank owning segment with an examination of solvency issues experienced in the present or expected in the future.

(5) An examination and survey of other states to determine "model solutions" to address the challenges of financing environmental cleanups following a tank release and the expedited return of impacted parcels to needed and normal real estate commerce.

SECTION 8.3. Deep River State Trail/State Parks System (S.B. 1431 – Atwater) – The Commission may study the desirability and feasibility of adding the Deep River State Trail to the State Parks System.

SECTION 8.4. Interstate Compact To Mediate Water Supply Issues (S.B. 1360 – Allran) – The Committee may study the need to negotiate an interstate compact with adjoining states that have a river basin that drains into or from North Carolina to mediate and cooperatively resolve water supply disputes that may arise from interbasin transfers and consumptive water uses in river basins that are shared by North Carolina and those states.

SECTION 8.5. State-Owned Land On Cape Fear River/Burgaw Creek (S.B. 780 – Soles) – The Committee may study issues related to the desirability and feasibility of adapting the use of a tract of State-owned land, located in the southeastern part of the State on the Northeast Cape Fear River and the Burgaw Creek that is currently State gamelands, to showcase the natural environment of Southeastern North Carolina, provide environmental education opportunities for youth and adults, and provide recreational opportunities for outdoor enthusiasts.

SECTION 8.6. Mountain Resources (Queen) – The Committee may study:

(1) Threats to important mountain resources, such as the Great Smoky Mountains National Park, the Blue Ridge Parkway, the Appalachian Trail, Mt. Mitchell, Lake James, Hickory Nut Gorge, and Gorges State Park, and the consequences to those resources of present trends and land-use practices in the mountains.

(2) Research and information from North Carolina and other states and jurisdictions regarding state and regional approaches to coordinating provision of infrastructure for the protection of mountain resources, and the efforts to encourage quality growth to protect those resources.

(3) Strategies or tools that would be helpful to address pressures on important mountain resources and whether and how those strategies and tools should be implemented to protect important mountain resources.

(4) Determine whether tools and strategies that could be used to protect important mountain resources could be applied to protect other resources in the mountains of North Carolina, including, but not limited to, groundwater, mountain streams, steep slopes and ridgelines, natural heritage areas, recognized historic areas or sites, and farmland.

PART IX. JOINT LEGISLATIVE OVERSIGHT COMMITTEE ON MENTAL HEALTH, DEVELOPMENTAL DISABILITIES, AND SUBSTANCE ABUSE SERVICES STUDIES

SECTION 9.1. The Joint Legislative Oversight Committee on Mental Health, Developmental Disabilities, and Substance Abuse Services may study the topics listed in this Part and report its findings, together with any recommended legislation, to the 2008 Regular Session of the 2007 General Assembly upon its convening.

SECTION 9.2. Facilities That Provide Housing For Adults With Mental Illness In The Same Location With Adults Without Mental Illness (S.B. 1266 – Nesbitt) – The Committee may study and identify rules and laws that are necessary to regulate facilities that provide housing for adults with mental illness in the same location with adults without mental illness.

SECTION 9.3. Effectiveness Of The 1915(b) Medicaid Waiver And Of Those LMEs Operating Under A Waiver (S.B. 1266 – Nesbitt) – The Committee may study the effectiveness of the 1915(b) Medicaid waiver and of those LMEs operating under a waiver.

SECTION 34. For legislative studies authorized by this act, out-of-state travel must be authorized by the President Pro Tempore of the Senate or the Speaker of the House of Representatives, as appropriate.

PART XXXV. BILL AND RESOLUTION REFERENCES

SECTION 35. The listing of the original bill or resolution in this act is for reference purposes only and shall not be deemed to have incorporated by reference any of the substantive provisions contained in the original bill or resolution.

PART XXXVI. EFFECTIVE DATE AND APPLICABILITY

SECTION 36. Except as otherwise specifically provided, this act is effective when it becomes law. If a study is authorized both in this act and in the Current Operations and Capital Improvements Appropriations Act of 2007, the study shall be implemented in accordance with the Current Operations and Capital Improvements Appropriations Act of 2007 as ratified.

§ 120-70.41. Commission established.

The Environmental Review Commission is hereby established.

§ 120-70.42. Membership; cochairs; vacancies; quorum.

(a) The Environmental Review Commission shall consist of six Senators appointed by the President Pro Tempore of the Senate, six Representatives appointed by the Speaker of the House of Representatives, who shall serve at the pleasure of their appointing officer, the Chair or a Cochair of the Senate Committee on Agriculture, Environment, and Natural Resources or the equivalent committee, the Chair or a Cochair of the House of Representatives Committee on Environment and Natural Resources or the equivalent committee, the Chair or a Cochair of the Senate Committee on Appropriations – Natural and Economic Resources or the equivalent committee, and the Chair or a Cochair of the House of Representatives Committee on Appropriations – Natural and Economic Resources or the equivalent committee.

(b) The President Pro Tempore of the Senate shall designate one Senator to serve as cochair and the Speaker of the House of Representatives shall designate one Representative to serve as cochair.

(c) Except as otherwise provided in this subsection, a member of the Commission shall continue to serve for so long as the member remains a member of the General Assembly and no successor has been appointed. A member of the Commission who does not seek reelection or is not reelected to the General Assembly may complete a term of service on the Commission until the day on which a new General Assembly convenes. A member of the Commission who resigns or is removed from service in the General Assembly shall be deemed to have resigned or been removed from service on the Commission. Any vacancy that occurs on the Environmental Review Commission shall be filled in the same manner as the original appointment.

(d) A quorum of the Environmental Review Commission shall consist of nine members.

§ 120-70.43. Powers and duties.

(a) The Environmental Review Commission shall have the following powers and duties:

(1) To evaluate actions of all boards, commissions, departments, and other agencies of the State and local governments as such actions relate to the environment or protection of the environment, including but not limited to an evaluation of:

a. Benefits of each program relative to costs;

b. Achievement of program goals;

c. Use of measures by which the success or failure of a program can be measured; and

d. Conformity with legislative intent;

(2) To study on a continuing basis the organization of State government as it relates to the environment or to the protection of public health and the environment, including but not limited to:

a. Improvements in administrative structure, practices, and procedures;

b. Increased integration and coordination of programs and functions;

c. Increased efficiency in budgeting and use of resources;

d. Efficient administration of licensing, permitting, and grant programs;

e. Prompt, effective response to environmental emergencies;

f. Opportunities for effective citizen participation; and

g. Broadening of career opportunities for professional staff;

(3) To make any recommendations it deems appropriate regarding the reorganization and consolidation of environmental regulatory agencies and the recodification of statutes relating to the environment, including but not limited to:

a. Ways in which agencies may operate more efficiently and economically;

b. Ways in which agencies can provide better services to the State and to the people; and

c. Instances in which functions of agencies are duplicative, overlapping, incomplete in scope or coverage, fail to accomplish legislative objectives, or for any other reason should be redefined or redistributed;

(4) To review and evaluate changes in federal law and regulations, relevant court decisions, and changes in technology affecting the environment or protection of the environment;

(5) To review existing and proposed State law and rules affecting the environment or protection of the environment and to determine whether any modification of law or rules is in the public interest;

(6) To make reports and recommendations, including draft legislation, to the General Assembly from time to time as to any matter relating to the powers and duties set out in this section; and

(7) To undertake such additional studies as it deems appropriate or as may from time to time be requested by the President Pro Tempore of the Senate, the Speaker of the House of Representatives, either house of the General Assembly, the Legislative Research Commission, the Joint Legislative Commission on Governmental Operations, the Joint Legislative Utility Review Committee, or the Joint Select Committee on Low-Level Radioactive Waste and to make such reports and

recommendations to the General Assembly regarding such studies as it deems appropriate; provided that the Environmental Review Commission shall not undertake any study which the General Assembly has assigned to another legislative commission or committee.

(b) The Environmental Review Commission may continue the study of environmental agency consolidation and reorganization. The study of environmental agency consolidation shall include, but is not limited to:

(1) Monitoring the implementation of Session Laws 1989, c. 727;

(2) Evaluation of the organization, programs, and operation of the Department of Environment and Natural Resources;

(3) Evaluation of the organization, functions, powers, and duties of the components of the Department of Environment and Natural Resources, including boards, commissions, councils, and regional offices; and

(4) Recodification of the General Statutes relating to the environment and environmental agencies.

(c) In addition to its general powers and duties, the Environmental Review Commission shall have the following powers and duties with respect to hazardous waste management:

(1) To study the current and projected need for hazardous waste treatment, storage, and disposal capacity in the State in light of anticipated generation of hazardous waste and alternatives for hazardous waste treatment and disposal;

(2) To evaluate the potential for the development of additional hazardous waste treatment, storage, and disposal capacity by the private sector;

(3) To study the necessity for and scope of hazardous waste treatment, storage, and disposal facilities which are sited, owned, or operated by the State;

(4) To review progress in securing a volunteer county to host a hazardous waste treatment facility;

(5) To study incentives and compensation for the community which hosts, either voluntarily or involuntarily, a hazardous waste treatment facility, including any additional incentives and compensation which may be needed, whether there should be differential compensation for a volunteer county, options for use of funds by local governments, distribution of compensation among local governments, and methods of providing flexibility in the development of an incentives and compensation package for a particular local community;

(6) To review progress in developing interstate agreements for the treatment, storage, and disposal of hazardous waste;

(7) To assist in the development of cooperative, comprehensive regional approach to hazardous waste treatment and disposal;

(8),(9) Repealed by Session Laws 2001-474, s. 12.

(10) To study the capacity assurance requirement under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, Pub.

L. No. 96-510, 94 Stat. 2767, 42 U.S.C. 9601 et seq., as amended, and the Superfund Amendments and Reauthorization Act of 1986, Pub. L. No. 99-499, 100 Stat. 1613, as amended as it relates to the continued eligibility of North Carolina for remedial actions under Superfund;

(11) To study alternatives available to the State for dealing with hazardous waste and the ramifications of those alternatives; and

(12) To receive and evaluate reports of every State agency, board, and commission which has any power or duty with respect to hazardous waste management.

§ 120-70.44. Additional powers.

The Environmental Review Commission, while in the discharge of official duties, may exercise all the powers provided for under the provisions of G.S. 120-19, and G.S. 120-19.1 through G.S. 120-19.4. The Environmental Review Commission may meet at any time upon the call of either cochairman, whether or not the General Assembly is in session. The Environmental Review Commission may meet in the Legislative Building or the Legislative Office Building upon the approval of the Legislative Services Commission.

Notwithstanding any rule or resolution to the contrary, proposed legislation to implement any recommendation of the Environmental Review Commission regarding any study the Environmental Review Commission is authorized to undertake or any report authorized or required to be made by or to the Environmental Review Commission may be introduced and considered during any session of the General Assembly.

§ 120-70.45. Compensation and expenses of members.

Members of the Environmental Review Commission shall receive subsistence and travel expenses at the rates set forth in G.S. 120-3.1.

§ 120-70.46. Staffing.

The Legislative Services Officer shall assign as staff to the Environmental Review Commission professional employees of the General Assembly, as approved by the Legislative Services Commission. Clerical staff shall be assigned to the Environmental Review Commission through the offices of the Supervisor of Clerks of the Senate and Supervisor of Clerks of the House of Representatives. The expenses of employment of clerical staff shall be borne by the Environmental Review Commission.

§ 120-70.47. Funding.

From funds available to the General Assembly, the Legislative Services Commission shall allocate monies to fund the work of the Environmental Review Commission.

Status of Reports to the ERC Required by Law

Organized by topics: air quality, coastal issues, env. health, fishing, general, hazardous substances, land resources, parks and conservation, solid waste, water quality, water quantity, wetlands

Air Quality

DAQ (DENR)	Report To/ Authority	Report Due	Status*
Shall study the costs and benefits of reducing emissions of oxides of nitrogen, particulate matter, and greenhouse gases from motor vehicles in this State. Shall also consider standards adopted in other states.	ERC, LCGCC S.L. 2006-248, Sec. 43	Interim : 15 Jan 2007 Final; 1 April 2007	Jan 07, distrib 1/17/07 Apr 07 Final Report rec'd

DENR	Report To/ Authority	Report Due	Status*
Shall report on the pilot program to retrofit certain school buses in nonattainment areas	ERC, DPI, and DOT 2007-465, Sec. 4.(b)	1 Sept 2008 and 1 Sept 2009	
Cost of the Title V program	ERC, Fiscal Research GS 143-215.3A(c)	Annually (1 Nov)	Mar 00 mail 3/29/00 May 02 oral 5/21/02 Jan 04 distrib 2/24/04 Nov 04 oral 11/19/04 Nov 05 distrib 3/8/06 Dec 06 distrib 12/13/06

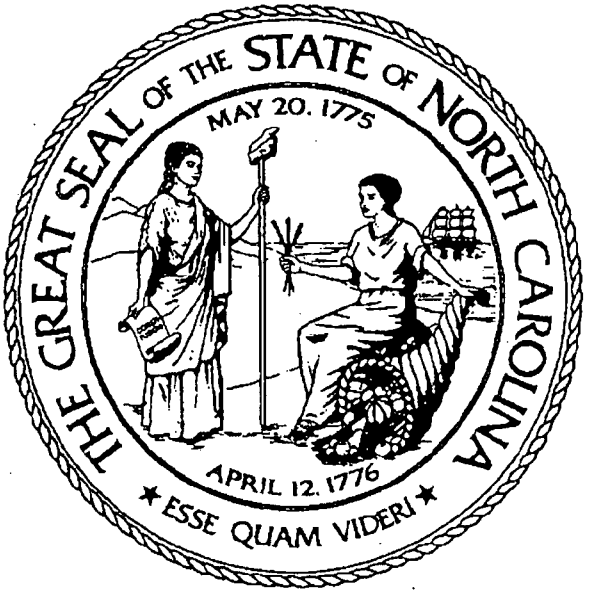
SUMMARIES OF SUBSTANTIVE RATIFIED ENVIRONMENT AND NATURAL RESOURCES LEGISLATION



2007 GENERAL ASSEMBLY
2007 REGULAR SESSION

Research Division
General Assembly North of North Carolina
October 2007

The following are summaries of environment and natural resources legislation enacted by the 2007 Regular Session of the General Assembly. These summaries were developed by staff members of the Research Division of the General Assembly for the Division's annual publication **SUMMARIES OF SUBSTANTIVE RATIFIED LEGISLATION**. Development of that publication is still underway. As such, the summaries included in this document are considered drafts.

This document includes numerous cross-references to other portions of the full **SUMMARIES OF SUBSTANTIVE RATIFIED LEGISLATION** that are not included in this excerpt.

We anticipate that the complete **SUMMARIES OF SUBSTANTIVE RATIFIED LEGISLATION** will be available in print format and on the Internet by November 2007. To access the online version, go to the General Assembly's homepage at: http://www.ncleg.net. Click on the "Legislative Publications" link on the right of the page. The summaries publication will be listed under "Research Division." Each summary will be hyperlinked to the final bill text, the bill history, and any applicable fiscal note.

If you would like additional information regarding any legislation summarized in this document, please contact the Research Division at (919) 733-2578.

Chapter 11
Environment and Natural Resources

George Givens (GG), Jeff Hudson (JH), Mariah Matheson (MM),
Jennifer McGinnis (JLM), Jennifer Mundt (JRM)

Enacted Legislation

Air Quality

Increase Penalties for Air Pollution

S.L. 2007-296 (HB 1646) increases the maximum per day civil penalty the Secretary of Environment and Natural Resources may assess for violations of air quality laws from $10,000 to $25,000.

This act becomes effective October 1, 2007, and applies to offenses committed on or after that date. (JRM)

School Bus Retrofits in Nonattainment Areas

S.L. 2007-465 (HB 1912) establishes a pilot program to provide funds to retrofit school buses in order to reduce diesel emissions in counties located in areas with air quality problems. The pilot program must be developed by the Department of Environment and Natural Resources (DENR) in consultation with the Departments of Public Instruction (DPI) and Transportation (DOT) and stakeholders and be administered by DENR. Local school administrative units may apply to DENR for a grant to retrofit an eligible school bus with a verified diesel emission control device. In order to qualify for grants under this program, an eligible school bus must:

- Have a model year 1994 through model year 2006 engine.
- Be registered in a county that is located in an area designated by the USEPA as having air quality problems.
- Be capable of operating on diesel fuel.
- Transport public school students.

DENR must develop grant application procedures, the criteria and priorities for selecting grant recipients and the selection of school buses for diesel retrofits, and procedures for distributing grants.

The act establishes the nonreverting School Bus Diesel Emissions Reduction Account within DENR. Funds in the Account must be distributed as grants to local school administrative units for school bus retrofits in an amount equal to 20% of the cost of purchasing a diesel retrofit for each bus selected for retrofitting and the funds must be used to match qualifying federal-aid funds.

The act requires DPI to submit to DENR information on or before August 1, 2008 on the total number of school buses eligible for grants under the program and the number of school buses that are equipped with an engine certified as meeting the USEPA standard for particulate matter. This act also requires DENR to prepare and submit an annual report on or before September 1, 2008 and September 1, 2009 to DPI and DOT and to the Environmental Review Commission on the pilot program.

The act provides that the DOT may reimburse up to $2,000,000 for the 2007-2008 fiscal year and up to $2,000,000 for the 2008-2009 fiscal year from the federal congestion mitigation

and air quality improvement program funds apportioned to the State by the United States to DENR for the costs of purchasing diesel retrofits for school buses under the pilot program. This section provides that DENR and DOT may enter into contracts that provide for the terms and methods by which DENR bills DOT for reimbursement of eligible costs.

The provisions of the act pertaining to reimbursement of federal aid funds became effective July 1, 2007. The remainder of the act became effective August 29, 2007. (JRM)

Safety/Emission Inspection Changes

S.L. 2007-503 (HB 679). See **Transportation**.

Animal Waste Management

Swine Farm Environmental Performance Standards

S.L. 2007-523 (SB 1465) makes the swine farm animal waste management system performance standards that the General Assembly enacted in 1998 permanent, establishes a program to assist in the conversion of traditional lagoon and sprayfield animal waste management systems to innovative animal waste management systems, and establishes a pilot program for the purchase of electricity by electric public utilities produced from methane captured on swine farm animal waste management systems.

Background. – In 1997, the General Assembly enacted a temporary statewide moratorium on the construction or expansion of animal waste management systems that serve swine farms. The moratorium was scheduled to expire March 1, 1999. In 1998, the General Assembly enacted legislation to provide specific performance standards for an innovative animal waste management system. In 1998, the legislation continued the moratorium on swine waste farm animal waste management systems that do not meet the performance standards, specifically the lagoon and sprayfield system described below and extended the duration of the moratorium to September 1, 1999. Since then, the General Assembly has amended and extended the moratorium several more times. Prior to S.L. 2007-523, the moratorium was set to expire September 1, 2007.

Performance Standards for Swine Farm Animal Waste Management Systems. – The act makes the swine farm animal waste management system performance standards that the General Assembly enacted in 1998 permanent. The Environmental Management Commission (EMC) may not issue or modify a permit for the construction, operation, or expansion of an animal waste management system that serves a swine farm that employs an anaerobic lagoon as the primary method of treatment and land application of waste by means of a sprayfield as the primary method of waste disposal. The EMC may issue a permit for the construction, operation, or expansion of an animal waste management system that serves a swine farm if the EMC determines that the animal waste management system will meet or exceed all of the following performance standards (the standards initially enacted in 1998):

- Eliminate the discharge of animal waste to surface water and groundwater through direct discharge, seepage, or runoff.
- Substantially eliminate atmospheric emission of ammonia.
- Substantially eliminate the emission of odor that is detectable beyond the boundaries of the parcel or tract of land on which the swine farm is located.
- Substantially eliminate the release of disease-transmitting vectors and airborne pathogens.
- Substantially eliminate nutrient and heavy metal contamination of soil and groundwater.

An animal waste management system that serves a swine farm for which a permit was issued prior to September 1, 2007 and that does not meet the performance standard requirements may continue to operate under that permit, including any renewal of the permit. Also, the EMC may modify a permit that was issued prior to September 1, 2007 for an animal waste management system that serves a swine farm to authorize the replacement of a lagoon that is a component of the animal waste management system if the EMC finds that several conditions are met, including that replacement, but not repair, of the lagoon will abate an imminent hazard.

The EMC must adopt rules to implement the performance standards. Until such rules become effective, the EMC will refer to the "Development of Environmentally Superior Technologies – Phase 3 Report: for Technology Determinations per Agreements Between the Attorney General of North Carolina and Smithfield Foods, Premium Standard Farms, and Frontline Farmers." The EMC must consult with the Animal and Poultry Waste Management Center of North Carolina State University regarding the application and modification of the performance standards.

Lagoon Conversion Program. – The act establishes the Lagoon Conversion Program (Program) to provide grants to assist in the conversion of traditional lagoon and sprayfield animal waste management systems that serve swine farms to systems that meet the new performance standards (innovative systems). Grants under the Program will be used to assist in the closure of traditional lagoon and sprayfield systems that are replaced by innovative animal waste management systems and to establish centralized waste collection and treatment systems that serve innovative animal waste management systems.

The Program will be administered by the Division of Soil and Water Conservation (Division) in the Department of Environment and Natural Resources (DENR). The Division must establish criteria for evaluating eligible innovative systems and for the selection of eligible applicants. Priority must be given to systems that are affordable, easily maintained, produce marketable by-products, reduce or eliminate the emission of ammonia and greenhouse gases, and are capable of being connected to a centralized waste collection and treatment. Priority must also be given to applicants whose participation in the program will result in the removal of animal waste management systems from floodplains; who have substantially complied with federal and State laws, regulations, and rules for the protection of the environment, natural resources, and public health; and who have a limited ability to pay for or finance an innovative swine waste management system through private or cooperative credit at reasonable rates and terms. The 2007 budget includes $2 million in funding for the Program.

Methane Capture Pilot Program. – The act establishes the Swine Farm Methane Capture Pilot Program (Pilot Program) to be administered by DENR and the North Carolina Utilities Commission (NCUC). Under the Pilot Program, each electric power supplier that serves a swine farm that is selected for participation in the Pilot Program must purchase all electricity generated by the swine farm using methane as a fuel. The total of all electric power that must be purchased from swine farms is capped at 25 megawatts. The NCUC will set the purchase price so that it will allow owners and operators of swine farms that participate in the Pilot Program to recover capital and operating costs of generating electricity from captured methane, but in no event will the purchase price exceed eighteen cents (18¢) per kilowatt hour. All costs incurred by an electric power supplier to comply with the Pilot Program will be recovered under the annual fuel adjustment.

Agreements. – S.L. 2007-523 will not affect any of the agreements between the Attorney General of North Carolina and various parties regarding the swine industry.

The Swine Farm Waste Management System Conversion Account became effective July 1, 2007. All other provisions of the act became effective September 1, 2007. The Methane Capture Pilot Program will sunset on September 1, 2017. (JH, GG)

Clarify/Extend Animal Waste Management Provisions

S.L. 2007-536 (HB 810) makes the following changes to animal waste management statutes and laws: (i) adds county employees and employees of Soil and Water Conservation Districts – who have federal engineering job approval that involves the planning, designing, or implementation of best management practices on agricultural land – to the list of practices that are not subject to the North Carolina Engineering and Land Surveying Act; (ii) extends the termination date of the pilot program for the inspection of animal waste management systems from September 1, 2007 to September 1, 2009; and (iii) clarifies the applicability of enforcement provisions.

This act became effective August 31, 2007. (JRM)

Coastal Development

Waterfront Access and Marine Industry Fund

S.L. 2007-323, Sec. 29.14(b) and (e) (HB 1473, Sec. 29.14(b) and (e)) requires the Director of the Division of Marine Fisheries in the Department of Environment and Natural Resources to establish a program to administer the Waterfront Access and the Marine Industry Fund. A maximum of $20 million in the Fund may be used to acquire waterfront properties or develop facilities for the purposes of providing public and commercial waterfront access and improving and developing these properties and facilities. The Director may consult with representatives of the commercial fishing industry and other marine industries and with State, local, or nonprofit agencies that have expertise in waterfront access issues and property acquisitions. The Director may establish a committee to review potential property acquisitions and capital and infrastructure improvements. Before expending any funds, the Division must report to the Joint Legislative Commission on Seafood and Aquaculture. The Division must also report to the Commission on the use of these funds on a quarterly basis until the funding expires.

This section became effective July 1, 2007. (JRM)

Enact Waterfront Access Study Committee Recommendations

S.L. 2007-485 (SB 646) enacts several recommendations of the Waterfront Access Study Committee.

Present-Use Value for Working Waterfronts. – The act provides that working waterfront property be taxed at its present use value rather than its true value. Working waterfront property is defined as any of the following property that has, for the most recent three-year period, produced an average gross income of at least one thousand dollars ($1,000):

- A pier that extends into coastal fishing waters and limits access to those who pay a fee.
- Real property that is adjacent to coastal fishing waters and is primarily used for a commercial fishing operation or fish processing, including adjacent land that is under improvements used for one of these purposes.

Deferred taxes are the difference between the taxes due on the property taxed at its present use and the taxes that would be due if the property were taxed at its true value. Deferred taxes for the preceding three fiscal years plus interest become due when the property no longer qualifies as working waterfront property.

Present use value taxation will be effective for taxes imposed for taxable years beginning on or after July 1, 2009.

Advisory Committee for the Coordination of Waterfront Access. – The act establishes the Advisory Committee for the Coordination of Waterfront Access within the Department of Environment and Natural Resources. The Advisory Committee will be composed of representatives of State and local government and is charged with developing a coordinated plan and recommendations for providing greater waterfront access in the State. The Advisory Committee will report its progress and any recommendations to the Joint Legislative Commission on Seafood and Aquaculture no later than October 1 of each year.

Department of Transportation to Expand Public Access to Coastal Waters. – The act directs the Department of Transportation to expand public access to coastal waters in its road project planning and construction programs. The Department will report on its progress to the Joint Legislative Commission on Seafood and Aquaculture and the Joint Legislative Transportation Oversight Committee no later than March 1 of each year.

Increase Boating and Waterway Access Funding. – The act increases certain boat numbering fees that are held in the Wildlife Resource Commission's Boating and Waterway Account. Prior to S.L. 2007-485, the fee for numbering a boat was $10. The act requires a $15 fee for a one-year period and a $40 fee for a three-year period. The act also provides that interest and other investment income earned by the Account accrue to the Account.

The increase in boat numbering fees becomes effective January 1, 2008.

Waiver of Fees from CAMA Emergency Permits. – The Secretary of Environment and Natural Resources may issue special emergency Coastal Area Management Act building permits when life or structural property is in imminent danger as a result of a storm, sudden failure of a man-made structure, or similar occurrence. S.L. 2007-485 provides that the fees associated with such a permit will be waived.

Study Construction and Repair in Regulated Flood Zones. – The act directs the Division of Emergency Management in the Department of Crime Control and Public Safety to study ways to facilitate construction and repair of water dependent structures in regulated flood zones. The Division will report on the results of the study and any recommendations to the Joint Legislative Commission on Seafood and Aquaculture by March 1, 2008.

Except as otherwise noted, this act became effective August 30, 2007. (JH)

Fisheries

Brunswick Menhaden Restrictions

S.L. 2007-320 (HB 1017) makes it unlawful to take menhaden or Atlantic thread herring with a purse seine net within three nautical miles of the shoreline of Brunswick County from May 1 through October 31. Violation of this prohibition is a Class A1 misdemeanor.

This act became effective August 29, 2007 and applies to offenses committed on or after that date. (JH)

Mercury Switch Removal Program Amendments

S.L. 2007-142 (HB 1758) substantially rewrites the laws governing the removal of mercury switches from end-of-life vehicles that were enacted in 2005 in order to make it feasible to implement the mercury switch removal program and to allow the program to be implemented under the Memorandum of Understanding to establish the National Vehicle Mercury Switch Recovery Program.:

Definitions. – The act adds new definitions for the terms "inaccessible," when used in connection with mercury switch, "mercury recovery performance ratio," "vehicle manufacturer," "vehicle crusher," and "vehicle dismantler" and amends the definition for the term "end of life vehicle."

Removal of Mercury Switches from End-of-Life Vehicles. – All vehicle crushers, vehicle dismantlers, vehicle recyclers, and scrap vehicle processing facilities must remove accessible mercury switches before destroying an end-of-life vehicle. If an end-of-life vehicle is conveyed to another crusher, dismantler, recycler, or processing facility without removing all accessible mercury switches, the receiving entity must agree to accept the vehicle and the responsibility for the proper removal of all accessible mercury switches. The act requires the person removing the switch to mark the vehicle to indicate that all accessible mercury switches have been removed and certify to any person to whom the vehicle is conveyed, in a form acceptable to the Department of Environment and Natural Resources (DENR), that all accessible mercury switches have been removed from the vehicle. The act also requires vehicle manufacturers to work with DENR to develop, implement, and to bear the cost of the mercury switch collection system in accordance with the National Vehicle Mercury Switch Removal Program (NVMSRP).

Mercury Switch Removal Account. – This act renames the Mercury Pollution Prevention Account as the Mercury Switch Removal Account and provides that vehicle crushers, vehicle dismantlers, vehicle recyclers, and scrap vehicle processing facilities may be reimbursed from the Account for costs incurred in implementing the mercury switch removal program. Requests for reimbursement must be made and verified against information posted by the vehicle manufacturers in accordance with either the NVMSRP or against other information that verifies the reimbursement request to the satisfaction of DENR. Persons who seek reimbursement shall maintain relevant records for at least three years.

Enforcement of Violations. – The act makes the penalty for knowingly destroying a vehicle that contains an accessible mercury switch or willfully failing to remove a mercury switch when required to do so a Class 1 misdemeanor. Making a false report or a fraudulent claim for reimbursement is a Class 2 misdemeanor carrying a maximum fine of $10,000. Other violations may be enforced by an administrative or civil action.

Annual Report. –DENR is required to submit a report on the mercury switch removal program to the Environmental Review Commission and the Senate and House Appropriations Subcommittees on Natural and Economic Resources by October 1 of each year beginning in 2008. The report must include a description of: (i) the mercury recovery performance ratio achieved by the program; (ii) the mercury switch collection system; (iii) recommendations or alternative actions necessary to achieve a mercury recovery performance ratio of at least 0.90 of the national mercury recovery; (iv) the number of mercury switches collected; (v) and costs required to implement the program, including receipts and disbursements from the Account.

The provisions of the act that pertain to definitions and the annual report became effective June 29, 2007. The provisions that amend the program for removal mercury switches from end-of-life vehicles, the Mercury Switch Removal Account, and changes in the enforcement

of violations became effective July 1, 2007, and apply to violations that occur on or after that date. This act sunsets December 31, 2017. (JRM)

Commercial and Noncommercial Leaking Petroleum Underground Storage Tank Program Administrative Costs

S.L. 2007-323, Secs. 12.1.(a) and 12.1.(b) (HB 1473, Secs. 12.1.(a) and 12.1.(b)) amend the Commercial and Noncommercial Leaking Petroleum Underground Storage Tank Cleanup Funds to provide that both Funds may be used to support the administrative functions of the program for underground storage tanks up to the amounts allowed by law, which amounts may be changed from time to time. In the case of a legislated increase or decrease in salaries and benefits, the administrative allowance existing at the time of the increase or decrease must be correspondingly increased or decreased by an amount equal to the legislated increase or decrease in salaries and benefits.

These sections became effective July 1, 2007. (JRM)

North Carolina Green Business Fund

S.L. 2007-323, Secs. 13.2.(a) through 13.2.(d) (HB 1473, Secs. 13.2.(a) through 13.2.(d)). See **Business and Commerce.**

Erosion and Sedimentation Control Plan Fee Increase

S.L. 2007-323, Secs. 30.1.(a) and 30.1.(b) (HB 1473, Secs. 30.1.(a) and 30.1.(b)). See **Finance.**

Modify Tax Credit for Constructing Renewable Fuel Facilities

S.L. 2007-323, Sec. 31.9.(a) and 31.9.(b) (HB 1473, Secs. 31.9.(a) and 31.9.(b)). See **Finance.**

Amend Wildlife Resources Management Laws

S.L. 2007-401 (SB 1464). See **Agriculture and Wildlife.**

Amend Environmental Laws/Environmental Technical Corrections 2007

S.L. 2007-495 (SB 844) makes clarifying, conforming, and technical amendments to various environmental and natural resources laws and amends various environmental and natural resources laws and reporting requirements as follows:

- Provides that as an alternative to submission of a plat, a site plan may be submitted with the application for a private drinking water well construction permit in situations where the well is proposed to be located on a site on which a regulated wastewater system is located or is proposed to be located.
- Clarifies that in order for a well contractor to renew his or her certification, the applicant must provide proof of having completed any professional development hours as may be required by rules of the Well Contractors Certification Commission.

- Provides an additional statutory exception for transplanting oysters from public grounds to private beds when seed clams and seed oysters are a certain size and originate from an aquaculture operation permitted by the Secretary of Environment and Natural Resources.
- Extends the terms of members of the Advisory Commission for the North Carolina State Museum of Natural Sciences from two years to four years and provides that members appointed by the Governor may not serve more than three consecutive four-year terms.
- Extends the exemption from continuing education requirements for 2 years from September 1, 2008 to September 1, 2010 for well contractors who: (i) are 70 years old or more; (ii) have engaged in well contractor activity for more than 20 years; (iii) have no record of having violated any provision of the Well Construction Act, Well Contractors Certification, or order issued pursuant to or rule adopted under these laws in the previous 10 years; (iv) and meet all other requirements for Well Contractors Certification.
- Amends certain laws governing the regulation of coastal fisheries to remove the Environmental Review Commission (ERC) from the list of entities responsible for reviewing draft Fishery Management Plans prepared by the Department of Environment and Natural Resources (DENR).
- Clarifies that the Roanoke River Basin Bi-State Commission must submit its annual report on or before October 1 of each year.
- Adds the ERC to the list of entities to which the North Carolina Agricultural Development and Farmland Preservation Trust Fund Advisory Committee must report on its activities, agriculture easements purchased, and agricultural projects funded during the previous year as required by law.
- Provides that DENR must submit annual reports on or before October 1 of each year on the cost of the hazardous waste management program as required by law.

This act became effective August 30, 2007. (JRM, GG)

Amend Dry-Cleaning Solvent Cleanup Act

S.L. 2007-530 (SB 1362) makes the following amendments the Dry-Cleaning Solvent Cleanup Act (Act):

- Modifies language throughout the Act to clarify that all site assessment and cleanup procedures will be performed by private contractors hired by the Environmental Management Commission (EMC). These changes clarify that the State is responsible for hiring private contractors and awarding of contracts pursuant to the Act.
- Amends the existing co-payment scheme to provide for a one-time $1,000 application fee effective September 1, 2007.
- Effective retroactively to August 1, 2001, revises the financial responsibility requirements payment schedule as follows:
  - Dry-cleaning facilities owned by persons who employ fewer than 5 full-time employees: 1% of the costs of assessment or remediation, but not exceeding $1,000,000.
  - (i) Dry-cleaning facilities owned by persons who employ at least 5 but fewer than 10 full-time employees, and (ii) abandoned dry-cleaning facility sites: 1.5% of the costs of assessment or remediation, but not exceeding $1,000,000.
  - (i) Dry-cleaning facilities owned by persons who employ 10 or more full-time employees, and (ii) wholesale distribution facilities: 2% of the costs of assessment or remediation, but not exceeding $1,000,000.
- Authorizes the Department of Environment and Natural Resources to use up to 1% of the balance in the Dry-Cleaning Solvent Fund (Fund) in each fiscal year for

investigation of inactive hazardous substance disposal sites that the Department believes to be contaminated by dry-cleaning solvent.

- Effective retroactively to January 1, 2007, the act increases the amount per year that may be disbursed for a site from the Fund as follows:
  - For assessment or remediation response costs incurred in connection with any individual dry-cleaning solvent assessment agreement, the maximum amount is increased from $200,000 to $500,000 per year.
  - For assessment and remediation costs incurred in connection with a certified facility or an abandoned site that poses an imminent hazard, the maximum amount is increased from $400,000 to $1 million per year.
- Provides the EMC with discretion to reject petitions made by operators who are not in compliance with minimum management practices for handling of solvents or operators who are delinquent in paying solvent taxes.
- Adds "implementing" the Act to the actions for which the State or its agents are immune from liability, effective retroactively to January 1, 1998.
- Authorizes the EMC to adopt temporary rules to establish a risk-based approach applicable to the assessment, prioritization, and remediation of dry-cleaning solvent contamination, in certain circumstances, provided the temporary rules are adopted in accordance with the Administrative Procedure Act.

Except as otherwise noted, this act became effective August 31, 2007. (JRM)

Parks and Public Spaces

State Nature & Historic Preserve Additions & Removals

S.L. 2007-307 (HB 1724) dedicates and accepts certain properties as part of the State Nature and Historic Preserve (Preserve), and removes certain lands from the Preserve.

The act adds the following units to the Preserve (each is a new unit of the State Parks System authorized since the last dedication of State property in 2003): Carvers Creek State Park, Chimney Rock State Park, Haw River State Park, Lower Haw River State Natural Area, Mayo River State Park, Mountain Bog State Natural Area, and Sandy Run Savannas State Natural Area.

The act changes the designation of Dismal Swamp and Elk Knob State Natural Areas to State Parks.

The act excepts or deletes previous exceptions from the Preserve as follows:

- Concerning Crowders Mountain State Park:
  - Deletes language from the statute that excepted a tract from the Preserve and authorized the State to sell the tract to adjacent landowners with the proceeds used for other land acquisition at the park. This transaction was completed, the tract is no longer part of the park, and thus the language was deleted
  - Adds language to the statute to except a small triangle of land containing approximately 0.54 acres that is across a road from the remainder of the park. The isolated triangle is of no further use or benefit to the park, and thus the tract was removed from the Preserve and the State Parks System.
- Concerning Stone Mountain State Park: The act deletes language from the statute that excepted a tract located within the park from the Preserve and authorized the State to exchange a portion of the land for property owned by the National Park Service in order to improve the boundaries of the State park and the Blue Ridge Parkway. The exchange was completed, the tract is no longer part of the park, and thus the language was deleted.
- Concerning South Mountains State Park: The act deletes existing language from the statute that excepted from the Preserve the following tracts located within the park:

- Two tracts excepted in order to allow for an exchange of a right-of-way with the Department of Transportation for the realignment of SR 1904.
- A 0.33 acre tract excepted in order to allow the tract to be transferred to the Walker Top Baptist Church to be used for church purposes.

These transactions have been completed, the tracts are no longer part of the park, and thus the language was deleted.

- Concerning Lake James State Park: The act adds language to the statute to except from the Preserve two tracts located within the park as follows:
  - The first clause authorizes the State to grant Duke Energy Corporation a temporary road easement across park property in order to allow trucks to transport fill material to facilitate the Catawba Dam Embankment Seismic Stability Improvements Project (fill material will come from Duke Energy property, not from the park). The tract must be removed from the Preserve because property in the Preserve may not be used for such a purpose under Section 5 of Article XIV of the Constitution of North Carolina. Because the easement is temporary, however, the tract will remain in the State Parks System. The easement will be terminated upon completion of the project, and the tract added back into the Preserve.
  - The second clause removes a tract of land from the Preserve and the State Parks System and authorizes the State to grant an easement to an adjacent landowner in order to extinguish a prescriptive easement that the landowner currently uses that interferes with management of the park.

This act became effective July 28, 2007. (JLM)

Conservation Tax Credit Modifications

S.L. 2007-309 (HB 463). See **Finance.**

Deep River State Trail/Parks Authority Members

S.L. 2007-437 (SB 1431) authorizes the Department of Environment and Natural Resources (DENR) to add Deep River State Trail to the State Parks System, and to acquire and manage lands and easements for the purpose of establishing the Deep River State Park and adding it to the State Parks System. The act also directs DENR to promote, encourage, and facilitate the establishment of connecting trail segments by other federal, State, local, and private landowners. As envisioned by the State Parks System, the Deep River State Trail would emerge as a land-based and paddle trail with access and recreation facilities along the river and its tributaries – beginning at the river's headwaters near High Point and Jamestown in Guilford County and extending through Randolph, Moore, and Chatham counties to the confluence of the Deep River and the Haw River near Moncure in Lee County.

In addition, the act increases the membership of the North Carolina Parks and Recreation Authority from 11 members to 15 members. Of the four additional members, two are to be appointed by the Governor, one by the General Assembly upon the recommendation of the Speaker of the House of Representatives, and one by the General Assembly upon the recommendation of the President Pro Tempore of the Senate.

This act became effective August 23, 2007. (JLM)

Renewable/Alternative Energy and Energy Efficiency

Facilitate Distribution of E-Blend Fuel

S.L. 2007-82 (SB 567). See **Transportation**.

Use of Solar Collectors

S.L. 2007-279 (SB 670). See **Local Government**.

Building Permit Reductions/Rebates

S.L. 2007-381 (SB 581). See **Local Government**.

Promote Renewable Energy/Baseload Generation

S.L. 2007-397 (SB 3) establishes a Renewable Energy and Energy Efficiency Portfolio Standard (REPS), amends the provisions for recovery of various costs by electric utilities, provides for the phaseout of the tax on the sale of energy to farmers and manufacturers, and provides a tax credit for certain renewable energy property.

Establish Renewable Energy and Energy Efficiency Portfolio Standard. – The following REPS provisions become effective January 1, 2008. The cost recovery provisions under the REPS apply only to costs that are incurred on and after January 1, 2008.

S.L. 2007-397 defines "renewable energy resource" as a solar electric, solar thermal, wind, hydropower, geothermal, or ocean current or wave energy resource; a biomass resource, including agricultural waste, animal waste, wood waste, spent pulping liquors, combustible residues, combustible liquids, combustible gases, energy crops, or landfill methane; waste heat derived from a renewable energy resource and used to produce electricity or useful, measurable thermal energy at a retail electric customer's facility; or hydrogen derived from a renewable energy resource. "Renewable energy resource" does not include peat, a fossil fuel, or nuclear energy resource.

S.L. 2007-397 establishes a REPS in North Carolina as follows:

Electric Public Utilities. – Each electric public utility (investor-owned public utility that sells electric power to retail electric customers) in the State must meet the REPS according to the following schedule:

Calendar Year	REPS Requirement
2012	3% of 2011 North Carolina retail sales
2015	6% of 2014 North Carolina retail sales
2018	10% of 2017 North Carolina retail sales
2021 and thereafter	12.5% of 2020 North Carolina retail sales

Electric Membership Corporations and Municipalities. – Each electric membership corporation and municipality that sells electric power to retail electric customers in the State must meet the REPS according to the following schedule:

Calendar Year	REPS Requirement
2012	3% of 2011 North Carolina retail sales
2015	6% of 2014 North Carolina retail sales
2018 and thereafter	10% of 2017 North Carolina retail sales

Use of Solar Energy Resources. – For calendar year 2018 and each calendar year thereafter, at least 0.2% of the total electric power in kilowatt-hours sold to retail electric

customers in the State must be supplied by a combination of new solar electric facilities and new metered solar thermal energy facilities that use solar hot water, solar absorption cooling, solar dehumidification, solar thermally driven refrigeration, or solar industrial process heat. Electric power suppliers must comply with these requirements according to the following schedule:

Calendar Year	Requirement for Solar Energy Resources
2010	0.02%
2012	0.07%
2015	0.14%
2018	0.20%

Use of Swine Waste Resources. – For calendar year 2018 and each calendar year thereafter, at least 0.2% of the total electric power in kilowatt-hours sold to retail electric customers in the State must be supplied by swine waste. Electric power suppliers must comply with these requirements according to the following schedule:

Calendar Year	Requirement for Swine Waste Resources
2012	0.07%
2015	0.14%
2018	0.20%

Use of Poultry Waste Resources. – For calendar year 2014 and each calendar year thereafter, at least 900,000 megawatt-hours of the total electric power sold to retail electric customers in the State must be supplied by poultry waste. Electric power suppliers must comply with these requirements according to the following schedule:

Calendar Year	Requirement for Poultry Waste Resources
2012	170,000 megawatt-hours
2013	700,000 megawatt-hours
2014	900,000 megawatt-hours

Cost Cap. – The recovery of costs that would be incurred by an electric power supplier to comply with the REPS requirements could not exceed an amount equal to the per-customer annual charges in the following schedule:

Customer Class	2008-2011	2012-2014	2015 and thereafter
Residential per account	$10.00	$12.00	$34.00
Commercial per account	$50.00	$150.00	$150.00
Industrial per account	$500.00	$1,000.00	$1,000.00

Adoption of Rules by the Utilities Commission. – The Utilities Commission (Commission) must adopt rules to implement the REPS requirements that specifically:

- Provide for the monitoring of compliance with and enforcement of the REPS requirements.
- Include a procedure to modify or delay the REPS requirements in whole or in part if the Commission determines that it is in the public interest to do so and the public utility demonstrates that it has made a reasonable effort to meet the REPS requirements.
- Ensure that energy credited toward compliance with the provisions of S.L. 2007-397 not be credited toward any other purpose.
- Establish standards for interconnection of renewable energy facilities and other non-utility owned generation with a generation capacity of 10 megawatts or less to a public utility's electric distribution system.
- Ensure that the owner and operator of each renewable energy facility that delivers electric power to an electric power supplier is in substantial compliance with all federal and state laws, regulations, and rules for the protection of the environment and conservation of natural resources.

- Consider whether it is in the public interest to adopt rules for electric public utilities for net metering of renewable energy facilities with a generation capacity of one megawatt or less.
- Track and account for renewable energy certificates.

Reports, Evaluation, and Analysis. – No later than October 1 of each year, beginning October 1, 2008, the Commission must submit a report on the activities taken by the Commission to implement and by electric power suppliers to comply with the REPS requirements to the Governor, the Environmental Review Commission (ERC), and the Joint Legislative Utility Review Committee.

The Environmental Management Commission (EMC) may establish a procedure for evaluating renewable energy technologies; establish standards to ensure that renewable energy technologies do not harm the environment, natural resources, cultural resources, or public health, safety, or welfare of the State; and, to the extent that there is not an environmental regulatory program, establish a regulatory program to implement these protective standards.

No later than September 1, 2008, the Commission must prepare and submit an analysis of whether rate structures, policies, and measures, including decoupling, in place in other states and countries that promote a mix of generation involving renewable energy sources and demand reduction should be implemented in North Carolina to the Governor, the Environmental Review Commission, and the Joint Legislative Utility Review Committee.

No later than October 1 of odd-numbered years, beginning October 1, 2009, the Commission must submit to the Governor, the ERC, and the Joint Legislative Utility Review Committee a report on the actual results of the costs allocation established by S.L. 2007-397.

Federal Action. – S.L. 2007-397 provides that if the federal government imposes requirements similar to the REPS requirements on electric power suppliers in the State, the Commission will determine the applicability of federal and State requirements so as to apply the more stringent requirements. The Commission would adopt rules to establish a procedure as an alternative to the procedure set out in G.S. 62-133 to annually adjust the rates of electric public utilities to allow timely recovery of all reasonable costs of compliance with the federal and State requirements.

Demand-Side Management and Energy Efficiency Measures. – S.L. 2007-397 defines "demand-side management" as activities, programs, or initiatives undertaken by an electric power supplier or its customers to shift the timing of electricity use from peak to nonpeak demand periods. "Demand-side management" includes, but is not limited to, load management, electric system equipment and operating controls, direct load control, and interruptible load. S.L. 2007-397 defines "energy efficiency measure" as an equipment, physical, or program change implemented after January 1, 2007 that results in less energy used to perform the same function. "Energy efficiency measure" includes, but is not limited to, energy produced from a combined heat and power system that uses non-renewable energy resources. "Energy efficiency measure" does not include demand-side management.

S.L. 2007-397 directs electric power suppliers to implement demand-side management and energy efficiency measures to establish the least cost mix of demand reduction and generation measures that meet the electricity needs of its customers. An electric power supplier may petition the Commission to approve an annual rider to its rates to recover all reasonable and prudent costs incurred for adoption and implementation of demand-side management and energy efficiency measures adopted and implemented after January 1, 2007. The Commission must assign the costs of measures only to the class of customers that directly benefit from the measures. No costs of demand-side management or energy efficiency programs would be assigned to an industrial customer that has or will implement its own demand-side management and energy efficiency measures. Recoverable costs would include, but not be limited to, all capital costs, including cost of capital and depreciation expenses, administrative costs, implementation costs, incentive payments to program participants, and operating costs.

The demand-side management and energy efficiency measures provisions became effective August 20, 2007. The cost recovery provisions for demand-side management and energy efficiency measures apply only to costs that are incurred on and after August 20, 2007.

Amend Cost Recovery Procedures for Electric Power Suppliers. – The following cost recovery provisions become effective January 1, 2008.

Recovery of Additional Costs under the Annual Fuel Charge. – S.L. 2007-397 shifts the recovery of certain costs incurred by an electric public utility from recovery through the rate base to recovery through the annual fuel charge adjustment. The new costs that are recoverable under this provision are:

- The cost of ammonia, lime, limestone, urea, dibasic acid, sorbents, and catalysts consumed in reducing or treating emissions. These costs will be adjusted for gains or losses resulting from the sale of by-products produced in the generation process.
- The total delivered non-capacity related costs, including all related transmission charges, of all purchases of electric power by the electric public utility.
- The capacity costs associated with purchases of electric power from qualifying cogeneration facilities and qualifying small power production facilities.
- Except for those costs recovered pursuant to the new REPS requirement statute, the total delivered costs of purchases of power from renewable energy facilities and new renewable energy facilities pursuant to the REPS requirement or any similar federal requirement.
- Cost recoverable under the fuel charge would be adjusted for gains or losses resulting from the sale of fuel, and other fuel related costs components.

The fuel clause amendments apply only to fuel and fuel related costs incurred on and after January 1, 2008.

Ongoing Review of Construction Costs and Inclusion of Construction Costs in Rates. – Prior to S.L. 2007-397, an electric public utility was responsible for bearing the construction costs of a generating facility until the facility began operation. In the first general rate case after the facility went into service, if the Commission found the facility to be used and useful, the total facility costs, excluding any imprudently incurred costs, were included in rates charged to customers. There was one exception to this system of construction cost recovery; prudently incurred expenses for construction work in progress may have been included in the rate base if the Commission finds that it was in the public interest and necessary to the utility's financial stability. If a facility was abandoned before it is completed, the Commission could authorize the electric public utility to recover the costs of the incomplete facility, excluding any imprudently incurred costs, by amortizing these costs over a period of years, with no return on the unamortized balance.

S.L. 2007-397 alters these procedures for construction cost recovery as follows:

- A certificate for the construction of a coal or nuclear facility will be granted only if the applicant demonstrates and the Commission finds that energy efficiency measures, demand side management, renewable energy resource generation, combined heat and power generation, or any combination of these, will not create a more cost-effective and reliable generation system and that the construction and operation of such a facility is in the public interest.
- Once a construction certificate has been granted by the Commission, a public utility may not cancel construction of a generating facility without receiving approval from the Commission. If the Commission finds that completion of the generating facility is no longer in the public interest, the Commission may modify or revoke the certificate.
- A public utility must submit an annual progress report on construction to the Commission, including any revisions in the cost estimate for the construction. The Commission may conduct an ongoing review of construction of the facility. If the Commission disapproves any part of the revised cost estimate or finds that the incurrence of the cost of that portion of the construction of the facility then under

review was unreasonable or imprudent, the Commission may modify or revoke the certificate.

- The public utility will recover through rates in a general rate case the actual costs it has incurred in constructing a generating facility in reliance on a construction certificate as provided below, unless new evidence is discovered (i) that could not have been discovered by due diligence at an earlier time and (ii) that reasonably tends to show that a previous determination by the Commission that a material item of cost had been just and reasonable and prudently incurred was erroneous.
  - Whether under construction or completed, if the construction of the facility:
    - Has been subject to ongoing review, the reasonable and prudent costs of construction approved by the Commission during the ongoing review will be included in the public utility's rate base.
    - Has not been subject to ongoing review, the costs of construction will be included in the public utility's rate base if the Commission finds that the incurrence of these costs is reasonable and prudent.
  - If the construction of a facility is cancelled and the facility:
    - Has been subject to ongoing review, the public utility will recover through rates in a general rate case the costs of construction approved by the Commission during the ongoing review that were actually incurred prior to cancellation, amortized over a reasonable time as determined by the Commission. The public utility will have the burden of proof to demonstrate that the material item of cost was in fact just and reasonable and prudently incurred. In the general rate case, the Commission will make any adjustment that may be required.
    - Has not been subject to ongoing review, the public utility will recover through rates in a general rate case the costs of construction that were actually incurred prior to cancellation and are found by the Commission to be reasonable and prudent, amortized over a reasonable time as determined by the Commission. In the general rate case, the Commission will make any adjustment that may be required.

The public utility has the burden of proof to demonstrate that the material item of cost was in fact just and reasonable and prudently incurred.

Recovery of Construction Costs for Out-of-State Electric Generating Facilities and Project Development Costs for Nuclear Facilities. – S.L. 2007-397 provides that upon petition by a public utility, the Commission would determine the need for and, if need is established, approve an estimate of the construction costs and construction schedule for an electric generating facility in another state. The construction cost estimate and the recovery of costs through a general rate case will be governed by the provisions that apply to facilities built in the State.

S.L. 2007-397 also provides for the treatment of project development costs for a nuclear facility as follows:

- S.L. 2007-397 defines "project development costs" as all capital costs associated with a potential nuclear electric generating facility, including the costs of evaluation, design, engineering, environmental analysis and permitting, early site permitting, combined operating license permitting, initial site preparation costs, and allowance for funds used during construction associated with such costs.
- A public utility may request that the Commission review the public utility's decision to incur project development costs for the construction of a nuclear electric generating facility. The Commission will approve the public utility's decision to incur project development costs if the public utility demonstrates by a preponderance of evidence that the decision to incur project development costs is reasonable and prudent.
- All reasonable and prudent project development costs, as determined by the Commission, incurred for the potential nuclear electric generating facility will be included in the public utility's rate base and will be fully recoverable through rates in

a general rate case If the public utility is allowed to cancel the project, the Commission will permit the public utility to recover all reasonable and prudently incurred project development costs in a general rate case amortized over a period equal to the period during which the costs were incurred, or five years, whichever is greater.

Recovery of Construction Work in Progress. – S.L. 2007-397 changes the standard by which the Commission may include construction work in progress in rates. Prior to S.L. 2007-397, construction work in progress could only be included if the Commission determined that inclusion is in the public interest and necessary to the financial stability of the utility. S.L. 2007-397 allows inclusion of construction work in progress if the construction is subject to ongoing review and Commission determines that expenditures are reasonable and prudent.

Adjust the public utility and electric membership corporation regulatory fees. – S.L. 2007-397 provides that the percentage rate to be used in calculating the public utility regulatory fee under G.S. 62-302(b)(2) is 0.12% for each public utility's North Carolina jurisdictional revenues earned during each quarter that begins on or after July 1, 2007. S.L. 2007-397 (SB 3) also provides that the electric membership corporation regulatory fee imposed under G.S. 62-302(b1) for the 2007-2008 fiscal year is $200,000. The adjustment in the public utility and electric membership corporation regulatory fees became effective July 1, 2007.

Phase out of sales taxes paid by farmers and manufacturers on electricity, piped natural gas, and other fuels. – S.L. 2007-397 phases out the current sales tax rate of 2.83% on sales of electricity to manufacturing industries and manufacturing plants for use in connection with their operation and to farmers to be used by them for farming purposes as follows:

- Effective October 1, 2007, reduces the rate from 2.83% to 1.8%.
- Effective July 1, 2008, reduces the rate from 1.8% to 1.4%.
- Effective July 1, 2009, reduces the rate from 1.4% to 0.8%.
- Effective July 1, 2010, exempts these sales from tax.

S.L. 2007-397 phases out the tax imposed on piped natural gas received by a manufacturer for use in connection with the operation of the manufacturing facility and on piped natural gas received by a farmer to be used for any farming purpose, other than preparing food, heating dwellings, and other household purposes. The phase out occurs from October 1, 2007 through July 1, 2010.

S.L. 2007-397 phases out the privilege tax imposed on a manufacturing industry or plant that purchases fuel to operate the industry or plant by reducing the tax rate as follows:

- Effective October 1, 2007, reduces the rate from 1% to 0.7%
- Effective July 1, 2008, reduces the rate from 0.7% to 0.5%
- Effective July 1, 2009, reduces the rate from 0.5% to 0.3%,
- Effective July 1, 2010, reduces the rate from 0.3% to 0.0%.

Establish renewable energy tax credit. – G.S. 105-129.16A provides a tax credit for investing in renewable energy property. This tax credit is not used by a nonprofit corporation that invests in renewable energy property because the nonprofit organization does not owe any tax. S.L. 2007-397 allows this tax credit to a taxpayer that makes an eligible contribution to a nonprofit organization organized under section 501(c)(3) of the Internal Revenue Code. An eligible contribution is a contribution designated by the taxpayer to be used for investing in renewable energy property and used by the nonprofit organization for investing in renewable energy property.

Renewable energy property includes the following machinery and equipment or real property:

- Biomass equipment that uses renewable biomass resources for biofuel production of ethanol, methanol, and biodiesel; anaerobic biogas production of methane utilizing agricultural and animal waste or garbage; or commercial thermal or electrical generation from renewable energy crops or wood waste materials. Renewable biomass resources are organic matters produced by terrestrial and aquatic plants and

animals, such as standing vegetation, forestry and agricultural residues, landfill wastes, and animal wastes.

- Hydroelectric generators
- Solar energy equipment
- Wind equipment

The tax credit is effective for taxable years beginning on or after January 1, 2008.

Severability Clause. – S.L. 2007-397 provides that if any section or provision of the act is declared unconstitutional or invalid by the courts, the unconstitutional or invalid section or provision does not affect the validity of S.L. 2007-397 as a whole or any part of S.L. 2007-397 other than the unconstitutional or invalid part. (JH, GG)

State Diesel Vehicles' Warranties/B-20 Fuel

S.L. 2007-420 (SB 1277). See **Transportation**.

Diesel School Buses to Use Minimum B-20 Fuel

S.L. 2007-423 (SB 1452) requires that certain school buses used to transport school children in North Carolina that are capable of using diesel fuel be capable of using diesel fuel with a minimum biodiesel fuel concentration of B-20 (defined as a blend of 20% biodiesel fuel and 80% petroleum-based diesel fuel). The act also requires that at least 2% of the total volume of fuel purchased annually for these buses be a minimum blend of B-20, to the extent that biodiesel fuel is available and compatible with the vehicles being used. This act applies to buses purchased by the State Board of Education, buses purchased by local boards of education, and buses purchased by private companies that contract to transport public school children.

This act becomes effective June 1, 2008, and applies to vehicles transferred or purchased on or after that date. (JRM)

Community Colleges/Participate in Energy Loan Program

S.L. 2007-476 (HB 177). See **Education**.

Conserve Energy/Insulate Hot Water Plumbing

S.L. 2007-542 (HB 1702) provides that the North Carolina Building Code Council (Council) may consider adopting rules concerning energy efficiency that require all hot water plumbing pipes that are larger than ¼ inch to be insulated. This act requires the Council to study the extent to which hot waterlines should be insulated to achieve greater energy efficiency and to amend the North Carolina State Building Code as necessary to achieve those ends. The Council must report its findings and actions to the Environmental Review Commission and the 2008 General Assembly on or before April 1, 2008.

The provision of the act that requires the Council to report its findings became effective August 31, 2007. The provision of the act that authorizes the Council to consider adopting rules concerning energy efficiency becomes effective January 1, 2008, and applies to all new construction for which permits are issued on or after that date. (JRM)

Energy Conservation in State Buildings

S.L. 2007-546 (SB 668) promotes the conservation of energy and water use in State, university, and community college buildings. The act requires new State, university, and community college buildings and major renovations of these buildings to be designed,

constructed, and certified in accordance with specified energy and water efficient construction standards and prohibits the State from purchasing buildings that did not meet applicable energy efficiency standards at the time of construction or renovation. New terms defined in this act include:

- ASHRAE means the American Society of Heating, Refrigerating and Air Conditioning Engineers.
- Major facility means a construction project, funded in whole or in part by the State, larger than 20,000 gross square feet of occupied or conditioned space or a building renovation project when the cost is greater than 50% of the insurance value and the project is larger than 20,000 gross square feet of occupied or conditioned space.

Sustainable Energy Efficient Buildings Program. – The act establishes the Sustainable Energy Efficient Buildings Program (Program) to require all major facility projects to be designed, constructed, and certified to at least 30% greater energy efficiency standards than ASHRAE 90.1-2004, and all major renovations to be at least 20% greater energy efficiency than ASHRAE 90.1-2004. Water systems must be designed and constructed to use 20% less potable water than the indoor water use baseline after meeting the 2006 North Carolina Plumbing Code. Outdoor potable water or harvested ground water consumption must be reduced by 50% over conventional means. These provisions apply only to major facility projects that have not yet entered the schematic design phase. Public agencies must monitor and document ongoing operating savings and report annually to the State Construction Office of the Department of Administration (Department) on these savings. If the average building energy or water consumption over 2 years following beneficial occupancy is 85% or less than the performance goals established by the applicable standards, the designer, owner agency, contractor, Construction Manager at Risk, and commissioning agent must investigate, determine the cause of the shortfall, and recommend corrections or modifications to meet the performance goals. The required reports on ongoing operating savings and any report from the State Building Commission regarding the ASHRAE 90.1-2004 standard are to be consolidated by the Department into one report by November 1 of each year beginning in 2008 and submitted to the General Government Appropriations Subcommittees of the Senate and the House of Representatives, the Environmental Review Commission, and the Joint Legislative Commission on Governmental Operations. This consolidated report must include recommendations on the ongoing implementation of the Program, including a discussion of incentives and disincentives related to implementing the Program.

The act establishes guidelines for administering the Program and authorizes the Department to develop and issue policies and technical guidelines to implement the Program for public agencies. Public agencies may hold a preproposal conference for prospective bidders to discuss the standards. The Department must also create a sustainable, energy efficient buildings advisory committee to provide advice on the implementation of the Program, including recommendations regarding an education and training process for the Program and water and energy efficiency requirements. After reviewing the committee's recommendations, the Department must develop levels of education and training requirements suitable for each of the following positions: (i) the chief financial officer of a public agency; (ii) the facility manager of each public agency responsible for the payment of the agency's utilities; (iii) the capital projects coordinator of a public agency and; (iv) architects and mechanical design engineers involved in the design of projects under the Program.

The act provides that when the Department, public agency, and the design team determine that the ASHRAE 90.1-2004 standard is not practicable for a major facility project, the State Building Commission (Commission) must determine if the standard is not practicable and, if not, which standard is practicable for the design and construction for that major facility project. If ASHRAE 90.1-2004 is not followed, the public agency and the Commission must include this information and the reasons to the Department in the required Program report. This act also requires the Department to determine whether other standards would better fulfill the intent of the Program. The Department is also specifically charged with following the development of

improved energy standards by ASHRAE and whether these standards or any other standard is adopted by the State Building Code Council. The Department must report to the General Government Appropriations Subcommittees of the Senate and the House of Representatives, the Environmental Review Commission, and the Joint Legislative Commission on Governmental Operations on the result of its monitoring no later than January 1, 2009 and again on or before January 1, 2010.

The act requires the Department to conduct a performance review of the Program's costs, savings, impacts on employee productivity, and effectiveness and to submit a preliminary report no later than December 1, 2010 and a final report no later than December 1, 2011 to the General Government Appropriations Subcommittees of the Senate and the House of Representatives, the Environmental Review Commission, and the Joint Legislative Commission on Governmental Operations. S.L. 2007-546 prohibits State agencies from purchasing any building, or a building that has had a major renovation, that was not designed and constructed to meet energy efficiency standards of a comparable State building or renovation of a State building in effect at the time the building was constructed or renovated. This prohibition does not apply to the purchase of a building having historic, architectural, or cultural significance or to buildings acquired by devise or bequest.

Implementation of Energy Conservation Measures. – The act requires the Department to administer and oversee the implementation of a program fully implementing the energy conservation measures in each State, university, and community college building no later than December 31, 2009. "Energy conversation measure" means a facility alteration, training, or services related to the operation of a facility, when the alteration, training, or services provide anticipated energy savings. Energy conservation measures that would be implemented under this act include:

- Lighting system changes
- Water system changes
- Review of heating, ventilation, and air-conditioning (HVAC) replacement equipment and training to ensure installation of programmable automated HVAC building systems is done properly
- Review of minor motorized equipment subject to replacement to ensure replacement equipment has premium efficiency motors and
- The following retrofits that require no significant expenditure of funds:
  - Disconnection of drink vending machine lamps
  - Use of power save features on office equipment
  - Purchase of Energy Star equipment and appliances

Develop/Update Standards. – The act requires the Department to develop or revise its architectural and engineering standards by February 1, 2008 to provide assistance in determining which energy conservation measures are best suited to the unique characteristics of each building. The Department must report to the Joint Legislative Commission on Governmental Operations and the Environmental Review Commission on its progress no later than February 1, 2008.

The requirements for the implementation of energy, water, or other utility conservation measures under this act do not apply for properties eligible for, nominated to, or entered on the National Register of Historic Places, pursuant to the National Historic Preservation Act of 1966.

Authority and Duties of State Agencies. – The act amends the statutes governing the authority and duties of State agencies to require the Department to develop a comprehensive program to manage energy, water, and other utility use and update the program annually. The energy consumption per gross square foot for all State buildings in total must be reduced by 20% by 2010 and 30% by 2015 compared to the 2003-2004 baseline. State agencies and universities must annually implement and update a management plan that is consistent with the State's program under this section. Each community college must submit an annual written report to the State Energy Office on its utility and consumption costs.

The Department, as part of the existing Facilities Condition and Assessment Program, must develop an energy audit and a procedure for conducting energy audits. Every five years, the Department must conduct an energy audit for each State agency or university facility. When conducting an energy audit, the Department must identify and recommend any State or institution of higher learning facility as suitable for building commissioning to reduce energy consumption or suitable for the installation of an energy savings measure pursuant to a guaranteed energy savings contract. The Department may adopt architectural and engineering standards to meet this requirement.

The act requires the Department to establish and train an additional team to examine existing facilities of State agencies and State institutions of higher learning to identify and recommend energy conservation maintenance and operating procedures designed to reduce energy consumption, to conduct energy audits, and to identify facilities that are suitable for the installation of an energy savings measure under the Facilities Condition and Assessment Program.

Life-Cycle Cost Analysis. – The act amends laws to require a life-cycle cost analysis to commence at the schematic phase of the construction or renovation project and be updated or amended at the design development phase and the construction document phase. The State agency, university, or community college must submit the life-cycle cost analysis to the Department for certification at the schematic phase and again when it is updated or amended as needed.

The provisions of the act concerning the Sustainable Energy Efficient Buildings Program became effective October 1, 2008 and expire October 1, 2010. These provisions apply to contracts for the design of major facility projects that are entered into on or after October 1, 2008. The provisions of this act concerning life-cycle cost analysis apply to life-cycle cost analyses commenced, and contracts entered into for life-cycle cost analyses, on or after December 1, 2007. All other provisions of this act became effective August 31, 2007. (JRM, JH)

Solid/Hazardous Waste

Hazardous Materials Task Force Recommendations

S.L. 2007-107 (HB 36) makes the following changes to statutes governing hazardous waste to improve the oversight of hazardous waste facilities as recommended by the Governor's Hazardous Materials Task Force:

- Imposes additional requirements applicable to hazardous waste facilities as follows:
  - Requires applicants for permits for commercial hazardous waste facilities to demonstrate financial responsibility for corrective action and for screening for potential off-site migration of contamination in the event of a release of hazardous waste or hazardous waste constituents into the environment. The provision also: (i) clarifies the methods by which an applicant or permit holder can establish financial assurance; (ii) clarifies who, in addition to an applicant or permit holder, is a guarantor of payment for closure, etc.; (iii) provides that assets used to meet financial assurance requirements must be in a form readily accessible to the Department of Environment and Natural Resources (DENR), and inaccessible to the permit holder except as approved by the Department; and, (iv) authorizes DENR to submit an applicants filings pertaining to financial responsibility to the State Treasurer for review and recommendations. This section became effective October 1, 2007.
  - Requires applicants for permits for hazardous waste facilities to seek input from local government and emergency response agencies on their contingency plans for the facilities. This section became effective June 26, 2007.

- Requires operators of commercial hazardous waste facilities to maintain certain information at an off-site location and make the information accessible to DENR, local government, and emergency response agencies that have a role under contingency plans. This section becomes effective October 1, 2007.
- Requires an applicant for a permit for a commercial hazardous waste facility to notify persons who reside or own property located within one-fourth mile of the proposed facility that an application has been filed, requires permit holders to provide periodic notice to these persons that includes information concerning the emergency response plan for the facility, and requires that documentation of these notices be provided to DENR. This section became effective October 1, 2007.
- Requires DENR to consider, when determining the frequency of inspections at commercial hazardous waste facilities, changes in sensitive land use or population density that occurred during the previous year in the area located within one-fourth mile of any property boundary of such facilities. This section became effective June 26, 2007.
- Requires commercial hazardous waste facilities to provide security and surveillance at the facility 24 hours a day, 7 days a week in order to monitor site conditions and to control entry to the site of the facility. This section became effective October 1, 2007.
- Requires permits for commercial hazardous waste facilities to be subject to renewal at least every five years. This section became effective June 26, 2007.
- Authorizes DENR to regulate facilities at which hazardous waste is stored for more than 24 hours but less than 10 days and directs DENR to study the need for further regulation of these facilities. This section became effective October 1, 2007.
- Requires commercial hazardous waste facilities to install and maintain on-site wind monitors. This section became effective October 1, 2007.
- Provides that a local zoning or land-use ordinance is presumed to be valid and enforceable to the extent the zoning or land-use ordinance imposes requirements, restrictions, or conditions that are generally applicable to development and requires the Office of the Governor to seek the advice of local units of government regarding the adequacy of current criteria the Secretary of Environment and Natural Resources must consider when deciding whether to preempt these local ordinances. This section became effective June 26, 2007.

➢ Authorizes State Medical Assistance Teams and the Epidemiology Section of the Division of Public Health of the Department of Health and Human Services (DHHS) to seek reimbursement for all reasonable deployment costs incurred in response to the release of hazardous material or hazardous waste into the environment. The act also directs the Department of Crime Control and Public Safety and DHHS to jointly study potential sources of permanent funding for the State Medical Assistance Teams.

➢ Clarifies that municipal 911 data has the same confidentiality as county 911 data and that data contained in a reverse 911 emergency notification system is confidential.

➢ Establishes a task force to review the State Building Code with respect to the regulation of facilities that store, treat, or dispose of hazardous materials. This section became effective July 1, 2007.

➢ Requires DENR to establish a digital information exchange system for a hazardous chemicals inventory database. This section became effective July 1, 2007.

➢ Requires DHHS to develop a model plan for public health response to events with a potential for chemical, biological, or radiological contamination. This section became effective July 1, 2007.

➢ Authorizes the Board of Governors of The University of North Carolina to establish an Institute for Disaster Studies and authorizes The University of North Carolina to study

the emission and transport of pollutants at fires at commercial hazardous waste facilities and the health and economic impacts of such fires. This section became effective July 1, 2007.

- Makes clarifying, conforming, and technical changes to statutes governing hazardous waste.

Except as otherwise noted, the provisions of this act became effective June 26, 2007. (JLM, GG)

Solid Waste Management Authority Property

S.L. 2007-131 (HB 1456). See **Local Government**.

Solid Waste Management Act of 2007

S.L. 2007-550 (SB 1492) as amended by S.L. 2007-543 (SB 6):

- Clarifies the circumstances under which the Department of Environment and Natural Resources (DENR) must deny a permit application for a solid waste management facility. This section became effective August 1, 2007 and applies to any application for a permit for a facility that is pending on that date.
- Provides that solid waste management permits are not transferable without the approval of DENR. This section became effective August 1, 2007.
- Increases the maximum penalties that may be imposed for nonhazardous and hazardous solid waste violations. This section became effective August 1, 2007, and applies to violations that occur on or after that date.
- Amends financial responsibility requirements for applicants and permit holders for solid waste management facilities as follows:
  - Adds definitions for "financial assurance," "financial qualification," and "financial responsibility." "Financial responsibility" encompasses both financial assurance and financial qualification.
  - With regard to financial responsibility, requires a permit holder to: (i) maintain financial responsibility in order to continue to hold a permit; (ii) provide any information requested by DENR concerning maintenance of financial responsibility; and, (iii) notify DENR of any significant change in information that might affect financial responsibility. Based upon review of information provided, DENR may require a permit holder to reestablish financial responsibility and may modify or revoke a permit, or require issuance of a new permit.
  - "Financial qualification" refers to the ability of an applicant or permit holder to pay the costs of proper design, construction, operation, and maintenance of the facility. With regard to financial qualification, authorizes DENR, in its sole discretion, to require an applicant to:
    - Demonstrate its financial qualification for the design, construction, operation, and maintenance of a facility. If DENR requires a demonstration of financial qualification, the applicant or permit holder: (i) must provide an audited, certified financial statement; (ii) may do so through a combination of cash deposits, insurance, and binding loan commitments from a financial institution licensed to do business in the State and rated AAA by Standard & Poor's, Moody's Investor Service, or Fitch, Inc. If assets of a parent, subsidiary, or other affiliate of the applicant or a permit holder, or a joint venturer with a direct or indirect interest in the applicant or permit holder, are proposed to be used to demonstrate its financial qualification, then the party whose assets are to be used must be designated as a joint permittee with the applicant on the permit of the facility.

- Provide cost estimates for site investigation; land acquisition, including financing terms and land ownership; design; construction of each five-year phase, if applicable; operation; maintenance; closure, and post-closure monitoring and maintenance of the facility to DENR.

- "Financial assurance" refers to the ability of an applicant or permit holder to pay the costs of assessment and remediation in the event of a release of pollutants from a facility, closure of the facility in accordance with all applicable requirements, and post-closure monitoring and maintenance of the facility. With regard to financial assurance:
  - Requires an applicant and permit holder to establish financial assurance by a method or combination of methods that will ensure that sufficient funds for closure, post-closure maintenance and monitoring, and any corrective action that DENR may require, will be available during the active life of the facility, at closure, and for any post-closure period of time that DENR may require.
  - The applicant or permit holder may establish financial assurance through insurance, irrevocable letters of credit, trusts, surety bonds, or any other financial device, or any combination of the foregoing shown to provide protection equivalent to the financial protection that would be provided by insurance if insurance were the only mechanism used.
  - Assets used to meet financial assurance requirements must be in a form readily accessible to DENR, and inaccessible to the permit holder except as approved by DENR.
  - Requires that the owner or operator of a sanitary landfill establish financial assurance sufficient to cover a minimum of $3 million in costs for potential assessment and corrective action at the facility, and gives DENR discretion to require financial assurance in a higher amount or increase the amount at any time based upon the types of waste disposed in the landfill, the projected amount of waste to be disposed in the landfill, the location of the landfill, potential receptors of releases from the landfill, and inflation. This provision applies to the owner or operator of a sanitary landfill when the permit is next subject to renewal after August 1, 2009.
  - Authorizes the Commission for Health Services to adopt rules to allow a unit of local government or solid waste management authority to meet the financial responsibility requirements by either a local government financial test or a capital reserve fund requirement.
- Except as otherwise noted, these provisions concerning financial responsibility became effective August 1, 2007 and apply to any application for a permit for a solid waste management facility that is pending on that date.

➢ Clarifies and expands the scope of environmental compliance review requirements. This section became effective August 1, 2007 and applies to any application for a permit for a solid waste management facility that is pending on that date.

➢ Clarifies that a parent, subsidiary, or other affiliate of the applicant or parent, including any person with a direct or indirect interest in the applicant (other than a minority shareholder of a publicly traded corporation who has no involvement in the management or control of the corporation) is subject to financial responsibility and environmental compliance review. This provision became effective August 1, 2007 and applies to any application for a permit for a solid waste management facility that is pending on that date.

➢ Provides for siting of combustion products landfills in areas that have been formerly used for the storage or disposal of combustion products from coal-fired generating units at the same facility that generated the combustion products, and technical requirements, including a double liner system, for these landfills. This section became effective August 1, 2007. Any permit issued for a combustion products

landfill as described in this section will, for purposes of this provision, be considered to have been permitted on property described in a solid waste management facility permit that is in effect on August 1, 2007.

- Specifies additional technical requirements for solid waste management facilities. The act requires:
  - DENR to conduct a study of environmental impacts (EIS) from the proposed facility, and require the applicant to pay all costs incurred by DENR in connection with the study.
  - A buffer of at least 200 feet between any perennial stream or wetland and the nearest waste disposal unit of a sanitary landfill, except in certain circumstances.
  - A sanitary landfill for the disposal of construction and demolition debris to be constructed with a liner system that consists of a flexible membrane liner over two feet of soil of specified permeability.
  - A sanitary landfill to be constructed so that the post-settlement bottom elevation of the liner system, or the post-settlement bottom elevation of the waste if no liner system is required, is a minimum of four feet above both the seasonal high groundwater table and the bedrock datum plane contours.
  - With respect to any sanitary landfill for which a liner is required, additional requirements for testing of geomembrane base liner systems for leaks and damage, and design and maintenance of leachate collection systems, lines, and pipes.
  - A permit holder for a sanitary landfill to develop and implement a waste screening plan to ensure compliance with State laws and rules, and any applicable local ordinances, that prohibit the disposal of certain items in landfills.

The act prohibits:

- Construction of a waste disposal unit of a sanitary landfill in: a 100-year floodplain, except as authorized by variance, or a wetland, except in certain circumstances.
- Construction of a waste disposal unit of a sanitary landfill if, at the earlier of (i) the acquisition by the applicant or permit holder of the land or of an option to purchase the land on which the waste disposal unit will be located, (ii) the application by the applicant or permit holder for a franchise agreement, or (iii) at the time of the application for a permit, any portion of the proposed waste disposal unit would be located within five miles of the outermost boundary of a National Wildlife Refuge, one mile of the outermost boundary of a State gameland, or two miles of the outermost boundary of a component of the State Parks System. This provision (i) became effective August 1, 2007, and applies to any application for a permit for a solid waste management facility that is submitted on or after that date; and (ii) applies to any application for a permit for a solid waste management facility that is pending on August 1, 2007 on the basis of the boundaries of an applicable National Wildlife Refuge, State gameland, or component of the State Parks System as of August 1, 2007.
- Issuance of a permit for a sanitary landfill that authorizes: (i) a capacity of more than 55 million cubic yards of waste; (ii) a disposal area of more than 350 acres; and (iii) a maximum height, including the cap and cover vegetation, of more than 250 feet above the mean natural elevation of the disposal area.

This section pertaining to additional technical requirements for solid waste management facilities became effective August 1, 2007 and, with certain exceptions as set forth in the act, applies to any application for a permit for a solid waste management facility that is pending on that date.

- Requires that applicants for a permit for a sanitary landfill or for a transfer station conduct a traffic study of the impacts of the proposed facility. This section became effective August 1, 2007 and, with certain exceptions as set forth in the act, applies

to any application for a permit for a solid waste management facility that is pending on that date.

- Clarifies the circumstances under which a unit of local government may collect a solid waste availability fee. This section became effective August 1, 2007.
- Authorizes units of local government to hire landfill liaisons. This section became effective August 1, 2007.
- Establishes a schedule of fees applicable to permits for solid waste management facilities to support the solid waste management program. Requires DENR to issue a draft permit decision on an application for a permit subject to a fee within one year after DENR determines the application is complete. This section became effective on August 1, 2007 and applies to any application for a permit for a solid waste management facility that is pending on that date, except that during the period August 1, 2007 through August 1, 2008 DENR must determine whether an application or a permit for a solid waste management facility is complete within 270 days after DENR receives the application for the permit.
- Establishes a solid waste disposal tax of $2.00 per ton of waste to be imposed on the disposal of municipal solid waste in landfills in the State and on the transfer of municipal solid waste for disposal outside the State in order to provide funds for: (i) 50% for the assessment and remediation of pre-1983 landfills; (ii) 18.75% to cities in the State on a per capita basis and 18.75% to counties in the State on a per capita basis, to be used by a unit of local government solely for solid waste management programs and services. Under this provision, persons who reside within a city would not be counted in the population of the county or counties in which the city is located; and (iii) 12.5% grants to State agencies and units of local government to initiate or enhance local recycling programs and to provide for the management of difficult to manage solid waste, including abandoned mobile homes and household hazardous waste.

  One designated use of the funds is remediation of pre-1983 landfills ("orphan" landfills). The act requires the Secretary of Environment and Natural Resources to assess these landfills, determine their priority for remediation, and to develop and implement a remedial action plan for each landfill that requires remediation. The act provides that with regard to these landfills, the Secretary may not seek cost recovery: (i) from a local government for assessment and remedial action performed; and (ii) from any other potentially responsible party if the Secretary develops and implements a remedial action for the site. If any potentially responsible party fails to cooperate with the assessment and implementation of control and mitigation measures, the Secretary may seek cost recovery for assessment and remedial action. The Secretary will develop and implement a remedial action plan only if funds are available to pay the cost of implementation.

  This section becomes effective July 1, 2008.
- Enacts provisions related to the recycling of discarded computer equipment. The act:
  - Requires each manufacturer of computer equipment sold in the State to:
    - Register with DENR.
    - Pay a $10,000 initial registration fee and a $1,000 annual renewal registration fee. The proceeds of the fees will be credited to the Computer Equipment Management Account, a non-reverting account established within DENR. A manufacturer of computer equipment that sells 1,000 items of computer equipment or less per year is exempt from the requirement to pay these fees. This provision becomes effective January 1, 2009.
    - Submit a plan to DENR for the recycling or reuse of computer equipment produced by the manufacturer and discarded by households in the State. This provision becomes effective October 1, 2009.

- Pay all costs associated with the development and implementation of its plan. This provision becomes effective January 1, 2009.
- Submit a report to the Department by January 31 of each year. This provision becomes effective February 1, 2011.

- Requires computers sold in the State to include a label identifying the manufacturer. This provision becomes effective January 1, 2009.
- Allows manufacturers to participate in collective recovery plans with other manufacturers. This provision becomes effective January 1, 2009.
- Prohibits manufacturers not in compliance with requirements from selling computer equipment to the State and to political subdivisions of the State. This provision becomes effective July 1, 2009.
- Requires DENR to: (i) develop and maintain a list of manufacturers in compliance with the applicable provisions; (ii) develop and implement a public education program on recycling of discarded computer equipment and provide technical assistance to local governments and manufacturers; and (iii) submit a report on the recycling of discarded computer equipment to the Environmental Review Commission no later than April 1st of each year. This section becomes effective January 1, 2009.
- Requires computer equipment collectors that participate in the program to ensure that discarded computer equipment is consolidated at central locations, properly stored, and either held for pickup by a manufacturer or delivered to a facility designated by a manufacturer. This section becomes effective January 1, 2010.

➢ Directs DENR to develop a proposal for a recycling program for fluorescent lamps.

➢ Directs the ERC to study issues related to the franchise of solid waste management facilities by units of local government and issues related to transportation of solid waste by rail or barge.

➢ Provides that an applicant for a permit for a sanitary landfill may be eligible for reimbursement of the reasonable costs of preparation of a permit application incurred prior to August 1, 2006 if the permit would be denied as a result of the required setbacks for solid waste management facilities from National Wildlife Refuges, State gamelands, and components of the State Parks System.

The provision includes a statement of purpose and intent that provides that, notwithstanding that an applicant for a permit does not have a reasonable expectation that the law governing the permit will remain unchanged and that the applicant acquires no vested right by virtue of having made an application, the General Assembly finds that it is in the public interest to provide for the potential compensation of certain applicants who submitted an application for a permit for a solid waste management facility prior to August 1, 2006 and whose application would be denied as a result of the required setbacks for solid waste management facilities from National Wildlife Refuges, State gamelands, and components of the State Parks System.

To be eligible for reimbursement under this provision, the applicant must submit a request to DENR for reimbursement no later than December 31, 2007 that demonstrates all of the following:

- The application for a permit to construct a sanitary landfill was submitted to DENR on or before August 1, 2006.
- The applicant obtained a landfill franchise from the local government with jurisdiction over the site of the proposed landfill on or before August 1, 2006.
- DENR did not grant the permit application in whole or in part.
- DENR did not deny the permit application before August 1, 2007.
- The applicant did not withdraw the permit application before August 1, 2007.

- That the applicant had a reasonable expectation that the application for a permit would have been approved but for the enactment of the required setbacks for solid waste management facilities from National Wildlife Refuges, State gamelands, and components of the State Parks System.

The costs eligible for reimbursement are those that are necessary for the preparation of the permit application and that are reasonably incurred. These costs may include site studies, facility plans, construction and engineering plans, construction quality assurance plans, geologic and hydrologic investigations, operation plans, wildlife or wildlife management studies, closure and post-closure plans, information required by DENR to satisfy financial assurance and financial responsibility requirements, and other information required by DENR in the permit review. These costs may also include the reasonable fees of environmental consultants, engineers, geologists, other professionals whose services were necessary to prepare the permit application or to respond to information requests from DENR, and legal costs to obtain a landfill franchise or other approval from the local government with jurisdiction over the site of the proposed sanitary landfill.

Costs not eligible for reimbursement include the costs of acquiring interests in land for construction of the proposed sanitary landfill, or legal or lobbying costs incurred in attempting to influence an administrative or legislative body.

DENR must review a request for reimbursement and notify the applicant and the Secretary of Revenue of the costs approved for reimbursement under this provision. The Secretary of Revenue must reimburse the approved costs from the proceeds of the solid waste disposal tax subject to availability of funds.

The act also provides that an applicant for a permit for a sanitary landfill who accepts reimbursement of costs under this section waives the right to seek reimbursement of those costs under any other provision of law, and requires that, prior to receiving any reimbursement, the applicant must execute a covenant not to sue the State of North Carolina or any political subdivision of the State for any costs as described in the act.

These provisions pertaining to reimbursement of applicants for permits for sanitary landfills became effective August 31, 2007.

- Provides that if any section or provision of the act is declared unconstitutional or invalid by the courts, the unconstitutional or invalid section or provision would not affect the validity of the act as a whole or any part of the act other than the part declared to be unconstitutional or invalid

Except as otherwise noted, the provisions of this act became effective August 31, 2007. (JLM, GG)

Water Quality/Quantity/Groundwater

Clean Water Grants

S.L. 2007-185 (HB 1370) provides that a planning grant or technical assistance grant made by the Clean Water Management Trust Fund for a regional wastewater collection system or a regional wastewater treatment works is not subject to the high-unit-cost threshold. High-unit-cost projects result in an estimated average household user fee for water and sewer service in the area served by the project in excess of the high-unit-cost threshold. High-unit-cost threshold is defined as either 1.5% of the median household income in an area that receives both water and sewer service or ¾% of the median household income in an area that receives only water or only sewer service.

This act became effective July 5, 2007, and applies to applications for planning grants and technical assistance grants received by the Clean Water Management Trust Fund on or after January 1, 2007. (JRM)

Limit Impervious Surfaces for Vehicle Parking

S.L. 2007-323, Sec. 6.22(a) (HB 1473, Sec. 6.22(a)) amends stormwater runoff rules and programs by requiring that any area designed for use as a vehicle parking area, except for covered vehicle parking areas or multilevel vehicle parking areas, not exceed 80% built-upon area, as defined in S.L. 2006-246. The remaining area designed for use as a vehicle parking area must meet:

- Design requirements for a permeable pavement system, as determined in guidance documents prepared by the Department of Environment and Natural Resources (Department) or
- Other design requirements for stormwater management approved by the Department, including, but not limited to, the use of (i) grass and other pervious surfaces and (ii) bioretention ponds, cisterns, and other water retention devices.

This section becomes effective October 1, 2008 and applies to any area designed to be used for vehicular parking for which an application for a building permit, a request for a zoning reclassification, or a subdivision plat is filed in the city or county in which the area is located on or after that date. (JRM)

Bernard Allen Memorial Emergency Drinking Water Fund

S.L. 2007-323, Sec. 12.2.(a) and 12.2.(b) (HB 1473, Sec. 12.2.(a) and 12.2.(b)) makes clarifying and substantive amendments to the Emergency Drinking Water Fund (Fund). The Fund is renamed the "Bernard Allen Memorial Emergency Drinking Water Fund" under the control and direction of the Department of Environment and Natural Resources (Department). The Fund is a nonreverting, interest-bearing fund consisting of monies appropriated by the General Assembly or made available to the Fund from any other source and investment interest credited to the Fund. Improved springs are added to the sources of drinking water covered by the Fund. The Fund may be used by the Department to pay the costs of testing private drinking water wells and improved springs for suspected contamination up to once every three years and for the provision of alternative drinking water supplies to persons whose drinking water well or improved spring is contaminated. Alternative drinking water supply includes the repair or replacement of a contaminated well or the connection to a public water supply.

The Fund may not be used for the provision of:

- Alternative water supply to households with incomes greater than 300% of the federal poverty level.
- Alternative drinking water supplies unless the concentration of one or more contaminants in the private drinking water well or improved spring exceeds the Maximum Contaminant Level, or the federal drinking water action level as defined in the Code of Federal Regulations.
- Temporary water supplies in any calendar quarter until all needs for permanent replacement water supplies that have been identified in that calendar quarter have been met through hookups to public water supplies, repair, or replacement of contaminated wells. The provision of permanent replacement water supplies must be given preference over the provision of temporary water supplies.

The Department, in consultation with the Commission for Health Services and local health departments, must report no later than October 1 of each year, beginning in 2008, to the Environmental Review Commission, the House of Representatives and Senate Appropriations Subcommittees on Natural and Economic Resources, and the Fiscal Research Division on the

implementation of these sections. The report must include the purpose and amount of all expenditures from the Fund during the prior fiscal year, a discussion of the benefits and deficiencies of the Fund, and may include recommendations for any legislative action.

This section became effective July 1, 2007 (JRM)

Nutrient Offset Program Transition

S.L. 2007-438 (HB 859) provides for the transition of the Nutrient Offset Payment Program from a fee-based program to a program based on the actual costs of providing nutrient offsets.

Background. – During the 1999 Regular Session, the General Assembly established the Riparian Buffer Protection Program to provide alternatives for persons who would otherwise be required to maintain riparian buffers. The General Assembly also directed the Environmental Management Commission (EMC) to establish a schedule of compensatory mitigation fees for the program. In January 2006, the EMC adopted a revised schedule of compensatory mitigation fees. There were a number of concerns expressed about the amount of increase in these nutrient offset payment fees. In response, the General Assembly enacted legislation during the 2006 Short Session to establish temporary nutrient offset payment fees in lieu of the fee schedule adopted by the EMC and directed the Environmental Review Commission (ERC) to study issues related to the nutrient offset payment program. The ERC entered into a contract with Research Triangle Institute, International (RTI), to provide consultant services for a study of the costs associated with providing nutrient controls adequate to offset point source and nonpoint source discharges of nitrogen and other nutrients. The ERC received the final report from RTI in June of 2007. In the final report RTI recommended:

- A nutrient offset payment factor for nitrogen in the Neuse River Basin of $25.77 per pound of nitrogen.
- A nutrient offset payment factor for nitrogen in the Tar-Pamlico River Basin of $19.70 per pound of nitrogen.
- A nutrient offset payment factor for phosphorous in the Tar-Pamlico River Basin of $26.02 per tenth of a pound of phosphorus.
- That a 10% fee be added to the nutrient offset payments to cover the costs of program administration.

S.L. 2007-438. – Establishes the following nutrient offset payment fees:

- For nitrogen in the Neuse River Basin, $28.35 per pound of nitrogen.
- For nitrogen in the Tar-Pamlico River Basin, $21.67 per pound of nitrogen.
- For phosphorous in the Tar-Pamlico River Basin, ($28.62) per tenth of a pound of phosphorous.

This fee schedule will expire September 1, 2009.

S.L. 2007-438 requires the Department of Environment and Natural Resources (DENR) to develop and implement a plan to transition the nutrient offset program from a fee-based program to a program based on the actual costs of providing nutrient credits no later than September 1, 2009. DENR will report on its progress in developing and implementing the new fee structure to the ERC on September 1, 2008 and March 1, 2009.

S.L. 2007-438 provides that nutrient offset credits may be obtained through nutrient offset projects provided by organizations that are not affiliated with DENR. This act also provides that nutrient offset projects must be located within the same eight digit Cataloging Unit, designated by the United States Geological Survey, in which the associated nutrient loading takes place.

This act became effective September 1, 2007 and applies to all nutrient offset payments. (JH, GG)

Amend Interbasin Transfer Laws

S.L. 2007-518 (HB 820) repeals the existing process and establishes a new process for applying for a certificate for an interbasin transfer and for determining whether such a certificate should be issued.

Study. – The Environmental Review Commission (ERC), with the assistance of the Department of Environment and Natural Resources (DENR), will study the allocation of surface water resources and their availability and maintenance in the State, including issues related to the transfer of water from one river basin to another and the withdrawal of water for consumptive use. The ERC may submit an interim report to the 2008 Regular Session of the General Assembly and will submit a final report of its findings and recommendations, including any legislative proposals, to the 2009 General Assembly.

The Division of Water Resources of DENR, in consultation with the ERC, will prepare a new river basin map that defines the extent to which river basins in North Carolina extend into adjacent states.

Certificate Required. – A person is required to obtain a certificate from the Environmental Management Commission (Commission) in order to transfer 2 million gallons of water or more per day from one river basin to another. A petition to extend or renew a certificate is treated as a new petition.

Notice of Intent to File a Petition. – An applicant must prepare a notice of intent to file a petition that includes a nontechnical description of the applicant's request and identifies the proposed water source. Within 90 days of filing the notice of intent, the applicant must hold at least one public meeting in the source river basin upstream from the proposed point of withdrawal, at least one public meeting in the source river basin downstream from the proposed point of withdrawal, and at least one public meeting in the receiving river basin to provide information to interested parties and the public regarding the nature and extent of the proposed transfer and to receive comment on the scope of the environmental documents. The applicant must provide at least 30 days notice of the public meetings by publishing notice in the North Carolina Register; by publishing notice in a newspaper of general circulation in many of the potentially affected areas in North Carolina and adjacent states; and by giving notice by first class mail to potentially affected state and local governments, water users in North Carolina and adjacent states, and persons who have requested notice.

Environmental Documents and Public Hearing. – An environmental assessment must be prepared for every petition for a certificate for an interbasin transfer and an environmental impact statement must be prepared for every petition for a certificate for an interbasin transfer from one major river basin to another. An environmental impact statement must include a comprehensive analysis of the impacts that would occur in the source river basin and the receiving river basin if the petition for a certificate is granted. The environmental impact statement must also include an evaluation of alternatives to the proposed interbasin transfer and a description of measures to mitigate any adverse impacts that may arise from the proposed interbasin transfer.

Within 30 days of the completion of the draft environmental impact document, the Commission will hold a public hearing on it. Notice of the hearing on the draft environmental document will be given as provided for notice of intent to file a petition, except that notice will be given in the Environmental Bulletin rather than the North Carolina Register. The Commission may not act on the petition until the Commission determines that the environmental document is complete and adequate.

Petition. – An applicant for a certificate must petition the Commission. The petition must be in writing and contain information on the nature and extent of the transfer, including: a description of the facilities to be used to transfer the water; a description of the proposed uses of the water to be transferred; a description of water quality in the source and receiving river basins; a description of the water conservation measures used by the applicant; a description of all sources of water within the receiving river basin; a description of existing, planned, or

reasonably foreseeable water transfers and withdrawals from the source river basin; a demonstration that the proposed transfer would not impair existing uses of water within the source river basin; the applicant's future water supply needs and the present and reasonably foreseeable future needs of other uses within the river basin, the applicant's water supply plan, and any other information deemed necessary by the Commission.

Settlement Discussions. – Upon the request of the applicant, any interested party, or DENR, or upon its own motion, the Commission may appoint a mediation officer. The mediation officer must make a reasonable effort to initiate settlement discussions between the applicant and all other interested parties.

Draft Determination and Public Hearing on the Draft Determination. – Within 90 days after the Commission determines that the environmental document is adequate or the applicant submits its petition for a certificate, whichever occurs later, the Commission will issue a draft determination on whether to grant the certificate. The draft determination will be based on the same criteria and include the same conditions and limitations, findings of fact, and conclusions of law that would be required in a final determination. Notice of the draft determination will be given as provided for notice of intent to file a petition. Within 60 days of the issuance of the draft determination, the Commission will hold a public hearing on the draft determination. At least one hearing will be held in the affected area of the source river basin and at least one hearing will be held in the affected area of the receiving river basin. The Commission will give at least 30 days' written notice of the public hearing as provided for notice of intent to file a petition.

Final Determination: Factors to be Considered. – In determining whether a certificate may be issued for the transfer, the Commission will specifically consider a number of factors, including: the necessity and reasonableness of the amount of surface water proposed to be transferred and its proposed uses; the present and reasonably foreseeable future detrimental effects on the source river basin; the cumulative effect on the source major river basin of existing and projected water transfer or consumptive water uses; the present and reasonably foreseeable beneficial and detrimental effects on the receiving river basin; all reasonable alternatives to the proposed transfer; and any other facts and circumstances that the Commission finds reasonably necessary to implement the interbasin transfer law.

Final Determination: Information to be Considered. – In determining whether a certificate may be issued for the transfer, the Commission will consider the petition, the environmental document, all oral and written comment submitted, the water quality of the source river basin and the receiving river basin, and any other information that the Commission determines to be relevant and useful.

Final Determination: Burden and Standard of Proof; Specific Findings. – The Commission will grant a certificate for a water transfer if the Commission finds that the applicant has established by a preponderance of the evidence that: the benefits of the proposed transfer outweigh the detriments of the proposed transfer; the detriments have been or will be mitigated to the maximum degree practicable; the amount of the transfer does not exceed the amount of the projected shortfall under the applicant's water supply plan after first taking into account all other sources of water that are available to the applicant; and there are no reasonable alternatives to the proposed transfer.

Final Determination: Certificate Conditions and Limitations. – The Commission may grant the certificate in whole or in part, or deny the certificate. The Commission may impose any conditions or limitations on a certificate that the Commission finds necessary. The certificate must include a number of conditions, including: a water conservation plan; a drought management plan; the maximum amount of water that may be transferred on a daily basis; a provision that the Commission may amend the certificate under certain conditions; a provision that the Commission shall amend the certificate under certain conditions, a requirement that the certificate holder report on the quantity of water transferred during each calendar quarter, and a provision that prohibits the resale of transferred water except under certain conditions.

Statement of Policy. – It is the public policy of the State to maintain, protect, and enhance water quality within North Carolina; that the reasonably foreseeable future water needs in the receiving river basin are subordinate to the reasonably foreseeable future water needs in the source river basin; and that the cumulative impact of transfers from a source river basin would not result in a violation of the State and federal antidegradation policies.

Severability Clause. – If any section or provision of S.L. 2007-518 is declared unconstitutional or invalid by the courts, the unconstitutional or invalid section or provision would not affect the validity of the bill as a whole or any part of S.L. 2007-518 other than the part declared to be unconstitutional or invalid

The effective date of S.L. 2007-518, as amended by S.L. 2007-484 (SB 613), Sec 43.7C, is set out below:

S.L. 2007-518 (HB 820) became effective August 31, 2007. Generally, it applies to any petition for a certificate for an interbasin transfer for which preparation of an environmental assessment or an environmental impact statement has begun on or after that date. For a petition for a certificate for an interbasin transfer to supplement ground water supplies in the fifteen counties designated as the Central Coastal Plain Capacity Use Area, S.L. 2007-518 becomes effective January 1, 2011. Prior to January 1, 2011, a petition for a certificate for such an interbasin transfer would be considered and acted upon by the Commission pursuant to the procedures and standards set out in G.S. 143 215.22I on July 1, 2007. (JH, GG)

Promote Innovative Water Protection Efforts

S.L. 2007-549 (SB 1468) authorizes the use of monies in the Clean Water Management Trust Fund to finance projects to clean up or prevent surface water pollution to also be used to finance innovative efforts, including pilot projects, to improve stormwater management, to reduce pollutants entering the State's waterways, to improve water quality, and to research alternative solutions to the State's water quality problems.

This act became effective August 31, 2007. (JRM)

Various Transportation Changes/Study

S.L. 2007-551 (HB 1005). See **Transportation.**

Studies

New/Independent Studies/Commissions

Hazardous Materials Task Force Recommendations

S.L. 2007-107, Sec. 4.1. (HB 36, Sec. Sec. 4.1.) establishes the Regulation of Hazardous Materials Facilities Task Force to study issues related to the treatment, storage, and disposal of hazardous materials and review all current fire code regulations regarding the commercial treatment, storage, and disposal of hazardous materials to ensure that the State Building Code addresses the needs and safety of the citizens of the State. The Task Force must submit a report of its findings and recommendations, including legislative proposals, to the 2008 Regular Session of the 2007 General Assembly, the Governor, the North Carolina Building Code Council, and the Environmental Review Commission on or before April 1, 2008. The Task Force will terminate upon filing its report. This section became effective June 26, 2007.

In addition, Sec. 5.3.(b) of the act authorizes the Board of Governors of The University of North Carolina to establish an Institute for Disaster Studies. This provision became effective July 1, 2007. (JLM)

Referrals to Existing Commissions/Committees

Limit Impervious Surfaces for Vehicle Parking

S.L. 2007-323, Sec. 6.22.(b) (HB 1473, Sec. 6.22.(b)) provides that the Environmental Review Commission (ERC) may study issues related to the use of pervious surfaces for vehicle parking areas, including the costs associated with the use of pervious surfaces, the impact to the environment of stormwater runoff, and the practices of other states with regard to stormwater best management practices. The ERC may report its findings and recommendations, including any legislative proposals, to the 2007 Regular Session of the General Assembly when it reconvenes in 2008.

This section became effective July 1, 2007. (JRM)

Amend Interbasin Transfer Laws

S.L. 2007-518, Sec. 1.(a) (HB 820, Sec. 1.(a)) directs the Environmental Review Commission (ERC), with the assistance of the Department of Environment and Natural Resources (DENR), to study the allocation of surface water resources and their availability and maintenance in the State, including issues related to the transfer of water from one river basin to another and the withdrawal of water for consumptive use. The ERC may submit an interim report to the 2008 Regular Session of the General Assembly and will submit a final report of its findings and recommendations, including any legislative proposals, to the 2009 General Assembly.

This section became effective August 31, 2007. (JH)

Solid Waste Management Act of 2007

S.L. 2007-550, Sec. 18 (SB 1492, Sec. 18) directs the Environmental Review Commission to: (i) study issues related to the franchise of solid waste management facilities by units of local government; (ii) study, with the assistance of the Department of Justice, issues related to the transportation of solid waste by rail or barge, including the extent to which regulation of the transportation of solid waste by rail or barge by state governments may be preempted by federal law. The ERC must report its findings and recommendations, including any legislative proposals, to the 2008 Regular Session of the General Assembly.

This section became effective August 31, 2007. (JLM)

Referrals to Departments, Agencies, Etc.

Hazardous Materials Task Force Recommendations

S.L. 2007-107, Sec. 1.8.(d) (HB 36, Sec. Sec. 1.8.(d)) directs the Department of Environment and Natural Resources to study the need for further regulation of hazardous waste transfer facilities, including whether to require these facilities to obtain a permit under Part 2 of Article 9 of Chapter 130A of the General Statutes, pay permit fees, provide contingency plans, and demonstrate financial responsibility. DENR must report its findings and recommendations,

including any legislative proposals, to the Environmental Review Commission on or before February 15, 2008. This section became effective October 1, 2007

In addition, Sec. 5.3.(b) of the act authorizes The University of North Carolina to study the emission and transport of pollutants at fires at commercial hazardous waste facilities and the health and economic impacts of such fires. This provision became effective July 1, 2007. (JLM)

Advisability of Adding Deep River State Trail to State Parks System

S.L. 2007-323, Sec. 12.9 (HB 1473, Sec. 12.9) requires the Division of Parks and Recreation (Division) of the Department of Environment and Natural Resources to study the advisability of the General Assembly authorizing the addition of the Deep River State Trail to the State Parks System. The Division must consider the costs over the next five years of land acquisition, park development, and park operations. The Department must report the results of this study to the Joint Legislative Commission on Governmental Operations by March 1, 2008.

This section became effective July 1, 2007. (JRM)

Promote Renewable Energy/Baseload Generation

S.L. 2007-397, Secs. 4.(c) and 14 (SB 3, Secs. 4.(c) and 14) requires the following studies:

- Section 4.(c) provides that no later than September 1, 2008, the Utilities Commission must prepare and submit an analysis of whether rate structures, policies, and measures, including decoupling, in place in other states and countries that promote a mix of generation involving renewable energy sources and demand reduction should be implemented in North Carolina to the Governor, the Environmental Review Commission, and the Joint Legislative Utility Review Committee. This section becomes effective August 20, 2007.
- Section 14 provides that no later than October 1 of odd-numbered years, beginning October 1, 2009, the Utilities Commission must submit to the Governor, the Environmental Review Commission, and the Joint Legislative Utility Review Committee a report on the actual results of the costs allocation established by S.L. 2007-397 (SB 3). This section became effective August 20, 2007. (JH)

Amend Interbasin Transfer Laws

S.L. 2007-518, Sec. 1.(b) (HB 820, Sec. 1.(b)) directs the Division of Water Resources of the Department of Environment and Natural Resources, in consultation with the Environmental Review Commission, to prepare a new river basin map that defines the extent to which river basins in North Carolina extend into adjacent states.

This section became effective August 31, 2007. (JH)

Major Pending Legislation

Electronics Recycling

The Solid Waste Management Act of 2007 (S.L. 2007-550, SB 1492) enacted provisions related to the recycling of discarded computer equipment. The act did not, however, provide for recycling of other electronic devices such as televisions. House Bill 1777 (Second Edition) would

establish a program for the recovery of televisions (as well as other electronic devices) for reuse or recycling. (JLM)

Underground Storage Tanks

House Bill 1010 (First Edition) and Senate Bill 1554 (First Edition) would address funding and administration of the Leaking Petroleum Underground Storage Tank (UST) Cleanup Program, including provisions as follows: (1) provide additional funds for the cleanup of releases and discharges of petroleum from USTs by increasing the fees paid by owners and operators of commercial USTs, (2) provide for expedited assessment and cleanup of releases and discharges from petroleum USTs by requiring DENR to establish a pilot program to evaluate the use of site-specific cleanup standards, (3) provide for various studies and reports, and (4) to make other improvements to the UST program. (JLM)

Steep Slope Legislation

Recently, several counties in the western part of the State have considered or adopted ordinances to regulate development on steep slopes. Concerns over the safety of development on mountain slopes arose after deaths and property damage caused by landslides resulting from Hurricanes Frances and Ivan in western North Carolina in September 2004. Stakeholder groups in western North Carolina expressed interest in enactment of statewide legislation to consistently regulate site-planning, design, and construction of artificial slopes in mountainous areas in order to promote safe and stable development on steep slopes.

House Bill 1756 (First Edition) would (1) require local governments to adopt ordinances to regulate site planning, design, and construction of artificial slopes in mountainous areas to promote safe and stable slopes for development and to reduce the likelihood of slope failures on developed or disturbed land, in order to protect human safety and property; (2) direct the Sedimentation Control Commission to assist local governments in development and implementation of safe slope construction programs; and (3) provide for disclosure of landslide hazards to purchasers of properties located in areas vulnerable to landslides as indicated on maps prepared by the North Carolina Geological Survey. (JLM)

I. SESSION LAW 2005-190 (with revisions from SL 2006-259) REPORTING REQUIREMENTS

Based upon Section 2. (b) of Session Law 2005-190, the Environmental Management Commission (EMC) continues to assess and identify nutrient control strategies and criteria necessary to prevent excess nutrient loading in each drinking water supply reservoir. In compliance with the goals of the Section, the Division of Water Quality received US EPA approval of a plan of action evaluating the current surface water quality standards to determine if adequate nutrient criteria controls are in place to prevent nutrient impairments in North Carolina lakes. Approval to continue with development of additional or revised lake nutrient criteria was mutually agreed with the US EPA on June 27, 2006.

Monitoring is continuing in Falls Lake and the Falls Lake watershed and has been extended to September 2007. This extension will cover another growing season to accommodate the collection of adequate chlorophyll *a* data.

Modeling tasks associated with this project have also progressed. Work has begun on three of the models to be developed of Falls Lake and the reservoir watershed. As of September 1, 2006, DWQ has a fully executed contract with NC State University to perform hydrodynamic and water quality modeling of Falls Lake. DWQ staff have begun to process data and information for another model, the watershed loading model.

Although Session Law 2006-259 technically corrected the target date for the EMC to develop a nutrient management strategy for the Falls Lake Reservoir from July 1, 2008 to July 1, 2009, the target date for the EMC to adopt the rules to implement the nutrient management strategy by the same date (July 1, 2009) does not consider timing for rule adoption in accordance with the Administrative Procedures Act, General Statutes 150B. The inaccurate date will not interfere with the EMC's goal, however.

The ninth Falls Lake Reservoir Technical Advisory meeting was held on November 1, 2006 at the TJCOG offices. A review of monitoring data collected in 2005 was presented to concerned stakeholders by Peter Caldwell of the Division of Water Quality's (DWQ) Modeling and Total Maximum Daily Load (TMDL) Unit. Summaries of the current status of the watershed loading model were presented by Narayan Rajbhandari of the DWQ's Modeling and TMDL Unit, and the lake hydrodynamic model and lake water quality model were presented by Jing Lin of the Marine Earth and Atmospheric Science Department at N.C. State University. Staff are continuing to work on calibration of the watershed loading model and the lake nutrient response model.

The next scheduled Falls Reservoir Technical Advisory meeting is scheduled for May 15, 2007, 9:30 am at the North Durham Reclamation Facility.

Section 4 of Session Law 2005-190 and amendments in Session Law 2006-259 require the Environmental Management Commission to report its progress in developing and implementing nutrient management strategies for drinking water supply reservoirs meeting certain criteria to the Environmental Review Commission by April 1 of each year beginning April 1, 2006. The B. Everett Jordan Reservoir fits these criteria. The following is an update on the progress made.

In January 2006, the Environmental Management Commission deferred proceeding to public comment with draft rules for Jordan Reservoir, and directed staff to address outstanding stakeholder issues with the draft rules. Issues included the modeling basis for strategy goals, point source timelines and costs, and existing development load reduction requirements and costs. Over the course of 2006, staff conducted over thirty stakeholder meetings, both technical and general. As a result, revisions have been made to the draft rules reflecting discussions over the last year and a fiscal note summarizing the estimated total costs of the rules has also been completed.

In March 2007, Division staff obtained Environmental Management Commission approval to initiate the formal public comment period for the draft rules. Public notice is expected to be published within the next quarter and will include a two month public comment period. Staff intends to hold several public hearings within the Jordan Reservoir watershed during the public comment period. Under this schedule, the Commission would adopt rules in time to reach the 2008 session of the General Assembly, if required.

TMDL Update:

The Jordan Reservoir draft TMDL went out for public review originally in 2005. The draft TMDL was based on the chlorophyll-a standard impairment of the Upper New Hope Arm of the reservoir. Since that time, the 2006 federal 303(d) listed adjoining waters as impaired. Specifically, the Lower New Hope Arm and the Haw River Arm of the lake are now listed as impaired based on the chlorophyll-a standard, and the Haw River Arm is also listed as impaired based on the pH standard. To respond to these newest impairment listings, a new version of the TMDL document has been drafted and placed on public review beginning April 1, 2007 through May 15, 2007. The TMDL is now a phased TMDL; Phase I (out for public review) addresses the chlorophyll-a impairment of the reservoir and a future Phase II will address the pH impairment of the Haw River Arm. Other modifications to the recently available draft TMDL document include incorporation of comments received from the US EPA as well as other miscellaneous updates and corrections. The draft TMDL is available on the following website: http://h2o.enr.state.nc.us/tmdl.

II. STANDING COMMITTEE MEETINGS

i. WATER ALLOCATION COMMITTEE
The Water Allocation Committee did not meet during this quarter.

ii. WATER QUALITY COMMITTEE
The Water Quality Committee conducted business in January and March 2007.

iii. GROUNDWATER COMMITTEE
The Groundwater Committee did not meet this quarter.

iv. AIR QUALITY COMMITTEE
The Air Quality Committee conducted business in January and March 2007.

v. STEERING COMMITTEE
The Steering Committee did not meet during this quarter.

vi. NPDES COMMITTEE
The NPDES Committee conducted business in January, February, and March 2007.

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION (EMC) ACTIONS

Agenda Item: Request by the Cities of Concord and Kannapolis for Interbasin Transfer Certification

Explanation: The Commission is responsible for Interbasin Transfer (IBT) certifications according to N.C. General Statutes §143-215.22I. The Cities of Concord and Kannapolis are requesting permission to transfer an average of 22 million gallons per day (MGD) of water from the Catawba River and Yadkin River Basins for use in the Rocky River Basin. The Cities are requesting permission to transfer up to a maximum of 10 MGD from the Yadkin River Basin with the remainder of up to a maximum of 36 MGD to come from the Catawba River Basin. Two public hearings were held in June 2005 in Charlotte and Albemarle. Two additional public meetings were held in September 2006 in Valdese and Charlotte.

The materials under review for this request includes three documents sent to EMC members on Dec. 11, 2007. They are:

1) The Hearing Officer's Report, including recommendations to the EMC (December 2006),
2) The Interbasin Transfer Petition (November 2004) with a July 2006 supplement, and
3) The Revised Final Environmental Impact Statement (November 2006) including public comments on the petition, draft, and final environmental impact statements.

Recommendation: Having reviewed and considered the comments received during the public review process and the requirements set forth in North Carolina General Statute §143-215.22I, the Hearing Officers recommend that the Environmental Management Commission grant the cities of Concord and Kannapolis a 10 million gallon per day maximum transfer from the Catawba River Basin to the Rocky River Basin and a 10 million gallon per daymaximum transfer from the Yadkin River Basin to the Rocky River Basin with conditions.

EMC ACTION:
The EMC approved an interbasin transfer for Concord and Kannapolis of 10 mgd (million gallons per day) from the Catawba River Basin and 10 mgd from the Yadkin River Basin.

Agenda Item: Request to Proceed to Public Hearing on VOC and NOx Reasonable Available Control Technology to Incorporate Contingency Provisions

Explanation: The Environmental Management Commission is requested to approve one or more public hearings on the amendments to rules to incorporate contingency provisions for reasonable control technology (RACT) for volatile organic compounds (VOC) and nitrogen oxides (NOx) for the Charlotte nonattainment area for ozone.

The US Environmental Protection Agency requires a pre-adopted contingency plan to be part of the State Implementation Plan (SIP) before it will approve an ozone nonattainment area plan. The purpose of the contingency plan is to apply additional controls quickly, without rulemaking, on sources if the nonattainment area plan fails to achieve compliance with the ambient are quality standard.

To satisfy this requirement, the NOx and VOC RACT rules are proposed to be amended to apply them to facilities whose potential emissions are between 50 and 100 tons per year. (Facilities whose emissions of NOx are greater than 100 tons per year are already required to apply RACT.) For NOx, this requires amending the applicability rule, 15A NACA 2D .1402, and the compliance schedule rule, 15A NCAC 2D .1403. For VOC, it requires amending the applicability rule, 15A NACA 2D .0902, and possibly the compliance schedule rule, .0909.

The NOx RACT requirements would be implemented when EPA notifies the State that its State Implementation Plan (SIP) for the Charlotte ozone nonattainment area failed to bring the area into compliance. However, VOC RACT would not be applied unless the area receives a "serious" designation.

Recommendation: The Director recommends that the Commission authorize a public hearing(s) on these amendments and that the Chairman appoint a member(s) of the Commission to serve hearing officer(s).

EMC ACTION: The EMC approved the request to proceed to public hearing on the proposed amendments.

Agenda Item: Request to Proceed to Public Hearing on Amendments to, Adoption of, and Repeal of Various Air Quality Rules

Explanation: The Environmental Management Commission is requested to approve one or more public hearings on proposed amendments to the control of nitrogen dioxide and nitrogen oxide rules, new source performance standard rule, fugitive dust rule, certification of leak tightness tester rule, open burning rules, banking applicability rule, permitting rules; proposed adoption of the other solid waste incinerator rule and a new open burning rule; and proposed repeal of automobile tailpipe emission standards rule and initial Title V permit application submittal rule.

The control of nitrogen dioxide and nitrogen oxides rule, 15A NCAC 2D .0519, is proposed to be amended to remove the requirements for nitric acid plants and boilers covered under new source performance standards or the nitrogen oxide standard for new generating units, large boiler, or large internal combustion engine standards. The standards in 15A NCAC 2D .0519 are not needed for these categories of sources. Currently, there are no nitric acid plants in North Carolina, and any new nitric acid plants will have to comply with the new source performance standard, which is more restrictive. Likewise, new combustion sources for which there is a new source performance standard will have to comply with that standard, which is more restrictive.

The new source performance standard rule, 15A NCAC 2D .0524, is proposed to be amended to add additional guidelines to the list of subparts in 40 CFR Part 60 that are not incorporated by reference into this rule. The guidelines apply to the states and not to industry. The Commission has adopted or is in the process of adopting rules based on these guidelines.

The fugitive dust rule, 15A NCAC 2D .0540, is proposed to be amended to extend it to both process and non-process fugitive dust emissions and to all required to have an air permit or subject to an air quality requirement. Currently, this rule applies only to non-process fugitive dust emissions from hot mix asphalt plants, mica and feldspar processing plants, lightweight aggregate processes, and sand, gravel, and crushed stone operations. It would not apply to non-production military base operations; land disturbing activities, such as clearing, grading, or digging; or public roads, public parking, timber harvesting, or crop production.

The rule for certification of leak tightness testers, 15A NCAC 2D .0960 is proposed to be amended to remove obsolete and unnecessary requirements.

The automobile tailpipe emission standards , 15A NCAC 2D .1004, is proposed to be repealed. The General Statutes eliminated tailpipe emissions testing on January 1, 2006. On-board diagnostic testing has completely replaced tailpipe emission testing.

The other solid waste rule, 15A NCAC 2D .1211, is a proposed new rule to control emissions from incinerators at institutions such as universities and military bases. This rule is based on the EPA guidelines for other solid waste incinerators. The incinerator definitions rule is proposed to be amended to add several definitions related to the new other solid waste incinerator rule. The air curtain burner rule, 15A NCAC 2D .1904, is proposed to be amended to reference the new

source performance standards for other solid waste incinerators and municipal waste combustors. Several rules are also proposed to be amended to reference the new rule: these rules are control of visible emissions rule, 15A NCAC 2D .0521, the incinerator purpose and scope rule, 15A NCAC 2D .1201, and the other incinerator rule, 15A NCAC 2D .1208.

Three open burning rules are proposed for amendment and a new open burning rule is proposed to clarify the number of violations when multiple piles of land cleaning debris being burned on the same site fail to meet the setback or other requirements of the permissible open burning without an air quality permit rule. 15A NCAC 2D .1903, and to require prescribed forest burns to comply with the Division of Forest Resource's smoke management program. The purpose and scope rule of the open burning section is rewritten to make it read more like open burning is prohibited instead of allowed. Two definitions are proposed to be added to the open burning definition rule, 15A NCAC 02D .1902. The permissible open burning without an air quality permit rule is proposed to be amended to clarify conditions under which a regional supervisor may not approve a waiver for reducing the setback requirements. It is also proposed to be amended to require prescribed forest burns to follow the smoke management plan outlined in the Division of Forest Resource's smoke management program. A new rule, 15A NCAC 2D .1907, is proposed to make clear that a single episode of open burning may result in multiple violations and multiple civil penalties.

The banking applicability and eligibility rule, 15A NCAC 2D .2303, is proposed to be amended to make it agree with other banking rules. Other banking rules allow banking of emission reductions that occur outside a nonattainment area. The language in the applicability and eligibility rule that restricts banking to nonattainment areas is being removed.

The permit exemption rule, 15A NCAC 2Q .0102, is proposed to be amended to exempt some storage tanks used to store ethanol-based fuels and to exempt portable generators regulated by rules adopted under Title II of the Federal Clean Air Act.

The initial Title V permit application submittal rule, 15A NCAC 2Q .0506, is proposed to be repealed. This rule established a schedule by which existing facilities required to have a Title V permit were to submit their initial Title V permit application. This rule is no longer needed as the deadline in the schedule has long passed.

Recommendation: The Director recommends that the Commission authorize a public hearing(s) on these amendments and that the Chairman appoint a member(s) of the Commission to serve hearing officer(s).

EMC ACTION: The EMC approved the request to proceed to public hearing on the proposed amendments, new rules, and repeals.

Agenda Item: Hearing Officer's Report on VOC and NOx Reasonable Available Control Technology

Explanation: On October 4, 2006, Mr. Steve Weber held a public hearing on the amendments to rules to extend the applicability of reasonable control technology (RACT) rules for volatile organic compounds (VOC) and nitrogen oxides (NOx) to all the counties in the Charlotte nonattainment area for ozone.

The applicability rules for VOC RACT (15A NCAC 02D .0902) and for NOx RACT (15A NCAC 02D .1402) are proposed to be amended to require facilities with the potential to emit 100 tons per year or more of VOC or NOx to comply with the RACT requirements for VOC or NOx if they are in the Charlotte nonattainment area for ozone. Counties covered are Cabarrus, Gaston, Lincoln, Mecklenburg, Rowan, and Union. Also, Davidson and Coddle Creek Townships in Iredell County are covered.

The compliance schedule rules (15A NCAC 02D .0909 and .1403) are proposed to be amended to add compliance schedules for the facilities to comply with the RACT requirements.

These rule changes are being proposed to meet EPA requirements for a complete State Implementation Plan (SIP) submittal for the Charlotte ozone nonattainment SIP.

Two people commented on these rules. As a result of these comments the compliance date to implement RACT was changed from October 2009 to April 2009 to comply with the 8-hour ozone Phase 2 Implementation rule. Several comments where related to the use of "rules in this Section," "of this Section," and "of this Rule" as causing some confusion. The terminology is required by codification of rules. Two paragraph references were changed.

Recommendation: The hearing officer recommends that the Commission adopt the proposed amended rules presented in Chapter II of the hearing record.

EMC ACTION: The EMC adopted the proposed amendments.

Agenda Item: Request for Approval to Proceed to Rulemaking with a of Notice of Text and Hearing for Proposed Risk-Based Rules to Address Contaminated Sites in the Dry-Cleaning Solvent Cleanup Program

Explanation: The Dry-Cleaning Solvent Cleanup Act of 1997 established a funded, voluntary program to address contamination resulting from dry-cleaning facilities, wholesale distribution facilities and abandoned sites. Section 143-215.104D of the Act states that "the Commission shall adopt rules establishing a risk-based approach applicable to the assessment, prioritization, and remediation of drycleaning solvent contamination". The rules shall address, at a minimum:

1. Criteria and methods for determining remediation requirements, including the level of remediation necessary to assure adequate protection of public health and the environment.
2. The circumstances under which information specific to the dry-cleaning solvent contamination site should be considered and required.
3. The circumstances under which restrictions on the future use of any remediated dry-cleaning solvent contamination site should be considered and required as a means of achieving and maintaining an adequate level of protection for public health and the environment.
4. Strategies for the assessment and remediation of drycleaning solvent contamination, including presumptive remedial responses sufficient to provide an adequate level of protection as described in item one above.

The Act states that the rules adopted by the Commission shall be applicable to all dry-cleaning facilities, wholesale distribution facilities and abandoned dry-cleaning facilities in the State and shall, to the maximum extent practicable, be cost-effective and technically feasible while protecting public health and the environment.

The DSCA Program brings before you today, the proposed risk-based rules to accomplish the goals set out in the Act. These rules were developed with extensive *input and cooperation from a large group of stakeholders that have been involved in the DSCA Program since its inception.*

It is essential that the DSCA program implement risk-based rules as quickly as possible. The DSCA program has hired independent contractors who are currently performing assessment activities at prioritized sites certified into the program. However, until risk-based cleanup levels are established, the DSCA program cannot issue "no further action" letters to sites that can be closed or determine appropriate remedial actions based on site-specific target cleanup levels determined through application of the riskbased rules.

Prior to drafting the proposed rules, a review of comparable risk-based programs across the country was completed. The majority of risk-based corrective action programs that have been implemented in various states across the country are generally based on the American Society for Testing and Materials (ASTM) Risk-Based Corrective Action (RBCA) guidelines published in November 2000. Prior to this ASTM RBCA standard, there was an ASTM RBCA standard for petroleum release sites published in 1995 that was also used as a framework for many risk-based

programs. The ASTM RBCA guidelines establish procedures for conducting a tiered approach to risk assessment.

This ASTM framework was used as the basis for the DSCA proposed risk-based rules. The first tier is a screening process with calculated look-up tables that provide concentrations protective of public health and the environment for different exposure scenarios (i.e. residential, non-residential, construction worker) and various media pathways (e.g. inhalation of vapors from groundwater, dermal contact with groundwater, ingestion of soil). The second tier allows the calculation of sitespecific target cleanup levels using prescribed models and input parameters along with site-specific data and information that are protective of public health and the environment. If necessary, a third tier may be conducted that allows site-specific cleanup levels to be calculated using various models and assumptions that are scientifically sound and agreed upon by the specific program requesting the risk assessment.

Currently, the only risk-based program in the Department of Environment and Natural Resources is in the Underground Storage Tank (UST) program. The DSCA program examined the UST risk-based approach to determine if any components of that program could be applied to the DSCA risk-based approach. The approach used in the UST program is not a typical risk-based approach since it is not a tiered approach and does not allow the determination of site-specific target cleanup levels based on site-specific conditions that may be appropriate for determining the level of remediation that will be required. The calculation of site-specific cleanup levels is an integral part of the ASTM RBCA guidelines and most, if not all, of the risk-based programs implemented in other states. Therefore, the proposed DSCA risk-based rules more closely follow the ASTM RBCA guidelines since this process is widely accepted in the scientific and regulatory community and is the most appropriate use of limited finances in a funded program that must address as many sites as possible that enter the program.

1. In addition to the proposed rules, there were several components of a risk-based program that have also been developed to support the implementation of the rules. These components are:
2. Technical guidance documents.
3. Tool kits or spreadsheet systems to calculate risk and site-specific target cleanup levels.
4. A standardized reporting format for assessment and risk reports.
5. Training to regulators, consultants and interested parties regarding any developed rules, guidance, tool kits or spreadsheet systems to complete risk assessments in accordance with the requirements of the DSCA program.

Development of a risk-based program as described above requires multiple personnel with various areas of expertise such as rule and guidance writing, risk calculations, modeling, database and spreadsheet development. Such personnel must also have the time necessary to focus solely on this project. Due to these requirements, most states with risk-based programs have hired outside contractors with expertise in assisting regulatory agencies with developing risk-based corrective action programs. To assist the DSCA program with development of the riskbased program, a contract was entered into with The RAM Group, Inc. The principal of the RAM Group, Inc. is Dr. Atul Salhotra. Dr. Salhotra is a nationally recognized expert in the field of risk assessment and was one of the original certified ASTM risk-based corrective action

trainers. Dr. Salhotra has assisted eleven states (Idaho, Alabama, Nebraska, Kansas, Oklahoma, Missouri, Louisiana, New York, New Mexico, Colorado, and Tennessee) in the development of risk-based corrective action programs and has provided support and training for risk-based programs in over twenty-six states. Dr. Salhotra and The RAM Group Inc.'s involvement in the development of the DSCA risk-based program provided:

- expertise in developing risk-based programs in other states that allowed a knowledge of what has worked and what has not worked in the past;
- personnel with various types of experience that the DSCA program did not have;
- the dedication of many RAM Group employees to accomplish the task in a shorter time frame than DSCA personnel could have done alone;
- the opportunity for DSCA personnel to continue to address other program issues while The RAM Group, Inc. completed aspects of the risk-based program; and
- expertise necessary to address comments and concerns from the DSCA program stakeholders and interested parties. This expertise will continue to be used throughout the rule-making process.

The proposed risk-based rules are based on scientifically sound, widely-accepted risk assessment protocols with the input of nationally recognized experts in the field of risk assessment and numerous stakeholders and interested parties and meet the requirements of the Act.

Recommendation: That the Environmental Management Commission approve DWM's request to proceed to rulemaking with a Notice of Text and hearing for proposed risk-based rules to address contaminated sites in the DSCA program.

EMC ACTION:
The EMC approved sending the rules out for public notice and hearing.

Agenda Item: Request for Approval of the Final Watauga River Basinwide Water Quality Plan

Explanation: The Watauga River Basinwide Water Quality Plan is in its third cycle of basinwide water quality plans that the Division of Water Quality is preparing for all 17 river basins across the state.

In September 2006, the draft basinwide plan was approved by the Water Quality Committee (WQC) to be released for public review and comment. The draft plan included language developed during an in-depth interim review process, which involved NCDENR agencies, the Soil and Water Conservation Districts, representatives of the Natural Resources Conservation Service (NRCS), the regional council of governments, and several local watershed groups. Staff received written and verbal comments from both state and local agencies during the public review phase. Revisions were made and information was added to or clarified in the draft plan. Copies of the revised plan were sent to EMC members in the EMC package.

The Basinwide Water Quality Plan is a planning document that will guide the Division's actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policies. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation: Staff recommends that the *Watauga River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in the Watauga River basin.

EMC ACTION: The EMC approved the Watauga River Basinwide Water Quality Plan.

Agenda Item: Request for Approval of the Hearing Officer's Report on the Proposed Reclassifications of the North Fork First Broad River in Rutherford County (Broad River Basin) to Class Outstanding Resource Waters (ORW), and Two Segments of the Broad River in Cleveland, Polk, and Rutherford Counties (Broad River Basin) to Class Water Supply IV (WS-IV) and WS-IV CA (Critical Area)

Explanation: •North Fork First Broad River

A request for a High Quality Waters (HQW) reclassification of the North Fork First Broad River was submitted by an organization known as The Concerned Citizens of Rutherford County, as well as by two individuals, Mr. and Mrs. Rob McComas. Because the requests mentioned that the area including these waters "...contains an impressive array of high quality natural communities, rare animal populations..." and "...several rare or unusual benthic macroinvertebrate species...", as well as excellent water quality as confirmed by studies conducted by DWQ in 2004 and 2005, DWQ staff determined the ORW classification to be more suitable for recognizing and protecting existing uses.

If reclassified, regulations that affect development and wastewater discharges would apply. There are no current or planned discharges in the proposed area, and no plans for development in the proposed area. However, DOT staff know of one DOT planned activity in the proposed watershed in the next several years, one road that may be paved. Additional erosion control devices would be needed in order for the paving project to meet ORW requirements.

- Broad River

McGill Associates, P.A. and the Town of Forest City ("Town") requested that portions of the Broad River be reclassified to WS-IV CA and WS-IV [Protected Area (PA)]. The reclassification is needed in order to construct a potable water supply intake. The Division of Environmental Health (DEH) granted the Town approval for use of these waters as a potable water source. The waters to be reclassified meet water supply water standards according to 2004 DWQ studies.

Willis Engineers and the City of Shelby ("City") requested that additional portions of the Broad River be reclassified to WS-IV CA and WS-IV (PA). The reason for the reclassification is to allow for a City "raw water supply pipe line", which is currently under construction, and "...intended for use in withdrawal of water from the Broad River under conditions where the current City supply of the First Broad River is inadequate." DEH granted the City approval for emergency use of this water source. The waters to be reclassified meet water supply water standards according to 2004 DWQ studies.

If reclassified, development and wastewater discharge restrictions will apply in the proposed water supply watersheds. There are facilities that hold wastewater discharge permits in these areas, but none of these facilities will most likely be affected by the proposed reclassifications. In addition, there are not any known planned dischargers and developments in these areas that will likely be affected by the proposed reclassifications. DOT staff stated that there are several bridge replacement projects and one road widening project planned to occur in the next several years in these areas. Additional stormwater control devices would be needed in order for such

projects to meet the proposed reclassifications' requirements. Cleveland, Polk, and Rutherford Counties as well as Boiling Springs, Mooresboro, and Lattimore are the local governments with jurisdiction in these areas, and each of these entities supports the proposed water supply reclassification/s within their jurisdiction. These local governments would need to develop or modify water supply watershed protection ordinances within 270 days after the reclassification effective date. However, please note that when a reclassification is anticipated to not become effective before waters are to be used as a potable water supply source, DWQ staff recommends that local governments create or modify water supply watershed protection ordinances before these waters are utilized as a potable water supply source.

In November 2005 and January 2006, the Water Quality Committee and the Commission, respectively, approved the request to proceed with rule-making for the proposed reclassifications. A public hearing was held in September 2006 in Spindale. Two speakers made comments, only addressed the proposed North Fork First Broad River reclassification, and were in favor of it.

During the comment period, one letter was received from a person in support of the three proposed reclassifications. No additional letters were received for the water supply proposals. However, an additional 526 distinct letters, including six template letters, addressing only the proposed North Fork First Broad River reclassification were received and support this proposal. 533 additional letters were received that were replicates of the template letters. The Report of Proceedings sent to the members of the EMC includes further details on these proposed reclassifications.

Recommendation: Staff recommends that the proposed reclassifications be approved by the Commission. If reclassified as proposed, and approved by the RRC in February 2007, the effective date for these reclassifications will be March 1, 2007.

EMC ACTION: The EMC approved the above reclassifications of surface waters.

Agenda Item: Request to Correct Cross-Reference in Best Available Retrofit Technology Rule

Explanation: The Environmental Management Commission is requested to approve correction of a cross-reference error in the recently adopted Best Available Retrofit Technology (BART) rule.

The recently adopted 15A NCAC 02D .0543, Best Available Retrofit Technology rule, contains a cross-reference error in paragraph (f). The paragraph specifically refers to a list of six items in paragraph (d) which are actually listed in paragraph (e). The reference is an obvious typographical error. The Administrative Procedures Act contains provisions in G.S. 150B-21.5 (a) (5) for correcting such typographical errors without going through public hearing. The Director proposes that this provision be used to correct this obvious cross-reference error.

Recommendation: The Director recommends that the Commission authorize correction of the cross-reference error using the provisions of the Administrative Procedures Act in 150B-21.5.

EMC ACTION: The EMC adopted the proposed amendment.

Agenda Item: Request to Adopt Hearing Officer's Recommendations On Proposed Changes to the Surface Water Quality Standards and Classifications Rules for the Triennial Review

Explanation: The Triennial Review is required under the Federal Clean Water Act to review and revise water quality standards and classifications. The proposed recalculation of numerical standards in 15A NCAC 02B is based on revised federal methodology for calculating human health protection criteria. The updated methodology revised the pollutants' toxicological risk assessments, including new or revised reference doses (RfD) and cancer potency factors. These recalculations integrated an updated national default freshwater/estuarine fish consumption rate (17.5 g/day) and, where applicable, relative source contribution (RSC) values obtained from US EPA. The water quality recreational use bacteria standard for saline coastal waters is proposed for revision in direct response to the Beaches Environmental Assessment and Coastal Health (BEACH) Act of 2000. Additionally, standards are proposed for revisions due to US EPA updates to Aquatic Life Water Quality Criteria and to further clarify existing standards.

Public hearings were held across the state in July 2006. Numerous comments were received in opposition to the proposed revision to the Cadmium standard. Comments were primarily related to NPDES and Pre-Treatment permitting issues, as well as analytical concerns. Comments on the remainder of the proposed rule changes were received and the majority of those comments support the proposed changes. A careful and comprehensive review of all the submitted written and oral comments is included in the Hearing Officer's Report.

The standard changes recommended for adoption are summarized below in the order in which they appear in rule:

- Language changes to include prohibition of mixing zones for point source dischargers in SB and SA waters.
- Proposed changes to factors affecting human health criteria calculations, including:
- Update "Dietary Intake" to the US EPA Relative Source Contribution (RSC) language and clarify applicability and use of RSC;
- Change the NC Fish Consumption Rate (FCR) of 6.5 g/person/day to the national default fish consumption rate of 17.5 g/person/day;
- Update standards with revised Cancer Potency Factors including revisions to 15 existing carcinogen standards applicable to Class C waters, removal of Beryllium from the carcinogen classification based on current science, addition of Tetrachloroethylene as a known carcinogen, and revisions to 12 existing carcinogen standards applicable to all Class WS waters.
- Proposed changes to aquatic life protective standards for Tributyltin.
- Clarification to narrative language for Temperature to clearly denote that a listing of thermal variances will be available for public access.
- Proposed changes to the recreational use bacterial indicators for Saltwaters, resulting in dual indicators for Class SA waters.

Based on the new data provided during the public hearing process, the Division staff recommends, at this time, a further review of the Cadmium standard proposal. All the submitted comments regarding water quality and thermal variances will be forwarded to the NPDES

Permitting Unit of DWQ for further review and consideration by appropriate parties at the time of the next scheduled renewal of these variances.

Recommendation: That the Commission adopt the changes to the surface water quality standards and amend rules in 15A NCAC 02B as proposed in the Hearing Officer's Report.

EMC ACTION: The EMC approved the surface water standards amendments.

Agenda Item: Request to Proceed to Formal Comment Period with Draft Nutrient Rules for the Jordan Reservoir Watershed

Explanation: Staff will request approval to initiate the formal public comment and hearing process on a nutrient strategy for the Jordan Reservoir watershed. An ad hoc session of the Commission in January 2006 directed staff to address outstanding stakeholder issues. Issues included the modeling basis for strategy goals, point source timelines and costs, and existing development load reduction requirements and costs. Revisions have been made to most of the rules and reflect discussion that has taken place over the last year. Staff will summarize the recent stakeholder process, the revised rules, estimates of costs to affected parties, and a rulemaking schedule.

Recommendation: That the Commission approve staff's request to proceed with the formal public comment period for the set of rules that comprise the Jordan nutrient strategy.

EMC ACTION: The EMC approved sending the draft rules out to public hearing for comments.

Agenda Item: Request to Adopt Hearing Officer's Recommendation to Reclassify Portions of the Catawba River in Burke County to "Trout" Waters

Explanation: A request to reclassify three segments of the Catawba River to "Trout" waters was received in a formal petition from the Southern Environmental Law Center on behalf of three petitioners: The Table Rock Chapter of Trout Unlimited, The Catawba Riverkeeper Foundation and American Rivers. Formal petitions require a recommendation to be based on the information submitted with the petition. Originally, the EMC denied the petition, but a court disagreed with the EMC's decision and ordered the EMC to reverse its action. Therefore, the EMC commenced rulemaking as petitioned. The petition documented the presence of reproducing trout in a portion of the river beginning approximately one mile downstream of the Linville Dam but did not include data documenting the presence of reproducing trout in the river above that. The tributary streams to the Catawba River are also not included in this proposed reclassification. The practice of stocking trout and management of cold-water releases from the Linville Dam are at least two factors contributing to the establishment of reproducing trout in the waters of the Catawba River. Staff has developed rule language to recognize and protect the existing use of this specific trout population in these specific waters. The Hearing Officer's Report is attached and includes the proposed rule language as was presented at public hearing.

Recommendation: That the Commission approve the reclassification and amend Rule 15A NCAC 2B .0308 as proposed in the Hearing Officer's Report.

EMC ACTION: The EMC approved the surface water reclassification to trout waters, as proposed by the Hearing Officer.

Agenda Item: Request for Approval of the Final Hiwassee, Little Tennessee, and Savannah River Basinwide Water Quality Plans

Explanation: The Hiwassee, Little Tennessee, and Savannah River Basinwide Water Quality Plans are in their third cycle of basinwide water quality plans that the Division of Water Quality is preparing for all 17 river basins across the state. In November 2006, the draft basinwide plans were approved by the Water Quality Committee (WQC) to be released for public review and comment. The draft plan included language developed during an in-depth interim review process, which involved NCDENR agencies, the Soil and Water Conservation Districts, representatives of the Natural Resources Conservation Service (NRCS), the regional council of governments, and several local watershed groups. Staff received written and verbal comments from both state and local agencies during the public review phase. Revisions were made and information was added to or clarified in the draft plan. Copies of the revised plan were sent to EMC members in the EMC package.

The Basinwide Water Quality Plan is a planning document that will guide the Division's actions in these river basins over the next five years and beyond. The management actions are based on existing rules and policies. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation: That the Commission approve the river basin plans.

EMC ACTION: These basin plans were approved.

- F. NPDES COMMITTEE

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION (EMC) ACTIONS

I. SESSION LAW 2005-190 REPORTING REQUIREMENTS

Based upon Section 2. (b) of Session Law 2005-190, the Environmental Management Commission continues to assess and identify nutrient control strategies and criteria necessary to prevent excess nutrient loading in each drinking water supply reservoir. In compliance with the goals of the Section, the Division of Water Quality received US EPA approval of a plan of action evaluating the current surface water quality standards to determine if adequate nutrient criteria controls are in place to prevent nutrient impairments in North Carolina lakes. Approval to continue with development of additional or revised lake nutrient criteria was granted by the US EPA on June 27, 2006.

Monitoring is continuing as scheduled in Falls Lake and the Falls Lake watershed and has been extended to September 2007. This extension will cover another growing season to accommodate the collection of adequate chlorophyll *a* data

Modeling tasks associated with this project have also progressed. At present, the watershed loading model is being calibrated for flow and temperature. Upon successful flow and temperature calibration and validation, work will begin to calibrate the model for TSS and nutrients. The lake hydrodynamic model is currently being calibrated for lake level and temperature. Upon successful calibration and validation, the model will then be calibrated for TSS. The lake nutrient response model calibration will follow.

Although Session Law 2006-259 technically corrected the target date for the EMC to develop a nutrient management strategy for the Falls Lake Reservoir from July 1, 2008 to July 1, 2009, the target date for the EMC to adopt the rules to implement the nutrient management strategy by the same date (July 1, 2009) does not allow rulemaking and rule adoption in accordance with the Administrative Procedures Act, General Statutes 150B. The inaccurate date will not interfere with the EMC's goal, however, to be technically correct, the Session Law should be corrected.

The tenth Falls Lake Reservoir Technical Advisory Committee meeting was held on May 15, 2007 at the North Durham WRF. A review of monitoring data collected in 2006 was presented to concerned stakeholders by Peter Caldwell of the Modeling and TMDL Unit, as well as summaries of the current status of the watershed loading model (presented by Narayan Rajbhandari of the Modeling and TMDL Unit), and the lake hydrodynamic model and lake water quality model (presented by Jing Lin of the Marine Earth and Atmospheric Science Department at N.C. State University).

The next scheduled Falls Reservoir Technical Advisory meeting is scheduled for November 15, 2007, 9:30 am at the TJCOG facility.

II. STANDING COMMITTEE MEETINGS

v. **STEERING COMMITTEE**
The Steering Committee did not meet during this quarter.

vi. **NPDES COMMITTEE**
The NPDES Committee conducted business in May 2007.

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION ACTIONS

Agenda Item: Hearing Officer's Report on Contingency RACT Requirements for the Charlotte Ozone Nonattainment Area

Explanation: On March 14, 2007, Mr. Steven Weber held a public hearing on proposed amendments to NOx RACT rules, VOC RACT rules, and the Annual Emissions Reporting rule.

The US Environmental Protection Agency requires a pre-adopted contingency plan to be part of the State Implementation Plan (SIP) before it will approve an ozone nonattainment area plan. The purpose of the contingency plan is to apply additional controls quickly, without rulemaking, on sources if the nonattainment area plan fails to achieve compliance with the ambient are quality standard.

To satisfy this requirement, the NOx and VOC RACT rules are proposed to be amended to apply them to facilities whose potential emissions are between 50 and 100 tons per year. (Facilities whose emissions of NOx are greater than 100 tons per year are already required to apply RACT.) For NOx, this requires amending the applicability rule, 15A NACA 2D .1402, and the compliance schedule rule, 15A NCAC 2D .1403. For VOC, it requires amending the applicability rule, 15A NACA 2D .0902, and the compliance schedule rule, .0909.

The NOx RACT requirements would be implemented when EPA notifies the State that its State Implementation Plan (SIP) for the Charlotte ozone nonattainment area failed to bring the area into compliance. However, VOC RACT would not be applied unless the area receives a "serious" designation.

Annual Emissions Reporting, 15A NCAC 2Q .0207, is proposed for amendment to require sources in the Charlotte ozone nonattainment area whose actual emissions of volatile organic compounds or nitrogen oxides are 25 tons and less than 100 tons per year to report those emissions annually. The inclusion of minor source emissions in the modeling assessments assures that reasonable further progress will be attained with the implementation of RACT for major sources.

One person commented on these rules. The commenter suggested that the substitution of "source" for "facility" in four paragraphs would improve rule clarity. The recommended substitutions have been made.

Recommendation: The Hearing Officer recommends that the Commission adopt the proposed rules as presented in Chapter II of the hearing record.

EMC ACTION: The EMC adopted the proposed amendments.

Agenda Item: Hearing Officer's Report on Miscellaneous Air Quality Rules

Explanation: On March 14, 2007, Mr. Steven Weber held a public hearing on proposed amendments to the control of nitrogen dioxide and nitrogen oxide rules, new source performance standard rule, fugitive dust rule, certification of leak tightness tester rule, open burning rules, banking applicability rule, permitting rules; proposed adoption of the other solid waste incinerator rule and a new open burning rule; and proposed repeal of automobile tailpipe emission standards rule and initial Title V permit application submittal rule.

The control of nitrogen dioxide and nitrogen oxides rule, 15A NCAC 2D .0519, is proposed to be amended to remove the requirements for nitric acid plants and boilers covered under new source performance standards or the nitrogen oxide standard for new generating units, large boiler, or large internal combustion engine standards. The standards in 15A NCAC 2D .0519 are not needed for these categories of sources. Currently, there are no nitric acid plants in North Carolina, and any new nitric acid plants will have to comply with the new source performance standard, which is more restrictive. Likewise, new combustion sources for which there is a new source performance standard will have to comply with that standard, which is more restrictive.

The new source performance standard rule, 15A NCAC 2D .0524, is proposed to be amended to add additional guidelines to the list of subparts in 40 CFR Part 60 that are not incorporated by reference into this rule. The guidelines apply to the states and not to industry. The Commission has adopted or is in the process of adopting rules based on these guidelines.

The fugitive dust rule, 15A NCAC 2D .0540, is proposed to be amended to extend it to both process and non-process fugitive dust emissions and to all required to have an air permit or subject to an air quality requirement. Currently, this rule applies only to non-process fugitive dust emissions from hot mix asphalt plants, mica and feldspar processing plants, lightweight aggregate processes, and sand, gravel, and crushed stone operations. It would not apply to non-production military base operations; land disturbing activities, such as clearing, grading, or digging; or public roads, public parking, timber harvesting, or crop production.

The rule for certification of leak tightness testers, 15A NCAC 2D .0960 is proposed to be amended to remove obsolete and unnecessary requirements.

The automobile tailpipe emission standards, 15A NCAC 2D .1004, is proposed to be repealed. The General Statutes eliminated tailpipe emissions testing on January 1, 2006. On-board diagnostic testing has completely replaced tailpipe emission testing.

The other solid waste rule, 15A NCAC 2D .1211, is a proposed new rule to control emissions from incinerators at institutions such as universities and military bases. This rule is based on the EPA guidelines for other solid waste incinerators. The incinerator definitions rule is proposed to be amended to add several definitions related to the new other solid waste incinerator rule. The air curtain burner rule, 15 A NCAC 2D .1904 , is proposed to be amended to reference the new source performance standards for other solid waste incinerators and municipal waste combustors.

Several rules are also proposed to be amended to reference the new rule: these rules are control of visible emissions rule, 15A NCAC 2D .0521, the incinerator purpose and scope rule, 15A NCAC 2D .1201, and the other incinerator rule, 15A NCAC 2D .1208.

Three open burning rules are proposed for amendment and a new open burning rule is proposed to clarify the number of violations when multiple piles of land cleaning debris being burned on the same site fail to meet the setback or other requirements of the permissible open burning without an air quality permit rule. The purpose and scope rule, 15A NCAC 2D .1901, of the open burning section is rewritten to make it read more like open burning is prohibited instead of allowed. Two definitions are proposed to be added to the open burning definition rule, 15A NCAC 02D .1902. The permissible open burning without an air quality permit rule, 15A NCAC 02D .1903, is proposed to be amended to clarify conditions under which a regional supervisor may not approve a waiver for reducing the setback requirements. It is also proposed to be amended to require prescribed forest burns to follow the smoke management plan outlined in the Division of Forest Resource's smoke management program. A new rule, 15A NCAC 2D .1907, is proposed to make clear that a single episode of open burning may result in multiple violations and multiple civil penalties.

The banking applicability and eligibility rule, 15A NCAC 2D .2303, is proposed to be amended to make it agree with other banking rules. Other banking rules allow banking of emission reductions that occur outside a nonattainment area. The language in the applicability and eligibility rule that restricts banking to nonattainment areas is being removed.

The permit exemption rule, 15A NCAC 2Q .0102, is proposed to be amended to exempt some storage tanks used to store ethanol-based fuels and to exempt portable generators regulated by rules adopted under Title II of the Federal Clean Air Act.

The initial Title V permit application submittal rule, 15A NCAC 2Q .0506, is proposed to be repealed. This rule established a schedule by which existing facilities required to have a Title V permit were to submit their initial Title V permit application. This rule is no longer needed as the deadline in the schedule has long passed.

One person commented on these rules. The commenter expressed concern about the fugitive dust rule, 15A NCAC 2D .0540. He is concerned that dust samples collected in the neighborhood of a rock quarry might actually come State maintained road paved with aggregate from the rock quarry. This rule is complaint driven. A DAQ inspector will be making visual observations and is expected to distinguish if the dust is generated from the rock quarry or the State maintained road. No additional changes to the rule are recommended.

Recommendation: The Hearing Officer recommends that the Commission adopt the proposed rules as presented in Chapter II of the hearing record.

EMC ACTION: The EMC adopted the proposed amendments, adoptions, and repeal.

Agenda Item: 07-20 Request Approval to Proceed to Public Notice and Comment with the Proposed Amendments to the State Coastal Stormwater Rules, 15A NCAC 02H .1005

Explanation: In January 2007 the Water Quality Committee (WQC) authorized the Division of Water Quality to proceed with proposed revisions to 15A NCAC 02H .1005, the Coastal Counties Stormwater Rule. The proposed, revised rule is attached. These revisions would apply requirements similar to the new coastal Phase 2 stormwater control requirements, which were established in Session Law 2006-246, to all of the 20 Coastal Counties.

Recommendation: That the Environmental Management Commission approve the request to proceed to Public Notice and Hearing with the proposed amendments to 15A NCAC 02H .1005.

EMC ACTION: The EMC approved sending the proposed rules to public hearing and notice.

Agenda Item: Request to Proceed to Public Hearing with the Proposed Reclassifications for:

- Horsepasture River in Jackson and Transylvania Counties (Savannah River Drainage Area) to Class ORW and "+",
- Big Laurel Creek and Spring Creek in Madison County (French Broad River Basin) to Class HQW,
- Boylston Creek in Transylvania and Henderson Counties and Fines Creek in Haywood County (French Broad River Basin) to Class Tr, and

Explanation: Horsepasture River (Jackson and Transylvania Counties, Savannah River Drainage Area)

A request for an Outstanding Resource Waters (ORW) reclassification of the Horsepasture River was submitted by the Sierra Club. Water quality studies that were conducted in 2006 indicated that only the lower 4.6 miles of the river fully meet the state's criteria for the ORW designation. However, the entire river's watershed is recognized for its exceptional State and national ecological significance via (a) fish species that are considered by the state as significantly rare, of concern, and/or proposed as threatened, (b) state and federal designations of natural, wild, scenic, and/or recreational that are assigned to various portions of the river, (c) natural heritage areas, and (d) national and state forest, park, and/or gamelands. Therefore, in addition to providing the ORW designation to the 4.6-mile segment of Horsepasture River, it is proposed that the ORW special protection measures, or management strategy, be applied throughout the entire watershed to protect the excellent downstream waters. Thus, the 4.6-mile segment is proposed to receive both the ORW classification and the ORW management strategy, and the remainder of the watershed is proposed to receive the ORW management strategy, as symbolized by the "+", but not the ORW classification.

If reclassified, regulations that affect new wastewater discharges, proposed expansions of existing wastewater discharges, new development, and NC Department of Transportation (DOT) projects would apply. There are no known plans for new development, new dischargers, or expansions of existing dischargers in the proposed ORW area. However, NCDOT staff have determined that there is one proposed road project that would be impacted by the proposal, and as a result, this project would require use of Best Management Practices (BMPs) associated with stormwater control.

Big Laurel Creek and Spring Creek (Madison County, French Broad River Basin)

Based on review of available data for this area, including results of DWQ studies conducted in 2006, DWQ staff determined the HQW classification to be suitable for recognizing existing uses and the excellent water quality in these waters. However, it is important to note that data from the NC Natural Heritage Program (NHP) revealed that aquatic species carrying a variety of federal and state designations were observed in these waters 10+ years ago. Studies are currently being conducted by DENR aquatic biologists to determine if one or more of these species is/are still present in these watersheds. If these studies do reveal that there is/are aquatic species that carry federal and/or state designations within these watersheds, then these waters may meet the ORW classification's criteria, and therefore, the possibility of pursuing the ORW classification

would be investigated. The WQC directed staff to present both ORW and HQW options during the hearing process to determine the most appropriate fit during the reclassification process, enabling staff to utilize the most recent data when available.

If reclassified, regulations that affect several activities and operations, including new development, NC DOT projects, new wastewater discharges, and proposed expansions of existing wastewater dischargers, would apply. In the area to be reclassified, there is no known proposed development and no known plans for new or expanded discharges that would be impacted by the proposal. However, there may be one proposed NC DOT bridge replacement project that would be impacted by the proposal, and as a result, this project would require use of BMPs associated with stormwater control.

Boylston Creek (Transylvania and Henderson Counties, French Broad River Basin)

In July 2006 DWQ received a request from the North Carolina Wildlife Resources Commission (WRC) to reclassify the segment of Boylston Creek, from its source in Transylvania County to SR 1323 in Henderson County, and the tributaries (Sutton Creek, Osborne Branch, Woody Branch, Sam Branch, Dog Creek, Betty Branch, Goldmine Branch, Polecat Branch, and Long Branch) to that segment from Class C to Class C Tr. These waters are located in the upper Boylston Creek watershed. The WRC found brook trout representing several age classes in Sutton Creek and Osborne Branch in 2005 and brook trout in Woody Branch and rainbow trout in Dog Creek in 2006. Western Carolina University also found brook trout representing multiple ages in the watershed in 2005. Current North Carolina surface water quality standards list Trout waters as a designated use of a waterbody in the state that is to be protected for natural trout propagation and survival of stocked trout. These standards also define Trout waters as waters that have conditions that shall sustain and allow for trout propagation and survival of stocked trout on a year-round basis. A 2006 fish sampling conducted in the upper Boylston Creek watershed by DWQ confirms that brook trout and rainbow trout do reside and reproduce (indicated by multiple age classes) within the upper Boylston Creek watershed.

If the EMC assigns the Trout waters designation to these waters, statutes additional restrictions will apply: North Carolina Sedimentation and Pollution Control Act, General Statutes 113A-57(1) requires land-disturbing activities to provide an undisturbed buffer zone 25 feet wide or of sufficient width to confine visible siltation within the twenty-five percent (25%) of buffer zone nearest the land-disturbing activity, whichever is greater; there are no National Pollutant Discharge Elimination System wastewater discharge permits or animal operation permits in this watershed, but any new dischargers would be required to meet the standards applicable to protect trout waters.

Fines Creek (Haywood County, French Broad River Basin)

In May 2005 DWQ received a request from Ms. Tracy Perkins to reclassify Fines Creek and its tributaries (Sally Branch, Orchard Branch, Phillips Branch, Sugar Cove Branch, Turkey Creek, Wesley Creek, Mooney Branch, Jacks Branch, Haynes Branch, Raccoon Branch, Shingle Branch, Gibson Branch, Morgan Creek, Cove Creek, Buckeye Cove Branch, Turkey Cove Branch, Poplar Cove Branch, James Branch, Martin Creek, and Toms Branch), all of which are

located in Haywood County, from Class C to Class C Tr. Her reason for this proposed reclassification is to "prevent further erosion of Fines Creek for the betterment of trout and creek banks" as well as " to establish regulation". Current North Carolina surface water quality standards list Trout waters as a designated use of a waterbody in the state that is to be protected for natural trout propagation and survival of stocked trout. These standards also define Trout waters as waters that have conditions that shall sustain and allow for trout propagation and survival of stocked trout on a year-round basis. Fish community data collected in 1997 and 2002 by DWQ and in 2005 by the University of Tennessee show that the Fines Creek watershed is supporting wild trout on a year-round basis and rainbow and brown trout propagation.

If the EMC assigns the Trout waters designation to these waters, statutes additional restrictions will apply: North Carolina Sedimentation and Pollution Control Act, General Statutes 113A-57(1) requires land-disturbing activities to provide an undisturbed buffer zone 25 feet wide or of sufficient width to confine visible siltation within the twenty-five percent (25%) of buffer zone nearest the land-disturbing activity, whichever is greater; there are no National Pollutant Discharge Elimination System wastewater discharge permits or animal operation permits in this watershed, but any new dischargers would be required to meet the standards applicable to protect trout waters.

Maps and more detailed information for each of these proposed reclassifications are included in the agenda item package. The Water Quality Committee (WQC) approved these requests at their March 2007 meeting. In addition, the WQC requested at their March 2007 meeting that the proposed reclassification of Lake Wright be presented to the May 2007 Water Allocation Committee prior to presentation at the May 2007 Environmental Management Commission (EMC) meeting. The proposed effective dates for these reclassifications range from March 1, 2008 through May 1, 2008.

Recommendation: The Director and staff recommend that the EMC grant staff permission to proceed to public hearings for the above-mentioned proposed reclassifications.

EMC ACTION: The EMC approved for staff to send the above reclassifications out to public hearing.

Agenda Item: Request for Approval of the Final White Oak River Basinwide Water Quality Plan

Explanation: The *White Oak River Basinwide Water Quality Plan* is in its third cycle of basinwide water quality plans that the Division of Water Quality is preparing for all 17 river basins across the state.

In January 2007, the draft basinwide plan was approved by the Water Quality Committee (WQC) to be released for public review and comment. The draft plan included language developed during an in-depth interim review process, which involved NCDENR agencies, the Soil and Water Conservation Districts and several local watershed groups. Staff received written and verbal comments from both state and local agencies during the public review phase. Revisions were made and information was added to or clarified in the draft plan. Copies of the revised plan were sent to EMC members in the EMC package. The Basinwide Water Quality Plan is a planning document that will guide the Division's actions in this river basin over the next five years and beyond. The management actions are based on existing rules and policies. Therefore, approval and endorsement of this plan by the Commission would affirm that the management actions set forth in this plan are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation: Staff recommends that the *White Oak River Basinwide Water Quality Plan* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities in the White Oak River basin.

EMC ACTION: The EMC approved the Basin Plan.

- F. NPDES COMMITTEE

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION (EMC) ACTIONS

I. SESSION LAW 2005-190 REPORTING REQUIREMENTS

Based upon Section 2. (b) of Session Law 2005-190, the Environmental Management Commission continues to assess and identify nutrient control strategies and criteria necessary to prevent excess nutrient loading in each drinking water supply reservoir. In compliance with the goals of the Section, the Division of Water Quality received US EPA approval of a plan of action evaluating the current surface water quality standards to determine if adequate nutrient criteria controls are in place to prevent nutrient impairments in North Carolina lakes. Approval to continue with development of additional or revised lake nutrient criteria was granted by the US EPA on June 27, 2006.

Monitoring for Falls Lake and the Falls Lake watershed was completed in September 2007. The data collected from 2005 – 2007 will be used to calibrate and validate the lake nutrient response model as well as the watershed loading model.

Modeling tasks associated with this project have also progressed. At present, the watershed loading model has been calibrated for flow and temperature, and calibration for TSS is underway. Upon successful calibration for these parameters, work will begin to calibrate the model for nutrients. The lake hydrodynamic model has been calibrated for lake level and temperature, and calibration for TSS is underway. The lake nutrient response model calibration will follow.

Although Session Law 2006-259 technically corrected the target date for the EMC to develop a nutrient management strategy for the Falls Lake Reservoir from July 1, 2008 to July 1, 2009, the target date for the EMC to adopt the rules to implement the nutrient management strategy by the same date (July 1, 2009) does not allow rulemaking procedure in accordance with the Administrative Procedures Act, General Statutes 150B.

The tenth Falls Lake Reservoir Technical Advisory Committee meeting was held on May 15, 2007 at the North Durham WRF. A review of monitoring data collected in 2006 was presented to concerned stakeholders by Peter Caldwell of the Modeling and TMDL Unit, as well as summaries of the current status of the watershed loading model (presented by Narayan Rajbhandari of the Modeling and TMDL Unit), and the lake hydrodynamic model and lake water quality model (presented by Jing Lin of the Marine Earth and Atmospheric Science Department at N.C. State University).

The next scheduled Falls Reservoir Technical Advisory meeting is scheduled for November 15, 2007, 9:30 am at the TJCOG facility.

Section 4 of Session Law 2005-190 amended SL 2006-259 Report:

Section 4 of Session Law 2005-190 and amendments in Session Law 2006-259 require the Environmental Management Commission to report its progress in developing and implementing nutrient management strategies for drinking water supply reservoirs meeting certain criteria to the Environmental Review Commission by April 1 of each year beginning April 1, 2006. The B. Everett Jordan Reservoir fits these criteria. The following is an update on the progress made.

In January 2006, the Environmental Management Commission deferred proceeding to public comment with draft rules for Jordan Reservoir, and directed staff to address outstanding stakeholder issues with the draft rules. Issues included the modeling basis for strategy goals, point source timelines and costs, and existing development load reduction requirements and costs. Over the course of 2006, staff conducted over thirty stakeholder meetings, both technical and general. As a result, revisions have been made to the draft rules reflecting discussions over the last year and a fiscal note summarizing the estimated total costs of the rules has also been completed.

In March 2007, Division staff obtained Environmental Management Commission approval to initiate the formal public comment period for the draft rules. The public comment period ran from June 15 – September 15, 2007 and included three public hearings held in Carrboro and Elon. The five hearing officers, all EMC members, are currently deliberating over rule changes based on the comments received. The rules are scheduled to appear before the EMC for adoption in January 2008 to reach the 2008 session of the General Assembly, if required.

Total Maximum Daily Load (TMDL) Update:

The Final Jordan Reservoir TMDL was approved by EPA in September 2007. This TMDL is a phased TMDL; Phase I (now final) addresses the chlorophyll-a impairment of the reservoir and a future Phase II will address the pH impairment of the Haw River Arm. The final Phase I TMDL document is available on the following website: http://h2o.enr.state.nc.us/tmdl.

II. STANDING COMMITTEE MEETINGS

i. **WATER ALLOCATION COMMITTEE**
The Water Allocation Committee conducted business in Sep 2007.

ii. **WATER QUALITY COMMITTEE**
The Water Quality Committee conducted business in July & Sep 2007.

iii. **GROUNDWATER COMMITTEE**
The Groundwater Committee conducted business in July & Sep 2007.

iv. **AIR QUALITY COMMITTEE**
The Air Quality Committee conducted business in July & Sep 2007.

v. **STEERING COMMITTEE**
The Steering Committee did not meet during this quarter.

vi. **NPDES COMMITTEE**
The NPDES Committee did not meet during this quarter

III. SUMMARIES OF ENVIRONMENTAL MANAGEMENT COMMISSION (EMC) ACTIONS

Correct one rule terminology objection by the Rules Review Commission (RRC) in 15A NCAC 02D .1211, Other Solid Waste Incineration Units

On March 14, 2007, Mr. Steven Weber held a public hearing that included amendments to solid waste incinerators. The EMC approved the amendments on May 11, 2007. The RRC reviewed the approved rules and has objected to the use of some language in the rule as unclear or ambiguous. The RRC staff found Subparagraph (e)(2) requires the owner or operator of an OSWI to meet emission standards by July 1, 2010 or "completed." It is not clear what is meant by "completed." This objection can be resolved by removing the words "*or completed, whichever comes earlier,*" without significantly changing the rule.

The Director of the Division of Air Quality recommends that the Commission adopt the new amendment change to 15A NCAC 02D .1211, Other Solid Waste Incineration Units.

EMC Action: EMC approved the rule correction.

Hearing Officer's Report and Request for Adoption of Dry-Cleaning Solvent Cleanup Act Risk-Based Rules

On January 11, 2007, the Environmental Management Commission granted approval to proceed with a Notice of Text and hearing for proposed risk-based rules to address contaminated sites in the Dry-Cleaning Solvent Cleanup Act Program.

The purpose of the proposed risk-based rules is to satisfy the requirement in the Dry-Cleaning Solvent Cleanup Act of 1997 that states that "the Commission shall adopt rules establishing a risk-based approach applicable to the assessment, prioritization, and remediation of dry-cleaning solvent contamination". In satisfying this requirement, the risk-based rules provide a framework for the Dry-Cleaning Solvent Cleanup Act Program to determine appropriate remedial actions based on site-specific target cleanup levels which protect human health and safety.

Very few comments were received during the public comment period and two public hearings held in May 2007. In general, comments were positive and support the risk-based rules. Only a few dissenting comments were received and will be specifically addressed in the Hearing Officer's report.

Overall, there has been a generally positive response to the proposed risk-based rules since they are necessary to address the growing number of contaminated dry-cleaning sites with the limited funds available, while protecting human health and safety.

Recommendation:
That the Environmental Management Commission adopt the risk-based rules for the Dry-Cleaning Solvent Cleanup Act Program.

EMC Action: EMC approved the rules.

Correct one rule terminology objection by the Rules Review Commission (RRC) in 15A NCAC 02D .0540, Particulates From Fugitive Dust Emission Sources

On March 14, 2007, Mr. Steven Weber held a public hearing that included amendments to a fugitive dust rule. The EMC approved the amendments on May 11, 2007. The RRC reviewed the approved rules and objected to the use of some terminology in the rule as unclear or ambiguous.

The RRC staff found that the definition, *"Substantive complaints" means complaints that are verified with physical evidence acceptable to the Division*, does not include what standards the Division is to use in determining that physical evidence is acceptable.

This objection can be resolved by removing the words "*acceptable to the Division*" without significantly changing the rule.

Further, the RRC found that it is not clear what standards the Division will use in determining that modeling is acceptable. The current subparagraph states; "The Director may require that the owner or operator of a facility covered by Paragraph (c) of this Rule, develop and submit a fugitive dust control plan as described in Paragraph (f) of this Rule if ambient air quality measurements or *dispersion modeling acceptable to the* Division show violation or a potential for a violation of an ambient air quality standard for particulates in 15A NCAC 02D .0400."

This objection can be resolved by removing the words "*acceptable to the Division*" and by adding "*as provided in 15A NCAC 02D .1106(e)*" without significantly changing the rule.

Recommendation: The Director of the Division of Air Quality recommends that the Commission adopt the new amendment changes to 15A NCAC 02D .0540, Particulates from Fugitive Dust Emission Sources.

EMC Action: EMC approved the rule correction.

Request for Delegation under Section 10 of the Phase 2 Stormwater Provisions (SessionLaw 2006-246) for Gaston County

Section 10 of Session Law 2006-246 authorizes local jurisdictions such as Gaston County, to "establish a joint program and to enter into any agreements that are necessary for the proper administration and enforcement" of a stormwater management program that meets the post-construction requirements of the Phase II National Pollutant Discharge Elimination System program. Such post-construction programs will involve the issuance of a stormwater permit for development activity disturbing one acre or more, after reviewing and approving stormwater management plans, maintaining records and annual reports on permitted BMPs, and conducting inspections and enforcement of the stormwater regulations.SL2006-246 can be found at: http://h2o.enr.state.nc.us/su/documents/SL2006-246.pdf. Gaston County has requested delegation under this program.

Recommendation: The Division recommends approval of Gaston County's request for delegation of authority to administer and enforce the post-construction stormwater control standards for new development and redevelopment in all of the unincorporated areas of Guilford County, including the long-term maintenance inspection duties. In addition, the Division requests that the EMC authorize DWQ to approve interlocal agreements as they are executed between Gaston County and county incorporated jurisdictions to implement this program upon receipt of their required documentation.

EMC Action: EMC approved the delegation.

Request for Approval of a Universal Stormwater Management Program Local Ordinance for the Town of Kure Beach

15A NCAC 2H .1020, the Universal Stormwater Management Program Rule, states that local governments that wish to implement the Universal Stormwater Management Program (USMP) within their local jurisdictions must do so by adopting a local ordinance that meets the minimum requirements of 15A NCAC 2H .1020. The USMP Rule further states that these local ordinances shall be approved by the Environmental Management Commission (EMC) if the Commission determines that the requirements in the local ordinance equal or exceed the mandatory provisions of the USMP Rule.

The Town of Kure Breach desires to adopt the Universal Stormwater Management Program within its jurisdiction. Accordingly, the town has adopted an appropriate local ordinance and submitted this ordinance to DWQ Staff for review. DWQ Staff has determined that this local ordinance does meet or exceed the minimum requirements of the USMP Rule. Kure Beach desires to have an effective date of September 1, 2007, for the implementation of the USMP within its jurisdiction.

Recommendation: That the EMC approve the implementation of the USMP within Kure Beach's jurisdiction with an effective date of September 1, 2007.

EMC Action: EMC approved the Kure Beach Universal Stormwater Management Program Ordinance.

Request for Delegation to the Water Quality Committee for Approval of Universal Stormwater Management Program Local Ordinances

15A NCAC 2H .1020, the Universal Stormwater Management Program Rule, states that local governments that wish to implement the Universal Stormwater Management Program (USMP) within their local jurisdictions must do so by adopting a local ordinance that meets the minimum requirements of 15A NCAC 2H .1020. The USMP Rule further states that these local ordinances shall be approved by the Environmental Management Commission (EMC) if the Commission determines that the requirements in the local ordinance equal or exceed the mandatory provisions of the USMP Rule.

DWQ Staff proposes that the EMC delegate the approval of future USMP local ordinances to the Water Quality Committee (WQC). This delegation would make the USMP approval process similar to the current practices of the Water Supply Watershed Program, in which the WQC is delegated the authority to approve local water supply ordinances.

Recommendation: That the EMC approve the delegation to the Water Quality Committee of the authority to approve future Universal Stormwater Management Program local ordinances.

EMC Action: EMC approved the delegation of the Universal Stormwater Management Program and also delegated Water Supply Watershed Protection Ordinances and Phase II Stormwater Delegations to the Director of Division of Water Quality.

Request for an Interpretive Ruling on Use of Soil Survey Maps for Implementation of Neuse and Tar-Pamlico Buffers

The Neuse and Tar-Pamlico Riparian Buffer Protection Rules (15A NCAC 2B .0233 and .0259, respectively) protect 50 foot wide buffers along intermittent and perennial streams, lakes, ponds and estuaries in these river basins as long as the surface water body is "approximately shown on either the most recent version of the soil survey map prepared by the Natural Resources Conservation Service of the United States Department of Agriculture or the most recent version of the 1:24,000 scale (7.5 minute) quadrangle topographic map prepared by the United States Geologic Survey (USGS). Riparian buffers adjacent to surface waters that do not appear on either of these maps shall not be subject to this Rule." (15A NCAC 2B .0233 (3) and .0259 (3)) (see attached rules). This provision was adopted to make land development and design predictable for the agricultural, silvicultural and development communities since both maps could be examined and an initial determination made concerning the presence of streams for project design purposes. The Neuse Buffer Stakeholder Committee took a careful look at the accuracy of both maps before recommending that the Environmental Management Commission use these two maps. The NRCS maps were (and are) paper-bound copies in county soil survey publications which depict soil polygons as well as streams in a particular county and are of various dates printed on aerial photos.

The Natural Resources Conservation Service (NRCS) has recently made available a Web Soil Survey for several counties in the Neuse and Tar-Pamlico River basins. Unfortunately, these maps do not show the streams that are depicted on the paper-bound copies of the county soil surveys. Instead, they appear to show streams shown on the 1:100,000 scale topographic map. These streams are provided only to assist in site location and this information is not intended to depict the actual stream network. For instance in a presentation to the Water Quality Committee on January 3, 2006, DWQ staff reported that for a particular area in northeast Raleigh, the USGS (1:24,000 scale) showed 15,060 feet of streams, the paper-bound NRCS soil map showed 31,680 feet of streams while the Web Soil Survey only showed 10,960 feet of streams.

The EMC heard an OAH case (Ray Carpenter versus NC DENR – Division of Water Quality) on January 11, 2007 and adopted as the final agency decision the Administrative Law Judge's decision holding that the paper-bound version of the Wake County Soil Survey Map is the version of the soil map that is referred to in the Neuse River riparian buffer rules. That holding concurred with DWQ's position. In an affidavit for that OAH case, NRCS staff stated that "The 1970 published Wake County Soil Survey map remains the official version of the Wake County Soil Survey map." In that case, the Administrative Law Judge agreed with NRCS staff and stated that "The partial transfer of data from that map onto more recent aerial photography does not constitute a more recent version of the Wake County soil survey map for the purposes of the Rule."

Recommendation: Therefore, DWQ staff request that the Environmental Management Commission issue an interpretive ruling affirming that the paper-bound versions of the NRCS soil surveys that were in place at the time that these maps were first referenced in the Neuse Buffer Rule (July 1997) are to be used for the Neuse and Tar-Pamlico Buffer Rules and

any other EMC Rules or EMC programs that refer to the NRCS Maps for stream location and identification purposes unless an updated version of these maps is available that depicts, at a minimum, an equal or greater amount of linear feet of streams that was shown on the paper-bound version of the map that was in place at the time the Neuse or Tar-Pamlico Buffer Rule was originally adopted.

EMC ACTION: The EMC Approved the staff recommendation.

Hearing Officer's Recommendation for the Adoption of Amendments to 15A NCAC 02N, Criteria and Standards Applicable to Underground Storage Tanks

On November 7, 2006, the EMC granted approval for the Division of Waste Management (Division) to proceed to public hearing with proposed amendments to 15A NCAC 02N. The proposed amendments affect underground storage tank (UST) systems installed or replaced on or after November 1, 2007 and establish new installation and monitoring requirements including secondary containment. The proposed amendments were published in the North Carolina Register on March 1, 2007. On March 19, 2007 and March 27, 2007, Mr. Kenneth Waldroup held public hearings in Raleigh and Winston-Salem respectively. The Public comment period closed on April 30, 2007. The Division received one oral comment and 28 written comments.

The comments showed general support of the secondary containment requirements. Some comments included concerns about cost [i.e., requiring full under dispenser containment when only one piece of equipment (e.g., product meter) within a dispenser is replaced. Only allowing third parties to perform certain required tests instead of allowing trained in-house personnel conduct the testing]. Other comments questioned the Division's authority to require manufacturers to train or certify installers of their equipment. Last, some comments were more broad in scope and expressed concern that the rules were not stringent enough (i.e., existing UST systems were not being required to be upgraded with secondary containment. The setback between UST systems and public water supply wells should be greater than the current 100 feet. There is not enough oversight by the Division of tank owners and operators to ensure compliance with the rules]. Appropriate changes and revisions were made to the proposed rules based on many of the comments. All of the comments received were considered and responses provided.

Recommendation: The Hearing Officer recommends that the Commission adopt the amendments to 15A NCAC 02N as proposed.

EMC Action: EMC approved the rules.

Request for Approval of 2007 to 2009 DWQ/EMC Implementation Plan for the Coastal Habitat Protection Plan (CHPP)

DWQ staff presented the major DWQ/EMC action items in the proposed CHPP Implementation Plan for 2007 – 2009 and requested approval for this course of action. The draft CHPP is available online at: draft CHPP 2007-2009 Implementation Plan (all agencies)

EMC Action: EMC approved the implementation plan for the CHPP.

Request to Confirm Recommendation to Re-appointment Two Members to the Water Pollution Control System Operators Certification Commission

It is recommended that Mr. Wayne Hollowell and, Mr. Gregory E. Young be reappointed as members of the Water Pollution Control System Operators Certification Commission. All current terms expire June 30, 2007. The new terms will be effective immediately and expire June 30, 2010.

Mr. Hollowell is Director of Water Resources for the City of Rocky Mount, NC. Mr. Hollowell fills the requirements for a member who is employed as a water pollution control facility operator, water pollution control system superintendent or water and sewer superintendent or director, or equivalent with a North Carolina municipality.

Mr. Young is Town Manager for the Town of Boone, NC. He fills the requirement for a member to be employed as manager of a North Carolina municipality having a population of more than 10,000 as of the most recent Federal census.

It is also noted that Mr. Chester Lowder of North Carolina Farm Bureau has been reappointed by the Commissioner of Agriculture to represent the animal industry on the WPCSOCC.

Recommendation: It is recommended by the Water Pollution Control System Operators Certification Commission that the above outlined information be confirmed by the EMC.

EMC Action: EMC approved the re-appointment of the Commissioners.

Proceed to rulemaking with Rules Governing Permitting and Inspection of Private Drinking Water Wells

In July, 2006 the General Assembly ratified House Bill 2873, which became Session Law 2006-202. That law amends G.S. 87-87 to require the Environmental Management Commission to adopt rules governing the permitting and inspection by local health departments of private drinking water wells pursuant to G.S. 87-97 effective July 1, 2008.

The purpose of the proposed rules is to provide better protection of North Carolina's groundwater resources by having all local health departments assure that private drinking water wells meet the construction and setback requirements adopted by the Environmental Management Commission. The Division of Water Quality and Division of Environmental Health met with stakeholders from the well drilling industry and local health departments to develop proposed rules to be administered through local health departments by the Division of Environmental Health, On-site Water Protection Section.

Because the effective date is rapidly approaching and DEH must train personnel in all 100 counties on the rules to be enforced, we are asking that the EMC Groundwater Committee and EMC dispense with the usual 30-day waiting period and allow the proposed rules to be published in September. This will permit the rules to be adopted in December and rulemaking proceedings to be concluded by the end of February, in time for training to be completed.

Recommendation: The Division of Environmental Health recommends the Commission approve initiating rulemaking proceedings in September to allow the Division to publish the proposed text of rules 15A NCAC 02C .0301 through .0308 in the North Carolina Register, to take public comments on the proposed rules, and to bring the rules before the Commission for adoption later this year.

EMC ACTION: EMC approved sending the proposed rules to public notice and hearing.

Hearing Officers' Recommendations for the Adoption of Revisions to the Schedule of Fees for the Ecosystem Enhancement Program (15A NCAC 2R .0101, .0201, .0203, .0401 and .0402)

In November of 2006, the Environmental Management Commission approved staff's request to proceed to public notice and hearings regarding proposed revisions to the Ecosystem Enhancement Program's schedule of fees regarding compensatory mitigation. Public hearings on the proposed revisions were held on January 8, 9 and 11 in New Bern, Raleigh and Morganton respectively. The public comment period for the proposed revisions ended on February 15, 2007.

The revisions proposed included the establishment of fee categories (urban, rural and coastal) to reflect higher engineering, construction and land acquisition costs experienced by EEP when implementing restoration projects in urban and coastal areas of the state. The proposals included fee increases for streams, riparian wetlands and non-riparian wetlands to reflect actual costs of satisfying compensatory mitigation requirements for these resource types.

Substantive comments received questioned the proposed fee category definitions and expressed concern for increasing mitigation costs. The Hearing Officers carefully considered all comments and determined that two alternate rule proposals should be put forth for consideration. In March 2007 additional proposals were published in the North Carolina Register and comments were received until May 15. The additional two alternatives were: a) to maintain a single statewide fee (consistent with the current system but with higher fees); and b) to establish a two-tiered system defined by 8-digit hydrologic units that would assess higher fees in some areas of the state where a variety of factors increase project costs.

Detailed descriptions of all alternatives proposed and all comments received have been mailed to Commission members in advance of EMC consideration.

Recommendation: The majority recommendation of the hearing officers is that the Commission adopt the proposed rule option that sets forth a two-tiered fee system where fees are separated by hydrologic unit boundaries. A minority opinion will be registered in support of maintaining a single statewide fee (while raising existing fees).

EMC Action: EMC approved the rules.

Request to Proceed to Public Hearing on Clean Air Interstate Rule (CAIR) Amendments

The Environmental Management Commission is requested to approve one or more public hearings on amendments to the Clean Air Interstate Rules.

15A NCAC 02D .2400, Clean Air Interstate Rules, are proposed for amendment to address concerns raised by EPA during its review of North Carolina's submittal for state implementation plan (SIP) approval. North Carolina's CAIR rules became effective July 1, 2006. DAQ submitted the final CAIR rules to US EPA Region 4 for SIP approval August 7, 2006. In May 2007 EPA provided comments raising concerns regarding approvability of the rules into North Carolina's SIP.

EPA commented that the applicability language in 15A NCAC 02D .2401 needs to be revised to cover the full universe of potential NOx SIP call sources not otherwise covered under CAIR. Because EPA would no longer operate a separate banking and trading program for NOx SIP call sources, those NOx SIP call sources not otherwise covered by CAIR were brought into the CAIR banking and trading program as allowed under the federal rule.-Applicability language from the old NOx SIP call rule is proposed to be added to ensure any new NOx SIP call sources will be covered.

EPA also noted that the total of the allocations to sources and the new source growth allowances is one greater than the total allocated to the state. This error is the result of rounding in establishing the allocations. To correct the error, 15A NCAC 02D .2412 is proposed to be amended to remove one ton from the new source growth pool.

In addition EPA commented that the rules did not adequately reference the provisions that state an allowance is not a property right and it can be terminated or limited. 15A NCAC 02D .2403, .2404, and .2405 are proposed to be amended to explicitly reference the appropriate subparagraphs.

Several other minor wording and referencing changes are being made at EPA's request. In addition, updating of several facility names that have changed since the rule was adopted is also proposed.

Recommendation: The Director recommends that the Commission authorize one or more public hearings on these rules and that the Chairman appoint one or more members of the Commission to serve as hearing officer.

EMC ACTION: EMC approved sending the proposed rules to public notice and hearing.

Request to Proceed to Public Hearing on Prevention of Significant Deterioration and Nonattainment New Source Review Rule Amendments

The Environmental Management Commission is requested to approve one or more public hearings on amendments to the Prevention of Significant Deterioration (PSD) and Nonattainment New Source Review (NSR) Rules.

15A NCAC 02D .0530, Prevention of Significant Deterioration, and 15A NCAC 02D. 0531, Sources in Nonattainment Areas, are proposed for amendment to formally incorporate NOx as a precursor to ozone and the use of PM10 as a surrogate for PM2.5. In late April 2007 EPA notified DAQ that its PSD and NSR rules submittals reference an older version of the federal requirements and need to be updated to be approvable. The changes to the federal rule occurred as part of the final eight-hour ozone implementation rule published November 29, 2005. The Division has in practice been treating NOx as a precursor to ozone in its permitting program since 1995 and using PM10 as a surrogate for PM2.5. The amendments are proposed to address these deficiencies identified by EPA.

These rules are also proposed to be amended to remove references to the pollution control project and clean unit test provisions for consistency with the federal regulations. These provisions were vacated by the D.C. Circuit Court in June of 2005. EPA amended the federal NSR and PSD regulations on June 13, 2007 to remove these provisions. Incorporating these housekeeping changes at this time with the other amendments will help avoid confusion that might be created by having the same rule undergoing multiple changes on an overlapping schedule.

Recommendation: The Director recommends that the Commission authorize one or more public hearings on these rules and that the Chairman appoint one or more members of the Commission to serve as hearing officers.

EMC ACTION: EMC approved sending the proposed rules to public notice and hearing.

Request to Proceed to Public Hearing on the Adoption of and Amendments to Various Rules

The Environmental Management Commission (EMC) is requested to approve one or more public hearings to consider the adoption of and amendments to various air quality rules.

The proposed new rule section consolidates all the compliance EPA testing methods and procedures into one section. These methods and procedures have been removed from existing rules and updated. Rules that had EPA methods and procedures removed are amended to reflect that action.

The proposed repeal of seven rules and modification of eight rules are to repeal the NOx SIP Rules and to remove reference to non-existent rules. EPA is discontinuing the emissions banking and trading program and the Clean Air Interstate Rule (CAIR) will effectively replace these rules.

The proposed adoption of emergency generator exemption rule will reduce a burden on the permitting and inspections process without any reduction to the air quality.

The rule concerning portable crushers is proposed for modification to change the term "portable" to "temporary" for rule clarity, require permit exemption compliance with MACT Subpart IIII, and add the criteria that "temporary" does not apply to a facility required to have a mining permit issued by the Division of Land Resources.

The rules for toxic air pollutant guidelines and annual emission rates requiring a permit are proposed for modification to reflect an increase in the acceptable ambient level (AAL) for 1,3 butadiene, with a decrease in the annual emission rate for 1,3 butadiene requiring a permit. The North Carolina Scientific Advisory Board found that the risk assessments were overstated.

The rule for changes not requiring permit revisions is proposed to be modified to exempt CAIR and CAMR permittees from the written notification requirement prior to trading allowances to avoid confusion in CAIR and CAMR trading program.

The rule on the national emission standards for hazardous air pollutants is proposed for amendment to correct the cross-references to another rule.

Two rules are proposed to be amended to differentiate large and small Municipal Waste Combustors. Two additional incinerator rules are proposed for amendment to clarify that small municipal waste combustors are not regulated under the Other Incinerator rule and that opacity for small municipal waste combustors is not regulated under the Visible Emissions rule.

Recommendation:The Director recommends that the Commission authorize a public hearing(s) on these items and that the Chairman appoint a member(s) of the Commission to serve as hearing officer(s).

EMC ACTION: EMC approved sending the proposed rules to public notice and hearing.

Request to Proceed to Public Hearing on the Amendments to Title V Fee Modifications

The Environmental Management Commission (EMC) is requested to approve one or more public hearings to consider amendments to Title V fees.

The rule that implements Title V fee modifications increases annual Title V permit tonnage fees to ensure that adequate permit fees are raised to maintain an effective Title V program. A related rule modification places a hold on consumer price index (CPI) inflation adjustment until 2012.

Recommendation: The Director recommends that the Commission authorize a public hearing(s) on these items and that the Chairman appoint a member(s) of the Commission to serve as hearing officer(s).

EMC ACTION: EMC approved sending the proposed rules to public notice and hearing.

Request Designation of Henderson, Tarboro, Washington, and Emerald Isle as Phase 2 Municipalities

This is a continuation of an Agenda Item from the May EMC Meeting. At that meeting the EMC designated Mooresville, Kings Mountain, Morehead City, and Atlantic Beach as new Phase 2 municipalities. However, the EMC deferred its final decision on the designation of Henderson, Tarboro, Washington and Emerald Isle pending the receipt of an Advisory Opinion from the Attorney General's Office regarding whether the Commission was provided with the discretion under Section 5 of Session Law 2006-246 (SL 2006-246) to not designate a municipality that the EMC determined had met the specified designation criteria. That Advisory Opinion has been provided by the Attorney General's Office under separate cover.

Recommendation: That the Environmental Management Commission review the Advisory Opinion provided by the Attorney General's Office and render a final decision regarding the designation of Henderson, Tarboro, Washington, and Emerald Isle as new Phase 2 municipalities.

EMC ACTION: EMC approved the designations.

Request for Approval of the Final Chowan River and Pasquotank River Basinwide Water Quality Plans

The *Chowan River and Pasquotank River Basinwide Water Quality Plans* are in their third cycle of basinwide water quality plans that the Division of Water Quality is preparing for all 17 river basins across the state.

In May 2007, the draft basinwide plans were approved by the Water Quality Committee (WQC) to be released for public review and comment. The draft plans included language developed during an in-depth interim review process, which involved NCDENR agencies, the Soil and Water Conservation Districts and several local watershed groups. Staff received written and verbal comments from both state and local agencies during the public review phase. Revisions were made and information was added to or clarified in the draft plans. Copies of the revised plans were sent to EMC members in the EMC package.

The Basinwide Water Quality Plans are planning documents that will guide the Division's actions in these river basins over the next five years and beyond. The management actions are based on existing rules and policies. Therefore, approval and endorsement of these plans by the Commission would affirm that the management actions set forth in these plans are consistent with the rules adopted by the Commission and with the decision-making policies under which the Division has acted in the past.

Recommendation: Staff recommends that the *Chowan River and Pasquotank River Basinwide Water Quality Plans* be approved and endorsed by the Commission as a guide to water quality program management and implementation by the Division of Water Quality as it carries out its Water Quality Program duties and responsibilities within the basins.

EMC ACTION: EMC approved these two River Basin Plans.

Request to Adopt Hearing Officer's Recommendation to Reclassify 33 Wetlands as "Unique Wetlands" (UWL)

The North Carolina Division of Water Quality Wetlands Unit submitted a request to the EMC to undergo rulemaking to reclassify thirty-three wetlands as a Unique Wetland (UWL). The EMC considers UWLs as wetlands of *exceptional state or national ecological significance, which require special protection to maintain existing uses.* North Carolina Natural Heritage Program datasets document the presence of factors that contribute to exceptional, ecological significance of these wetlands such as state or federally listed threatened or endangered species or high-quality natural communities. The proposed UWL wetlands are on state or federal lands or on land trust property. They are located in eleven North Carolina river basins – Little Tennessee, French Broad, Watauga, New, Yadkin-Pee Dee, Lumber, Cape Fear, White Oak, Roanoke, Tar-Pamlico, and Pasquotank. The rules on these eleven river basins are proposed to be amended to recognize the exceptional ecological significance of these specific wetland sites as UWLs. If reclassified, the wetlands will be protected under existing EMC rules as Class UWL wetlands. The Hearing Officer's Report is attached and includes the proposed rule language that was presented at the public hearings.

Recommendation: The Hearing Officer and staff recommends that the EMC approve the reclassification by amending Rules 2B .0303, 2B .0304, 2B .0305, 2B .0307, 2B .0309, 2B .0310, 2B .0311, 2B .0312, 2B .0313, 2B .0316, 2B .0317 as proposed in the Hearing Officer's Report.

EMC ACTION: The EMC approved the reclassifications of these 33 unique wetlands.

Request for Approval of the Hearing Officer's Report on the Proposed Reclassification of Deep Creek in Durham and Person Counties (Neuse River Basin) to Class Outstanding Resource Waters (ORW)

From a 2005 review of available data for Deep Creek (Durham and Person Counties, Neuse River Basin), DWQ staff determined the ORW classification to be suitable for recognizing existing uses. DWQ staff determined that the subject waters meet Class ORW criteria because these waters: (a) are a fish community site serving as a regional reference site because of high quality instream and riparian habitat characteristics, (b) support a very diverse fish community, (c) include a portion of the North Carolina Natural Heritage Program's Flat River Aquatic Habitat, a state-significant site that is home to rare and endangered mussels, and (d) have excellent water quality, as confirmed by the most current (2005) good benthic and excellent fish community ratings.

If reclassified, regulations that affect new development projects, new and expansions of wastewater discharges, and new DOT projects would apply. There is no proposed development that would be impacted by the proposal, and no plans for new or expanded discharges. NCDOT staff have determined that there is one planned DOT project in the subject area that would be impacted by the proposal, and this project would require additional stormwater control devices in order to meet the proposed reclassification's requirements.

In September 2006 and November 2006, the Water Quality Committee and the Commission, respectively, approved the request to proceed with rule-making for the proposed reclassification. A public hearing was held in May 2007 in Timberlake. One speaker made comments, and was in favor of the proposed reclassification.

During the comment period, three letters were received from persons in support of the proposed reclassification, and one template letter used by two landowners was received against the proposed reclassification. The Report of Proceedings sent to the members of the EMC includes further details on the proposed reclassification.

Recommendation: Staff recommends that the proposed reclassification be approved by the Commission. If reclassified as proposed, and approved by the RRC in October 2007, the effective date for this reclassification will be November 1, 2007.

EMC ACTION: The EMC approved the reclassification to Outstanding Resource Waters.

Request Approval to Proceed to Public Hearing with the Site-Specific Endangered Species Management Strategy for the Goose Creek Watershed

Rule 15A NCAC 2B .0110 requires the development of site-specific management strategies for waters providing habitat for federally-listed threatened and endangered aquatic animal species. The Goose Creek watershed in the Yadkin Pee-Dee River Basin provides habitat for a federally endangered freshwater mussel species, the Carolina heelsplitter (*Lasmigona decorata*). DWQ has worked with a number of agencies over several years to collect recommendations on protecting this species.

The draft rule language, as written, incorporates the lessons learned from previous, extensive buffer rule development for nutrient management purposes and proposes 50-foot wide buffers in the watershed. Secondly, DWQ has incorporated into the proposed rule the lessons learned from more recent, and equally extensive, stormwater management resolutions and has proposed stringent stormwater control on new, ½ acre disturbed areas. Thirdly, requirements in the proposed rule would control impervious surfaces in floodplains and would prevent new, impervious surfaces up to 200 feet from streams. Fourth, the proposed rules prohibit any additional NPDES wastewater discharge. Fifth, the rule is proposed to recognize if ammonia toxicity occurs to the mussel species, actions would be required by any party causing such toxicity. DWQ has set forth in the proposed rule a holistic approach for the watershed, recognizing that important partnerships are necessarily to achieve successful protective measures. The proposed rule is a combination of buffer management, stormwater management, and site-specific measures with the goal of restoring and protecting the water quality in the watershed for the endangered mussel species.

At the July 11, 2007, the WQC approved sending the rules to both the September 12th WQC and September 13th, 2007, EMC consecutive meetings for approval to go to hearing. The July WQC approved the draft rule language as written but to include modifications that were discussed at the July WQC meeting. The currently proposed draft rule, including the modifications discussed at the July WQC, is attached. The modifications that are included are:

1. Clarified existing uses are exempt from new buffer requirements;
2. Clarified that installation of non-electric utility lines within the 50-foot buffer require installation methods such as directional boring, micro-tunneling or bore and jack techniques;
3. Clarified that "allowable" uses in the proposed table of buffer uses are really "potentially allowable" that require permission; and,
4. Clarified that the proposed control on ammonia is an adaptive management strategy and that if any activity, including those that are elsewhere in the draft rule, is documented to cause ammonia toxicity to the mussels, that activity would be subject to additional preventive measures.

The WQC also included in their motion in July that an alternative and several options for the rules should simultaneously be sent to public hearing. The alternative (A) and options (B – D) that the WQC requests comment on are:

A. An alternative for 100 foot undisturbed buffers on intermittent streams and 200 foot undisturbed buffers on perennial streams.

B. An option to allow non-electric utility line installations, such as sanitary sewers, parallel to streams within the proposed 50-foot buffers. If allowed in the inner 30 feet of the buffer, non-electric utility line installations would require appropriate mitigation. Allow perpendicular crossings of non-electric utility lines to impact greater than 150 linear feet with appropriate mitigation.

C. An option to collect comment on what the appropriate mitigation multiplier would be if mitigation were allowed.

D. An option to include rule language requiring the existing NPDES wastewater permit holders to connect to sanitary sewers when sanitary sewers are available.

Recommendation: The DWQ staff recommended that the EMC approve sending the draft rule language to public hearing. Following public hearing, the DWQ would return to the EMC with a Hearing Officer Report of Proceedings and recommendation on the proposed rule.

EMC ACTION: The EMC approved sending the rule text alternatives out to public hearing to simultaneously receive comment on all of the options.

Request to Consider a Special Order by Consent for the City of Wilmington

The City of Wilmington, in New Hanover County has requested a Special Order by Consent (SOC) EMC SOC WQ S07-006, for Permit number WQCS00012. Currently, the City of Wilmington operates a 12 MGD and an 8 MGD wastewater treatment works that discharges treated wastewater to the Cape Fear River, Class "SC" waters of this State in the Caper Fear River Basin. The City of Wilmington is unable to consistently comply with the permit conditions set forth in Permit number WQCS00012. This Order, if issued, will allow the facility to become compliant with aforementioned permit conditions. Compliance will require, but is not limited to, preparation of plans and specifications for upgrades, and/or new construction of additional treatment and/or collection system components to facilitate compliance. This Order contains a detailed schedule for compliance and stipulated penalties for failing to meet interim requirements. This Order will expire 90 days after completion of the detailed compliance schedule contained within the SOC.

A public hearing has been scheduled concerning the proposed Special Order by Consent to take place on August 30, 2007 at 7:00 pm at Kenan Auditorium on the campus of UNCW 601 S. College Rd, Wilmington, NC

Recommendation: It is the Staff's sincere belief that entry into this Special Order by Consent will result in long-term benefit to waters of the State, thus we recommend the Order by entered in to and place into full force and effect at the earliest possible date.

EMC ACTION: The EMC approved the Special Order of Consent.

Stormwater Management Program Annual Report

In Accordance With G.S. 143-214.7(e)
October 2007

The Environmental Management Commission (EMC), through the N.C. Department of Environment and Natural Resources and the N.C. Division of Water Quality (DWQ), implements state and federal programs to control the water quality impacts of stormwater runoff from development activities and urban and developing areas. These programs include the federal National Pollutant Discharge Elimination System (NPDES) program for stormwater discharges that requires permits for point source discharges of stormwater from industrial activities and from certain urbanizing and developing areas. In addition the EMC and DWQ implement state stormwater permitting programs that are designed to control stormwater runoff from new development and redevelopment activities occurring near sensitive waters (Water Supply Watersheds, High Quality and Outstanding Resource Waters, Nutrient Sensitive Waters, Coastal Waters).

The Division continues to implement regular permit activities within both the NPDES and state stormwater program areas. Previous reports have outlined changes that have been occurring in the program, especially through the Phase II program. Under the NPDES program DWQ issues permits that regulate stormwater discharge from individual industrial and construction activities as well as comprehensive stormwater permits issued to municipal, state and federal entities for control of stormwater within their jurisdictional areas. The state stormwater program requires stormwater permits for new development and redevelopment and is implemented through a combination of state and local government administration with state oversight. As programs have changed DWQ has recognized the need for more technical resource for the implementation of the program. Major efforts have included:

- A comprehensive update of the Division's Stormwater Guidance Manual. The updated manual and other support information can be downloaded from the Division's website at: http://h2o.enr.state.nc.us/su/bmp_forms.htm
- Development of an online Mapping Tool. Working with NC Center For Geographic Information and Analysis the DWQ has establish an interactive web-based mapping system to help development activities determine whether they are covered by the post-construction permitting program or other Stormwater permitting requirements. This system can be accessed at: http://h2o.enr.state.nc.us/su/msi_maps.htm
- Finalization of the Universal Stormwater Management Program (USMP). The EMC and DWQ have finalized the development of a voluntary stormwater management effort, the USMP, that allows local governments to consolidate some of their current stormwater programs under one set of requirements. One local government has adopted this program. For more information see: http://h2o.enr.state.nc.us/su/usmp.htm

Previous reports have outlined ongoing activities associated with implementation of the phase II municipal (MS4) NPDES stormwater program. This program is implemented under S.L. 2006-246 and continues to be a major emphasis. Permits under this program currently regulate 107 entities across the state. A number of other entities have received waivers or been exempted in accordance with SL 2006-246. The Session Law also established a process for considering other entities for "designation" under the MS4 program. The EMC and DWQ have reviewed several

River Basins in this process and six additional entities have been designated and are required to submit applications for permit coverage.

Along with the MS4 program, the state began implementing the post-construction program outlined in the Session Law in areas adjacent to regulated entities in July of 2007. Information on the implementation of this program can be found at: http://h2o.enr.state.nc.us/su/msi_post-construction.htm. Two counties (Guilford and Gaston) have requested and received delegation to implement the post-construction provisions within their jurisdiction, including some municipal areas. The Division has participated in a large number of meetings and workshops across the state to share information about the stormwater programs, especially those related to phase II implementation. This includes four workshops coordinated by DENR. Workshops and meetings have included participation from local governments, the development community, the environmental community and from the consulting industry.

Another major initiative has been the response to stormwater program studies that have been discussed in previous reports and in presentations to the ERC. Specifically the EMC has worked with the Division to address results of reviews of the state's current coastal stormwater program. Proposed rule changes for this program have been developed submitted for public review and comment. Four public hearings were held on the proposed changes and the hearing officers are reviewing comments and considering modifications at this time. It is anticipated that the hearing officers will present their recommendations to the full EMC in early 2008. The proposed rules include provisions that would strengthen the existing coastal stormwater measures across the twenty coastal counties. These changes would be similar to the phase II stormwater measures applicable to the coastal areas.

In the industrial permitting program the Division has recently reissued six general stormwater permits covering a variety of industrial activities. These permits allow for continued stormwater permit coverage for around 1,100 industrial facilities across the state. Eight other stormwater general permits will be up for renewal over the coming year.

Quarterly Reports
April, July and October 2007

- Session Law 2005-190
  - Plan of action approved by EPA
  - Monitoring of Falls Lake extended through September 2007
  - Modeling has progressed:
    - Temperature and flow
    - Total suspended solids
    - Nutrient response\
  - Management strategy by July 2009

Exhibit K

Total Max. Day Load (TMDL) for Jordan Lake

- Originally sent out for public review 2005
- Adjoining water listed as impaired 2006
- Phase I addresses Chlorophyll-a - new version out to public review in April
- Phase II will address pH

Other Water Quality

- Coastal Stormwater Rules sent to public hearing
- Several stream reclassifications
- Basinwide plans approved for White Oak, Watauga, and Hiiwassee/Little Tennessee/Savannah
- Approved Jordan Lake Nutrient Rule to go to public hearing

Other Water Quality

- Approved implementation plan for Coastal Habitat Protection Plan
- Site-specific endangered Species Management Strategy for Goose Creek sent to public hearing
- Several delegations of stormwater programs to local governments

Air Quality

- Numerous minor corrections and modifications to bring rules up to date
- Approved VOC and NOx Reasonably Available Control Technology
- Sent RACT Contingency Requirements for Charlotte Ozone Nonattainment to hearing in April; approved in July
- Amendments to Clean Air Interstate Rule sent to public hearing

Air Quality

- Amendments to PSD and New Source Review sent to public hearing
- Title V fees sent to public hearing

Other Actions

- Rulemaking initiated on permitting and inspection of private wells
- Adopted revisions to fees for Ecosystem Enhancement Program
- Sent dry-cleaning solvent cleanup risk-based rules to public hearing in July and approved rules in October
- Issued IBT certificate to Concord-Kannapolis

Risk Assessment for Typical Piedmont Water Supply

- Using Streamflow Records for Eno River at Durham 1963-2006
- Average 43-year flow = 82.9 million gallons per day (MGD)
- Case 1: Withdrawal = 25 MGD, 30 % of average annual flow.
- Case 2: Withdrawal = 33 MGD, 40 % of average annual flow.
- Four worst droughts in record: 1968, 1976, 2002, and 2005

Amount of storage Needed to Avoid Going Dry Before April 1

- How much do you have to have in your account at the start of any month so that you will not overdraft your account before next April 1 when you can expect large deposits.
- You are making daily deposits (streamflow inputs) and withdrawals on a daily basis.

2007 Stormwater Programs Annual Report

Environmental Review Commission
October 31, 2007

Overview

- Update on State Stormwater Programs
- Proposed Amendments to Coastal SW Rules

Why is Stormwater so important?

- The pollution associated with stormwater run-off is the number one water quality problem in North Carolina.

Stormwater Programs Update

- New Municipal Phase 2 Designations
  - Mooresville, Kings Mountain, Morehead City,
  - Atlantic Beach, Washington, Henderson
- New State Phase 2 Permit – Effective July 1
  - Effective in MSIs & Unincorporated Areas
- New Stormwater BMP Manual Released
- New Stormwater Online Map Viewer

Amendments to Coastal Stormwater Rule

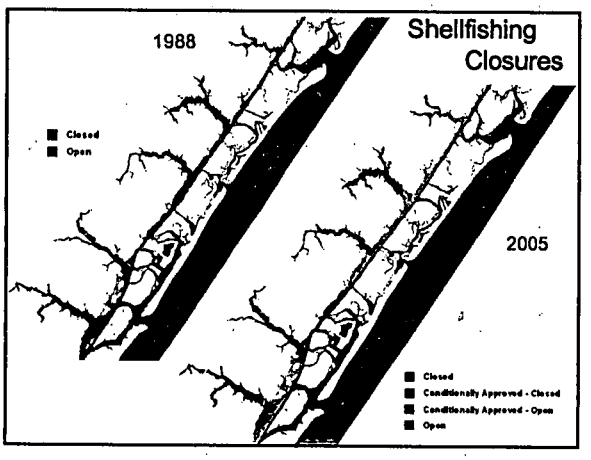
- EMC has proposed amendments to the Coastal Stormwater Rule for the 20 CAMA Counties.
- Rule citation: 15A NCAC 2H .1005.
- Public Comment period closed on Oct 15.

Why did the EMC propose changing these rules?

- DWQ study that the existing rules were not effectively protecting water quality.

Overview of DWQ Study

- Based on review of:
  - Statewide shellfish closure data
  - Statewide development trends
  - Effectiveness of rules in developing watersheds
  - Conversations with DMF, DCM, & others
- Review of available scientific literature
- Review of latest information on watershed protection
- NOT based on single study.
- NOT based on only one part of the Coast.



Study Conclusions

- Existing rules not protecting shellfishing use.
- 90% of closures due to stormwater runoff.
- Closure of additional 1200 acres in 2006.
- Coastal rules need to be updated & improved.
  - Non-coastal stormwater programs more protective.
- No evidence submitted to refute DWQ findings.

What is the EMC proposing?

- Extend Phase 2 Controls to all 20 Coastal Counties.
- Controls contained in Session Law 2006-246.
- Currently implemented in Brunswick, New Hanover, & Onslow Counties.

What is the EMC proposing?

Within ½ mile & draining to shellfishing (SA) waters

	Proposed		Existing
Low Density	12%		25%
Control Req.- High Density	1-yr, 24-hr storm		Runoff from 1.5" of rain.

What is the EMC proposing?

Not within ½ mile and draining to shellfish waters.

	Proposed		Existing
Low Density (BUA)	24%		30%
Control Req.- High Density	Runoff from 1.5" of rain.		Runoff from 1.0" of rain.

What else is open for consideration?

- Modify Threshold for Coverage
  - Current threshold: 1 acre or CAMA Major
  - Rule changes may lower threshold to 10,000 sq ft.
- Expand setback from 30 to 50 feet.
- Wetlands & Impervious Surface Calculations.
  - Rule changes may prohibit use of coastal wetlands or all wetlands in impervious surface calculations.

What happens next?

- Four Public Hearings already conducted.
- Public comment period closed on October 15.
- Final EMC decision in Jan 2008.
- Rule changes reviewed by Rules Review Comm.
- Legislative review.
- Changes could become effective Aug 1, 2008.

Other Option Available

- Universal Stormwater Management Program
- Optional program – Effective: January 2007.
- Allows for local control of stormwater program.
- Supersedes State programs within jurisdiction.

Report to the Environmental Review Commission On the Implementation of the Sedimentation Pollution Control Act By the Department of Environment and Natural Resources Division of Land Resources, Land Quality Section

October 1, 2007

§ 113A-67. Annual report. The Department shall report to the Environmental Review Commission on the implementation of this Article on or before 1 October of each year. The Department shall include in the report an analysis of how the implementation of the Sedimentation Pollution Control Act of 1973 is affecting activities that contribute to the sedimentation of streams, rivers, lakes, and other waters of the State. The report shall also include a review of the effectiveness of local erosion and sedimentation control programs.

The following information is submitted to fulfill this reporting requirement.

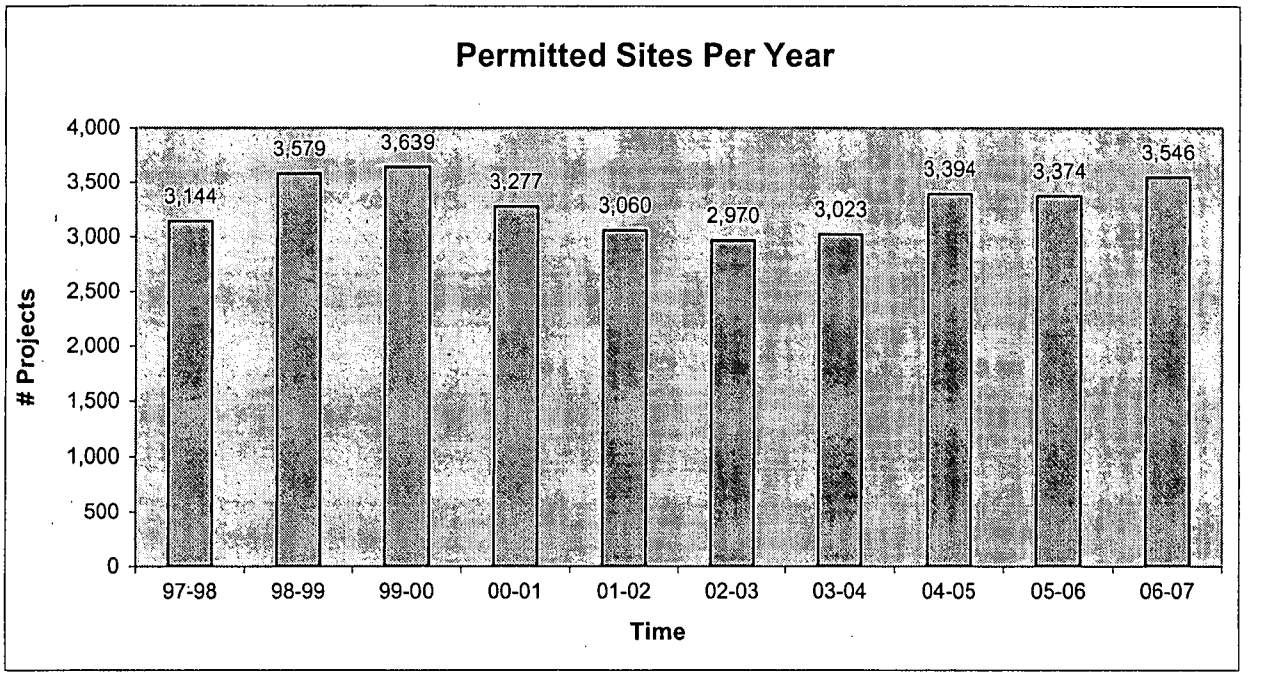
Executive Summary

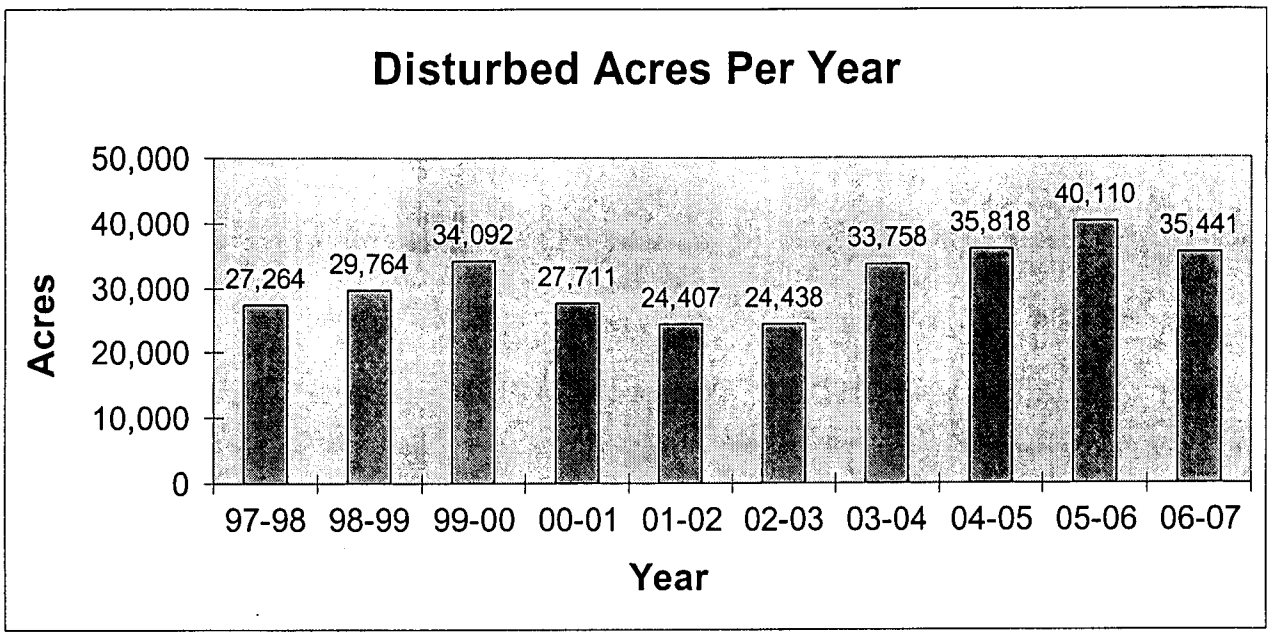
Land disturbing activities for development in North Carolina remained at a very high level this past year as illustrated by the charts below. Much of the land disturbing activity was within the sensitive areas of the mountain and coastal regions, as well as near lakes or other waterways throughout the State. In addition to plan approval and compliance activities, the Sedimentation Program introduced the improved erosion and sedimentation control methods from the program's recently revised *Erosion and Sedimentation Control Planning and Design Manual* to design and local government professionals at training workshops. These new measures are increasingly being utilized at construction sites. The delegation of four additional erosion and sedimentation control programs this year will improve the coverage of the State for compliance inspections and should improve the control of erosion and sedimentation in those areas. The statutory increase in plan review fees this past session will also improve compliance coverage by funding seven additional inspector positions. However, the current high level of development, particularly in environmentally sensitive areas, continues to challenge the efforts of the program. Additionally, while the current drought conditions for most of the State have reduced erosion in the short term, the drought's adverse impact on trying to establish permanent vegetation at disturbed areas will make it more difficult to control erosion on these sites in the long term.

Background

Sedimentation is the number one pollutant in the State of North Carolina and in the United States. More stream miles are impaired by sediment than any other pollutant. When the Sedimentation Pollution Control Act became law in 1973, the words of the Preamble proved prophetic. *"The sedimentation of streams, lakes and other waters of this State constitute a major pollution problem. Sedimentation occurs from the erosion or depositing of soil and other materials into the waters,*

principally from construction sites and road maintenance. The continued development of this State will result in an intensification of pollution through sedimentation unless timely and appropriate action is taken. Control of erosion and sedimentation is deemed vital to the public interest and necessary to the public health and welfare, and expenditures of funds for erosion and sedimentation control programs shall be deemed for a public purpose". The number of new projects under State jurisdiction increased slightly from 3,374 last year to 3,546 this year. The actual area of land-disturbance covered by these approved erosion and sedimentation control plans decreased to 35,441 acres for the 2006-2007 Fiscal Year from the record last year of 40,110 acres. However, this total does not include areas administered by local governments, which have increased since the last report. These figures also do not include land disturbed by the Department of Transportation.





Implementation

The Division of Land Resources, Land Quality Section, administers the SPCA within the Department of Environment and Natural Resources. The Sedimentation Control Commission has also delegated administration of the SPCA to 50 county or municipal governments. These local program delegations do not include land-disturbing activities conducted by local, State or United States government or persons with the power of eminent domain (e.g. public utilities), which remain under jurisdiction of the Land Quality Section. The Sedimentation Control Commission delegated program authority to Iredell, Lincoln, Henderson and Caldwell Counties in 2007.

The Land Quality Section has 54 full time equivalent positions (FTE) to handle the administration, plan review, inspection and enforcement of the sedimentation program. In addition, there are 5.25 FTE positions funded through the Express Review program. Most of the personnel are located in the Department's seven regional offices, where they conduct inspections and review erosion and sedimentation control plans.

Regional activities for the 2006-2007 Fiscal Year include:

5,270 erosion and sedimentation control plan reviews;
13,189 sedimentation site inspections;
658 notices of violation;
67 enforcement case referrals.

The Land Quality Section Program collaborates closely with the Division of Water Quality's Stormwater Management Program in permitting, inspection and enforcement activities. The Land Quality Section issues the required stormwater permits for construction activities in conjunction with the erosion and sedimentation control plan approval, and performs the compliance inspections for these sites. Any enforcement actions involving stormwater management violations are carefully

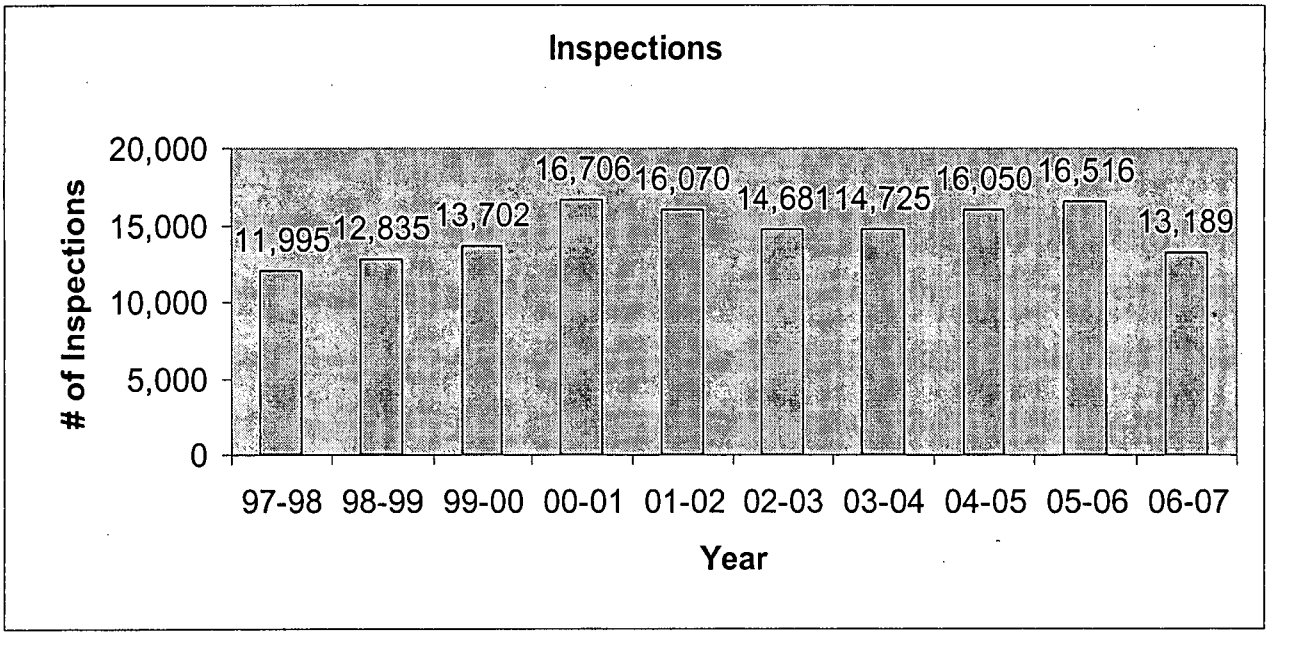
coordinated between the Land Quality Section and the Division of Water Quality to avoid overlap and to ensure the most effective enforcement.

Plan Approval

The SPCA requires a review of the required erosion and sedimentation control plan within 30 days of first submittal or 15 days of resubmittal. Over 90% of the plans are reviewed with 25 days of first submittal and 10 days of resubmittal. However, an Express Permitting program for erosion and sedimentation control plans provides for plan review within three days for an additional fee and is now available at all regional offices. During the 2006-2007 Fiscal Year, 530 Express Permit reviews were performed, ranging from 50 per year in Asheville and Mooresville to 113 in Wilmington.

Inspection

Land disturbing activities should be frequently inspected because of the dynamic change that can occur on a construction site in a short time. Not only can new areas be affected, but also existing erosion and sedimentation control measures can fail from lack of maintenance or be accidentally destroyed by construction equipment. The failure of existing measures can release previously trapped sediment into waterways. Regional staff completed 13,189 sedimentation inspection reports in the 2006-2007 Fiscal Year.



Enforcement

The Division of Land Resources documents compliance or non-compliance with the SPCA with sedimentation inspection reports. Most violations are resolved by sending an inspection report to the

responsible party and requesting correction of the deficiencies. Of the 13,189 inspections conducted during the 2006-2007 Fiscal Year, 658 (5%) resulted in a Notice of Violation. The Notices of Violation led to 67 requests from the regional offices for additional enforcement action (10% of NOV's issued).

Local Programs

Four additional local sedimentation programs have been delegated this year – Henderson County, Caldwell County, Lincoln County and Iredell County. Each of these counties has considerable ongoing development. This brings the total of delegated programs to 26 municipal, 22 county and two joint city/county programs. Well administered, local government sedimentation programs offer the advantages of inspecting sites more often than the State program, being more geographically accessible to their constituents, and incorporating plan reviews with planning, zoning and building approvals.

The Sedimentation Control Commission encourages local governments to administer a delegated erosion and sedimentation control program by providing a model ordinance, cost share funding for start-up and technical assistance. Once a program is delegated to a local government, the Land Quality Section provides periodic oversight to ensure that the local programs are meeting the standards for the State program. State personnel informally assist and advise the local staff on problematic sites. A review of each local program is scheduled at least every two years. Land Quality and the Attorney General's Office review the city or county ordinance to ensure that it is as stringent as State law and rules. The Land Quality Regional Engineer and Sediment Specialist and/or their assistants meet with the local program staff during the review. A detailed report is provided back to the local government, noting strengths, deficiencies and corrective actions. A summary report is presented to the Sedimentation Control Commission at its quarterly meetings. The Commission then takes action to continue the delegation, place the program on probation, or give 30 days' notice that the Commission will assume administration and enforcement of the program.

Database Management

Records of erosion and sedimentation control plan reviews and inspections are kept in diverse separate databases in each regional office, complicating statewide data gathering. Land Quality and Information Technology Services continue to work together to develop an online data management and word processing system that will be used by all offices. Plan reviews, fee receipts, inspections, complaints, notices of violation, local program activity, and NC DOT inspections will be tracked in a single database. The data entry and storage applications have been developed. Report and document generation capabilities have not been completed.

Training

Training efforts focused on the implementation of the improved methods of erosion and sedimentation control outlined in the *Erosion and Sedimentation Control Planning and Design*

Manual. Revision is currently underway of the *Field Manual* for contractors. It is being revised to reflect changes adopted last year in the *Erosion and Sedimentation Control Planning and Design Manual.* Four workshops were held for design professionals, along with the annual workshop for local programs. The Clear Water Contractor training modules were revised using an EPA 319 grant, and have been renamed the "Green Dozer" training.

Statutory Amendments

The plan review fee was increased from $50 per acre to $65 per acre in the budget adopted by the General Assembly for the 2007-2008 Fiscal Year. This fee increase will allow the creation of seven additional positions in the regional offices. In addition to compliance activities, this position will provide training to the other field inspectors and assist with problem sites.

Regulatory Issues

Trout Stream Buffer Zone

Background Information From Last Year's Report

G.S. 113A-57(1) requires a buffer zone along a lake or natural watercourse of sufficient width to confine visible siltation within the twenty-five percent (25%) of the buffer zone nearest the land-disturbing activity. Waters that have been classified as trout waters by the Environmental Management Commission shall have an undisturbed buffer zone 25 feet wide or of sufficient width to confine visible siltation within the twenty-five percent (25%) of the buffer zone nearest the land-disturbing activity, whichever is greater. Provided, however, that the Sedimentation Control Commission may approve plans which include land-disturbing activity along trout waters when the duration of said disturbance would be temporary and the extent of said disturbance would be minimal.

In a third party appeal of the issuance of such a variance, an administrative law judge granted a summary judgment in January 2006 that essentially ruled that the terms "temporary and minimal" applied to impacts during and after the construction phase whether or not those impacts may cause or contribute to sedimentation. This interpretation would mean that the effect of almost any land disturbing activity resulting in a permanent change in natural cover or topography would not be "temporary and minimal," and hence, no variance could be allowed. Consequently, the Division ceased to issue variances from land disturbing activity that created permanent changes in cover or topography within trout stream buffer areas, pending legal resolution.

Legislative efforts during the 2006 session to better define the terms "temporary and minimal" disturbance within trout stream buffers were unsuccessful. The Sedimentation Control Commission made a final agency decision during their November 16, 2006 meeting overruling the administrative law judge's January 2006 ruling. Pending further legal review of the contested case, the Sedimentation Control Commission directed the Division to return to the Division's earlier practices in applying the "temporary and minimal" variance standard to impacts that may cause or contribute

to sedimentation in the review of request for variances for land disturbing activities within trout buffers. In addition, the Sedimentation Control Commission declared that a project could meet the "temporary and minimal" variance standard when a project redisturbs an area so that the project ultimately reduces sedimentation and the impacts in the trout buffer are first avoided, then minimized, then restored to native vegetation characteristic of an undisturbed buffer as soon as practical after the completion of construction.

Update

The decision of the Sedimentation Control Commission has been appealed by the third party to Superior Court, and remains in litigation.

Description of Tiered Water Supply Systems

J. Wayne Munden, Head
Technical Services Branch, Public Water Supply Section
Division of Environmental Health, DENR

Tier-1: water supply systems are considered to be in a crisis mode (or) have less than 100 days of present supply remaining (or) are likely to be in a crisis if conditions persist because they lack interconnections for emergency water supply

Tier-2: systems are not in crisis now but could be within the next few months.

Tier-3: systems are not yet in a vulnerable position but are subject to change as the drought continues.

This ranking is a subjective assessment based on best professional judgment and experience of PWS field staff coupled usually with recent communication with the systems. The Tier list is an on-going working document and is subject to change at any time.

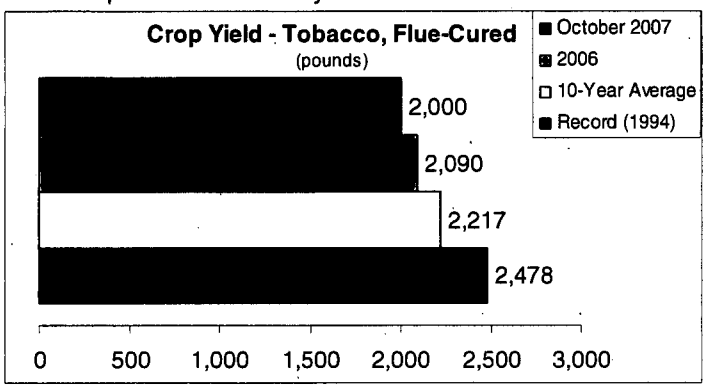
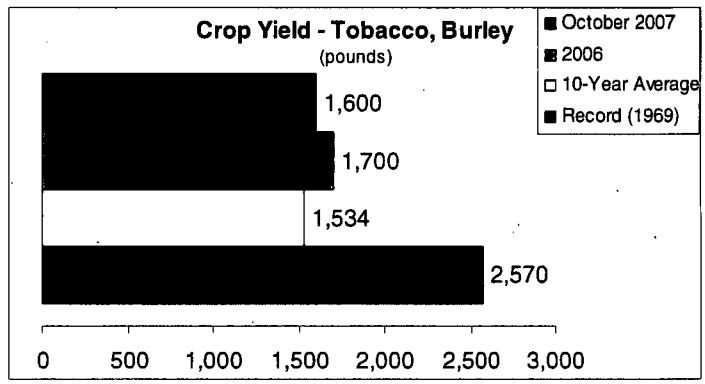
Exhibit P

NC CROP PRODUCTION IMPACTED BY WEATHER CONDITIONS

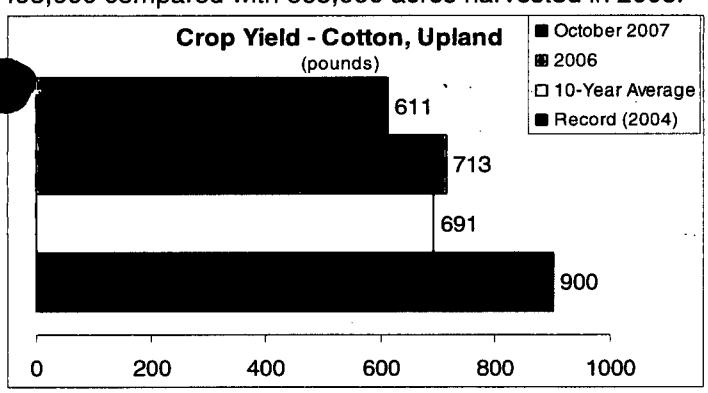
Flue-cured tobacco production is forecast at 330 million pounds, 2% above the 324 million pounds produced in 2006. Acres for harvest are estimated at 165,000, up 10,000 acres from last year. Yield per acre is forecast at 2,000 pounds, down 90 pounds from last year.



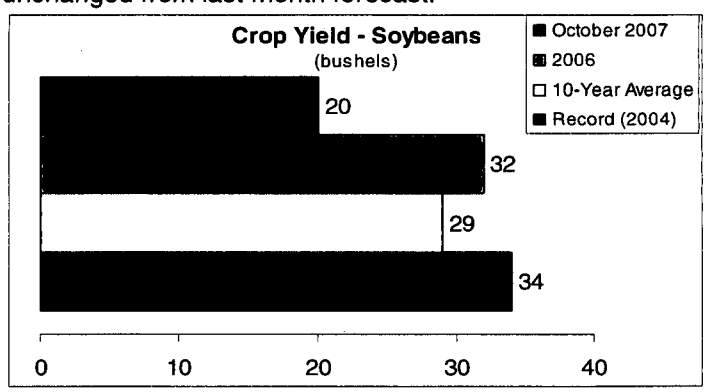
Burley tobacco production is forecast at 6.4 million pounds, down slightly from 2006 production of 6.46 million. Yield is forecast at 1,600 pounds per acre, 100 pounds less than last year's crop. Area for harvest is forecast at 4,000 acres, 200 acres more than was harvested in 2006.



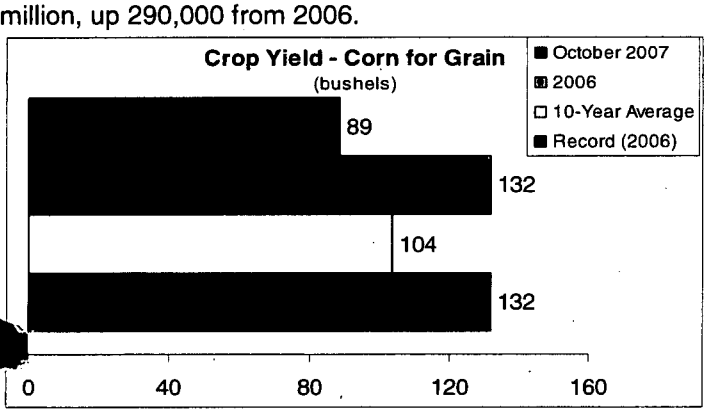
Cotton production is forecast to total 630,000 bales, unchanged from last month's forecast and down 51% from last year's production of 1.285 million bales. The yield forecast at 611 lbs per acre remained unchanged from September's forecast. Harvested acres are expected to total 495,000 compared with 865,000 acres harvested in 2006.



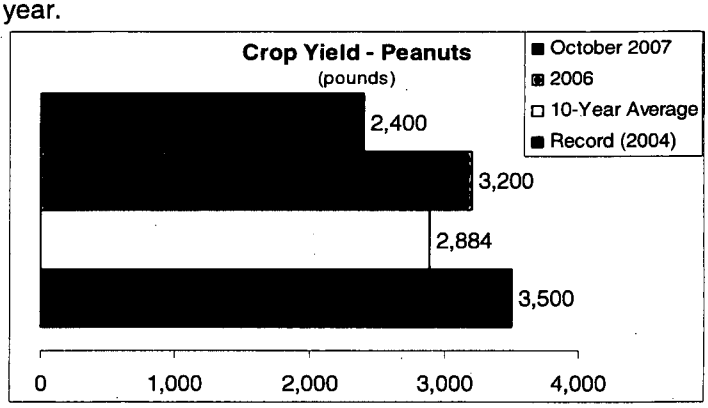
Soybean yield is forecast to average 20 bushels per acre, down 2 bushels per acre from last month's forecast and down 12 bushels from last year. Production is forecast to total 27.4 million bushels; down 37% from last year. Harvested area is projected to 1.37 million acres, unchanged from last month forecast.



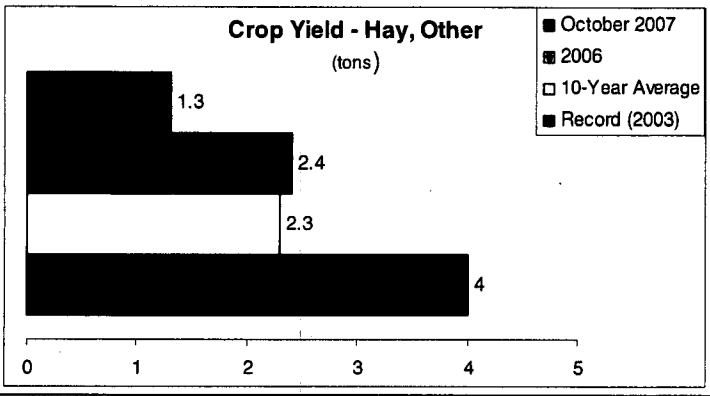
Corn for grain yield is forecast 89 bushels per acre unchanged from last month and down from last years record high of 132 bushels per acre. Production is forecast to total 91.67 million bushels; 6% less than last year. Harvested acres are unchanged from last month's forecast at 1.03 million, up 290,000 from 2006.



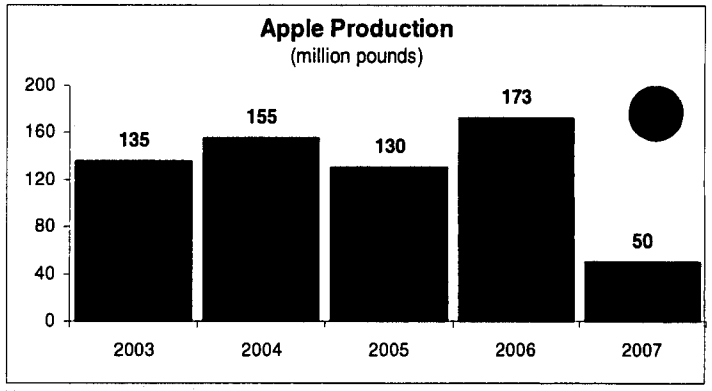
Peanut production is forecast at 220.8 million pounds, up 4% from last month and down 18% from last year's production. Harvested area is projected at 92,000 acres. Yield per acre is forecast at 2,400 pounds, up 100 pounds from last month and down 800 pounds per acre from last year.



Other hay yields are forecast at 1.3 tons per acre, down from Augusts' forecast of 2.0 tons per acre. Production is expected to total 897 thousand tons, 45% below the 2006 tonnage.



Apple production expectations remained the same as the August forecast, 50 million pounds. The freeze in early April and the persistent drought are the main contributors.



September 2007 Crop Weather: Dry weather and above normal temperatures dominated the month of September resulting in soil moisture levels being rated mostly very poor and poor. Many crops are being negatively affected by the continued drought and above normal temperatures. By month's end, harvest progress for corn for grain, sorghum, sweetpotatoes and burley tobacco were above the five year averages. Apples, peanuts, corn for silage and hay were inline with the 5-year average and flue-cured tobacco was slightly behind the 5 year average.

U.S. flue-cured tobacco production is expected to total 456 million pounds, down less than 1 % from the previous forecast but 2 % above 2006. **U.S. burley tobacco** production is expected to total 192 million pounds, down 3 % from the September forecast and 12 % below a year ago. **U.S. corn for grain** production is forecast at 13.3 billion bushels, up slightly from last month and 26% above 2006. . **U.S. cotton** production is forecast at 18.2 million 480-pound bales, up 2 % from last month but down 16 % from last year's 21.6 million bales. **U.S. soybean** production is forecast at 2.60 billion bushels, down less than 1% from the September forecast and down 19% from last year's record high. **U.S. peanut** is forecast at 3.42 billion pounds, down 1 % from last year's crop.

CROP ACRES, YIELD AND PRODUCTION, OCTOBER 1, 2007

Introduction

This is the third report of the North Carolina Drought Management Advisory Council on the implementation of North Carolina General Statute 143-355.1, which created the council in 2003. The General Assembly amended this statute in 2004, adding a new section requiring an annual report: "(g) The Council shall report on the implementation of this section to the Secretary, the Governor, and the Environmental Review Commission no later than 1 October of each year. The report shall include a review of drought advisories issued by the Council and any recommendations to improve coordination among local, State, and federal agencies; public water systems; and water users to improve the management and mitigation of the harmful effects of drought. (2003-387, s. 2; 2004 195, s. 2.5.)"

Drought Management Advisory Council

The Drought Monitoring Council was an interagency coordination and information exchange body created in 1992. The council did a creditable job of monitoring and coordinating drought responses in 2002 and increased public awareness of its functions and its effectiveness. The General Assembly recognized the Drought Monitoring Council's leadership and performance by giving it an official statutory base and by changing its name to Drought Management Advisory Council (DMAC), reflecting the broader role of the council, which goes beyond monitoring of drought conditions.

North Carolina General Statute 143.355.1., ratified July 17, 2003, assigns the DMAC an important new role, the need for which became evident in 2002. A number of local governments indicated that it would be helpful to have official, objective drought status advisories, to give them a reliable basis for their management responses. The new statute assigns this role to the DMAC and specifies that the drought advisories are to be based on technical data and are to be crafted to fit varying conditions in different parts of the state. This system will avoid the

problems that some states have experienced in declaring drought warnings statewide, when conditions did not warrant it in all parts of the state.

Section 1 of this Act also makes drought response provisions mandatory in local government water supply plans and extends this planning responsibility to all community water systems that serve 1,000 or more connections or 3,000 or more individuals.

The intent of the new statute is for the DMAC to continue with essentially the same membership and functions that the Drought Monitoring Council previously exercised, but with new statutory authority and a new responsibility for providing a system of drought advisories when needed. Most importantly, the operations of the DMAC will carry on the same role as the Drought Monitoring Council did in support of the North Carolina Emergency Operations Plan.

Monitoring Drought Conditions

The U.S. Drought Monitor of North Carolina (www.ncwater.org) is the reference for drought classifications and response actions in the state. The drought monitor is a map identifying general drought areas, labeling droughts by intensity, with D1 being the least intense and D4 being the most intense. D0 signifies drought watch areas either drying out and possibly heading for drought, or recovering from drought but not yet back to normal, suffering long-term impacts such as low reservoir levels or minimum streamflow for the time of year.

The Technical Drought Advisory Team a sub group of the Council, participates each Tuesday in a telecom to gather and feed information to the National Drought Monitor author about local drought conditions in North Carolina. The team includes DMAC representatives and National Weather Service offices located in Tennessee, South Carolina and Virginia. The Drought Monitor is published on Thursday morning of each week.

Council Meetings

The DMAC chairman called for meetings of the council on Mar. 7, June 7, Aug. 21, and Sept. 27, 2007 at the Archdale Building in Raleigh. Average attendance was about 40 representatives. The total number of people in attendance at the Sept. 27, DMAC meeting was 69, including 10 representatives from the media. These included WRAL, WUNC public radio, WTVD (ABC 11), WGHP (Fox 8), NBC 17, the North Carolina News Network, Freedom Newspapers, Wake Weekly, Star News, and the Fayetteville Observer.

Items on the meeting agenda included assessment and forecast reports about the seasonal drought outlook and the impact of drought on streamflow and ground water levels, lake and reservoir levels, and agriculture, forestry and public water systems.

Press Releases

Press releases were sent out after each DMAC meeting. A total of 24 press releases were issued concerning drought conditions and drought advisories issued.

On-Going Drought Assessment and Drought Coordination 2007

The technical team of the Drought Management Advisory Council continued to hold a weekly conference call on Tuesdays to assess drought conditions in 2007. The information they produce goes to the weekly update of the drought status map, which comes out on Thursdays.

The Water Sources Task Force was activated in August and is now joining the DMAC technical team on the weekly conference call.

The Water Sources Task Force is part of the NC Emergency Response Plan and brings a few additional agencies to the table with capabilities for drought response and evaluation of water supply. The Public Water Supply Section and the Division of Water Resources have established a list that ranks local water systems in three tiers of drought vulnerability. At the weekly conference call, the participants update

and review the drought vulnerability tier list and identify communities needing assistance.

Tier-1: systems are considered to be in a crisis mode (or) have less than 100 days of present supply remaining (or) are likely to be in a crisis if conditions persist because they lack interconnections for emergency water supply

Tier-2: systems are not in crisis now but could be within the next few months.

Tier-3: systems are not yet in a vulnerable position but are subject to change as the drought continues.

This ranking is a subjective assessment based on best professional judgment and experience of PWSS field staff coupled usually with recent communication with the systems.

The Water Sources Task Force is having meetings with all of the Tier-1 systems to help in identifying a near-term water supply solution and funding to obtain an emergency supply of potable water.

The Task Force is currently working with and helping Rocky Mount and Siler City, Tier-1 systems, to expedite plans/construction necessary to obtain an emergency water supply.

The DMAC is working with the NC League of Municipalities to have three Regional Drought Meetings in the state planned for Greensboro, Raleigh, and Asheville to inform all water systems on drought conditions and on responses that are needed.

River Basin Management

The DMAC and the Water Sources Task Force is participating in weekly conference calls with managers of major reservoirs, including the Corps of Engineers private power companies, and TVA, to review specific drought conditions in each basin and to discuss changes needed in reservoir management to conserve stored water. These conference calls have resulted in significant adjustments in reservoir release policies, with a resulting increase in the conservation of stored water and a reduction in our risk of depleting reservoirs. These changes are made with the participation of the Division of Water Quality, the U.S. Army Corps of Engineers, and the Wildlife Resources Commission. River basins with on-going telecoms include the Neuse, Catawba, Roanoke, Yadkin, Cape Fear, and Tennessee Valley.

In September, the Division of Water Resources sent a message to public water system managers statewide, reminding them of the necessity to monitor water supply and demand carefully and of the requirement to mandate water use restrictions as indicated by their local water supply plans. Also, letters were sent to golf courses concerning water use registration requirements. These messages followed a press release by Governor Easley asking for local water conservation actions to avoid a state government mandate for mandatory water use restrictions.

Drought Advisories Issued

The DMAC issued official drought advisories based on data adjusted for varying conditions in different parts of the state to provide local governments with a reliable basis for managing drought response in their region. The advisory was updated each week (www.ncdrought.org) to reflect drought classifications on the weekly U.S. Drought Monitor of North Carolina.

In April, severe drought conditions developed in the southern mountains. Exceptional drought conditions moved eastward to central NC during the first week of October 2007 and were depicted in 55 counties; with 31, 11, and 3 counties

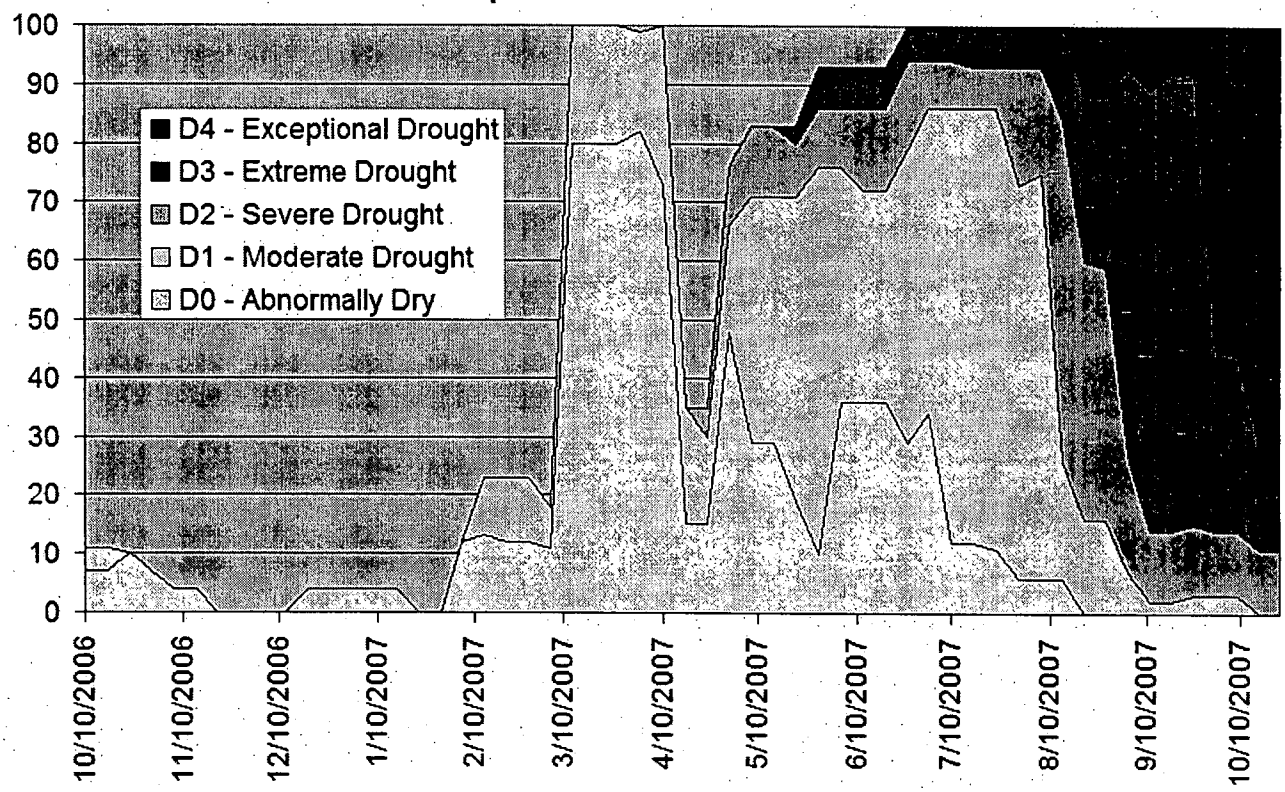
having extreme, severe and moderate drought conditions respectively. Figure 1 summarizes the number of counties each week under drought advisories as issued by the DMAC.

The USGS reported record low water levels in May for North Carolina rivers in Western NC and in August 2007 reported the lowest streamflows in more than 110 years for some North Carolina rivers as drought conditions worsened.

The drought advisory requests the implementation of drought response actions until further notice for all water users located in or dependent upon water resources from the areas of the state experiencing drought. The highest drought classification applies to the entire county, if any portion of the county is depicted on the U.S. Drought Monitor of North Carolina as having those conditions. Counties under the current advisory and requested drought response actions are updated each Thursday and listed (www.ncdrought.org) by drought classification.

Since mid June, all 100 counties in the state had some level of drought classification. Figure 1 summarizes the number of counties each week under drought advisories as issued by the DMAC.

Figure 1. County Summary with Drought Advisories issued September 2006 -- October 2007



Water System Water Conservation Status

The Division of Water Resources and the Public Water Supply Section (PWSS) regional offices are working together to make possible this reporting and data available on the Web on the status of water conservation requirements by public water systems. This on-line database provides a consistent way to document and track impacts to public water supply systems. The system is operational and in use, and tracks the more than 600 water systems throughout the state. This information can be accessed at:

www.ncwater.org/Drought_Monitoring/reporting/displaystate.php.

The number of water systems that called for water use restrictions is displayed in Figure 2.

Improving Coordination and Drought Depiction

DMAC Web Site

The DMAC Web site (www.ncdrought.org) depicts the U.S. Drought Monitor for North Carolina that is updated and released on Thursday 8:30 a.m. EST each week. The data cutoff for each week is Tuesday 7:30 a.m. EST. The weekly release can include drought advisories issued by the DMAC for all water users located in or dependent on water resources from the areas of the state experiencing drought conditions. Advisories are color-coded and range from Abnormally Dry (D0) to Exceptional Drought (D4).

The U.S. Drought Monitor establishes a baseline for hydrological and agricultural drought conditions; North Carolina is fortunate in that it has the DMAC to work closely with the U.S. Drought Monitor to adjust designations to better reflect North Carolina's local conditions.

The DMAC Web site also has a number of tabs that link to available resources of information, some with real-time data about current conditions, news, information about the DMAC, contact information and education about drought, archives (N.C. monitor) and water conservation tips.

Drought Indicator Wells

Drought indicator wells are a network of wells that monitor the effects of droughts and other climate variability on ground water levels in the surficial aquifers (water table). The Division of Water Resources has a goal of increasing the number and geographic distribution of drought indicator wells. DWR currently has 45 actively monitored wells in the network and has a short-term goal of adding two wells to that network this fiscal year. The long-term goal is to have a minimum of 60 drought indicator wells. This will allow a much more complete assessment of impending or actual drought conditions in each of the major river basins of the state.

River Basin Drought Management Plans

As part of the relicensing of hydropower projects in the Catawba-Wateree and Yadkin-Pee Dee river basins, procedures have been established and tested for adjusting operations during periods of low-inflow to conserve the limited water supply during the 2007 drought. The Low-Inflow Protocol (LIP) provides trigger points and procedures for how the projects will be operated as well as water withdrawal reduction measures and goals for other water users during periods of low-inflow.

Efforts are currently underway with stakeholders in the Neuse River Basin to work together with the Division of Water Resources to fund and develop a drought management model for the basin.

The Division of Water Resources is working with the U.S. Army Corps of Engineers and stakeholders on updating drought management plans on Falls and Jordan Reservoirs.

Water Resources Information

The Division of Water Resources is working together with the N.C. State Climate Office, the U.S. Army Corps of Engineers, the N.C. Ground Water Management Section, and the U.S. Geological Survey and have developed a water resources information, storage, analysis, and retrieval system (WRISARS). This program will provide a single archive of historical and on-the-spot data about hydrology (including stream flow, groundwater and reservoir data), weather and climate, and water use in North Carolina. Products are now available for public use at (http://www.ncwater.org/wrisars/index.php).

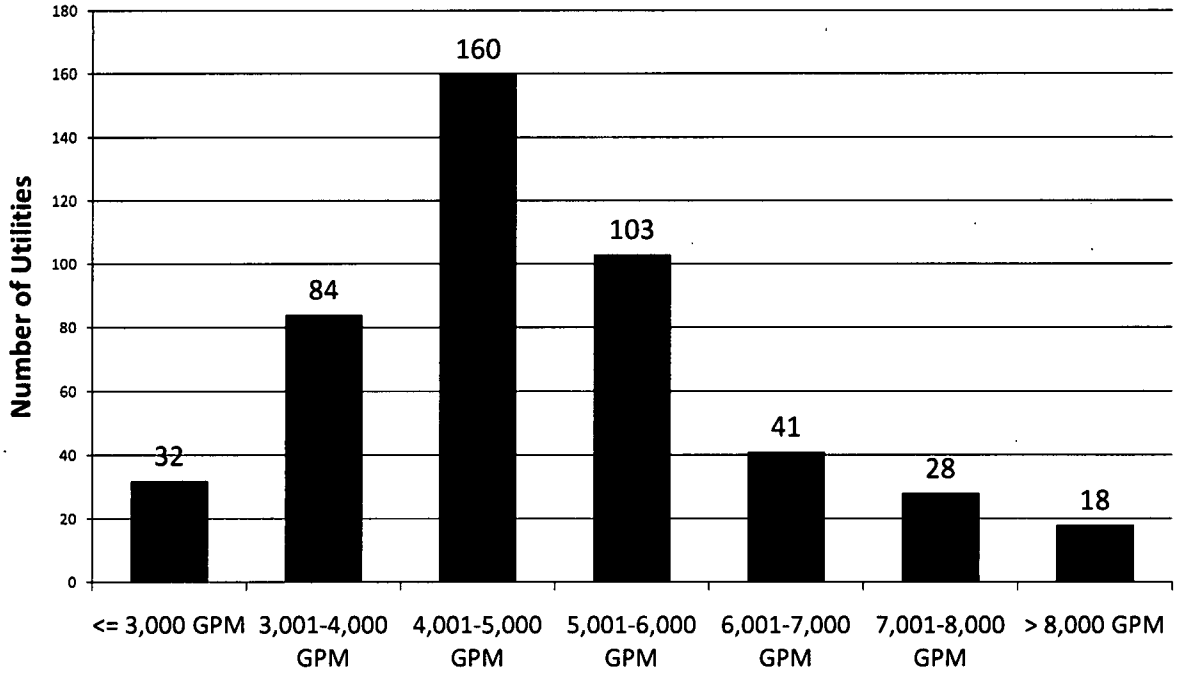
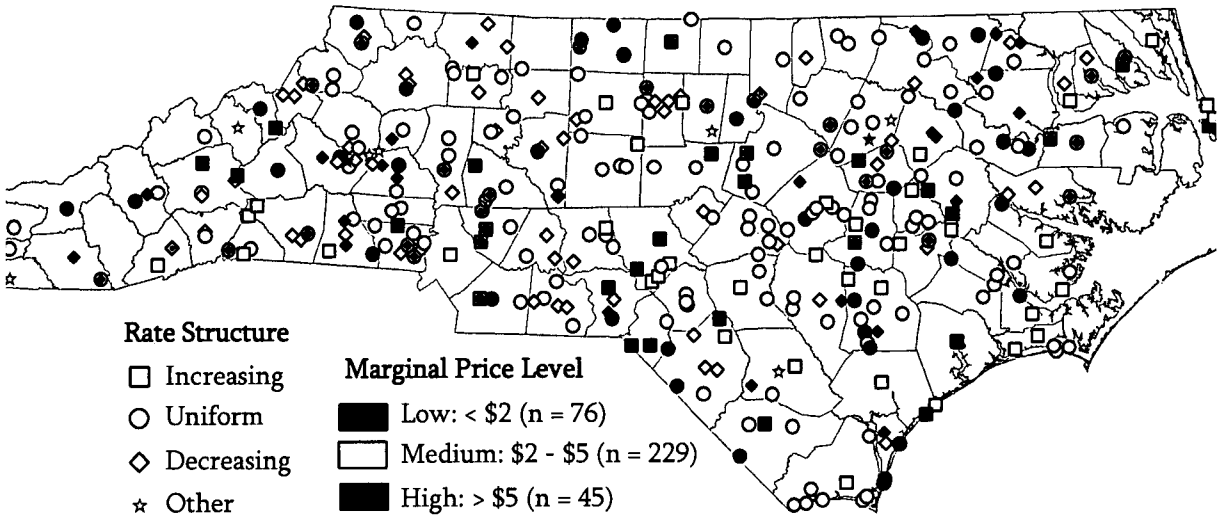
Average Residential Consumption in 2002
Among 466 Utilities

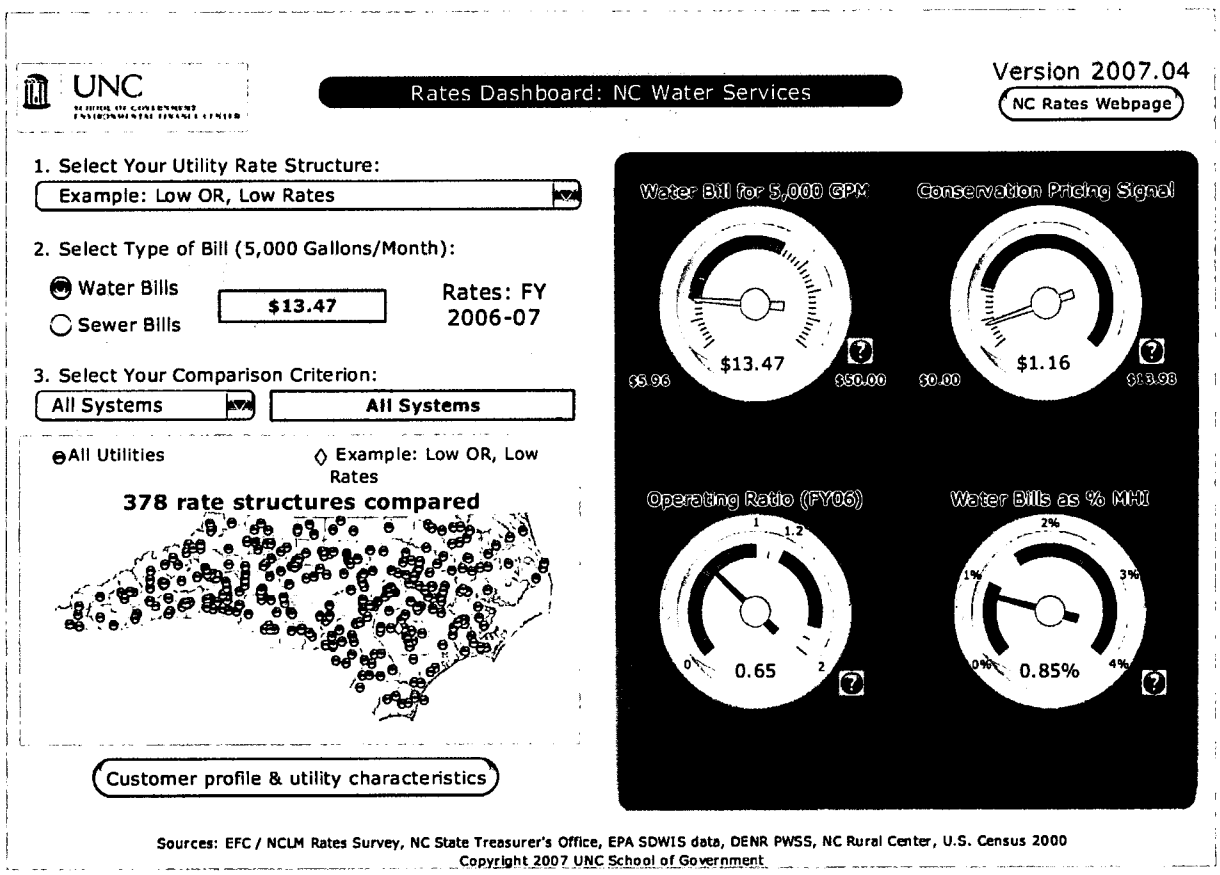


Source: Data collected by DWR, NCDENR Local Water Supply Plans

Rate Structures and Pricing Signals Across North Carolina



Source: 2007 NCLM/SOG Rate Survey, Price is $/1,000 for Customer using 14,000 gal./mo.



Considerations

- Sudden usage reductions often lead to significant revenue reductions but only modest cost reductions
- Relationship between usage and price may be difficult to predict
- Some utility rates are artificially low
- A utility's starting point will influence difficulty of meeting uniform reduction targets
- Current billing practices often limit the ability of price to influence demand
  - Time lag
  - Disconnections between usage and payment
- One size does not fit all

Short Term Options

- Expand usage monitoring
- Expand customer usage research
- Increase volume charges
- Increase base charges
- Increase enforcement of usage restriction penalties

Medium Term Options

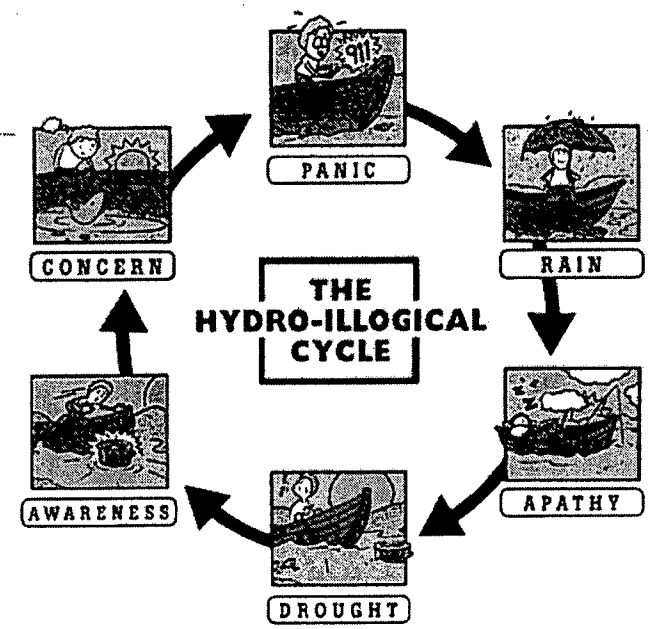
- Move towards "full cost" pricing by limiting artificially low rates
- Expand pricing and consumption information included on bills
- Move to monthly billing
- Consider alternative rate structures (seasonal, water budget, uniform block, increasing block)
- Establish emergency assistance fund for water services customers

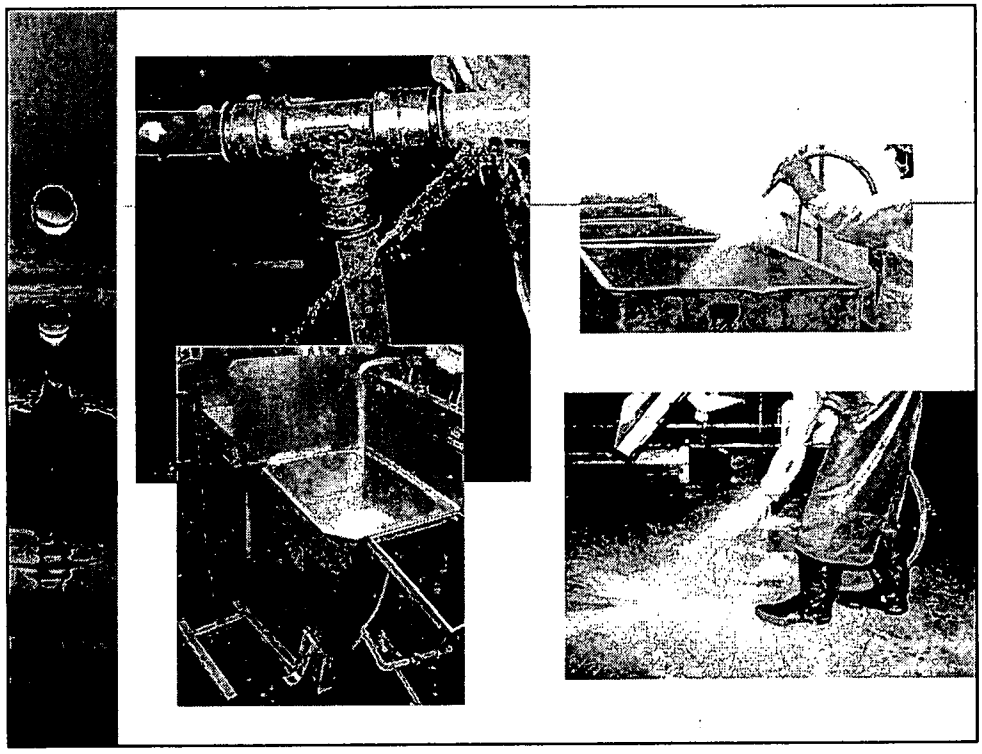
Longer Term Options

- Invest in meter technology
- Invest in reuse systems
- Fund credit program for installation of water efficiency devices/fixtures
- Fully funded capital improvement programs (CIPs) with significant conservation, efficiency, and rehabilitation investments
- Establish rate stabilization fund
- Maintain significant undesignated reserves (utility fund balance)

Water Conservation
The Other Water Source

Gary Hunt
Division of Pollution Prevention and
Environmental Assistance

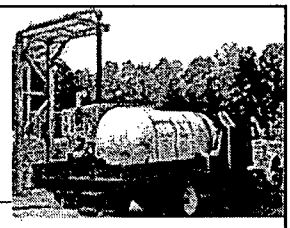




Top Water Efficiency Measures

- Recycle process water
- Improve maintenance to replace misc. parts
- Use domestic water efficiency measures
- Change operational practices
- Adjust cooling tower blowdown
- Reuse of condensate water
- Adjust equipment
- Repair leaks
- Install spray nozzles
- Install/replace automatic shut-offs
- Reduce dishwasher loads
- Turn off equipment when not in use

Use of Reclaimed Water
An Opportunity



- Reclaimed water can be used for landscape irrigation, dust control, soil compaction, non-potable industrial process, cooling
- Many Cities already using reclaimed water: Raleigh, Cary, Wilson, Johnson Co.
- DWQ is expediting permit approval process for reclaimed water use
- Many municipalities and industries may be able to meet the requirements for reclaimed water with few modifications

Environmental Stewardship Initiative

Members reduced water use by over one billion gallons (2003-2006)

NC Environmental Stewardship Initiative

Current Water Conservation Activities

- Regional Drought Meetings
- Working with Department of Commerce
- Expanded technical information on website
- Water conservation teams
- Technical assistance
- Workshops/outreach

North Carolina Green Industry

Economic Impact Survey 200

North Carolina
Department of Agriculture
and Consumer Services

January 3, 2007

The industry described as the North Carolina green industry represents a significant and diversified component of our state's economy. The data presented in this study provides the first comprehensive analysis of the economic impact of the entire green industry.

Today the green industry in North Carolina is comprised of nursery stock growers, golf courses, sod producers, commercial flower growers, Christmas tree growers, landscape architects, landscape designers, landscape contractors, landscape and grounds management contractors, lawn care contractors, tree care contractors, irrigation contractors, independent retail garden centers, big box garden centers and allied suppliers.

The dynamic nature of the North Carolina green industry is reflected in the $8.6 Billion dollars spent in 2005 on the purchase of green industry products and services as well as the 151,982 people employed by the industry statewide.

The information documented by the graphs, charts and conclusions stated in this study clearly illustrate the economic value of this diverse and vibrant industry in North Carolina, the green industry.

Steven W. Troxler

Steve Troxler
Commissioner of Agriculture

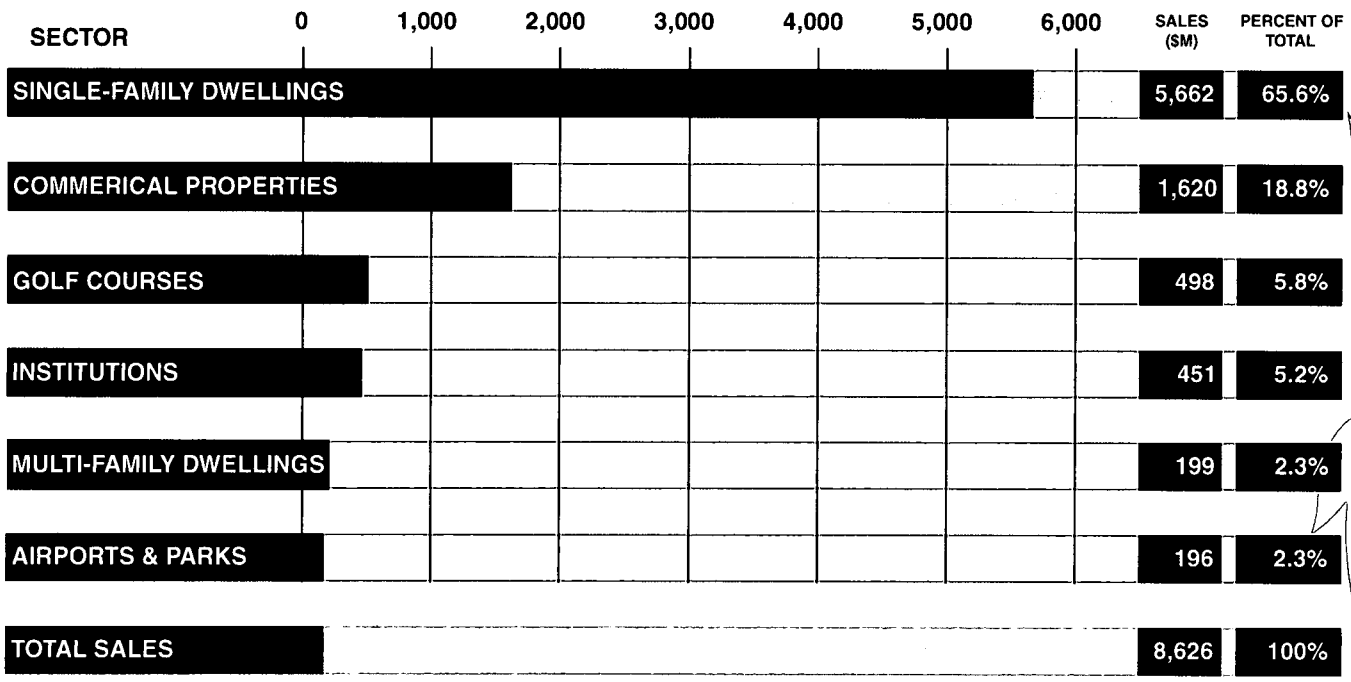
Acknowledgements

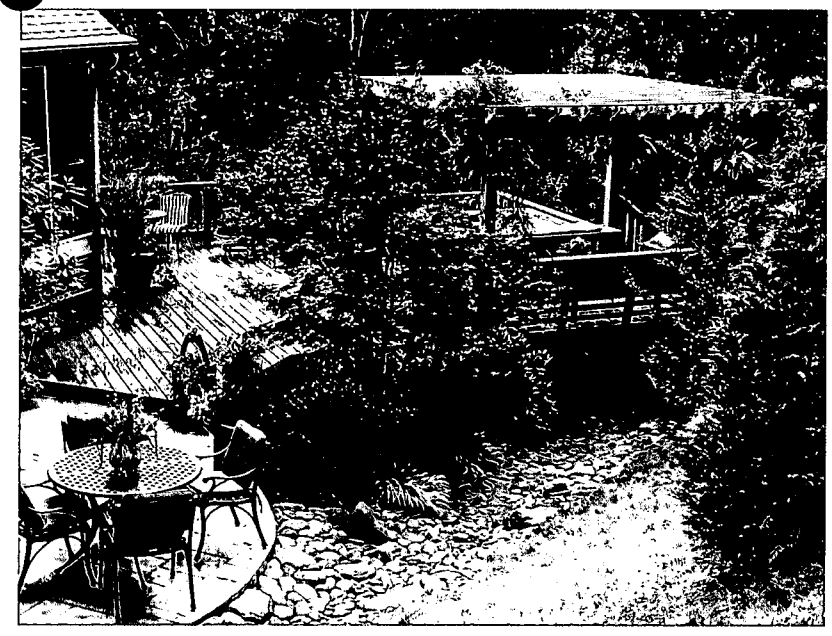
Information included in this publication, unless otherwise noted, references statistics from *Economic Impact of the North Carolina Green Industry* by Charles D. Safley, Professor and Extension Economist, and Michael L. Waldon, William Neal Reynolds Distinguished Professor and Extension Economist, Department of Agricultural and Resource Economics, North Carolina State University. The study was funded by the North Carolina General Assembly. Data collected and compiled by the Agricultural Statistics Division of the NCDA & CS in cooperation with USDA/NASS.

2,000 copies of this public document were printed at a cost of $803.90 or $.40 per copy.

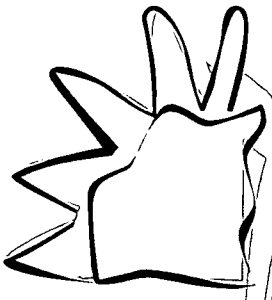
Total Economic Impact

North Carolina's Green Industry 2005 Total Economic Impact on the States Economy was more than $8.6 billion.





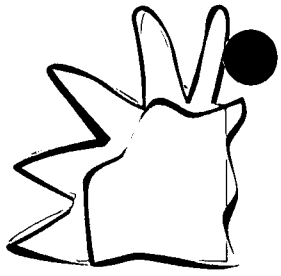
There were more than 3.4 million single family dwellings on over 4.7 million acres of property.



TOTAL ECONOMIC IMPACT OF NORTH CAROLINA'S GREEN INDUSTRY:

$8.6 Billion

Arborists, Landscapers & Lawncare experts spent an average of $149,298 on labor expense.



Employment Impact

North Carolina Green Industry, 2005 Employment

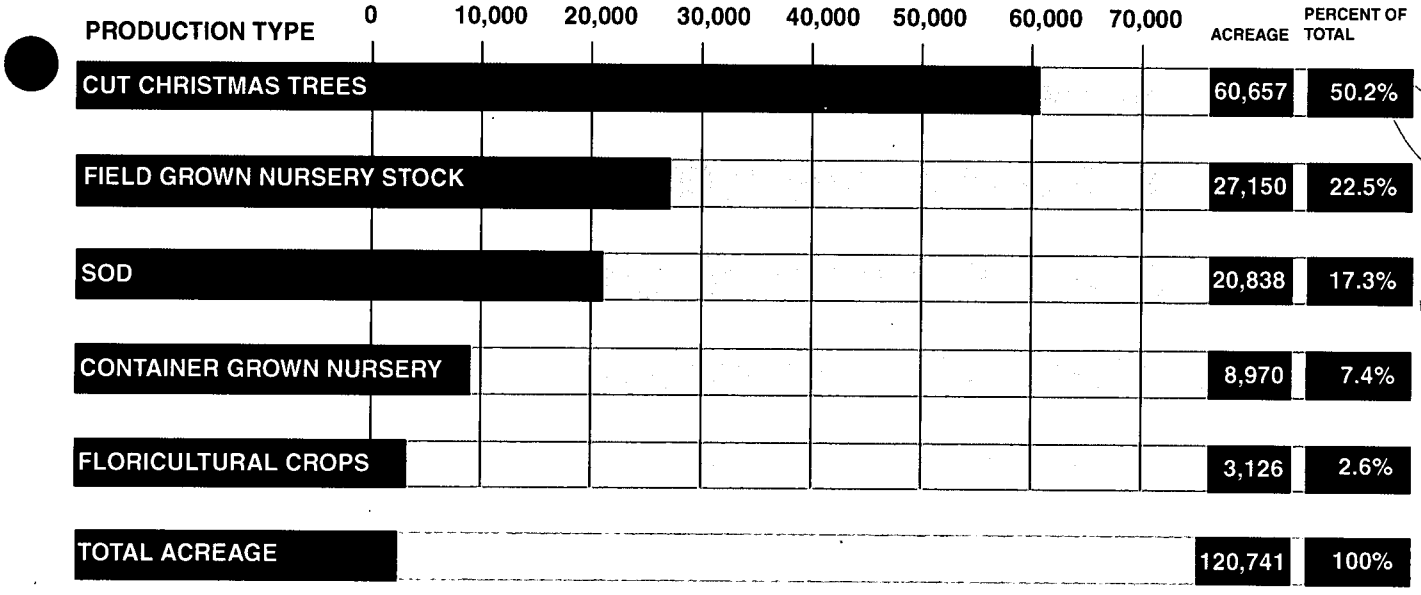
Sector	Full-Time Employment	Part-Time Employment	Total Full- and Part-Time Employment
Nursery, Floriculture & Christmas Tree Growers	12,885	21,196	34,081
Sod Producers	776	484	1,260
Retail Garden Centers	4,632	4,261	8,893
Florists	3,546	4,226	7,772
Arborists, Landscapers & Landscape designers	32,272	14,008	46,280
Landscape Architects	13,006	4,692	17,698
Irrigation Companies	6,014	2,792	8,806
Golf Courses	4,913	3,462	8,375
Institutions	9,747	5,699	15,446
Airports and Parks	2,256	1,115	3,371
Total	90,047	61,935	151,982

TOTAL EMPLOYMENT IMPACT FOR NORTH CAROLINA'S GREEN INDUSTRY IN PRODUCING SECTORS:

151,982 Employees

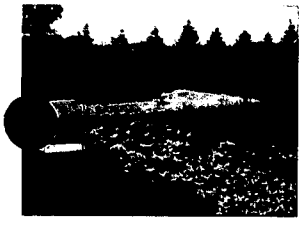
TOTAL ACREAGE

North Carolina Production Acreage in 2005: 120,741 acres

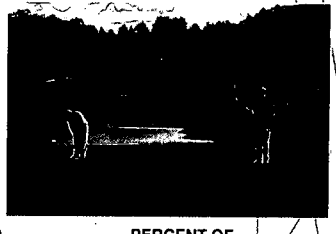


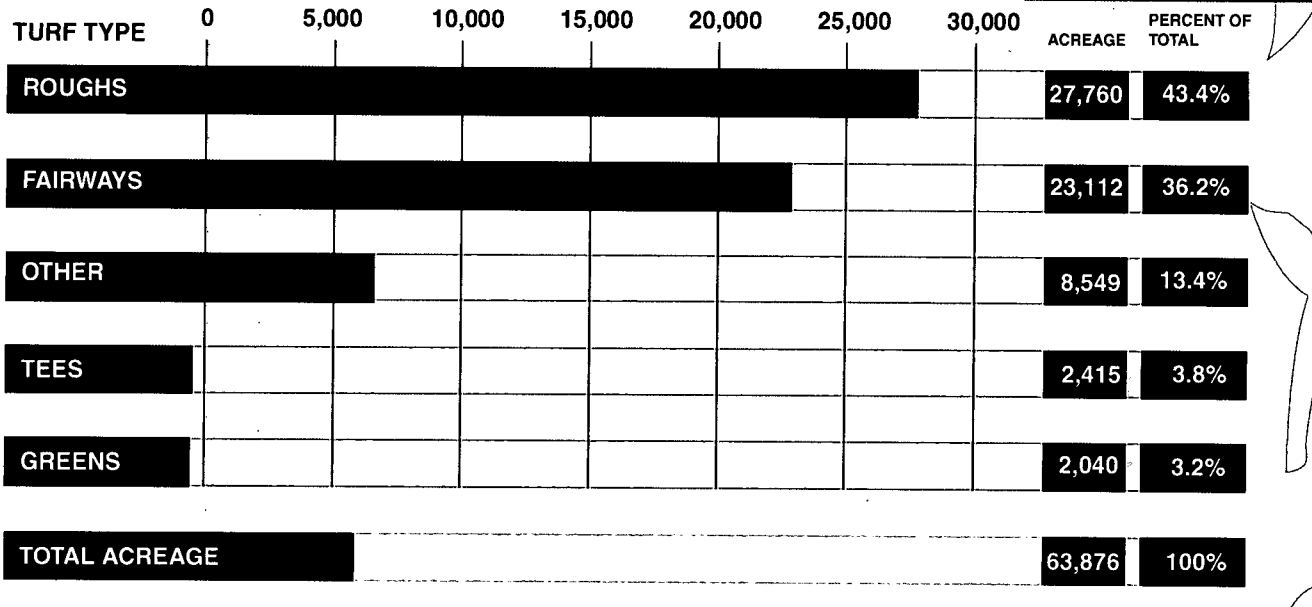
TOTAL FOR NORTH CAROLINA'S PRODUCTION ACREAGE :

120,741 ACRES



Over 17.2 million rounds of golf were played on North Carolina's 605 golf courses in 2005.



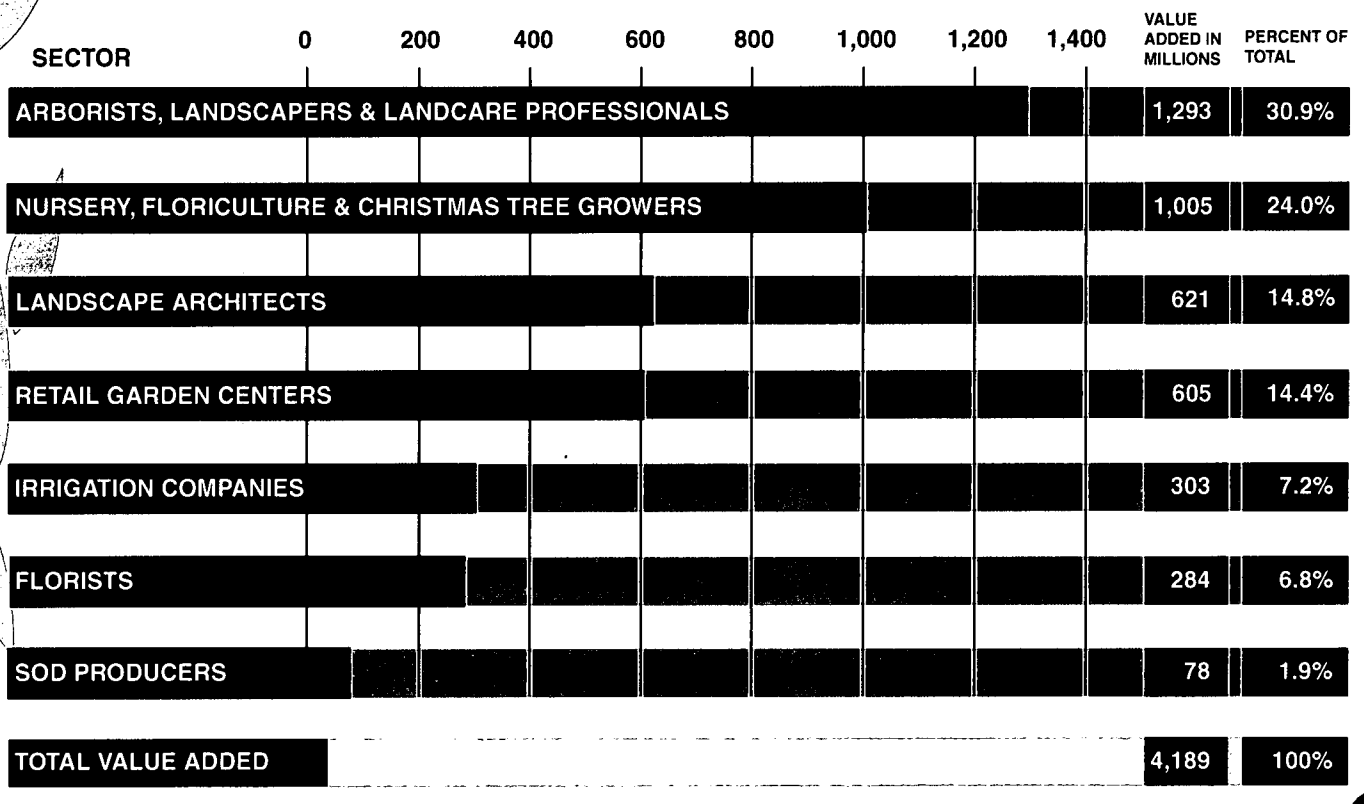


TOTAL FOR NORTH CAROLINA'S GOLF COURSE ACREAGE :

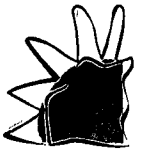
63,876 ACRES

North Carolina Green Industry

Total Value Added of Production in North Carolina was more than $4.1 billion.



Plant sales at North Carolina garden centers, both independent and mass merchants exceeded $322.4 million in 2005.

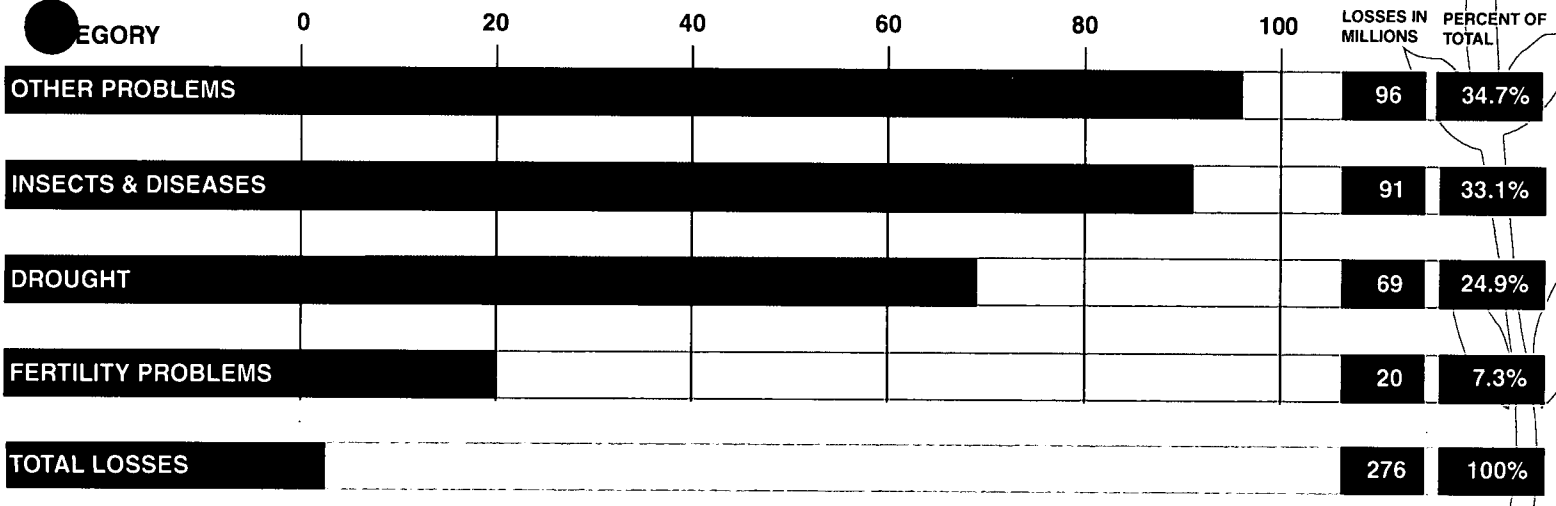


TOTAL VALUE ADDED OF PRODUCTION IN NORTH CAROLINA:

$4.1 Billion

North Carolina Green Industry

Total Economic Losses for both Producer and Consumer Sectors



TOTAL ECONOMIC LOSSES FOR BOTH PRODUCER AND CONSUMER SECTORS IN NORTH CAROLINA:

$276 MILLION (TOTAL LOSSES)

Total Gross Sales by North Carolina Florists exceeded $256.6 million in 2005.

Average Homeowner expenditures for all Lawn and Landscape Services was $838 in 2005.

Total Gross Sales by North Carolina Arborists, Landscapers, and Lawn Care Professionals was $1.2 billion in 2005

Gross Sales by North Carolina Landscape Architects and Designers totaled $574.2 million in 2005.

Over 2.9 million North Carolina homeowners spent an average of $718 for green goods, equipment, and supplies in 2005.

Over 2,936 owners of commercial multi-family residences or apartment complexes spent an average of $10,321 for green goods, equipment, and supplies in 2005.

Progress Energy

Progress Energy Carolinas
Drought Update for the NC Environmental Review Commission
October 31, 2007

- As a result of past droughts, most notably the 2000 - 2002 drought, Progress Energy has developed multi-stage drought contingency plans for its generating plants. These plans include procedures for managing lake levels while providing for required minimum downstream flows, preparations for acquiring alternate means of cooling water, and steps for coordinating water usage with federal, state and local governmental agencies.

- Progress Energy has been closely monitoring drought conditions. We will continue to evaluate our drought contingency plans and implement them as needed.

- To date, the drought has moderately impacted our operations, but has not limited our ability to generate at our fossil or nuclear plants. Most of the water used at these types of generating facilities is for plant cooling. While some water used in that process is lost due to evaporation, the majority of the water used is returned to the water body. With the onset of cooler temperatures, the amount of water lost to evaporation is reduced.

- The drought has affected our hydroelectric generation. While these hydro plants are an important portion of our generation mix, they comprise less than 2 percent of our total supply resources.

- Progress Energy operates its system of power plants as a fleet. Should the water levels continue to drop, requiring reduced generation at some facilities, we can rely on our other plants or we can purchase power as needed to continue to provide for our customers' electricity needs. We have a balanced portfolio of resources, fuel sources and technologies, as well as interconnections with our neighboring utilities to promote reliability in a number of contingencies.

- When customers conserve electricity, they also are helping us conserve water and other natural resources. Learn more at www.savethewatts.com.

Hydro Impacts

- Since early summer, Progress Energy has managed its hydroelectric generation to ensure minimal impacts to lake levels. Our hydroelectric generation has been reduced by nearly 30 percent.

- Progress Energy is a member of the Yadkin/Pee Dee River Drought Team. This team includes representatives from federal and state regulatory agencies, several N.C. power companies and community organizations. The team has

adopted measures to help protect this important resource in a way that benefits all users.

- Progress Energy has voluntarily reduced generation and adjusted the operating schedule of its Tillery Plant. We are currently leveling and supplementing flows downstream of the plant in order to supply a dependable daily water supply for downstream industry and public water systems.

Corporate Facilities

- In both regional and corporate facilities, we are following local government mandates for limiting irrigation and other water use.

- We have shut off the irrigation systems for all of our regional facilities.

- Irrigation at the Progress Energy headquarters building on Wilmington St. in Raleigh was shut off several weeks ago.

Recent Rainfall Helps; Yet Drought Situation Remains Serious

CHARLOTTE, N.C. – In the Catawba-Wateree River basin, Duke Energy currently estimates that without substantial additional rainfall, Stage 4 drought conditions which call for tougher water restrictions may be declared in six to 10 weeks – between mid-December 2007 and mid-January 2008. The estimate was extended based upon last week's rainfall.

Stage 4 does not mean the remaining supply of water in the basin is depleted. Rather, water suppliers would likely place additional restrictions on water use. Additional rainfall and greater water conservation could help further delay the onset of Stage 4.

Last week's rainfall amounts ranging from 1-3 inches across the Catawba-Wateree River basin began replenishing the region's water supply for essential drinking water, electricity and industrial needs.

Estimated Remaining Water Supply in Basin

Predicting the time until the remaining useable storage will be fully depleted is difficult due to a number of variables. The key variables are:

- Evaporation -- The rate at which water evaporates from the surface of the river and its 11 reservoirs. (This rate has fallen significantly and should

continue to drop through the winter.)

- Conservation – Continued water and energy conservation has and will continue to be important.
- Rainfall – While the rainfall received during the past week is helpful, the region needs a significant amount of rainfall over the next several months to help the area recover completely from the drought situation.

Through the use of water modeling, Duke Energy has determined a worst case scenario for estimating when the usable water storage in the basin will be depleted. In that scenario, assuming a storage decline of 2 percent per week, which is the average weekly storage loss rate for the period from Aug. 27 through Oct. 19, and assuming the same rainfall/drought conditions seen in recent months, the most shallow water intakes and equipment on the lakes could begin to be impacted by the middle of March 2008.

"Although this scenario is extremely unlikely to occur, the long-term forecast through February 2008 is for drier than normal weather," said Steve Jester, hydro licensing and lake services vice president. "According to the Climate Prediction Center, there is only a 10 percent or less probability the extreme lack of rainfall experienced in the past several months will continue. However, it's important to understand that each of us needs to continue to conserve until more rainfall like we saw last week reaches our region."

While this worst case scenario would not mean that the Catawba-Wateree reservoirs would be dry, it does mean the most shallow water intakes in the basin could be at risk at that time and contingency plans would need to be implemented to ensure essential needs are met.

Duke Energy Actions

Since April, Duke Energy has reduced hydroelectric operations by more than 50 percent in order to save water. Hydroelectric, coal and nuclear plants on the Catawba lakes generate approximately 9,000 megawatts of electricity for Duke Energy's customers in the Carolinas.

Duke Energy built 11 lakes on the Catawba to help provide vital electricity to more than 2.2 million customers in the Carolinas.

"Duke Energy is committed to being a good steward of the lakes it built," Jester said. "Besides providing water for drinking and other purposes, these lakes contribute other essential services to communities in the region, including drought management.

"In the Catawba-Wateree River basin, we're fortunate to have 11 dams to help manage the flow of water. Many free flowing creeks and streams have already dried up," Jester said.

In addition, Duke Energy has worked for months with 24 major public water system operators as part of a drought management team. The team has shared extensive data about the drought situation and coordinated efforts to conserve water in the basin. This regional approach has resulted in more than 20 percent water savings through conservation efforts.

Major Water Suppliers' Next Steps

As part of the regional approach to ensuring water remains available for essential water use, owners of water intakes in the Catawba-Wateree River basin are finalizing contingency planning in order to protect the water supply.

- more –

Residents should contact their local water supplier with any questions about their drinking water.

Conservation

By reducing our individual water use we can help buy more time until needed rainfall can arrive in the region. Since power plants use water in their operations, it's important to conserve both water and electricity.
